*IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT.*

- B. Related Sections:

1. Section 018113: Sustainable Design Requirements.
2. Section 019100/019110: Facilities Commissioning
3. Section 220500: Common Work Results for Mechanical
4. Section 220513: Motors
5. Section 237323: Custom Air Handling Units
6. Section 237324: Semi Custom Air Handling Units
7. Section 230900: Mechanical Systems Controls
8. Section 230593: Testing, Adjusting and Balancing
9. Division 26: Electrical

**1.2 SUMMARY**

- A. Products specified in this section include the following:
1. Desiccant coated rotary air-to-air heat exchangers for the recovery of sensible and latent energy.
  2. Rotary air-to-air heat exchangers for the recovery of sensible energy.

**1.3 SUBMITTALS**

- A. Product Data: For each energy recovery wheel indicated, provide the following:
1. Complete performance data including all data required by AHRI 1060 at both Standard and Application conditions and data validating all specified and scheduled performance requirements.
  2. Motor ratings, manufacturer, electrical characteristics, and motor accessories.
  3. Belt, gear reducer, coupling, and tensioner data.
  4. Materials, gages and anti-corrosion finish data.
- B. Shop Drawings:
1. Project specific drawings with dimensions of each wheel assembly.

- C. Submit certification by a qualified independent organization documenting sensible and latent efficiencies per ASHRAE 84-78P and AHRI 1060.
- D. Submit cross-contamination certification reports from a credible testing agency.
- E. Submit antimicrobial agent performance certification report (when a antimicrobial coating is specified) from a credible testing agency, verifying that antimicrobial coating will be effective in this application.
- F. Installation, operation, and maintenance manuals.

**1.4 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  - 1. AHRI 1060 - Performance Rating for Air-to-Air Exchangers for Energy Recovery Ventilation Equipment
  - 2. ASHRAE 62.1 - Ventilation for Acceptable Indoor Air Quality
  - 3. ASHRAE 84 - Method of Testing Air-to-Air Heat/Energy Exchangers
  - 4. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
  - 5. ASTM E84 - Standard Test Method of Surface Burning Characteristics of Building Materials
  - 6. NFPA 70 - National Electric Code.
  - 7. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.
  - 8. NEMA MG-1 - National Electrical Manufacturers Association Motor Standards.
  - 9. SMACNA - HVAC Duct Construction Standards- Metal and Flexible

**1.5 DELIVERY, STORAGE AND HANDLING**

- A. Ship all components in weather-proof wrap for storage outdoors. Protect wheels, housings, control panels, and any other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.

**1.6 WARRANTY**

- A. Provide a complete warranty for parts and labor for a minimum of **ten** years from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
1. Semco
  2. Desiccant Rotor International
  3. Thermotech Enterprises Inc.

**2.2 ENTHALPY ENERGY RECOVERY WHEELS**

- A. General

*THIS SPECIFICATION IS WRITTEN ASSUMING THE ENERGY RECOVERY WHEEL WILL BE INSTALLED IN AN AIR HANDLER/ENERGY RECOVERY UNIT, AND THEREFORE ACCESS DOORS WILL BE PROVIDED ON ALL FOUR SIDES OF THE WHEEL PER THE SPECIFICATION FOR THAT EQUIPMENT. IF THE WHEEL IS TO BE INSTALLED IN DUCTWORK, THE DESIGNER MUST DESIGNATE ACCESS DOORS OR PANELS UPSTREAM AND DOWNSTREAM OF BOTH SIDES OF THE WHEEL TO PERMIT ACCESS.*

1. The recovery wheel assembly shall be furnished in an air handler casing. Recovery wheel casing construction and performance shall match that of the associated air handler/energy recovery unit of which the recovery wheel is a component.
2. Recovery wheel manufacturer shall provide a complete sequence of operation to allow the Owner's Direct Digital Control System to provide proper recovery wheel control. The sequence shall include how motors speed is to be adjusted to optimize heat recovery, summer/winter change-over, economizer mode, and defrost control.

*IF THE RECOVERY WHEEL IS TO BE USED IN A LABORATORY OR CRITICAL APPLICATION, CONSULT WITH THE U-M DESIGN MANAGER TO DETERMINE IF TESTING OF THE RECOVERY WHEEL PRIOR TO SHIPMENT AT AN INDEPENDENT TESTING AGENCY, IN PARTICULAR FOR LEAKAGE BETWEEN THE EXHAUST AND SUPPLY AIR STREAMS (I.E. VERIFICATION OF EXHAUST AIR TRANSFER RATIO) IS JUSTIFIED. IF SO, SPECIFY SUCH TESTING BELOW. TESTING IS EXPENSIVE AND HAS A SIGNIFICANT LEAD TIME.*

*AHRI CERTIFICATION IS GIVEN IN HIDDEN TEXT BELOW BECAUSE SEMCO AND THERMOTECH ARE CURRENTLY IN THE PROCESS OF OBTAINING AHRI CERTIFICATION. REPORTEDLY AS OF DEC. 2012 ONLY DRI HAS AHRI CERTIFICATION. THE DESIGNER SHOULD CONSIDER IF THE PROJECT TYPE MANDATES THAT ONLY AHRI CERTIFIED WHEELS BE USED. ONCE ALL MFR.S ARE AHRI CERTIFIED THE TEXT BELOW SHOULD BE CHANGED TO VISIBLE TEXT.*

- B. Performance

1. The recovery wheel shall bear the AHRI Certification Seal.
2. The recovery wheel shall meet NFPA 90A requirements for flame spread and smoke generation when tested per ASTM E84.

3. The manufacturer shall guarantee that the performance requirements stated below and scheduled on the project drawings will be met by the recovery wheel as installed at the project site, when tested per ASHRAE Standard 84 and AHRI STANDARD 1060. The manufacturer similarly guarantees all Application Ratings submitted for review. The Owner reserves the right to field verify that the performance requirements and Application Ratings were met by testing in accordance with ASHRAE Standard 84/AHRI STANDARD 1060, utilizing an independent testing agency. The Owner has exclusive right to select the testing agency. Recovery wheels found deficient of any performance requirement shall be corrected and retested by the manufacturer (utilizing the testing agency that performed the original tests) without additional cost to the Owner until all the requirements are achieved.
4. The Exhaust Air Transfer Ratio (EATR) shall be less than 0.04 percent at the scheduled air flow and pressure conditions. The purge volume required to achieve this EATR shall not exceed the purge volume indicated by the scheduled air flows.

*THE BELOW PARAGRAPH REQUIRES THAT LESS THAN 10% LEAKAGE OCCUR FROM THE EXHAUST TO THE SUPPLY SIDE OF THE RECOVERY WHEEL WITH THE PURGE SET TO ZERO. ASHRAE 62.1-2010 PERMITS UP TO 10% LEAKAGE OF AIR THAT IT DEFINES AS CLASS 2, FOR EXAMPLE TOILET EXHAUST. THIS ALLOWS THE RECOVERY WHEEL TO BE USED IN CLASS 2 AIR WITHOUT THE NEED FOR PURGE AIR, WHICH WASTES ENERGY AND REQUIRES THAT THE SUPPLY FAN TO BE OVERSIZED. HOWEVER, THE DESIGNER NEEDS TO WEIGH ANY DISADVANTAGES THAT MAY OCCUR IF THE PURGE SECTOR IS SET TO ZERO. FOR LOW RISK APPLICATIONS INVOLVING CLASS 2 AIR, DESIGNERS SHOULD STRONGLY CONSIDER SPECIFYING THAT THE PURGE BE SET TO ZERO. ALSO NOTE THAT THE WORDING BELOW "RECIRCULATION FROM LEAKAGE, CARRYOVER, OR TRANSFER FROM THE EXHAUST SIDE SHALL NOT EXCEED 10.0 PERCENT OF THE OUTDOOR INTAKE FLOW" IS TAKEN FROM ASHRAE 62.1 AND SHOULD NOT BE MODIFIED INDISCRIMINATELY.*

5. With the adjustable purge sector set to zero degrees (zero purge), recirculation from leakage, carryover, or transfer from the exhaust side shall not exceed 10.0 percent of the outdoor intake flow at a differential pressure between the supply and exhaust/return air streams at the recovery wheel location of up to 12 inches water column.

C. Rotor Media:

*FOR CORROSIVE SERVICE A MORE ROBUST COATING THAN MFR.'S STANDARD ANTI-CORROSION COATING MAY BE APPROPRIATE. CONTACT MFR. FOR OPTIONS.*

1. The heat transfer substrate shall be constructed of aluminum formed into a honeycomb media structure. Non-metallic substrates made from paper, plastic, synthetic or glass fiber media are not acceptable.
2. The substrate surfaces shall have an anti-corrosion coating.
3. The faces of the recovery wheel shall be sealed with a two part acid resistant coating that limits surface oxidation.
4. Dry particles up to 800 microns shall pass freely through the media.

5. The media shall be cleanable with low-pressure steam (less than 5 PSI), hot water or light detergent, without degrading the sensible or latent recovery capabilities of the energy recovery wheel system.
6. Desiccant coating:
  - a. All substrate surfaces shall be coated with a non-migrating solid absorbent desiccant layer prior to being formed into the honeycomb.
  - b. The desiccant coating shall be applied to the surfaces of the aluminum substrate and the two faces of the energy recovery wheel.
  - c. The desiccant shall be an inorganic 3Å molecular sieve type certified by the manufacturer to have an internal pore diameter distribution which limits adsorption to materials not larger than the critical diameter of a water molecule (2.8 Å).
  - d. The desiccant shall be a "Balanced Sieve" type that provides equal sensible and latent heat transfer.
  - e. An independent test from a credible test laboratory shall document that the desiccant material utilized does not transfer pollutants typically encountered in the indoor air environment.

*THE BELOW SAMPLE LANGUAGE (IN HIDDEN TEXT) FOR AN ANTIMICROBIAL AGENT MAY BE APPROPRIATE FOR HOSPITAL AND OTHER CRITICAL APPLICATIONS. IF REQUIRED, VERIFY WITH WHEEL MFR.S EXACTLY WHAT CAN BE SUPPLIED, THEN REVISE THE BELOW AFTER UN-HIDING THE TEXT.*

- f. The media shall be treated with an antimicrobial agent, tested and certified by an independent testing agency for effective antimicrobial action and bacteria-static properties in an energy recovery wheel (or functionally equivalent) application. .

D. Rotor Assembly

*FOR CORROSIVE SERVICE A MORE ROBUST COATING THAN MFR.'S STANDARD ANTI-CORROSION COATING MAY BE APPROPRIATE. CONTACT MFR. FOR OPTIONS.*

1. Rotor media shall be supported in a spoked rotor-wheel system constructed of an extruded aluminum ring and extruded aluminum spokes and welded construction. All rotor assembly surfaces shall be coated with an anti-corrosion coating.
2. The rotor media shall be provided in segments to allow for field erection or replacement of one section of media at a time by removal from the rotor face. Provide as many segments as necessary to allow the media segment to be removed through the air handler/energy recovery unit rotor section access door. No external pullers or other special tools shall be required for field assembly or replacement of the media segments. Media segments shall be compressed in place independent of other segments and shall not be secured with adhesives or silicone.

3. The rotor shall be supported by tapered roller bearings in pillow block housings. The bearings shall be selected to provide a minimum L-10 life of 200,000 hours. It shall be possible to replace the bearings without removing the rotor or rotor shaft. Shaft journals shall be machined to proper tolerance as specified by the bearing manufacturer. The Shaft shall be machined to provide a shoulder against the bearings to eliminate any lateral movement of the rotor due to axial bearing loads. Provide easily accessible grease fittings.
4. The rotor structural support framework shall be minimum G90 galvanized tubular steel with welded construction, suitably braced for rigging and operation to assure all performance requirements are achieved.
5. The deflection of the entire rotor assembly, as measured at the outer radius, shall not exceed 1/32" at the scheduled maximum rotor air pressure drop and at the maximum pressure difference between the exhaust/return and the supply side of the recovery unit.
6. Provide a field adjustable purge sector, factory set. Mark the factory set purge sector position.
7. Rotor seals shall be non-contact minimum 4-pass labyrinth type, secured and field adjustable via an aluminum retainer or stainless steel clips, adjustable by means of slots and bolts, and factory set to within 0.05 inch of the rotor surface. The seal system shall withstand a pressure difference up to 12 in. w.c. without damage, deflection or causing excessive air leakage.

E. Rotor Drive System

1. Provide motor, speed reducer, and dual V-belts riding in a groove in the rotor rim to eliminate side-to-side movements and slippage.
2. Speed reducer shall be grease lubricated with a flexible elastomeric input coupling allowing easy motor separation and for absorption of shock and vibration.
3. Motors shall be inverter duty rated and comply to Related Section "Motors".
4. Locate the motor and gear reducer in the supply air stream in an easily accessible location.
5. Drive system, except belts, shall be parts and labor warranted for 90,000 hours of operation.

**2.3 SENSIBLE ENERGY RECOVERY WHEELS**

- A. Provide sensible energy recovery wheels matching all the requirements specified for Enthalpy Energy Recovery wheels with the exception that desiccant coating shall not be provided.

**PART 3 - EXECUTION**

**3.1 EXAMINATION AND PREPARATION**

- A. Store units protected from weather, dirt, water, and construction debris, and per manufacturer's recommendations.

### 3.2 INSTALLATION

- A. Install Energy Recovery Wheel assemblies in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Rig units with spreader bars and at adequate lifting points to prevent twisting and bending of the recovery wheel assembly.
- C. Verify the orientation of the purge sector relative to the direction of the supply air stream.
- D. Install rigid card board of plywood over both wheel faces to prevent media damage. Maintain this protection until the point the wheel is started for testing.
- E. Install a complete set of filters of the same quality and efficiency as the specified permanent filters for the project, if the system into which the recovery wheel is installed is to be run for temporary service. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.
- F. The Test and Balance Contractor shall verify purge volumes and adjust the purge sector, if required, to achieve the required purge volumes. Before adjusting the purge sector consult with the wheel manufacturer for adjustment instructions.

### 3.3 START-UP

- A. Provide a qualified service technician from the Manufacturer's staff to perform recovery wheel start-up, prior to any temporary use. Coordinate start-up of recovery wheel to occur in conjunction with air handler/energy recovery unit start-up. The manufacturer's service technician shall perform the following tasks:
  - 1. Verify correct installation of recovery wheel.
  - 2. Grease bearings, verify motor direction and adjust belt tension if required.
  - 3. Adjust recovery wheel seals.
  - 4. Caulk all energy wheel components at locations recommended by the wheel manufacturer.
  - 5. Verify purge volumes and adjust purge to achieve the required purge volumes, in cooperation with the Test and Balance contractor.
  - 6. Perform any other manufacturer's recommended prestart activities.
  - 7. Start-up wheel and verify proper operation.
  - 8. Before leaving premises, provide the Owner's representative a start-up report certifying that all start-up activities were completed and that the energy recovery wheel operates properly.

### 3.4 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

**3.5 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures, minimum of 1 hour or 30 minutes per unit if multiple units were supplied. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall include belt and rotor seal adjustment, bearing greasing, motor, belt and bearing replacement, media removal, media cleaning methods, and a description of purge sector operation and what position the purge sector should be set at for the project's particular application.
- C. Schedule training with Owner with at least seven (7) days prior notice. Training and start up services are separate functions - training shall not be combined with startup services.

**SPECIFICATION DIVISION 23**

NUMBER            SECTION DESCRIPTION

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**

SECTION 237323 - CUSTOM AIR HANDLING UNITS

**END OF CONTENTS TABLE**

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)  
SECTION 237323 - CUSTOM AIR HANDLING UNITS

REVISED TO REQUIRE CERTAIN PRODUCT DATA W/SUBMITTALS, AND TO ALLOW A SMOOTH FLOOR ILO A CHECKER PLATE FLOOR, ALL PER MECH TECH TEAM. D. KARLE, 7/29/08.

ADDED SPECIFICATION FOR HINGED PRIMARY RACK. MINOR IMPROVEMENTS TO ELECTRICAL AND TEMPERATURE CONTROL WIRING SECTION BY K. BIRINGER AND D. KARLE, ALL 07/01/09.

REVISED TO ELIMINATE SEALTITE AND FIBERGLASS LIGHT FIXTURES DUE TO NEC CODE CHANGE. CLARIFIED FILTER REQUIREMENTS DURING TEMPORARY USE (3.1.J.) D. KARLE FOR MECH TECH TEAM, 3/26/10.

GENERAL IMPROVEMENT OF CONTENT ARRANGEMENT AND REVISION TO NEW FORMAT, MARCH 2011.

CORRECTED FORMATTING ERROR THAT HAD MADE SOUND TRANSMISSION LOSS DATA IN ARTICLE 2.5 APPLY TO EXTERIOR UNITS ONLY. D. KARLE 1-25-13.

AIR ENTERPRISES AND VENTROL ADDED AS APPROVED 3/26/13, PER HVAC MTT.

REVISED TO ALLOW THINNER ALUMINUM GAUGE FOR ALUMINUM FOAM PANELS PER MTT 7/11/13.

**PART 1 - GENERAL**

REVISE CAREFULLY IF SPECIFICATION IS TO BE USED FOR PREPURCHASE; TO SPECIFY WHO PROVIDES FILTERS FOR THE AIR HANDLER IF IT WILL BE USED FOR TEMPORARY SERVICE. IT IS SUGGESTED THAT THE AIR HANDLER SUPPLIER PROVIDE ONE SET OF FILTERS, AND THE MECHANICAL CONTRACTOR RUNNING THE UNIT DURING TEMPORARY SERVICE PROVIDE THE ADDITIONAL FILTER SETS, SINCE IT IS UNKNOWN HOW MAY FILTER SETS WILL BE REQUIRED DURING TEMPORARY OPERATION. THIS SECTION SPECIFIES FILTERS SUPPLIED IN THIS MANNER (PER PART 2, MFR. SUPPLIES FILTERS WITH UNIT. PER PART 3, UNIT MUST BE TURNED OVER WITH NEW FILTERS).

THIS SPEC CANNOT BE USED STAND-ALONE FOR AIR HANDLERS! THE RELATED SPEC SECTIONS LISTED IN PART 1 MUST BE INCLUDED IN THE PROJECT SPEC BOOK TO PROVIDE THE COMPLETE REQUIREMENTS. HOWEVER, INFO IN THIS SECTION IS COMPLEMENTARY TO THOSE RELATED SECTIONS; THEREFORE DO NOT DELETE, FOR EXAMPLE INFO IN THIS SECTION REGARDING COILS, DRAIN PANS, FILTERS, ETC.

**1.1 RELATED DOCUMENTS**

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
  - 1. Section 220500: Common Work Results for Mechanical.
  - 2. Section 220513: Motors.
  - 3. Section 220548: Vibration Control
  - 4. Section 238216: Coils and Drain Pans
  - 5. Section 233400: Fans
  - 6. Section 234000: HVAC Air Cleaning Devices.
  - 7. Section 233300: Air Duct Accessories and RGDs
  - 8. Section 230900: Mechanical Systems Control
  - 9. Section 230593: Testing, Adjusting, and Balancing.
  - 10. Division 26: Electrical.

**1.2 SUMMARY**

- A. Section Includes:
  - 1. Custom built-up supply and return/exhaust air handling units.
  - 2. Factory and field testing of custom air handling units.

**1.3 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
  - 1. ANSI/AHRI Standard 430. Performance Rating of Central Station Air-Handling Units.
  - 2. AHRI Standard 260- Sound Rating of Ducted Air Moving and Conditioning Equipment.
  - 3. NFPA 70 National Electric Code.
  - 4. NFPA 90A: Standard for the Installation of Air-Conditioning and Ventilating Systems

**1.4 DELIVERY, STORAGE, AND HANDLING**

- A. Manufacturer shall provide shipping protection to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.
- B. Support coil headers independently during transport to prevent potential damage from vibration.
- C. Restrain fans and other components to prevent damage during shipping.

**1.5 ADMINISTRATIVE REQUIREMENTS**

- A. Provide a qualified service technician from the Manufacturer's staff to supervise installation and reconnection of unit sections and to perform start-up, testing and training as detailed in part 3.

**1.6 SUBMITTALS**

- A. Submit the following product data for approval, for each unit:
  - 1. Overall unit dimensions, weight, and center of gravity.
  - 2. Ductwork connections including sizes, locations, and methods of connecting to mating ductwork.
  - 3. Piping connections including size, material types, and dimensioned locations for each service.
  - 4. Detail methods of sealing inner and outer walls at locations of pipe penetrations.
  - 5. Locations and sizes of access doors.
  - 6. Details of access door handles, latching mechanisms, hinges, and vision panels.
  - 7. Locations of interior light fixtures and light switches.
  - 8. Locations of electric power convenience receptacles.
  - 9. Dimensions, weights and centers of gravity for each section when units will be shipped in multiple sections.
  - 10. Cabinet material, metal thickness, finishes, insulation and accessories.
  - 11. Details of vibration isolation bases including selections for vibration isolation springs.
  - 12. Details of fan discharge flexible duct connector where required.
  - 13. Details of motor and belt guards.
  - 14. Motor ratings, electrical characteristics, and motor accessories.
  - 15. Sound power data for the entire air-handling unit for each octave band at the following locations: At unit inlet, at unit discharge, and transmitted sound.
  - 16. Factory testing procedure.
  - 17. Factory test results.
  - 18. Field test results.

*REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.*

**1.7 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
  - 1. Buffalo Air Handling.

2. TMI Custom Air Systems.
3. Governair LLC.
4. Mafna Air Conditioning, Inc.
5. Air Flow Equipment.
6. Air Enterprises
7. Ventrol

**2.2 GENERAL**

- A. Provide factory fabricated, double-wall air handling units with components and equipment as scheduled and detailed on Drawings.
- B. Components shall be fabricated in major sections at the Manufacturer's factory and shall carry the Manufacturer's nameplate. Sections, after having framework completely installed on their base structures, shall be final assembled at factory into one-piece for testing and to ensure that sections will fit together properly when reassembled in the field.
- C. Provide units of height, width, and length indicated, and that comply with project weight and spatial limitations.
  1. Weight, spatial, and dimensional limitations shall also apply to individual sections, including to facilitate unit rigging and installation.
- D. Provide a minimum of four lifting lugs per separately shipped section, of adequate strength to allow rigging without damage.
- E. Manufacturer shall supply gasketing, sealant, and installation instructions.
- F. Manufacturer shall provide touch-up paint(s) for use after field assembly.
- G. Touch up all galvanized surfaces damaged from welding or other fabrication operations with zinc rich paint, minimum 65 percent metallic zinc by weight.

**2.3 COMPONENTS- GENERAL REQUIREMENTS**

- A. Provide all components integral to the air handling unit including, but not limited to, the following. These components shall comply with Related Sections and any additional requirements of this Section.

***EDIT THESE ITEMS FOR EACH PROJECT***

1. Motors
2. Vibration Isolation
3. Coils and Drain Pans
4. Fans and Accessories
5. Air Filters
6. Sheet Metal Accessories
7. Dampers (as specified in Controls section)
8. Energy Recovery Wheels/Heat Exchangers
9. Sound Attenuators

**2.4 MANUFACTURING**

- A. Casings shall be manufactured only after panel components (structural members, facing sheets and insulation) have been thoroughly cleaned of mill grease, dirt and oxidation.
  - 1. Interior and exterior of panel system shall be thoroughly protected from contamination from the manufacturing process through start-up procedures and acceptance.
  - 2. Internal components (fans, coils, air filter frames, equipment and piping) shall arrive from their respective manufacturing facilities free of grease and dirt.
- B. In general, products such as sealants and gaskets, used within the unit, shall be non-petroleum based products, with no outgassing characteristics.
- C. Equip, prepare, identify and match-mark individual shipping sections so that field reassembly and installation can be performed without reworking, interchanging, adjusting, springing, drilling new bolt holes, etc. All supplemental supplies necessary to assemble the unit shall be provided by the Manufacturer.

**2.5 UNIT HOUSING**

- A. Performance
  - 1. Maximum U-Value: 0.07
    - a. Minimum insulation density (fiber glass): 3 lbs/sq. ft.
  - 2. Under normal operating conditions there shall be no condensation on the exterior at 100 deg F db/74 deg F wb ambient.
  - 3. Maximum deflection of walls shall be L/250 at plus or minus 10 in. w.c. (L = span in inches.).
  - 4. Maximum deflection of roof and floor shall be L/250 at design loading. (L = span in inches).
    - a. Minimum floor design load: 150 lbs/sq. ft.
    - b. Minimum roof design load: 75 lbs/sq. ft. plus snow load for exterior unit.
  - 5. Outdoor design conditions
    - a. Minimum wind load: 120 mph.
    - b. Minimum snow load: 50 lbs/sq. ft., or per applicable codes, whichever is greater.

*REVISE SOUND TRANSMISSION LOSS DATA BELOW AS NECESSARY TO MEET PROJECT PERFORMANCE REQUIREMENTS, THE BELOW IS A GENERAL GUIDELINE. ALSO FILL IN 64 AND 8000 HZ OCTAVE BANDS WHEN THESE FREQUENCIES ARE IMPORTANT TO PROJECT PERFORMANCE REQUIREMENTS.*

6. Minimum sound transmission loss

Octave Band (Hz)	DB Reduction
--64	XX
--125	30
--250	42
--500	40
--1000	46
--2000	53
--4000	52
--8000	XX

B. Construction

1. Materials
  - a. Exterior of unit: Galvanized steel (G-90), aluminum, or stainless steel
  - b. Interior of unit: Solid galvanized steel (G-90) or aluminum
2. Minimum Panel Thickness: 4 inches. Minimum 2-inch panel construction with a foam insulation core that meets all the requirements of this specification, including sound transmission loss, is also permitted. Foam insulation shall be UL Class 1 rated.
3. Minimum Gauge: The following are minimum gauges. Heavier gauges may be required to meet the performance deflections and/or sound transmission loss specified, or to allow for proper welding:
  - a. Roof interior and exterior: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels).
  - b. Wall interior and exterior: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels).
  - c. Floor interior: steel 10 gauge smooth or 1/8" checker plate or aluminum 1/8" checker plate.
  - d. Floor exterior (bottom/underliner): steel 20 gauge or aluminum 0.063" (0.040" aluminum for foam core insulated panels).
  - e. Partition walls: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels)
  - f. Safing at cooling coils: stainless steel 18 ga. or aluminum 0.071".
  - g. Safing all other: steel 18 ga. or aluminum 0.071".
4. Openings and penetrations
  - a. On any piping subject to sweating, including condensate drains, piping penetrations shall be sleeved.
    - 1) Sleeve shall extend fully from interior to exterior of unit.
    - 2) Sleeve shall be continuously welded or seamless, rolled (round), and sealed airtight to unit.
    - 3) Provide rubber grommet or similar mechanical seal on unit interior and exterior to seal between sleeve and piping.
  - b. All non-sweating piping or conduit penetrations shall be sealed airtight with rubber grommet or similar mechanical seal.
  - c. At openings, cover exposed edges of insulation with structural steel angles and seal edges.
  - d. Protect exposed fastener ends with plastic caps.
  - e. Floor penetrations shall incorporate a minimum 1 in. high waterproof dam fabricated of steel angle iron or equivalent, seal welded to floor.
  - f. For units located outside, no penetrations shall be made through the roof.
5. For units located outside, slope roof to prevent standing water.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 237323 - - 6

6. Unit shipping sections shall be fabricated to have air and water tight connections. Seals between sections shall consist of 1/4 in. thick by minimum 1-1/2 in. wide neoprene gaskets and continuous caulking on contact surfaces.

C. Floor/Base Frame

1. Floor shall be continuously welded between mating sections and along wall edges to form a watertight surface. Watertight floor shall not be used as part of a coil drain pan system. Provide sleeves for any piping penetrating the unit; if through the floor, continuously weld to waterproof the floor.
2. Floor shall be min. 4 in. thick, insulated with 3-lb./cu. ft. density fiberglass (or 4 in. of U.L. Class 1 foam insulation of equivalent or better R-value), sealed airtight in place by solid galvanized or aluminum underliner.
3. Fabricate base frame of welded structural steel or aluminum members as required to accommodate drain outlet height requirements for proper drain pan trapping, and around the entire unit and under major internal equipment such that all components are completely supported by the factory installed base frame.

D. Ductwork Connections

1. Provide flanged connections with flanges extending a minimum of 2 in. past the outside wall of the unit.
2. For fans discharging directly at the unit casing, provide flexible duct connector internal to the unit.

E. Paint

1. Prior to assembly, prime coat all non-galvanized ferrous metal parts with two coats of lead-free prime paint.
  - a. Quick-drying, rust-inhibitive, alkyd-based primer; total dry film thickness of not less than 1.3 mils.
  - b. Paint: Benjamin Moore IronClad Alkyd Low Luster Metal and Wood Enamel C163, or equivalent.
2. For interior units, finish paint the same surfaces with two coats of enamel paint of a different color.
  - a. Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
  - b. Paint: Benjamin Moore Super Spec Latex Eggshell Enamel 274 or equivalent.
3. For exterior units, finish paint the same surfaces with two coats of enamel paint of a different color.
  - a. Semi-gloss, alkyd, exterior enamel; total dry film thickness of not less than 2.6 mils.
  - b. Paint: Benjamin Moore IronClad Alkyd Low Luster Metal and Wood Enamel 163 or equivalent.
4. Prepare surfaces per paint manufacturer's recommendations before painting.

F. Sealants:

1. Provide sealant that is non-toxic, including outgassing during curing period.
2. Sealant shall be warranted to maintain the leak-test performance for 25 years.

G. Access Doors and Panels

1. Access doors and panels shall be of same construction as unit housing, including insulation.
2. Doors shall be minimum 24 in. wide. Provide doors that are the full height of the unit, maximum 6' high.
3. Each access door and panel shall be equipped with continuous gaskets and shall fit in the door frame in a manner to guarantee the same leakage criteria as the unit casing.
4. Each access door shall be mounted with stainless steel or cast aluminum hinges and hardware. Provide a minimum of two cast aluminum handles per door, operable from either side.
5. Access doors in positive pressure sections shall open inward. Access doors in negative pressure sections shall open outward.
6. Each door shall contain a non-fogging thermal window of double pane safety glass. Coordinate height of window with housekeeping pads, base frame and isolators to ensure that location is at approximate eye level when standing outside of unit. Each window shall be a minimum 12 in. by 12 in., properly sealed to prevent condensation and to operate safely against positive or negative pressure.
7. Each access door shall have a built-in static pressure probe port.
  - a. Ventlock Model 699 by Ventfabrics, Inc.
8. Removable access panels shall be provided in unit sections where components contained are larger than door opening and where access to components for cleaning and maintenance is required.

H. Outside and exhaust air openings

1. Outside air and exhaust openings shall be furnished with 25 mesh, galvanized steel or aluminum bird screen. Rain hood velocities shall not exceed 1,000 FPM.

**SELECT BELOW IN COORDINATION WITH ARCHITECTURAL SPECIFICATIONS. ENSURE LOUVERS ARE NOT SPECIFIED IN ARCHITECTURAL DIVISIONS. DELETE THIS PARAGRAPH IF LOUVERS ARE SPECIFIED BY THE ARCHITECT.**

I. Louvers

1. Provide louvers as shown and scheduled on Drawings. Louver airstream shall not entrain water or snow.
2. Louvers shall be self-draining.

2.6 COMPONENTS

**MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER. AVOID MIXING BOXES WHICH ALMOST ALWAYS RESULT IN STRATIFICATION (FREEZE STAT TRIPPING) PROBLEMS.**

A. Mixing Box Section

1. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.
2. Outside and exhaust air openings shall not be on the same side of the unit in order to minimize recirculation, if air is exhausted at the unit.

B. Dampers

1. Provide dampers as specified in Related Section Mechanical Systems Controls.
2. In addition to the requirements in Mechanical Systems Controls, dampers designated as smoke dampers shall be labeled in accordance with the latest editions of UL 555S.

C. Filters

1. Provide filters and filter gauges of types as shown and scheduled on Drawings and as specified in Related Section.
2. Provide hinged primary filter frames where indicated, complying to the following:
  - a. Primary filters shall be mounted on vertically hinged non-racking frames that are completely independent of the secondary filter frame. Frames shall swing away from the secondary filter frame in a door-like manner to allow secondary filter removal without removing the primary filters.
  - b. Provide multiple hinged frames. Primary filter frames shall be no wider than 2 ft. Frames shall swing out on an arc of 90 degrees, or to the degree required to allow the secondary filters to be easily removed, whichever is greater.
  - c. Frame hinges shall be continuous piano type.
  - d. The primary filter frames shall be supported by galvanized structural steel support members. Arrange frame and support system relative to the secondary filters to provide a gap long enough to allow accurate measurement of static pressure between the two filter types with a static pressure tap.
  - e. Frames shall be gasketed on all four sides. Provide spring type tension fasteners and latching system to lock and seal the hinged frames to the support members. Lock system shall be operable without tools.
  - f. Primary filter frame and support system shall meet or exceed all of the performance requirements of the Related Section "Air Filters." Provide all accessories required by that section.

**BLENDERS ARE NOT PREFERRED. MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER TO AVOID THE NEED FOR BLENTERS WHICH HAVE GENERALLY PROVEN TO BE INEFFECTIVE. SEE RELATED DESIGN GUIDELINE. IF BLENTERS MUST BE USED, CHANGE BELOW HIDDEN TEXT TO VISIBLE TEXT.**

D. Blender Assembly

1. Blender assemblies shall be welded, rigid, vibration and deflection free, and adjustable; designed to impart a counter-rotational mixing to the air stream, producing a minimum standard deviation through a plane parallel with the blenders between entering air streams.
2. Mixing performance: Constant from 500 fpm to 2500 fpm blender velocity.
3. Minimum mixing effectiveness: 80 percent and plus or minus 5 deg F standard deviation when mixing 30 percent outdoor air and 70 percent return air at 50 degrees F inlet temperature differential. Capable of acceptable performance throughout entire operating range of unit, including system turndown.
4. Acceptable Manufacturers:
  - a. RM Products
  - b. Blender Products, Inc.

**THE FOLLOWING SPECIFICATION FOR AN AIR TO AIR HEAT EXCHANGER (IN HIDDEN TEXT) IS PROVIDED FOR CONVENIENCE AND SHALL BE EDITED TO BE PROJECT SPECIFIC. "TURN ON" THIS TEXT IF REQUIRED.**

E. Air-to-Air Heat Exchanger Section

1. Minimum capacities shall be as scheduled on the Drawings.
2. Heat exchanger shall be furnished as an integral part of the overall air-handling unit.
3. Heat exchanger shall be a cross-flow, fixed-plate exchanger with a diamond-shaped cross section. Plates shall be fabricated of aluminum and formed with profiles that maximize heat transfer and minimize pressure loss. Frames shall be constructed of galvanized steel and/or aluminum. Configuration shall allow for access and cleaning of each of the air pathways.
4. Furnish the heat exchanger with bypass dampers and a bypass air pathway to allow for the automatic prevention of frost formation on the plates. Provide dampers as specified in the Related Section "Mechanical Systems Controls".
5. Casing for the heat exchanger shall be constructed to the standards indicated elsewhere in this section for the overall air-handling unit. Provide baffle plates to seal and separate the two air streams from each other. Provide condensate drain pan(s) in compliance with Related Section, beneath the heat exchanger media.
6. Provide the air handling unit a total of 4 access sections at the inlet and discharge of each air path. Each access section shall be furnished with an access door.

F. Coils and drain pans

- a. Provide preheat, energy recovery, heating, cooling coils and associated drain pans as shown and scheduled on Drawings and as specified in Related Sections.
- b. Provide drain pans and drain connections for the following sections: cooling coils, humidifiers, and energy-recovery coils or wheels.
- c. All coil assemblies shall be safed on top and bottom and at all coil splits.

- d. Drain pans shall be sloped in a minimum of 2 planes to eliminate standing water and shall be stainless steel construction. Drain pans shall be constructed of adequate downstream length to collect any condensate that blows off the coil at air velocities up to the design air flow rate or 500 FPM, whichever is greater.
- e. Insulate drains pans, including intermediate drain pans, to prevent sweating.

**COILS MUST BE REMOVABLE VIA COIL TRACKS OR TROLLEY BEAMS. UM'S PREFERENCE IS COIL TRACKS SINCE IT IS DIFFICULT TO REMOVE THE TOP COIL IN A STACK WITH TROLLEY BEAMS. THEREFORE TROLLEY BEAMS ARE NOT MENTIONED BELOW. IF YOUR APPLICATION REQUIRES TROLLEY BEAMS, EDIT THE BELOW SECTION ACCORDINGLY.**

- f. Each coil section shall be removable without disruption to other unit components or coils. Fasten coil assemblies with bolts or screws; per manufacturer's recommendations, (welds or rivets are not acceptable). Provide coil tracks in assembly frame for removal of coil assemblies from housing.
- g. Provide an individual access panel for each (stacked) coil section, to allow removal of a coil section without disrupting operation of coil sections located above or below the section being serviced. Example: a 3 coil high by 2 coil wide assembly shall have 3 access panels provided per side, for a total of 6.
- h. Extend coil connections, vents and drains to the outside of the air handling unit casing to allow field connections.
- i. Label coil inlet, outlet, vent and drain piping connections with labels applied outside the casing.

**DIFFUSER PLATES ARE NOT PREFERRED. IT IS THE ENGINEER'S RESPONSIBILITY TO CONSIDER POSSIBLE STRATIFICATION ISSUES. USE DIFFUSER PLATE ONLY WHEN OTHER SOLUTIONS ARE NOT ACCEPTABLE.**

G. Diffuser Plate

- 1. If air velocity across the cooling coil varies by more than 15 percent, provide a perforated, aluminum, sectionally-removable diffuser plate immediately upstream of the cooling coil section (plus or minus 6 in.). Diffuser plate shall completely cover cooling coil section and shall be rigid, vibration, and deflection free.

**THIS SECTION SPECIFIES BACKWARD OR AIR FOIL STYLE FANS WHICH ARE PREFERRED IN MOST CASES. HOWEVER ON SOME SMALL AIR HANDLERS A FORWARD CURVED FAN MAY BE A MORE APPROPRIATE CHOICE, IN WHICH CASE EDIT THE BELOW. ALSO CONSIDER H.2 BELOW: SAFETY CAGES MAY NOT BE NECESSARY OR PRACTICAL FOR SMALL UNITS.**

H. Fans and Accessories

- 1. Provide fans and accessories as shown and scheduled on Drawings and as specified in Related Section. Fans shall be backward inclined or air foil type.

2. When plenum/plug type fans are furnished provide a galvanized steel safety cage that entirely surrounds the fan wheel. Provide hinged or bolt-off sections large enough to allow bearing, motor, and belt replacement or service. Provide a safety cage of bolted panel construction that allows the cage to be easily disassembled and reassembled.

I. Trolley Beams

1. Provide fan sections with trolley beams where shown on the Drawings. Design and fabricate the unit structural members and housing to support the weight of the trolley beam fully loaded with the weight of the fan motor, trolley hoist, and chain. Trolley beams shall be centered on access doors or on removable component access panels, which shall be centered on fan motor or component. Beams shall be mounted to the ceiling and shall extend continuously from interior wall to interior wall. Trolley hoists and chain shall be provided "by others" in the future as needed.

J. Sound Attenuators

1. Provide sound attenuators where shown integral to air handling unit, as scheduled on Drawings and as specified in Related Section.

*AIR HANDLERS ARE NOT SPECIFIED TO BE EQUIPPED WITH DISCONNECTS. DISCONNECTS ARE NOT TYPICALLY REQUIRED FOR FANS DRIVEN BY VFDS; SEE DESIGN GUIDELINE 220514 FOR MORE INFO. FOR FANS NOT DRIVEN BY VFDS, REQUIRE THE ELECTRICAL ENGINEER TO INDICATE A DISCONNECT. DISCONNECTS SHALL BE MOUNTED OUTSIDE FAN CASINGS.*

**2.7 ELECTRICAL AND TEMPERATURE CONTROL WIRING**

1. Provide a junction box on the outside of the fan section casing for single point connection of external power wiring to each unit fan motor.
2. Provide EMT metal conduits and wiring between the junction boxes and the motor(s). Final connections to motors shall be 1/2 in. minimum flexible metal conduit with steel fittings.
3. For each unit section that has an access door, provide 120V 4-ft. dual tube fluorescent light fixture(s) consisting of industrial type metal fixture with 10 percent up-light, full depth end plates with wire guard, electronic ballast, T-8 lamps, and secured with a minimum of four fasteners. Similar to Lithonia type AF.
4. Provide a light switch with red pilot light adjacent to the latch side of the door for each lighted section. Pilot light shall be "on" when associated light fixture is "on". Provide one weatherproof, GFCI duplex convenience receptacle mounted centrally on the outside of unit, on the side with the most doors.

5. Provide a junction box on the outside of the unit for single point connection of external power wiring to the unit's lights and receptacle. Provide EMT conduit and wiring between the junction box, switches, associated lights and receptacle. Provide flexible conduit "whips" with wiring at section splits, for reconnection of the lighting circuit by the Electrical Contractor after sections are assembled.
6. Provide all electrical components in accordance with NFPA 70 (NEC) and Division 26 requirements. Indoor electrical enclosures shall be rated NEMA 1. Outdoor electrical enclosures shall be rated NEMA 3R.
7. Power and temperature control wiring shall be run in conduit.
  - a. Run power and control wire in separate conduits.

**2.8 SOURCE QUALITY CONTROL**

- A. Assemble and factory test each unit prior to shipping. Correct deficiencies in unit performance at the factory prior to shipping. University representatives shall witness testing and shall be notified of factory testing dates at least four (4) weeks in advance. Associated travel expenses for witnessing tests shall be paid for by the University.
- B. Submit proposed test procedure to the University representative for approval, detailing methods, equipment, and techniques to be employed for each specific test. Equipment will not be considered approved until written approval of testing procedures is attained. Testing must also be in accordance with Quality Assurance Standards section.
- C. At the conclusion of factory testing, a formal written report of results shall be submitted to the University Representative for approval.
- D. Factory test each air handling unit as follows:
  1. Verify that the airflow rate is within the range of 100 percent to 110 percent of scheduled CFM requirements when operating at scheduled design total static pressure.
  2. Airflow measuring devices shall be installed in ducts returning to or leaving the unit. These devices shall be installed per manufacturer's recommendations. External static pressure to the unit shall be simulated using a combination of ducts and dampers and must be equal to or greater than the scheduled external static pressure. Tests shall prove design airflow and static capability of the assembled unit.
  3. Perform leakage tests to validate that the unit casing leakage is less than 1/2 percent of the scheduled design airflow (CFM) at 10 in. w.c.
    - a. Positive Pressure Test: Duct openings in the positive pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.

- b. Negative Pressure Test: Duct openings in the negative pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
4. Both the leakage and the airflow tests shall meet the required acceptance criterion without the use of temporary sealant at any permanent panel joints. Temporary sealing methods identical to those applied in field shall be used at the shipping splits to simulate "as installed" conditions.
5. Sound Test: System sound levels shall be measured at eight (8) octave bands at the scheduled design operating conditions. Airborne sound levels at openings shall be read in the test ductwork 5 ft. from openings. Transmitted sound levels shall be read 5 ft. from outside of fan sections or components, on all sides and on top.
  - a. Readings shall be taken at all outside, return, exhaust and supply air openings.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Use spreader bars with lifting cables and hoist sections from lifting lugs, to prevent cable damage to sections.
- B. Rig individual sections under direct supervision of Unit Manufacturer's Representative.
- C. Install on concrete housekeeping pad. Coordinate final pad size and location in field.
- D. When indicated, install units on steel supports. Coordinate final location and placement of steel supports and ductwork connections in field.
- E. Secure the unit to the housekeeping pad or steel supports with suitable anchors bolted through the unit's base rail. Prior to anchoring, level unit in all directions with stainless steel shims.
- F. Shipping splits requiring field reconnection shall be made under the direct supervision of unit Manufacturer's Representative. Provide labor to reconnect utilities, piping, conduits and sheet metal sections of the unit. Openings to ductwork and piping shall remain protected and covered until unit assembly. Immediately after unit assembly, restore all factory protection. Maintain protection after assembly until just prior to final acceptance by Owner.
- G. Make piping and duct connections, install filters and unit accessories, and complete all work required to place the unit into service.

**MFR. START-UP SERVICE IS NOT GENERALLY NECESSARY EXCEPT FOR UNITS OF NEW DESIGN OR OF PARTICULAR COMPLEXITY. THEREFORE, THE PARAGRAPH BELOW SHOULD NORMALLY BE DELETED. IF START-UP**

*SERVICES ARE REQUIRED, PROVIDE EXPANDED DETAIL REGARDING WHAT IS TO BE PERFORMED BY THE MFR.'S TECHNICIAN.*

**3.2 START-UP**

- A. Provide a qualified service technician from the Manufacturer's staff to perform unit start-up. This start-up service shall be provided prior to commissioning activities, and prior to any temporary use.

**3.3 TEMPORARY USE OF AIR HANDLING UNITS**

- A. Thoroughly clean unit of all grease, dirt, dust, etc.
- B. Prior to placement into temporary service:
  - 1. Perform manufacturer's pre-start protocol.
  - 2. Perform commissioning activities.
- C. Perform all manufacturer's required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store log at unit during temporary use period and include log as part of the final O&M manual.
- D. While operating the air handler for temporary use, install a complete set of filters in the air handling unit of the same quality and efficiency as the specified permanent filters for the project.

*BELOW PARAGRAPH REQUIRES MINIMUM MERV 8 FILTERS TO PROTECT DUCT WORK DURING CONSTRUCTION, WHICH MATCHES LEED REQUIREMENTS AND IS RECOMMENDED FOR NON-LEED PROJECTS AS WELL.*

*SOME SPECIALTY INSTALLATIONS (E.G. CLEAN ROOM OR CLEAN-ROOM-LIKE SPACES) MAY REQUIRE THAT TEMPORARY DUCTWORK FILTERS BE EQUIVALENT TO SECONDARY FILTER PERFORMANCE. IF THAT IS THE CASE, REVISE BELOW ACCORDINGLY.*

- E. Provide temporary filters, minimum MERV 8, to protect all ductwork and building contents when unit is operated during construction. Filters shall have an equal or better performance rating than primary filters specified for permanent use in order to prevent construction dirt infiltration into the air handling unit systems.
- F. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.

**3.4 FIELD QUALITY CONTROL**

- A. Units shall undergo air and water balance and vibration testing per Related Section Testing, Adjusting and Balancing.
- B. Each unit shall be field tested. Deficiencies related to manufacture or installation shall be corrected without cost to Owner.

1. The unit Manufacturer shall correct and pay for the repair of deficiencies found during testing, except for leaks found at unit section joints, which shall be the responsibility of the Contractor to repair.

**BE AWARE THAT THE MANUFACTURER WILL HAVE PROVIDED A UNIT THAT PASSED THE FOLLOWING TEST PROCEDURE IN THE FACTORY. ASSUMING THE UNIT IS ACCEPTED ON SITE BY THE CONTRACTOR WITH NO SHIPPING DAMAGE, RESPONSIBILITY FOR ANY DEFICIENCIES FOUND DURING FIELD TESTING WILL LIKELY FALL TO THE INSTALLING CONTRACTOR.**

2. Perform leakage tests after reassembly of unit sections to validate that the unit casing leakage is less than 1/2 percent of the scheduled design air flow (CFM) at 10 in. w.c.
  - a. Positive Pressure Test: Duct openings in the positive pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
  - b. Negative Pressure Test: Duct openings in the negative pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
  - c. At the conclusion of field tests, a formal written report of results shall be submitted to the University Representative for approval.

**INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.**

### **3.5 COMMISSIONING**

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

### **3.6 ADJUSTING, CLEANING, PROTECTION**

- A. After unit has completed any temporary service and just prior to final acceptance by Owner, contractor shall:
  1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts, and perform manufacturer's pre-start protocol
  2. Install a new, complete set of filters.
  3. Perform all commissioning activities, even if previously performed to ready for temporary service.
  4. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight.
  5. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

**MFR. TRAINING SERVICE IS NOT GENERALLY NECESSARY EXCEPT FOR UNITS OF NEW DESIGN OR OF PARTICULAR COMPLEXITY. THEREFORE, THE PARAGRAPHS BELOW SHOULD NORMALLY BE DELETED. IF TRAINING**

**SERVICES ARE REQUIRED, PROVIDE EXPANDED DETAIL REGARDING WHAT IS TO BE COVERED DURING TRAINING. .**

**3.7 OWNER TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures, minimum of 2 hours or 1 hour per unit if multiple units were supplied. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.
- C. Schedule training with Owner through the Project Construction Manager with at least seven (7) days prior notice. Training and start up services are separate functions - training shall not be combined with startup services.

Fax: 734-936-3334

**SPECIFICATION DIVISION 23**

NUMBER            SECTION DESCRIPTION

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**

SECTION 237324 - SEMI-CUSTOM AIR HANDLING UNITS

**END OF CONTENTS TABLE**

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)  
SECTION 237324 - SEMI-CUSTOM AIR HANDLING UNITS

REVISED NAME FROM "MODULAR" TO "SEMI-CUSTOM" AIR HANDLING UNITS AT THE REQUEST OF THE HVAC/CONTROLS GROUP. D. KARLE 4/14/08.

REVISED TO REQUIRE CERTAIN PRODUCT DATA W/SUBMITTALS, AND AIR-TO-AIR HX SPEC., ALL PER MECH TECH TEAM. D. KARLE, 7/29/08.

MINOR IMPROVEMENTS TO ELECTRICAL AND TEMPERATURE CONTROL WIRING SECTION BY K. BIRRINGER AND D. KARLE, 7/1/09

REMOVED REFERENCE TO AHRI 410, WHICH IS COVERED IN 238216. D. KARLE FOR MECH TECH TEAM 9/11/09.

REVISED TO ELIMINATE SEALTITE AND FIBERGLASS LIGHT FIXTURES DUE TO NEC CODE CHANGE. CLARIFIED FILTER REQUIREMENTS DURING TEMPORARY USE. D. KARLE FOR MECH TECH TEAM, 3/26/10.

GENERAL IMPROVEMENT OF CONTENT ARRANGEMENT AND REVISION TO NEW FORMAT, MARCH 2011.

THERMAL CORP AND VENTROL ADDED AS APPROVED 3/26/13, PER HVAC MTT.

**PART 1 - GENERAL**

AIR HANDLERS COVERED BY THIS SPECIFICATION ARE NON-CUSTOM TYPE FOR LIGHT TO MEDIUM DUTY USE.

REVISE CAREFULLY IF SPECIFICATION IS TO BE USED FOR PREPURCHASE; TO SPECIFY WHO PROVIDES FILTERS FOR THE AIR HANDLER IF IT WILL BE USED FOR TEMPORARY SERVICE. IT IS SUGGESTED THAT THE AIR HANDLER SUPPLIER PROVIDE ONE SET OF FILTERS, AND THE MECHANICAL CONTRACTOR RUNNING THE UNIT DURING TEMPORARY SERVICE PROVIDE THE ADDITIONAL FILTER SETS, SINCE IT IS UNKNOWN HOW MAY FILTER SETS WILL BE REQUIRED DURING TEMPORARY OPERATION. THIS SECTION SPECIFIES FILTERS SUPPLIED IN THIS MANNER (PER PART 2, MFR. SUPPLIES FILTERS WITH UNIT. PER PART 3, UNIT MUST BE TURNED OVER WITH NEW FILTERS).

THIS SPEC CANNOT BE USED STAND-ALONE FOR AIR HANDLERS! THE RELATED SPEC SECTIONS LISTED IN PART 1 MUST BE INCLUDED IN THE PROJECT SPEC BOOK TO PROVIDE THE COMPLETE REQUIREMENTS. HOWEVER, INFO IN THIS SECTION IS COMPLEMENTARY TO THOSE RELATED SECTIONS; THEREFORE DO NOT DELETE, FOR EXAMPLE INFO IN THIS SECTION REGARDING COILS, DRAIN PANS, FILTERS, ETC.

**1.1 RELATED DOCUMENTS**

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
  - 1. Section 220500: Common Work Results for Mechanical.
  - 2. Section 220513: Motors.
  - 3. Section 220548: Vibration Control
  - 4. Section 238216: Coils and Drain Pans
  - 5. Section 233400: Fans
  - 6. Section 234000: HVAC Air Cleaning Devices
  - 7. Section 233300: Air Duct Accessories and RGDs
  - 8. Section 230900: Mechanical Systems Control
  - 9. Section 230593: Testing, Adjusting, and Balancing.
  - 10. Division 26: Electrical.

## **1.2 SUMMARY**

- A. Section Includes:
  - 1. Air handling units of semi-custom construction consisting of modular sections.

## **1.3 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
  - 1. ANSI/AHRI Standard 430. Performance Rating of Central Station Air-Handling Units.
  - 2. AHRI Standard 260- Sound Rating of Ducted Air Moving and Conditioning Equipment.
  - 3. NFPA 70 National Electric Code.
  - 4. NFPA 90A: Standard for the Installation of Air-Conditioning and Ventilating Systems

## **1.4 DELIVERY, STORAGE, AND HANDLING**

- A. Manufacturer shall provide shipping protection to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.
- B. Support coil headers independently during transport to prevent potential damage from vibration.
- C. Restrain fans and other components to prevent damage during shipping.

**1.5 SUBMITTALS**

- A. For each unit, submit for approval, the following product data:
  - 1. Overall unit dimensions, weight, and center of gravity.
  - 2. Ductwork connections including sizes, locations, and methods of connecting to mating ductwork.
  - 3. Piping connections including size, material types, and dimensioned locations for each service.
  - 4. Detail methods of sealing inner and outer walls at locations of pipe penetrations.
  - 5. Locations and sizes of access doors.
  - 6. Details of access door handles, latching mechanisms, hinges, and vision panels.
  - 7. Locations of interior light fixtures and light switches.
  - 8. Locations of electric power convenience receptacles.
  - 9. Dimensions, weights and centers of gravity for each section when units will be shipped in multiple sections.
  - 10. Cabinet material, metal thickness, finishes, insulation and accessories.
  - 11. Details of vibration isolation bases including selections for vibration isolation springs.
  - 12. Details of fan discharge flexible duct connector where required.
  - 13. Details of motor and belt guards.
  - 14. Motor mfg., ratings, electrical characteristics, and motor accessories.
  - 15. Sound power level data per AHRI Standard 260.

**REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.**

**1.6 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
  - 1. Buffalo Air Handling.
  - 2. TMI Custom Air Systems.
  - 3. Governair LLC.
  - 4. Mafna Air Conditioning, Inc.
  - 5. Air Flow Equipment.
  - 6. Trane.
  - 7. McQuay.
  - 8. Thermal Corporation
  - 9. Ventrol

**2.2 GENERAL**

- A. Provide factory fabricated, double-wall air handling units with components and equipment as scheduled and detailed on Drawings.
- B. Components shall be fabricated in major sections at the Manufacturer's factory and shall carry the Manufacturer's nameplate.
- C. Provide units of height, width, and length indicated, and that comply with project weight and spatial limitations.
  - 1. Weight, spatial, and dimensional limitations shall also apply to individual sections, including facilitate unit rigging and installation.
- D. Provide a minimum of four lifting lugs per separately shipped section, of adequate strength to allow rigging without damage.
- E. Manufacturer shall supply gasketing, sealant, and installation instructions.
- F. Manufacturer shall provide touch-up paint(s) for use after field assembly.
- G. Touch up all galvanized surfaces damaged from welding or other fabrication operations with zinc rich paint, minimum 65 percent metallic zinc by weight.

**2.3 COMPONENTS- GENERAL REQUIREMENTS**

- A. Provide all components integral to the air handling unit including, but not limited to, the following. These components shall comply with Related Sections and any additional requirements of this Section.

*EDIT THESE ITEMS FOR EACH PROJECT*

- 1. Motors
- 2. Vibration Isolation
- 3. Coils and Drain Pans
- 4. Fans and Accessories
- 5. Air Filters
- 6. Sheet Metal Accessories
- 7. Dampers (as specified in Controls section)
- 8. Energy Recovery Wheels/Heat Exchangers
- 9. Sound Attenuators

**2.4 MANUFACTURING**

- A. Casings shall be manufactured only after panel components (structural members, facing sheets and insulation) have been thoroughly cleaned of mill grease, dirt and oxidation.
  - 1. Interior and exterior of panel system shall be thoroughly protected from contamination from the manufacturing process through start-up procedures and acceptance.
  - 2. Internal components (fans, coils, air filter frames, equipment and piping) shall arrive from their respective manufacturing facilities free of grease and dirt.

- B. In general, products such as sealants and gaskets, used within the unit, shall be non-petroleum based products, with no outgassing characteristics.
- C. Equip, prepare, identify and match-mark individual shipping sections so that field reassembly and installation can be performed without reworking, interchanging, adjusting, springing, drilling new bolt holes, etc. All supplemental supplies necessary to assemble the unit shall be provided by the Manufacturer.

**2.5 UNIT HOUSING**

- A. Maximum Casing Leakage (inclusive of all components):
  - 1. Shall not exceed 1 percent of the scheduled design air flow at 6 in. wg positive or 4 in. wg negative static pressure, or:
  - 2. 1 percent of the scheduled design air flow at the scheduled casing pressure ratings, when such ratings are scheduled.
- B. Construction
  - 1. The unit shall be constructed of modules with a complete frame with removable side and bottom panels. Frame-less construction with removable panels for coil and fan access may also be supplied. For either type construction, removal of panels shall not affect the structural integrity of the unit.
  - 2. The unit shall be equipped with a base rail or similar support structure so that the bottom of the unit does not rest directly on the housekeeping pad or floor. The base rail/supports shall be designed to allow the unit to be leveled with shims and anchored to the pad or floor.
  - 3. Minimum wall panel thickness shall be 2 in.

*IF CONDITIONS WARRANT, SELECT THE SPECIFIC CASING MATERIAL BY EDITING B.4, OTHERWISE THE MFG. MAY PROVIDE ANY OF THE 3 LISTED.*

  - 4. Interior and exterior casing shall be G-90 galvanized steel, aluminum, stainless steel, or as scheduled.
  - 5. The casing shall be able to withstand up to 6 in. wg positive or 4 in. wg negative static pressure, or as scheduled.
  - 6. Maximum deflection of walls, floors, and roof shall be L/250 (L = span in inches.), under the following conditions:
    - a. Wall deflection maximums are at 6 in. wg positive or 4 in. wg negative static pressure, or at scheduled pressures. .
    - b. Floor deflection maximum: 150 lbs. /sq. ft.
    - c. Roof deflection maximum: 75 lbs/sq. ft. plus snow load
  - 7. Outdoor design conditions:
    - a. Minimum wind load: 120 mph.
    - b. Minimum snow load: 50 lbs/sq ft or per code, whichever is greater.
  - 8. Modules shall be factory-insulated. Insulate walls, roof, and entire bottom, including below drain pans. Insulation and insulation adhesive shall comply with NFPA-90A requirements for flame spread and smoke generation and be rated UL Class 1. Insulation adhesive shall be UL-listed.

**SELECT EITHER SOLID (B.9) OR PERFORATED (B.10) INNER WALL.  
AVOID PERFORATED WALLS WHENEVER POSSIBLE.**

9. Module panels shall be of double-wall construction to facilitate cleaning of the unit interior. The interior wall shall be solid. Fiberglass insulation shall be 3 lbs./cu.ft. density. Insulation thermal resistance R shall be a minimum of 8.33 ft<sup>2</sup>·h·°F/Btu.
10. Module panels shall be of double wall construction, fabricated from solid wall at cooling coils and humidifiers with the balance of the inner wall perforated to enhance acoustical performance. Foam insulation shall not be used behind perforated panels. Configure perforation spacing and hole size to prevent insulation breakaway, flake off, or delamination when tested at 9,000 fpm, in accordance with UL Standard 181. Thermal resistance R shall be 8.33 ft<sup>2</sup>·h·°F/Btu.

C. Ductwork Connections

1. Provide flanged connections with flanges extending a minimum of 2 in. past the outside wall of the unit.

D. Roof

1. For units located inside, roof performance shall match all panel performance requirements.
2. For units located outside, no penetrations shall be made through roof. Slope roof to prevent standing water.

E. Paint

1. Prior to assembly, paint all non-galvanized ferrous metal parts with two coats of lead-free rust-inhibitive, alkyd-based primer paint.
2. For exterior units, paint exterior surfaces with two coats of alkyd exterior enamel paint. Properly prepare all surfaces prior to painting according to paint manufacturer's instructions.

F. Access Doors and Panels

1. Access doors and panels shall be of same construction as unit housing, including insulation.
2. Doors shall be minimum 18 in. wide, 24 in. wide is preferred, or widths as indicated on drawings. Provide doors that are the full height of the unit, maximum 6ft. high.
3. Each access door and panel shall be equipped with continuous gaskets and shall fit in the door frame in a manner to guarantee the unit's specified leakage criteria.
4. Hinges and hardware shall be galvanized, stainless steel or aluminum. Outdoor unit hardware shall be stainless steel, or aluminum. At least 2 handles per door, operable from either side, shall be provided.
5. Access doors in positive pressure sections shall open inward. Access doors in negative pressure sections shall open outward.

**STRIKE THE FOLLOWING IF DOOR WINDOWS ARE NOT TO BE PROVIDED.**

6. Unless otherwise noted, each door shall contain a safety glass window. Provide double pane non-fogging thermal windows downstream of cooling coils, single or double pane non-fogging type elsewhere. Each window shall be a minimum 6 in. by 6 in. properly sealed to prevent leakage and condensation, and be able to operate safely against the unit's positive and negative pressure capabilities.
7. Removable access panels shall be provided in unit sections where components contained are larger than the respective access module door opening.

G. Outside and exhaust air openings

1. Outside air and exhaust openings shall be furnished with 25 mesh, galvanized bird screen. Rain hood velocities shall not exceed 1000 FPM.

**2.6 COMPONENTS**

*SELECT LOUVERS IN COORDINATION WITH ARCHITECT. ENSURE LOUVERS ARE NOT ALREADY SPECIFIED IN ARCH DIVISIONS. DELETE THE PARAGRAPH BELOW IF LOUVERS ARE SPECIFIED BY THE ARCHITECT.*

A. Louvers

1. Provide louvers as shown and scheduled on drawings. Louver airstream shall not entrain water or snow.
2. Louvers shall be self-draining.

*MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER. AVOID MIXING BOXES WHICH ALMOST ALWAYS RESULT IN STRATIFICATION (FREEZE STAT TRIPPING) PROBLEMS.*

B. Mixing Box Section

1. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.

C. Face and Bypass Modules

1. Face and bypass modules shall be provided as shown on the drawings.
2. Bypass shall be the external type, routed to a factory fabricated opening located downstream of all coils. The pressure drop through the bypass shall be equal to the pressure drop through the coils.
3. Dampers shall be opposed blade at the coil and either opposed or parallel blade at the bypass. Dampers shall be mechanically linked together.
4. Damper construction shall be per the Related Section.

D. Dampers

1. Provide dampers as specified in Related Section Mechanical Systems Controls.
2. In addition to the requirements in Mechanical Systems Controls, dampers designated as smoke dampers shall be labeled in accordance with the latest editions of UL 555S.

E. Sound Attenuators

1. Provide sound attenuators where shown integral to air handling unit, as scheduled on Drawings and as specified in Related Section.

F. Filters

1. Provide filters and filter gauges of types as shown and scheduled on drawings and as specified in Related Section.

**BLENDERS ARE NOT PREFERRED. MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER TO AVOID THE NEED FOR BLENTERS WHICH HAVE GENERALLY PROVEN TO BE INEFFECTIVE.**

G. Blender Assembly

1. Blender assemblies shall be welded, rigid, vibration and deflection free, and adjustable; designed to impart a counter-rotational mixing to the air stream, producing a minimum standard deviation through a plane parallel with the blenders between entering air streams.
2. Mixing performance: Constant from 500 fpm to 2,500 fpm blender velocity.
3. Minimum mixing effectiveness: 80percent and +/- 5 deg F standard deviation when mixing 30percent outdoor air/70percent return air at 50 deg F inlet temperature differential. Capable of acceptable performance throughout entire operating range of unit, including system turndown.
4. Blender material shall be the same as the casing interior material.
5. Acceptable Manufacturers:
  - a. RM Products
  - b. Blender Products, Inc.

**THE FOLLOWING SPECIFICATION FOR AN AIR TO AIR HEAT EXCHANGER (IN HIDDEN TEXT) IS PROVIDED FOR CONVENIENCE AND SHALL BE EDITED TO BE PROJECT SPECIFIC. "TURN ON" THIS TEXT IF REQUIRED.**

H. Air-to-Air Heat Exchanger Section

1. Minimum capacities shall be as scheduled on the Drawings.
2. Heat exchanger shall be furnished as an integral part of the overall air-handling unit.
3. Heat exchanger shall be a cross-flow, fixed-plate exchanger with a diamond-shaped cross section. Plates shall be fabricated of aluminum and formed with profiles that maximize heat transfer and minimize pressure loss. Frames shall be constructed of galvanized steel and/or aluminum. Configuration shall allow for access and cleaning of each of the air pathways.
4. Furnish the heat exchanger with bypass dampers and a bypass air pathway to allow for the automatic prevention of frost formation on the plates. Provide dampers as specified in the Related Section "Mechanical Systems Controls".

5. Casing for the heat exchanger shall be constructed to the standards indicated elsewhere in this section for the overall air-handling unit. Provide baffle plates to seal and separate the two air streams from each other. Provide condensate drain pan(s) in compliance with Related Section, beneath the heat exchanger media.
6. Provide the air handling unit a total of 4 access sections at the inlet and discharge of each air path. Each access section shall be furnished with an access door.

I. Coils and drain pans

1. Provide preheat, energy recovery, heating, cooling coils and associated drain pans as shown and scheduled on Drawings and as specified in Related Sections.
2. Provide drain pans and drain connections for the following sections: cooling coils, humidifiers, and energy-recovery coils or wheels.
3. All coil assemblies shall be safed on top and bottom and at all coil splits.
4. Drain pans shall be sloped in a minimum of 2 planes to eliminate standing water and shall be stainless steel construction. Drain pans shall be constructed of adequate downstream length to collect any condensate that blows off the coil at air velocities up to the design air flow rate or 500 FPM, whichever is greater.
5. Insulate drains pans, including intermediate drain pans, to prevent sweating.
6. All coil assemblies shall be removable without disruption to other unit components or coils. Fasten coil assemblies with bolts or screws per manufacturer's recommendations (welds or rivets are not acceptable).
7. Extend coil connections, vents and drains to the outside of the air handling unit casing to allow field connections.
8. Label coil inlet, outlet, vent and drain piping connections with labels applied outside the casing.

J. Diffuser Modules:

1. A diffuser module shall be provided immediately downstream of the fan module on blow through units. The diffuser shall provide equal air distribution to components immediately downstream of the diffuser. Diffusers shall be made of G90 galvanized steel, stainless steel, or aluminum.

*THIS SECTION SPECIFIES BACKWARD OR AIR FOIL STYLE FANS WHICH ARE PREFERRED IN MOST CASES. HOWEVER ON SOME SMALL AIR HANDLERS A FORWARD CURVED FAN MAY BE A MORE APPROPRIATE CHOICE, IN WHICH CASE EDIT THE BELOW.*

K. Fans and Accessories

1. Provide fans and accessories as shown and scheduled on drawings and as specified in Related Section. Fans shall be backward inclined or air foil type.

2. When plenum/plug type fans are furnished provide a galvanized steel safety cage that entirely surrounds the fan wheel. Provide hinged or bolt-off sections large enough to allow bearing, motor, and belt replacement and service. Provide a safety cage of bolted panel construction that allows the cage to be easily disassembled and reassembled.
3. Isolate the fan from the unit casing by flexible duct connection(s) and a spring isolation base

**THIS SECTION REQUIRES ACCESS SECTIONS BE PROVIDED TO ALLOW BOTH UP AND DOWNSTREAM ACCESS TO EVERY MODULE COMPONENT. THE DESIGNER MUST ACCOMMODATE THESE ACCESS SECTIONS WHEN FITTING UNITS INTO THE AVAILABLE SPACE.**

- L. Access/Inspection Sections: Modules shall include an access section complete with a double-wall door. Access sections shall be provided to allow up and down stream access to every module component.

**CONSIDER MOISTURE ELIMINATORS WHEN LESS THAN IDEAL CONDITIONS EXIST AT OUTSIDE AIR INTAKES OR HUMIDIFIERS.**

- M. Moisture Eliminator Module

1. A module consisting of a vertically mounted, maintenance-free moisture eliminator shall be provided. The moisture eliminator shall consist of "sine-wave" fins or stainless steel mesh for effective moisture removal.
2. Moisture eliminators shall be made of stainless steel or aluminum, of rigid construction, and be vibration and deflection free.

**AIR HANDLERS ARE NOT SPECIFIED TO BE EQUIPPED WITH DISCONNECTS. DISCONNECTS ARE NOT TYPICALLY REQUIRED FOR FANS DRIVEN BY VFDS; SEE DESIGN GUIDELINE 220514 FOR MORE INFO. FOR FANS NOT DRIVEN BY VFD'S, REQUIRE THE ELECTRICAL ENGINEER TO INDICATE A DISCONNECT. DISCONNECTS SHALL BE MOUNTED OUTSIDE FAN CASINGS.**

- N. Electrical and Temperature Control Wiring

1. Provide a junction box on the outside of the fan section casing for single point connection of external power wiring to each unit fan motor.
2. Provide EMT and flexible metal conduits and wiring between the junction boxes and the motor(s). Final connections to motors shall be 1/2" minimum flexible metal conduit with steel fittings.
3. For each unit section that has an access door, provide a 120V compact fluorescent light fixture complete with vapor-tight globe, aluminum globe guard, and rough service lamp. For units wider and taller than 6ft., provide for each section a 4ft. dual tube fluorescent light consisting of industrial type metal fixture with 10percent up-light, full depth end plates with wire guard, electronic ballast, T-8 lamps, and secured with a minimum of four fasteners. Similar to Lithonia type AF.

4. Provide a light switch with red pilot light adjacent to the latch side of the fan door to control all of the unit's lights. Pilot light shall be "on" when associated light fixture is "on."
5. Provide a junction box on the outside of the unit for single point connection of external power wiring to the unit's lights. Provide EMT conduit and wiring between the junction box, switch, and associated lights. Provide flexible conduit "whips" with wiring at section splits, for reconnection of the lighting circuit by the Electrical Contractor after sections are assembled.
6. Provide all electrical components in accordance with NFPA 70 (NEC) and Division 26 requirements. Indoor electrical enclosures shall be rated NEMA 1. Electrical enclosures located outdoors shall have a NEMA 3R rating.
7. All electrical and temperature control wiring shall be run in conduit.

### **PART 3 - EXECUTION**

#### **3.1 INSTALLATION**

- A. Use spreader bars with lifting cables and hoist sections from lifting lugs, to prevent cable damage to sections.
- B. Install on concrete housekeeping pad. Coordinate final pad size and location in field
- C. When indicated, install units on steel supports. Coordinate final location and placement of steel supports and ductwork connections in field
- D. Secure the unit to the floor or housekeeping pad with suitable anchors bolted through the unit's base rail or support feet. Prior to anchoring, level unit in all directions with stainless steel shims.
- E. Openings to ductwork and piping shall remain protected and covered until just prior to connection of utilities, or unit assembly. Immediately after unit assembly, restore all factory protection. Maintain protection after assembly until just prior to final acceptance by Owner.
- F. Make piping and duct connections, install filters and unit accessories, and complete all work required to place the unit into service

#### **3.2 TEMPORARY USE OF AIR HANDLING UNITS**

- A. Thoroughly clean unit of all grease, dirt, dust, etc.
- B. Prior to placement into temporary service:
  1. Perform manufacturer's pre-start protocol.
  2. Perform commissioning activities.

- C. Perform all manufacturer's required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store log at unit during temporary use period and include log as part of the final O&M manual.
- D. While operating the air handler for temporary use, install a complete set of filters in the air handling unit of the same quality and efficiency as the specified permanent filters for the project.

**BELOW PARAGRAPH REQUIRES MINIMUM MERV 8 FILTERS TO PROTECT DUCT WORK DURING CONSTRUCTION, WHICH MATCHES LEED REQUIREMENTS AND IS RECOMMENDED FOR NON-LEED PROJECTS AS WELL.**

**SOME SPECIALTY INSTALLATIONS (E.G. CLEAN ROOM OR CLEAN-ROOM-LIKE SPACES) MAY REQUIRE THAT TEMPORARY DUCTWORK FILTERS BE EQUIVALENT TO SECONDARY FILTER PERFORMANCE. IF THAT IS THE CASE, REVISE BELOW ACCORDINGLY.**

- E. Provide temporary filters, minimum MERV 8, to protect all ductwork and building contents when unit is operated during construction. Filters shall have an equal or better performance rating than primary filters specified for permanent use in order to prevent construction dirt infiltration into the air handling unit systems.
- F. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.

### **3.3 FIELD QUALITY CONTROL**

- A. Units shall undergo air and water balance and vibration testing per Related Section Testing, Adjusting and Balancing.

### **3.4 COMMISSIONING**

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

### **3.5 ADJUSTING, CLEANING, PROTECTION**

- A. After unit has completed any temporary service and just prior to final acceptance by Owner, contractor shall:
  - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts, and perform manufacturer's pre-start protocol
  - 2. Install a new, complete set of filters.
  - 3. Perform all commissioning activities, even if previously performed to ready for temporary service.
  - 4. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight.
  - 5. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

**SPECIFICATION DIVISION 23**

NUMBER            SECTION DESCRIPTION

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**  
SECTION 238216 - COILS AND DRAIN PANS

**END OF CONTENTS TABLE**

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**  
**SECTION 238216 - COILS AND DRAIN PANS**

*04/2011 - REVISED FORMAT AND TECHNICAL CONTENT - D. KARLE AND  
M. PLATT.*

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

**1.2 SUMMARY**

- A. Section Includes:
1. Coils and drain pans for all purposes, unless specified in other specification sections as part of a manufactured unit or assembly.

**1.3 SUBMITTALS**

- A. Submit the following product data for approval, for each unit.:
1. Certified coil-performance ratings with all system operating conditions indicated.
  2. Coil performance data substantiated by computer generated output data.
  3. Coil materials of construction including headers, frames, and coil tracks, number of rows, fin spacing, fin types, and any heat transfer enhancements.
  4. Details of coil supports for stacked coils.
  5. Details and materials of cooling coil condensate collection drain pans and drain piping.
  6. Coil anti-corrosion coating material data sheets.

**1.4 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
1. AHRI Standard 410 Forced-Circulation Air Cooling and Air Heating Coils.
  2. ANSI/ASHRAE Standard 62.1 Ventilation for Acceptable Indoor Air Quality.

**1.5 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
  - 1. Trane, a business of Ingersoll Rand.
  - 2. York by Johnson Controls.
  - 3. McQuay International.
  - 4. Aerofin.
  - 5. Marlo DRS Technologies, Inc.
  - 6. Coil Replacement Co.
  - 7. Heatcraft Worldwide Refrigeration.
  - 8. USA Coil & Air.

**2.2 GENERAL COIL INFORMATION**

- A. Coil Tubes: Copper, minimum 5/8 in. diameter, minimum 0.035 in. tube wall thickness.
- B. Coil Fins: Aluminum, plate type, minimum 0.0095 in. thickness.
- C. Coil Header and Connection Materials: Seamless copper with extruded tube holes to permit expansion and contraction without creating undue stress or strain. Copper connections.
- D. Coil Configuration: A maximum of 6 rows and a maximum of 10 fins per in.
- E. Brazed joints.
- F. Fins shall consist of corrugated aluminum plates with full fin collars for accurate spacing and maximum fin/tube contact. Fins shall have no openings punched on them to accumulate lint or dirt. Tubes mechanically expanded into fins to provide a continuous primary to secondary compression bond over the entire finned length for maximum heat transfer rates. Tubes that have been expanded through use of hydraulic methods are not acceptable.
- G. Casing and Tube Supports: Construct with bolt holes for mounting at approximately 8-in. centers. Minimum 16 gauge, reinforced flange type, constructed to support the coil properly without sagging, racking, or stressing coil tubes. Provide heavier gauge casings and additional reinforcement where required to properly support stacked coils.
- H. Coil manufacturer shall select the coil based on the most efficient coil circuiting. All coil circuits shall be of equal pressure drop. All coils shall be counter-flow configuration. Coils shall achieve uniform leaving air temperature across entire coil face. Use of internal restrictive devices to obtain turbulent flow is not acceptable. Coil performance shall be substantiated by computer generated output data.

- I. Circuit coils to facilitate air venting and draining when installed level and plumb, and for service without removing individual plugs from each tube. Provide coils with same end connections, unless indicated otherwise. Provide vent and drain connections on the coil header.
- J. Provide a foam strip seal located between casing channels and fins along top and bottom to prevent air bypass and water carryover.
- K. Factory label inlet, outlet, vent, and drain connections.
- L. Coil inlet, outlet, vent, and drain connections shall not penetrate drain pans. Configure coil and mounting arrangement accordingly.
- M. Provide anti-corrosion coating for coils mounted in corrosive air streams, such as those mounted in lab exhaust heat recovery systems. Provide a coating type that will protect against the specific corrosives in the air stream. Coil coating subject to Owner and Engineer review, approval, or modification.

### 2.3 WATER COILS

- A. Hot Water Coil Casings: Galvanized steel.
- B. Chilled Water Coil Casings: Stainless steel.
- C. Face velocities across chilled water coils shall not exceed 500 FPM.
- D. Connection Type:
  - 1. Sizes up to and including 2 in.: Soldered, screwed, or flanged type. Give consideration to equipment installation conditions when selecting connection type.
  - 2. Sizes greater than 2 in.: Flanged connections.
- E. Water Coil working pressure and temperature: 200 psig/220 deg. F.

### 2.4 DIRECT EXPANSION COILS

- A. Face velocities across DX coils shall not exceed 500 FPM.
- B. Dehydrate and seal with a dry nitrogen charge before shipment.
- C. Evaporator coil connections: Male sweat type.
- D. Liquid piping connections: Brass.
- E. Suction piping connections: Copper.
- F. Use interlaced tube configuration in VAV applications.
- G. Direct expansion coil working pressure: 300 psig.

### 2.5 STEAM COILS

**NON-DISTRIBUTING TYPE STEAM COILS SHOULD ONLY BE USED FOR APPLICATIONS WELL ABOVE FREEZING AND ARE NOT SPECIFIED HERE. THEY ALSO CAN SUFFER FROM POOR CONTROLLABILITY IN LARGER SIZES. NOT GENERALLY RECOMMENDED EXCEPT FOR SMALL ABOVE-FREEZING TERMINAL UNIT TYPE APPLICATIONS.**

*FOR ANY HORIZONTAL TUBE STEAM COIL LONGER THAN 108" FINNED LENGTH, DISTRIBUTING TYPE ARE STRONGLY RECOMMENDED WITH SUPPLY CONNECTIONS AT BOTH ENDS OF THE COIL, TO ASSURE EVEN HEATING ACROSS THE COIL FACE.*

- A. One row, steam distributing tube-in-tube type, with 1-in. diameter outside tubes and 5/8-in. diameter inside tubes; same or opposite end connections as required. Uniform leaving-air distribution temperature with maximum 4 deg. F temperature difference between leaving air from any lengthwise quadrant of coil area (based on nine or more equal area temperature readings in any given quadrant) and average leaving air temperature over entire coil face area. Die-form distributor tubes. Orifices shall discharge steam in the direction of condensate flow. Tubes shall be located concentrically within condensing tubes with corrosion resistant support clips. Provide steam deflectors opposite the supply connection, to prevent impingement of steam into tubes in connection area.

*VERTICAL TUBE STEAM COILS FOR 100% OUTSIDE AIR APPLICATIONS (SPECIFIED BELOW) ARE LESS PRONE TO FREEZING AND ARE STRONGLY RECOMMENDED FOR SUCH APPLICATIONS FOR LARGE (> 48" LONG) COILS. HOWEVER DESIGNER MUST ASSURE THAT ADEQUATE VERTICAL SPACE IS AVAILABLE TO PROVIDE PROPER STEAM TRAP INLET HEIGHT. ALSO ASSURE SPACE IS ADEQUATE FOR STEAM CONNECTION TO THE COIL. A COMPROMISE OPTION IS HORIZONTAL 1" O.D. DISTRIBUTING TUBE TYPE WITH SUPPLY CONNECTIONS AT BOTH ENDS OF THE COIL.*

- 1. 100 percent outside air steam coils with finned length greater than 48 inches: Provide vertical tubes; 1-in. diameter outside tubes and 5/8-in. diameter inside tubes.
- B. Steam coil working pressure and temperature: 100 psig/400 deg. F.

## **2.6 DRAIN PANS**

- A. Provide a drain pan under each cooling coil, and where indicated. Provide intermediate drain pans at each level of stacked coils. Drain pans shall capture all condensate from coil assembly; including pipe header, pipe return bends, upstream run-off, and downstream carryover.
- B. Drain Pan Construction: 304 stainless steel, self-supporting, sloped in two directions minimum, leak-tight with welded seams. Design, fabricate and install to prevent standing water.
- C. For coils mounted in 100 percent outside air units, insulate the bottom of intermediate drains pans with 3/8-in.-thick flexible closed cell elastomeric insulation, with the upstream edge protected by a stainless steel angle.
- D. Provide rigidly supported, leak tight copper downcomer drains from each intermediate pan to pan below.

*TWO OPTIONS EXIST FOR BOTTOM PAN - ABOVE FLOOR OR DEPRESSED-IN-FLOOR. ABOVE FLOOR OPTION IS PREFERRED DUE TO EASE OF CONSTRUCTION, VERIFICATION AND EVENTUAL REPLACEMENT, AND HIGHER DRAIN OUTLET. HOWEVER ABOVE FLOOR OPTION WILL TYPICALLY INCREASE UNIT HEIGHT BY 3 TO 6 INCHES. CHOOSE BETWEEN FOLLOWING OPTIONS CAREFULLY.*

- E. Above Floor Bottom Pan: Minimum 16 gauge construction. Insulate between pan and floor with 1/2 in. thick flexible closed cell elastomeric insulation. Provide threaded outlet at pan low point.
- F. Depressed-in-floor Bottom Pan: Minimum 16 gauge construction, maximum deflection 1/250 at 150 lbs./sq.ft. load.
  - 1. Insulate below pan as part of the floor insulation system. Provide waterproof seal between pan and floor deck.
  - 2. Provide threaded outlet at pan low point.
- G. Flexible Closed Cell Elastomeric Drain Pan Insulation: Armacell-Armaflex or equivalent. Composite flame spread / smoke density not to exceed 25/50. Fully adhere to the pan bottom with insulation manufacturer's recommended adhesive.

**2.7 SOURCE QUALITY CONTROL**

- A. Factory test all coils.
- B. Proof test all water and steam coils to 300-psig minimum, and leak test to 200 psig, minimum.
- C. Proof test all direct expansion coils to 450 psig minimum, and leak test to 300 psig, minimum.

**PART 3 - EXECUTION**

**3.1 INSTALLATION**

- A. Install coil assemblies in accordance with details, other specifications sections, approved submittals, and the coil manufacturer's installation requirements and recommendations.
- B. Install coils level and plumb.
- C. Use fin combs to restore bent fins to upright condition.
- D. Block (safe) gaps around coil casings to prevent air flow bypass. Use sheet metal matching the coil casing material, secured with sheet metal screws. Close minor gaps with gasketing and sealants. All safing to match adjacent construction.
- E. Clean coils using materials and methods recommended by manufacturers, to remove dust and debris

**3.2 COMMISSIONING**

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

NUMBER            SECTION DESCRIPTION

Fax: 734-936-3334

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**

SECTION 238219 - FLOOR MOUNTED FAN COIL UNITS (UN-DUCTED)

**END OF CONTENTS TABLE**

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)  
SECTION 238219 - FLOOR MOUNTED FAN COIL UNITS (UN-DUCTED)

**REVISIONS:**

*FIRST EDITION MAY 2010, AEC MECH TECH TEAMS - HVAC/CONTROLS GROUP. DEVELOPED BASED ON THE NORTH QUAD RESIDENCE HALL FAN COIL SPECIFICATION. GENERALLY INTENDED FOR SMALL (< 1/2 HP) VERTICAL FAN COILS MOUNTED INSIDE THE ROOM WITH CHW AND HEATING COILS. COULD BE ADAPTED FOR OTHER TYPE IN-ROOM FAN COILS.*

*FAN COIL ROOM CONTROLLER (I.E. THERMOSTAT) AND CONTROL VALVES ARE SPECIFIED IN SECTION 230900 MECHANICAL SYSTEMS CONTROLS, AND NOT IN THIS SECTION. THIS SECTION COVERS ONLY THE FAN COIL CONTROL TRANSFORMER AND RELAY PACK.*

*NEW FORMAT DRAFT NOVEMBER 15, 2010. MANUFACTURERS UPDATED, FORMAT AND ORGANIZATION REVISED.*

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.*

- B. Related Work Specified Elsewhere: Examine Drawings and other sections of the Specifications for requirements that affect and specify work under this section, in particular the following:
1. Section 221113: Piping Materials and Methods.
  2. Section 220523: Valves.
  3. Section 220513: Motors.
  4. Section 220719: Mechanical Systems Insulation.
  5. Section 232116: Hydronic Piping Specialties.
  6. Section 230900: Mechanical Systems Controls.
  7. Division 26: Electrical.

**1.2 SUMMARY**

- A. Section Includes

1. Floor-mounted fan-coil units, with controls provided in part or in entirety by the fan coil manufacturer, as specified.

*REVISE THE ALTERNATES REQUIREMENTS AND THE CORRESPONDING INFORMATION IN PART 1 AND PART 2 BASED ON PROJECT REQUIREMENTS. IF THERE ARE NO BID ALTERNATES, INDICATE*

*"NONE." CONSIDER SPECIFYING ECM MOTORS AS AN ALTERNATE. CONSIDER SPECIFYING WELDED, RADIUSED CORNERS ON FRONT AND SIDE EDGES OF TOP AS AN ALTERNATE. WELDED EDGES RESULT IN A MUCH MORE ATTRACTIVE AND DURABLE CABINET AND ARE PREFERRED BY U-M HOUSING.*

**1.3 ALTERNATES**

- A. Bid Alternate No. 1: Furnish fan-coil units with pre-assembled hydronic piping package. Tubing, valves, fittings, instrumentation, supports and insulation as specified herein and as indicated on the Drawings.
  - 1. Piping package shall be shipped from the manufacturer's factory connected to coil(s), secured and protected from damage during shipment.
  - 2. Piping package shall include the required control valves. Control valves shall be as specified in Section "Mechanical Systems Controls."

**1.4 COORDINATION**

- A. Coordinate dimensions and arrangement of fan coils with building elements including windowsill height, floor finish, pipe entry location, and wall construction.

*REVISE SUBMITTALS AS REQUIRED. SAMPLE PARAGRAPHS UNDER 1.5 REQUIRE DELIVERY OF A SAMPLE FAN COIL WITH THE BID, AND IS WRITTEN ASSUMING THE FAN COILS WILL BE PREPURCHASED, AND THAT A PREPIPED FAN COIL WILL BE CONSIDERED AS AN ALTERNATE. SAMPLE UNIT SUBMITTAL IS HIGHLY RECOMMENDED FOR PROJECTS WITH A LARGE QUANTITY OF FAN COILS.*

**1.5 SUBMITTALS**

- A. Submit the following product data for approval:
  - 1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
  - 2. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
  - 3. Details of motor including type, manufacturer and electrical characteristics.
  - 4. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
  - 5. Control transformer-sizing calculations.
  - 6. Detailed information on fan control relay board.
  - 7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.
  - 8. Evidence of UL or ETL listing and labeling.

- B. Equipment schedule with the following information for each unit type:
  - 1. Quantity of each type.
  - 2. Equipment tag.
  - 3. Model number.
  - 4. Manufacturer's size designation.
  - 5. Configuration (2-pipe or 4-pipe).
  - 6. Number of coils, number of rows for each coil, fin spacing for each coil, airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.
- D. Warranty Documentation: Submit warranty documentation according to requirements of Contract Documents.
- E. Detailed schedule with each fan coil tagged by room number, indicating unit style, heating and cooling capacity, left- or right-hand piping configuration, and 2-way or 3-way control valves.

*THE FOLLOWING PARAGRAPHS SPECIFY CONDITIONS WHEN THE FAN COILS ARE PREPURCHASED, AND THAT A PREPIPED FAN COIL WILL BE CONSIDERED AS AN ALTERNATE. REQUIRE THAT A SAMPLE FAN COIL UNIT BE DELIVERED WITH THE BID AND IS WRITTEN ASSUMING. SAMPLE UNIT IS HIGHLY RECOMMENDED FOR PROJECTS WITH LARGE QUANTITIES OF FAN COILS.*

- F. Samples: Submit sample fan coil unit with bid: One unit, Type FCU-XX, pre-piped, with factory-applied color finish, and factory-installed piping package:
  - 1. Sample unit shall comply with these specifications in all respects.
  - 2. Configure piping for 2-way control valves with 3/4 inch nominal control valve body size.
  - 3. Provide Sample unit pre-piped with piping accessories and control valves, arranged per the drawing details. See "Factory-Provided and Installed Hydronic Piping Package" in Part 2.
  - 4. Piping shall be 3/4 inch nominal size. Pipe unit for 4-pipe configuration.
  - 5. Configure sample unit to allow the fan to operate at all three speeds after temporary power is provided.

**1.6 DELIVERY, STORAGE AND HANDLING**

- A. Mark each fan coil cabinet back with the scheduled room location.
- B. Mark the fan coil room locations on the outside of the shipping box.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.

- E. Ship each unit wrapped in a heavy plastic bag, packed in a corrugated cardboard shipping box.

*REVISE MAINTENANCE MATERIAL SUBMITTALS TO SUIT PROJECT REQUIREMENTS. FILTERS AND TOUCH-UP PAINT ARE GENERALLY NOT REQUIRED FOR SMALL PROJECTS. REVIEW PART 3 REGARDING TEMPORARY USE OF FAN COILS DURING CONSTRUCTION AND FINAL FAN COIL TURN-OVER TO OWNER AND THE REQUIREMENTS FOR EXTRA FILTERS. REVISE TOOLS IN PARA. D BASED ON THE QTY. OF FAN COILS. CONSIDER LISTING OTHER SPARE PARTS THAT MIGHT BE UNIQUE TO THE FAN COIL.*

**1.7 EXTRA STOCK MATERIALS**

- A. Furnish extra materials described below that match installed products. Package with protective covering for storage. Affix labels describing contents.
- B. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
  - 1. Fan-Coil-Unit Filters: Furnish start-up filter (installed in the shipped unit) and one spare filter for each filter installed.
  - 2. Touch-up paint: 48 fluid ounces total for each cabinet color, in spray cans.
  - 3. Tool or bit to remove the tamper-proof fasteners: total quantity of twenty.
- C. Extra materials, excluding start-up filters, are for the Owner's use, not for Contractor's use, during construction.
- D. Provide units built, tested, and installed in compliance with the latest edition of the following quality assurance standards, unless noted otherwise:
  - 1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
  - 2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.
  - 3. NFPA 70- National Electric Code.
  - 4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
  - 5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
  - 6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
  - 7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
  - 8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation
  - 9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
  - 10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
  - 11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

12. Fan coils shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

*REVISE WARRANTY PER PROJECT. TWO-YEAR WARRANTY MAY BE APPROPRIATE WHEN PURCHASING LARGE QUANTITIES OF FAN COILS.*

- E. Promptly remedy any Work not in accordance with the Contract Documents, within a one-year period from the date of Substantial Completion, according to the Standard General Conditions and Supplemental General Conditions.

## **PART 2 - PRODUCTS**

### **2.1 MANUFACTURERS**

- A. Subject to compliance with all requirements, provide products from one of the following manufacturers:
  1. Airtherm, Westfield, MA.
  2. Enviro-Tec by Johnson Controls, Largo, FL.
  3. International Environmental Corporation, Oklahoma City, OK.
  4. Rittling, Buffalo, NY.

*VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE FAN COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD HEIGHT UNITS MAY NOT FIT PROPERLY UNDER EXISTING WINDOWS/WINDOW SILLS.*

*LIST FAN COIL SOUND POWER LEVELS IN THE FAN COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR FAN COILS USED IN SLEEPING QUARTERS.*

### **2.2 MANUFACTURED FAN COIL UNITS**

- A. Factory fabricated Fan Coil Units: Built, tested, and rated in accordance with the Quality Assurance Standards referenced in this Section.
  1. Mark the room location on the fan coil cabinet back.
- B. Capacities: As indicated in the equipment schedules.
- C. Dimensions: Maximum allowable dimensions as indicated on the Drawings. Maximum allowable height shall include the height of the leveling legs when adjusted to their minimum extension position.

### **2.3 FAN COIL UNIT CONSTRUCTION**

- A. Chassis:
  1. Construction: Heavy gauge, minimum G60 galvanized or A40 galvanized steel. Construct to eliminate racking.
  2. Provide a minimum of four leveling legs with minimum 1-inch adjustment.

3. Provide framing members with a minimum of two 7/16 inch diameter minimum, wall-mounting holes and two floor-mounting holes. Provide additional holes if required for safe and secure mounting. Mounting holes to permit bolting to the wall and the floor with lag screws.

B. Cabinet: Steel with baked-enamel or powder coat finish.

1. Tops: Steel, 18 gauge minimum thickness.
2. Front and sides of cabinet: Steel, 16 gauge minimum thickness.

**NOTE THAT THE PARAGRAPH BELOW IS FOR AN EXTERNAL (REMOTE) THERMOSTAT FOR THE FAN COIL. REVISE WHEN THE PROJECT REQUIRES A FAN COIL WITH DOORS TO ACCESS A FAN SPEED SWITCH OR THERMOSTAT CONTROL.**

3. Cabinet tops: Sloped, seamless and continuous without access doors for temperature controls, fan speed switches, and other controls.
4. Outlet grille: Pencil-proof and stamped into the top with all grille edges recessed into the casing and not projecting out of the casing.
5. Cabinets and front panels shall have all edges turned over and all burrs removed. The finished product shall have no sharp edges.
6. Front panel: Removable, with channel-formed edges and insulation on the entire interior face of the panel, and secured with tamper-resistant cam fasteners. Fasteners designed with a hexagonal socket for use with a common hex-head tool (allen wrench) shall not be acceptable.
7. Extend the front access panel for the full width of the fan coil cabinet, included the piping pocket extension and electrical pocket.
8. Provide an extension on the piping side of the cabinet unit. Extension shall result in an overall inside width of the piping pocket of not less than 17 inches. Extension shall be continuous with the front, top, sides, and bottom of the cabinet and shall not have an "add-on" configuration. Provide a cutout in the cabinet end to allow connecting piping to be routed into the piping pocket.
9. Provide an electrical equipment pocket, on the side opposite of the piping pocket, with a minimum clear inside width of 8 inches.
10. Base or legs: Form all vertical surfaces of solid sheet metal, including sides facing the air stream (facing the return air/air filter opening); open construction is not permissible.
11. Apply insulation in the entire cabinet on the interior faces including the end pockets, sides, front, and top panel away from the coil section. Apply insulation to interior cabinet surfaces to insulate the conditioned air stream and to prevent sweating. Do not insulate chilled water/dual temperature piping inside the cabinet. Secure Insulation to cabinet with water-based, non-out-gassing adhesive providing 100 percent coverage of the cabinet interior surfaces.

- C. Finished Surfaces: Clean, phosphatize, and coat with a factory baked-on or powder-coat primer, and separately applied baked or powder coated finish paint. Final color shall be as selected from the manufacturer's standard color palette.
- D. Insulation: Coil and Cabinet: minimum 1/2-inch-thick closed-cell elastomeric foam complying with the following:
  - 1. ASTM C 411 Standard Test.
  - 2. Attach with adhesive complying with ASTM C 916.
  - 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
  - 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- E. Drain Pans: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.
  - 1. Main drain pan (pan immediately below coil): Stainless steel, insulated.
  - 2. Auxiliary drain pan: Insulated molded plastic or stainless steel with threaded drain connection. Pan shall receive condensate from main drain pan. Provide large enough to capture condensate dripping from all chilled water and dual temperature piping located inside the fan coil cabinet.
    - a. Note: Do not insulate chilled water/dual temperature piping inside the cabinet.
- F. Filters: Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2
  - 1. Disposable Type 1 inch pleated cotton-polyester media: 90 percent arrestance and 7 MERV.
  - 2. Replaceable through return air opening without removing access panel.

**2.4 HYDRONIC COILS**

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.
  - 1. Factory test all coils as specified in the Source Quality Control article.
  - 2. Include manual air vent and drain connections accessible from the pipe access chase end of unit.
  - 3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.
  - 4. Provide coil piping connections extended into the piping pocket.

**2.5 FAN AND MOTOR BOARD ASSEMBLY (BLOWER DECK):**

- A. Fan(s) and motor(s): Mount on a common, rigid, sheet metal panel, fully insulated and removable as an assembly for ease of maintenance. Assembly shall be removable and replaceable through the front access panel and shall not require the removal of side panels.
- B. Fan: Forward curved, double width, centrifugal; directly connected to motor. Galvanized steel or aluminum wheels; galvanized-steel fan scrolls.
- C. Motor: Three speed, single phase, permanent split capacitor (PSC) type with permanently lubricated bearings. Provide motor with resilient mounting and built-in overload protection with automatic reset.
- D. Wiring termination: Pre-wire motor to power/relay board with quick-disconnect plug connection.
- E. The maximum allowable fan and motor RMS velocity at the maximum fan speed shall not exceed 0.15 in. /sec. in the horizontal, vertical and axial directions. Fans may be field tested after installation by an independent third party. The manufacturer, without cost to the Owner, shall correct any fan/motor found to exceed these vibration limits.

*NOTE THAT THE FOLLOWING ARTICLE IS WRITTEN FOR AN EXTERNAL (REMOTE) THERMOSTAT (ROOM CONTROLLER) USED FOR THE FAN COIL, SUPPLIED BY THE CONTROLS CONTRACTOR. EDIT AS REQUIRED IF PROJECT REQUIRES DIFFERENT CONTROLS,*

**2.6 FAN COIL CONTROLS AND ELECTRICAL CONNECTIONS**

- A. Control devices and operational sequences are specified in Section "Mechanical System Control" and the Sequence of Operation indicated on the control drawings. Provide pre-wired controls that achieve the operational sequences and that are compatible with the remote thermostat (room controller) specified in Related Section "Mechanical Systems Control." Remote thermostat will be provided and wired to the fan coil by the controls contractor.
- B. Provide a three-speed fan relay control board pre-wired to the fan, and with connections for the low voltage remote thermostat. Coordinate with controls contractor and assure control relay board is compatible with remote thermostat. Relays shall be silent in operation.
- C. Provide 120/24 volt control transformer inside a separate protective cover, or with fully guarded wiring connections. Control transformer shall be a discrete device, not part of a circuit or relay board. Size transformer for control valve(s), thermostat, and fan relays, plus 20 percent of maximum load. Transformer shall be appropriately fused on both the line side and the load side.
- D. Mount all electrical devices secured to the chassis inside the chassis pocket opposite the piping pocket.

- E. Completely factory pre-wire disconnect switch, motor(s), control transformer, and relay board. Isolate all high voltage (120V) wiring from low voltage (24V) wiring via separate junction boxes and wireways.
  - 1. Provide 120V disconnect switch mounted on a junction box adequately sized to allow external "single point" high voltage power connection to the fan coil unit. Configure disconnect wiring to turn off all high and low voltage power in the fan coil.
  - 2. Provide a thermostat junction box to allow "single point" connection of thermostat wiring. Terminate control valve (when control valves provided by fan coil manufacturer), control transformer, and relay board wiring in the thermostat junction box. Provide a junction box of adequate size to allow controls contractor to terminate all thermostat connections, and control valve wiring when control valves are not provided by fan coil manufacturer, inside the box with wire nuts.
- F. Provide a project specific wiring diagram affixed to the inside of each fan coil cabinet.
- G. All electrical work shall comply with applicable Related Documents, Electrical Sections and Quality Assurance Standards.

**2.7 FAN COIL UNIT WITH HYDRONIC PIPING PACKAGE - BASE BID AND ALTERNATE WORK**

*REVISE BELOW DEPENDING ON PROJECT REQUIREMENTS. FILL IN BID ALTERNATE NUMBER IN PARAGRAPH B OR EDIT, AS APPLICABLE:*

- A. Base Bid Work: Factory-Provided and Installed Hydronic Piping Package is not provided.
  - 1. Provide coil piping connections protected with plastic end caps, ready for field connection.
  - 2. Provide threaded brass plugs in coil header air vent and drain connections.
- B. Alternate Work: Complete pre-assembled hydronic piping package under Bid Alternate No. X.
  - 1. Configure piping as indicated in the piping details.
  - 2. Tubing: Seamless copper tubing, Type L, soldered joints.
  - 3. Provide piping components including piping, valves, fittings, joints, instrumentation, as specified in Related Specification Sections. Do not provide components or products from component manufacturers that are not specified and listed in the Contract Documents.
  - 4. Include control valves as described in Related Specification Section. Valves shall be of pipe size and 2-way or 3-way configuration as indicated for specific fan coils. Engineer shall select Control valve Cv during submittal process. At the discretion of the Engineer, smaller valve body size may be selected at that time.
  - 5. Do not insulate chilled water and dual temperature piping. Arrange piping completely above the auxiliary drain pan as described under Drain Pans paragraph.

6. Insulate hot water piping. Insulate any chilled water and dual temperature piping that cannot be located above the auxiliary drain pan.
7. Insulate with closed cell elastomeric insulation per Related Specification Sections.
8. Install piping to allow access to all piping components (drain connections, unions, etc.), arranged so that it is possible to remove the control valve body and actuator without removing any other component.
9. Provide adequate and easily removable pipe hangers. Hangers shall rigidly support the pre-assembled piping package from the fan coil chassis, preventing damage during shipping and operation. Provide plastic coated hangers to prevent galvanic corrosion between hanger and piping components.
10. Provide plastic end caps on the field connection points.

## 2.8 SOURCE QUALITY CONTROL

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.
- B. Assemble and factory test each unit prior to shipping. Pressure test coils and piping packages for leaks. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

## PART 3 - EXECUTION

### 3.1 EXAMINATION

- A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before fan-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Install fan coil units level and plumb. Adjust leveling legs individually to the minimum height required to level units. Do not use leveling legs to align coil connections with field piping - adjust field piping instead.
- B. Bolt unit to blocking in wall after leveling. Bolt units to floor if inadequate wall support exists in the wall. Do not use toggle bolts or dry-wall anchors. Install bolts in every fan coil mounting hole.
- C. Install fan coil units to comply with Quality Assurance Standards and manufacturer's installation instructions.

### **3.3 CONNECTIONS AND INSULATION**

- A. General piping installation requirements are specified in Related Work Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Install as follows:
  - 1. Connect hydronic and condensate drain piping to the unit.
  - 2. Install piping to allow access to all piping components (drain connections, unions, etc.), arranged so that it is possible to remove the control valve body and actuator without removing any other component.
  - 3. Provide adequate and easily removable pipe hangers to rigidly support piping within the fan coil. Provide plastic coated hangers to prevent galvanic corrosion between hanger and piping components.
  - 4. Arrange chilled water and dual temperature piping so that it is installed completely above the auxiliary drain pan, to capture any condensate dripping from the piping.
- B. Insulate condensate drain and hot water piping with closed cell elastomeric insulation per Related Specification Sections. Insulate any chilled water and dual temperature piping that cannot be located above the auxiliary drain pan.
  - 1. Insulate piping all the way to coil headers and drain pan connection.
  - 2. If fan coil unit is provided with pre-assembled hydronic piping package under the Alternate Work, provide insulated piping, as described in the Part 2 article. Insulate all field installed piping as described above.
- C. Connect wiring and ground equipment according to electrical requirements indicated in the Related Specification Sections.

### **3.4 CLEANING AND PROTECTING**

- A. Protect units from damage, scratching, dirt and debris immediately after installation as follows:
  - 1. Wrap or cover entire cabinet with heavy plastic. Completely cover return air inlet. Secure plastic in place with tape.
  - 2. Cover entire cabinet with heavy cardboard secured in place. Utilize fan coil shipping box when possible. Mark top with large letters stating, "FRAGILE - DO NOT STAND."
  - 3. Use only tape that will not mar finishes. Clean and remove all tape and adhesive residue prior to starting units.
  - 4. Remove all protective materials immediately prior to starting each unit. Do not uncover any unit before all drywall taping and sanding has been completed in that area.

### **3.5 TEMPORARY USE PRIOR TO OCCUPANCY**

- A. Start fan coil units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of fan coil units serving that area.

- C. Prior to starting each unit, remove front access cover and vacuum complete unit including coils, fan scrolls, drain pans, access sections, chassis, and cabinet.
- D. Perform manufacturer's pre-start protocol and commissioning activities immediately prior to placing into temporary service.
- E. Tape foam filter material over entire discharge grille.
- F. Install a complete set of temporary filters in the fan-coil unit equal to the quality and efficiency of the specified permanent filters. If the fan coil unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- G. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

### 3.6 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
  1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
  2. Test unit operation with thermostat in all modes of operation.
  3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.
  4. Remove and replace malfunctioning units and retest as specified above.

**ENGINEER SHALL VERIFY THAT THE MECHANICAL SYSTEMS CONTROLS SPECIFICATION DESCRIBES CONTROLS START-UP FOR FAN COIL UNITS.**

- B. Coordinate controls start-up for fan coil units with the Mechanical Systems Controls Specifications.

### 3.7 COMMISSIONING

- A. Perform complete functional testing as required by the Commissioning Agent.
- B. Perform manufacturer's pre-start protocol and commissioning activities after unit has completed temporary service.

### 3.8 FINAL TURN-OVER TO OWNER

- A. Immediately prior to Substantial Completion, re-clean all fan-coil units. Remove front access cover and vacuum complete unit including coils, fan scrolls, drain pans, access sections, chassis, and cabinet. Clean and remove all tape and adhesive residue from cabinet.
- B. Straighten coil fins with a fin comb.

- C. Sand, prime coat, and touch-up all scratches with color-matched, factory-supplied touch-up paint. Where touch-up painting does not match adjacent, unblemished finish in either color or texture, field paint the entire cabinet surface exposed to view with factory-provided spray paint.
- D. After final cleaning and painting, install a new, clean set of air filters in each unit if units were used for Temporary Use.

**REVISE TO COORDINATE WITH PART 1 SUBMITTALS IF SPARE FILTERS ARE REQUIRED.**

- E. Provide spare filters to Owner.

### **3.9 OWNER TRAINING**

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic fan-coil unit maintenance by demonstrating the following: location of control devices, removal of access panel, filter replacement, relay replacement, and motor replacement.

**END OF SECTION 238219**

BuildingName  
The Description of the Project  
P00000000 0000

ARCHITECTURE & ENGINEERING  
326 East Hoover, Mail Stop B

**SPECIFICATION DIVISION 23**

NUMBER            SECTION DESCRIPTION

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**

SECTION 238220 - HORIZONTAL FAN COIL UNITS

**END OF CONTENTS TABLE**

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)  
SECTION 238220 - HORIZONTAL FAN COIL UNITS

*NEW SECTION: JUNE 2011.*

*FAN COILS IN THIS SPECIFICATION ARE LIMITED TO SINGLE PHASE UNITS OF LESS THAN 1/2 HP WITH DIRECT DRIVE FANS. COMPARED TO BLOWER COILS, FAN COILS TYPICALLY PROVIDE RELATIVELY LOW FAN STATIC PRESSURE AND ARE DESIGNED TO ACCOMMODATE MINIMAL OR NO ATTACHED DUCTWORK.*

*HORIZONTAL FAN COILS ARE AVAILABLE IN NUMEROUS CONFIGURATIONS AND WITH MULTIPLE OPTIONS; THIS SPECIFICATION IS THEREFORE NECESSARILY OUTLINE IN NATURE. EDIT SECTION CAREFULLY TO MAKE IT PROJECT SPECIFIC. SPECIFICATIONS FOR MFR. PROVIDED CONTROLS INCLUDING 3 SPEED FAN CONTROL (RELAY BOARD), FACTORY PIPING PACKAGES, DX COILS, CABINETS FOR FINISHED SPACE USE, AND INTEGRAL GRILLES/REGISTERS/DIFFUSERS ARE NOT INCLUDED AND MUST BE ADDED IF REQUIRED. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S AND OTHER SPEC. LANGUAGE THAT MAY BE USEFUL WHEN SPECIFYING HORIZONTAL FAN COILS.*

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*SPEC EDITOR: CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.*

- B. Related Sections:

1. Section 2220513: Motors.
2. Section 220719: Mechanical Systems Insulation.
3. Division 26: Electrical.

**1.2 SUMMARY**

- A. Section Includes:

1. Horizontal fan-coil units with motors less than 1/2 HP, direct drive fans, and hydronic coils. Controls provided in part or in entirety by the fan coil manufacturer, as specified.

**1.3 COORDINATION**

- A. Coordinate dimensions and arrangement of fan coils with building elements including to maintain all maintenance clearances. Pay special attention to required electrical clearance.

**1.4 SUBMITTALS**

- A. Submit the following product data for approval:
  - 1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
  - 2. Piping connections including size, material types, and dimensioned locations for each service.
  - 3. Ductwork connections including sizes, locations, and methods of connections to mating ductwork.
  - 4. Locations of electric power connections.
  - 5. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
  - 6. Details of motor including type, manufacturer and electrical characteristics.
  - 7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.
  - 8. Evidence of UL or ETL listing and labeling.

**SPEC EDITOR: UNHIDE THE BELOW HIDDEN TEXT IF DISCONNECT SWITCH, CONTROLS, TRANSFORMER, OR 3 SPEED FAN RELAY BOARD ARE TO BE PROVIDED BY THE FAN COIL MFR.**

- 9. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
  - 10. Control transformer-sizing calculations.
  - 11. Detailed information on fan control relay board.
- B. Equipment schedule with the following information for each unit type:
  - 1. Equipment tag.
  - 2. Room number of thermostat location.
  - 3. Model number.
  - 4. Manufacturer's size designation.
  - 5. Configuration (2-pipe or 4-pipe).
  - 6. Number of coils, number of rows for each coil, fin spacing for each coil.
  - 7. Heating and cooling capacity.
  - 8. Airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.

**1.5 DELIVERY, STORAGE AND HANDLING**

- A. Mark each fan coil cabinet with the room number where it is scheduled to be installed.
- B. Mark each fan coil shipping box with the room number where it is scheduled to be installed.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.
- E. Ship each unit wrapped in a heavy plastic bag, packed in a corrugated cardboard shipping box.

**1.6 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  - 1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
  - 2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.
  - 3. NFPA 70- National Electric Code.
  - 4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
  - 5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
  - 6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
  - 7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
  - 8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation.
  - 9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
  - 10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials.
  - 11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
  - 12. Units shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

**1.7 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
  - 1. Airtherm.
  - 2. Enviro-Tec by Johnson Controls.
  - 3. International Environmental Corporation.
  - 4. McQuay International.
  - 5. Trane.
  - 6. Zehnder Rittling.

*VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE FAN COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD SIZE UNITS MAY NOT FIT PROPERLY IN EXISTING FACILITIES.*

*LIST FAN COIL SOUND POWER LEVELS IN THE FAN COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR FAN COILS USED IN SOUND SENSITIVE AREAS.*

*THIS SPECIFICATION ASSUMES NONE OF THE FAN COIL CONTROLS ARE PROVIDED BY THE FAN COIL MFR. IF ANY CONTROLS ARE TO BE PROVIDED BY THE MFR.(3-SPEED RELAY BOARD, CONTROL TRANSFORMER, ETC.), EDIT THIS SPECIFICATION TO INCLUDE THOSE REQUIREMENTS. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S THAT MAY BE USEFUL WHEN SPECIFYING HORIZONTAL FAN COILS.*

**2.2 FAN COIL UNIT CONSTRUCTION**

- A. Dimensions: Maximum allowable dimensions as indicated on the Drawings.
- B. Casing Construction:
  - 1. Construction: Minimum 18 gauge, G60 galvanized or A40 galvanized steel or as scheduled. Construct to eliminate racking.
  - 2. Access panels shall be fully insulated and attached with fasteners on at least two opposite sides. No coil or drain piping or electrical connections shall pass through any access panel.
  - 3. One inch duct collars if connected to ductwork.
- C. Insulation: Exterior panels and access panels: Foil faced minimum 1-inch-thick, 1-1/2 lb density fiberglass fire resistant insulation complying with the following:
  - 1. ASTM C 411 Standard Test.
  - 2. Attach with adhesive complying with ASTM C 916.
  - 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
  - 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

**2.3 HYDRONIC COILS**

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.
  - 1. Factory test all coils as specified in the Source Quality Control article.
  - 2. Include manual air vent and drain connections.
  - 3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.

**2.4 DRAIN PANS**

- A. Condensate Drain Pan: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.
  - 1. Drain pan: Stainless steel, insulated.
    - a. Located under cooling coil allowing the drain pan to be fully inspected and cleaned.
    - b. Slope to drain completely dry upon fan coil shutdown.

*SPEC EDITOR: SELECT BELOW, ONE OF THE FOUR CODE REQUIRED METHODS OF PROTECTING AGAINST PRIMARY DRAIN PAN FAILURE AND SHOW DRAIN TERMINATION POINTS ON THE DRAWINGS. DELETE THE OTHER THREE OPTIONS.*

- 2. Overflow drain pan connection: shall be on the same side and at a higher elevation than the primary drain pan connection.
- 3. Water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.
- 4. Auxiliary drain pan with drain connection.
- 5. Auxiliary drain pan with capped or no drain connection, with water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to auxiliary drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.

**2.5 FILTERS**

- A. Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2
  - 1. Disposable Type: 2-inch pleated cotton-polyester media: 90 percent arrestance and a MERV A rating of 8 (or as scheduled) when tested per Appendix J of ASHRAE 52.2.

*SPEC EDITOR: SELECT BELOW, DIRECTION OF FILTER REMOVAL. WHEN SELECTING, CONSIDER THE OBSTRUCTIONS TO FILTER REMOVAL AT THE FAN COIL MOUNTING LOCATION.*

- 2. Provide filters that are removable horizontally from the casing.
- 3. Provide filters that are removable vertically from the casing.

*SPEC EDITOR: FAN COILS ARE RARELY BELT DRIVEN. IF YOUR PROJECT REQUIRES BELT DRIVE, STRONGLY CONSIDER USING THE BLOWER COIL SPEC. OTHERWISE, EDIT BELOW TO INCLUDE SPEC FOR BELT DRIVE AND REVISE THE MOTOR TYPE.*

## **2.6 FAN AND MOTOR:**

- A. Fan: Forward curved, double width, centrifugal, direct drive fan(s) mounted on removable fan deck or with easily removable fan and motor. Galvanized steel or aluminum wheels; galvanized-steel fan scrolls.
- B. Motor Wiring: Terminate wiring in a junction box, external to the unit casing for a single point connection.
- C. Provide a project specific wiring diagram affixed to the inside of each fan coil cabinet.

*SPEC EDITOR: SELECT EITHER 3 SPEED PSC OR ECM MOTORS, BELOW.*

*SPEC EDITOR: ECM MOTORS AUTOMATICALLY ADJUST TO VARYING LOAD/STATIC PRESSURE (E.G. FILTER LOADING). SPEED IS TYPICALLY FACTORY SET BUT CAN BE RESET IN FIELD. ECM MOTORS ARE MORE ENERGY EFFICIENT AND ARE CLAIMED TO LAST LONGER THAN PSC MOTORS. THOUGH ECM MOTORS ARE GENERALLY PREFERRED, CAUTION MUST BE UTILIZED WHEN USING LARGE QUANTITIES OF SINGLE PHASE ECM MOTORS ON 3 PHASE CIRCUITS SINCE ECM GENERATED HARMONICS COULD OVERHEAT NEUTRAL CONDUCTORS, CONNECTORS, AND TRANSFORMERS. FOR HOSPITAL AND OTHER PROJECTS, ECM MOTOR LOCATION MUST BE CONSIDERED RELATIVE TO SENSITIVE ELECTRONIC EQUIPMENT, DUE TO POSSIBLE INTERFERENCE BY ECM GENERATED HARMONICS.*

- D. Motor: In compliance with Related Section "Motors", permanent split capacitor (PSC) type, 3 speed/3 tap, sleeve bearings.
- E. Motor: In compliance with Related Section "Motors", electronically commutated motor (ECM). Designed for use with a single phase electrical input. Motor to be complete with and operated by a single phase integrated speed controller/inverter, speed adjustable manually or via external 0-10 VDC signal, built-in soft start/speed ramps, with permanently lubricated ball bearings.

## **2.7 SOURCE QUALITY CONTROL**

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.
- B. Assemble and factory test each unit prior to shipping. Pressure test coils and piping packages for leaks. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

**PART 3 - EXECUTION**

**3.1 EXAMINATION AND PREPARATION**

- A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before fan-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 INSTALLATION**

- A. Install fan coil units level and plumb and to comply with Quality Assurance Standards and manufacturer's installation instructions.

*SPEC EDITOR: REGARDING THE BELOW PARAGRAPH: BE SURE TO SHOW OVERFLOW DRAIN ROUTED TO A CONSPICUOUS TERMINATION POINT, IF AN OVERFLOW DRAIN IS BEING USED.*

**3.3 CONNECTIONS**

- A. General piping installation requirements are specified in Related Documents Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Connect hydronic, condensate drain, and overflow drain piping to the unit.

**3.4 TEMPORARY USE PRIOR TO OCCUPANCY**

- A. Start units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of units serving that area.
- C. Thoroughly clean unit of all grease, dirt, dust, etc.
- D. Prior to placement into temporary service:
  - 1. Perform manufacturer's pre-start protocol.
  - 2. Perform commissioning activities.
- E. Install a complete set of temporary filters in the unit equal to the quality and efficiency of the specified permanent filters. If the unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- F. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

**3.5 FIELD QUALITY CONTROL**

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
  - 2. Test unit operation with thermostat in all modes of operation.
  - 3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.
  - 4. Remove and replace malfunctioning units and retest as specified above.

**3.6 COMMISSIONING**

- A. Perform the commissioning activities as outlined in the Division 01 Section titled Commissioning and other requirements of the Contract Documents.

**3.7 CLOSEOUT ACTIVITIES**

- A. Perform all commissioning activities, even if previously performed to ready for temporary use.
- B. After unit has completed final commissioning and just prior to final acceptance by Owner:
  - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts.
  - 2. Install a new, complete set of filters.
  - 3. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

**3.8 OWNER TRAINING**

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic fan-coil unit maintenance by demonstrating the following: location of control devices, removal of access panels, filter replacement, and motor replacement.

**END OF SECTION 238220**

BuildingName  
The Description of the Project  
P00000000 0000

**SPECIFICATION DIVISION 23**

NUMBER            SECTION DESCRIPTION

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**

SECTION 238221 - BLOWER COIL UNITS

**END OF CONTENTS TABLE**

*REVISION: JUNE 2011.*

*BLOWER COILS FOR THE PURPOSES OF THIS SPECIFICATION ARE UNITS OF GREATER THAN 1/2 HP (AND THEREFORE NORMALLY HAVE THREE PHASE MOTORS) USUALLY WITH BELT DRIVE FANS. BLOWER COILS TYPICALLY PROVIDE HIGHER AIR FLOWS AND FAN STATIC PRESSURES THAN ARE AVAILABLE FROM FAN COIL UNITS, IN A COMPACT PACKAGE. UPPER CFM LIMIT FOR STANDARD UNITS IS TYPICALLY 3000-4000 CFM.*

*BLOWER COILS ARE AVAILABLE IN NUMEROUS CONFIGURATIONS AND WITH MULTIPLE OPTIONS; THIS SPECIFICATION IS THEREFORE NECESSARILY OUTLINE IN NATURE. EDIT SECTION CAREFULLY TO MAKE IT PROJECT SPECIFIC. SPECIFICATIONS FOR MFR. PROVIDED CONTROLS, FACTORY PIPING PACKAGES, DX COILS, CABINETS FOR FINISHED SPACE USE, AND INTEGRAL GRILLES/REGISTERS/DIFFUSERS ARE NOT INCLUDED, AND MUST BE ADDED IF REQUIRED. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S AND OTHER SPEC. LANGUAGE WHICH MAY BE USEFUL WHEN SPECIFYING BLOWER COIL UNITS.*

**DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)**  
**SECTION 238221 - BLOWER COIL UNITS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.*

- B. Related Sections:
1. Section 220513: Motors.
  2. Section 220719: Mechanical Systems Insulation.
  3. Division 26: Electrical.

**1.2 SUMMARY**

- A. Section Includes:
1. Horizontal and vertical blower coil units with motors 1/2 HP and greater, and hydronic coils.

**1.3 COORDINATION**

- A. Coordinate dimensions and arrangement of blower coils with building elements including to maintain all maintenance clearances. Pay special attention to required electrical clearance.

**1.4 SUBMITTALS**

- A. Submit the following product data for approval:
1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
  2. Piping connections including size, material types, and dimensioned locations for each service.
  3. Ductwork connections including sizes, locations, and methods of connections to mating ductwork.
  4. Locations of electric power connections.
  5. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
  6. Details of motor including type, manufacturer and electrical characteristics.

7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.
8. Evidence of UL or ETL listing and labeling.

**UNHIDE THE BELOW HIDDEN TEXT IF DISCONNECT SWITCH, CONTROLS, TRANSFORMER, OR 3 SPEED FAN RELAY BOARD ARE TO BE PROVIDED BY THE FAN COIL MFR.**

9. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
  10. Control transformer-sizing calculations.
  11. Detailed information on fan control relay board.
- B. Equipment schedule with the following information for each unit type:
1. Equipment tag.
  2. Room number of thermostat location.
  3. Model number.
  4. Manufacturer's size designation.
  5. Configuration (2-pipe or 4-pipe).
  6. Number of coils, number of rows per coil, fin spacing for each coil.
  7. Heating and cooling capacity.
  8. Airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.

#### **1.5 DELIVERY, STORAGE AND HANDLING**

- A. Mark each blower coil cabinet with the room number where it is scheduled to be installed.
- B. Mark each blower coil shipping box with the room number where it is scheduled to be installed.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.
- E. Shipping protection shall be provided by Manufacturer to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings must be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.

#### **1.6 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.

1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.
3. NFPA 70- National Electric Code.
4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation
9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
12. Units shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

**1.7 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers:
  1. Airtherm.
  2. Enviro-Tec by Johnson Controls.
  3. International Environmental Corporation.
  4. McQuay International.
  5. Trane.

*VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE BLOWER COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD HEIGHT UNITS MAY NOT FIT PROPERLY IN EXISTING FACILITIES.*

*LIST BLOWER COIL SOUND POWER LEVELS IN THE BLOWER COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR BLOWER COILS USED IN SOUND SENSITIVE AREAS.*

*THIS SPECIFICATION ASSUMES NONE OF THE BLOWER COIL CONTROLS ARE PROVIDED BY THE BLOWER COIL MFR. IF ANY CONTROLS ARE TO BE PROVIDED BY THE MFR. (DISCONNECTS, CONTROL TRANSFORMER, ETC.), EDIT THIS SPECIFICATION TO INCLUDE THOSE REQUIREMENTS. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS*

**UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S WHICH MAY BE USEFUL WHEN SPECIFYING BLOWER COIL CONTROLS.**

**2.2 BLOWER COIL UNIT CONSTRUCTION**

- A. Dimensions: Maximum allowable dimensions as indicated on the Drawings.
- B. Casing Construction:
  - 1. Construction: Minimum 18 gauge, G60 galvanized or A40 galvanized steel or as scheduled. Construct to eliminate racking.
  - 2. Access panels shall be fully insulated and attached with fasteners on at least two opposite sides. No coil or drain piping or electrical connections shall pass through any access panel.
  - 3. One inch duct collars if connected to ductwork.
- C. Insulation: Exterior panels and access panels: Foil faced minimum 1-inch-thick, 1-1/2 lb density fiberglass fire resistant insulation complying with the following:
  - 1. ASTM C 411 Standard Test.
  - 2. Attach with adhesive complying with ASTM C 916.
  - 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
  - 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

**2.3 HYDRONIC COILS**

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.
  - 1. Factory test all coils as specified in the Source Quality Control article.
  - 2. Include manual air vent and drain connections.
  - 3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.

**2.4 DRAIN PANS**

- A. Condensate Drain Pan: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.
  - 1. Drain pan: Stainless steel, insulated.
    - a. Locate under cooling coil allowing the drain pan to be fully inspected and cleaned.
    - b. Slope to drain completely dry upon fan coil shutdown.

**SELECT BELOW, ONE OF THE FOUR CODE REQUIRED METHODS OF PROTECTING AGAINST PRIMARY DRAIN PAN FAILURE AND SHOW DRAIN**

**TERMINATION POINTS ON THE DRAWINGS. DELETE THE OTHER THREE OPTIONS.**

2. Overflow drain pan connection: shall be on the same side and at a higher elevation than the primary drain pan connection.
3. Water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.
4. Auxiliary drain pan with drain connection.
5. Auxiliary drain pan with capped or no drain connection, with a water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to auxiliary drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.

## **2.5 FILTERS**

- A. Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
  1. Disposable Type: 2 inch pleated cotton-polyester media: 90 percent arrestance and MERV A rating of 8 (or as scheduled) when tested per Appendix J of ASHRAE 52.2.

**SELECT BELOW, DIRECTION OF FILTER REMOVAL. WHEN SELECTING, CONSIDER THE OBSTRUCTIONS TO FILTER REMOVAL AT THE BLOWER COIL MOUNTING LOCATION.**

2. Provide filters that are removable horizontally from the casing.
3. Provide filters that are removable vertically from the casing.

**IF MIXING DAMPERS ARE REQUIRED, INDICATE SUCH ON THE CONTRACT DRAWINGS.**

## **2.6 INLET DAMPER MIXING SECTION**

- A. Provide when indicated on Drawings.
- B. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.
  1. Section shall be constructed of minimum 18 gauge galvanized steel.
  2. Two, steel, low leak parallel blade dampers in a heavy-gauge steel frame with extruded vinyl blade seals and flexible metal jamb seals.
  3. Provide extended drive rod for externally mounted actuator connection.
  4. Provide access panels for access to the section's internal components.

**INDICATE THE FAN TYPE (FC, BI, INLET TYPE, ETC.) ON THE DRAWING SCHEDULES, OR ADD BELOW. FC IS TYPICAL. IF FAN IS DIRECT DRIVE, CONSIDER USING THE FAN COIL SPEC, OTHERWISE EDIT THE BELOW.**

*BELOW SECTION WILL ALLOW THE BLOWER COIL MFR. TO PROVIDE THEIR STANDARD QUALITY FANS AND DRIVES. FOR PROJECTS WITH LARGE QUANTITIES OF BLOWER COILS, CONSIDER EDITING THE BELOW TO SPECIFY HIGHER QUALITY FANS AND DRIVES. U-M SPEC SECTION 233400 "FANS " IS A RESOURCE FOR HIGH QUALITY FAN/DRIVE SPEC. LANGUAGE.*

**2.7 FAN AND MOTOR:**

- A. Fan: Galvanized steel or aluminum wheels; galvanized-steel fan scrolls. Adjustable speed belt drive with motor mounted on an adjustable steel base plate.
- B. Motor: Provide motors in compliance with Related Section "Motors".
- C. Motor Wiring: Terminate wiring in a junction box, external to the unit casing.

**2.8 SOURCE QUALITY CONTROL**

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.
- B. Assemble and factory test each unit prior to shipping. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

**PART 3 - EXECUTION**

**3.1 EXAMINATION AND PREPARATION**

- A. Examine areas to receive blower-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before blower-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

**3.2 INSTALLATION**

- A. Install blower coil units level and plumb and to comply with Quality Assurance Standards and manufacturer's installation instructions.

*REGARDING THE BELOW PARAGRAPH: BE SURE TO SHOW OVERFLOW DRAIN ROUTED TO A CONSPICUOUS TERMINATION POINT, IF AN OVERFLOW DRAIN IS BEING USED.*

**3.3 CONNECTIONS**

- A. General piping installation requirements are specified in other Related Documents Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Connect hydronic, condensate drain, and overflow drain piping to the unit.

**3.4 TEMPORARY USE PRIOR TO OCCUPANCY**

- A. Start units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of units serving that area.
- C. Thoroughly clean unit of all grease, dirt, dust, etc.
- D. Prior to placement into temporary service:
  - 1. Perform manufacturer's pre-start protocol.
  - 2. Perform commissioning activities.
- E. Install a complete set of temporary filters in the unit equal to the quality and efficiency of the specified permanent filters. If the unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- F. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

**3.5 FIELD QUALITY CONTROL**

- A. Perform the following field tests and inspections and prepare test reports:
  - 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
  - 2. Test unit operation with thermostat in all modes of operation.
  - 3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.
  - 4. Remove and replace malfunctioning units and retest as specified above.

**3.6 COMMISSIONING**

- A. Perform the commissioning activities as outlined in the Division 1 Section titled Commissioning and other requirements of the Contract Documents.

**3.7 CLOSEOUT ACTIVITIES**

- A. Perform all commissioning activities, even if previously performed to ready for temporary use.
- B. After unit has completed final commissioning and just prior to final acceptance by Owner:
  - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts.
  - 2. Install a new, complete set of filters.
  - 3. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight. Touch up damaged painted surfaces with manufacturer provided touch-up paint

**3.8 OWNER TRAINING**

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic blower-coil unit maintenance by demonstrating the following: location of control devices, removal of access panels, filter replacement, and motor replacement.

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*SPEC EDITOR: IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT. DELETE COMMISSIONING IF NOT APPLICABLE TO PROJECT.*

- B. Related Sections:

1. Section 018113: Sustainable Design Requirements.
2. Section 019110/019100: Commissioning
3. Section 220500: Common Work Results for Mechanical
4. Section 221113: Piping Materials and Methods
5. Section 220523: Valves
6. Section 220553: Mechanical Identification
7. Section 220719: Mechanical Systems Insulation
8. Section 221119: Domestic Water Piping Specialties
9. Section 232216: Steam and Condensate Piping Specialties
10. Section 230900: Mechanical Systems Controls
11. Division 26: Electrical

**1.2 SUMMARY**

- A. Products specified in this section include the following:

1. Jacketed Steam Humidifiers
2. Steam Injection Dispersion Panels
3. Self-contained Electric Humidifiers
4. Condensate Drain Coolers

**1.3 SUBMITTALS**

- A. Product Data: Include catalog illustrations, model, rated capacities, performance, weights, dimensions, component sizes, rough-in requirements, piping and wiring diagrams and details, materials of construction, accessories, operating and maintenance clearance requirements. Wiring diagrams shall be project specific, and differentiate between factory wiring and field wiring. Include shop drawings and fabrication drawings for equipment indicating piping connections, power and utility requirements, rigging, installation and support details and instructions. Include written sequence of operations for all controls.

- B. Provide information for the following:

1. At conditions specific to the project:
  - a. Non-wetting (absorption) distance, assuming air downstream of the humidifier is 90% R.H. at 52°F
  - b. Air pressure drop across the humidifier array
  - c. For steam injection dispersion panels, required orientation of tubes in the duct.
2. Strainers and steam traps
3. Humidifier actuator and temperature switch
4. Room and duct transmitters and proof of air flow switch
5. Electrode type self-contained Electric humidifiers:
  - a. Published cylinder life based on incoming water conductivity
  - b. Published replacement pricing
6. Condensate drain cooler
7. Installation, operation, and maintenance manuals

#### **1.4 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  1. Underwriters Laboratories

#### **1.5 DELIVERY, STORAGE AND HANDLING**

- A. Ship all components in weather-proof wrap for storage outdoors. Protect control panels, pipe openings, and other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.

#### **1.6 WARRANTY**

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

### **PART 2 - PRODUCTS**

#### **2.1 ACCEPTABLE MANUFACTURERS**

- A. Basis of Design and model numbers (where provided) are Dri-Steem. Subject to compliance with all requirements and matching the features of the Basis of Design and model numbers, provide products from any of the below manufacturers.
  1. Armstrong
  2. Spirax Sarco
  3. Nortec
  4. Hermidifier
  5. Dri-Steem

*SPEC EDITOR: INSTALLATION REQUIREMENTS ARE SPECIFIC FOR EACH TYPE HUMIDIFIER, PARTICULARLY FOR STEAM INJECTION DISPERSION PANELS. CAREFULLY REVIEW MANUFACTURER'S LITERATURE TO ASSURE THAT THE TYPE YOU ARE SELECTING WILL WORK PROPERLY UNDER YOUR PROJECT CONDITIONS. MAKE SURE TO PROVIDE A DETAIL ON THE PROJECT DRAWINGS INDICATING INSTALLATION REQUIREMENTS SPECIFIC TO THE HUMIDIFIER(S) SELECTED.*

*SPEC EDITOR: BE SURE TO INDICATE THE REQUIRED NON-WETTING (ABSORPTION) DISTANCE FOR EACH HUMIDIFIER AND THE DUCT AIR PRESSURE DROP ON THE HUMIDIFIER SCHEDULE (PREFERRED) OR IN THIS SPECIFICATION. IT IS ALWAYS PREFERRED TO USE CENTRALLY GENERATED STEAM WHEN AVAILABLE. DISCUSS SPECIAL SITUATIONS THAT MAY REQUIRE USE OF STEAM TO STEAM ("CLEAN STEAM") HUMIDIFIERS OR GAS FIRED HUMIDIFIERS WITH THE DESIGN MANAGER.*

## 2.2 JACKETED STEAM HUMIDIFIERS

- A. Steam separator type that discharges dry steam into the air stream through a steam jacketed dispersion tube or manifolded dispersion tubes. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. Provide manifolded multiple dispersion tube type when required to meet the capacity requirements or the conditions at the mounting location, including the indicated non-wetting (absorption) distance. All components shall be rated for a minimum 100 PSIG steam working pressure.
- B. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream.
- C. Unless indicated otherwise, the air pressure loss across the humidifier array shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.
- D. Provide type 304 stainless steel dispersion tubes, manifold and separator.
- E. Dispersion tubes shall be surrounded by a steam jacket and shall span the width of duct.

*SPEC EDITOR: A PNEUMATICALLY ACTUATED CONTROL VALVE IS SPECIFIED. IF CHANGED TO ELECTRIC ACTUATION, THE SPECIFICATION FOR THE PNEUMATIC CONDENSATE TEMPERATURE SWITCH MUST BE EDITED AS WELL.*

- F. Provide bronze or stainless steel, fail closed, pneumatic steam control valve for operation with a modulating 3-15 PSI control air signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.
- G. Provide a pneumatic condensate temperature switch for interlocking with control valve. Switch shall be normally closed and shall prevent steam flow to dispersion tubes upon cold start or flooded condensate line.

- H. Steam traps shall be per Related Section, sized and provided by the humidifier manufacturer. Provide F & T or thermostatic traps that allow modulating steam control valve service.

*SPEC EDITOR: DESIGNER SHOULD INDICATE IN THE HUMIDIFIER SCHEDULE IF THE HUMIDIFIER STEAM SUPPLY IS GENERATED BY RO/DI WATER*

- I. Provide Type 316 stainless steel dispersion tubes, manifold, separator, and interconnecting piping; and stainless steel strainers, control valve and traps when fed by clean steam (steam generated with RO/DI water).

*SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. DESIGNER SHOULD EVALUATE THE ENERGY PENALTY FROM INCREASED AIR PRESSURE DROP CAUSED BY INSULATED TUBES VERSUS THE ENERGY SAVED. THE ENERGY CODE REQUIRES THAT JACKET STEAM AUTOMATICALLY TURNS OFF WHEN HUMIDIFICATION IS NOT REQUIRED. THIS GENERALLY NEGATES MUCH OF THE BENEFIT OF INSULATED DISPERSION TUBES. DESIGNER SHOULD CONSIDER IF EACH HUMIDIFIER REQUIRES A JACKET STEAM CONTROL VALVE OR IF THE STEAM SUPPLY TO MULTIPLE JACKETS CAN BE TURNED OFF BY A COMMON CONTROL VALVE. A COMMON VALVE MAY BE POSSIBLE IF THE HUMIDIFIERS OPERATE AT THE SAME TIME SUPPLYING ZONES WITH THE SAME SETPOINT. ZONES WITH A UNIQUE SETPOINT SHOULD HAVE THEIR OWN JACKET STEAM CONTROL VALVE. NOTE THAT JACKET STEAM CONTROL VALVES SHOULD GENERALLY BE OPERATED BASED ON AN ACTUAL CALL FOR HUMIDITY, AS OPPOSED TO ON A SEASONAL BASIS.*

- J. Dispersion tubes shall be insulated with 1/2" fiberglass, enclosed in a stainless steel wrapper.

### 2.3 STEAM INJECTION DISPERSION PANELS

*SPEC EDITOR: FOR INSTALLATION IN AHU'S OR DUCTS AND WHERE AVAILABLE ABSORPTION DISTANCE IS VERY SMALL, 3' OR LESS.*

*SPEC EDITOR: WHEN ABSORPTION DISTANCES PERMIT, JACKETED TYPE HUMIDIFIERS, SPECIFIED IN THE ARTICLE ABOVE, ARE PREFERRED OVER STEAM INJECTION DISPERSION PANELS DUE TO LOWER INITIAL COST AND HIGHER RELIABILITY.*

*SPEC EDITOR: BASIS OF DESIGN FOR THIS SPEC IS DRI-STEEM LV/LH (TYPE A) AND DRISTEEM XV (TYPE B). LV OR LH CAN BE USED WITH PRESSURIZED OR NON-PRESSURIZED STEAM, CONDENSATE MUST DRAIN BY GRAVITY. XV CAN ONLY BE USED WITH PRESSURIZED STEAM, BUT CAN LIFT CONDENSATE. EDIT SPEC TO SELECT REQUIRED TYPE.*

*SPEC EDITOR: TYPE A HUMIDIFIER MUST BE MOUNTED HIGH ENOUGH TO ALLOW GRAVITY DRAINING OF CONDENSATE AND REQUIRES A DEEP PLUMBING TRAP (7"-10" DEEP) FOR CONDENSATE DISPOSAL, THEREFORE MAKE SURE MOUNTING LOCATION IS HIGH ENOUGH TO ACCOMMODATE SUCH A TRAP. TYPE B MAY BE SPECIFIED WHEN THE MOUNTING LOCATION IS TOO LOW TO ACCOMMODATE TYPE A, PROVIDED PRESSURIZED STEAM IS AVAILABLE.*

**SPEC EDITOR: BE SURE TO SCHEDULE THE NON-WETTING (ABSORPTION) DISTANCE AND THE DISPERSION PANEL DUCT AIR PRESSURE DROP ON THE HUMIDIFIER DRAWING SCHEDULE.**

A. Ultra-sorb LV/HV Multi-tube style - TYPE A:

1. Multi-tube non-jacketed style humidifier for use with pressurized or non-pressurized steam and gravity draining of condensate. Each panel shall consist of a steam supply header/separator, a condensate collection header and a bank of closely spaced steam dispersion tubes spanning the distance between the two headers. Stainless steel construction. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. All components shall be rated for a minimum 100 PSIG steam working pressure.
2. Each steam tube outlet shall contain an orifice sized for its required steam capacity. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream.
3. Unless indicated otherwise, the air pressure loss across the humidifier array shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.
4. Provide horizontally or vertically oriented tubes as required for the specific location, considering the steam pressure available at that location.
5. Each packaged humidifier panel assembly of tubes and headers shall be contained within a galvanized metal casing to allow convenient duct mounting or to facilitate the stacking of and/or the end-to-end mounting of multiple panels in ducts or air handler casings. Provide multiple panels and all related accessories for the panels and installation, in order to achieve the specified capacities.
6. Provide type 304 stainless steel tubes and headers. All joints shall be heli-arc welded.
7. Provide bronze or stainless steel, fail closed, pneumatic steam control valve for operation with a modulating 3-15 PSI control air signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.

**SPEC EDITOR: DESIGNER SHOULD INDICATE IN THE HUMIDIFIER SCHEDULE IF THE HUMIDIFIER STEAM SUPPLY IS GENERATED BY RO/DI WATER**

8. Provide Type 316 stainless steel humidifier construction and stainless steel strainer and control valve when fed by clean steam (steam generated with RO/DI water).

**SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. ENGINEER MUST EVALUATE IF HIGH-EFFICIENCY INSULATED TUBES ARE COST EFFECTIVE AND APPROPRIATE FOR THE PROJECT.**

9. High-efficiency insulated tubes shall be used to substantially reduce dispersion-generated condensate and airstream heat gain. Tube insulation shall be 1/8" thick polyvinylidene fluoride insulation (PVDF).

B. Ultra-sorb XV Multi-tube Style - TYPE B:

1. Multi-tube non-jacketed style humidifier for use with pressurized steam, with integral heat exchanger to provide for condensate lifting. Each panel shall consist of a steam supply header/separator, a condensate collection header and a bank of closely spaced steam dispersion tubes spanning the distance between the two headers. Stainless steel construction. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. All components shall be rated for a minimum 100 PSIG steam working pressure.
2. Each steam tube outlet shall contain an orifice sized for its required steam capacity. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream
3. Unless indicated otherwise, air pressure loss across humidifier panel shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.
4. Provide horizontally or vertically oriented tubes as required for the specific location, considering available steam pressure at that location.
5. Each packaged humidifier panel assembly of tubes and headers shall be contained within a galvanized metal casing to allow convenient duct mounting or to facilitate the stacking of and/or the end-to-end mounting of multiple panels in ducts or air handler casings. Provide multiple panels and all related accessories for the panels and installation, in order to achieve the specified capacities.
6. Provide type 304 stainless steel tubes and headers. All joints shall be heli-arc welded.

***SPEC EDITOR: A PNEUMATICALLY ACTUATED CONTROL VALVE IS SPECIFIED. IF CHANGED TO ELECTRIC ACTUATION, THE SPECIFICATION FOR THE PNEUMATIC CONDENSATE TEMPERATURE SWITCH MUST BE EDITED AS WELL.***

7. Provide bronze or stainless steel, fail closed, pneumatic steam control valve for operation with a modulating 3-15 PSI control air signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.
8. Provide a pneumatic condensate temperature switch for interlocking with control valve. Switch shall be normally closed and shall prevent steam flow to dispersion tubes upon cold start or flooded condensate line.
9. Provide an integral steam heat exchanger with steam trap arranged to vaporize dispersion-tube-generated steam condensate and return pressurized condensate to a condensate return main.

*SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. ENGINEER MUST EVALUATE IF HIGH-EFFICIENCY INSULATED TUBES ARE COST EFFECTIVE AND APPROPRIATE FOR THE PROJECT*

10. High-efficiency insulated tubes shall be used to substantially reduce dispersion-generated condensate and airstream heat gain. Tube insulation shall be 1/8" thick polyvinylidene fluoride insulation (PVDF).

#### **2.4 SELF-CONTAINED ELECTRIC HUMIDIFIERS**

- A. Packaged wall mounted self-contained U.L. listed electric humidification unit providing all required steam generation equipment and controls, to provide atmospheric pressure steam generation. Provide either Steam Injection Distribution Panels for steam injection into ducts, or Blower Pack for direct space applications, as indicated.

*SPEC EDITOR: SELECT EITHER ELECTRODE TYPE OR RESISTANCE HEATING ELEMENT TYPE, DELETE TYPE NOT USED. MAKE SURE SPEC OR DRAWINGS ALSO INDICATE THE REQUIRED STEAM INJECTION SYSTEM FOR USE WITH THE ELECTRIC HUMIDIFIER: EITHER STEAM INJECTION DISTRIBUTION PANELS OR BLOWER PACK.*

*SPEC EDITOR: ELECTRODE TYPE MUST USE TAP WATER, NOT RO/DI WATER. PLASTIC STEAM CYLINDERS ARE DISPOSABLE AND NEED TO BE CHANGED REGULARLY; EVEN WITH DISPOSABLE CYLINDERS THIS TYPE IS LESS RELIABLE THAN RESISTANCE TYPE SINCE DRAINS AND DRAIN VALVES CAN PLUG. ACCURACY OF CONTROL IS +/- 5%, NOT RECOMMENDED WHERE HIGH ACCURACY CONTROL IS DESIRED.*

*SPEC EDITOR: RESISTANCE HEATING ELEMENT TYPE USES RO/DI WATER AND PROVIDES BETTER CONTROL ACCURACY THAN ELECTRODE TYPE, TYPICALLY +/- 3% OR BETTER. CYLINDERS DO NOT NEED TO BE REPLACED; MORE RELIABLE THAN ELECTRODE TYPE WHEN RO/DI FEED WATER IS USED. CAPABLE OF OPERATION WITH TAP WATER (IF SPECIFIED THAT WAY, NOT SPECIFIED THAT WAY BELOW) BUT WILL RAPIDLY FOUL. CITY OF ANN ARBOR WATER CONDUCTIVITY WAS 500-700 MICRO-MHOS (UMHOS) (RECORDED DURING FY 2010-2011).*

- B. Furnish electrode heating element type humidifier capable of boiling water at the required capacity with a minimum conductivity of 125 umho (micro-mho).
  1. Replaceable plastic steam cylinder.
  2. Controller shall monitor water conductivity and automatically drain and flush unit to reduce solids build-up and optimize humidifier performance.
  3. Published cylinder life based on incoming water conductivity.
  4. Published replacement pricing.
  5. Pre-notification of automatic shutdown at end of cylinder life
  6. Power to the heating elements shall be controlled through the actuation of contactors and solid state relays, to provide a control accuracy of +/- 5% RH or better.

- C. Furnish resistance heating element type humidifier capable of boiling water at the required capacity using reverse osmosis or de-ionized water (conductivity of 50 umho (micro-mho) or less).
  - 1. Serviceable stainless steel steam cylinder.
  - 2. Controller shall automatically drain and flush unit to reduce solids build-up and optimize humidifier performance.
  - 3. Corrosion resistant heating elements.
  - 4. Water level control shall be provided by float switch or float valve located in a portion of the tank segregated from the main steam generating portion of the tank.
  - 5. Power to the heating elements shall be controlled through the actuation of contactors and solid state relays, to provide a control accuracy of +/- 3% RH or better.
- D. Over temperature safety switch to prevent heating element failure.
- E. Water make-up system with inlet strainer, solenoid valve with flow regulator, and fill tee or cup with built-in air gap to prevent back siphoning
- F. Solenoid operated automatic drain valve.
- G. Bottom drain outlet. Large perforated strainer at drain outlet to prevent blockage of drain valve or drain lines
- H. A system on/off switch with power indicator light, external to the humidifier enclosure.
- I. Enclosure to be minimum 18 gauge steel and powder-coat painted to prevent against corrosion. The electrical and steam generating compartments shall be separate, but contained within the same cabinet to minimize field wiring. The cylinder access door shall be lockable with a key. A door interlock switch shall prevent humidifier operation when the access door is open.

**SPEC EDITOR: DELETE BLOWER PACK PARAGRAPH BELOW IF A BLOWER PACK IS NOT REQUIRED. BLOWER PACKS ARE AVAILABLE THAT PRODUCE NO VISIBLE STREAM TRAIL, BUT TYPICALLY ONLY FOR LOW STEAMING CAPACITY HUMIDIFIERS. IF NO VISIBLE STEAM TRAIL IS DESIRED, MODIFY THE BELOW TO REQUIRE THAT FEATURE, AFTER VERIFYING THAT THE HUMIDIFIER MANUFACTURER CAN PROVIDE SUCH A BLOWER PACK FOR YOUR REQUIRED STEAM OUTPUT.**

- J. Provide a fan blower pack to disperse steam directly into the room air. Blower pack shall be 120 VAC and shall be capable of being mounted integral to the top of the humidification unit, or remotely via interconnecting piping. Provide an air flow proving switch to prevent humidification when the blower fan is off.
- K. Controls
  - 1. Provide a UL listed and labeled microcomputer based controller with the following capabilities:
    - a. Control of humidity to within +/- 3% RH (resistance heating element type humidifiers) or +/- 5% RH of set point (electrode heating element type humidifiers).
    - b. Proportional/integral/derivative (PID) algorithms for humidifier control.

- c. Integral 24 VDC power supply of adequate size to power controllers and all axillary devices (humidity transmitters, etc.)
- d. LCD or LED display and integral controller keypad to allow adjustment of all humidifier settings, programming of alarms and viewing of alarm history.
- e. High water sensor circuitry to prevent over filling.
- f. Integral drain water tempering feature. Drain water shall be automatically cooled to below 140°F before entering the drain.
  - 1) If unit cannot provide this feature, provide an external condensate drain cooler.
- g. Automatic drain and flush feature to reduce the concentration of conductive ions in the water and reduce mineral build-up.
- h. Automatic off-season shut-down [user adjustable, factory default set after 3 days of "no call"] to completely drain the tank(s) and automatically restart unit on call for humidity.
- i. External fan control: controller shall have the ability to cycle an external steam dispersion fan on and off in conjunction with a call for humidification.
- j. Fan control off-delay feature. When the humidifier unit controls an external fan, fan "off" is time delayed after steam output stops.
- k. A dry contact rated 10 amps at 24 VDC, which can be programmed to energize when any humidifier alarm condition occurs.
- l. Password protection. Controller adjustment shall only be enabled after a password is entered. It shall be possible to disable the password protection feature.
- m. For duct mounted humidifiers, controller shall limit duct humidity downstream of the humidifier to a user adjustable set point by modulating humidifier output, and prevent humidifier operation if duct air flow is not present.
- n. For space mounted humidifiers, controller shall prevent humidifier operation if air flow is not present at the blower pack fan.
- o. The controller shall monitor and display the following conditions, minimum:
  - 1) Space relative humidity
  - 2) Space relative humidity set point
  - 3) Space dew point
  - 4) Space dew point set point
  - 5) Duct relative humidity
  - 6) Duct high relative humidity limit set point
  - 7) Air flow status
  - 8) Tank temperature
  - 9) Tank level
  - 10) All units shall be displayed in inch-pounds.
- 2. Controller shall accept two wire 4-20mA input signals for space humidity, duct humidity, and room temperature.
- 3. Provide the following auxiliary devices for use with the humidifier controller:
  - a. 4-20 mA room humidity transmitter

- b. 4-20 mA duct relative humidity transmitter (duct mounted humidifiers only)
  - c. Air flow proving switch
  - d. Auxiliary devices shall comply with Related Section Mechanical Systems Control, and be compatible with the humidifier controller.
4. Controller shall be capable of operation in ambient conditions of 32°F to 140°F and a humidity range of 5% to 95%, non-condensing.
  5. The controller shall hold its software in non-volatile memory. On-line field modified data entries shall be stored in flash memory to prevent accidental loss of data due to power loss, voltage surge or spike. In the event of a complete power outage, all field and factory settings shall remain stored and shall automatically be restored when power is restored

**SPEC EDITOR: THE BELOW FEATURE (IN HIDDEN TEXT ) IS NOT AVAILABLE ON ALL BRANDS OR MODELS WITHIN A BRAND. IF YOUR PROJECT REQUIRES THIS FEATURE, RESEARCH AND SPECIFY SPECIFIC MFR.S AND MODELS THAT CAN PROVIDE IT.**

6. Provide humidifier set point reset based on window glass temperature, to prevent condensation on windows. Provide control algorithm and 4-20 mA temperature transmitter with a RTD designed to be mounted on a window surface.

## **2.5 CONDENSATE DRAIN COOLER**

- A. Provide a stainless steel drain cooler for condensate water being discharged. Provide a unit of size and volume adequate for handling the expected discharge from the humidification system.
- B. Drain cooler shall include a self-actuated thermostatically controlled water valve to control mixing.
- C. Drain cooler shall be capable of metering a sufficient amount of cold water into the mixing chamber to temper 212°F (100°C) water to a 140°F (60°C) max. discharge temperature
- D. Cooler dimensions must allow gravity flow of condensate to the waste discharge point based on the height of the humidifier's condensate discharge connection.
- E. Provide all mounting components and hardware required to properly support the drain cooler, independent of the humidifier unit.
- F. Provide a vacuum breaker in the unit to prevent backflow into the potable water systems.

## **PART 3 - EXECUTION**

### **3.1 EXAMINATION AND PREPARATION**

- A. Store units protected from weather, dirt, water, and construction debris.

- B. Examine roughing-in for equipment support, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Proceed with installation only after unsatisfactory conditions have been corrected.

### 3.2 INSTALLATION

- A. Install in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Route steam line to humidifier by connecting to top of steam main (either straight up or at 45 degrees (preferred)). Provide a steam trap upstream of the humidifier if the top of steam main could not be tapped or if the distance between the steam main and the humidifier exceeds ten feet.
- C. Install separate devices furnished by manufacturer and not factory installed, including but not limited to control valve, steam traps, and temperature switch.
- D. Provide and install any manufacturer's accessory devices necessary or recommended to meet the particular needs of the humidifier installation.
- E. Install condensate drain coolers where indicated or required.
- F. Install to provide a minimum of ten feet of straight, unobstructed (no filters, turning vanes, etc.) duct downstream from the humidifier, unless a shorter non-wetting (absorption) distance upstream of such obstructions is indicated on the reviewed/approved submittal.
- G. Direction of steam injection relative to air flow is dependent on humidifier features and duct orientation. Review manufacturer's installation instructions carefully and install accordingly.
- H. Seal all duct penetrations made as a result of humidifier installation. Use sealant appropriate for service.

**SPEC EDITOR: DELETE THE INSTALLATION INSTRUCTIONS FOR HUMIDIFIER TYPES THAT ARE NOT USED ON THE PROJECT.**

- I. Jacketed Steam Humidifiers
  - 1. Install the humidifier's discharge steam trap to allow the condensate piping to drain by gravity. Do not lift condensate piping downstream of this steam trap.
- J. Steam Injection Dispersion Panels
  - 1. Dispersion panels are typically designed for a specific duct orientation (either horizontal or vertically oriented duct). Verify that the dispersion panel supplied is the correct model for the duct orientation at the humidifier mounting location.
  - 2. Rotate tubes to the correct orientation to inject steam into the air stream, typically perpendicular to the air stream.
  - 3. Install all required p-traps. Do not lift condensate discharging from p-traps

*SPEC EDITOR: WHEN SELF CONTAINED ELECTRIC HUMIDIFIERS ARE USED, PROVIDE A DETAIL ON THE DRAWINGS INDICATING THE REQUIRED PIPING CONNECTIONS. HUMIDIFIER DRAINS MUST BE ROUTED TO A BUILDING FLOOR DRAIN VIA AN AIR GAP. THIS AIR GAP WILL BE A SOURCE OF FLASH STEAM AND SHOULD BE INSTALLED AT LOCATIONS WHERE THE FLASH STEAM WILL NOT CAUSE DAMAGE. INDICATE THE ROUTE OF THE STEAM VAPOR PIPING AND INDICATE IF HOSE OR PIPING IS TO BE UTILIZED. REVIEW MANUFACTURERS LITERATURE AND ASSURE VAPOR PIPING CAN BE INSTALLED TO MEET REQUIRED PITCH AND DRAINAGE REQUIREMENTS.*

*SPEC EDITOR: WHEN A FAN BLOWER PACK IS USED, THE DESIGNER MUST INDICATE A MOUNTING LOCATION THAT WILL PREVENT CONDENSATION OF THE VAPOR TRAIL ONTO ROOM SURFACES.*

K. Self-Contained Electric Humidifiers

1. Mount humidifier and accessories at locations indicated on the drawings, maintaining manufacturers recommended service clearances.
2. Connect power to the humidifier. Comply with Division 26 requirements.
3. Install water supply and drain piping to each unit in compliance with manufacturer's recommendations, including pipe sizes.
  - a. Install an isolation valve, water hammer arrestor, and a strainer in the supply piping to the humidifier. Install the strainer between the isolation valve and the humidifier.
  - b. When plastic pipe is used for water supply piping, provide a minimum of 3 feet of stainless steel tubing for the last 3 feet of the supply piping before connecting to the unit.
  - c. Install unions at each supply and drain connection.
  - d. Install traps in supply and drain piping as recommended by the unit manufacturer.
  - e. All drain piping shall be type L copper pipe. When humidifiers are not installed in mechanical rooms or similar spaces that are typically inaccessible to occupants, insulate the tank/flush drain with ½" thick insulation per Related Section. Overflow drains do not require insulation.
4. Connect drain piping via an air gap fitting to the building drain. Prior to connecting to building drain, install a condensate drain cooler for units that are not equipped with an integral drain water tempering feature.
5. Install steam vapor hose or piping, as indicated, between steam dispersion device and humidifier.
  - a. Piping material shall be per Related Section.
  - b. When piping is used, install a union at the humidifier to allow humidifier removal.
  - c. Electrically ground the piping. Bond the ground to the humidifier cabinet ground.
  - d. When hose is used, use approved hose, fittings, and clamps obtained from the humidifier manufacturer.
  - e. Pitch steam vapor hose or piping to allow condensate to drain back into the humidifier.

- f. Install steam condensate drains where required. Route such drains back to the humidifier tank fill connection in lieu of to a building drain where possible and when permitted by humidifier manufacturer.
  - 1) Where routed to building drains, provide condensate cooler and route drain through cooler before connection to building drain.
- g. Insulate hose/piping per Related Section.
- 6. Install steam dispersion devices.
- 7. Install the fan blower pack when utilized.
  - a. Mount blower pack to prevent the discharged steam from condensing on nearby surfaces.
  - b. Install power to blower pack in compliance with Division 26 requirements.
  - c. When mounted remote from the humidifier, install steam vapor hose or piping between humidifier and blower pack, pitched to allow condensate to drain back to humidifier. Install drain piping, complying with the same requirements indicated above for the humidifier drain piping.
- 8. Install separate devices furnished by manufacturer and not factory installed, including but not limited to, room humidity transmitter, proof of air flow switch, duct high limit humidity transmitter, and control wiring between fan blower pack and humidifier.
  - a. Install wiring in conformance with Related Section (Mechanical Systems Controls), utilizing approved contractors listed in that section.
- 9. Program the humidifier controller.

### **3.3 STARTUP**

- A. Adhere to manufacturer's start-up instructions.
- B. Assure that actuators operate freely, close off steam tightly (no leaking steam discharges into the duct or space), and that the stem packing is not leaking. Verify proper steam trap operation.
- C. For dispersion panel types, check dispersion tubes for leaks at slip couplings while steam is being injected into the duct or space; repair any leaks.
- D. When provided as part of the humidifier package, verify that the air flow proving switch and duct high limit humidistat operate properly. Prime any p-traps and verify the operation of temperature switches, float switches, and similar devices specified or provided, prior to putting humidifier into operation.
- E. For self-contained electric humidifiers, adjust all control parameters as directed by the Commissioner and as appropriate for the project, and place into service. For projects without a Commissioner, consult the project engineer for direction regarding control parameter settings. Record all settings and include in the O&M manual.

### **3.4 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

*SPEC EDITOR: TRAINING IS TYPICALLY ONLY REQUIRED FOR SELF  
CONTAINED ELECTRIC HUMIDIFIERS, FOR OTHER TYPES DELETE THE  
ARTICLE BELOW.*

**3.5 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
  - 1. Provide 2 hours of training minimum.

**DIVISION 26 ELECTRICAL**

SECTION 260500 - COMMON WORK RESULTS FOR ELECTRICAL

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 260500 - COMMON WORK RESULTS FOR ELECTRICAL**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 019100/019110 - Commissioning
  2. Section 017823 - Operation and Maintenance Manual
  3. Section 260513 - Medium, Low & Control Voltage Cables
  4. Section 260526 - Grounding and Bonding for Electrical
  5. Section 260533 - Electrical Materials and Methods

**1.2 SUMMARY**

- A. Provide all equipment, materials, labor and services necessary to furnish, install, test and turn over to the Owner the following electrical work as required by these specifications and as shown on the drawings, including all shop drawings, test reports, record drawings, operations and maintenance manuals, Owner training and incidental items necessary to complete the project in every respect.
- B. Participate in project coordination, scheduling and commissioning activities as specified in Division 01.

**1.3 REFERENCES**

- A. Provide equipment and materials that conform to the applicable standards of the following organizations:
1. American National Standards Institute (ANSI).
  2. Institute of Electrical and Electronic Engineers (IEEE).
  3. National Electrical Manufacturers Association (NEMA).
  4. National Fire Protection Association (NFPA).
  5. Telecommunications Industry Organization/Electronic Industries Alliance (TIA/EIA)
- B. All materials and equipment shall be listed and labeled by Underwriters Laboratories (UL), Electrical Testing Laboratories (ETL), MET Laboratories (MET), or the Canadian Standards Association (CSA).

C. Install equipment and materials in compliance with the following:

1. Michigan Electrical Code (MEC).
2. Michigan Building Code (MBC).
3. Michigan Mechanical Code (MMC).
4. Michigan Plumbing Code (MPC).
5. Americans with Disabilities Act (ADA).
6. State of Michigan DLEG Bureau of Fire Services.
7. Owner's Inspection Authorities.
8. Manufacturers' instructions.

#### 1.4 DESIGN DOCUMENTS

- A. Contact the Owner's Representative about design questions and discrepancies between design documents before performing the work.
- B. Notify the Owner's Representative if existing code violations are uncovered that are not addressed in the design documents.

#### 1.5 SUBMITTALS

- A. Submit for approval copies of shop drawings and product literature for the following equipment. Submittals shall include adequate information to prove that the systems, equipment and materials comply with the contract documents. Each copy of the submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked will be rejected.

**DELETE ITEMS NOT PART OF THE PROJECT. ADD ITEMS AS NECESSARY.**

1. Primary Equipment and Unit Substations.
  2. Generator and Uninterruptible Power Supply Systems.
  3. Distribution Transformers.
  4. Power Distribution, Lighting, and Receptacle Panels.
  5. Motor Control Centers, Starters and Motor Controls.
  6. Disconnect and Safety Switches.
  7. Lighting Contactors.
  8. Capacitors.
  9. Bus Ducts and Bus Duct Plugs.
  10. Wiring Devices.
  11. Transient Voltage Surge Suppressor Devices.
  12. Lighting Fixtures.
  13. Lighting Control Systems, Dimmer Systems and Switches.
  14. Timers and Time Switches.
  15. Fire Alarm Systems.
  16. Clocks and Clock Systems.
  17. Security and Card Access Control Systems.
  18. Sound Reinforcement Systems.
  19. Intercom and Public Address Systems.
  20. Closed Circuit TV Systems.
  21. Manholes and Duct Bank Spacers.
  22. Cable Trays.
  23. Conduits and Fittings.
  24. Cables, Wires and Terminations.
  25. Grounding Connections.
- B. Participate in the coordination drawing process and submit coordination drawings for approval in accordance with Division 01.

**1.6 RECORD DOCUMENTS**

- A. Submit record drawings in electronic format (AutoCAD or Microstation) for approval as specified in Division 01. Show the locations of equipment, light fixtures, switches, receptacles and junction boxes, riser information, the sizes of conduits and conductors, circuit numbers, and deviations from the design. Dimension the locations of buried, embedded and concealed primary and feeder conduits from permanent building features.

**1.7 OPERATIONS AND MAINTENANCE MANUALS**

- A. Submit for approval copies of operations and maintenance manuals as specified in Division 01 and the other Division 26, 27 and 28 sections. Each copy of the manuals shall be marked to indicate the specific models, sizes, types and options of the systems and equipment that were provided. Manuals not so marked will be rejected.

**1.8 QUALITY ASSURANCE**

- A. Electrical work shall be performed by licensed Journeyman or registered Apprentice Electricians. The number of Apprentices on a project shall not exceed the number of Journeymen. Electricians shall carry a copy of their license or registration while working on The Owner's projects.
- B. Contact the Owner's Code Inspection Department (734-764-2457) before starting the project to arrange for periodic inspections. Normal inspections will be performed at no cost to the Contractor, but the costs for repeat re-inspections of rejected work may be deducted from the Contractor's final payment.

**1.9 SHIPPING, HANDLING AND STORAGE**

- A. For deliveries of equipment to the Owner, notify the Owner's Representative of the deliveries 3 working days in advance. Deliveries shall occur on normal workdays between 8:00 AM and 2:00 PM. Deliveries that arrive without adequate notice may be rejected.
- B. Provide unloading and storage for Owner furnished equipment that is shipped to the project site.
- C. Pick up, transport and unload at the project site Owner furnished equipment that is stored in the Owner's warehouses.
- D. Provide packaging Waste management in accordance with Division 1.

**1.10 WARRANTY**

- A. Guarantee work for a period of one year from the date of the Owner's final acceptance of the project (Substantial Completion). A manufacturer's warranty beginning upon equipment receipt or startup shall be extended to one year from final project acceptance. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.

**PART 2 - PRODUCTS (NOT APPLICABLE)**

**PART 3 - EXECUTION**

**3.1 SUBSTITUTIONS**

- A. Provide equipment and materials from the manufacturers specified. Substitutions for specified products are acceptable only if proposed and approved in writing at the time of bid.

**3.2 TEMPORARY SERVICE**

*DELETE NEXT SENTENCE IF THE PROJECT IS PAYING FOR THE ELECTRICITY. DELETE PARAGRAPH 1 BELOW IF THE UNIVERSITY IS PAYING FOR THE ELECTRICITY)*

- A. Provide, maintain and remove all temporary lighting and power required to complete the project. If used reasonably, the Owner will pay for the electricity consumed.
  - 1. Provide an Owner approved watthour meter and box. Coordinate with the Plant High Voltage Shop (734 764-9445) and submit a Utilities Services Request for circuit energization.
- B. Provide ground fault protection on temporary feeders rated 200 amps and larger.
- C. Temporary feeders shall be limited to the following types:
  - 1. Conductors installed in raceways.
  - 2. NEC Type MC cable.
  - 3. Multi-conductor cable with an overall outer jacket (where inaccessible to the public and not subject to damage or abuse).
  - 4. NEC recognized hard usage cord or extra hard usage cord (where inaccessible to the public and not subject to damage or abuse).
- D. Install and support temporary wiring in accordance with the NEC requirements for permanent wiring.
- E. Label temporary power feeders every 25 feet maximum.
- F. Temporary wiring may either be copper or aluminum.

**3.3 ELECTRICAL COORDINATION**

- A. Participate in the project scheduling and coordination drawing activities specified in Division 01 of the project specifications.
- B. Coordinate power interruptions with the other disciplines in accordance with Division 01. Notify the Owner's Representative of power interruptions 3 working days in advance. Maintain power to all loads outside of the work area.
- C. Coordinate with the Plant Operations Call Center 10 working days in advance at (734) 647-2059:
  - 1. Before performing any work affecting primary power distribution circuits, unit substations or outdoor lighting.

2. Before performing any work affecting engine-generators, automatic transfer switches or variable speed drives.
  3. Before performing any work affecting fire alarm, security or card access control systems.
  4. Before performing any work affecting telecommunications ducts, manholes, rooms or circuits.
  5. Before performing any work affecting roofs.
- D. Notify OSEH at (734) 647-1143 before starting up engine-generators.

### **3.4 DEMOLITION**

- A. Protect adjacent building services and materials indicated to remain. Install and maintain barriers to keep dirt, dust and noise from being transmitted to adjacent areas. Remove protection and barriers after demolition is completed.
- B. Remove all equipment and materials designated for demolition as follows:
1. Power wiring - remove back to the source or to the first junction box where the circuit continues on to remaining loads.
  2. Telecommunications wiring - remove from conduits and J-hooks back to cable trays or to the outer walls of the building entrance (BE) room or telecommunications rooms (TRs).
    - a. Cut and label wire ends "Abandoned" when abandoning sections of wires in cable trays and at BE and TR outer walls. Do not remove telecommunications wiring from cable trays, the BE or the TRs.
    - b. Coordinate for the Telecommunications Installation Contractor to remove abandoned wiring from cable trays and inside the BE and TRs.
  3. Conduits and boxes in walls and above permanent ceilings - abandon in place. Install blank cover plates on boxes.
  4. Conduits through floors and walls, and boxes in floors - remove completely. Patch and paint penetrations to match existing.
  5. Exposed and accessible conduits, wireways and boxes - remove completely. Patch and paint surfaces to match existing, and plug unused panel and junction box holes.
  6. Lighting fixtures and electrical equipment - remove and dispose of completely (unless designated for relocation).

### **3.5 LAMP AND BALLAST RECYCLING**

- A. Recycle tubular fluorescent, compact fluorescent, HID, LED, induction and cold cathode lamps removed during demolition or replaced during construction. These six types of lamps shall not be disposed of as solid waste.

1. Package unbroken tubular fluorescent lamps in their original cardboard boxes, or contact OSEH Hazardous Materials Management at (734) 647-1142 and arrange to pick up U-lamp, 60 lamp, 100 lamp or 250 lamp boxes at the North Campus Transfer Facility located at 1655 Dean Road. Package unbroken compact fluorescent, HID, LED, induction and cold cathode lamps in appropriately sized corrugated cardboard boxes.
    - a. Use separate boxes for each type and physical size of lamp. Do not mix lamp types or sizes in the same box.
    - b. Fill the boxes as completely as possible.
  2. Obtain Universal Waste Labels from OSEH. Fill out and attach one label to each box.
    - a. Enter the building name, quantity of lamps, and the accumulation start date (date the box started to be filled).
    - b. Mark the appropriate check box to indicate the type and length of lamps.
  3. Tape the boxes closed on all sides.
  4. Sweep up any broken lamps and seal them in a heavy plastic bag. Place the plastic bag in a corrugated cardboard box and tape the box closed on all sides. Label the box to indicate the type and quantity of broken lamps inside. Notify OSEH of the broken lamps.
  5. Contact OSEH at (734) 647-3120 and arrange to deliver the sealed and labeled boxes to the storage area at the Campus Safety Services Building located at 1239 Kipke Drive. Take care to avoid breaking the lamps. Position the boxes on their sides during transport. Do not stack anything on top of the boxes.
  6. If lamps inside a box become broken, seal the entire box in a heavy plastic bag. Copy the Universal Waste Label information onto a new label and attach the new label to the outside of the plastic bag.
  7. Place the boxes into the designated storage area. Position the boxes on their sides so that the labels are forward and visible. Do not stack the boxes more than three high (two high for 250 lamp boxes). OSEH will recycle the lamps at no cost to the Contractor.
- B. Recycle fluorescent, HID and cold cathode lighting ballasts removed during demolition. Recycle LED and induction lighting drivers removed during demolition. Lighting ballasts and drivers shall not be disposed of as solid waste.
1. Contact OSEH Hazardous Materials Management at (734) 763-4568 and arrange to pick up DOT approved 30 gallon steel drums and 5 gallon pails at the North Campus Transfer Facility located at 1655 Dean Road.
  2. Place the drums in an accessible location and on a hard surface so that OSEH can use a drum cart to pick them up later. Lawns, dirt piles, gravel drives, muddy areas and basements without elevators are not considered accessible locations.
  3. Wearing rubber gloves, deposit any leaking ballasts into the 5 gallon pails for separate handling. When finished, deposit the rubber gloves into the 5 gallon pails.

4. Deposit the non-leaking ballasts and drivers into the 30 gallon drums. Leave enough space at the top of the drums for installation of lids.
5. Obtain Universal Waste Labels from OSEH. Fill out and attach one label to each 5 gallon pail and each 30 gallon drum. Enter the building name, quantity of ballasts and drivers, and the accumulation start date (date the pail or drum started to be filled).
6. Contact OSEH at least 3 working days in advance to request pick-up of the pails and drums. OSEH will pick up and recycle the ballasts and drivers at no cost to the Contractor.
7. Do not deposit ballasts from other projects or any other refuse in the drums. All costs for disposing of foreign items found in the drums will be deducted from the Contractor's final payment.

**3.6 RELOCATION**

- A. Carefully remove, clean and restore items designated for relocation to a "like new" condition, and store them for reuse.

**3.7 SALVAGE**

- A. Equipment and materials removed during demolition, unless noted otherwise, shall become the property of the contractor with due consideration for all such removed equipment included in the bid price.

**3.8 CLEANUP**

- A. Remove and legally dispose of demolished items, rubbish and debris from the construction site daily, and at the completion of the work. Failure to do so may result in the cleanup being performed by others and all costs thereof being deducted from the Contractor's final payment.

**3.9 EQUIPMENT PROTECTION**

- A. Protect equipment and materials during shipment, storage and construction against damage and contamination.
- B. Items that become damaged or contaminated shall be restored to a "like new" condition or replaced at the Contractor's expense.

**3.10 WORK PERFORMANCE**

- A. Locate equipment as close as practical to the locations shown on the drawings. Should field conditions prevent the installation of equipment or materials as indicated on the drawings, make any deviations only with the prior approval of the Owner's Representative.
- B. Install and connect new work to existing work neatly and carefully. Existing work that is disturbed shall be repaired or replaced as necessary to restore it to its prior condition.

- C. Coordinate work with the other trades to ensure completion consistent with the project schedule. Do not unduly delay the startup, testing or turnover of project systems.
- D. Coordinate work with the other trades to ensure the NEC-required dedicated spaces above and working spaces around electrical equipment is provided, and to ensure access to equipment requiring calibration or maintenance. Working space and access shall be sufficient for an adult to perform maintenance safely without straddling or removing obstructions. Work that encroaches on working space or that impedes maintenance shall be relocated at the Contractor's expense.
- E. Coordinate work with the other trades to provide access doors to maintainable electrical equipment (including lighting fixture remote ballasts) located behind walls or above permanent ceilings.
- F. Prior to core drilling concrete floors, test for the presence of electrical conduits. Use an impulse induction type scanner capable of detecting both metallic conduits and copper wires in PVC conduits. Tracers that scan for energized cables or that scan for injected high frequency signals are not acceptable. Notify the Owner's Inspection Department prior to all tests. Prior to core drilling, arrange for the Owner's Representative to notify building occupants of the potential for an unscheduled power outage. Conduits damaged during core drilling shall be restored immediately at the Contractor's expense.

**3.11 EQUIPMENT AND WIRING IDENTIFICATION AND COLOR CODING**

- A. Provide nameplates indicating equipment names or numbers and power sources as specified in Section 260533.
- B. Paint fire alarm system and temperature controls system junction boxes and covers as specified in Section 260533.
- C. Mark junction box covers with the panel and breaker numbers of the circuits contained within as specified in Section 260533.
- D. Provide Arc-Flash labels at all substations, switchboards, panelboards, motor control devices, and other power equipment as specified in Section 260533.
- E. Color code and identify wiring in accordance with Section 260513.

**3.12 FIELD QUALITY CONTROL**

- A. Arrange for testing and commissioning of electrical systems, equipment and materials prior to final acceptance of the work. Acceptance tests and commissioning shall be performed as specified in Division 01 and the other Division 26, 27 and 28 sections, and in applicable codes, standards and manufacturers' instructions.
- B. Provide all test equipment, materials and labor necessary to perform the tests, and coordinate with the other trades for necessary services, such as scaffolding and the uncoupling of motors.
- C. Notify the Owner's Representative 3 working days in advance of tests. The Owner shall witness the tests unless the Owner's Representative waives such witnessing in writing.

- D. Notify manufacturers sufficiently in advance of tests for which the manufacturers should be present.
- E. Replace any equipment or materials found to be defective or found to be of lesser quality than that specified or shown on the drawings.
- F. Provide written test reports, signed and dated, for all tests prior to acceptance of the electrical equipment by the Owner.
- G. Provide the training specified in each specification section.

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 260513 - MEDIUM, LOW AND CONTROL VOLTAGE CABLES

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**

**SECTION 260513 - MEDIUM, LOW AND CONTROL VOLTAGE CABLES**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.*

*IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 260526 - Grounding and Bonding for Electrical
4. Section 260533 - Electrical Materials and Methods
5. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

*EDIT THE SUMMARY TO MAKE IT PROJECT SPECIFIC.*

- A. Furnish, install, terminate, splice (where permitted), test and label electrical cables and wires as shown.
1. Unless shown otherwise on the drawings, medium voltage cables, splices, terminations and labels will be provided by the U-M Plant High Voltage Shop.
  2. Unless shown otherwise on the drawings, telecommunications voice and data cables, terminations and labels will be provided by others.

**1.3 REFERENCES**

- A. Cables shall comply with the latest versions of the following codes and standards as applicable.
1. ANSI/NEMA WC 74/ICEA S-93-639, "5-46 kV Shielded Power Cable for Use in Transmission and Distribution of Electric Energy".
  2. ANSI/NEMA WC 70/ICEA S-95-658, "Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy".
  3. Michigan Electrical Code (MEC) which invokes NFPA 72, the National Electrical Code (NEC).

**1.4 SUBMITTALS**

- A. Medium Voltage Cables, Terminations, Splices and Labels: Submit for approval product literature identifying the following:
  - 1. Manufacturers' names, catalog numbers and illustrations.
  - 2. Weights and overall diameters.
  - 3. Conductor AWG sizes, materials, dimensions and stranding.
  - 4. Insulation NEC Type letters, materials, thicknesses, voltage ratings, temperature ratings, dry or wet location ratings and percent insulation levels.
  - 5. Shield types, materials, thicknesses and percent coverage.
  - 6. Jacket materials and thicknesses.
  - 7. Surface markings including special ratings, characteristics, approved uses and NRTL listings.
  - 8. Maximum allowable pulling tensions and side wall pressures.
  - 9. Minimum pulling and training bend radii.
  - 10. Lubrication requirements and lubricant compatibilities.
  - 11. Cold weather pulling limitations.
  - 12. Cable reel dimensions and weights.
  
- B. Cables 600 Volts and Below: Submit for approval product literature identifying the following (as applicable to each cable type):
  - 1. Manufacturers' names and catalog numbers.
  - 2. Conductor AWG sizes, materials, dimensions and stranding.
  - 3. Insulation NEC type letters, materials, voltage ratings, temperature ratings and dry or wet location ratings.
  - 4. Shield types, materials, thicknesses and percent coverage.
  - 5. Jacket materials and colors.
  - 6. Metallic sheath types and materials.
  - 7. Surface markings indicating special characteristics, special ratings, approved uses and UL listings.
  - 8. Crimp-type terminals for aluminum feeder cables (if permitted).
  
- C. Test Reports:
  - 1. Factory quality control test reports (medium voltage cables only).
  - 2. Written test reports, signed and dated, for specified field tests prior to acceptance of the cables by the Owner.

**1.5 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
  
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards, latest editions, unless noted otherwise.
  - 1. Cables: Applicable ANSI, ICEA, IEEE and NEMA standards.
  - 2. Cables, Terminations, Splices and Accessories: Listed, labeled and marked for intended use by Underwriters Laboratories (UL), Electrical Testing Laboratories (ETL), MET Laboratories (MET), or the Canadian Standards Association (CSA).

**1.6 DELIVERY, STORAGE, AND HANDLING**

- A. Shipping and Handling Requirements: Store materials raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Seal cable ends from absorption of water. Protect materials from damage, dirt and debris at all times.

**1.7 WARRANTY**

- A. Provide a complete warranty for materials and labor for a minimum of one year from the date of Substantial Completion. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.

**PART 2 - PRODUCTS**

**2.1 CABLE (MEDIUM VOLTAGE)**

- A. Medium voltage cable shall be single conductor stranded copper, with ethylene propylene rubber (EPR) insulation rated 15kV, 105 degrees C, 133 percent insulation level, a 5-mil thick minimum tape shield with 12-1/2 percent minimum overlap, and a polyvinyl chloride (PVC) jacket approved for use in cable trays. The cable shall be suitable for use on a 13.2 kV, 3-phase, 3-wire, ungrounded, system. General Cable, Kerite, Okonite, or Prysmian.

**2.2 CABLE (600 VOLTS AND BELOW)**

- A. Secondary distribution and power cables for indoor use and for above ground outdoor use shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.

*IF ALUMINUM FEEDER CABLES ARE PERMITTED, PROVIDE AN ALUMINUM CABLE AND CONDUIT SIZING CHART. PROVIDE U-M STANDARD DETAIL 26051301. IDENTIFY CIRCUITS WHERE ALUMINUM FEEDER CABLES ARE PROHIBITED BY THE EQUIPMENT MANUFACTURERS, SUCH AS FOR CHILLER AND ELEVATOR FEEDERS.*

Where the drawings permit, indoor secondary feeder cables only may be single conductor stranded, Type AA-8000 Series aluminum, No. 1 AWG minimum, with NEC Types THHN or XHHW-2 insulation rated 90 degrees C, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, or Southwire. Terminations shall be Burndy or Thomas & Betts.

- 1. Aluminum cables may be used for indoor feeder circuits only, not for branch circuits or outdoor circuits.
- 2. Size conduits and device enclosure wiring gutters for the larger diameters and bend radii of aluminum cables.

3. Pre-train Electricians in aluminum cable preparation and termination.
  4. Terminate cables using crimp-type terminals in accordance with U-M Standard Detail 26051301. The die and crimp numbers shall be clearly visible after the lugs are crimped. Burndy or Thomas & Betts.
  5. Identify where aluminum conductor cables were installed on the project as-built drawings.
- B. Lighting cable for indoor use and for above ground outdoor use shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
  - C. Secondary distribution, power and lighting cable for underground use in conduit shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type XHHW insulation rated 90 degrees C in dry locations and 75 degrees C in wet locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
  - D. Control cable shall be single conductor stranded copper No. 14 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
  - E. Instrumentation, telecommunications, fire alarm, security, card access control, audio/visual and other special systems wire shall be in accordance with system manufacturer's recommendations, but shall not be less than 20 AWG. Conductors shall be stranded copper unless manufacturer's instructions require the use of solid conductor. Conductors or jackets shall be color coded as specified.
  - F. Manufactured wiring systems shall consist of multiple solid or stranded copper conductors as specified above, an insulated grounding conductor, a corrugated aluminum or galvanized steel jacket, and locking-type connectors from the same manufacturer and product line as the mating fixture connectors. Conductors shall be color coded as specified.
  - G. Type MC cable for power and lighting use shall consist of multiple stranded copper conductors as specified above, an insulated grounding conductor and a corrugated aluminum or galvanized steel jacket. Conductors shall be color coded as specified. AFC, Encore, Kaf-Tech, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.

- H. Type MC cable for fire alarm system use shall consist of multiple solid or stranded copper conductors sized in accordance with the fire alarm system manufacturer's instructions, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, an insulated grounding conductor and a corrugated aluminum or galvanized steel jacket. Cable shall be plenum rated. Conductors and jacket shall be color coded as specified. AFC, Encore, Kaf-Tech, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
- I. Type MI mineral-insulated cable shall be nickel-clad copper conductor, magnesium oxide insulated and copper alloy sheathed, rated 600 volts, with either factory installed terminations or field termination kits from the same manufacturer as the cable. Cable shall be UL labeled as 2 hour fire rated. Pentair Pyrotenax only.
- J. Grounding electrode conductors and equipment grounding conductors shall be single conductor stranded copper, No. 12 AWG minimum, bare where shown or with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified.

**PART 3 - EXECUTION**

**3.1 INSTALLATION REQUIREMENTS**

- A. Install cables and wires in raceways, except low voltage control, instrumentation, telecommunications, fire alarm, security, audio/visual and other power limited circuit wiring may be installed in J-hooks where shown on the drawings.
- B. Use cable lubricant when pulling medium voltage cables and secondary feeder cables. Avoid exceeding manufacturer's recommendations on pulling tensions, sidewall pressures and cable bend radii.
- C. Route cables in J-hooks, manufactured wiring systems and Type MC cable parallel to or perpendicular to building lines, and in a neat and workmanlike manner. Coil the excess and support independently of the ceiling grid system.
- D. Terminate Type MC cable with steel set screw connectors that have integral insulating bushings. Self-locking, twist-in type connectors are not acceptable.
- E. Install Type MI and other 2-hour fire rated cable in strict accordance with manufacturer's instructions on pulling, bending, raceways, additional supports, protection from moisture, and installation of field termination kits.
- F. Segregate wiring of different voltage levels. Except as follows, circuits operating at different voltages shall not share raceways.
  - 1. Power wiring to rooftop motors and rooftop receptacles may be routed together.
  - 2. Power and control wiring between variable speed drives and motor disconnect switches may be routed together.
  - 3. Class 1 power limited cables may share the same cable tray.

- G. Splice power cables with solderless compression butt splices or ring lugs. Terminate power cables including motor leads with solderless compression ring lugs. Splice branch circuit wiring, lighting wiring, and control and instrumentation wiring with wire nut connectors. Terminate control and instrumentation wiring with solderless compression ring or spade lugs. Compression splices and lugs shall be crimped with tools specifically designed for the terminations being crimped. Compression splices and lugs used with aluminum feeder cables shall be identified as accepting aluminum cables.
- H. If no color coding system exists for each indicated system function and voltage, color code circuits as follows:
1. Three Phase Power Over 600 Volts:
    - Phase X (A): Black
    - Phase Y (B): Red
    - Phase Z (C): Blue
  2. Three Phase Power 480/277 Volts:
    - Phase X (A): Brown
    - Phase Y (B): Orange
    - Phase Z (C): Yellow
    - Neutral: Gray
    - Ground: Green
  3. Three Phase Power 208/120 Volts:
    - Phase X (A): Black
    - Phase Y (B): Red
    - Phase Z (C): Blue
    - Neutral: White
    - Ground: Green
  4. Single Phase Power 240/120 Volts:
    - Phase X (A): Black
    - Phase Y (B): Red
    - Neutral: White
    - Ground: Green
  5. Fire Alarm Wiring:
    - Addressable Initiating Device: #18 Shielded Twisted Pair (STP) Red with Black Stripe.
    - Horn, Horn/Strobe or Controlled Output Positive (+) 24 VDC: #14 Stranded Red.
    - Horn, Horn/Strobe or Controlled Output Negative (-) 24 VDC: #14 Stranded Black.
    - Horn, Horn/Strobe or Controlled Output MC Cable Jacket (if MC cable is used): Red.
    - Speakers: #18 STP Red.
    - Clear Strobe Light Positive (+): #14 Stranded Yellow.
    - Clear Strobe Light Negative (-): #14 Stranded Blue.
    - Clear Strobe Light MC Cable Jacket (if MC cable is used): Red with Blue Stripe.
    - Amber Strobe Light Positive (+): #14 Stranded Yellow with Black Stripe.
    - Amber Strobe Light Negative (-): #14 Stranded Blue with Black Stripe.
    - Amber Strobe Light MC Cable Jacket (if MC cable is used): Red with Yellow Stripe.
    - NOTE: When clear and amber strobe lights are addressable and require only one pair of wires, color code the wires

and MC cable jacket as specified for the clear strobe light.

Panel Communications: #18 STP Red with Black Stripe.

Fireman's Telephone: #18 STP Red with Yellow Stripe.

6. Synchronized Clock Wiring:
  - Line: Black
  - Neutral: White
  - Clock Correction: Red
7. Control wires to light fixtures for light dimming shall be:
  - Hot control wire: Black with white stripe
  - Neutral control wire: White with Black stripe
8. Less Than 120 Volts: Use Industry Standard Methods

I. For University Hospital projects, color code circuits as follows:

1. Three Phase Power Over 600 Volts:
  - Phase X (A): Black
  - Phase Y (B): Red
  - Phase Z (C): Blue
2. Three Phase Power 480/277 Volts:
  - Phase X (A): Red
  - Phase Y (B): Blue
  - Phase Z (C): Black
  - Neutral: Gray
  - Ground: Green
3. Three Phase Power 208/120 Volts:
  - Phase X (A): Yellow
  - Phase Y (B): Orange
  - Phase Z (C): Brown
  - Neutral: White
  - Ground: Green
4. Control wires to light fixtures for light dimming shall be:
  - Hot control wire: Black with White Stripe
  - Neutral control wire: White with Black Stripe
5. Less Than 120 Volts: Use Industry Standard Methods

J. Provide home runs of No. 10 AWG wire for 20 amp branch circuits that exceed 150' in length.

K. Ground the shields of shielded instrumentation and control cables at one end only. The shields at the other end shall be insulated from ground.

L. Provide identification tags on all cables and conductors terminated in panels.

### 3.2 FIELD QUALITY CONTROL

A. Prior to any testing, perform visual inspections to verify the following:

1. Conductor and jacket color coding is correct.
2. Labeling is correct.
3. Electrical terminations have been properly tightened.
4. The cables are ready to be tested.

- B. Perform a continuity test, 2,500-volt DC Megger test, a DC high potential test, and a second 2,500-volt DC Megger test on medium voltage cables. The high potential test shall be performed at 45kV for new cable and at 30kV when new cable has been spliced to existing cable. Submit a test report.
- C. Perform a continuity check and a 1,000 volt DC Megger test on 600 volt power cables No. 4 AWG and larger.
  - 1. The Megger test shall be performed between each pair of conductors and from each conductor to ground.
  - 2. The Megger test shall be performed for 15 seconds or until the insulation resistance value stabilizes.
  - 3. The insulation resistance between conductors and from each conductor to ground shall be 100 megohms minimum in one minute or less. In addition, the lowest insulation resistance value shall not differ from the highest resistance value by more than 20 percent. But if the lowest value is above 1,000 megohms, the 20% balance requirement may be waived.
- D. Perform a continuity check on control and instrumentation wiring.

**3.3 COMMISSIONING**

- A. Perform commissioning activities in accordance with Related Sections.

**END OF SECTION 260513**

BuildingName  
The Description of the Project  
P00000000 0000

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 260526 - GROUNDING AND BONDING FOR ELECTRICAL

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**

**SECTION 260526 - GROUNDING AND BONDING FOR ELECTRICAL**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. Provide grounding for all systems and equipment.

**1.3 GROUNDING SYSTEM REQUIREMENTS**

- A. Each ground rod shall have a maximum resistance to ground of 10 ohms before connection to the other ground rods. If reading is above 10-ohms, drive one extension. Further testing of that individual rod is not needed

*FILL IN THE APPROPRIATE RESISTANCE VALUE BELOW. SPECIFY 2 OHMS FOR PRIMARY SERVICES OR 5 OHMS FOR SECONDARY SERVICES.*

- B. The total grounding system with all connections completed shall have a maximum resistance to ground of \_\_\_\_\_ ohms.

**1.4 CONNECTION REQUIREMENTS**

- A. Provide exothermic weld type, or Burndy Hyground, ground connections for concealed, underground, and concrete encased ground connections, for ground connections to structural steel, connections between sections of the main ground bus and all connections to the substation room ground bus bars.
- B. Exposed ground connections (except connections to structural steel and substation room ground bus bars) may be made with copper or bronze compression ground fittings or bolted compression ring lugs.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 260526 - - 1

- C. Provide exothermic weld type, or Burndy Hyground ground connections for splices and taps of grounding conductors No. 8 AWG and larger. Exposed splices and taps shall be taped.

**PART 2 - PRODUCTS**

**2.1 GROUND RODS**

- A. Unless shown otherwise, ground rods shall be 3/4" diameter by 10' long, copper clad steel. Ground rods shall be capable of being extended when additional length is required.

**2.2 GROUNDING CONDUCTORS**

- A. Grounding conductors for direct burial underground, for encasement in concrete, and for grounding of unit substations shall be No. 4/0 AWG minimum, bare, stranded copper.
- B. Grounding conductors for general use shall be stranded, copper conductor, sized in accordance with the NEC unless shown otherwise on the drawings, and insulated with green NEC Type THHN insulation rated 90 degrees C, 600 volts.

**2.3 GROUND CONNECTIONS**

- A. Ground connections shall be Burndy Hyground, Cadweld, Thermo-weld or Thomas & Betts Blackburn only.

**PART 3 - EXECUTION**

**3.1 INSTALLATION REQUIREMENTS**

- A. Ground duct banks and manholes in accordance with Specification Section 260543.
- B. Ground the shields of medium voltage primary cables in accordance with Specification Section 261000, and the shields of shielded instrumentation and control cable in accordance with Specification Section 260513.
- C. Provide bare copper grounding conductors from duct banks, manholes, unit substations, primary switches, transformers, switchgear, panelboards, motor control centers and control panels to the building grounding system. Equipment rated above 480 volts or 600 amps shall be grounded by a minimum of two independent grounding conductors.
- D. Bond transformer, UPS system, central battery/inverter system, emergency generator, and separately derived electrical system neutrals to the building grounding system.
- E. Ground motors rated 460 volts and below by motor feeder equipment grounding conductors. Stranded copper grounding conductors connected to building steel shall also bond motors rated over 460 volts.

- F. Provide green insulated equipment grounding conductors in all service, feeder, and branch circuits for connection of load devices to the power source ground. Raceways shall not be used as equipment grounding conductors.
  - 1. Equipment grounding conductors shall not be daisy-chained.
  - 2. Bond equipment-grounding conductors in boxes and enclosures where the grounding conductors are terminated or spliced.
- G. Bond conduits, cable trays, wireways, surface raceways, boxes, and enclosures together, and to the building grounding system. Provide bonding bushings and bonding jumpers to bond conduits where they enter a box or enclosure.
- H. Ground the lightning protection system with separate ground rods. The building grounding system ground rods shall not be used. After completion of both systems, the lightning protection system shall be bonded to the building grounding system.
- I. Protect separately routed grounding conductors subject to damage or physical abuse by Schedule 40 PVC nonmetallic conduits. Grounding conductors shall not be routed in metallic conduits except when routed with phase conductors.

**3.2 FIELD QUALITY CONTROL**

- A. Test the grounding in accordance with Specification Section 260800, and submit a test report.
- B. When the total grounding system fails its test by having a higher resistance to ground than specified in Section 260800, contact the Project Electrical Engineer for corrective action.

**3.3 COMMISSIONING**

- A. Perform commissioning activities in accordance with Related Sections.

**END OF SECTION 260526**

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 260533 - ELECTRICAL MATERIALS AND METHODS

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 260533 - ELECTRICAL MATERIALS AND METHODS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
  - 1. Section 260513 - Medium, Low & Control Voltage Cables
  - 2. Section 260526 - Grounding and Bonding for Electrical

**1.2 SUMMARY**

- A. Provide conduits, cable trays, surface raceways, boxes, fittings, and supports to form a complete, coordinated, and continuously grounded raceway system.

**1.3 CONDUIT REQUIREMENTS**

- A. Conduits indoors in general areas shall be electrical metallic tubing (EMT) with steel set screw fittings.
- B. Conduits indoors in hazardous areas, encased in concrete floor slabs or subjected to water, physical damage or abuse shall be galvanized rigid steel (RS) or intermediate metal conduit (IMC) with cast or malleable iron threaded fittings and bushings.
- C. Conduits indoors for primary power distribution circuits or for fire pump feeders shall be galvanized rigid steel or intermediate metal conduit with cast or malleable iron threaded fittings and bushings. Where the conduits are routed through the building, they shall be encased in 2 inches of concrete.
- D. Conduits outdoors shall be galvanized rigid steel or intermediate metal conduit with cast or malleable iron threaded fittings and bushings.
- E. Conduits encased in concrete underground shall be Type DB PVC with matching fittings.
- F. Conduits direct buried underground shall be Schedule 40 PVC with matching fittings.
- G. Conduits in parking structures, steam tunnels and near or in cooling towers shall be fiberglass-reinforced epoxy or Schedule 80 PVC with matching fittings. Exceptions to this requirement are tunnel segments inside building (i.e., mechanical rooms), or in heated rooms of parking structures. In these cases EMT may be used

- H. Final connections to recessed lighting fixtures and under-counter lights shall be 1/2" minimum flexible metallic conduit, manufactured wiring systems, or Type MC cable.
  - 1. Manufactured wiring systems shall only be used above accessible ceilings.
  - 2. Terminate Type MC cable with steel set screw connectors that have integral insulating bushings. Self-locking, twist-in type fittings are not acceptable.
- I. Final connections to motors, transformers and equipment subject to vibration or removal for maintenance shall be 1/2" minimum liquid tight flexible metallic conduit with steel liquid tight fittings. Transformer connections may be non-liquid tight flexible metallic conduit in electrical rooms only.
- J. Connections to recessed power receptacles, and light switches, in areas with accessible ceilings:
  - 1. In new partitions and walls, the final connections may be made with Type MC cable. Type MC cable, shall:
    - a. Be run to a box immediately above the accessible ceiling. The box size shall not exceed 4-11/16" square.
    - b. Conduit shall be used for the entire run, from this junction box, to the power source, load (lights), etc.
    - c. No more than three circuits may be run through any given junction box.
    - d. Secure the Type MC cables in the wall cavity.
    - e. Type MC cables shall be as short as possible.
  - 2. In existing partitions and walls where the surface is not being otherwise opened up, the final connections to new devices may be made using flexible metallic conduit or Type MC cable.
- K. Connections to other recessed devices, (including communication outlet boxes, junction or pull boxes, etc.) shall be with standard conduit of the type appropriate for the wall construction.

**1.4 CABLE TRAY REQUIREMENTS**

- A. Power cable trays shall be aluminum ladder type of the sizes shown on the drawings.
- B. Telecommunications cable trays shall be aluminum ladder type or zinc plated steel wire mesh type of the sizes shown on the drawings.
- C. Center spline telecommunications cable tray may only be used where shown.
- D. Changes in cable tray direction or elevation shall be made using standard fittings from the same manufacturer as the cable tray.
- E. Barriers shall be installed in cable trays where shown to separate circuits of different voltage levels.

**1.5 SURFACE RACEWAY REQUIREMENTS**

- A. When conduits in finished areas cannot be concealed in walls or above ceilings, surface raceways may be used where shown. Boxes and fittings shall match and be from the same manufacturer as the raceways.

**1.6 J-HOOKS**

- A. Subject to the cable manufacturer's installation requirements, low voltage cables may be installed using J-hooks in rooms above accessible ceilings and in unfinished open ceiling areas. Do not use J-hooks in corridors, in finished open ceiling areas, above inaccessible ceilings or as a substitute for cable trays. Bridle rings shall not be used.

**1.7 BOX REQUIREMENTS**

- A. Provide sheet steel outlet boxes, extensions, and plaster rings for EMT, flexible metal conduit, and Type MC cable.
- B. Provide cast or malleable iron outlet boxes and covers for galvanized rigid steel conduits, intermediate metal conduits, and liquid tight flexible metal conduits.
- C. Boxes shall be sized for all conductors and devices to be contained within. Box extensions shall not be used to correct for undersized boxes. A single extension may be used as follows only if all free conductors extend at least 3 inches outside of the extension opening.
  - 1. On boxes being flush mounted in masonry walls.
  - 2. On existing boxes in walls that are being furred out.
  - 3. On existing boxes for connecting to an existing circuit.
  - 4. On fire alarm, security and clock system boxes where required by the system manufacturer's instructions.
- D. Plaster rings shall not be considered box extensions, but their capacities may be included in box fill calculations.

**1.8 SUPPORT REQUIREMENTS**

- A. Surface mounted equipment shall be secured to steel channels. The channels shall be attached with toggle bolts to hollow tile, block or similar surfaces, and attached with screws or bolts and expansion shields to solid masonry or concrete.

**PART 2 - PRODUCTS**

**2.1 CONDUITS**

- A. Electrical metallic tubing shall be thin wall steel tubing, electro-galvanized or hot dipped galvanized inside and outside. Fittings and bushings shall be galvanized steel set screw type with two screws per connection for sizes over 2".
- B. Galvanized rigid steel conduit and intermediate metal conduit shall be hot dipped galvanized inside and outside, in 10' lengths and threaded on both ends. Fittings and bushings shall be cast or malleable iron, and hot dipped galvanized inside and outside.
- C. PVC conduit and fittings shall be Type DB for encasement in concrete, Schedule 40 for direct burial, concealed and exposed work, and schedule 80 in parking structures. Fittings shall be of the same type and from the same manufacturer as the conduit. PVC conduit shall be UL Labeled for 90 degrees C cables. Cantex, Carlon, or National Pipe & Plastic.

- D. Fiberglass reinforced epoxy conduit shall be standard wall, iron pipe size, sunlight resistant, gray color, with matching push-fit fittings. FRE or Champion.
- E. Flexible metallic conduit shall be galvanized steel or aluminum. Fittings shall be of steel with cadmium or galvanized finish. Fittings shall be machine screw clamp type, single or two-piece. Self-locking, twist-in type fittings are not acceptable.
- F. Liquid tight flexible metallic conduit shall consist of a flexible, galvanized steel core, a continuous copper ground strip and a polyvinyl chloride jacket. Fittings shall be steel liquid tight grounding type from the same manufacturer as the conduit.

**2.2 CABLE TRAYS**

- A. Ladder type cable tray shall be aluminum, of the widths shown, with 4" rail height, 13/16" minimum rung width, and 9" maximum rung spacing. The tray with a 10' span shall be capable of sustaining a working load of 145 pounds per lineal foot with a load deflection of 1.0" when tested in accordance with NEMA VE 1. B-Line, Chalfant, Cope, Globetray, Husky, Legrand Cablofil, MonoSystems, or Thomas & Betts.
- B. Wire mesh cable tray shall be of high strength steel rods meeting the mechanical properties of ASTM A510, of the widths shown, and with a 4" load depth minimum. Cable tray shall be constructed of wires configured in a 2" x 4" grid pattern with wires welded at intersection points. The ends of the wire grid shall be bent up to form the sides of the tray. Cut ends at the top and end rails shall be free of sharp edges to prevent damage to the cables and injury to installers. The tray shall be zinc electro-plated or zinc galvanized after forming and welding. The tray with a 8' span shall be capable of sustaining a working load of 32 pounds minimum per lineal foot with a load deflection of 1.2" when tested in accordance with NEMA VE 1. B-Line, Chalfant, Legrand Cablofil, or MonoSystems only.
- C. Center spline cable tray shall be aluminum, of the width shown, with top mounted rungs, 3" load depth, 13/16" minimum rung width, and 9" maximum rung spacing. The tray with a 10' span shall be capable of sustaining a working load of 145 pounds per lineal foot with a load deflection of 1.0" when tested in accordance with NEMA VE1. B-Line, Legrand Cablofil, MonoSystems, or Thomas & Betts only.
- D. Tray fittings including horizontal and vertical bends, tees, crosses, reducers, splice plates, expansion joints and cable roll-outs shall be from the same manufacturer and of the same product line as the tray. Ladder and center spline tray bends, tees, crosses and reducers shall have a 13/16" minimum rung width, a 9" maximum rung spacing, and a 12" minimum bend radius.
- E. Tray fasteners shall be galvanized or zinc plated steel.

**2.3 SURFACE RACEWAYS**

- A. Where surface raceways are called for on the drawings, or when conduits in finished areas cannot be concealed in walls or above ceilings, provide surface raceways. Raceway boxes and fittings shall match and be from the same manufacturer as the surface raceway.
- B. Surface raceways shall consist of a base and cover, shall be sized for the number of conductors contained within, and shall be complete with all boxes, connectors, fittings, bushings, dividers and mounting hardware. For internal or external elbows, corners, or tees, provide raceway with 1-1/4" full-capacity bend radius.
- C. Surface raceways shall be 600 volt rated and in compliance with the applicable paragraphs of NEC Article 352.
- D. Surface raceways shall be non-flammable and UL labeled under UL 5 or UL 5A (as applicable).
- E. The completed surface raceway system shall be vandal resistant.
- F. Surface raceways shall accept receptacles, cover plates, telephone/data jacks and other standard wiring devices as specified elsewhere or shown on the drawings.
- G. Cover plates used for wiring devices and telephone/data jacks shall be of the overlapping type and shall therefore cover the cut ends of the raceway cover.

***SELECT THE REQUIRED COLOR AND DELETE THE OTHER COLORS. MATCH EXISTING COLOR WHEN ADDING TO EXISTING DEVICES.***

- H. Surface raceways shall be white (ivory, brown, gray) in color, have a scuff resistant finish, and be paintable. All components exposed to view shall be of the same color and shade.
- I. Barriers shall be provided when necessary to separate conductors of different voltages or services.

***SELECT THE REQUIRED MATERIAL AND DELETE UNNEEDED REQUIREMENTS.***

- J. Surface raceways shall be steel (plastic) as noted below:
  - 1. Metallic
    - a. Metallic raceways shall be of .040" thick (minimum) zinc plated or galvanized steel.
    - b. The acceptable levels of quality are as provided by:
      - 1) Wiremold 500 Series and 700 Series for smaller single channel raceway applications,
      - 2) Wiremold 3000 Series for larger single channel raceway applications, and
      - 3) Wiremold 4000 Series for larger multi-channel raceway applications.
    - c. Manufacturers include Hubbell, MonoSystems, Thomas and Betts, or Wiremold.
  - 2. Plastic
    - a. Plastic raceways shall be of a material meeting all of the requirements of UL 5A, (including flammability, resistivity, structural strength, etc.).
    - b. The acceptable levels of quality are as provided by:

- 1) Panduit Series LDS5 and LDS7, Carlon Series 30 or Wiremold Series PN05 or PN10 for raceway applications when surface raceway replaces conduit in finished areas.
  - 2) Panduit LD Series, Carlon Series 30 or Wiremold Series PN05 for smaller single channel raceway applications.
  - 3) Panduit Type T-70, Carlon Premiere or Wiremold Type 40N2 for larger single or multi-channel raceway applications.
  - 4) Panduit Twin 70, Carlon Prestige or Wiremold Type 60N2 for larger multi-channel raceway applications.
- c. Manufacturers include Carlon, Hubbell, MonoSystems, Panduit or Wiremold.

#### 2.4 J-HOOKS

- A. J-hooks shall be zinc electro-plated steel or plastic, UL Listed for use in plenum spaces, with a minimum of a 3/4 inch wide cable support area, and rated for use with Categories 5e and 6 UTP, fire alarm, security, temperature controls and similar low voltage cables. J-hooks shall include a retaining means for closing the hook so the cables do not fall out.

#### 2.5 BOXES

- A. Boxes for fixtures, outlets, switches, equipment connections and wire pulling shall be
1. Cast or formed from carbon steel sheets of commercial grade steel not less than 14-gauge,
  2. One-piece construction, zinc, or cadmium plated,
  3. Tapped for mounting plates and covers as required.
- B. Pull and junction boxes shall be
1. Fabricated from galvanized or painted code gauge cold rolled carbon steel sheets.
  2. Welded construction with flat removable covers fastened to the box with machine screws.
  3. Seams and joints shall be closed and reinforced with flanges formed of the same material from which the box is constructed or by continuous welding which will provide equivalent strength to flange construction.
  4. Preferably not provided with 'knockouts'.
- C. Box covers shall be fastened in place by machine screws or hinges and latches. Self-tapping or sheet metal fasteners are not acceptable.

#### 2.6 SUPPORTS

- A. Hangers and brackets shall be made of steel pipe, channel iron, angle iron or prefabricated steel channel. Prefabricated steel channel shall be by B-Line, Hilti, Powerstrut, or Unistrut.
- B. Anchors shall be lead shield anchors or plastic expansion anchors for small loads, and expansion or epoxy anchors for large loads. Powder-driven anchors shall not be used.

## 2.7 NAMEPLATES, LABELS AND DIRECTORIES

- A. Equipment nameplates shall be engraved .125 inch (1/8") thick laminated plastic, white, with black letters. The engraved letters shall be at least one quarter inch (1/4") high.
- B. Arc flash hazard warning labels shall be 3" by 5" minimum, white with a yellow, orange or red stripe header and black font, of ultraviolet and weather-resistant nylon, and adhesive backed.
- C. Receptacle and light switch plates shall be labeled using clear adhesive backed nylon or Mylar tape with black text permanently laminated to the tape.
- D. Panel directories shall be typed on supplied card stock with panel, or card stock similar in thickness and material as those supplied with the panels. Install supplied clear plastic cover, or one of like material.

## PART 3 - EXECUTION

### 3.1 CONDUITS

- A. Size conduits in accordance with the NEC, but not less than the sizes shown on the drawings. Minimum power and control conduit size shall be 1/2". Minimum telecommunications conduit size shall be 1".
- B. Install concealed and exposed conduits and cable trays parallel to or at right angles to building lines. Conduits shall not be embedded in concrete slabs except where specifically shown. Install surface raceways as close to room corners or trim features as possible to make the surface raceways less obvious. Where conduits are routed over beams and under corrugated decking, conduits shall be offset 3" below the decking to avoid damage from future decking penetrations.
- C. Make directional changes in primary power distribution conduits above ground with sweeps and long radius elbows, and underground with 20' minimum radius bends.
- D. Conceal conduits wherever possible and practical. When conduits cannot be concealed in finished areas, use surface raceways with matching boxes from the same manufacturer as the raceways.
- E. Metal conduits, fittings, enclosures and raceways shall be mechanically joined together in a firm assembly to form a continuous electrical conductor providing effective electrical grounding continuity.
- F. Provide expansion fittings between adjacent buildings, at building expansion joints and in straight runs at the intervals specified in the manufacturer's instructions.
- G. Conduits entering panels located outdoors, in parking structures, in steam tunnels and on cooling towers shall enter from the sides, back, or bottom. Conduits shall not enter from the top.
- H. Separate raceways from un-insulated steam pipes, hot water pipes, and other hot surfaces by a minimum of 4" horizontally or 12" vertically. Separate raceways from ventilation ducts and insulated pipes so that they do not come into contact with each other.

- I. Low voltage signal circuits shall be separated or shielded from power circuits to prevent the induction of noise into the signal circuits.
- J. EMT entering sheet metal enclosures and outlet boxes shall be secured in place by a connector with a locknut. Rigid conduit shall be secured with locknut inside and outside and a bushing. Sufficient thread on the connector or conduit shall extend into the enclosure so that the bushing will butt tight into the connector or conduit. Bushings shall not be used as jamb nuts or in lieu of locknuts.
- K. Flexible metallic conduit to motors and similar equipment shall not exceed 3'-0" in length, and shall have adequate slack to absorb the maximum vibration. Flexible conduit connections to lighting fixtures shall not exceed 6'-0" in length.

### **3.2 CABLE TRAYS**

- A. Install cable trays in accordance with NEMA VE 2. Install trays parallel to or at right angles to building lines. Provide a minimum of 12" working space above and 12" working space along one side for cable installation.
- B. Support cable trays with trapeze hangers spaced 10' maximum on center for ladder trays and 8' on center maximum for wire mesh trays. Center hung supports are not allowed
- C. After cable installation, firestop cable tray penetrations in fire rated walls with intumescent fire protective bags, bricks or sealant in accordance with the appropriate UL approved system.

### **3.3 SURFACE RACEWAYS**

- A. Install surface raceways parallel or perpendicular to building lines.
- B. Locate surface raceways as close to room corners or vertical breaks in mid wall as is possible.
- C. Provide vertical surface raceways to feed cables from junction boxes above the ceiling to horizontal surface raceways. Exposed vertical conduits are not acceptable.

### **3.4 J-HOOKS**

- A. Install cables in J-hooks as follows.
  - 1. Install cables parallel or perpendicular to building lines.
  - 2. Space J-hooks in accordance with the cable manufacturers' instructions, but not more than 5 feet apart and not more than 3 feet from both sides of a change in direction.
  - 3. Maintain a minimum separation of 2" from lighting ballasts, transformers, motors, power circuits and similar equipment.
  - 4. Anchor J-hooks to walls or suspend J-hooks using 1/4-inch minimum diameter threaded rod hangers. Do not support J-hooks from ceiling or equipment hangers. J-hooks shall not impede removal of accessible ceiling tiles.
  - 5. Load J-hooks to no more than the maximum fill stated in the J-hook manufacturer's instructions.

6. Cables shall not sag more than 12 inches between J-hooks and shall not impede access to equipment requiring maintenance.
  7. Cables in open areas shall be a minimum of 10 feet A.F.F. and a maximum of 16 feet A.F.F.
  8. Cables above accessible ceilings shall not touch the ceiling grid or tiles.
  9. Cables shall be protected from physical damage.
  10. Cables shall be completely accessible for replacement. Cables hidden above ductwork or other obstructions, and cables so high they cannot be reached safely while standing on a ladder shall be replaced with cables in new J-hooks located in a more accessible location.
- B. Provide conduit sleeves for cables penetrating walls. If cables in J-hooks penetrate a corridor wall from a room, and the distance from the corridor wall to the corridor cable tray is more than 18 inches, provide conduit stubs through the wall to the cable tray.
- C. Contain cables inside J-hooks in accordance with the J-hook manufacturer's instructions so cables do not fall out, but so existing cables can be pulled out and new cables can be pulled in. Cables shall not be strapped to the J-hooks. Bond the conduit stubs to the cable tray.
- D. Provide separate J-hooks for each cable system. Cables from one system shall not use the J-hooks of another system.
- E. Color code J-hooks to indicate the system of the cables they contain:
1. Telecommunications - silver or gray
  2. Fire alarm - red.
  3. Temperature controls - blue.
  4. Laboratory controls - white.
  5. Security & card access control - orange.
  6. Audio/visual - yellow.

### 3.5 MOUNTING HEIGHTS

- A. Except where shown otherwise, install equipment and devices at the following heights:
1. Receptacles (Wall Mount): 18" A.F.F. to center
  2. Receptacles (Above Counter): 44" A.F.F. to center
  3. Receptacles (Unfinished Area): 44" A.F.F. to center
  4. Surface Raceway Receptacle Strips: 42" A.F.F. to bottom
  5. Light Switches: 44" A.F.F. to center
  6. Telephone Outlets (Wall Phone): 44" A.F.F. to center
  7. Telephone/Data Outlets: 18" A.F.F. to center
  8. Clocks: 88" A.F.F. to bottom
  9. Exit Signs: 88" A.F.F. to bottom
  10. Emergency Light Wall Packs: 88" A.F.F. to bottom
  11. Fire Alarm Pull Stations: 44" A.F.F. to center
  12. Fire Alarm Horn/Strobes and Speaker/Strobes: Entire strobe lens at a uniform height between 80" A.F.F. and 96" A.F.F.
  13. Card Readers (Wall Mount): 42" A.F.F. to center
  14. Card Readers (Pedestal Mount): 36" A.F.F. to center
  15. Door Actuator Pushbutton (Wall and Pedestal Mount): 36" A.F.F. to center

16. Card Reader and Door Actuator Pushbutton (Stacked Vertically):  
Card Reader 42" A.F.F. to center and Pushbutton 36" A.F.F. to center
17. Security System Controls: 44" A.F.F. to center
18. Thermostats/HVAC Controls: 44" A.F.F. to center
19. Electrical Panels: 72" A.F.F. to top
20. Safety Switches/Motor Starters/Variable Frequency Drives: 72" A.F.F. to top (except top of handle shall not exceed 78" A.F.F.)
21. Motor Control Pushbuttons: 60" A.F.F. to center

### **3.6 SUPPORTS**

- A. Provide 4" thick concrete housekeeping pads for floor-mounted equipment.
- B. Support all electrical items independently of supports provided by the other trades.
- C. Support conduits and boxes using steel conduit straps or 1/4-inch minimum diameter threaded rod hangers. Suspended ceiling hangers or hanger wire shall not be used.
- D. Support cable trays with support brackets or 3/8" diameter minimum threaded rod hangers at intervals not exceeding 10'-0" for ladder cable trays and 8'-0" for wire mesh cable trays. Additional supports shall be provided at tray fittings.
- E. Hangers shall be of sufficient strength that their deflection at mid span does not exceed 1/240 of the hanger span length after the cables are installed.
- F. Route flexible metallic conduit, manufactured wiring systems and Type MC cable parallel to or perpendicular to building lines, and in a neat and workmanlike manner. Coil the excess and support independently of the ceiling grid system.

### **3.7 PENETRATIONS, SLEEVES AND FIRE SEALS**

- A. Cut floor and wall penetrations neatly and to the minimum size required for installation of the equipment and raceways.
- B. Provide galvanized steel pipe sleeves for all conduits penetrating floors, exterior walls and roofs.
  1. Extend floor sleeves above the floor a minimum of 2 inches.
  2. Embed sleeves in new concrete or step-core concrete and grout sleeves into existing concrete with epoxy grout.
  3. Seal floor sleeves using fire-sealing systems approved by a Nationally Recognized Testing Laboratory.
  4. Seal exterior wall and roof penetrations water tight.
- C. Patch both sides of wall penetrations cut for electrical equipment and raceways to seal against the passage of air, sound and fire.
  1. Seal cable tray penetrations in fire rated walls using fire sealant bags approved by a Nationally Recognized Testing Laboratory.
  2. Seal conduit penetrations in fire rated walls using fire-sealing caulk approved by a Nationally Recognized Testing Laboratory.

3. Seal conduit penetrations in non-rated walls using masonry materials that match the wall construction.
4. Fire seal between recessed outlet boxes located on opposite sides of a fire rated wall if the box openings are over 16 square inches and the boxes are less than 24 inches apart.

### **3.8 EXPANSION FITTINGS**

- A. Provide expansion fittings at all building expansion joints. Expansion fittings shall be bonded to the raceway on both sides.
- B. Provide expansion fittings, in accordance with manufacture recommendations, in all areas subject to swings in temperature of more than 15 degrees C.
- C. Install expansion fittings in all locations were expected expansion difference is 1/4", or more, between boxes.

### **3.9 IDENTIFICATION**

- A. Provide nameplates and labels in accordance with Article 2.7.
  1. Laminated plastic labels shall be mechanically secured in place with sheet metal screws and/or bolts and nuts.
  2. Labels shall be neatly centered. Place labels in like positions on similar equipment.
- B. Color code wiring in accordance with Section 260513.
- C. Color code junction boxes and box covers of emergency and fire alarm circuits with red paint. Color code junction boxes and box covers of temperature control circuits with blue paint.
- D. Mark junction box covers in indelible ink with the panel and breaker numbers of the circuits contained within.
- E. Provide generic "Warning - Arc Flash Hazard" labels on equipment with an arc flash incident energy level exceeding 1.2 calories/square centimeter and likely to require examination, adjustment, servicing or maintenance while energized. This includes but is not limited to automatic transfer switches, switchboards, panelboards, transformers, storage batteries, battery chargers, inverters, control panels, variable speed drives, motor controllers, circuit breakers and disconnect switches. Provide labels for the line and load sides of fused disconnect switches and circuit breakers 800 amps and above, and for the primary and secondary sides of transformers.
  1. Contractor-provided labels are not required on primary switchgear or unit substations. U-M Plant Operations will provide device-specific labels on this equipment.
  2. Contractor-provided labels are not required on equipment that is factory labeled by the manufacturer.
  3. Center the labels horizontally and vertically on the outsides of panel doors, covers, etc. to ensure they are visible to maintenance personnel before the equipment is opened up.

### **3.10 FIELD QUALITY CONTROL**

- A. Perform visual inspections to verify the following:

1. The equipment is properly installed and anchored.
2. The equipment is free from damage and defects.
3. Electrical terminations have been properly tightened.
4. The equipment has been thoroughly cleaned inside and outside.
5. The equipment is properly labeled and labels are correct.

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 260543 - UNDERGROUND SERVICES FOR ELECTRICAL SYSTEMS

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 260543 - UNDERGROUND SERVICES FOR ELECTRICAL SYSTEMS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
  - 1. Section 260513 - Medium, Low & Control Voltage Cables
  - 2. Section 260526 - Grounding and Bonding for Electrical
  - 3. Section 260533 - Electrical Materials and Methods

**1.2 SUMMARY**

- A. Provide concrete encased duct banks with manholes and pullholes for medium voltage primary cables and telecommunications/data cables. Provide direct buried ducts and handholes for secondary power cables and site lighting cables.

**1.3 DUCT BANK REQUIREMENTS**

- A. Ducts for concrete encased duct banks shall be Type DB PVC conduits with matching fittings except where galvanized rigid steel conduits and fittings are shown.
- B. Ducts for direct burial underground shall be Schedule 40 PVC with matching fittings.

**1.4 MANHOLE REQUIREMENTS**

- A. Manholes shall be precast or cast in place reinforced concrete. Primary manholes shall have inside dimensions of 10' wide by 10' long by 7' high. Communications manholes shall have inside dimensions of 6' wide by 12' long by 7' high.
- B. Manholes shall include a cast iron frame with cover, a hot dipped galvanized steel ladder, hot dipped galvanized pulling eyes embedded in the concrete walls opposite each duct entrance and in the floor beneath the cover, and a sealed indentation for use of a portable pump, offset to one side to clear pulling iron.
- C. Primary manholes shall contain a minimum of 2 vertical stanchions on each wall. The stanchions shall be Underground Devices CR-36.
- D. Primary manholes shall contain cable racks for routing cables between the duct openings. The racks shall be Underground Devices with 20" arms.

- E. Telecommunications manholes shall include: 14-"47 Hole" racks, 7 on each long wall, 16-"B" brackets, 4 in each corner, and 24-"S" brackets in side walls.

**PART 2 - PRODUCTS**

**2.1 DUCTS**

- A. PVC conduit and fittings for encasement in concrete shall be Type DB, UL Labeled for 90 degrees C cables. Carlon or Cantex.
- B. PVC conduit and fittings for direct burial, concealed and exposed use shall be Schedule 40, UL Labeled for 90°C cables. Carlon or Cantex.
- C. Galvanized rigid steel conduit shall be hot dipped galvanized inside and outside, in 10' lengths threaded on both ends. Allied, Republic Steel, Triangle PWC, Wheatland or Western Tube.
- D. Steel Casing pipe shall be non-spiral pipe and have a minimum yield strength of 35,000 psi. All joints shall be made leak-proof using full penetration, continuous welds. Welds shall be ground smooth outside and inside (except 22" diameter and less) to prevent conflict with the soil or pipe placement. Steel pipe shall meet the requirements of ASTM A53, Type E or S, Grade B.
  - 1. The following information shall be clearly marked on each length of pipe:
    - a. The pipe designation and class (e.g., A53, Type S, Grade B).
    - b. The name or trademark of the manufacturer.
    - c. Identification of the manufacturing plant.
    - d.
  - 2. All pipe furnished shall be subject to inspection on arrival at the job site. The purpose of the inspection shall be to cull and reject pipe that, independent of physical tests specified under the standard specifications designated herein, fails to conform to the requirements of these specifications.
  - 3.
  - 4. 3. Rejected pipe shall be plainly marked by the Inspector and immediately removed from the site of the work by the Contractor, without cost to The University of Michigan.

**2.2 MARKER STRIP**

- A. Marker strip shall be red plastic, 6" wide, and labeled to indicate type of service. Brady or Seaton.

**PART 3 - EXECUTION**

**3.1 DUCT BANK INSTALLATION REQUIREMENTS**

- A. Concrete encased and direct buried ducts (except site lighting ducts) shall be 4" minimum.

- B. Duct banks shall be supported on undisturbed soil or on piers extending down to undisturbed soil.
- C. Changes in duct bank direction shall be made with 10' minimum radius bends for telecommunications, and 20' minimum radius bends for power. Manufactured sweeps are preferred.
- D. Duct banks shall be sloped downward toward manholes and away from buildings a minimum of 6" per 100'. Duct banks shall not contain traps where water may accumulate.
- E. End bells shall be installed on primary duct ends where the ducts enter the manholes and buildings. End bells shall be firmly embedded in and flush with the inside surface of the wall.
- F. Pull a solid mandrel and a stiff bristled brush through each duct to clean them and insure the absence of kinks and flat spots. A minimum 3-1/4" diameter by 5" minimum long mandrel shall be used for 4" conduit and a minimum 4" diameter by 6" minimum long mandrel shall be used for 5" diameter conduit. The mandrel pull shall be witnessed by the Owner's Representative.
- G. Direct buried a 3" thick minimum concrete cover shall protect ducts over the entire length and width of the duct bank.
- H. Duct banks shall be marked with a 6" wide red plastic marker strip placed in the backfill approximately 12" above the entire length of the duct bank.
- I. All ducts installed by this project shall contain measuring-type pull tape, Greenlee No. 435 or similar. The tape shall be waterproof polyester or nylon, printed with length measurements every foot to indicate the length of the duct, and have a minimum breaking strength of 130 lbs. A minimum of 60" of excess is required at both ends.

### **3.2 MANHOLE INSTALLATION REQUIREMENTS**

- A. Manholes shall be accessible by trucks, cable reel trailers and other cable pulling equipment.
- B. Underground ducts shall be permanently identified in the manholes and at both ends with numbered tags. Tagging requirements shall be obtained from the Owner's Electric Shop through the Owner's Representative.

### **3.3 GROUNDING**

- A. Primary duct banks shall be grounded with a No. 4/0 AWG bare stranded copper ground wire that is run within the duct bank and is bonded and grounded at both ends. Conduit shall not be used as the ground conductor.

- B. Primary manholes shall be grounded with four ¾" diameter by 10' long ground rods, one driven inside or outside of the manhole at each corner. Connect the ground rods with a No. 4/0 AWG bare, stranded copper ground wire loop. A No. 2 AWG bare stranded copper pigtail from the ground wire loop shall be used to bond together and ground the manhole cover frame, ladder support bracket, concrete inserts, metallic cable racks, duct bank ground conductors, and the shields of any primary cables that are spliced in the manhole.

**3.4 FIELD QUALITY CONTROL**

- A. The University shall assign an agent to coordinate Quality Control associated with activities as outlined throughout Part 3, "Execution".
- B. Contractor shall assist with establishing the order, timing, and duration of the activities requiring Quality Control for inclusion in the Project Schedule.
- C. The electrical equipment and construction to be observed by the Quality Control Agent include the following:
  - 1. Manholes
  - 2. Spacers
  - 3. Grounding
  - 4. Bell Ends
  - 5. Concrete Pours
- D. Provide the Quality Control Agent with reports, lists, forms, plans and drawings described throughout Part 3, "Execution".
- E. During the Shop Drawing Submittal Process, submit one set of the Shop Drawings to the Quality Control Agent for Review. Return to the Quality Control Agent one set of the A/E reviewed and stamped Shop Drawings.
- F. Correct the incomplete and non-conforming items that are identified by the Quality Control Agent.

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 260800 - ELECTRICAL ACCEPTANCE TESTS

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 260800 - ELECTRICAL ACCEPTANCE TESTS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 019100/019110 - Commissioning
  2. Section 017823 - Operation and Maintenance Manual

**1.2 TESTS**

- A. Perform the visual inspections, manual operations and tests on systems and equipment as described in Part 3, "Execution".
- B. Tests shall be performed and documented by an independent testing agency.

**1.3 TEST REPORTS**

- A. Provide written test reports, signed and dated, for all tests prior to acceptance of the tested equipment by the Owner. Test reports on Megger, dielectric absorption and high potential tests shall include the ambient temperature and relative humidity existing at the time of the tests.

**PART 2 - PRODUCTS (NOT APPLICABLE)**

**PART 3 - EXECUTION**

**3.1 VISUAL INSPECTIONS**

- A. Prior to any testing, perform visual inspections to verify the following:
1. The equipment is properly installed and anchored.
  2. The equipment is free from damage and defects.
  3. Shipping blocks and restraints have been removed.
  4. Electrical terminations have been properly tightened.
  5. The equipment has been properly aligned.
  6. The equipment has been properly lubricated.

7. The ventilation louvers are open and unobstructed.
8. The equipment has been thoroughly cleaned inside and outside.
9. The equipment is properly labeled and labels are correct.
10. The equipment is ready to be tested.

### **3.2 MANUAL OPERATION**

- A. Prior to any testing, mechanical devices shall be exercised or rotated manually to verify that they operate properly and freely.

### **3.3 PRIMARY CABLE TESTS**

- A. Perform a continuity test, 2,500-volt DC Megger test, a DC high potential test, and a second 2,500-volt DC Megger test on primary cables. The high potential test shall be performed at 45kV for new cable and at 30kV when new cable has been spliced to existing cable.

### **3.4 POWER CABLE TESTS**

- A. Perform a continuity check and a 1,000 volt DC Megger test on 600 volt power cables No. 4 AWG and larger.
  1. The Megger test shall be performed between each pair of conductors and from each conductor to ground.
  2. The Megger test shall be performed for 15 seconds or until the insulation resistance value stabilizes.
  3. The insulation resistance between conductors and from each conductor to ground shall be 100 megohms minimum in one minute or less. In addition, the lowest insulation resistance value shall not differ from the highest resistance value by more than 20 percent. But if the lowest value is above 1,000 megohms, the 20% balance requirement may be waived.

### **3.5 CONTROL CABLE TESTS**

- A. Perform a continuity check on control and instrumentation wiring.

### **3.6 ENGINE-GENERATOR SYSTEM TESTS**

- A. Perform a continuity check and 1,000 volt DC Megger test on the generator windings, generator circuit breaker, power circuit portions of the automatic transfer switch, and interconnecting power circuit wiring.
- B. Perform a continuity check on the control wiring.
- C. Calibrate the metering and time delay relays.
- D. Perform the normal start-up testing recommended by the engine-generator manufacturer.
- E. Perform a load bank test of overall system with a load bank rated at 100% preferred for a period of at least 120 minutes.

1. Open normal power to transfer switch and observe proper operation of engine-generator and automatic transfer switch (throwing over to emergency power), noting engine-generator start, time delays and other appropriate variables.
  2. Close normal power and observe proper transfer back to normal and proper shutdown of engine-generator, again noting time delays and other appropriate variables.
  3. Operate maintenance bypass switch to insure proper labeling and operation in all modes
- F. Test operation of all generator control and alarm connections to the Automatic Transfer Switches, remote annunciator(s), the Fire Command Center, the fire alarm system, the BAS system, and accessories under all conditions.

### **3.7 PRIMARY SWITCH TESTS**

- A. Perform a continuity check, 2,500-volt DC Megger test, and a DC high potential test on primary switches. DC high potential tests shall be performed at 37kV on new and existing primary switches.

### **3.8 SUBSTATION TRANSFORMER TESTS**

- A. Perform a DC Megger test and a turns-ratio test on unit substation transformers. The DC Megger test shall be performed at 2,500 volts on coils rated over 600 volts, and at 1,000 volts on coils rated 600 volts and below. The turns-ratio test shall be performed on each tap.
- B. Verify proper setting and operation of the fan control panel to insure it and the fans are operable and functional. Temperature-test the probes in each winding.

### **3.9 SECONDARY SWITCHGEAR TESTS**

- A. Perform a continuity check and 1,000 volt DC Megger test on buses, and on main and feeder breakers.
- B. Perform a primary current injection test and a 'Ducter' (contact resistance) test on main breakers.
- C. Perform a 1,000-volt DC Megger test and a turns-ratio test on CT's and PT's.
- D. Calibrate the metering.

### **3.10 SERVICE, DISTRIBUTION AND MOTOR CONTROL EQUIPMENT TESTS**

- A. Verify proper phasing of power circuits.
- B. Perform a 1,000-volt Megger test on buses, motor starters and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
- C. Perform a continuity check on control circuits and control panel internal wiring.
- D. Perform an operational test on the controls and alarms.

- E. Perform a continuity check and a 1,000-volt DC Megger test on 3 phase distribution and isolation transformers.

**3.11 MOTOR TESTS**

- A. Perform a 1,000-volt Megger test on 460 volt, 3 phase motors, and a 500 volt Megger test on 200 volt, 3 phase motors.
- B. "Bump" motors to verify proper direction of rotation.
- C. Run motors and check for vibration.

**3.12 GROUNDING TESTS**

- A. Measure the resistance to ground of each ground rod before connection to the other ground rods. The resistance shall not exceed 10 ohms.
- B. Measure the resistance to ground of the total ground system with all connections completed. The resistance shall not exceed 2 ohms for primary services or 5 ohms for secondary services.
- C. Tests of the resistance to ground shall be made using either the three point method or the fall-of-potential method.
- D. Perform a continuity check from equipment ground bus bars and ground lugs to the ground system.

**3.13 FIRE ALARM SYSTEMS**

- A. Perform testing in accordance with NFPA 72.

**3.14 HEAT TRACING CABLES AND MATS**

- A. Perform a continuity check, 500-volt DC Megger test and an operational test on heat tracing circuits prior to insulation of the pipe or tank. Verify proper current draw and heating of the heat tracing.
- B. Perform an operational test on the alarms as applicable.

**3.15 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

**1.2 PHASING**

- A. The Owner's primary system phase rotation is A-B-C.
- B. Phase new installations X-Y-Z (or A-B-C) from top to bottom, front to back and left to right when viewed from the front. Phase existing installations to match the existing.

**1.3 SPLICES AND TERMINATIONS**

- A. The Owner's Electric Shop primary crew shall install medium voltage primary cable splices. Coordinate installation through the Owner's Representative. Splices shall be made with Raychem Type HVS heat shrink splice kits only. Connectors for straight splicing shall be of the two way, solderless, compression type.
- B. Medium voltage primary cable terminations shall be made with Raychem Type HVT heat shrink termination kits or 3M Company Quick Term cold shrink termination kits. Lugs for terminations shall be of the two-hole, solderless, compression type.

**PART 2 - PRODUCTS (NOT APPLICABLE)**

**PART 3 - EXECUTION**

**3.1 INSTALLATION REQUIREMENTS**

- A. Pull primary cables in lengths not exceeding 500 feet. Avoid exceeding manufacturer's recommendations on pulling tension, sidewall pressures and cable bend radii. Train cables passing through manholes neatly in the same relative positions as in the duct bank, without crossing each other, and support them by porcelain insulators from the manhole cable racks.
- B. Ground the shields of primary cables at both ends. When primary cables are spliced in manholes, bond the cable shields at the splices to the manhole ground system.
- C. Identify the cable phases at all primary cable terminations. Identify phases in 1-1/2" high minimum letters painted on the cable supports or potheads wherever possible. When painting is not possible, identify phases in 1/2" high minimum letters on tags permanently attached to the cables.

**3.2 FIELD QUALITY CONTROL**

- A. Perform testing in accordance with Specification Section 260800, and submit a test report.

**3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. Provide an indoor, metal enclosed, unit substation assembly, configured as single-ended or double-ended as shown on the drawings, and consisting of primary section(s), transformer section(s), and secondary voltage distribution section(s).
- B. The substation and its major assemblies shall be designed and shipped in sections to accommodate the restricted size and configuration of the delivery route through the building, and the size of the substation room.

**INCLUDE THE FOLLOWING THREE PARAGRAPHS IF THE UNIT SUBSTATION IS PRE-PURCHASED BY THE UNIVERSITY. IF NOT BEING PRE-PURCHASED, DELETE THESE PARAGRAPHS.**

**INSERT DATE AND PROJECT ADDRESS BELOW IF PARAGRAPH IS RETAINED**

- C. Deliver the unit substation, in one coordinated shipment, to the installing Contractor at the project site, on or before the week of \_\_\_\_\_. The project site is at \_\_\_\_\_, Ann Arbor MI 48109-2080.
- D. Coordinate final delivery date, time, and other details with installing Contractor (to be named) at least 3 business days in advance of delivery date. Under Manufacturer's supervision, the installing Contractor will unload, move into position, and install the overall unit substation.

**DELETE PARAGRAPH BELOW IF BREAKDOWN IS NOT REQUIRED ON A PARTICULAR PROJECT**

- E. Provide supervision for the "breakdown" and "re-assembly" of the transformer section as needed to allow installation into the building.
- F. Before energization, provide a final inspection, testing, and written certification from the equipment supplier.
- G. Assist with substation start-up and commissioning activities.
- H. Provide a one-year minimum warranty from the date of acceptance by the University.

**INCLUDE PARAGRAPH BELOW FOR THE PURCHASE OF UNIT SUBSTATION WITH SIZE, SHIPPING SPLIT OR OTHER PHYSICAL RESTRICTIONS. INSERT DRAWING NUMBERS AND TITLES FOR THOSE DRAWINGS ACCOMPANYING THE SPEC. OMIT THIS PARAGRAPH IF NO DRAWINGS ARE TO ACCOMPANY THE SPEC.**

- I. The attached drawings are an integral part of these specifications. Carefully note the physical size of the unit, as well as shipping split and other physical restrictions noted on these drawings. Attached drawings include:
  - 1. Drawing \_\_\_\_\_
  - 2. Drawing \_\_\_\_\_
  - 3. Drawing \_\_\_\_\_
  - 4. etc..

**1.3 RELATED SECTIONS**

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 01 and other Division 26 specification sections apply to this section.

**1.4 REFERENCES**

- A. The unit substation shall comply with the following codes and standards as applicable:

1. MV Load Interrupter Switchgear: ANSI C37.20.3 and 20.4, ANSI C37.22, NEMA SG-5, and NEMA SG-6.
  2. Secondary Substation Transformers: 10 CFR Part 431, ANSI C57, IEEE 100, NEMA 201 and 210, and UL 1562.
  3. LV Metal-Enclosed Switchgear Assemblies: ANSI-C37.20, NEMA SG-5, and UL 1558.
  4. Low-Voltage Power Circuit Breakers: ANSI-C37.13, NEMA SG-3.
  5. Circuit Breaker Trip Devices: ANSI-C37.17.
  6. National Electrical Code (NEC): NFPA 70.
- B. Where differences exist between various Codes and Standards, the ANSI and IEEE Standards shall govern.
- C. Each of the three main sections of the substation (primary switch section, transformer section, and secondary distribution section) shall be UL listed and shall bear a UL label.
- D. The secondary distribution section shall be labeled as suitable for use as service equipment unless the One Line Diagram defines the primary loop switches or primary transformer disconnect switch as the service equipment.

#### 1.5 SUBMITTALS

- A. Submit for approval the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the University's project name and the University's full project number. Submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked will be rejected.
1. Dimensioned substation plan and elevations with dimensions of the installation clearances, working clearances, conduit entry points, and base mounting points. Identify the substation front and the shipping sections.
  2. Size, weight, and movement restrictions for shipping sections. Affirm that shipping sections meet noted building size and movement restrictions.
  3. One line diagram including normal and fault ratings, phase rotations, and major component locations.
  4. Bill of material with Manufacturers' names and model numbers for major components.
  5. Enclosure details including paint color.
  6. Primary switch section submittals including:
    - a. Dimensioned plan and elevations with bus and switch dimensions, switch handle dimensions, and phase and ground bus terminal locations and barriers.
    - b. One line diagram with bus, switch and fuse ratings, and interlock provisions.
    - c. Compartment details including front door and rear panel descriptions, sheet metal gauge, and painting details.
    - d. Terminal locations and details for phase and ground connections.
    - e. Phase-to-phase clearances and phase-to-ground clearances.
    - f. Bus bar details, connection methods, and materials.
    - g. Insulator and barrier details and materials.
    - h. Fuse and fuse holder descriptions.

- i. Fuse time-current characteristic curves.
  - j. Nameplate engraving.
7. Transformer section submittals including:
- a. Dimensioned plan and elevations with tap, control power transformer, temperature monitor, fan and control power connection point locations, and phase, neutral and ground connection locations.
  - b. Enclosure details including removable panel descriptions, louver locations, control wiring routing, sheet metal gauge, and painting details.
  - c. Terminal locations and details for phase, neutral, and ground connections.
  - d. Coil conductor materials and construction.
  - e. Insulation materials.
  - f. Test data sheets for similar transformers with test data on load losses, no-load losses, and sound level.
  - g. Temperature control system description, including details on the control power transformer, fans, temperature monitor, temperature alarms, hinged panel for the monitor, and control power connection points.
  - h. Schematic and connection diagrams for the temperature control system.
  - i. Full size copy of the nameplate.
  - j. Coil-to-bus/line connection materials, supports, and details.
  - k. Bus bar and line termination connection and support details.
8. Secondary voltage distribution section submittals containing:
- a. Dimensioned plan and elevations with circuit breaker, control power transformer, and metering device locations, and phase, neutral, and ground bus terminal locations.
  - b. One line diagram with bus, circuit breaker, trip unit, metering device and fuse quantities and ratings, and interlock provisions.
  - c. Compartment details including front door and rear panel descriptions, sheet metal gauge, painting details, mimic bus details, and breaker lifting device description.
  - d. Terminal locations and details for phase, neutral, and ground connections.
  - e. Phase-to-phase clearances and phase-to-ground clearances.
  - f. Bus bar connection and support details and bus materials.
  - g. Insulator and barrier details and materials.
  - h. Circuit breaker, trip unit, and current sensor descriptions.
  - i. Trip unit time-current characteristic curves.
  - j. Secondary metering description, including details on the current transformers, potential transformers, ammeter, voltmeter, watt-hour meter, and meter switches.
  - k. Schematic and connection diagrams for the secondary metering systems.
  - l. Nameplate engraving.

- B. Prior to acceptance of the substation by the University, submit for approval, copies of installation, operation, and maintenance manuals for the following equipment:
  - 1. Primary switches.
  - 2. Primary fuses.
  - 3. Transformer.
  - 4. Transformer temperature monitor, fans, and alarms.
  - 5. Circuit breakers and breaker lifting device.
  - 6. Circuit breaker trip units.
  - 7. Control power transformer.
  - 8. Electrical metering devices.

**1.6 SHIPPING, HANDLING, AND STORAGE**

- A. Protect the substation from weather and moisture condensation at all times.

*DELETE PARAGRAPH BELOW IF UNIT SUBSTATION IS BEING PRE-PURCHASED BY THE UNIVERSITY.*

- B. Provide temporary electric heaters in the transformer in accordance with Manufacturer's instructions until the substation is energized.

*INCLUDE PARAGRAPHS C-I BELOW IF UNIT SUBSTATION IS BEING PRE-PURCHASED BY THE UNIVERSITY. IF NOT BEING PRE-PURCHASED, DELETE THESE PARAGRAPHS.*

- C. Notify the University and University's installing Contractor (to be named) at least 3 working days in advance of delivery.
- D. Arrange for delivery of the substation at the noted site. The University's installing Contractor will unload, move, and install the unit substation under Manufacturer's direction.

*ENGINEER TO EDIT THE REQUIREMENTS BELOW AS APPLICABLE TO THE PARTICULAR BUILDING AND ROUTING PATH. INSERT THE DIMENSIONS BELOW (LENGTH X WIDTH) FOR THE ACCESS WAY BEING USED.*

- E. The transformer shall be constructed so it can be broken down in the field, if necessary, so it can be lowered through the access hatch, which measures \_\_\_\_\_ x \_\_\_\_\_ clear.
- F. The Manufacturer shall provide field service technicians, who will supervise the breakdown of the transformer, i.e. removing the enclosure and the secondary bus from the transformer assembly.
- G. The same technicians shall supervise the reassembly of the transformer at the final installation site.
- H. Ensure that all necessary extra bracing and tools required are in place, so, if necessary, the primary switches and secondary sections can be transported within the building, with their rear panel located at the bottom of transporting assembly.
- I. MANUFACTURER WARRANTIES OR CERTIFICATIONS SHALL NOT BE VOIDED BY THE DISASSEMBLY AND REASSEMBLY OF THE TRANSFORMER AND SWITCHGEAR SECTIONS.

**1.7 EXTRA MATERIALS**

- A. Deliver to the Owner the following extra materials matching the products installed, packaged with protective covering for storage, and identified with labels clearly describing the contents.

**INSERT THE QUANTITY OF SPARE FUSES NEEDED IN ITEM 1 BELOW; SELECT THREE FOR SINGLE ENDED UNIT OR SIX FOR DOUBLE ENDED UNIT.**

- 1. Spare Fuses: Provide \_\_\_\_\_ for each size of:
  - a. Fused primary switch power fuses.
  - b. Potential circuit fuses.
  - c. Control power fuses.
- 2. Spare Indicating Lights/Lenses: Six of each type installed.
- 3. Spare Kirk Keys: Two for each Kirk Key interlock.
- 4. Touch Up Paint: Three half pint containers or three spray cans of paint matching enclosure exterior finish.
- 5. Contact Lubricant: One container.

**1.8 QUALITY ASSURANCE**

- A. Perform standard industry tests on the substation prior to shipping.
- B. Provide copies of written test reports, signed and dated, for all factory and prototype tests.
- C. Provide a product certification, signed and dated by the substation Manufacturer, certifying that the substation complies with the specifications except as approved by the University in writing.

**1.9 WARRANTY**

- A. Guarantee work (parts and labor) for a period of one year from the date of the Owner's final acceptance of the project, Substantial Completion. A manufacturer's warranty beginning upon equipment receipt or startup shall be extended to one year from final project acceptance. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.
  - 1. Refer to Specification Section 011400 "Work Restrictions" for the Substantial Completion date.

**PART 2 - PRODUCTS**

**2.1 UNIT SUBSTATION ASSEMBLY**

- A. The following unit assemblers are approved when they use the components specified elsewhere in this specification:
  - 1. Eaton
  - 2. General Electric
  - 3. Square D by Schneider Electric

- B. The listing of specific assemblers does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed are not relieved from meeting these specifications in their entirety.
- C. The unit substation shall be a front and rear accessible structure suitable for indoor installation, consisting of primary section(s), transformer section(s), and secondary voltage distribution section(s).
  - 1. The sections shall be constructed to allow for straightforward field assembly into a single structure.
  - 2. The sections shall be constructed of steel frames and heavy gauge steel panels sized to maintain required alignments and clearances at all times. The sections shall also be sufficiently rigid to restrict deformation from external forces and weights that may be applied during maintenance activities.
  - 3. The sections shall be capable of withstanding the lifting, skidding, jacking or rolling (in any direction) actions needed to install the equipment. Factory-installed lifting eyes shall be provided on each section.
  - 4. The assembly shall have provisions for anchoring to steel leveling channels embedded in a concrete housekeeping pad.
- D. The substation shall be a front-aligned structure. Any variations in section depth shall be reflected on the rear side of the substation.

**ENGINEER TO VERIFY OVERALL DIMENSIONS FOR THE PROJECT. INSERT THE MAXIMUM ALLOWABLE DIMENSION BELOW.**

- E. The overall length of the assembly (HV switches, transformer section and secondary voltage distribution section) shall not exceed \_\_\_\_\_ feet.
- F. Buses and terminations shall be:
  - 1. Phased X-Y-Z (or A-B-C) from top to bottom, front to back, and left to right when viewed from the front.
  - 2. Bus bars, flexible connectors, jumpers, and terminations shall be copper.
  - 3. Bus bars, flexible connectors, jumpers, and terminations (except transformer winding terminals) shall be silver-plated before final assembly and shall be connected using two bolts minimum at each bus joint and insulator. Bolted connections shall use hex head bolts and split lock washers made of stainless steel or Grade 5 steel with clear zinc finish.
    - a. The NEMA specified minimum current-carrying cross sectional area of the bus shall not be compromised by the holes needed to make bus connections.
    - b. The overlap on bus connections shall be sufficient to ensure at least one bolt diameter distance from edge of bolt hole to edge of bus.
- G. Phase-to-phase and phase-to-ground clearances within the substation shall reflect the specified BIL ratings.

- H. Primary (medium voltage) insulators shall be porcelain or cycloaliphatic epoxy, sized to withstand the noted BIL and fault currents. When sizing the insulators, assume full load conditions and an ambient temperature of up to 40 degrees Celsius. The supports shall provide ANSI minimum creep distances between phases and ground.
- I. Secondary (low voltage) insulators shall be porcelain, cycloaliphatic epoxy, or of high strength, moisture, track, and fire resistant glass polyester. Insulators shall be sized to withstand the noted BIL and fault currents, and rated for the maximum temperatures that would occur under design load and fault current conditions and an ambient temperature of up to 40 degrees Celsius.
- J. Where glass polyester insulators are used, the cut edges shall be sealed to prevent moisture absorption.
- K. Barriers shall be provided to enclose openings where electrical connections pass from one section to another.
- L. Ventilation louvers shall be provided to dissipate the heat generated within each section. The louvers shall be located and guarded to minimize accidental contact with live parts.
- M. The sections shall be painted with Manufacturer's standard gray finish that meets the applicable standards of UL and ANSI.
- N. The unit substation shall include a continuous 1/4" by 2", hard-drawn copper ground bus bar extending the full length across the entire unit substation bottom. In each section, (primary switch, transformer, and secondary distribution), the ground bus bar shall include a Burndy HyGround compression grounding lug suitable for a #4/0 AWG equipment grounding conductor. The ground bus bar shall be drilled and tapped at regular intervals for feeder and branch circuit grounding conductor terminals.
- O. The substation shall include engraved metal or laminated plastic nameplates on the front of each section indicating ratings of equipment and Manufacturer's shop order number for the equipment. The nameplates shall consist of black letters at least 1/4" high on a white background. The nameplates shall be affixed with machine screws.
- P. The substation shall include 1/2-inch wide minimum red acrylic mimic bus affixed with machine screws. Mimic bus shall indicate switches, transformers, circuit breakers, fuses, TVSS units, terminations, fire pump tap, and similar devices.
- Q. All lugs within the substation shall be of the long barrel, two-hole compression type. Mechanical lugs shall not be accepted.

**2.2 PRIMARY SWITCH SECTION(S)**

- A. Subject to compliance with these specifications, provide products from the following Manufacturers:
  - 1. Eaton
  - 2. Powercon
  - 3. Square D by Schneider Electric

- B. Each primary switch section shall consist of two metal enclosed, non-fused, load break, primary loop switches as shown on the drawings, and a metal enclosed, fused, load-break, transformer disconnect switch.
- C. Ratings
1. Design Voltage: 15 kV, suitable for use on a 13.2 kV grounded system.
  2. Continuous Current and Interrupting Current: 600 amperes rms.
  3. Momentary Short Circuit Current and Fault Closing Current: 61,000 amperes asymmetrical at the system voltage, with system impedance X/R ratio of 15.
  4. Short Time (2 second) Current: 38,000 amperes symmetrical.
  5. Basic Impulse Level: 95 kV.
  6. Fuse Interrupting Capacity: 50,000 amperes symmetrical at the system voltage with a system impedance X/R ratio of 15.
- D. Bus and Compartment Requirements
1. The phase bus bars shall be routed across the top of the compartments to eliminate unnecessary transition sections.
  2. The loop switches shall be arranged for top or bottom entry of the primary cables.
  3. The primary cable terminations shall be located on bus 'run-backs', near the vertical center of the compartments. A minimum of 30" of straight space shall exist above and below the terminations to facilitate installation of stress cones and to prevent bending of the primary cables to less than the minimum cable bend radius.
  4. Provide side to side insulated cable supports above and below the 'run back' bus and connection points to relieve strain on the cable terminations.
  5. Two-hole, long barrel, compression type lug terminals shall be provided in each loop switch to accept single conductor, 350 kcmil, copper, shielded cable with 15 kV, 133 percent EPR insulation.
  6. The fused switch shall be cable-connected to the transformer section. Provide two-hole, long barrel, compression type lugs in the fused switch to accept the transformer primary connections.
  7. The switch compartments shall be NEMA 1 rated.
  8. The switch compartments shall contain hinged front doors for access to the switches and fuses, interlocked with the switch handles, and secured by three point latches. The hinges shall be concealed. The doors shall open a minimum of 90 degrees. The latch handles shall include provisions for padlocking in the closed position.
  9. The switch compartments shall contain hinged rear doors for access to the rear cable termination areas. Rear doors shall be secured to the compartment frames with hex head machine screws.
  10. In the loop switches, provide heavy-duty grounding bails to accommodate portable grounding equipment.

11. In the loop switches, provide full height and width insulating barriers between the incoming cables section of the switch in the rear, and the energized switch and bus components toward the front portion of the switch. The primary cable terminations shall be the only energized components exposed to the rear of the compartments.
12. The bus shall be insulated or totally enclosed by barriers, and shall not be accessible normally from either the front or the rear of the switch.
13. Provide an 8" x 16" minimum high-impact viewing window on the front door of each switch that permits full viewing of the position of all three switch blades. The window shall be affixed with metal through-bolts or brackets, and shall not be more than 62" above the finished floor.

**FOR FRONT-ONLY ACCESSIBLE SWITCHES, THE DESIGN CONSULTANT SHALL COORDINATE AND REVISE THE FOLLOWING PARAGRAPH WITH UM HIGH VOLTAGE AS NEEDED.**

14. Provide a viewing window on the rear door of each loop switch to allow viewing of fault indicators on primary cables (fault indicators provided by Owner). The window shall be affixed approximately 18" above the bus run backs if the cable is top entry or 18" below if the cable is bottom entry.
15. Provide a hinged grounded metal barrier bolted closed in front of every switch to prevent inadvertent contact with any live part, yet allow for a full-view inspection on the switch blade position.
16. Provide green OPEN and red CLOSED switch position indicators with the words "Open" and "Closed".
17. The primary switch shall be removable as a complete operational component.

E. Load Break Switches

1. The switches shall be fused or non-fused as shown on the drawings, gang operated, 3-pole, and 2-position.
2. The switches shall be bottom hinged.
3. In the fused switch, the fuses shall be de-energized when the switch is open. With the loop switches, it is realized that the blade may in some cases be energized even in the open position.
4. Switch blade materials shall be copper.
5. The switch mechanisms shall be quick make, quick break, and stored-energy type, providing quick operation independent of handle speed.
6. The switch mechanisms shall be direct coupled. Chain or cable drives are not acceptable, except if supplied as a complete unit (switch, operator, and enclosure) from Powercon ONLY.
7. Glass polyester phase barriers shall be provided for the full length of the switches and fuses for each pole. The barriers shall be easily removable, and shall allow for visual inspection of the switches and fuses with the barriers in place.
8. The switches and operators shall be rigidly supported entirely from the interior framework of the compartments.

9. The external manual operating handles shall include lock open and lock closed padlocking provisions for multiple padlocks. The handles shall not project more than 6 inches in front of the substation when the switches are in the open or closed position.
10. The fuses shall be located for easy removal and replacement from the front.
11. The fuses shall be separated from the switch and bus components by the minimum clearances specified by the fuse Manufacturer.
12. Mechanical interlocks shall prevent the opening of the compartment doors unless the switches are open, and to prevent the closing of the switches if the compartment doors are open.
13. Provide switch handle position switches within each switch for remote indication. Wire the position switches to a terminal block in the secondary section control cubicle.
14. A Kirk Key interlock shall prevent the opening or closing of the fused switch unless the secondary main breaker is open. The interlock shall be arranged so that the same key required for fused switch operation is held captive at the secondary main breaker unless the breaker is in the open position.

F. Primary Fuses

1. Primary fuses shall be of the current limiting type.
2. Fuses shall be Mersen (formerly Ferraz Shawmut) Type CL-14, GE Type EJO-1, or Eaton Type 15CLE.
3. The University and Engineer-of-Record will specify the required "E" rating of the fuses after review of the TCC curves submitted with the shop drawings.
4. After the University and Engineer-of-Record specify the fuse "E" rating, the substation Manufacturer shall confirm that the E rating specified is consistent with the coordination of the substation main and feeder circuit breakers as well as utility and fire pump disconnects, that the momentary and interrupting ratings of the substation are within acceptable limits, and that the fuses will operate within the damage curve of the supplied transformer.
5. Provide a metal or laminated plastic nameplate on the front door of the fused switch indicating the fuse type, fuse rating and the identification number of the time-current curve.
  - a. Provide a storage rack sized for storing 3 spare fuses in their original cartons inside the fused switch rear door.
  - b. If clearances cannot be maintained with fuse storage, then furnish a wall cabinet for installation by the Contractor.

**2.3 TRANSFORMER SECTION(S)**

- A. Subject to compliance with these specifications, and the special shipping and installation requirements noted in Part 1 of these Specifications, provide products from the following Manufacturers:

1. Asea Brown Boveri
2. Eaton

3. General Electric
4. MGM
5. Olsun
6. Square D by Schneider Electric

B. Each transformer section shall consist of a dry-type transformer with fans, temperature controls and any transitions required to connect to the substation primary and secondary sections.

**INSERT APPROPRIATE RATINGS BELOW.**

C. Ratings

1. Type: Air self-cooled and fan cooled, ventilated, dry-type.
  - a. Capacity: \_\_\_\_/\_\_\_\_/\_\_\_\_ kVA, AA/AA/FA.
  - b. Phase: 3.
  - c. Frequency: 60 Hertz.
  - d. Primary Voltage: 13.2 kV, delta connected.
  - e. Secondary Voltage: \_\_\_\_/\_\_\_\_ volts, 4 wire, wye connected, solidly grounded.
  - f. Withstand Rating: Suitable for a maximum available primary fault of 750 mVA with a system impedance X/R ratio of 15.
2. Insulation Class: 220 degrees C.
3. Insulation Temperature Rise: 115 degrees C maximum rise above a 40 degrees C maximum ambient. The transformer shall be capable of carrying a minimum of 15 percent continuous overload without exceeding a 150 degrees C rise in a 40 degrees C maximum ambient.
4. Insulation Basic Impulse Level:
  - a. 95 kV BIL on the 13.2 kV primary
  - b. 10 kV BIL on the secondary
5. Impedance: 5.75 percent (from 5.32 to 6.18 percent) on the base rating of the transformer.
6. Efficiency: In accordance with Federal requirements for energy efficient transformers contained in 10 CFR Part 431.
7. Sound level: 3 dBA below NEMA standard when tested in accordance with NEMA TR-1.
8. Harmonic Rating: None.

D. Core Requirements

1. The core shall be constructed with three or four legs.
2. The core shall consist of high grade, grain oriented, non-aging, high permeability silicon steel laminations with progressively stepped, rigidly clamped joints.
3. The core's magnetic flux density shall be well below the saturation point.
4. The core shall be grounded by use of a removable flexible ground strap between the core and ground bus.

E. Coil Requirements

1. The coils shall be copper. Inter-phase connections shall be copper.
2. The coils shall be wound with the secondary winding inside the primary winding.
3. Ventilating ducts shall provide proper cooling under all load conditions.

F. Assembly Requirements

1. The coils shall be rigidly clamped to the core to prevent movement during short circuit conditions.
2. The assembled core and coils shall be vacuum pressure impregnated (VPI) polyester, with clean insulating varnish, and then baked. Coils containing debris baked into the varnish are not acceptable.
3. The core and coils shall be mounted on vibration isolators to mechanically isolate them from the frame and enclosure for sound reasons. These isolators shall also electrically isolate the core and coils for testing purposes.

G. Taps

1. Provide five full capacity, 2.5 percent taps on the primary winding, two below and two above the nominal voltage tap of 13.2 kV.
2. Jumper cables between taps shall be supported to prevent whipping during a fault.

H. Primary and Secondary Connections

1. The primary connections shall be of the flexible cable type. These primary connections shall be supported and shall pass through the primary switch/transformer barrier through smooth grommets, insulated bushings.
2. The secondary connections shall be of the braced bus bar type, equipped with flexible straps for vibration isolation.
3. The primary connections shall accept a minimum of two-bolts and the secondary connections shall accept a minimum of four bolts.

I. Cooling Fans

1. Cooling fans shall be of the propeller type, direct drive, with 120 VAC, single phase, TEFC motors. The motor circuits shall be fused or thermally protected.
2. Power for the fans and controls shall come from a control power transformer in the secondary distribution section.
3. The transformer temperature shall be monitored and the cooling fans shall be controlled by a Qualitrol, Cimco, or Eaton TC-100 temperature monitor.
  - a. The temperature monitor shall be rated 120 volts and mounted flush on the front of the transformer, approximately 54" above the finished floor.
  - b. The temperature monitor shall be mounted on a hinged front plate of a flush mounted box. The electrical connections shall be accessible and the monitor shall be removable without de-energizing the transformer.
  - c. Wiring to the temperature monitor shall be routed and supported independently of the transformer enclosure so that enclosure panels can be removed without affecting the wiring.
  - d. The temperature monitor shall include three hot spot temperature sensors, one for each transformer phase.

- e. The temperature monitor shall start the fans at a temperature of 100 degrees C. It shall initiate an audible alarm, close an "alarm" contact and illuminate a red alarm LED at 135 degrees C. It shall close a breaker "trip" contact and illuminate a second red alarm LED at 175 degrees C. The temperature set points shall be adjustable. The contacts shall be Form C and wired out to a terminal strip inside the temperature monitor box and are to be left for future use.
  - f. The temperature monitor shall include an LED or LCD display to allow reading of the hot spot temperature in each phase, and the highest temperature seen on each phase since the last reset. A reset button shall be provided to reset the maximum readings.
  - g. The temperature monitor shall include LED's indicating "power on" and "fans running".
  - h. The temperature monitor shall include an RS-485 data port for future connection to a remote monitor.
  - i. The temperature monitor shall include a Hand - Auto control switch connected in parallel with the temperature monitor fan control contacts.
  - j. Power for the temperature monitor shall come from the control power transformer located within the secondary section.
  - k. Provide sufficient wire coiled up to extend between the temperature monitor and the control power transformer.
- J. A metal nameplate conforming to NEMA standards shall be mounted on the front of the transformer.

#### 2.4 SECONDARY VOLTAGE DISTRIBUTION SECTION

- A. Subject to compliance with these specifications, provide products from the following Manufacturers:

1. Eaton
2. General Electric
3. Square D by Schneider Electric

**USE PARAGRAPH B FOR INDOOR SINGLE-ENDED UNIT SUBSTATIONS. USE PARAGRAPH C FOR INDOOR DOUBLE-ENDED UNIT SUBSTATIONS.**

- B. Single-ended unit substation secondary distribution section shall consist of two or more metal enclosed vertical stacks housing a main circuit breaker, feeder circuit breakers and circuit breaker spaces (as shown on the drawings), a control power transformer, a secondary metering compartment including CTs and PTs, and accessories.
- C. Double-ended unit substation secondary distribution section shall consist of four or more metal enclosed vertical stacks housing two main circuit breakers, tie circuit breakers, feeder circuit breakers and circuit breaker spaces (as shown on the drawings), circuit breaker controls, two control power transformers with transfer switch, two secondary metering compartments including CTs and PTs, and accessories.

**DELETE THE NEXT PARAGRAPH IF A FIRE PUMP TAP SECTION IS NOT REQUIRED.**

- D. If required, provide a fire pump bus tap vertical section between the transformer section and secondary main breaker section. The fire pump tap section shall be completely barriered from the transformer and secondary sections and shall not contain any equipment except metering CTs and PTs. The CTs shall be located ahead of the fire pump bus tap. The section shall comply with all requirements of NEC Articles 230 and 695.

**INSERT APPROPRIATE RATINGS BELOW.**

E. Ratings

- 1. Voltage: \_\_\_\_/\_\_\_\_ volts, 4-wire, wye connected.
- 2. Current: \_\_\_\_\_ amps.
- 3. Phase: 3.
- 4. Frequency: 60 Hertz.
- 5. Insulation Basic Impulse Level: 10 kV BIL.
- 6. Bus Bracing: The assembly shall be rated to withstand mechanical forces exerted during short-circuit conditions when connected directly to a power source having available fault current \_\_\_\_,\_\_\_\_ amperes symmetrical at rated voltage. The bus system shall have a minimum ANSI 4-cycle short-circuit withstand rating of 100,000 amperes symmetrical.
- 7. Circuit breakers shall have a minimum symmetrical interrupting capacity of \_\_\_\_, \_\_\_\_ amperes.
- 8. To ensure a fully selective system, circuit breakers shall have 30 cycle short-time withstand ratings equal to their symmetrical interrupting ratings as follows regardless of whether equipped with instantaneous trip protection or not:
  - a. For 800-2000 AF frame size, short time rating shall equal symmetrical rating up through 65,000 amperes.

**REVISE THE FOLLOWING PARAGRAPHS B AND C IF THE MODELED SHORT TIME RATINGS INDICATE THAT A SMALLER RATING IS ACCEPTABLE.**

- b. For 3200 AF frame size, short time rating shall equal symmetrical rating up through 85,000 amperes.
- c. For greater than 3200 AF frame size, short time rating shall equal symmetrical rating up through 100,000 amperes.

F. Bus and Compartment Requirements

- 1. Neutral bus shall be rated at 100 percent of the ampacity of the phase buses. The neutral bus shall be isolated from ground and the enclosure. The neutral bus shall be equipped with compression lugs for terminating circuit neutral conductors.
- 2. Blank compartments are not permitted. Spaces shall be fully bused, fitted with neutral current sensors rated to match the breaker frame sizes, and ready to accept future circuit breakers.
- 3. Provide a rear compartment barrier between the cable compartment and the main bus to protect against inadvertent contact with main or vertical bus bars
- 4. Provide a metal barrier full height and depth between adjacent vertical structures in the cable compartment.

**REVISE THE FOLLOWING PARAGRAPH IF SOME OR ALL OF THE FEEDERS WILL ENTER FROM THE BOTTOM.**

5. Compartments shall be arranged for top entry of the secondary cables, and shall include adequate space and support members for installing and supporting the feeder cables.
6. Circuit breaker compartments shall include hinged front doors secured by thumbscrews, three point latches or single quarter-turn latches.
7. Enclosure shall include removable top and rear panels. The panels shall be secured to the compartment frames with hex head machine screws.

G. Circuit Breakers

1. Circuit breakers shall be individually mounted, draw out, metal enclosed, stored energy type, quick-make and quick-break air circuit breakers.

**RETAIN THE FOLLOWING PARAGRAPH FOR DOUBLE-ENDED UNITS. DELETE FOR SINGLE-ENDED UNITS.**

2. Tie breaker(s) shall be identical to the main breakers and shall be capable of being exchanged with either main breaker.

**REVISE THE FOLLOWING PARAGRAPH IF SOME OR ALL OF THE FEEDER BREAKERS ARE TO BE ELECTRICALLY OPERATED. FOR DOUBLE-ENDED UNITS, BEGIN THE PARAGRAPH WITH "THE MAIN AND TIE BREAKERS SHALL..."**

3. Main breaker(s) shall be electrically operated and charged. The feeder breakers shall be manually operated and charged.
4. Electrically operated breakers shall use a dedicated and removable charging motor that is included with the substation.
5. Electrically operated breakers shall be equipped with open and close push buttons and position indicating lights.
6. Breakers shall be equipped with removable arcing contacts and operation counters.
7. Breakers shall be rated for 100 percent continuous duty, with frame and trip ratings as shown on the drawings.
8. Breakers shall be capable of being manually racked into three positions; "connected", "test", and "disconnected". The breaker frames shall be grounded in all positions.
9. The circuit breaker door design shall be such that the following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.
10. A breaker shall be tripped open and the stored energy in the breaker mechanism shall be discharged as the breaker is moved into the disconnected position.
11. Breaker compartments shall be dead-front. Shutters shall close automatically as a breaker is racked into the test or disconnected position. Control contacts shall be 'made' when breaker is in test or connected positions.

**FOR THE MAIN AND TIE BREAKERS IN DOUBLE-ENDED SUBSTATIONS, EDIT THE FOLLOWING PARAGRAPH TO ADD ISOLATED CONTACTS FOR REMOTE MONITORING OF THE MAIN AND TIE POSITIONS.**

12. Breakers shall have a minimum of two spare "Form C", isolated contacts brought out to an accessible terminal strip in the compartment. The contacts shall be rated 120 volts, 10 amperes, 60 Hz.
13. Each breaker shall be equipped with three phase current sensors, neutral current sensor, and a microprocessor-based trip unit.
  - a. Current sensors shall be rated to match the frame sizes of the breakers, except current sensors for breakers with trip ratings less than 50 percent of their frame sizes shall match the breaker trip ratings.
  - b. Current sensors shall be rated for 100 percent continuous duty.

**DELETE THE FOLLOWING PARAGRAPH IF BREAKER SHUNT-TRIP IS NOT REQUIRED. IF SHUNT TRIP IS REQUIRED, MODIFY THE SHUNT TRIP DEVICE VOLTAGE RATING IF NECESSARY.**

14. Where shown on the drawings, breakers shall be equipped with a shunt-trip device. The shunt trip device shall be a hinged armature device rated for operation at 120 volts AC. The shunt trip wiring shall be terminated on an accessible terminal strip in the breaker compartment.
15. Breakers shall be capable of being padlocked in the "open" position.
16. A Kirk Key interlock shall be provided to prevent the operation of the fused primary switch unless the main breaker is open.

**DELETE THE FOLLOWING PARAGRAPH IF SECTION 2.4.I "CIRCUIT BREAKER CONTROLS" IS REQUIRED BY SPECIFIC PROJECT PARAMETERS.**

17. A Kirk Key interlock shall be provided to prevent operation of the tie breaker unless one of the main breakers is open.

H. Solid State Trip Units

1. Solid-state trip units shall be provided on all secondary main and feeder breakers. Units shall be rated as indicated on the drawings. Trip units shall be true RMS sensing. Trip units shall be magnitude and time adjustable, and shall include local and remote indication of the cause of a trip.
2. Trip units shall allow adjustment without breaker trip. Using the test kit to inject a signal to test a breaker can cause the breaker to trip.
3. Trip units shall be rated for 100 percent continuous duty.
4. Trip units shall provide the following ranges and functions as a minimum:
  - a. Long time (L) current settings of at least 50-100 percent of the current sensor rating, divided into seven or more steps, and time delays of at least 2-22 seconds, at 600 percent of the long time current setting, divided into seven or more steps.

- b. Short time (S) current settings of at least 250-1000 percent of the long time current setting, divided into seven or more steps, and time delays of at least .1-.5 seconds, divided into seven or more steps, to include "flat response" and "I<sup>2</sup>T response" characteristics.
  - c. Instantaneous (I) settings of at least 200-1000 percent of current sensor rating. The instantaneous setting shall be provided on the feeder circuit breakers only. If it is provided on the main breaker, it shall be capable of being defeated.
  - d. Ground fault (G) current settings of 25-100 percent of current sensor rating, with a 1200 ampere maximum, divided in seven or more steps, with ground fault time delay settings of at least .1-.5 seconds, divided into five or more steps, to include "flat response" and "I<sup>2</sup>T response" characteristics.
5. Additional functions:
- a. Trip units shall provide the ability to field-select either instantaneous, short time pick-up and delay, or both instantaneous and short time protective functions.
  - b. Trip units shall provide integral metering functions including an integral keypad and back-lit graphical display capable of displaying:
    - 1) voltage
    - 2) amperage
    - 3) power factor
    - 4) frequency
    - 5) watts
    - 6) volt-amperes
    - 7) crest factor
    - 8) ampere demand
    - 9) watt demand
    - 10) voltage and current unbalance
    - 11) fault current levels phase-phase, phase-neutral, and phase-ground
    - 12) time-stamped event logs
    - 13) trip logs
  - c. Trip units shall be equipped to provide alarms based on primary over-current, ground over-current, over ampere demand, over kW, over kW demand, over kVAR, over kVA, and phase sequence. The alarms shall have separate adjustable pick-up and delay settings.
  - d. Trip units shall be equipped to provide selective alarm and breaker tripping functions based on neutral over-current, current unbalance, under/over-voltage, voltage unbalance, and under/over-frequency.
  - e. Trip units shall be equipped to provide digital harmonic sampling capability through at least the 13<sup>th</sup> harmonic.

- f. The main and tie circuit breaker trip unit(s) only shall include technology to reduce arc flash incident energy during maintenance activities. This technology shall reduce the trip unit instantaneous or short time trip value, arc flash incident level, and Personal Protection Equipment (PPE) level when enabled. This technology shall not compromise breaker phase protection even when enabled. When this technology is enabled and disabled, the recalibration of trip unit phase protection shall be accomplished without opening the circuit breaker door and exposing operators to energized parts.
  - 1) This technology shall reduce the arc flash incident energy during maintenance activities to a magnitude requiring PPE of Level 4 or less.
  - 2) This technology shall be enabled via a key lock switch located on the breaker trip unit or above the breaker door. An LED shall provide confirmation of protection.
- 6. Trip units shall have open protocol communication features (Modbus/TCP) including remote monitoring of power metering functions, remote open/close control of electrically operated breakers via communications, remote trip unit configuration, and remote alarming based on metered values.
- 7. Power for operating trip units shall be obtained from within the circuit breaker assembly itself, or by a separate control circuit connected to the secondary bus ahead of the secondary main breaker. The solid-state trip units shall have non-volatile memory to maintain all settings, trip indications, and fault data during a power outage. Batteries should not be required to maintain the memory. If batteries are required, the battery shall be capable of replacement without taking the breaker out of service.

**INCLUDE THE FOLLOWING ARTICLE (CIRCUIT BREAKER CONTROLS) FOR DOUBLE-ENDED UNITS ONLY IF REQUIRED BY SPECIFIC PROJECT PARAMETERS. DELETE FOR SINGLE-ENDED UNITS.**

I. Circuit Breaker Controls

- 1. For double-ended substations, provide main and tie circuit breaker controls to automatically or manually transfer one or both secondary main buses to the opposite power source. When transferring or retransferring an energized bus to the opposite power source, the transfer shall be closed-transition.
  - a. Provide a switch for selecting between "Automatic" or "Manual" Transfer.
  - b. Provide a switch for selecting between "Automatic" or "Manual" Retransfer.
  - c. Provide sensors to detect low voltage on any phase of either secondary bus. The low voltage setpoint shall be field adjustable between 80% and 100% of nominal.

- d. Provide time delays to control the timing of breaker operation. Transfer time delays shall be field adjustable between 0 and 60 seconds. Retransfer time delays shall be field adjustable between 10 and 600 seconds. The time that the breakers may be in closed transition shall be field adjustable between 5 and 30 cycles.
  - e. Upon a voltage drop on any phase of one side of the secondary bus, and after a time delay, the appropriate main breaker shall open and the tie breaker shall close. The low voltage setpoint shall be field adjustable between 80% and 100% of nominal, and the time delay shall be field adjustable between 0 and 30 seconds.
2. In the Automatic Transfer mode with both main breakers closed and the tie breaker open, a low voltage at one main breaker shall cause that main breaker to open and the tie breaker to close. If both main breakers experience a low voltage, no action shall be taken.
  3. In the Automatic Transfer mode with one main and the tie breaker closed and the other main breaker open, a low voltage at the closed main breaker shall cause that main breaker to open and the open main breaker to close. If both main breakers experience a low voltage, no action shall be taken.
  4. In the Automatic Retransfer mode with one main and the tie breaker closed and the other main breaker open, a return to nominal voltage at the open main breaker shall cause that open main breaker to close and the tie breaker to open.
  5. In the Manual Transfer and Manual Retransfer modes, breaker operation shall be manual only, except that the closing of all three breakers shall cause the tie breaker to open automatically after the closed transition time delay.

J. Control Power Transformer

**FOR DOUBLE-ENDED UNITS, BEGIN THE PARAGRAPH WITH "PROVIDE TWO CONTROL POWER TRANSFORMERS WITH..."**

1. Provide a control power transformer with primary and secondary fusing to supply power needed by the transformer temperature monitor, cooling fans, electrically operated breakers, and other equipment needing 120 volt control power. Place the transformer and fusing in a secondary compartment.

**INCLUDE THE THREE FOLLOWING SUBPARAGRAPHS FOR DOUBLE-ENDED UNITS. DELETE FOR SINGLE-ENDED UNITS.**

- a. Locate the transformers and fusing in cubicles.
  - b. Connect one transformer ahead of each main breaker.
  - c. Provide a control power transfer circuit that automatically transfers the control circuit from one control power transformer to the other.
2. Provide a terminal block for the wiring connecting the control power transformer to the transformer temperature monitor and cooling fans.
  3. Size the control power transformer to 125 percent of the anticipated maximum load (include the load of known future equipment when sizing).
  4. 208/120-volt substations do not need dedicated control power transformers, but the circuit shall be fused regardless.

K. Secondary Metering

1. Metering equipment shall be mounted so the top of meters (or switches) is no greater than 66 inches above finished floor.
2. Instrument Transformers

**FOR DOUBLE-ENDED UNITS, BEGIN THE PARAGRAPH WITH "PROVIDE THREE POTENTIAL TRANSFORMERS ON EACH SECONDARY MAIN BUS WITH..."**.

- a. Provide three potential transformers with a secondary voltage of 120 volts, a mechanical rating equal to the momentary rating of the circuit breakers, and an ANSI accuracy class of 0.3.
- b. Potential transformer leads shall contain current limiting fuses. The fuses shall be accessible so that they can be maintained without shutting down the substation. 208/120 volt substations do not need potential transformers, but shall be fused regardless.

**FOR DOUBLE-ENDED UNITS, BEGIN THE PARAGRAPH WITH "PROVIDE THREE CURRENT TRANSFORMERS ON EACH SECONDARY MAIN BUS WITH..."**.

- c. Provide three current transformers with a ratio that is equal to one-half of bus rating, a 5 ampere secondary, a service rating of 2.0, and an ANSI accuracy class of 0.3 or better. The current transformers shall be sized to carry, at rated accuracy, 133 percent of the burden of all equipment connected to them. The minimum burden rating shall be B0.5 (12.5 VA). Current transformers shall be capable of sustained primary current levels of 200 percent of nameplate rating.
  - d. Locate the current transformers between the transformer section and main breaker to include measurement of fire pump tap current. Locate shorting terminal blocks adjacent to their current transformers.
    - 1) Current transformers shall be installed so that their nameplates are readable.
    - 2) Current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks located adjacent to the CTs before connecting to any other devices. Shorting screws with provisions for storage shall be provided.
3. Ammeter and Voltmeter
    - a. The meters shall be 4.5 inch diameter or 6 inch square, flush or semi-flush, with 1 percent accuracy, anti-parallax 250 degree scales, and external zero adjustment.
    - b. The ammeter shall have a maximum reading equal to twice the rating of the current transformers and the full scale reading shall be equal to 10 Amps.
    - c. The voltmeter shall have a maximum reading of 240-volts on a 208-volt secondary, or 600-volts on a 480-volt secondary.
  4. Instrument Switches
    - a. Instrument switches shall be of the rotary type with an "off" position between each "phase" position.
    - b. The voltmeter switch shall permit the reading of all phase-to-phase and phase-to-neutral voltages.

- c. The ammeter switch shall permit the reading of all phase currents, and shall maintain current transformer secondary circuits closed at all times.
  - d. The switches shall be mounted under their associated meter, and they shall include appropriate escutcheon plates.
5. Kilowatt-Hour Meter:
- a. The kilowatt-hour meter shall be a transformer rated (minimum Class 10) polyphase electronic meter, ION8650 series as manufactured by Schneider Electric, complete with kWh energy and kW demand monitoring, drawout case, Ethernet port (10/100Base-T), RS-485 port, infrared port, 4 digital outputs, 3 digital inputs, 32MB memory, password protected; Schneider Electric catalog #M8650C4C0H6E1B0A.

**DELETE THE FOLLOWING PARAGRAPH IF FEEDER BREAKER SUB-METERING IS NOT REQUIRED.**

6. Kilowatt-Hour Sub-Meter:
- a. Provide kilowatt-hour sub-meters for individual feeder breakers as shown on the drawings.
    - 1) Kilowatt-hour sub-meters shall be the same as the main kilowatt-hour meter. Ammeters, voltmeters and instrument switches are not required.
    - 2) Voltage signals shall be obtained from the main potential transformers.
    - 3) Current signals shall be obtained from separate current transformers located at the feeder cable connections. Provide three current transformers with a ratio equal to one-half the feeder breaker frame size, a 5 ampere secondary, a service rating of 2.0, an ANSI accuracy class of 0.3 or better, and a minimum burden rating of B0.5.
    - 4) Current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks located adjacent to the CTs before connecting to any other devices. Shorting screws with provisions for storage shall be provided.
  - b. Sub-meters shall be mounted adjacent to the main kilowatt-hour meter or in a remote panel suitable for Contractor mounting on a wall 60" above the finished floor.
7. Provide small wiring, fuse blocks and terminal blocks within the switchgear as required. Control components mounted within the assembly shall be suitably marked for identification corresponding to the appropriate designations on Manufacturer's wiring diagrams.
8. Provide front access to all circuit breaker secondary connection points for ease of trouble shooting and connection to external field connections without the need of removing the circuit breaker for access.
9. Provide a front or rear accessible, isolated vertical wireway for routing of factory and field wiring. Wireway covers shall be secured by thumbscrews, three point latches or single quarter-turn latches. Factory provisions shall be made for securing field wiring without the need for adhesive wire anchors.

10. All control wire shall be Type SIS. Wire bundles shall be secured with nylon ties and anchored to the assembly with the use of pre-punched wire lances or nylon non-adhesive anchors. Adhesive anchors shall not be used.
  11. Control wires leaving the switchgear shall be provided with terminal blocks with suitable numbering strips and provisions for #10 AWG field connections. Each control wire shall be marked with its origin zone, wire name and destination zone over the entire length of the wire using a UV-cured ink process.
  12. Provide wire markers at each end of all control wiring. Plug-in terminal blocks shall be provided for all shipping split wires. Terminal connections to remote devices or sources shall be front accessible via doors above each circuit breaker or a wire trough in the cable compartment.
- L. Engraved laminated plastic nameplates shall be provided for breakers, the metering compartment, meters, instrument switches, fuse blocks, control power transformer, PT's, and CT's.
- M. The following accessories shall be provided:
1. A top mounted, manually operated, breaker-lifting device including mounting rails.
  2. For NEMA 3R rated exterior unit substations with non walk-in enclosure, a portable breaker lifting device capable of working from the floor between any nearby obstructions and housekeeping pads.
  3. Circuit breaker test plug and cable(s) as needed to test the breakers.
  4. Meter test plug.
  5. Circuit breaker trip unit test device.

### **PART 3 - EXECUTION**

*FOR ANYONE UNFAMILIAR WITH THE PRE-PURCHASE SPEC, THIS DOCUMENT GOES TO A MANUFACTURER, AND NOT TO A CONTRACTOR. AS SUCH, PART 3 SHOULD REMAIN BECAUSE IT INFORMS THE MANUFACTURER THAT THEIR RESPONSIBILITY DOES NOT END WITH THE DELIVERY OF THE SUBSTATION; THEY HAVE OBLIGATIONS TO FULFIL AT THE TIME OF INSTALLATION.*

#### **3.1 INSTALLATION**

*USE PARAGRAPHS A, B & C IF THE SUBSTATION IS PRE-PURCHASED IF NOT BEING PRE-PURCHASED, DELETE THESE PARAGRAPHS.*

- A. Installation and final testing of this unit substation shall be done under a separate contract, by the installing Contractor.
- B. All necessary hardware to secure the assembly in place shall be provided by the installing Contractor.
- C. The installing Contractor shall install all equipment per the Manufacturer's recommendations and the contract drawings.

*DELETE PARAGRAPHS D-I IF THE SUBSTATION IS PRE-PURCHASED.*

- D. Install all equipment per the Manufacturer's recommendations and per contract drawings.
- E. Provide a 4-inch thick minimum concrete housekeeping pad with 1" chamfered edge for the substation. Size and shape the pad in accordance with the approved substation shop drawings. Pad shall not extend more than four inches beyond the substation footprint. Pad shall be level to within 1/8 inch per three feet or in accordance with Manufacturer's recommendations.
- F. Anchor the unit substation to the concrete housekeeping pad using concrete anchors.
- G. Install fuses and set the temperature monitor, and circuit breaker trip units in accordance with the short circuit and coordination studies, the Owner's directions, and the Manufacturer's instructions.
- H. Provide temporary heaters in accordance with the Manufacturer's instructions until the substation is energized.
- I. The substation sections shall be installed and checked in accordance with the Manufacturer's recommendations. This shall include, but not be limited to:
  1. Checking to ensure that the pad location is level to within 1/8 inch per three feet of distance in any direction.
  2. Checking to ensure that all bus bars are torqued to the Manufacturer's recommendations.
  3. Assembling all shipping sections, removing all shipping braces, and connecting all shipping split mechanical and electrical connections.
  4. Measuring and recording Megger readings phase-to-phase, phase-to-ground, and neutral-to-ground (four-wire systems only).
  5. Inspecting and installing all circuit breakers in their proper compartments.
- J. Adjust taps to deliver appropriate secondary voltage.
- K. Confirm operation of circuit breakers using primary current injection method.
- L. Measure primary and secondary voltages for proper tap settings.
- M. Megger primary and secondary windings.
- N. Assist the University's Plant High Voltage Shop and Commissioning Authority with substation testing, start-up, and commissioning activities.
- O. For each kilowatt-hour meter, provide a dedicated one-inch conduit with nylon pull string from the substation to the nearest voice/data cable tray or Telecommunication Room.
- P. For switch handle position switches, provide a dedicated one-inch conduit with nylon pull string from the substation to the nearest voice/data cable tray or Telecommunication Room.

**3.2 FIELD QUALITY CONTROL**

- A. The substation's Manufacturer shall provide the services of a qualified factory-trained Manufacturer's representative to assist the installing Contractor in the installation and start-up of the equipment specified under this section for a period of two working days.
- B. The substation's Manufacturer shall provide to the Owner a line item cost for each additional day of the factory-trained Manufacturer's representative services that may be required, for up to a total of seven days.
- C. The Manufacturer's Representative shall provide technical direction and assistance to the contractor in general assembly of the equipment, connections, and adjustments. The Manufacturer's Representative shall provide testing of the assembly and components.
- D. The Manufacturer shall provide to the installing contractor three copies of the Manufacturer's field start-up report and written certification that the equipment has been installed and assembled per Manufacturer's direction and is approved for energization.

***DELETE PARAGRAPHS E-P IF THE SUBSTATION IS PRE-PURCHASED.***

- E. Provide the visual inspections, manual operations, and tests on systems and equipment described below. Tests shall be performed and documented by an independent testing agency.
- F. Provide written test reports, signed and dated, for all tests prior to acceptance of the unit substation by the Owner. Test reports on Megger (insulation resistance), dielectric absorption, high potential and ducter (contact resistance) tests shall include the ambient temperature and relative humidity existing at the time of the tests.
- G. Prior to any testing, perform visual inspections to verify the following:
  - 1. The equipment is completely and properly installed.
  - 2. The equipment is free from damage and defects.
  - 3. Shipping blocks and restraints have been removed.
  - 4. Electrical terminations have been properly tightened.
  - 5. The equipment has been properly aligned.
  - 6. The equipment has been properly lubricated.
  - 7. The ventilation louvers are open and unobstructed.
  - 8. The equipment is ready to be tested.
- H. Prior to any testing, exercise mechanical devices to verify they operate properly and freely.
- I. Prior to any testing, verify that all circuit breaker trip units are set in accordance with the approved short circuit and coordination studies.
- J. Perform a continuity check, 2,500-volt DC Megger test, and a DC high potential test on primary switches. DC high potential tests shall be performed at 37kV on new and existing primary switches.

- K. Perform a DC Megger test and a turns-ratio test on unit substation transformers. The DC Megger test shall be performed at 2,500 volts on coils rated over 600 volts, and at 1,000 volts on coils rated 600 volts and below. The turns-ratio test shall be performed on each tap.
- L. Verify proper setting and operation of the fan control panel to ensure it and the fans are operable and functional. Temperature-test the probes in each winding.
- M. Perform a continuity check and 1,000 volt DC Megger test on the secondary switchgear buses and on the main and feeder breakers.
- N. Perform a primary current injection test and a ducster (contact resistance) test on all breakers.
- O. Perform a 1,000-volt DC Megger test and a turns-ratio test on CT's and PT's.
- P. Calibrate the metering.

**DELETE 3.3 IF SUBSTATION IS BEING PRE-PURCHASED.**

### **3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

### **3.4 TRAINING**

**DELETE PARAGRAPH A IF THE SUBSTATION IS PRE-PURCHASED BY THE UNIVERSITY.**

- A. Provide a qualified service technician from the Manufacturer's staff to conduct two training sessions.

**DELETE PARAGRAPH B WHEN THE SUBSTATION IS PROVIDED BY THE CONTRACTOR.**

- B. A Manufacturer's qualified representative shall conduct two training sessions. **These services have been purchased under the substation's pre-purchase agreement, by the University.**
- C. The installing Contractor shall arrange and coordinate the two training sessions, for up to fifteen Owner's Representatives. Each session shall last four hours and shall be conducted during normal workdays at a jobsite location determined by the owner. These training sessions shall take place BEFORE the start-up of the new substation.
- D. Coordinate the training session topic(s) with the Owner's Representatives a minimum of two weeks prior to the session. Training topics may include basic substation maintenance and operation or may include detailed training on any of the substation components.

Fax: 734-936-3334

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 261102 - INSTALLATION OF PRE-PURCHASED UNIT SUBSTATIONS

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**

**SECTION 261102 - INSTALLATION OF PRE-PURCHASED UNIT SUBSTATIONS**

**PART 1 - GENERAL**

**1.1 SUMMARY**

- A. The University of Michigan will pre-purchase an indoor, metal-clad, unit substation assembly consisting of primary voltage switch, transformer, and secondary voltage switchgear sections. The unit substation assembly shall be received, handled and properly stored, as needed and installed, tested and activated by this Contractor.

**1.2 RELATED SECTIONS**

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 1 and other Division 26 specification sections apply to this section.

**PART 2 - PRODUCTS**

**2.1 INSTALLATION HARDWARE**

- A. All necessary hardware to secure the assembly in place shall be provided by the installing Contractor.

**PART 3 - EXECUTION**

**3.1 FIELD QUALITY CONTROL**

- A. The substation's Manufacturer is providing the services of a qualified factory-trained Manufacturer's representative to assist the installing Contractor in the installation and start-up of the equipment specified under this section for a period of two (2) working days.
- B. The substation's Manufacturer has provided to the Owner a line item cost for each additional day of the factory-trained Manufacturer's representative services that may be required, for up to a total of seven (7) days.
- C. The Manufacturer's representative shall provide technical direction and assistance to the contractor in general assembly of the equipment, connections and adjustments, and testing of the assembly and components contained herein.
- D. The installing Contractor shall provide three (3) copies of the Manufacturer's field start-up report.

### 3.2 INSTALLATION

- A. Accept delivery of new unit substation and, if necessary, store unit in a heated, secure building.
- B. Co-ordinate with the Owner's Representative for an independent inspection of the delivered substation assemblies. The University will hire and pay an independent agency to inspect the delivered substation sections and to verify that all specifications and drawing requirement of the pre-purchase package have been met.
- C. The same independent agency will perform the overall commissioning of the installed substation and all their services will be paid by the University. The installing contractor shall coordinate and facilitate the commissioning tasks.

*EDIT AND/OR REMOVE PARAGRAPH, IF BREAK-DOWN IS NOT REQUIRED IN A PARTICULAR PROJECT.*

- D. Under the direction of Manufacturer's field representative, break down the unit substation's transformer by removing the enclosure and the secondary bus from the transformer assembly. This is necessary to clear the existing low clearance of \_\_\_\_\_ inches vertically inside the building.

*EDIT AND/OR REMOVE PARAGRAPH IF BREAK-DOWN IS NOT REQUIRED IN YOUR PARTICULAR PROJECT.*

- E. The Manufacturer's field representative shall supervise the reassembly of the transformer at the final installation site.

*EDIT AND/OR REMOVE PARAGRAPH IF TILTING OR LOW POINTS ARE NOT REQUIRED OR ARE NOT RELEVANT IN YOUR PARTICULAR PROJECT.*

- F. Ensure that all necessary extra bracing and tools required are in place, so that the primary switches and secondary sections can be transported tilted as necessary, so they can pass under the low point of the travel path of \_\_\_\_\_ inches within the building.
- G. Remove secondary breakers from their compartments, before transporting secondary sections to the substation room.
- H. Re-install secondary breakers in their compartments, after installing secondary sections to the substation room.

*EDIT AND/OR REMOVE PARAGRAPH IF THERE IS NO ROUTING DRAWING REQUIRED IN YOUR PARTICULAR PROJECT.*

- I. Consult Drawings regarding the proposed routing of the unit substation.
- J. The Contractor shall install all equipment per the Manufacturer's recommendations and per contract drawings.

- K. Provide a 4 inch thick minimum concrete housekeeping pad for the substation. Size and shape the pad in accordance with the approved substation shop drawings. Pad shall not extend more than four (4) inches beyond the substation footprint. Pad shall include embedded steel leveling channels that are level to within 1/8 inch per three (3) feet. Leveling channels shall have a 1/8 inch reveal above the top of the concrete. The quantity, size and locations of leveling channels shall be in accordance with Manufacturer's recommendations.
- L. Anchor the unit substation to the concrete housekeeping pad using concrete anchors.
- M. Install fuses, set the temperature monitor, and circuit breaker trip units in accordance with the short circuit and coordination studies, the Owner's directions, and the Manufacturer's instructions.
- N. Provide temporary heaters in accordance with the Manufacturer's instructions until the substation is energized.
- O. Arrange for testing and setting of the unit substation devices in accordance with these specifications, applicable codes and standards, and Manufacturer's instructions. The University will supply breaker settings and transformer primary fuse size.
- P. The substation sections shall be installed and checked in accordance with the Manufacturer's recommendations. This shall include but not limited to:
  - 1. Checking to ensure that the pad location is level to within 1/8 inch per three feet of distance in any direction.
  - 2. Checking to ensure that all bus bars are torqued to the Manufacturer's recommendations.
  - 3. Assembling all shipping sections, removing all shipping braces and connecting all shipping split mechanical and electrical connections.
  - 4. Measuring and recording Megger readings phase-to-phase, phase-to-ground, and neutral-to-ground (four wire systems only).
  - 5. Inspecting and installing all circuit breakers in their proper compartments.
- Q. Adjust taps to deliver appropriate secondary voltage.
- R. Confirm operation using primary current injection method.
- S. Measure primary and secondary voltages for proper tap settings.
- T. Megger primary and secondary windings.
- U. Assist the University's Plant High Voltage Shop and Commissioning Authority with substation testing, start-up and commissioning activities.

**3.3 MANUFACTURER'S CERTIFICATION**

- A. A qualified factory-trained Manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the Manufacturer's recommendations. **These services have been purchased under the substation's pre-purchase agreement, by the University.**

- B. Provide three (3) copies of the Manufacturer's representative's certification.

**3.4 TRAINING**

- A. A Manufacturer's qualified representative shall conduct two training sessions. **These services have been purchased under the substation's pre-purchase agreement, by the University.**
- B. The installing Contractor shall arrange and coordinate the two training sessions, for up to fifteen (15) Owner's Representatives. Each session shall last 4 hours and shall be conducted during normal workdays at a jobsite location determined by the owner. These training sessions shall take place BEFORE the start-up of the new substation.
  - 1. One training program shall be of the "start-up" type and shall include instructions on the assembly, including primary equipment, transformer, and secondary equipment. All circuit breakers, protective devices and other major components shall be included.
  - 2. A second training program shall be focused on the maintenance of the unit substation, including primary equipment, transformer, and secondary equipment. All circuit breakers, protective devices and other major components shall be included.

**3.5 PRIOR TO SHIPPING**

- A. Approximately 7 days prior to shipment of the unit substation components, the local representative of the manufacturer shall meet with the U-M design manager (electrical engineer), as well as other designated U-M stakeholders at the U-M A&E office complex. The purpose of the meeting will be to participate in a conference telephone call to the factories where the substation components are being assembled. The local representative shall coordinate with the factories to ensure that an authorized and qualified factory representative is available (at all sites) who will be able to discuss in detail the U-M assembly. Items such as shop drawing comments, etc. shall be discussed and verified during the telephone conference calls. Under no circumstance may the components be shipped prior to the telephone verifications.

**SECTION 262000 - LOW VOLTAGE ELECTRICAL DISTRIBUTION**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO  
BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.*

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 019100/019110 - Commissioning
2. Section 017823 - Operation and Maintenance Manual
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

**PART 2 - PRODUCTS**

**2.1 POWER AND DISTRIBUTION PANELBOARDS - FUSIBLE SWITCH TYPE**

- A. Power and distribution panelboards shall be of the voltage and amperage shown, 3 phase, 4 wire, 200,000 amps AIC, dead front, fusible switch type, with main fused switch or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface trim. Provide switches and Class R dual element fuses as shown. Eaton Pow-R-Line 4F, GE Spectra, Siemens P4 or P5, or Square D QMB.

1. Blank switch positions shall be fully bused and ready to accept future switches.
2. Bus and switch terminals shall be identified as accepting copper and aluminum cables.
3. Enclosure shall be sized to provide adequate conduit knockout space and gutter wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.

4. Door shall have concealed hinge, flush handle, lock, with 2 keys and panel directory frame. All panel locks shall be keyed alike.

## **2.2 POWER AND DISTRIBUTION PANELBOARDS - CIRCUIT BREAKER TYPE**

- A. Power and distribution panelboards shall be of the voltage and amperage shown, 3 phase, 4 wire, 50,000 amps AIC minimum, dead front, circuit breaker type, with main circuit breaker or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface trim. Provide circuit breakers as shown. Eaton Pow-R-Line 4B, GE Spectra, Siemens P4 or P5, or Square D I-Line.
  1. Blank circuit breaker spaces shall be fully bused and ready to accept future circuit breakers.
  2. Bus and circuit breaker terminals shall be identified as accepting copper and aluminum cables.
  3. Enclosure shall be sized to provide adequate conduit knockout space and gutter wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.
  4. Door shall have concealed hinge, flush handle, lock with 2 keys, and panel directory frame. All panel locks shall be keyed alike.

## **2.3 LIGHTING AND RECEPTACLE PANELS**

- A. Lighting and receptacle panels shall be of the voltage, amperage and number of positions shown, 3 phase, 4 wire, 22,000 amps AIC minimum unless shown otherwise, circuit breaker type, with main circuit breaker or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface or flush trim as shown. In main circuit breaker panels, the main circuit breaker shall be separate from and not mounted in feeder breaker positions. Load center type panels are not acceptable. Provide circuit breakers as shown. Eaton Pow-R-Line 1 or 2, GE A series, Siemens P1 or P2, or Square D NF or NQOD.
  1. Bus and circuit breaker terminals shall be identified as accepting copper and aluminum cables.
  2. Enclosure shall be sized to provide adequate conduit knockout space and wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.

3. Front cover shall be factory manufactured, UL/NRTL listed, one-piece, hinged "door-in-door" type with: Interior hinged door with hand-operated latch or latches as required to provide access to circuit breaker operating handles only; not energized parts. Outer hinged door to provide access to the entire closure including the dead front and all wiring gutters. Outer door shall be kept securely closed with factory bolts, screws, clips or other fasteners to the panel box, requiring a tool for entry; hand operated latches are not acceptable. Both inner and outdoor doors shall open left to right. Include one-piece, removable, inner dead front cover, independent of the panelboard cover. Door shall have concealed hinge, flush handle, lock with 2 keys and panel directory frame. All panel locks shall be keyed alike.

#### **2.4 CIRCUIT BREAKERS**

- A. Circuit breakers shall be molded case, bolt-on, quick make and quick break, thermal-magnetic type with trip indication, and shall be from the same manufacturer as the panel in which they are installed. Circuit breaker terminals shall be identified as accepting copper and aluminum cables. Eaton, GE, Siemens or Square D.
  1. Circuit breakers for power and distribution panelboards shall have a minimum interrupting rating of 35,000 amps RMS at 240 volts AC or 25,000 amps RMS at 480 volts AC.
  2. Circuit breakers for lighting and receptacle panelboards shall have a minimum interrupting rating of 22,000 amps RMS at 240 volts AC or 25,000 amps RMS at 480 volts AC.
  3. Circuit breakers used for switching fluorescent lighting or for protecting air conditioning compressors shall be so listed.
  4. Circuit breakers used for feeding electrical heat tracing shall include ground fault equipment protection rated to trip at 30 ma.

#### **2.5 DISTRIBUTION TRANSFORMERS**

- A. Distribution transformers shall be 480-208Y/120 volts, of the kVA and K rating shown, dry type, with copper or aluminum windings, a 220 degrees C insulation system, and designed for a maximum temperature rise at full load of 115 degrees C above a 40 degrees C ambient. Terminals shall be identified as accepting copper and aluminum cables. Transformers shall have a sound rating 3 dB below NEMA standard (42 dB for 10-50 kVA, 47 dB for 51-150 kVA, 52 dB for 151-300 kVA and 57 dB for 301-500 kVA rated transformers), and shall be equipped with four taps, two 2-1/2 percent above and two 2-1/2 percent below nominal. Acme, Cutler Hammer/Westinghouse, GE, Hevi-Duty, MGM, Olsun, Siemens, or Square D.

#### **2.6 FUSES**

- A. Fuses for general use shall be rated 250 or 600 volts as required, Class R, dual element type with a 200,000 amp AIC interrupting rating. Bussmann, Gould Shawmut or Littelfuse.

**PART 3 - PART 3 EXECUTION**

**3.1 INSTALLATION**

- A. Provide No. 10 AWG wire to NEMA Type 6-20R receptacles serving freezers, window air conditioners or other large appliances.
- B. Where shown on the drawings, provide a separate neutral conductor for each single-phase branch circuit. The neutrals of these single-phase circuits shall not be shared or daisy-chained.
- C. Color code circuit breakers and disconnect switches of fire alarm systems and emergency circuits with red paint. Provide lock-on clips on the circuit breaker handles.
- D. Provide nameplates in accordance with Section 260500.
- E. Provide a detailed typed directory for all new and modified panelboards.

**3.2 FIELD QUALITY CONTROL**

- A. Prior to any testing, perform visual inspections to verify the following:
  - 1. The equipment is properly installed and anchored.
  - 2. The equipment is free from damage and defects.
  - 3. Electrical terminations have been properly tightened.
  - 4. The ventilation louvers are open and unobstructed.
  - 5. The equipment has been thoroughly cleaned inside and outside.
  - 6. The equipment is properly labeled and labels are correct.
  - 7. The equipment is ready to be tested.
- B. Perform the following testing and submit a test report.
  - 1. Verify proper phasing of power circuits.
  - 2. Perform a 1,000-volt Megger test on buses and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
  - 3. Perform a continuity check on control circuits and control panel internal wiring.
  - 4. Perform an operational test on the controls and alarms.
  - 5. Perform a continuity check and a 1,000-volt DC Megger test on 3 phase distribution and isolation transformers.

**3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

**END OF SECTION 262000**

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 262726 - WIRING DEVICES

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 262726 - WIRING DEVICES**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

***IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.***

- B. Related Sections:
1. Section 017823 - Operation and Maintenance Manual
  2. Section 019100/019110 - Commissioning
  3. Section 260513 - Medium, Low & Control Voltage Cables
  4. Section 260526 - Grounding and Bonding for Electrical
  5. Section 260533 - Electrical Materials and Methods
  6. Section 260800 - Electrical Acceptance Tests

**1.1 SUMMARY**

- A. Section Includes:
1. Lighting switches and occupancy sensors.
  2. Receptacles.
  3. Device cover plates.
  4. Receptacle strips and power poles.
  5. Floor boxes and floor poke-through devices.
  6. Pin and sleeve connectors.

**1.2 SUBMITTALS**

- A. Product Data: Include manufacturers, catalog illustrations, models, rated capacities, dimensions, rough-in requirements, wiring diagrams and materials of construction. Wiring diagrams shall be project specific and differentiate between factory wiring and field wiring. Include written sequences of operation for all controls.
- B. Installation, Operation and Maintenance Manuals

**1.3 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards, latest editions, of all NEMA and UL standards applicable to each type of wiring device.

**1.4 WARRANTY**

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

*CHANGE DEVICE COLORS WHEN NECESSARY TO MATCH EXISTING DEVICES.*

**2.1 TOGGLE SWITCHES**

- A. Toggle switches shall be rated 120/277 volts, 20-amperes, single-pole, double-pole, 3-way or 4-way as shown, heavy duty, back and side wired, with white handles. Arrow Hart (Cooper), Bryant, Hubbell, Leviton or Pass & Seymour.

**2.2 DIMMER SWITCHES**

- A. Dimmer switches shall be rated for the types of lamps being controlled, 1000 watts minimum, specification grade, heavy duty, with white slider or knob and radio noise filter, and suitable for use in a single gang box. Leviton, Lithonia or Lutron.

**2.3 OCCUPANCY SENSORS**

*SHOW OCCUPANCY SENSOR TYPES, LOCATIONS AND AIMING ON PLAN DRAWINGS. PROVIDE SEPARATION BETWEEN OCCUPANCY SENSORS AND SOURCES OF AIR CURRENTS PER MANUFACTURERS INSTRUCTIONS.*

- A. Wall mounted occupancy sensors shall be rated 600 watts minimum, 180 degrees coverage minimum, 300 sq. ft. coverage minimum, infrared type, heavy duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", integral manual override switches, and suitable for mounting in single gang wall mounted boxes. Sensors with triac power switching devices are not acceptable. Hubbell, Leviton, Lutron, Sensorswitch, Tork or Wattstopper.
- B. Ceiling mounted occupancy sensors shall be rated 1000 watts minimum, 180-360 degrees coverage as required, 1000 sq. ft. coverage minimum, infrared type, heavy duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling mounted boxes. Sensors shall utilize a low voltage power supply and control circuits, and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Hubbell, Leviton, Lutron, Sensorswitch, Tork or Wattstopper.

**DELETE EITHER C OR D BELOW. DUAL TECH MICROPHONIC/PIR OCCUPANCY SENSORS ARE PREFERRED DUE TO LESS SENSITIVITY TO AIR CURRENTS AND LESS POSSIBILITY OF HEARING AID INTERFERENCE.**

- C. Dual technology microphonic/PIR occupancy sensors shall be rated 1000 watts minimum, 180-360 degrees coverage as required, 1000 sq. ft. coverage minimum, and combination microphonic/infrared type. The microphonic component shall be acoustically passive and "listen" for sounds indicating occupant motion. The overall occupancy sensor shall be heavy duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling or wall mounted boxes. Sensors shall utilize low voltage power supply and control circuits and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Sensorswitch.
- D. Dual technology ultrasonic/PIR occupancy sensors shall be rated 1000 watts minimum, 180-360 degrees coverage as required, 1000 sq. ft. minimum coverage, and combination ultrasonic/infrared type. The ultrasonic component shall operate at 32 kHz minimum and be compatible with hearing aids. The overall occupancy sensor shall be heavy duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling or wall mounted boxes. Sensors shall utilize low voltage power supply and control circuits and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Hubbell, Leviton, Lutron, Tork or Wattstopper.

**2.4 DUPLEX RECEPTACLES**

- A. Duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire, NEMA Type 5-20R, heavy duty, back and side wired, grounding type with nylon or Lexan bodies. Except where shown otherwise, normal power receptacles shall have white faces, emergency power receptacles shall have red faces, and "special power" receptacles shall have gray faces. Arrow-Hart (Cooper), Bryant or Hubbell 5362, or Leviton or Pass & Seymour 5362A.

**2.5 GFCI AND AFCI DUPLEX RECEPTACLES**

- A. Ground-fault circuit interrupter (GFCI) and arc-fault circuit interrupter (AFCI) duplex receptacles shall be rated 125 volts, 20 amps, 2 pole, 3 wire straight blade type with nylon or Lexan bodies and white faces. GFCI receptacles shall trip when ground currents exceed 5 ma, and shall trip in 25 milliseconds maximum. AFCI receptacles shall recognize characteristics unique to an arcing fault and trip when an arc fault is detected. Receptacles shall have an interrupting rating of 2000 amps and shall lock out (off) when the protection system fails. Arrow Hart (Cooper), Bryant, Hubbell, Leviton or Pass & Seymour.

**2.6 TVSS AND TAMPER-RESISTANT DUPLEX RECEPTACLES**

- A. TVSS and tamper-resistant duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire straight blade type with nylon or Lexan bodies and white faces. TVSS receptacles shall clamp at 330 volts or less, and shall have visual indication of the failure of their protective circuitry. Tamper-resistant receptacles shall require the simultaneous insertion of both line and neutral plug blades before power is applied to the receptacle contacts. Arrow Hart (Cooper), Bryant, Hubbell, Leviton or Pass & Seymour.

**2.7 USB CHARGER DUPLEX RECEPTACLES**

- A. USB charger duplex receptacles shall be rated 125 volts, 20 amps, with two 2 pole, 3 wire, tamper-resistant receptacles and two USB Type A charger ports. Receptacles shall be NEMA Type 5-20R, heavy duty, back and side wired or pigtail wired, grounding type with nylon or Lexan bodies and white faces. USB ports shall be 5 volts DC, 3.1 amps minimum combined total, compatible with USB Type 2.0 and 3.0 devices. Arrow Hart (Cooper), Bryant, Hubbell, Leviton or Pass & Seymour.

**2.8 SPECIAL PLUGS AND RECEPTACLES**

- A. Special plugs and receptacles including twist-lock devices shall be of the voltage, amperage, number of poles, number of wires, configuration, and NEMA Type shown, heavy duty, with nylon or Lexan bodies and white or gray faces. Arrow-Hart (Cooper), Bryant, Hubbell, Leviton or Pass & Semour. Provide the required quantity of mating plugs when shown on the drawings.

**2.9 DEVICE COVER PLATES**

- A. Except where unique cover plates are required (wall box dimmers, occupancy sensors, surface raceways, etc.), cover plates for devices shall be of high quality Type 302 stainless steel unless otherwise indicated.

**2.10 RECEPTACLE STRIPS**

- A. Surface mounted receptacle strips shall consist of white color surface wireways containing matching receptacles of the types shown. Receptacles shall be heavy duty, specification grade, and shall be grounded by a separate green ground conductor. The receptacles shall be spaced and circuited as shown.

**2.11 POWER POLES**

- A. Power poles shall be white color painted steel unless shown otherwise, with an internal barrier to separate power wiring from telecommunications wiring. Poles shall utilize a Velcro pad at the bottom for attachment to carpeting or tile, and an adjustable T-bar assembly with trim plate for attachment to the ceiling. Receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire, NEMA Type 5-20R, heavy duty, white color, and shall be grounded by a separate green ground conductor. Hubbell, Steelcase or Wiremold.

**COORDINATE WITH THE ARCHITECT AND OWNER'S REPRESENTATIVE REGARDING SIZE, COVER TYPE AND FINISH. EDIT ACCORDINGLY.**

**2.12 FLOOR BOXES**

- A. Floor boxes shall be of the flush, multi-service type, UL listed for fire resistance. Boxes shall be of stamped, galvanized steel, fully adjustable, with a minimum capacity of 80 [50, 30] cubic inches, split into 2 [3] compartments of equal capacity by removable partitions. Boxes shall include polycarbonate [brass] gasketed and watertight covers with integral carpet flanges, dual locking flip lids on the power side and four concentric breakouts on the telecommunications side. FSR, Hubbell, or Wiremold.

**COORDINATE WITH THE ARCHITECT AND OWNER'S REPRESENTATIVE REGARDING COVER TYPE AND FINISH.**

**2.13 FLOOR POKE-THROUGH DEVICES**

- A. Floor poke-through devices shall be of the flush type, with two duplex 20A power receptacles and two telecom outlets. Unit shall include two blank inserts for unused telecom openings and the "Communication Adapter" for connecting two ½" conduits to the assembly. Flange shall be of brushed brass finish. Unit shall be UL listed for fire resistance. Wiremold RC9 Series or Hubbell PT9 Series.

**2.14 PIN AND SLEEVE CONNECTORS**

- A. Pin and sleeve connectors shall comply with IEC Standard 309. They shall consist of nylon housings with integral locking rings and cord grips that are color coded by voltage. Pins and sleeves shall be sized, arranged and keyed to prevent incorrect assembly. Pins or sleeves shall be staggered so that the ground conductor mates first, the neutral conductor mates second, and the energized conductors mate last. Provide integral safety switch interlocks where shown. Crouse-Hinds, Hubbell, Leviton or Pass & Seymour.

**PART 3 - EXECUTION**

**3.1 INSTALLATION**

- A. Provide hospital-grade receptacles in patient care areas.
- B. Except where necessary to match existing receptacles, install receptacles with their ground slots below or to the left of the line and neutral slots.
- C. Provide No. 10 AWG wire to NEMA Type 6-20R receptacles serving freezers, window air conditioners or other large appliances.
- D. Provide a separate neutral conductor for each single phase of a multiwire branch circuit. The neutrals of multiwire branch circuits shall not be shared or daisy-chained.
- E. Receptacles installed in surface raceways being fed by multiple circuits, shall have adjacent receptacles from alternate circuits.

- F. Provide GFCI receptacles or GFCI-protected branch circuits for new and existing 120 volt duplex receptacles located outdoors, in garages, on rooftops, in toilet rooms, in unfinished basements, in kitchens, and within 6 feet of water sources including sinks, cup sinks, fume hood sinks, faucets and hose bibs. Provide GFCI receptacles for water coolers and vending machines. Standard receptacles protected by an upstream GFCI receptacle or a GFCI circuit breaker are not acceptable.
- G. Provide AFCI receptacles or AFCI-protected branch circuits for new and existing 120 volt duplex receptacles located in dwelling unit common rooms, dining rooms, living rooms, bedrooms, closets, hallways and similar rooms or areas. Standard receptacles protected by an upstream AFCI receptacle are acceptable only when shown on the drawings.
- H. Provide tamper resistant receptacles for new and existing 120 volt duplex receptacles located in dwelling units, guest rooms, guest suites and child care facilities.
- I. Provide waterproof enclosures for receptacles located outdoors or when designated "waterproof" in special indoor applications. Enclosures shall remain watertight even while in use. Cantex, Carlon, Leviton or TayMac Corporation.
- J. Provide a nametag on each cover plate of new and existing light switches and receptacles identifying the panel and circuit number feeding the device. Trace the existing circuits using an electronic circuit tracer if necessary. Nametags shall consist of black text permanently laminated to adhesive backed clear nylon or Mylar tape. Brother P-Touch. Embossed plastic tape labels are not acceptable.
- K. Color code junction boxes and box covers of emergency circuits with red paint.
- L. Mark junction box covers in indelible ink with the panel and breaker numbers of the circuits contained within.
- M. Set occupancy sensors as follows:
  1. Classrooms, labs: Set for "auto on" and timer for 20-30 minutes.
  2. Offices: Set for "manual on" and timer for 20-30 minutes.
  3. Storage rooms, janitor closets, telecommunication rooms, copy rooms, kitchenettes: Set for "auto on" and timer for 5 minutes.
  4. Toilet rooms and locker rooms: Set for "auto on" and timer for 10 minutes.
  5. Corridors: Set timer for 20-30 minutes.

**3.2 FIELD QUALITY CONTROL**

- A. Perform testing in accordance with Specification Section 260800 and submit a test report.

**3.3 COMMISSIONING**

- A. Perform commissioning activities in accordance with Related Sections.

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 262900 - MOTOR CONTROLS

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 262900 - MOTOR CONTROLS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO  
BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.*

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 019100/019110 - Commissioning
2. Section 017823 - Operation and Maintenance Manual
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. Install the following equipment furnished by others.
1. Variable speed drives and variable speed motor controllers.
  2. Motor controls that are shipped loose with packaged mechanical systems.
- B. Provide the following equipment as shown.
1. Motor starters
  2. Motor control centers (MCC's)
  3. Disconnect switches
  4. Motor control devices
  5. Power factor correction capacitors

**1.3 REFERENCES**

- A. Provide motor controls in conformance with NEMA Standard ICS 2, "Standards for Industrial Control Devices, Controllers and Assemblies."
- B. Provide MCC's in conformance with UL Standard 845, "Motor Control Centers."

- C. Install MCC's in accordance with NEMA Standard ICS 2.3, "Instructions for the Handling, Installation, Operation, and Maintenance of MCC's".

**1.4 SUBMITTALS**

- A. Submit shop drawings for each MCC including dimensioned plans and elevations and component lists. Show ratings, including short time and short-circuit current ratings, and horizontal and vertical bus ampacities.
- B. Submit schedule of features, characteristics, ratings, and factory settings of individual MCC units.
- C. Submit interconnecting wiring diagrams of individual MCC units pertinent to the class and type specified for the MCC.
- D. Submit schematic diagram of each type of controller unit indicated.

**1.5 MOTOR CONTROL REQUIREMENTS**

- A. Motor starters and MCC's shall include motor short circuit and overload protection, and a motor disconnecting means as shown.
- B. Reduced voltage or soft starters shall be provided for motors over 100 horsepower as shown.

**1.6 POWER FACTOR CORRECTION CAPACITORS**

- A. Provide power factor correction capacitors for constant speed motors 50 horsepower and above. For two speed motors, provide capacitors for the low speed winding only.
  - 1. Do not provide power factor correction capacitors for motors controlled by variable speed drives, variable speed motor controllers, or electronic soft starters.
  - 2. Size capacitors to correct their motor full load power factors to at least 90 percent but not more than 96 percent.

**PART 2 - PRODUCTS**

**2.1 MEDIUM VOLTAGE MOTOR STARTERS**

**INSERT CODE GAUGE NEMA TYPE 1, NEMA TYPE 3R OR OTHER ENCLOSURE TYPE IN THE BLANKS BELOW AS APPLICABLE.**

- A. Medium voltage motor starters shall be rated 5kV, of the fused disconnect switch, vacuum breaker contactor type, with 3 motor feeder CT's and overload relays, "hand-off-auto" selector switch, red "run" pilot light, 120 volt fused control transformer, 2 N.O. and 2 N.C. auxiliary contacts, and code gauge NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Allen-Bradley, Eaton, GE, Siemens or Square D. Provide current limiting, medium voltage fuses sized in accordance with the motor nameplates.

## 2.2 COMBINATION MOTOR STARTERS

*MODIFY PARAGRAPH BELOW TO INDICATE NUMBER AND TYPES OF CONTACTS REQUIRED.*

- A. Combination motor starters shall be of the voltage and NEMA type shown, horsepower rated for the motors shown, 3 pole, fusible disconnect switch type, with "hand-off-auto" selector switch, red "run" pilot light, 120 volt control transformer with 3 amp maximum fuses, 2 N.O. and 2 N.C. auxiliary contacts, and a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Provide fuse rejection kits, Class R dual element fuses and overload heaters sized in accordance with the motor nameplate. Allen-Bradley, Eaton, GE, Siemens or Square D.

## 2.3 MANUAL MOTOR STARTERS

- A. Manual motor starters shall be of the voltage shown, horsepower rated for the motors shown, single-pole, double-pole or three-pole as shown, single throw, toggle operated. Terminals shall be identified as accepting copper and aluminum cables. Provide a red "run" pilot light, motor overload heater(s), padlock provision and a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Allen-Bradley, Eaton, GE, Siemens or Square D.

## 2.4 MOTOR CONTROL CENTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by Allen-Bradley, Eaton, General Electric, Siemens, or Square D.
- B. Wiring Classification: Class I, Type A, as defined in NEMA ICS 2. Bus and switch terminals shall be identified as accepting copper and aluminum cables.
- C. Enclosure: Freestanding modular steel cabinets, NEMA Type 1.
- D. Compartments: Modular, with individual doors with concealed hinges and quick-captive screw fasteners.
- E. Interchangeability: Construct compartments so it is possible to remove units without opening adjacent doors, disconnecting adjacent compartments, or disturbing the operation of other units in the control center. Units requiring the same size compartment shall be interchangeable, and compartments shall be constructed to permit ready rearrangement of units.
- F. Wiring Gutters: Provide each vertical section of structure with horizontal and vertical wiring gutters for wiring to each unit compartment in each section. When aluminum feeder cables are being used, oversize the wiring gutters for aluminum cables. Provide supports to hold wiring rigidly in place.
- G. Short-Circuit Current Rating for Each Section shall be 22,000-amperes rms, symmetrical amperes.

- H. Bus Ampacity Ratings: Confirm ampere ratings 600 amperes for horizontal and 300 amperes for the vertical main buses. Install bus and bus accessories, as needed, to install additional starters in the future in locations currently marked (or shown) as 'spaces'.
- I. Horizontal Bus Arrangement: Extend main phase and ground buses with same capacity the entire length of the MCC, with provision for future extension at select either one end or both ends both ends by means of bolt holes and captive bus splice sections or approved equivalent.
- J. Short-Circuit Withstand Rating: Same as short-circuit current rating of section.
- K. Motor Controller Units: Combination controller units as specified in "Combination Starters" above; of types and with features, ratings, and circuit assignments as indicated. Provide units with full-voltage, across-the-line, magnetic controllers up to and including Size 3 installed on drawout mountings with connectors that automatically line up and connect with vertical section buses while being racked into their normal energized positions. Units shall have short-circuit current ratings, equal to or greater than, the short-circuit current rating of the MCC section.
- L. Overcurrent Protective Devices: Provide types of devices with features, ratings, and circuit assignments indicated, as specified in "Combination Starters" above. Individual feeder tap units through 225 ampere rating shall be installed on drawout mountings with connectors that automatically line up and connect with vertical section buses while being racked into their normal energized positions.
- M. Spaces and Blank Units: Compartments fully bussed and equipped with guide rails or equivalent, ready for insertion of drawout units.
- N. Spare Units: Provide type, sizes, and ratings as indicated, and install in compartments indicated "spare."
- O. Identification Products: Provide nameplates as specified in Section 260500, "Basic Electrical Materials and Methods."
- P. Finishes: Manufacturer's standard finish suitable for the environment in which installed.

## 2.5 DISCONNECT SWITCHES

- A. Disconnect switches shall be of the voltage and amperage shown, horsepower rated for motor applications, fusible or non-fusible as shown, 3 pole, NEMA Type HD heavy duty, in a NEMA Type 1 enclosure indoors or NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Provide fuse rejection kits and Class R dual element fuses in fusible disconnect switches. Provide early break auxiliary contacts in motor disconnect switches used with variable frequency drives. Disconnect switches shall be lockable in the open and closed positions. Allen-Bradley, Eaton, GE, Siemens or Square D.

## **2.6 MOTOR CONTROL CIRCUIT DEVICES**

- A. Motor control circuit devices shall be heavy duty, rated for operation at 120 volts AC, and contained in a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Pilot lights shall be "push-to-test" transformer type. Allen-Bradley, Eaton, GE, Siemens or Square D.

## **2.7 POWER FACTOR CORRECTION CAPACITORS**

- A. Power factor correction capacitors shall be unitized with metallized electrodes, polypropylene dielectric, biodegradable fluid, pressure activated circuit interrupters, and shall be self-healing. Capacitors shall be equipped with discharge resistors, replaceable current limiting fuses, and blown fuse indicators. Terminals shall be identified as accepting copper and aluminum cables. Eaton, General Electric, Myron Zucker, Siemens, Square D.
  - 1. When MCC's are provided, locate the power factor correction capacitors within the MCC structures.
  - 2. Label each capacitor as "Power Factor Correction Capacitor" and indicate the load served and the capacitor KVA rating.

## **PART 3 - EXECUTION**

### **3.1 INSTALLATION REQUIREMENTS**

- A. Anchor MCC assemblies to steel channel sills arranged and sized in accordance with manufacturer's recommendations. Attach by tack welding or bolting. Level and grout sills flush with MCC mounting surfaces. Provide 4-inch high concrete housekeeping pads where indicated.
- B. Tighten MCC bus joint bolts and electrical connector and terminal bolts in accordance with manufacturer's installation instructions and torque-tightening values. Where manufacturer's torque values are not stated, use those specified in UL 486A and UL 486B.
- C. Motor starter hand-off-auto switches shall be wired so that in the "hand" position, the motor runs independently of automatic start/stop controls. Only the safety and modulating controls shall remain active. In the "auto" position, all start/stop controls shall be active.
- D. High temperature detectors (firestats), smoke detectors, low temperature detectors (freezestats), flow switches and other safety controls shall be energized and operational whenever the equipment they protect is operating.
- E. Motor starters shall be wired so that the motors automatically restart after a power disruption. Time delay relays shall be provided for large pumps and fans so that they can coast down before restarting after a momentary outage, and to prevent all of the large motors from restarting simultaneously.
- F. Motor controls installed below piping or in areas with fire protection sprinklers shall be protected by drip shields.

- G. Connect power factor correction capacitors between the motor starter contacts and the overload relays.

**3.2 FIELD QUALITY CONTROL**

- A. Prior to any testing, perform visual inspections to verify the following:
  - 1. The equipment is properly installed and anchored.
  - 2. The equipment is free from damage and defects.
  - 3. Shipping blocks and restraints have been removed.
  - 4. Electrical terminations have been properly tightened.
  - 5. The equipment has been properly aligned.
  - 6. The equipment has been properly lubricated.
  - 7. The ventilation louvers are open and unobstructed.
  - 8. The equipment has been thoroughly cleaned inside and outside.
  - 9. The equipment is properly labeled and labels are correct.
  - 10. The equipment is ready to be tested.
- B. Perform the following testing and submit a test report.
  - 1. Verify proper phasing of power circuits.
  - 2. Perform a 1,000-volt Megger test on buses, motor starters and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
  - 3. Perform a continuity check on motor control circuits and control panel internal wiring.
  - 4. Perform an operational test on the controls and alarms.

**3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

*DELETE THE FOLLOWING SECTION UNLESS THE PROJECT INCLUDES UNUSUAL MOTOR CONTROLS UNFAMILIAR TO MAINTENANCE ELECTRICIANS.*

**3.4 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

*REVISE THE TRAINING REQUIREMENTS BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING*

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities. Provide 2 hours of training minimum.

**SPECIFICATION DIVISION 26**

NUMBER            SECTION DESCRIPTION

**DIVISION 26 ELECTRICAL**

SECTION 263000 - ENGINE-GENERATOR SYSTEM

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 263000 - ENGINE-GENERATOR SYSTEM**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

***IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER.  
DELETE 3 IF NO FIRE PUMP CONNECTIONS ARE INVOLVED.***

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 213113 - Fire Pumps
4. Section 231123 - Facility Natural Gas Piping
5. Section 235100 - Breechings, Chimneys and Stacks
6. Section 260513 - Medium, Low & Control Voltage Cables
7. Section 260526 - Grounding and Bonding for Electrical
8. Section 260533 - Electrical Materials and Methods
9. Section 260800 - Electrical Acceptance Tests

***SHOW THE GENERATOR RATINGS, AUTOMATIC TRANSFER SWITCH RATINGS  
AND TYPES (OPEN TRANSITION, CLOSED TRANSITION OR SOFT  
LOADING), CONTROL CIRCUITS AND ALARMS ON THE ONE LINE, RISER  
AND SCHEMATIC DIAGRAMS.***

**1.2 SUMMARY**

- A. Section Includes:

***EDIT TO MAKE PARAGRAPHS PROJECT-SPECIFIC.***

1. Packaged natural gas fueled engine-generator sets for emergency and/or standby power supply, rated as defined below and as shown on the Drawings.
2. Open transition, closed transition and/or soft-loading automatic transfer switches (ATSS) with full maintenance bypasses, rated as defined below and as shown on the Drawings.
3. Accessories as defined below.

- B. Work Not Included:

***EDIT TO MAKE PARAGRAPHS PROJECT-SPECIFIC.***

1. Natural gas piping from the utility gas regulator including a gas line isolation valve at the engine-generator, except the gas strainer, secondary regulator, gas pressure gauge and solenoid valve shall be provided with the engine-generator.
2. Exhaust system from the engine silencer to its discharge point, except the rain cap shall be provided with the engine-generator.

### 1.3 SUBMITTALS

- A. Manufacturer name and model number of major components.
- B. Shop Drawings including overall plan and elevation of major components with dimensions. Indicate the required installation and maintenance access clearances, conduit entry points, and cable termination point details.
- C. Details for weatherproof enclosure including maintenance access details and dimensions, fluid check and drain details and acoustic performance details.
- D. Battery and charger details, model numbers and interconnection details.
- E. Remote annunciator panels, points monitored, wiring requirements, and spare contacts available to other monitoring systems.
- F. Size, weight, and movement restrictions of shipping sections.
- G. Diagrams and data noting normal load, sustainable fault current during faults downstream, and emergency ratings of the system.
  1. Generator impedance data.
  2. Generator thermal damage curve.
  3. Generator breaker time-current characteristic curves.
- H. Computer simulations showing the anticipated voltage and frequency dips during the specified step loading sequence.
- I. Fuel supply flow requirements including volumetric flow rate and pressure to achieve 100 percent full load in the specified time.
- J. Projected sound level of system measured at 7 meters (23 feet) in front of the radiator. Include the load bank's sound contribution if a load bank is adjacent to the generator.
- K. Exhaust gas temperatures at full load.
- L. Complete wiring diagrams specific to this project, including control wiring between the engine-generator, automatic transfer switches, load bank, remote start and stop switches, remote annunciators, ATS position indicating lights and outputs to the Building Automation System.
- M. Automatic Transfer Switches
  1. Manufacturer and model
  2. Overall physical sizes, weights, environmental constraints.
  3. Voltage ratings, ampere ratings, number of poles.
  4. Full power schematic including maintenance bypass assembly.
  5. Affirmation that ATS is UL listed for this application.
- N. Certified reports of source quality control and factory tests prior to engine-generator delivery.

1. Certification of engine compliance to the current Environmental Protection Agency (EPA) emissions standards.
  2. Certifications of compliance with NFPA 110 for a Level 1 system, and with UL 2200.
  3. Certification of compliance with transient and voltage dip responses and steady state voltage and frequency stability.
  4. Test reports, signed and dated, for all factory and prototype tests.
- O. Installation, Operation and Maintenance (O&M) manuals per Related Sections.
- P. Commissioning reports and documentation per Related Sections.
- Q. Warranty Documentation.

**1.4 DELIVERY, STORAGE AND HANDLING**

- A. Protect the engine-generator, automatic transfer switches and accessories from the weather, moisture condensation, dirt and debris at all times. Do not stage equipment on the ground.
- B. Deliver engine-generator, automatic transfer switches and accessories adequately packaged for lifting, skidding, or rolling into final position, according to manufacturer's instructions.

**1.5 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, factory certified and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  1. EPA emissions standards for stationary internal combustion engines.
  2. IEEE C2, "National Electrical Safety Code".
  3. IEEE Standard 446, "IEEE Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications".
  4. NEMA Standard ICS 10, "AC Automatic Transfer Switches".
  5. NEMA Standard MG 1, "Motors and Generators".
  6. NFPA 70, "National Electrical Code".
  7. NFPA 110, "Emergency and Standby Power Systems".
  8. UL 1008, "Standard for Automatic Transfer Switches".
  9. UL 2200, "Standard for Stationary Engine Generator Assemblies".
- C. Perform manufacturer's standard quality assurance testing on the engine-generator system prior to shipping.

**1.6 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

1. Return a call for service within 24 hours, and provide a repair person on site within 48 hours after the call.

**PART 2 - PRODUCTS**

*EDIT 2.1 TO MAKE IT PROJECT-SPECIFIC.*

**2.1 MANUFACTURERS**

- A. Engine-Generator Manufacturers: Subject to compliance with all requirements, provide generators from one of the following manufacturers:
  1. Caterpillar.
  2. Cummins Power Generation.
  3. Generac Industrial Power (up through 300 kW).
  4. Kohler Co.
- B. Open and Closed Transition Automatic Transfer Switch Manufacturers: Subject to compliance with all requirements, provide ATSS from one of the following manufacturers:
  1. ASCO.
  2. Cummins.
  3. Eaton.
  4. GE Zenith.
  5. Kohler.
- C. Soft Loading Automatic Transfer Switch Manufacturers: Subject to compliance with all requirements, provide ATSS from one of the following manufacturers:
  1. ASCO.
  2. Eaton.
  3. Kohler.

*DELETE PARAGRAPH D IF LOAD BANK IS NOT REQUIRED.*

- D. Load Bank Manufacturers: Subject to compliance with all requirements, provide load banks from one of the following manufacturers:
  1. Avtron.
  2. Sephco.
  3. Simplex.

**2.2 ENGINE-GENERATOR ASSEMBLY**

- A. The system including all components shall be NFPA 110 Level 1 compliant, UL 2200 labeled, and rated for operation in a Seismic Category B area at an elevation up to 1,000 feet above sea level.

*EDIT B TO SPECIFY GENERATOR STEP LOADING SEQUENCE. LIST THE STEPS, LOADS IN EACH STEP, AND RELATIVE PRIORITY OF EACH STEP.*

- B. The system shall be rated to provide power in four steps while complying with the specified transient and steady state voltage and frequency requirements:

1. 20 kW emergency power in 10 seconds to life safety loads and high rise elevators.
2. 150 kW required standby power in 30 seconds to mechanical system motor loads.
3. 100 kW required standby power in 45 seconds to fire pump.
4. 100 kW optional standby power in 60 seconds to laboratory equipment including computer servers and freezers.

**EDIT FOR PROJECT CONDITIONS. SELECT ONE OF THE FOLLOWING TWO GENERATOR ENCLOSURE PARAGRAPHS.**

- C. Configure the engine-generator for outdoor installation in an enclosure. Outdoor temperatures range from minus 22 degrees F to 104 degrees F (minus 30 degrees to 40 degrees C), with condensing conditions, rain, snow or ice all being possible.
- D. Configure the engine-generator for indoor installation in a room supplied with combustion and ventilation air directly from the outside. Outdoor air temperatures range from minus 22 degrees F to 104 degrees F (minus 30 degrees to 40 degrees C) and humidity may be condensing.
- E. Mount the engine-generator with vibration isolators on a welded steel base, to permit suitable mounting on any level surface.
- F. Provide engraved metal or laminated plastic nameplates indicating ratings of equipment and Manufacturer's shop order number for the equipment. Laminated plastic nameplates shall consist of black letters at least 1/4" high on a white background. The nameplates shall be affixed with machine screws.

**2.3 ENGINE**

- A. Provide a natural gas fueled, liquid cooled, naturally or blower aspirated engine of 4-cycle design, sized as required to meet the specified generator kW output continuous rating.
- B. The engine shall be factory certified as compliant with the current EPA emissions standards. When the engine is not factory certified as compliant with EPA emissions standards, provide an EPA compliant capable engine. Provide the services of an independent testing agency to perform the first field certification.
- C. Provide controls to allow emergency load pickup in 10 seconds or less, with recovery time of less than 3.5 seconds, a voltage dip of less than 39.5%, and a frequency dip of less than 1.5 Hz.
- D. The engine-generator shall produce full rated output at a gas pressure of 10"-20" inches of water column.
- E. Provide a unit mounted radiator, fan, engine-driven coolant pump, and closed coolant recovery system with the following.
  1. Coolant solution of 50 percent ethylene-glycol antifreeze and 50 percent water.
  2. A sight glass in which the coolant level can easily be observed.
  3. A reclamation bottle to contain coolant overflow.

4. Coolant fill and oil fill drain points that are easily accessible for maintenance without the use of a pump and hoses.
  5. A radiator designed to allow safe full load operation in minus 22 degrees to 104 degree F ambient temperature conditions.
  6. A duct flange on the radiator outlet.
  7. A fan guard for personnel safety.
- F. Provide an intake air filter with replaceable element.
1. Provide an electronic isochronous governor with speed sensing to maintain generator output frequency within 0.5 percent from no load to full load during steady state conditions, and within 5 percent during a 50 percent step load increase or decrease.
- G. When required to achieve full rated output at 104 degrees F ambient air temperature, provide an aftercooler to cool the combustion air. The aftercooler shall be equipped with the same accessories as the radiator.
- H. Provide a starter battery system to serve the engine-generator and automatic transfer switches, including:
1. Lead acid storage batteries, battery rack and all cables and connections. Size the battery for the range of ambient conditions and to meet the power requirements of the engine-generator and automatic transfer switches after eight cyclic attempts to start the engine.
  2. A remotely mounted battery charger with a solid state voltage regulator in a separate enclosure suitable for wall mounting near the batteries.
  3. Remote 2-wire starting utilizing a solenoid shift electric starter.
- I. Provide an engine-driven positive displacement lube oil pump to supply full pressure lubrication. Provide a replaceable, easily accessible oil filter with internal bypass.
- J. Provide an engine fuel system designed for operation on natural gas having a BTU content of 1000 BTU per cubic foot. Include a gas strainer, secondary gas regulator, gas pressure gauge downstream of the regulator, gas solenoid valve, flexible gas line, and all necessary piping, installed at the point of manufacturing, and terminating at a single pipe opening external to the mounting base.
- K. Provide sensing elements for oil pressure, coolant temperature, coolant level, overcrank, and overspeed. Connect these sensors to the control panel using a wiring harness with wire numbering at each end of the harness for easy identification. Provide each connection with a molded rubber boot to protect the connection from corrosion. Provide all wiring in flexible conduit with wiring and conduit rated for the application.

**EDIT THE VOLTAGE OF JACKET HEATER TO MATCH ELECTRICAL SYSTEM DESIGN.**

- L. Provide an engine mounted, thermostatically controlled, 208 Volt or 120 Volt, single phase, coolant jacket heater to aid in quick starting.

**EDIT THE DBA VALUE TO MATCH THE SOUND STUDY. SEE DG 263000.**

- M. Provide a silencer rated for a minimum sound attenuation of 35 dB when measured 7 meters from its discharge opening. Mount the silencer and connect to the exhaust stack using a flexible, seamless, stainless steel exhaust connection. Provide a hinged, flapper style rain cap. A stack termination that deflects exhaust horizontally, including an inverted cone style cap is not acceptable. Properly size all components to assure operation without excessive backpressure.
- N. Silencer shall be selected and sized by engine manufacturer and designed with an exhaust piping system that will not exceed manufacturer's engine backflow pressures.
- O. Provide a catalytic converter when necessary to meet EPA emissions standards. The catalytic converter may be separate from or integral to the silencer. It shall include a hatch or port for changing of the catalyst.
- P. Provide a manual blow-down ball valve no more than 78 inches above the floor in a pipe tapped into the low point of the exhaust system. Pipe the discharge to a bucket on the floor.

#### **2.4 GENERATOR**

- A. Provide a 4-pole, 3-phase, 4-wire, ungrounded wye, brushless 60 Hz alternator with a 2/3 pitch and fully linked amortisseur windings, rated as indicated on the Drawings. Mount and directly connect the generator to the engine shaft to ensure permanent alignment. Extend all phase and neutral leads into a connection panel.
- B. Generator shall include an integral brushless permanent magnet exciter.
- C. Generator and exciter shall have Class H insulation rated for a temperature rise of 105 degrees C over a 40 degrees C ambient.
- D. Provide a solid-state voltage regulator, separate from the exciter, to control output voltage within 1.0 percent from no load to full load during steady state conditions, and within 20 percent during a 50 percent step load increase or decrease. Upon a 50 percent step load increase, the voltage shall recover to steady state within 3.0 seconds.
  - 1. If a heavy load dips the output frequency, the voltage regulator shall have a voltage droop of 4 volts/hertz to maximize motor starting capability. The frequency at which the droop operation begins shall be adjustable, allowing the generator to be properly matched to the load characteristics and ensuring optimum system performance.
  - 2. Provide a limiting circuit in the voltage regulator to prevent output voltage surges in excess of 110 percent of rated voltage during generator set operation.

3. Provide capability of the voltage regulator to shut down on a loss of the sensing signal, to prevent an overvoltage condition from occurring. A voltage regulator that can go into a full field condition is unacceptable.
  4. Provide LED lights on the voltage regulator to indicate proper sensing and operation.
  5. Provide a minimum of plus or minus 10 percent voltage adjustment from the rated value.
  6. At no load the generator's harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for any single harmonic. The Telephone Influence Factor as determined according to NEMA MG 1 shall not exceed 50 percent.
  7. For a 3 phase bolted fault at the output terminals, the generator shall produce a minimum of 250 percent of rated full load current for not less than 10 seconds, with no damage to the engine-generator.
- E. Provide a connection panel that is an integral part of the generator to allow the Contractor a convenient location to make electrical output connections. Panel shall be NEMA 1. The panel shall include phase and isolated neutral connection bars suitable to accept Owner's 2 hole compression lugs. Provide a NEMA standard 2 hole compression lug sized for No 4/0 AWG cable for bonding of the engine-generator.
- F. Provide UL listed, 100 percent rated, generator main circuit breakers with adjustable long time, short time and instantaneous trip settings, rated as shown on the drawings. A system utilizing a manual reset generator field circuit breaker with current transformer is not acceptable. Locate the circuit breakers in the generator connection panel. Provide barriers between emergency and standby power circuit breakers.

**DELETE THE NEXT PARAGRAPH IF THE SYSTEM DOES NOT INCLUDE A  
SOFT LOADING AUTOMATIC TRANSFER SWITCH.**

- G. Provide a DC-operated shunt trip coil on each generator main circuit breaker, with coils rated at the engine starter battery system voltage. Mounting level shall be accessible from adjacent grade.

## **2.5 CONTROLS**

- A. Provide an NFPA 110 Level 1 compliant engine-generator control panel in a NEMA 1 enclosure, shock mounted to the engine-generator set by the manufacturer. The top of the panel shall be no more than 78 inches above the finished floor.
- B. Provide a fused low voltage control circuit to power the controls.
- C. Provide the following analog or digital indicators and controls as required by NFPA 110 for a Level 1 system. The AC voltmeter, AC ammeter and frequency meter shall be three separate indicators, not part of a scrollable digital display.
1. AC voltmeter.
  2. AC ammeter.
  3. Frequency meter.

4. Voltmeter and ammeter phase-selector switches.
  5. DC voltmeter (battery charging voltage).
  6. Generator voltage adjustment.
  7. Engine cool-down timer.
  8. Non-resettable engine run-time meter.
  9. Engine coolant temperature gauge.
  10. Engine lubricating-oil pressure gauge.
  11. Complete engine start-stop control, which starts the engine upon a contact closure and stops the engine upon a contact opening.
  12. Cyclic cranking limiter to open the starting circuit after eight attempts if the engine has not started within that time.
  13. 3-position RUN/OFF/AUTOMATIC selector switch. The engine-generator annunciator shall monitor this switch and provide a "Generator Trouble" alarm when the switch is not in AUTOMATIC.
  14. "Generator Running" and "Generator Trouble" output contacts for connection to the Building Automation System DDC panel.
- D. Provide a solid state annunciator complying with NFPA 110 on the control panel, complete with individual alarm lights, a common audible alarm with reset switch, and one common "Generator Trouble" output contact indicating the following engine and generator conditions:
1. Engine-generator system providing power.
  2. Overcrank shutdown.
  3. High coolant temperature shutdown.
  4. Low lube oil pressure shutdown.
  5. Overspeed shutdown.
  6. Loss of coolant shutdown.
  7. Overvoltage shutdown.
  8. Low coolant temperature alarm.
  9. High coolant temperature pre-alarm.
  10. Low coolant level pre-alarm.
  11. High battery voltage alarm.
  12. Low battery voltage alarm.
  13. Battery charger failure.
  14. Control switch not in Automatic alarm.
  15. Lamp test.
- E. Provide a remote manual stop station with a red mushroom head pushbutton and a clear plastic hinged cover in accordance with NFPA 110. The stop station shall be waterproof and suitable for wall mounting outdoors. Locate stop station remotely from the engine generator control panel and the engine generator enclosure where directed by the Owner.

## 2.6 ENGINE-GENERATOR ACCESSORIES

*DELETE A FOR AN INDOOR INSTALLATION. OUTDOORS, EDIT A.1 BY DELETING THE FLOOR REQUIREMENT IF THE ENGINE-GENERATOR WILL SIT ON A CONCRETE HOUSEKEEPING PAD.*

- A. Provide a weather-tight protective enclosure for the engine-generator set as follows:

1. Provide a heavy gauge steel enclosure constructed with corner posts. Provide a solid steel floor. Coat the enclosure with electrostatic applied zinc and finish with baked enamel paint on all interior and exterior surfaces.

*EDIT OR DELETE A.2 TO COMPLY WITH THE SOUND STUDY. DELETE THE FLOOR REQUIREMENT IF THE ENGINE-GENERATOR WILL SIT ON A CONCRETE HOUSEKEEPING PAD.*

2. Provide a sound attenuating type enclosure including louvers, with sound insulated walls, roof, floor and doors, which achieves a maximum of 70 dBA at 7 meters.
3. Provide bird screens and filters arranged to permit air circulation while excluding exterior dust, birds, rodents and the insertion of foreign objects.
4. Locate the silencer and catalytic converter inside the enclosure.
5. Provide large, easily opened doors on the enclosure to allow access to the engine, generator, radiator and aftercooler caps, all normally accessed maintenance points including oil and coolant fill, drain and filter points, and the control panel. Provide each door with stainless steel lockable hardware with identical keys. Padlocks are not acceptable.
6. Construct the enclosure of sufficient structural integrity to resist deformation and denting by people climbing on it and rugged enough to be vandal resistant. Comply with the Michigan Building Code requirements for wind loads.

*DELETE 7 ON UNITS 300 KW OR LESS.*

7. Provide the enclosure with 120 Volt dust and moisture resistant, low temperature, interior fluorescent lighting, a light switch, and two 120 Volt GFCI duplex receptacles.

*DELETE B IF A GENERATOR-BACKED 208Y/120 VOLT RECEPTACLE PANEL IS AVAILABLE NEAR BY.*

- B. Provide a 208Y/120 Volt, 60 amp minimum, 3 phase, main lugs only load center panel with circuit breakers to feed the battery charger, coolant jacket heater, motorized ventilation dampers, lights and receptacles. Mount the load center panel where shown on the Drawings.
- C. Provide a remote annunciator panel to monitor alarm and trouble conditions at the engine-generator, batteries, and battery charger. The annunciator shall be in a NEMA 1 enclosure suitable for flush or surface mounting on a wall.
  1. Provide an "Engine-generator providing power" alarm light in the annunciator.
  2. Provide the same alarm lights contained on the engine-generator control panel annunciator.

## 2.7 AUTOMATIC TRANSFER SWITCHES

*EDIT A TO MAKE IT PROJECT SPECIFIC. STATE EACH ATS VOLTAGE RATING, CURRENT RATING AND NUMBER OF POLES ON THE DRAWINGS.*

- A. Provide open-transition, closed-transition and/or soft-loading automatic transfer switches (ATSS) with full maintenance manual bypass isolation, UL 1008 listed, rated and with the number of poles indicated on the Drawings.
1. Open-transition ATSS shall perform an open transition (break-before-make) transfer from the normal to the emergency source and a break-before-make re-transfer back to the normal source. A sync-check relay shall normally delay re-transfer (when both sources are available) until both sources are close to being in synchronization.
    - a. Open-transition ATSS only shall provide a re-transfer pre-signal to elevators operating on emergency power.
    - b. The pre-signal shall be a dry contact closure at an adjustable time of 1 to 10 seconds before re-transfer.
  2. Closed-transition ATSS shall perform a closed-transition (make-before-break) transfer from the normal to the emergency source and a closed transition re-transfer back to the normal source, thus eliminating a momentary interruption of power to the loads. A sync-check relay shall normally delay transfer and re-transfer (when both sources are available) until both sources are close to being in synchronization.
  3. Soft-loading ATSS shall provide the same modes of operation as the closed-transition ATSS and include paralleling and protective control equipment to permit the following additional modes:
    - a. Soft Load Transfer Mode: Allows the ATS load to be completely isolated from the utility using a programmed soft load transfer / re-transfer sequence to or from the engine-generator.
    - b. Maintained Parallel Base Load: Establishes and maintains a safe parallel connection of the engine-generator with the normal source until a local or remote signal terminates this condition. The engine-generator shall operate at the base load level set by the Owner on the control panel.
    - c. In the event either source connected to the load becomes unacceptable while in any operating mode, the soft load ATS shall automatically isolate the emergency and normal sources and revert to operation as an open transition ATS.

**INSERT THE WORST CASE ATS 1.5 OR 3 CYCLE CLOSE ON AND WITHSTAND RMS SYMMETRICAL SHORT CIRCUIT CURRENT RATING REQUIRED BASED UPON USING ANY UPSTREAM CIRCUIT BREAKERS.**

- B. ATSS shall be rated to close on and withstand, and UL 1008 tested and labeled with a 1.5 or 3 cycle rating of [insert] amps minimum RMS symmetrical short circuit current when used with any upstream circuit breakers. ATSS not UL 1008 tested and labeled with 1.5 or 3 cycle ratings, or that have series or specific upstream breaker ratings only, are not acceptable.
- C. Four pole ATSS shall include fully rated, overlapping neutral contacts. The normal power and emergency power neutrals shall only be connected together during transfer and re-transfer operations, and only for 100 milliseconds or less.

- D. ATSS shall contain readily accessible terminal blocks for connection of external wiring.
- E. ATSS shall include a full maintenance bypass and isolation switch section to allow either the normal or the emergency source to directly feed the load while totally isolating all components in the automatic transfer switch compartment from power except from the 120 Volt control power.
  - 1. Bypass isolation switches shall be rated the same as the automatic transfer switches.
  - 2. Bypass isolation switches shall include closed transition (make before break) contacts to avoid power interruptions during transfer and re-transfer.
  - 3. Provide manual operators with operating handles capable of being used without opening the enclosure door.
- F. ATSS shall be electrically operated and mechanically held with a solenoid operated, momentarily energized electrical operator.
- G. ATSS shall be positively locked and unaffected by momentary outages, so that contact pressure is maintained at a constant value.
- H. Main switch contacts shall be of silver composition. ATSS rated 600 amperes and above shall have front removable and replaceable contacts, and main contacts shall be protected by separate arcing contacts.
- I. Inspection of contacts shall be possible from the front without disassembly of operating linkages and without disconnection of power conductors.
- J. ATSS shall be housed in NEMA 1 enclosures with a hinged front door secured by a latch. The door shall open a minimum of 90 degrees. The latch handle shall include provisions for locking in the closed position.
- K. Provide a control panel with sensing and control logic directed by a built-in microprocessor.
  - 1. Mount the control panel on the front door of the ATS enclosure. Connect the control panel to the transfer switch with an interconnecting wiring harness. Include a keyed disconnect plug with the harness to enable the control panel to be disconnected from the transfer switch for maintenance.
  - 2. Provide sensing and control logic on printed circuit boards. Provide industrial grade plug-in type interfacing relays with dust covers.
  - 3. Provide monitoring of voltage of each phase of the normal and emergency sources. Provide voltage sensing with pickup voltage adjustable from 85 percent to 100 percent of nominal dropout, adjustable from 75 percent to 98 percent of pickup setting, and independent frequency sensing with pickup adjustable from 90 percent to 100 percent of nominal.
  - 4. Provide a repetitive accuracy of all settings within plus or minus 2 percent over an operating temperature range of minus 22 degrees F to 104 degrees F.
  - 5. Provide voltage and frequency settings that are field programmable in 1 percent increments.

6. Provide a time delay on transfer to emergency power, adjustable from 0 to 5 minutes for controlled timing of transfer of loads to emergency.
7. Provide a time delay on re-transfer to normal power, adjustable from 0 to 30 minutes. Provide an automatic bypass of this time delay if the emergency source fails and the normal source is acceptable.
8. Provide momentary-type test switches to simulate a normal source failure.
9. Provide terminals for two remote controlling contacts; one that signals the ATS to transfer to emergency and the other to inhibit transfer to emergency and/or re-transfer to normal.
10. Provide auxiliary contacts rated 10 amps, 250 VAC, consisting of two contacts that are closed when the ATS is connected to the normal source and two contacts that are closed when the ATS is connected to the emergency source. Wire these contacts to terminals for connection to external wiring.
11. Provide indicating lights for the presence of normal power and presence of emergency power; one showing ATS is connected to the normal source (green) and another to indicate when the ATS is connected to the emergency source (red).

L. Provide one ATS with a system exerciser for automatic exercising and testing of the engine-generator and ATSs. Include the following features.

1. An engine start time clock capable of being programmed for time of day, day of the week, week of the month, months of the year, and duration of the exercising.
2. Time clock shall automatically adjust, resetting itself for changes between Standard Time and Daylight Savings Time.
3. Controls to enable and disable the transfer of the ATSs during engine exercising.

**EDIT THIS ARTICLE PER DESIGN GUIDELINE SBA-J FOR A HIGH RISE BUILDING OR A BUILDING WITH SMOKE CONTROLS IF THE BUILDING HAS MULTIPLE GENERATORS. DELETE THIS ARTICLE IF THE BUILDING IS NOT A HIGH RISE AND IF IT DOES NOT HAVE SMOKE CONTROLS.**

M. Provide engine-generator and ATS manual start and transfer features for installation in the Fire Command Center as required by the Michigan Building Code.

1. Provide one two-position, "Auto-Run" selector switch with one contact per ATS to manually initiate an engine-generator start and ATS transfer. In the "Auto" position, each ATS shall be in normal stand-by mode. In the "Run" position, each ATS shall simulate a loss of normal power. This shall cause each ATS to start the generator(s) and transfer to generator power when its generator is ready.
2. Provide a green "normal power" and a red "generator power" indicating light for each ATS to indicate the position of the ATS. Label each pair of lights to indicate the generator and ATS equipment numbers and the types of loads connected to the ATS.

**DELETE 3 WHEN EXISTING ATSS ARE BEING CONNECTED TO THE SYSTEM.**

3. In lieu of providing one "Auto-Run" selector switch and multiple green and red indicating lights, one ATS remote annunciator may be provided. The annunciator shall be from the same manufacturer as the ATSS. It shall include means to manually start the engine-generator and transfer all ATSS, and a green "normal power" and a red "generator power" position indicating light for each ATS.

*DELETE THIS ARTICLE IF NOT APPLICABLE. IF A LOAD BANK IS TO BE PROVIDED, SHOW ON THE PLAN DRAWINGS THE DIRECTION OF EXHAUST AIR FLOW.*

## **2.8 LOAD BANK**

- A. Provide a self-contained resistive load bank suitable for permanent installation outdoors. The load bank shall be rated for 100 percent of generator output at unity power factor, and shall include the following:

1. A weather protective, thermostatically controlled heated housing for contactors and other control components.
2. A heavy-duty blower with integral blower motor.

*EDIT 3 TO INDICATE THE DIRECTION OF AIR EXHAUST.*

3. Fixed louvers on exhaust openings capable of exhausting air upward as shown on the Drawings.
4. Corrosion resistant chromium alloy wire resistors.
5. Branch circuit fusing on all load steps.
6. 480V - 120V control power transformer.
7. Load dump circuit to disconnect the load bank automatically upon loss of normal utility power.
8. Remote control panel integral to the load bank enclosure and including the following:
  - a. Control power on-off switch.
  - b. Control power light.
  - c. Blower power light.
  - d. Air failure light.
  - e. Master load on-off switch.
  - f. Load step on-off switches.
  - g. Digital multi-function meter displaying instantaneous voltage, current, power or frequency for all 3 phases.

*DELETE THIS ARTICLE IF LOAD BANK IS BEING PROVIDED.*

## **2.9 LOAD CONNECTION BOX**

- A. Provide a generator output circuit breaker or generator bus tap located in a connection box for connection of cables to a portable load bank. Size the circuit breaker or bus tap for 100 percent full load current of the generator. Box shall have a grommeted opening sized for the cables and a cover capable of being closed while the cables are connected.

## 2.10 SOURCE QUALITY CONTROL

- A. Before shipment of the equipment, factory test the engine-generator under rated load and power factor for performance and proper functioning of controls and interfacing circuits. Tests shall include:
  - 1. Proper operation of controls, indicators and safety shutdowns.
  - 2. Single step load pick-up per NFPA 110.
  - 3. Compliance with the specified transient and steady state voltage and frequency requirements.
  - 4. Provide a certified factory test report.

## PART 3 - EXECUTION

### 3.1 INSTALLATION

- A. Maintain Code and manufacturer defined working clearance around the generator and automatic transfer switches.

*SHOW ON THE PLAN DRAWINGS THE ORIENTATION OF ENGINE-GENERATOR.*

- B. Install engine-generator on grillage or concrete housekeeping pad as shown with sound isolation pads or springs between mounting surface and generator.
- C. Install and orient exhaust pipe rain flapper cap with hinge toward the southwest.
- D. Set timers, overcurrent protective devices, and other items needing to be set in accordance with the design documents and manufacturer's directions.

### 3.2 CONNECTIONS TO REMOTE EQUIPMENT

*DELETE ITEMS THAT DO NOT APPLY.*

- A. Install the following remote equipment where shown on the Drawings and connect them with wire in conduit to the engine-generator system.
  - 1. Engine-generator emergency stop station.
  - 2. Engine-generator remote annunciator.
  - 3. Engine-generator remote "auto-run" switch and ATS status indicators in Fire Command Center.
  - 4. Load bank.
- B. Provide control circuits from the ATSS and fire pump controller to start the engine-generator.
- C. Provide control circuits from the engine-generator and ATSS to BAS to provide "generator running", "generator trouble", and ATS "on generator power" alarms.
- D. Provide control circuits from the soft-loading ATS to its normal power and generator power feeder breaker shunt trip coils. Utilize engine-generator starter battery power to energize the coils.

- E. Provide 120 Volt control and miscellaneous power to engine-generator and automatic transfer switch auxiliaries to insure proper operation. Update panel directories and install labels indicating the sources on the auxiliary equipment.

### **3.3 SYSTEM STARTUP**

- A. Coordinate with the Plant Operations Call Center at (734) 647-2059 before starting up or testing engine-generators or automatic transfer switches.
- B. Notify OSEH at (734) 647-1143 before starting up engine-generators.
- C. Prior to any testing, perform visual inspections to verify the following:
  - 1. The equipment is completely and properly installed.
  - 2. The equipment is free from damage and defects.
  - 3. Shipping blocks and restraints have been removed.
  - 4. Electrical terminations have been properly tightened.
  - 5. The equipment has been properly aligned.
  - 6. The equipment has been properly lubricated.
  - 7. The ventilation louvers are open and unobstructed.
  - 8. The equipment is ready to be tested.
- D. Perform a continuity check and 1,000 Volt DC Megger test on the generator windings, generator circuit breakers, power circuit portions of the automatic transfer switch, and interconnecting power circuit wiring.
- E. Perform a continuity check on the control wiring.
- F. Calibrate the metering and time delay relays.
- G. Provide a factory-trained technician to check and perform an initial startup of the engine-generator and automatic transfer switches.
- H. The manufacturer's representative shall provide a certificate in writing that the equipment installation and operation meets their requirements and the project design criteria.

### **3.4 ENGINE-GENERATOR SYSTEM FIELD TESTING**

- A. Perform a load bank test of the overall system using a resistive load bank or soft-loading automatic transfer switch rated at 100 percent of generator full load for at least 120 minutes.
- B. Test the completed engine-generator system in accordance with NFPA 110 and Manufacturer's written instructions.
  - 1. Open normal power to each automatic transfer switch and observe proper operation of engine-generator and automatic transfer switch (throwing over to emergency power), noting engine-generator start, time delays and other appropriate variables.
  - 2. Restore normal power and observe proper transfer back to normal power and proper shutdown of engine-generator, again noting time delays and other appropriate variables.

3. Operate maintenance bypass switch to ensure proper operation in all modes.
  4. Demonstrate each automatic transfer switch in each mode of operation.
  5. Demonstrate the automatic test function.
- C. Test the operation of engine-generator control and alarm connections to the automatic transfer switches, remote annunciator, Fire Command Center, BAS system and accessories under all operating conditions.

*DELETE D IF THE ENGINE-GENERATOR BEING PROVIDED IS FACTORY CERTIFIED AS COMPLIANT WITH EPA EMISSIONS STANDARDS.*

- D. When the engine is not factory certified as compliant with EPA emissions standards, make all modifications and adjustments necessary to obtain field certification.

### **3.5 COMMISSIONING**

- A. Perform the commissioning activities per Related Sections.

### **3.6 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

*REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING*

- B. Provide the Owner's personnel with training on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures of the engine-generator, automatic transfer switches and accessories. Do not conduct training until after start up and commissioning is completed. Provide training documents and the approved Operations and Maintenance manuals to the Owner at least two weeks prior to the training to allow sufficient time for review.
1. Provide a minimum of 4 hours of training on the engine-generator.
  2. Provide a minimum of 4 hours of training on the automatic transfer switches.

SECTION 265100 - INTERIOR LIGHTING

**END OF CONTENTS TABLE**

**DIVISION 26 ELECTRICAL**  
**SECTION 265100 - INTERIOR LIGHTING**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 017823 - Operation and Maintenance Manual
  2. Section 019100/019110 - Commissioning
  3. Section 260513 - Medium, Low & Control Voltage Cables
  4. Section 260526 - Grounding and Bonding for Electrical
  5. Section 260533 - Electrical Materials and Methods
  6. Section 260800 - Electrical Acceptance Tests

**PART 2 - PRODUCTS**

**2.1 LIGHTING FIXTURES**

- A. Lighting fixtures shall be of specification grade and listed or labeled by Underwriters Laboratories (UL) or other approved Nationally Recognized Testing Laboratory. Provide lighting fixtures in accordance with the Fixture Schedule.
- B. Recessed lighting fixtures shall be thermally protected.
- C. LED fixtures shall comply with UL Standard 8750, with IES Standards LM-79 and LM-80, and shall have a parts and labor warranty of 5 years minimum on the fixtures and components.
1. User serviceable LED lamps and drivers shall be replaceable from the room side.
  2. Dimmable LED fixtures shall have either a 0-10 volt, 3-wire dimming driver, or a two-step (50%-100%) line voltage, two switch controlled dimming driver.

**2.2 LAMPS**

- A. Except where T-5 lamps are shown in the Fixture Schedule, tubular fluorescent lamps shall be T-8, straight tube, rapid start, multi-phosphor type with a medium bi-pin base, average rated life of 24,000 hours, 3000 initial lumens and 2820 mean lumens. T-8 and T-5 lamps shall have a correlated color temperature of 3500 degrees K and a CRI of 85 minimum. Lamps shall be designed to pass the Federal TCLP test in effect at the time of manufacture. U-tube lamps shall not be used. GE Ecolux, Osram/Sylvania Ecologic, or Philips Alto only.
- B. Compact fluorescent lamps shall be 4 pin, 13 watt minimum with a color temperature of 3500 degrees K, a CRI of 80 minimum, end-of-life protection, and suitable for use with electronic ballasts. Self-ballasted compact fluorescent lamps are not acceptable except for retrofitting existing incandescent fixtures. Osram/Sylvania, GE or Philips only.
- C. Induction lamps, LED lamps and LED fixtures with non-replaceable lamps shall have a color temperature of 3500 degrees K and a CRI of 80 minimum.
- D. Retrofit LED lamps shall comply with NEMA SSL 4.
- E. High intensity discharge (H.I.D.) lamps shall conform to their applicable ANSI codes.
- F. Incandescent lamps shall be rated 120 volts and shall have a life of 2000 hours minimum. Standard "A" Type lamps shall be inside frosted.

**2.3 BALLASTS AND DRIVERS**

- A. Except where indicated otherwise, fluorescent fixtures with multiple T-8 or T-5 lamps shall have two ballasts or a two-step (50%-100%) dimming ballast to accommodate dual switching. Fluorescent fixtures with multiple compact fluorescent lamps may have one ballast.
- B. Fluorescent ballasts shall be of the electronic, programmed rapid start, series circuited, and completely solid state. Ballasts shall be rated for the specific lamps they are supplying, shall have a maximum crest factor of 1.6, a maximum current total harmonic distortion of 10 percent, a minimum starting temperature of 0 degrees F, and a sound rating of "A". Ballasts for T-8 and T-5 lamps shall be Osram/Sylvania Quicktronic Professional, Advance Optanium, or Universal Accustart only. Ballasts for compact fluorescent lamps shall be the fixture manufacturer's standard electronic type.
- C. Fluorescent dimming ballasts shall be electronic, comply with the other requirements for electronic ballasts, be capable of smoothly and consistently dimming the lamps from full output to 10 percent or less output, and maintain a cathode voltage between 3 to 4 volts. A low voltage slide switch that is compatible with the ballast shall control light level. Osram/Sylvania Quicktronic, Lightolier or Lutron only.

- D. LED drivers shall be electronic, labeled as compliant with radio frequency interference (RFI) requirements of FCC Title 47 Part 15, comply with NEMA SSL 1, have a sound rating of "A" and be rated for a THD of less than 20 percent at all input voltages.
- E. Dimmable LED drivers shall be capable of dimming without LED strobing or flicker across their full dimming range.
- F. H.I.D. ballasts shall conform to their applicable ANSI codes. H.I.D. ballasts for use indoors in finished areas shall be of the quietest type available or shall be mounted remote from the fixtures.
- G. Ballasts and drivers shall be rated for the ambient temperatures in which they are located. Outdoor fixtures shall be equipped with ballasts or drivers rated for reliable starting to -20 degrees F. Indoor fixtures located in areas with direct sunlight or above normal ambient temperatures shall have ballasts or drivers rated at 65 degrees C minimum.
- H. Individually fused ballasts and drivers shall have their fuses accessible from outside of the fixture chassis.
- I. Induction lamp drivers shall be electronic and comply with radio frequency interference (RFI) requirements of FCC Title 47 Part 15 and be rated for a total harmonic distortion (THD) of less than 20 percent at all input voltages.

**2.4 EMERGENCY LIGHTING**

- A. Emergency lighting shall consist of normal lighting fixtures with generator or battery-inverter system backup, emergency lighting fixtures with individual battery backup, or sealed beam emergency lighting units in accordance with the Fixture Schedule.
  - 1. Battery-backed fluorescent emergency lighting fixtures shall consist of a fluorescent fixture with one or more lamps connected either to a battery pack and charger mounted remote from the fixture, or to an emergency power ballast mounted internal to the fixture. Minimum light output shall be 1100 lumens. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of fixture operation. The charger shall be solid state and provide overload, short circuit, brownout and low battery voltage protection. The battery and charger shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The fixture shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The fixture shall not contain an audible alarm.
    - a. Remote mounted battery packs and chargers: Chloride, Dual-Lite, Emergi-Lite, Exide Lightguard, Lightalarms, Lithonia or Sure-Lites.
    - b. Emergency power ballasts: Bodine or Lithonia

2. Battery-backed LED emergency lighting fixtures shall consist of a normal LED fixture with some or all of the LEDs connected to a battery and charger. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of fixture operation. The charger shall be solid state and provide overload, short circuit, brownout and low battery voltage protection. The battery and charger shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The fixture shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The fixture shall not contain an audible alarm.
3. Sealed beam emergency lighting units shall consist of sealed beam LED lamps connected to an internally mounted battery and charger. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of battery operation. The charger shall solid state and provide overload, short circuit, brownout and low battery voltage protection. The unit shall be suitable for wall or ceiling mounting as required. It shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The unit shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The unit shall not contain an audible alarm.

## 2.5 EXIT SIGNS

- A. Exit signs shall be of the LED type. Fluorescent, electro luminescent light panel or self-powered luminous signs shall not be used. Chloride, Dual-Lite, Emergi-Lite, Exide Lightguard, Lightalarms, Lithonia, LSI Industries, Morelite, Prescolite or Sure-Lites.
  1. LED's shall be wired in parallel to prevent multi-lamp failure, and shall be concealed within the sign by a clear panel and red optical diffuser. Power consumption shall not exceed 2 watts per face.
  2. Exit signs shall have white die cast aluminum or polycarbonate housings with universal mounting brackets; brushed aluminum stencil faces with red letters and multi-directional knockout arrows.
  3. Exit signs shall be provided with emergency battery packs and battery chargers when required. Batteries shall be maintenance free nickel cadmium, and shall be mounted within the signs.

**PART 3 - EXECUTION**

**3.1 INSTALLATION REQUIREMENTS**

- A. Support recessed troffers independently of the ceiling grid system by using two safety wires minimum on diagonally opposite corners of the fixtures. Support recessed downlights by using safety wires or by rigidly attaching the fixtures to the building structure or ceiling grid system. Removable T-bar clips shall not be used to attach fixtures to the ceiling grid system.
- B. Install fixtures level, with no gaps between adjacent fixtures or between fixtures and surrounding surfaces. Lenses, reflectors and trims of fixtures shall be properly and uniformly aligned.
- C. Where fixtures are shown with dual switches, control all inner lamps with one switch and all outer lamps with the other switch. Where dimming or occupancy sensor-controlled fixtures are shown, control the fixtures in accordance with the appropriate wiring diagram or manufacturer's instructions.
- D. Connect night light fixtures and emergency lighting fixtures to the hot (unswitched) side of lighting circuits.
- E. Provide an individual feed with ground conductor from a junction box to each lighting fixture. Lighting fixtures shall not be daisy-chained.
- F. Drops to recessed fixtures may be flexible metallic conduit, or manufactured wiring systems may be used where accessible. Fixtures shall be provided with sufficient length to permit removal and lowering of the fixtures 12" below the ceiling.
- G. Provide green grounding conductors back to the panel ground for lighting circuits. Raceways shall not be used as grounding conductors.
- H. Fixtures shall have their exterior labels removed and shall be thoroughly cleaned. Burned out lamps shall be replaced.
- I. Locate emergency lighting remote battery packs and remote test/monitor modules identically so their status indicating lights are visible to the public and they form a straight line when viewed from the end of the corridor or room. Where a suspended ceiling exists, center the status indicating lights in adjacent ceiling tiles.
- J. Mount sealed beam emergency lighting units where shown and aim their lamps to light the egress path as uniformly as possible.
- K. When emergency lighting fixtures contain audible alarms, disable the alarms in accordance with manufacturer's instructions.

**3.2 FIELD QUALITY CONTROL**

- A. A visual inspection shall be performed to verify cleanliness and alignment of the fixtures. Misalignment and light leaks shall be corrected, and rattles due to ventilation system vibration shall be eliminated.
- B. An operational test shall be performed to verify that all fixtures light properly, and are switched according to the drawings.

**3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

*DELETE THE FOLLOWING SECTION UNLESS THE PROJECT INCLUDES UNUSUAL LIGHTING UNFAMILIAR TO MAINTENANCE ELECTRICIANS.*

**3.4 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

*REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING*

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
  - 1. Provide 2 hours of onsite training minimum.

**DIVISION 26 ELECTRICAL**  
**SECTION 265600 - EXTERIOR LIGHTING**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER  
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 017823 - Operation and Maintenance Manual
  2. Section 019100/019110 - Commissioning
  3. Section 260513 - Medium, Low & Control Voltage Cables
  4. Section 260526 - Grounding and Bonding for Electrical
  5. Section 260533 - Electrical Materials and Methods
  6. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

*VERIFY THE LIGHTING DRAWINGS CONTAIN ALL APPLICABLE LIGHTING  
FIXTURE SCHEDULES AND STANDARD DETAILS.*

- A. Section Includes:
1. Provide all equipment and materials required for pedestrian (security), street and parking lot outdoor lighting as shown on the Drawings.
- B. When indicated by the Contract Documents that the Owner is furnishing fixtures, poles, lamps, and standard anchor bolts, contact the Owner's Outside Lighting Shop at 734-647-2049 or 734-355-9396 to pick up the Owner furnished items from the North Campus warehouse on Baxter Road.
- C. See the fixture schedules and details on the drawings for information on the fixtures, poles and accessories to use.

**1.3 ADMINISTRATIVE REQUIREMENTS**

- A. Contact MISS DIG at 800-482-7171 or 811 before performing any excavation work.
- B. Provide barricades around open holes and trenches. Provide temporary bridges over trenches cut through major sidewalk routes. Major sidewalk routes shall not be closed to pedestrian traffic.

- C. Contact the Owner's Electrical Inspectors 734-764-2457 for inspections before backfilling excavations and before energizing circuits.
- D. Until completion of new outdoor lighting, maintain the Owner and Detroit Edison's existing outdoor lighting. Coordinate with the Owner's Outside Lighting Shop at 734-647-2049 or 734-355-9396 for maintenance and repairs to existing lighting.

**1.4 SUBMITTALS**

- A. Lighting equipment specifications and manufacturer cut sheets, including:
  - 1. Luminaire types, descriptions, dimensions, optics, materials, finishes and photometric data.
  - 2. Pole and/or mounting support descriptions, dimensions, materials and finishes.
  - 3. Lamp type for each luminaire, and lamp wattage, color temperature, color rendering index, and related life.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
  - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
- C. Submit marked up "as built" drawings showing the actual locations of lighting poles, sleeves and junction boxes, circuit numbers for all loads, and all deviations from the design. Dimension the locations of sleeve ends, conduits, and junction boxes from a permanent building or landscape feature.

**1.5 QUALITY ASSURANCE**

***INCLUDE PARAGRAPHS A AND B IN EVERY SPECIFICATION SECTION.  
EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.***

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  - 1. IEEE C2, National Electrical Safety Code.
  - 2. NFPA 70; National Electrical Code.
  - 3. MDOT Standard Specifications for Construction.
  - 4. AASHTO, American Association of State Highway and Transportation Officials
  - 5. Aluminum Association Standards.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

**1.6 WARRANTY**

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 PEDESTRIAN LIGHTING**

A. Fixtures

1. Fixtures shall be Philips Lumec "New Westminster" (NW) Series only.
2. Fixtures shall be of the round globe type, suitable for mounting singly or in multiples on round, tapered aluminum poles.
3. Globes shall be 20-inch diameter and made of clear acrylic with a partially obscure, non-diffusing finish.
4. The lower half of each globe shall be guarded by a cast aluminum, 6-spoke basket that supports a 2-inch-wide horizontal aluminum band around the luminous center of the globe.
5. Fixtures shall be equipped with a round, spun aluminum reflector, porcelain medium base lamp socket with spring loaded center contact, and high power factor, copper wound, multi-tap, CWA ballast. Ballast shall be capable of starting at minus 20 degrees F. Socket and ballast shall be wired with a polarized quick disconnect plug to permit removal for maintenance.
6. Fixtures shall be equipped with a vertical burning, 100-watt, 3200 degrees K, coated metal-halide, lamps, having a nominal output of 9,000 lumens and a nominal life of 40,000 hours. Lamps shall be Venture MHL-100W/U/ED17/PS/740 only.

B. Poles

1. Poles shall be of the round, tapered, aluminum type. Pole height shall be in accordance with the Lighting Fixture Schedule.
2. Poles shall be of one-piece construction with a 0.120 inch minimum wall thickness, a 5-inch diameter at the base and a 4-inch diameter maximum at the top. Any longitudinal welds shall be ground flush and unnoticeable.
3. Poles shall include a base plate 5/8 inch minimum thick. The base plate shall be continuously welded both top and bottom (or inside and outside) to the pole base.
4. Pole base plates shall have four slots suitable for installing over four 3/4 inch diameter anchor bolts set in a 9-1/2- inch- diameter bolt circle pattern.
5. Poles shall include a reinforced 2-inch by 4-1/2-inch hand hole located in the base. The hand hole shall include an internal ground lug and a gasketed cover plate that is firmly held in place by two tamper resistant screws.
6. Poles shall be mechanically cleaned and painted with a black polyester powder coat outside to match the light fixtures.
7. Each pole shall include a one-piece, decorative, cast aluminum base bolt cover painted to match the pole.

8. The poles shall be from the same supplier as the lighting fixtures.
- C. Anchor bolts for pedestrian lighting fixtures shall be 3/4 inch diameter by 20 inches long with a 3 inch "L", fully hot dip galvanized steel having a yield strength of 36,000 psi, each with two zinc plated flat washers and hex nuts.
- D. Column and wall mounted fixture bases shall be fabricated from aluminum pipes and plates in accordance with the drawings, and shall be painted to match the lighting fixtures.

## **2.2 STREET AND PARKING LOT LIGHTING**

### **A. Fixtures**

1. Fixtures shall be Lithonia KSF2 Series only. Fixtures shall be of the low profile, sharp cutoff, shoebox type with horizontal 250-watt metal halide lamps, suitable for mounting singly or in doubles on round, tapered, aluminum poles. Unless noted otherwise, the fixtures shall have Type III light distribution.
2. Fixture housings shall be rectangular, nominally 20 inches long by 15 inches wide by 7 inches deep, of one-piece die cast aluminum construction with continuously welded seams.
3. Fixture door frames shall be cast or extruded aluminum with stainless steel hinge pins and quick release latches; 0.25 inch thick minimum clear tempered glass lens and weatherproof silicone rubber or EPR gasket.
4. Fixtures shall be equipped with a formed, specular, anodized aluminum reflector, position oriented porcelain mogul base lamp socket with spring loaded center contact, and high power factor, copper wound, multi-tap, CWA ballast. Ballast shall be capable of starting at minus 20 degrees F. Socket and ballast shall be wired with a polarized quick disconnect plug to permit removal for maintenance.
5. Fixtures shall be equipped with a horizontal burning, position oriented, 250-watt, 3200 degrees K, coated metal halide, lamps having a nominal output of 21,000 lumens and a nominal life of 10,000 hours. Lamps shall be Osram/Sylvania MS250/3K/HOR.
6. Fixture external surfaces shall be mechanically cleaned and finish painted with a black polyester powder coat.
7. Fixtures shall mount to poles with rectangular, extruded aluminum arms nominally 9 inches long.
8. Except where shown otherwise, fixtures shall be provided with a photocell for on-off control. Photocells shall be mounted on the top of the housing.
9. Fixtures shall be UL 1572 Listed as suitable for wet locations.

### **B. Poles**

1. Provide tapered aluminum poles as follows:
  - a. For 12 foot tall poles, Valmont Model 1108-30506T4L only.
  - b. For 20 foot tall poles, Valmont Model 1908-40705T4 only.
  - c. For 25 foot tall poles, Valmont Model 2408-45806T4 only.
  - d. For 30 foot tall poles, Valmont Model 2908-45808T4 only.

2. Poles shall be of the round, tapered, aluminum type. Poles shall be of seamless, one-piece construction with a uniform taper of approximately 0.14 inches per foot from base to top. The poles shall be of the heights shown on the plan drawings.
  3. Poles shall be 6063 alloy aluminum, 0.250 inches thick, and heat treated to achieve a T6 temper, having a yield strength of 50,000 psi minimum and an ultimate tensile strength of 65,000 psi minimum.
  4. Poles shall be rated for a continuous wind of 80 MPH plus a gust factor of 1.3 per AASHTO, an Effective Projected Area (EPA) of 20.0 minimum, and a fixture load of 400 pounds minimum.
  5. Poles shall include a base plate of A356 alloy aluminum, 1 inch minimum thick, and heat treated to achieve a T6 temper, having a minimum yield strength of 36,000 psi. Base plate shall be continuously welded both top and bottom (or inside and outside) to the base of the pole.
  6. Pole base plates shall have four slots suitable for installing over four 1-inch- diameter anchor bolts set in an 11-inch- diameter bolt circle pattern.
  7. Poles shall include a reinforced 4-inch by 6-inch hand hole located in the base. The hand hole shall include an internal ground lug and a gasketed cover plate that is firmly held in place by two tamper resistant screws.
  8. Poles shall be mechanically cleaned, and either plastic resin coated or polyester powder coated inside over their entire length. Poles shall be painted with a black polyester powder coat outside to match the specified light fixtures.
  9. Each pole shall be provided with a 5/16 inch-18 tapped provision for a ground connector.
- C. Anchor bolts for street and parking lot lighting shall be 1 inch diameter by 42 inches long with a 4 inch "L", fully hot dipped galvanized steel having a yield strength of 36,000 psi. Each bolt shall be provided with two zinc plated flat washers and two galvanized hex nuts.
- D. Provide Valmont Nut Cover, "Dart Square - 2T" Model only, made of A356 alloy aluminum and finished to match the pole. The nut cover shall be a single unit, installed in two pieces, covering all four nuts and the base plate. Pieces shall be held together and anchored to the pole base with stainless steel set screws.

### **2.3 BANNER ARMS**

- A. Banner arms shall be provided by the banner supplier and are not the responsibility of the pole supplier.
- B. Banner arms shall be 6061 cast aluminum, heat treated to a T6 temper, welded to the arm base plate. Banner arm length (banner width) shall be 24 inches maximum for pedestrian light poles and 30 inches maximum for street light poles as indicated in the University Banner Guidelines.
  1. Top banner arms for pedestrian light poles shall be Valmont "BannerSaver" Model, break-away type with self-restoring feature. The break-away/self-restoring hardware, shall be welded directly to the arm base plate.

2. Top banner arms for street light poles shall be either Valmont non-break-away type or Valmont "BannerSaver" Model, break-away type with self-restoring feature. The non-break-away arm, or the break-away/self-restoring hardware, shall be welded directly to the arm base plate.
3. Bottom banner arms for all poles shall be Valmont "BannerSaver" Model, break away type with self-restoring feature. The breakaway/self-restoring hardware shall be welded directly to the base plate.
4. Banner Arm base plates shall be anchored to the poles with adjustable aluminum compression straps or aluminum clamps, finished to match the poles. Arms and straps/clamps shall be removable without any damage to the pole or to its finish. Drilling of any holes for banner arm or hardware attachment is not allowed.
5. End caps for banner arms shall be A356 alloy aluminum, standard type, attached to the arm per manufacturer's standards.
6. Mounting heights of the bottom arms shall be 13 feet clear above the pole base on street light poles, and 6 feet 8 inches minimum clear above grade on pedestrian light poles.

#### **2.4 CONCRETE**

- A. Concrete for lighting pole and emergency telephone kiosk bases shall be 6 bag, minimum mix, with aggregate not exceeding 3/4 inch, 3000 psi minimum compressive strength after 28 days, air content minimum 5 percent and maximum 7 percent.

#### **2.5 RACEWAYS**

- A. Conduits indoor, in general areas shall be electrical metallic tubing (EMT) with steel set screw fittings.
- B. Conduits outdoors (except where galvanized rigid steel is shown on the drawings) shall be Schedule 40 PVC with matching fittings, UL Labeled for use with 90 degrees C cables. Acceptable Manufacturers:
  1. Cantex.
  2. Carlon
  3. National Pipe & Plastic.
- C. Sleeves for underground outdoor lighting and irrigation installations shall be 6" Schedule 40 PVC, UL Labeled for use with 90 degrees C cables. Acceptable Manufacturers:
  1. Cantex.
  2. Carlon.
  3. National Pipe & Plastic.
- D. Junction boxes shall be pre-cast polymer concrete or polymer foam, heavy duty rated, one size larger than required by the NEC, bottomless, with a single piece cover engraved "UM Outside Lighting" and attached with pentahead stainless steel bolts. Provide metal barriers in junction boxes containing circuits of two different voltages or containing both power and telephone circuits. Acceptable Manufacturers:

1. Carson-Brooks.
2. CDR Systems.
3. Quazite.

E. Marking tape shall be plastic, vinyl, or Mylar, 6 inches wide, red for electrical power circuits and orange for telephone circuits, and labeled to indicate the type of circuit buried below.

## **2.6 WIRING**

- A. Wire and cable for general indoor use shall be single conductor stranded copper; with Type THHN insulation rated 90 degrees C, 600 volts.
- B. Wire for use outdoors shall be single conductor stranded copper; with Type XHHW insulation rated 90 degrees C in dry locations and 75 degrees C in wet locations, 600 volts.

## **2.7 TERMINATIONS**

- A. Connectors for splicing and terminating lighting conductors in junction boxes shall be Homac 3 RAB4 or RAB6 "Flood Seals" only.
- B. Connectors for terminating lighting conductors in poles shall be Utilco SLC4-01-L terminal blocks with Utilco No. R6131 boots or Polaris IPL Series terminal blocks only.
- C. Connectors for terminating lighting conductors in column and wall mounted fixture bases only shall be copper split bolt connectors with full tin plating. Blackburn 1HPW for No. 3 AWG wire and 4HPW for No. 6 or No.8 AWG ground wire.

## **2.8 FUSING**

- A. Fuse holders for lighting fixtures shall be Bussmann TRON No. HEB-AA in-line, waterproof fuse holders rated 300 volts and 30 amps.
- B. Fuses for lighting fixtures (unless shown otherwise on the drawings) shall be Bussmann No. KTK-5, rated 5 amps.

## **2.9 CONTROLS**

- A. Lighting contactors shall be of the voltage and amperage shown, 3 pole, fused disconnect switch type, electrically held, with a hand-off-auto switch and a 120 volt control power transformer. Lighting contactors located indoors shall be installed in NEMA 1 enclosures, and lighting contactors located outdoors shall be installed in NEMA 3R stainless steel enclosures with pad lockable doors. Square D Class 8903 only.
- B. Timers for lighting contactor control (only when Building Automation System DDC control is not available) shall be electronic astronomical type, with at least one Form C contact rated 120 volts, 10 amps. Timer shall automatically adjust for changing sunrise and sunset times, have a battery backup sized for 24 hours minimum, and shall be mounted in a NEMA 1 surface mounted box. Paragon EC71ST or Tork DZS100.

## 2.10 CIRCUIT REQUIREMENTS

- A. Unless shown otherwise on the drawings, provide circuits as follows:
  - 1. Feed parking lot lighting, pedestrian lighting, street lighting, emergency telephone kiosks, illuminated signs, and parking lot electric gates and meters all from separate circuits.
  - 2. Feed pedestrian lighting on opposite sides of a street or sidewalk from separate circuits.
  - 3. Feed pedestrian, street, and parking lot lighting at 277 volts from a 480Y/277 volt, three-phase circuit. Feed emergency telephone kiosks, illuminated signs and parking lot electric gates and meters at 120 volts.
  - 4. Pedestrian and street lighting circuits shall consist of four No.4 AWG conductors plus a No. 8 AWG ground conductor in a 1-1/4" conduit.
  - 5. Emergency telephone kiosk, illuminated sign and parking lot electric gate and meter power circuits shall consist of two No. 8 AWG and one No.12 AWG ground conductors in a 1-1/2 inch conduit.
  - 6. Telecommunications conduits to emergency telephone kiosks and parking lot electric gates and meters shall be 1 inch minimum and shall include a nylon pull string.
- B. Provide a means for expanding the outdoor lighting circuits. Stub out a spare 1-1/4-inch conduit from each pole base indicated by "STUB SPARE C" on the plan drawings.

## 2.11 CONTROL REQUIREMENTS

- A. Switch the outdoor lighting with lighting contactors where shown. Lighting contactors shall be controlled by normally closed contacts of a Building Automation System DDC control panel (the preferred option whenever DDC is available), or a 24-hour timer, or a photocell (when DDC is not available). The control circuit shall be wired to energize the lighting upon a failure of the DDC control panel, timer, or photocell. Contact the Owner's Utilities Department (734-647-0962) to coordinate connection to a DDC control panel.
- B. Where specified in the Lighting Fixture Schedule, provide a photocell on top of each fixture housing.

## PART 3 - EXECUTION

### 3.1 EXAMINATION AND PREPARATION

- A. Remove existing conduits and pole bases completely when demolishing existing lighting. Direct buried wiring may be abandoned in place, unless shown otherwise.
- B. Where sidewalk sections must be removed for installation of outdoor lighting, remove the sidewalk sections completely from joint to joint.

- C. Where asphalt must be removed for installation of outdoor lighting, saw cut the asphalt in two, straight, parallel lines, with clean edges.

### **3.2 EXCAVATION AND BACKFILL**

- A. Excavate and maintain trenches according to applicable Safety and Code requirements. Protect existing features.
- B. Backfill excavated trenches in accordance with the drawings. Excavated materials may be used to backfill the trench only if the backfill is sand or suitable soil that conforms to Section 312000 Earth Moving backfill material requirements, that is free of rocks and debris over 3/4 inch. . Dispose of unsuitable material, clay or rocky excavated material, and replace with MDOT Class II sand.
- C. Mark sleeves and conduits for their entire length with a marking tape buried 12 inches above the top of the sleeve or conduit.
- D. Backfill excavated trenches in 6-inch layers and mechanically compact to 98 percent compaction.
- E. Backfill and mechanically compact holes left by demolished pole bases with MDOT Class II sand or clean dirt to a depth of 6 inches below grade. Backfill the last 6 inches with topsoil. Reseed holes in lawn areas.

### **3.3 SLEEVE INSTALLATION**

- A. Sleeves shall be buried at a minimum depth of 24 inches to their top. Sleeves shall extend a minimum of 12 inches beyond the pavement they pass under.
- B. Sleeves shall be taped closed at both ends with duct tape.
- C. Sleeve ends shall be marked with steel stakes, pipes or conduits that are 3 feet long minimum, driven vertically down at the sleeve ends to a depth of 6 inches below grade to their top.
- D. Where lighting and irrigation sleeves are installed adjacent to each other, maintain a minimum of 2 feet between them.

### **3.4 CONDUIT INSTALLATION**

- A. Conduit bends shall not be smaller than the radius of standard manufactured elbows (7-1/4 inches bend radius for 1-1/4 inches conduit).
- B. Install conduits parallel to or at right angles to building lines and site features.
- C. Locate underground conduits as close to curbs and sidewalks as possible to avoid interference with future landscaping.
- D. Where conduits cannot be installed at a minimum depth of 24 inches, install rigid steel conduits or pour concrete over the conduits in accordance with the NEC.

**3.5 JUNCTION BOX INSTALLATION**

- A. Keep the number of junction boxes to a minimum. Make splices in pole bases wherever possible.
- B. Locate junction boxes in mulched areas wherever possible. The top of the junction box shall be level with the existing grade.
- C. Install junction boxes on a base of pea gravel or MDOT Class II sand at least 1-foot deep.

**3.6 FIXTURE AND POLE INSTALLATION**

- A. Locate fixture bases on centerlines where centerlines are shown on the plan drawings. Install fixtures shown on the plan drawings in a straight line.
- B. Lubricate anchor bolt threads with an anti-seize compound.
- C. Align pole with hand hole away from the sidewalk.
- D. Install poles using 2 flat washers and 2 hex head nuts on each anchor bolt so that poles can be leveled. Poles shall be plumb. The center band of pedestrian lighting fixtures shall be level.
- E. Align pedestrian lighting fixtures so that one spoke of the globe basket is perpendicular to the street, sidewalk or wall.
- F. Provide adequate slack in the pole conductors so that the conductors can be pulled out of the handhole for maintenance.

**3.7 GROUNDING**

- A. Provide a ½ inch minimum diameter copper clad ground rod, 8-inch minimum length, for each light fixture pole.
- B. Provide exothermic weld type ground connections or acorn clamps for concealed, underground and concrete encased ground connections and for splices and taps of ground conductors.
- C. Provide No. 10 AWG green insulated grounding conductors in lighting fixture poles.

**3.8 CONCRETE WORK**

- A. Install light pole and emergency telephone kiosk concrete bases according to details. Provide specified concrete mix.
- B. Exposed portions of light pole and emergency telephone kiosk concrete bases shall be free of voids and honeycombs.
- C. Provide a uniform, 1-inch, 45-degree chamfer on all light pole and emergency telephone kiosk concrete bases.

**3.9 ADJUSTING, CLEANING, PROTECTION**

- A. Restore concrete sidewalks and asphalt in accordance with the applicable Division 02 and 03 Sections.
- B. Restore lawn areas to Owner's satisfaction, according to the Lawn Repair Section and the Contract Documents.

**3.10 FIELD QUALITY CONTROL**

- A. Outdoor Lighting Work will be inspected by Owner. Contact the U-M Code Inspection Department at 734-764-2457 before pouring concrete, backfilling excavations, and energizing circuits to arrange for inspections.

**3.11 COMMISSIONING**

- A. Perform commissioning activities per Related Sections.

*DELETE THE FOLLOWING SECTION UNLESS THE PROJECT INCLUDES UNUSUAL LIGHTING UNFAMILIAR TO MAINTENANCE ELECTRICIANS.*

**3.12 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

*REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING*

- B. Train Owner's maintenance personnel on equipment operation, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.

- 1. Provide training of 1 hour minimum.

**DIVISION 27 COMMUNICATIONS**

SECTION 272000 - VOICE AND DATA COMMUNICATIONS

**END OF CONTENTS TABLE**

**DIVISION 27 COMMUNICATIONS**  
**SECTION 272000 - VOICE AND DATA COMMUNICATIONS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

***IN B.2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.***

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manuals.
2. Section 019100/019110 - Commissioning.
3. Section 260513 - Medium, Low & Control Voltage Cables.
4. Section 260526 - Grounding and Bonding for Electrical.
5. Section 260533 - Electrical Materials and Methods.
6. Section 260543 - Underground Services for Electrical Systems.

**1.2 SCOPE OF WORK**

- A. Section Includes:

1. Communications underground ducts, manholes, cable trays, conduits, floor sleeves, J-hooks, surface raceways, outlet boxes and cable pull strings as shown on the drawings.
2. Lighting, power and grounding in Building Entrance (BE) rooms and Telecommunications Rooms (TRs) as shown.

- B. Work Not Included:

1. Communications backboards, equipment racks, equipment, cable ladders, cable managers, cables, terminations, jacks and outlet cover plates will be provided by others.

**1.3 DEFINITIONS**

- A. The Building Entrance room (BE) is the main termination point for interconnecting cables external to the building with cables internal to the building. In addition, the BE may house communications equipment and electronic equipment of other systems. A BE may also serve as a combination BE and TR and serve local telecommunication work outlets.
- B. Telecommunications Rooms (TRs) are distribution and termination rooms that serve the telecommunication work outlets in the immediate area. TRs may house communications equipment and electronic equipment of other systems.

**1.4 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers referenced in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  - 1. ANSI/TIA/EIA-568-C Commercial Building Standards for Telecommunications Cabling Standards.
  - 2. ANSI/TIA/EIA-569-C Commercial Building Standards for Telecommunications Pathways and Spaces.
  - 3. ANSI/TIA/EIA-607-B Commercial Building Grounding and Bonding Requirements for Telecommunications.

**BELOW IS U-M STANDARD WARRANTY LANGUAGE. ALL WARRANTIES ARE TO START FROM THE DATE OF SUBSTANTIAL COMPLETION. DO NOT USE TERMS LIKE "UPON OWNER ACCEPTANCE" OR "18 MONTHS FROM SHIPMENT OR 1 YEAR FROM STARTUP, WHICHEVER OCCURS FIRST", ETC.**

**1.5 WARRANTY**

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

- A. Communications pathways, lighting, power and grounding shall be in accordance with the Related Sections.
- B. Equipment rack power strips shall be 125 volt, 20 amp, 3 wire, single circuit type with 10 NEMA 5-20R single receptacle outlets on 6" centers, Wiremold #V24GB506.

**PART 3 - EXECUTION**

**3.1 RACEWAY INSTALLATION REQUIREMENTS**

**VERIFY THE MINIMUM CONDUIT SIZE TO FEED OUTLET BOXES. SOME OWNERS MAY WANT A DIFFERENT MINIMUM SIZE. IF SO, CHANGE THE BELOW SIZES ACCORDINGLY, BUT THE 1-1/4" TO A SURFACE RACEWAY SHALL REMAIN UNCHANGED.**

- A. Minimum conduit size shall be 1" for serving one outlet box. Daisy chaining of outlet boxes is unacceptable. Instead, multiple outlets may be served from an appropriately sized junction box. The conduit feeding the junction box shall be sized as follows:
  - 1. 1-1/4" for serving two outlet boxes.
  - 2. 1-1/2" for serving three outlet boxes.
  - 3. 1-1/4" for serving up to three outlets in a surface raceway.

- B. Communications ducts and conduits entering the building from the outside shall transition to galvanized rigid steel conduit or intermediate metal conduit at the building wall, and shall continue as galvanized rigid steel conduit or intermediate metal conduit until entering the BE room or TR. Maximum conduit length to meet Code shall be 50'. Notify the Project Manager if this length is exceeded.
- C. Riser conduits and sleeves connecting BE rooms and TRs shall be 4". Install conduits and sleeves as close as possible to the walls, at the locations shown. Stub up floor conduits and sleeves 4" AFF. Stub wall conduits and sleeves 4" into the room, and cable trays 6" into the room.
- D. When conduits are needed to bypass a large interference in a cable tray run, the cross sectional area of the conduits shall equal or exceed the cross sectional area of the cable tray. These bypass conduits shall have sweeps and bends as noted below, and shall be braced well to allow pulling of communication cables.
- E. Conduit bends and offsets shall be made with sweeps or manufactured elbows. Conduits shall not have more than the equivalent of 2 ninety-degree bends between pull points. Pull boxes shall not be used to make directional changes. Provide pull boxes in straight sections of conduit only.
- F. Provide insulated bushings on both ends of conduits.
- G. Provide double gang sheet metal outlet boxes 2-1/8" deep, and provide double gang plaster rings.
- H. Bond the entire raceway system together and connect it to the ground system.
- I. Provide nylon pull strings in conduits and sleeves. Label pull strings with room number and wall (N, S, E, or W) of the outlet.

### 3.2 BE ROOM AND TR REQUIREMENTS

- A. Provide ceiling-hung lighting with a wall switch at the door.
- B. Provide power to HVAC equipment.

**COORDINATE WITH ITSComm AND EDIT THE CIRCUIT REQUIREMENTS ACCORDINGLY.**

- C. Provide dedicated 120 volt, 20 ampere circuits to duplex receptacles 48" AFF and 10' apart on the plywood backboards. Plywood backboards are by others.
- D. Provide dedicated 120 volt, 30 ampere circuits to NEMA L5-30R receptacles and provide dedicated 120 volt, 20 ampere circuits to power strips on the telecom equipment racks. See Standard Detail 27200003.
- E. In rooms with DAS equipment plywood backboards, provide two dedicated 120 volt, 20 ampere circuits to quad receptacles on each DAS backboard.
- F. Provide one 120 volt, 20 ampere normal power circuit to a duplex receptacle on the wall near the door.
- G. Coordinate all receptacle locations with ITSComm.

- H. Provide a 1" wide x 12" long x 1/4" thick copper ground bus bar where shown. Connect it to the unit substation room ground bus bar and to the ground bus bars in the receptacle panels feeding the telecom room receptacles. Ground cables shall be No. 6 AWG green insulated, stranded, copper. The resistance to building ground shall be 1 ohm maximum.

**3.3 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

- B. Related Sections:

*IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.*

- C. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. Provide all equipment, materials, labor and services necessary to furnish, install, test and turn over to the Owner the following electrical work as required by these specifications and as shown on the drawings.

1. GPS Wireless Clocks
2. GPS Signal Transmitters

- B. Participate in project coordination and scheduling activities when required by Division 01 and in project commissioning activities when required by Section 019100/01910.

**1.3 SUBMITTALS**

- A. Product Data Sheets.
- B. Installation, Operation and Maintenance Manuals.
- C. Warranty Documentation.

**1.4 QUALITY ASSURANCE**

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
  - 1. Reference Standards: UL.

**1.5 DELIVERY, STORAGE, AND HANDLING**

- A. Deliver clocks adequately packaged to prevent damage during shipment, staging and installation.
- B. Protect clocks during shipping and while onsite from the weather, moisture condensation, dirt and debris at all times. Store clocks raised up on pallets or other supports until ready for installation.

**1.6 WARRANTY**

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers: Primex Wireless Inc.

**2.2 CLOCKS**

**REVISE THE FOLLOWING PARAGRAPHS TO MAKE THEM PROJECT SPECIFIC.**

**VERIFY WITH ENGINEER THAT DRAWINGS DIFFERENTIATE 120 VOLT POWERED FROM BATTERY POWERED, SINGLE FACE FROM DOUBLE FACE.**

- A. Clocks shall be single face wall mounted or double face edge mounted, 120 volt powered or battery powered, GPS signal synchronized, wireless, analog clocks as indicated on Drawings.
- B. Clocks shall be 12.5 inch nominal diameter with white face, black polycarbonate frame, polycarbonate lens, standard black numerals, and sweep second hand.
- C. Clocks shall include a GPS signal receiver to synchronize wirelessly with GPS time at least every two hours, and shall include an internal oscillator to maintain time within plus or minus 0.2 seconds between synchronizations. Clocks shall maintain accurate time despite the temporary loss of GPS signal. Clocks shall automatically adjust for Daylight Savings Time.

- D. Single face, 120 volt powered clocks shall surface mount to the wall over a NEMA 5-20R simplex receptacle in a single-gang, flush mounted outlet box. Clock shall mount with a clock lock hanger which requires a sequence of movements to install and remove the clock.
  - 1. Acceptable Manufacturer: Primex Model 14306.
- E. Double face, 120 volt powered clocks shall mount edgewise to the wall with a bracket that completely covers a NEMA 5-20R simplex receptacle in a single-gang, flush mounted outlet box.
  - 1. Acceptable Manufacturer: Primex Model 14330.
- F. Single face, battery powered clocks shall surface mount to the wall over a clock lock hanger which requires a sequence of movements to install and remove the clock.
  - 1. Acceptable Manufacturer: Primex Model 14155.

**2.3 GPS SIGNAL TRANSMITTERS**

- A. GPS wireless signal transmitters shall receive and rebroadcast GPS signals throughout the building.
- B. GPS wireless signal transmitters shall be 120 volt powered, have an internal antenna, and produce a 1 watt GPS signal output compatible with the GPS clocks.
  - 1. Acceptable Manufacturer: Primex Model 14000.

**PART 3 - EXECUTION**

**3.1 EXAMINATION AND PREPARATION**

- A. Examine areas, substrates, and conditions, for compliance with requirements for installation and other conditions affecting performance of the units.
- B. Proceed with installation only after unsatisfactory conditions have been corrected. Commencement of the work constitutes acceptance of the existing conditions.

**3.2 INSTALLATION**

- A. Install clocks at the locations and heights shown on the drawings.
- B. Install clocks plumb, level and tight against the wall using the clock-lock hanging method and suitable fasteners as recommended by the clock manufacturer. Initiate clock operation in accordance with manufacturer's instructions.
- C. Assemble GPS signal transmitter and install where shown on the drawings. Plug transmitter into adjacent receptacle and initiate transmitter operation in accordance with manufacturer's instructions.

**3.3 FIELD QUALITY CONTROL**

- A. Test units prior to putting into service to the extent required by the Manufacturer and the Commissioning Authority.

**3.4 TEMPORARY SERVICE**

- A. Start units for temporary use only with the expressed written permission of the Project Manager and in compliance with all requirements of the Contract Documents.
- B. Test units prior to putting into temporary service to the extent required by the Manufacturer and the Commissioning Authority.
- C. Perform all required routine maintenance procedures during temporary service.

**3.5 STARTUP**

- A. Conduct final inspection and testing of equipment and systems according to the manufacturer's requirements, and verify the system meets the project design criteria.
- B. Thoroughly clean units of all grease, dirt, dust, etc.

**3.6 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. This section refers to new work and work that will be performed to modify existing systems. The Security Contractor shall provide all equipment, materials, labor, and services necessary to furnish, install, connect, activate, and test a complete Access Control and Monitoring System. All materials, equipment fabrication, installation, and tests shall conform with applicable Codes and authorities having jurisdiction. Access Control and Monitoring System shall include but is not limited to the following:

1. Provide a complete Access Control and Monitoring System. A Complete system is defined as all conduit, raceways, junction boxes, cables, card readers, controllers, alarm contacts, and programming needed to achieve a complete and functional system connected to the existing University central system. Also included are all required power supplies, power filtering, mounts, housings, equipment stands, and interfaces to existing equipment.
2. The Access Control and Monitoring System shall be an expansion of the existing University of Michigan campus wide Software House system. Work includes adding system panels, card readers and associated access control devices in locations identified on Drawings.
3. Provide all 120VAC power wiring, low voltage work to the system and all necessary components.

4. Coordinate system requirements with the University of Michigan's project management team.
5. Establish system communication with the Access Control System Server and panels via the Owner's LAN/WAN network.
6. Provide system administrative support throughout the installation process to meet the specific needs of the project scope of work.
7. Furnish and any install required interface relays, materials, and cabling to the fire alarm control panel.
8. Coordinate with the Owner's Representative and the U-M key office to provide installation, testing, adjustment, and initial programming for all equipment.
9. Provide written documentation and instructions for system as installed.

### **1.3 RELATED SECTIONS**

- A. Section 281300 articles including but not limited to:
  1. References
  2. Quality Assurance
  3. Submittals
  4. Warranty
  5. Record Documents
  6. Commissioning / Acceptance Testing
  7. Training

### **1.4 QUALITY ASSURANCE**

- A. Pre-programming conference: Prior to programming new doors in Owner's existing access control systems, conduct conference at Project Site to be attended by Owner's Representative, security contractor, Architect, and representatives from Owner's key office.
- B. Qualified Installers:
  1. Siemens (Mike Atzenhofer, 734 456-3800)
  2. Cabling Concepts (Tim Grady, 248 363-4200)

  6. Johnson Controls

## **PART 2 - PRODUCTS**

### **2.1 ACCESS CONTROL PRODUCTS**

- A. System Specifications

1. Manufacturer's catalog and system numbers of equipment listed in this specification indicate type, quality, and functions of the equipment required, and represent the minimum acceptable standards. Provide all compatible parts for the submitted system. The Access Control system work shall integrate with Owner's existing SoftwareHouse C-Cure 800 system.

## 2.2 ACCESS CONTROL EQUIPMENT

- A. Access Control panels shall be SoftwareHouse I-Star Pro Series only. Access Control panels shall include, at a minimum, the following:
  1. I/O boards, and power supplies for DC locks with battery back-up sufficient to maintain full operation of monitoring junctions for a minimum of 4 hours, plus a minimum of 25 lock activations in the event of power failure.
  2. Interfacing relays between Access Controller Panel (ACP) outputs and locks being controlled. Diode noise suppression shall be used on all relay coils and electric lock coils.
  3. Sufficient input boards to accept all monitored points on the Access Control System and sufficient output boards to accept all outputs on the Access Control System. All input and output boards shall include 20% extra points for future connections to the system.
  4. Reed tamper switches.
  5. Output contacts that open on AC power failure and low battery conditions from power supplies. Low battery monitoring must be unique to each power supply.
- B. Card Readers
  1. Provide one reader at each new card reader access control door opening noted on Drawings:

**SELECT ONE OF THE FOLLOWING. COORDINATE SELECTION WITH DESIGN MANAGER.**

- a. Multi-technology reader: SoftwareHouse - RM2L-4000-UM.
  2. Mount readers on shallow depth double gang electrical boxes.
  3. Provide manufacturer's standard thermostatically controlled heater for exterior installations powered from power supply located at access control panel assembly.
  4. Provide reed tamper switch.
- C. Door Monitor Switch
    1. Provide low voltage magnetic position sensor with SPDT switch. Utilize recessed door monitors wherever possible.
      - a. Recessed door monitors: ABS plastic enclosure. Provide GE/Sentrol 1078 series switch.
      - b. Surface mounted door monitor: Anodized alloy housing with stainless steel armored cable. Provide GE/Sentrol 2500 series switch.
      - c. Overhead door monitor: Heavy duty anodized aluminum housing with stainless steel armored cable. Provide GE/Sentrol 2202 series switch.
      - d. Connect Door Switch Monitor (DSM) to the RM/Reader input number 1.

- D. Access Control Cards
  - 1. Existing University of Michigan identification cards will be utilized. NIC.
- E. Request-to-Exit (RTE) Motion Sensors
  - 1. Request to exit motion sensors: Bosch DS-150 series or equal by Software House. Light gray or black color to match adjacent finishes.
  - 2. Relay output will be connected to the RM/Reader input number.
  - 3. Power for RTE from the power supply at the panel.
  - 4. Mount device on ceiling or door frame. Exact location will depend on existing conditions and required coverage area. Unless noted otherwise on Drawings, conceal wireways and junction box.
- F. Power Supplies and accessories
  - 1. Power supplies at panel assembly:
    - a. Lock / heater power: Provide 24VDC power supplies for all electrically controlled door locks and reader heating elements. (Lock power will be wired back to the power source at the panel. Do not use the RM/Reader output relay for the electric locking device.) Power supplies to permit simultaneous continuous-duty activation of all door locks and reader heating elements, with an additional minimum 30% capacity on each supply. Provide battery back-up sufficient for 25 activations for all DC locks. A single power supply may be used for two doors when the power supply is located near both doors.
      - 1) Manufacturer: Securitron BPS-24-10.
      - 2) At existing panel assemblies modified to connect new doors but maintain existing capacity, provide additional power supply capacity to serve new doors.
    - b. Access control panel power: Provide battery backed power supply.
      - 1) Securitron AQM20/16 SoftwareHouse approved power supply.
    - c. Reader heat: Provide low voltage power supplies for all reader heating elements.
      - 1) Securitron BACS-12-20
    - d.
  - 2. Power Supplies at EL-type doors:
    - a. Provide manufacturer's standard battery backed power supply for EL-type exit device used.
    - b. Locate power supply in accessible location, concealed from view within manufacturer's recommended distance.
    - c. In locations where two EL-type devices are within close proximity, provide single power supply to serve both doors.
    - d. Coordinate location with requirements of Division 08 for Doors.
  - 3. Accessories: If necessary, provide interfacing relays between Access Control Panel (ACP) and electric locks being controlled. Install noise suppression diodes on all locks as close as possible to the lock and at the control relay coil.

**PART 3 - EXECUTION**

**3.1 SYSTEM INTERRUPTIONS**

- A. Coordinate with the U-M Fire Protection Shop (734-647-2046) and UMHHC Facility Command Center (734-936-4000) before performing any work affecting an existing fire alarm system. Operating, programming, modifying or impairing an existing system without approval of the U-M Fire Protection Shop and UMHHC Facility Command Center is strictly prohibited.
- B. Coordinate with the U-M Key Office (734-764-3481) before performing any work affecting existing electrically controlled doors, existing control panels, or other access control components.
- C. Coordinate door hardware installation with panel work, system programming, Owner's Representative and Owner's key office such that each door is fully operational with 24 hours of hardware modifications.

**3.2 PROGRAMMING**

- A. Special coordination is required with the U-M Key Office regarding programming requirements. Meet with Owner representatives and submit proposed labels for all input and output points for review and comment. Software labels shall be consistent between various integrated systems. Refer to 281600.
- B. Program automatic door unlock, time specifications, and access levels as directed by the Owner.

**3.3 INSTALLATION**

- A. All electrical power work, conduit work and wire pulling shall be by licensed electricians, and all card reader installation and interconnection work shall be Tyco SoftwareHouse CCure 800 certified technicians
- B. Provide all wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Method and routing of any exposed raceways and/or wiring shall be approved by the owner prior to installation.
- D. Wiring shall be grouped and harnessed to facilitate access to all equipment, as well as maintenance and replacement of equipment.
- E. All cable shall be labeled at origin and termination, referencing to a master legend schedule shown on submittal drawings. Labeling and any splice locations shall be noted on Record Drawings.

**3.4 WIRE AND CABLE PRODUCTS**

- A. Wire and Cable Specifications
  - 1. Security Contractor shall follow the manufacturers' recommendation for cabling or the minimum requirements of the Specifications, whichever provides for the most stringent requirements.

2. Cables are to be shielded as necessary to preclude any outside noise or interference from entering the cable and degrading system performance. All cables shall be U.L. Listed, and appropriate for the application.
3. Coordinate with the Owner's IT department connections to off-site monitoring.
4. Cables run underground, under slab, or in slab shall be installed in conduit and rated for direct-burial application. Cables exposed to weather shall be rated for that use.
5. Mixing of low voltage cables with Telephone/Data cables will not be permitted.
6. All cables shall be run in unbroken lengths of 1000 feet or less. No coaxial or power cables less than 1000 feet shall be spliced. When cable cannot be run in unbroken lengths due to cable spool limitations, coax splices shall be made in junction boxes with crimp-type BNC connectors, power cable splices shall be made using solder and tape. For coaxial cable the center conductor tip shall be a crimp-on style; the ferrule shall be a hexagonal crimp with a minimum ferrule length of 3/8 inch. All splices and junction boxes shall be clearly marked on the "As-Built" Record Drawings.
7. The use of all screw type connectors i.e. snap caps, wire nuts, and the "twist and tape" method are prohibited.
8. All 24VAC power cabling shall be of stranded construction. Terminal strips and fork spade lugs shall be utilized for all terminations.
9. Wiring shall be grouped, bundled, harnessed and dressed neatly to facilitate access to all equipment, as well as maintenance and replacement of equipment.
10. All cable shall be labeled at origin and termination, referencing to a master legend schedule as shown on "As-Built" Record Drawings. Labeling and any splice locations shall be noted on "As-Built" Record Drawings. All labels shall be done using machine generated cable tags in the "flagged" position. Hand written labels are not acceptable.

### 3.5 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

### 3.6 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

**REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING**

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
  - 1. Provide 2 hours of training minimum.

**DIVISION 28 ELECTRONIC SAFETY AND SECURITY**  
SECTION 281600 - SECURITY SYSTEMS

**END OF CONTENTS TABLE**

**DIVISION 28 ELECTRONIC SAFETY AND SECURITY**  
**SECTION 281600 - SECURITY SYSTEMS**

**PART 1 - GENERAL**

**1.1 RELATED DOCUMENTS**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.  
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

*IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. This Specification contains a combination of prescriptive and performance requirements. The Contractor is responsible for fully implementing the functions described in the Specifications and shown on the Drawings. This will require the Contractor to perform substantial work selecting system components, integrating system functions, and integrating new components with the existing campus wide security system and with equipment provided and installed by other Sections.
- B. Security Contractor shall provide all materials, equipment, fabrication, installation and tests in compliance with applicable Codes and Authorities Having Jurisdiction.
- C. Provide all necessary components of an Access Control and Monitoring System (ACMS) as described in the Specifications and as indicated on the Drawings.
- D. Provide a complete system which is defined as all labor and materials required to complete the Work described herein and as indicated on the Drawings. Security Contractor shall provide all hardware, and programming for installation, connection and operation of the new equipment required to provide a fully functional system that integrates with the existing Campus Wide Security System.

- E. Products, equipment, materials, systems, assemblies, and accessories as specified herein define the minimum standards. Documents do not undertake to show or list every item to be provided. Items not shown or listed but are clearly necessary for proper installation, operation and functioning of the equipment and systems shall be provided, installed, tested and certified at no additional cost to the owner.
- F. Provide installation, testing, adjustment, configuration and initial programming for all equipment and systems.
- G. Provide training to the Owner's Representatives in the overall system layout, operation, and programming. Training will consist of review of on-site review of O&M manuals and record drawings.
- H. Provide any interface relays, materials, enclosures, cabling, programming and testing required to interface Access Control
- I. Provide any interface relays, materials, enclosures, cabling, programming and testing that may be required to interface with the Fire Alarm Control Panel (FACP).

### **1.3 RELATED SECTIONS**

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 01
- C. Applicable Division 28 specification sections as follows:
  - 1. Section 260500: "Basic Electrical Requirements"
  - 2. Section 260533: "Basic Electrical Materials and Methods"
  - 3. Section 260513: "Cables and Wiring"
  - 4. Section 262726: "Wiring Devices"
  - 5. Section 262000: "Service and Secondary Distribution"
  - 6. Section 260526: "Grounding"
  - 7. Section 281300: "Access Control and Monitoring Systems"
  - 8. Section 260800: "Electrical Acceptance Tests"

### **1.4 SECURITY CONTRACTOR REQUIREMENTS**

- A. The Security Contractor shall be responsible for coordinating the installation of all building electronic security devices specified in referenced Sections. Security Contractor shall meet the following minimum qualifications:
  - 1. Possess all applicable Contractors' licenses.
  - 2. Provide supervision by a person who has successfully installed similar systems by the same equipment manufacturers at three locations.
- B. Perform all work in accordance with acknowledged industry and professional standards and practices, existing building conditions, and as specified herein.

- C. Maintain a competent supervisor and supporting technical personnel, acceptable to the Owner, during the entire installation. A personnel change of the supervisor during the Project shall not be acceptable without prior written approval from the Owner's Representative.
- D. Provide all required cables, cable support materials, conduit, backboxes, connectors, mounting hardware and trim materials for a completely functional/operational system.
- E. Provide 120VAC power, conduit, and wiring per Division 26 requirements from existing power panels as directed by Owner.
- F. Coordinate with the Owner's Representatives regarding connection of the new system components to the Owner's Campus Security System via the Owner's LAN and WAN networks. IP addresses and or DHCP naming conventions will be provided by Owner.

#### **1.5 REFERENCES**

- A. Published specifications, standards, tests, codes, or recommended standards of trade, industry, or governmental organizations apply to work in these Sections, including:
  - 1. ADA - Americans with Disabilities Act
  - 2. ASCII - American Standard Code for Information Interchange
  - 3. ASTM - American Society for Testing and Materials
  - 4. EIA - Electronic Industry Association
  - 5. IBC - International Building Code
  - 6. NEMA - National Electrical Manufacturers' Association
  - 7. NFPA - National Fire Protection Association with University of Michigan amendments
  - 8. NEC - National Electrical Code
  - 9. UL - Underwriters Laboratories, Inc.
  - 10. UL 294 - Access Control Systems,
  - 11. UL 1076 - Proprietary Burglar Alarm Systems,
  - 12. UL 1037 - Anti Theft Alarms and Devices
- B. Electronic devices radiating "RF" energy shall comply with Federal Communication Commission regulations, particularly Part 15, and shall meet minimum Class "B". Provide FCC certificate numbers indicating that products have been approved by the FCC.

#### **1.6 QUALITY ASSURANCE**

- A. Where applicable, all equipment supplied by the Contractor shall be UL listed or listed by some other nationally recognized testing laboratory approved by the Owner.
- B. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.
- C. All items of a given type shall be the products of the same manufacturer.
- D. All items shall be of the latest technology; no discontinued models or products are acceptable.
- E. No 'beta' products will be accepted.

- F. Security Contractor shall be capable of performing service or maintenance work on the specified systems. Security Contractor's lead technician shall be factory-certified by the security system(s) manufacturer(s).
- G. Security Contractor must be a SoftwareHouse authorized reseller. Security Contractor shall have installed the system bid for this project in at least two projects of similar size and scope.
- H. The Security Contractor shall maintain a local office staffed with factory trained technicians and adequately equipped to provide preventative and emergency service.
- I. Security Contractor shall possess all required licenses and permits.
- J. The Manufacturer, or their Authorized Representative, shall confirm that within 100 miles of the Project site there is an established agency which: Stocks a full complement of parts. Offers service during normal working hours as well as (24 hour/7 days a week) emergency service on all equipment to be furnished. Will supply parts and service without delay and at reasonable cost.
- K. In the event of a discrepancy between the Specifications and the Drawings, whichever is more stringent or calls for the highest quantity or quality of materials has precedence. Specifications and Drawings are complementary and what is required by one is as binding as if required by all.

#### **1.7 SUBMITTALS**

- A. Submittals shall be provided for review and acceptance by the Owner's Representative prior to commencement of the work.
- B. All security system submittals shall be complete and in a similar format for ease of review. The Owner reserves the right to reject any submittals determined to be incomplete.
- C. The Security Contractor should not consider the Owner's review of submittals to be exhaustive or complete in every detail. Approval of submittals, including substitutions, indicates only the acceptance of intent to comply with the general design or method of construction and quality as specified. The functional requirements, operations, arrangements, and quantities must comply with the Contract Documents unless changes are specifically approved in writing. Submittal approval does not relieve the Security Contractor of responsibility for errors or omissions in dimensions, details, and sizes or for coordinating items with actual building conditions.
- D. Work provided without approved submittals is done at the Security Contractor's risk and may be changed at no cost to the Owner.
- E. Equipment Submittals shall include:
  - 1. Bill of Material for all new equipment.
  - 2. Manufacturer's name, brand name, and catalog number with UL listing identified.

3. Written approval from each manufacturer affirming that Security Contractor is certified and approved for systems installation and service for all systems in this Section.
4. Service information, including address of nearest representative
5. Note: When a cut sheet is supplied that shows multiple items, clearly identify the specified parts being used including any optional items.

F. Installation Submittals shall include:

1. To scale drawings in AutoCAD DWG format.
2. Elevation and mounting details showing all modules and components.
3. Point-to-point, and termination drawings for all work showing all devices and each conductor identified. "Typical" drawings will not be accepted.
4. Battery calculations for all batteries.
5. Voltage-drop calculations are required for all lock circuits.

G. Programming Submittals shall include

1. Device names and descriptions,
2. Complete written sequence of operations for all functions of the system.

**1.8 PRODUCT DELIVERY, STORAGE AND HANDLING**

- A. Replace, at no expense to Owner, equipment and material damaged during storage and installation as directed by the Owner's representative.
- B. Products delivered to the job site shall be protected from water, dust, dirt, and foreign matter. All equipment shall be protected from water, dents, bumps, and scratching.

**1.9 WARRANTY**

- A. Security Contractor and manufacturer guarantee installation, equipment, and all parts and labor for one year from written notification of acceptance. Security Contractor is required to submit a Service Level Agreement for the performance of warranty work, including response time, exceptions to warranty coverage, and the process to initiate warranty service call(s).
- B. All warranty and service work shall be performed by personnel who have been trained and certified by equipment manufacturers and are experienced in the operation and maintenance of the installed systems.
- C. The following Service Level Agreement identifies the expectations to be included in project.
  1. Service Hours: Normal hours for service are Monday through Friday, 8:00 a.m. to 5:00 p.m., excluding recognized national holidays. Service calls commencing within these time frames, through to completion of the service call, will not be considered after-hours calls and will not be subject to premium rates.

2. Response Time - Normal Service: Service requests will be transmitted to the Security Contractor both by phone and e-mail. Service requests will be tagged as either Normal or Emergency. Normal requests for service transmitted to the Security Contractor prior to 10:00 a.m. Monday through Friday will be responded to by an on-site technician the same business day. Normal requests transmitted to the vendor after 10:00 a.m. will be responded to by an on-site technician by 12:00 p.m. the following business day.
  3. Response Time - Emergency Service: Emergency service requests will be responded to by an on-site technician within 4 hours, regardless of the time of day transmitted or the day of week. Emergency service calls will be reimbursed to the Security Contractor at an additional fifty percent (50%) of his standard service rate.
  4. Service Expectation: The Owner expects the Security Contractor to respond with a technician suitably trained and equipped to return the system to complete operation during the duration of the service call. Dispatching additional personnel, delivery of additional parts or return calls to correct the originally identified problem will not expose the Owner to additional charges. The service team will not leave the Owner's site without either returning the system to full operation or providing a documented acceptable explanation as to why the call cannot be completed. Technicians remaining on-site to complete calls after 5:00 p.m. will not expose the Owner to premium time charges.
  5. Warranty service shall include the replacement of all parts and or components as required to restore normal system operation. In the event that system parts or components must be removed for repair the Security Contractor shall furnish and install temporary parts and or components as required to keep the system fully operational.
- D. Owner's Responsibilities: Owner will allow unhindered access for the service technicians to areas where they will perform their work, and will promptly provide escorts if technicians need to work in areas where an Owner escort is required. Owner will provide power and telephone access for the technician to operate test equipment and power tools, and to allow the technician to communicate with their office or equipment manufacturers.
- E. The Owner reserves the right to expand or add to the system during the warranty period using firm(s) other than the Security Contractor for such expansion without affecting the Security Contractor's responsibilities, provided that the expansion is done by a firm which is an authorized dealer or agent for the equipment or system being expanded.
- F. Provide written notice to the Owner documenting any work performed during the warranty period.

## **PART 2 - PRODUCTS**

### **2.1 SECURITY SYSTEMS PRODUCTS**

- A. Refer to individual security system Sections for product details.

**PART 3 - EXECUTION**

**3.1 REQUIREMENTS**

- A. Coordinate all work including schedule and integration of work with other trades.
- B. Coordinate work with Owner's Representatives for all network connections.
- C. All systems shall be complete and operational in all respects.
- D. Provide installation of all wiring, raceway, conduit, and approved wireways for Division 28 work. Provide connection of power to security systems as required.
- E. Wiring in wet or damp locations, including all underground conduits, shall be rated for wet applications.
- F. Security Contractor shall consult manufacturer's recommendations for cabling and conduit and use whichever is greater in size, quality, quantity, gauge, shielding and number of conductors at no additional cost to the Owner. All cables will be provided by the Security Contractor.
- G. All security equipment in public areas shall be installed utilizing tamper proof mounting hardware. Provide a minimum of 2 driver bits or hand tools for each type of security fastener to the Owner. The standard type of security screw shall be a star configuration with a security center piece.
- H. Cables are to be protected from excessive tension, abrasion, or damaging bends or kinks during installation. Care shall be taken not to bend, crush or kink cables.
- I. Cables shall be combed straight and formed in a neat and orderly manner. Tie wraps are to be used for cable management, not support. Use tie wraps of the appropriate size and type. Do not over-tighten tie wraps.
- J. Provide service loops at each termination point so devices can be dismantled for service and inspection.
- K. Provide bracing for all equipment, including equipment racks and consoles.
- L. Refer to individual security system Sections for additional installation requirements.

**3.2 RECORD DOCUMENTS**

- A. As Built Drawings
  - 1. Maintain a complete set of prints of Contract Drawings of the work forming a part of the security systems. As work is installed, carefully draw on prints, in colored pencil, actual location of work including depth of underground runs, if any, with dimensions from permanent structures. Wiring diagrams and details shall be included.

2. Upon completion of the Project, transfer this information to reproducible Drawings and updated CAD (AutoCAD DWG files) disks, and submit to the Owner, along with hand marked field record set.
3. The Security Contractor shall provide three bound sets of drawings and two CDRoms with all AutoCAD drawing files and corresponding PDF files.
4. Record Drawings shall include:
  - a. Complete wiring diagrams for all components, including cable types and quantities, routings, floor plans indicating device locations, room numbers, conduit sizes.
  - b. Complete elevation, mounting, and point-to-point and termination drawings for all devices. "Typical" drawings will not be accepted.
  - c. A Master Legend/Spreadsheet on the drawings that identifies all devices, device location on the drawings, wire label verbiage, panel termination points and detail numbers. Each spreadsheet will be specific to the control panel. The legend/spreadsheet will also be place in each control panel for service support and termination assistance. For work in existing panels, provide information noted above for all additions and modifications.
  - d. A complete written sequence of operations for all functions as installed and programmed for each system.
  - e. A complete list of all equipment installed organized by building.

B. Operations and Maintenance Manuals

1. Provide operations and maintenance manuals Division 01 requirements and as follows
2. Operations:
  - a. The operations section shall contain complete guidance and procedures for operation of the system and each subsystem including all required actions at each operator position, step by step instructions for system start-up and execution of all system functions and commands.
  - b. Operation section shall include the following information:
    - 1) Detailed descriptions including step by step procedures for initialization, recovery and re start for each system.
    - 2) Complete operational descriptions for each system including all functions and features.
    - 3) Detailed descriptions for all programming and data base entry functions including step by step procedures, screen illustrations and flow charts.
    - 4) Copies of manufacturer operation manuals and instructions.
3. Maintenance
  - a. The maintenance section shall contain complete guidance and procedures for routine maintenance of the system and each subsystem including manufacturer recommendations for preventative maintenance.

- b. Maintenance section shall include the following information:
  - 1) The names, addresses and contact information for each manufacturer, local manufacturer representative and all subcontractors that performed work or furnished material for the project.
  - 2) Detailed descriptions of all user performed maintenance on all system components including inspection, periodic preventative maintenance, fault diagnosis and replacement of all modules.
  - 3) A summary of all TCP/IP addresses used and which system component they are associated with.
  - 4) Manufacturer data specification sheets for each piece of equipment, device and system.
  - 5) Manufacturer service and installation manuals for each piece of equipment, device and system.
  - 6) Manufacturer warranty certificates.
  - 7) Reduced copy of as built drawings.

### 3.3 COMMISSIONING/ACCEPTANCE TESTING

- A. Perform Commissioning activities per Related Sections above.
- B. There are two distinct types of tests for which the Security Contractor is responsible:
  - 1. The first type is the Pre-Functional Performance Test. These tests ensure that all equipment, wiring, and systems are installed in accordance with the Specifications, Drawings, and manufacturers' requirements.
  - 2. The second type of test is the Substantial Completion Test. These tests ensure that all equipment and systems operate in accordance with design intent. These are dynamic tests, and test the systems through all possible modes of operation.
- C. Perform systems tests using personnel who have attended a manufacturer's training school for installation and testing of the systems as described above. Perform testing with the test instruments as required by the manufacturer; testing by means other than the manufacturer's procedures will not be acceptable unless agreed to by the Owner's Representative.
- D. Upon completion of the installation of the security systems, the Contractor shall submit to the Owner Pre-Functional Performance Test reports including, but not limited to, the following information:
  - 1. A complete list of all equipment installed, including serial numbers of major components.
  - 2. Certification that all equipment is properly installed and functional, and it conforms with Contract Specifications and Drawings.
  - 3. Test reports of all new and existing inputs and outputs, devices, and equipment.
  - 4. Test technician's name, company, and dates of test.

- E. Following review of the Pre-Functional Performance Test report by the University of Michigan project team, the Contractor shall schedule a substantial completion test with the University of Michigan projects team. A Substantial Completion Test shall include performance tests of each device, switch, control unit, power supply, battery standby unit, monitor panel, controller, and all other equipment and material required by the Contract. Tests will only be conducted at completed buildings, partial testing of buildings will not be performed by the University of Michigan project team. Owner will provide testing document.
- F. At a minimum, perform tests to demonstrate that:
  1. All systems are free from grounding and open circuits.
  2. Each alarm-initiating device consistently functions as specified and produces the specified alarm actions.
  3. An abnormal condition of any circuit or device required to be electrically supervised will result in activating the specified trouble or tamper alarm signal.
  4. Doors lock and unlock at programmed times and allow access upon activation from a valid card.
  5. The system is operable under specified trouble conditions.
  6. All software functions properly as specified, and all equipment is fully programmed. The Security Contractor shall be responsible for programming system English-language descriptors as specified by the Owner's representative.
  7. System Record Drawings correspond with actual installation.
- G. Final commissioning by Owner is required for final acceptance. Final commissioning is to be scheduled simultaneous with punch list.
- H. If retesting is required due to Security Contractor equipment failure, incorrect programming, omission, or error, the Security Contractor shall correct the problem, retest, and state in writing the system is ready for the Owner to witness a demonstration.

**3.4 TRAINING**

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

*REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING*

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
  1. Provide 2 hours of training minimum.

**SPECIFICATION DIVISION 28**

NUMBER            SECTION DESCRIPTION

**DIVISION 28 ELECTRONIC SAFETY AND SECURITY**

SECTION 283100 - FIRE DETECTION AND ALARM SYSTEM

**END OF CONTENTS TABLE**

**DIVISION 28 ELECTRONIC SAFETY AND SECURITY**  
**SECTION 283100 - FIRE DETECTION AND ALARM SYSTEM**

*DELETE FROM AND ADD TO THIS SECTION TO MAKE IT PROJECT SPECIFIC. HIDDEN TEXT DIRECTIONS INDICATE SOME BUT NOT ALL OF THE REQUIRED EDITING. DELETE THE HIDDEN TEXT DIRECTIONS BEFORE PRINTING FOR PUBLICATION.*

*VERIFY THE TYPES, QUANTITIES AND LOCATIONS OF FIRE ALARM COMPONENTS SHOWN ON PLAN DRAWINGS MATCH THE SYSTEM DESIGN REQUIREMENTS BELOW.*

**PART 1 - GENERAL**

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

**1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT OR DELETE IF Cx IS NOT REQUIRED.*

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

**1.2 SUMMARY**

- A. Provide all equipment, devices, appliances, wiring, and materials necessary for a complete and expandable fire detection and alarm system which adheres to applicable codes, standards, and University of Michigan requirements.
- B. Coordinate with and provide submittals to the Michigan Bureau of Fire Services, Ann Arbor Fire Department, U-M Fire Marshal, and FM Global as required.

*IF THE BUILDING WILL REMAIN OCCUPIED DURING THIS WORK, INCLUDE THE FOLLOWING PARAGRAPH.*

- C. Maintain the existing fire alarm system in service while the new work is installed, tested and made operational.

*ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.2.D AND THE NON-APPLICABLE PARAGRAPHS OF 1.2.E.*

- D. Provide a new fire alarm system with the following features:

1. A main fire alarm control panel (FACP).
2. Node and notification appliance circuit (NAC) panels.
3. Automatic and manual initiating devices.
4. Audible and visual notification appliances.
5. Control inputs and outputs to ventilation systems.
6. Control outputs to each elevator controller to initiate elevator recall.
7. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
8. Alarm, supervisory, trouble, fire pump running and maintenance alert outputs to the MOSCAD alarm transmitter.
9. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
10. System programming in accordance with the system's sequence of operation.

**ON PROJECTS PROVIDING A NEW FIRE ALARM SYSTEM, DELETE ALL OF 1.2.E.**

- E. Renovate the existing fire alarm system by providing the following as appropriate for the project's scope:
1. A pre-renovation test of the existing system to document the condition of the system before it is changed.
  2. A main fire alarm control panel (FACP).
  3. Node and notification appliance circuit (NAC) panels.
  4. Automatic and manual initiating devices.
  5. Audible and visual notification appliances.
  6. Control inputs and outputs to ventilation systems.
  7. Control outputs to each elevator controller to initiate elevator recall.
  8. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
  9. Alarm, supervisory, trouble, fire pump running and maintenance alert outputs to the MOSCAD alarm transmitter.
  10. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
  11. System programming as required to incorporate changes to the system's sequence of operation.

**EDIT 1.2.F AND G TO MAKE THEM PROJECT-SPECIFIC.**

- F. Provide the following additional work where shown on the drawings:
1. Remote annunciators.
  2. A smoke control system control panel.
  3. Status monitoring of other building life safety systems.
  4. Control outputs to automatically control smoke control system equipment.
  5. Status lights indicating the current status of smoke control system equipment.
  6. Control switches to manually override the automatic control outputs to smoke control system equipment.
  7. Control outputs to interrupt power to electrically operated access control door hardware devices.
  8. Non-battery backed power to door hold-open devices.
  9. Emergency voice/alarm communications.
  10. Building-wide mass notification system.

11. Remote microphone cabinets.
12. Fire Department telephone communications.

G. The following work is not included unless shown otherwise:

1. Smoke and heat detectors that actuate a fire suppression system.
2. Electrically operated door hardware devices.
3. Power to electrically operated door hardware devices.
4. Door hold-open devices.

### 1.3 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the other Division 28 specification sections, including the following, apply to this section.
  1. Section 260533, "Basic Electrical Materials and Methods".
  2. Section 260513, "Cables and Wires".
  3. Section 262000, "Service and Secondary Distribution".
  4. Section 260526, "Grounding".
  5. Section 260800, "Electrical Acceptance Tests".

### 1.4 REFERENCES

- A. Comply with the current versions of the following codes and standards as applicable:
  1. ANSI/IEEE C2, "National Electrical Safety Code".
  2. MBC, "Michigan Building Code".
  3. MEC, "Michigan Electrical Code".
  4. "Michigan Elevator Code"
  5. MMC, "Michigan Mechanical Code".
  6. "Michigan Rehabilitation Code".
  7. "Michigan Residential Code".
  8. NFPA 13, "Standard for the Installation of Sprinkler Systems".
  9. NFPA 20, "Standard for the Installation of Centrifugal Fire Pumps".
  10. NFPA 72, "National Fire Alarm Code", clarified as follows:
    - a. Smoke and heat detectors shall not be required above suspended ceilings.
    - b. Horns or speakers shall not be installed in elevator machine rooms. Horns, speakers, or strobes shall not be installed in elevator cars.
    - c. Fire alarm system shall not shut down power to the elevators upon sprinkler water flow.
    - d. Optional smoke detectors in rooms with beam pockets shall be spaced as shown on the plan drawings.
  11. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems".
  12. UL 217, "Single and Multiple Station Smoke Detectors".
  13. UL 268, "Smoke Detectors for Fire Protective Signaling Systems".
  14. UL 268A, "Smoke Detectors for Duct Applications".
  15. UL 464, "Audible Signal Appliances".
  16. UL 521, "Heat Detectors for Fire Protective Signaling Systems".
  17. UL 864, "Control Units for Fire Protective Signaling Systems"

18. UL 1480, "Speakers for Fire Protective Signaling Systems".
19. UL 1971, "Signaling Devices for the Hearing Impaired".

- B. For classroom, in-patient medical, and Housing projects, comply with the applicable sections of NFPA 101, "Life Safety Code" as adopted and amended by the Michigan Bureau of Fire Services.
- C. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, comply with the NFPA 72 requirements related to survivability from attack by fire.
  1. Designate each notification appliance circuit to serve no more than one notification zone.
  2. Protect power supply and notification appliance circuits from fire until they enter the notification zone they serve.
  3. Monitor the integrity of audible and visual notification appliance power supplies, audio generators, amplifiers and circuits.
  4. Monitor the integrity of Fire Department telephone communications circuits.

#### **1.5 SYSTEM DESIGN REQUIREMENTS**

- A. The system shall be device addressable and power limited.
- B. Provide a fire alarm control panel with the following:
  1. Digital display.
  2. Multiple pushbutton keypad.
  3. LED status indicating lights.
  4. Audible status signals.
  5. Output relays.
  6. Battery charger and batteries.
  7. RS-232 communications card.
- C. Evaluate and document the appropriate signaling line circuit class designation.
  1. In general, provide Class B signaling line circuits except where an applicable code requires a different circuit class.
  2. Provide sufficient spare capacity on each signaling line circuit for an additional 25 percent of initiating and control devices.
- D. Evaluate and document the appropriate notification appliance circuit class designation.
  1. In general, provide Class B notification appliance circuits except where an applicable code requires a different circuit class.
  2. Size the control panel power supplies, amplifiers, and batteries for 25 percent spare capacity calculated with 40 ma horn loads, 1 watt speaker loads, and 150 ma strobe light loads.
  3. Provide sufficient spare capacity on each notification appliance circuit for an additional 25 percent of notification appliances.
- E. The system shall supervise the following circuits and components:
  1. Initiating device circuits.
  2. Signaling line circuits.
  3. Notification appliance circuits.

4. Addressable initiating and control devices.
  5. Control output wiring.
  6. Auxiliary control switches.
  7. System node panels, NAC panels, remote annunciators, and remote microphone panels.
  8. Primary power supply.
  9. Secondary power supply.
- F. The system shall be capable of being programmed by the Owner on site to accommodate expansion or sequence of operation changes.
- G. Provide 120 volts AC primary power to the system from a dedicated emergency power branch circuit.
- H. Provide a control panel battery charger capable of fully charging a 200 amp-hour battery within 24 hours.
- I. Provide sufficient secondary power battery capacity to operate the entire system (except the door hold-open devices) upon the loss of primary power for a period of 24 hours in a normal supervisory mode followed by 5 minutes of evacuation alarm operation.
1. When emergency voice/alarm communications is provided, provide sufficient battery capacity for 24 hours of operation in a normal supervisory mode followed by 15 minutes of voice/alarm operation.
  2. The system shall automatically transfer to and from the secondary power batteries upon an interruption of primary power without initiating a nuisance alarm.
  3. The system shall delay initiating a trouble condition for two seconds upon a transfer to or from primary power to avoid nuisance trouble conditions during emergency generator testing.
- J. Provide smoke and heat detectors as required by code and as shown, including the following.
1. Provide smoke detectors in each elevator lobby, in each elevator machine/control room, and at the top of each elevator shaft to initiate elevator recall.
  2. Provide two heat detectors, one in front and one behind, each unit substation transformer.
  3. Provide a smoke detector in each mechanical, electrical, telecommunications, trash collection, and recycling room.
  4. Provide smoke detectors in residence hall corridors, each sleeping room, and immediately outside each sleeping room that is located within a suite or apartment.
  5. Provide duct smoke detectors where required by code. When not in plain view or when more than 10 feet above the floor, provide duct detector remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.

**FOR THE FOLLOWING, IN RENOVATIONS IN WHICH THE ROOM USAGES WILL REMAIN THE SAME, THE DESIGNER SHALL METER AND DOCUMENT THE EXISTING MAXIMUM AMBIENT SOUND LEVEL OF EACH SPACE. REFER TO NFPA 72, 18.4.1.3 AND A.18.4.1.3.**

- K. Provide sufficient audible notification appliances to achieve a sound level of 15 dBA above ambient sound level, but not less than 60 dBA nor more than 110 dBA in all occupiable spaces. The sound level in mechanical rooms shall be not less than 90 dBA, and in sleeping rooms shall be not less than 75 dBA measured at pillow level. The sound shall be a three-pulse temporal pattern evacuation tone.
1. In rodent rooms, the sound shall be a slow whoop or warble with a peak frequency below 500 Hz.
  2. Do not provide horns or speakers in exit stair enclosures.
  3. Do not provide horns or speakers in elevator machine rooms or in elevator cars.
  4. Provide a speaker in each sleeping room and a sounder base in each sleeping room smoke detector. The speaker shall provide the general alarm and the sounder base shall alarm upon smoke within the room.
- L. Provide visual notification appliances in accordance with the intensity and spacing requirements of NFPA 72.

**THE DESIGNER SHALL INCLUDE ROOM NAMES ON THE PLAN DRAWINGS AND SHALL DIFFERENTIATE BETWEEN SINGLE PERSON AND MULTI-PERSON OFFICES.**

1. Provide strobes in all public areas including multi-person offices.
2. Do not provide strobes in exit stair enclosures or in animal rooms.
3. Combine horns or speakers with strobes when both are required at the same location.
4. Synchronize strobes when more than two appliances are in any point of view and are less than 55 feet apart.
5. Provide strobes in elevator machine rooms. Do not provide strobes in elevator cars.
6. Provide strobes in accessible sleeping rooms and in living spaces of accessible suites or apartments.
7. Provide strobes in mechanical rooms and other areas that have an average ambient noise level exceeding 95 dBA.

**DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.**

- M. Provide a waterproof horn/strobe or speaker/strobe with waterproof back box on the exterior of the building between 8 and 12 feet above each fire department connection. Audible sound shall be 90 dBA minimum at 10' and visual intensity shall be 110 candelas. Program this device to alarm upon sprinkler system water flow only, and to cease operation upon termination of water flow.
- N. Provide individually addressable monitor modules to monitor non-addressable initiating devices and status contacts of other systems.
1. Monitor modules shall use Class B initiating device circuits to monitor the initiating devices and status contacts.

**FOR THE FOLLOWING, THE DESIGNER SHALL IDENTIFY THE MAKE AND MODEL OF THE EXISTING FIRE ALARM CONTROL PANEL AND THEN CONSULT WITH THE MANUFACTURER TO DETERMINE WHETHER A CROSS-TIE WITH SIMULTANEOUS RESET IS FEASIBLE. DETERMINE AND DOCUMENT REQUIRED PROGRAMMING AND HARDWARE REVISIONS.**

2. When interconnecting with an existing fire alarm system control panel, provide monitor modules as required.
    - a. New and existing control panels shall function as a single system.
    - b. All control panels shall be capable of being reset simultaneously from a single location.
- O. Provide panel auxiliary relay contacts and individually addressable control module contacts, including the required panel control logic programming, to interface with control circuits of other systems and equipment.
1. Provide normally closed duct smoke detector contacts to shut down ventilation systems.
  2. Provide three control module output contacts for each elevator to control elevator recall.
  3. Provide normally closed auxiliary relay or control module contacts to release electrically held door locks and door hold-opens, and to disable electrically operated door proximity sensors.
  4. When interconnecting with an existing fire alarm system control panel, provide control modules as required.
    - a. New and existing control panels shall function as a single system.
    - b. All control panels shall be capable of being reset simultaneously from a single location.
- P. Provide a smoke control system panel.
1. Provide normally open auxiliary relay or control module contacts to automatically control smoke control system equipment.
  2. Provide smoke control panel On/Off/Auto switches with "On" and "Off" or "Open" and "Closed" LED indicators for overriding the normally open contacts that control smoke control system equipment.
    - a. In the Auto position, the contacts shall operate in accordance with the fire alarm system program. In the Off position, the contacts shall remain open. In the On position, the contacts shall close to test the controlled equipment.
    - b. The LED indicators shall indicate the status of the controlled equipment in accordance with the MMC.
    - c. Turning any switch out of the Auto position shall initiate a system trouble condition.
- Q. Assign each initiating device and control module a unique device address. Label each device with its unique address using a clear adhesive backed nylon or Mylar tape with black text. Install the label on the base of any device with a removable or replaceable head.
- R. Develop a custom location label for each initiating device and control module that describes the type, floor, room number and exact location of the device.
1. If the device is in a corridor or similar large space, state device is by Room XXX.
  2. If room numbers are not available, provide compass directions and references to unique building features.

- S. Provide transient voltage surge suppression for the system.

**1.6 SYSTEM PERFORMANCE REQUIREMENTS**

- A. Under normal conditions, the control panel digital display shall display a "SYSTEM NORMAL" message and the current time and date.
- B. Should an abnormal condition be detected, the appropriate alarm, supervisory, or trouble panel LED shall flash and the appropriate panel audible signal shall sound.
- C. The appropriate panel alarm, supervisory, trouble, or supervisory maintenance alert output relay contact shall close and send a signal through the MOSCAD alarm transmitter to the Division of Public Safety and Security (DPSS).
- D. The fire alarm control panel shall manage all input and output signals through software programming and hardware configuration. In addition to managing and supervising the fire alarm devices, the control panel shall be configured to trigger a supervisory condition when the fire pump runs.
- E. The panel shall display the following information relative to the abnormal condition:
  - 1. Custom location label (40 characters minimum).
  - 2. Type of initiating device.
  - 3. Type of abnormal condition (alarm, supervisory or trouble).
- F. If the abnormal condition is an alarm, the following actions shall occur:
  - 1. Audible notification appliances shall sound throughout the building.
  - 2. Visible notification appliances shall flash throughout the building.
  - 3. Control outputs to mechanical systems and elevator controllers shall perform their programmed functions.
  - 4. Control outputs shall interrupt power to electrically operated door hardware devices.
  - 5. Power to door hold-open devices shall de-energize.
- G. Pressing the appropriate Acknowledge pushbutton shall acknowledge the alarm, supervisory or trouble condition unless the system is in the silence inhibit mode. Once acknowledged, the appropriate LED shall latch on and the panel audible signal shall be silenced.
- H. If the abnormal condition is an alarm, pressing the Silence pushbutton shall silence the audible notification appliances and stop the visual notification appliances from flashing.
- I. Upon a subsequent abnormal condition from another device, the appropriate panel LED shall flash, the panel audible signal shall again pulse and the panel display shall show the new abnormal condition.
- J. After all of the points have been acknowledged and silenced, the LED's shall glow steady and the panel audible signals shall be silenced. The total number of alarms, supervisory, and trouble conditions shall be displayed along with a prompt to review each list chronologically. The end of the list shall be indicated.

- K. Pressing the System Reset pushbutton shall return the system to its normal state if the abnormal conditions have been remedied.
  - 1. The display shall step the user through the reset process with simple English language messages. Messages including "IN PROCESS", "RESET COMPLETED", and "SYSTEM NORMAL" shall provide operator assurance of the sequential steps as they occur.
  - 2. The ventilation system motors shall restart sequentially.
  - 3. The outputs to control circuits of other systems and equipment shall return to normal.
  - 4. When interconnecting with an existing fire alarm system control panel, resetting shall not require the simultaneous operation of reset pushbuttons or switches on multiple control panels, or the disconnection of wiring.
- L. Should an abnormal condition continue to exist, the system shall remain in an abnormal state. The system control relays shall not reset. The panel LED's shall remain on. The display shall indicate the total number of alarm, supervisory and trouble conditions present in the system along with a prompting to review the points. These points shall not require acknowledgment if they were previously acknowledged.
- M. Should a trouble condition continue to exist, the trouble audible signal shall resound at preprogrammed time intervals to act as a reminder that the fire alarm system is not 100 percent operational. Both the time interval and the trouble audible signal shall be programmable to suit the Owner's application.
- N. Should the Alarm Silence Inhibit function be active, the System Reset pushbutton shall be ignored and a "RESET INHIBITED" message shall be displayed for a short time to indicate that action was not taken. For operator assurance, a "RESET NO LONGER INHIBITED" message shall be displayed when the inhibit function times out.

**1.7 ITEMIZED QUOTATION**

- A. Submit with your bid an itemized cost breakdown listing all major component costs, labor costs (including subcontractor labor and material costs), and engineering costs, for base bid and for each alternate, for the entire fire alarm system scope of work. When requested, provide an itemized breakdown to the Owner post-bid for review and approval.

**1.8 SUBMITTALS**

- A. Submit for approval copies of the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the project name and number. Submittals shall be marked to indicate the specific models, sizes, types, and options being provided. Submittals not so marked and incomplete submittals will be rejected.
  - 1. Plan drawings showing the locations (with room names and numbers) of the system components, including any adjustments in the quantities and locations of initiating devices and notification appliances to meet code requirements.
  - 2. Riser diagram showing system components, interconnecting wiring and connections to other building systems and equipment.

3. Wiring diagrams showing manufacturer and field connections at component terminals, complete with conductor color codes and wire numbers.
4. System configuration list showing inputs, outputs, device addresses and custom location labels, device configurations and program logic.
5. Bill of materials.
6. Catalog pages showing system components.
7. System battery sizing calculations.
8. Power supply, amplifier and circuit sizing calculations.
9. Door hold-open power supply sizing calculations.

**ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.9.**

#### **1.9 EXTRA MATERIALS**

- A. Provide to the Owner the following extra materials matching the products installed, packaged in protective coverings for storage, and identified with labels clearly describing the contents. Provide 1 percent of the installed amount of each with a minimum of one of each.
  1. Fuses: Each size and type used in the system.
  2. Manual Pull Stations.
  3. Detector Bases.
  4. Detector Heads: Each type used in the system.
  5. Addressable Monitor and Control Modules: Each type used in the system.
  6. Notification Appliances: Each size and type used in the system.
  7. Output Relays.
- B. Provide one data cable for connecting a lap top computer to the fire alarm control panel's RS-232 communications card so that the Owner can perform panel programming.

#### **1.10 RECORD DOCUMENTS**

- A. Submit four copies of record drawings showing the locations of fire alarm panels, devices and appliances, the locations of end-of-line resistors and junction boxes, the addresses of addressable devices, the tap settings of audible notification appliances, the intensity ratings of visual notification appliances, the sizes of conduits and conductors, circuit numbers, and deviations from the design.
- B. Submit four printed copies of the final system configuration list showing inputs, outputs, addresses, custom location labels, device configurations, and program logic.
- C. Provide an electronic file storage device (USB drive, SD card, etc.) containing the following final system software:
  1. The master program generic to the model of system being provided.
  2. The building specific program containing the unique information for the system being provided.
  3. A software license and the system passwords required by the Owner to perform programming changes.

**1.11 OPERATIONS AND MAINTENANCE MANUALS**

- A. Submit for approval four copies of operations and maintenance manuals for the specified system and equipment prior to startup. The manuals shall be the same manuals used by the Manufacturer's field service technicians. The manuals shall be marked to indicate the specific models, sizes, types and options that were provided. Manuals not so marked will be rejected.

**1.12 QUALITY ASSURANCE**

- A. The fire alarm system shall be the standard product of a single fire alarm system manufacturer who has been producing this type of equipment for at least 10 years, and has a fully equipped service organization within 150 miles of the Owner. Each component shall display the manufacturer's name.
- B. Each fire alarm system component shall be listed under the appropriate standard of Underwriters Laboratories and shall bear a UL label.
- C. The fire alarm system shall be UL labeled as a system and approved by FM Global.

*DELETE ALL PARTS OF PARAGRAPH D IF NOT APPLICABLE.*

- D. For classroom, in-patient medical, and Housing projects, the fire alarm system shall also be approved by the State of Michigan Bureau of Fire Services.
  - 1. Submit shop drawings to the Michigan Bureau of Fire Services for approval.
  - 2. Arrange for a Michigan Bureau of Fire Services Inspector to inspect the system installation and testing.
  - 3. Submit to the Owner a copy of the FS-12A Form submitted to the Michigan Bureau of Fire Services.
- E. The fire alarm system shall comply with the requirements of the National Fire Alarm Code, the Owner's Inspection Authorities and with the Manufacturer's instructions.

**1.13 WARRANTY**

- A. Provide a complete parts and labor warranty for twelve months from the date of final acceptance of the system by the Owner.
- B. Provide a telephone response to Owner's questions within 4 hours and on-site assistance within 24 hours.
- C. Permit Owner's Fire Alarm Technicians to perform temporary bypasses and emergency repairs on the system without voiding the warranty.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers and Models:
  - 1. EST Model EST-3, represented by Riverside Integrated Systems.
  - 2. Honeywell Model XLS3000.
  - 3. SimplexGrinnell Model 4100 Series.

**2.2 SYSTEM COMMUNICATIONS**

- A. The fire alarm control panel shall communicate with each addressable initiating and control device individually via shielded twisted pair signaling line circuits. EST SIGA-Loop or SimplexGrinnell MAPNET II or IDNET.
- B. Each signaling line circuit shall be capable of accessing up to 127/250 addressable devices.
- C. Each signaling line circuit shall allow up to 10,000 feet of wire length to the furthest addressable device.
- D. Communications shall use a broadcast polling protocol to allow t-tapping of the circuit except where Class A wiring is required. T-taps shall be limited to 64 per loop.
- E. Communications shall be completely digital and shall include parity data bit error checking routines for address codes and check sum routines for the data transmission protocol.
- F. Each device shall be uniquely identified by a device address.
- G. There shall be no limit to the number of initiating devices which may be activated simultaneously.
- H. Each device shall be individually annunciated at the panel. Annunciation shall include the following conditions for each device.
  - 1. Alarm, supervisory or trouble condition.
  - 2. Open, short or ground.
  - 3. Device failure or incorrect device installed.

*PER NFPA 72, 21.3.2, IN BUILDINGS WITHOUT A FIRE ALARM SYSTEM (I.E. PARKING DECK), INITIATING DEVICES USED FOR ELEVATOR RECALL SHALL BE CONNECTED TO A FIRE ALARM CONTROL UNIT DESIGNATED AS "ELEVATOR RECALL CONTROL AND SUPERVISORY CONTROL UNIT." THIS SHALL BE IDENTIFIED ON THE FIRE ALARM CONTROL UNIT AND ON THE RECORD DRAWINGS.*

**2.3 FIRE ALARM CONTROL PANEL**

- A. The fire alarm control panel shall be modular with solid state, microprocessor based electronics.
- B. The panel shall display only those primary controls and displays essential to operation during a fire alarm condition.
- C. The panel shall include a LCD digital display, with a minimum of 80 characters.

1. The display shall be backlit for enhanced readability. It shall not be lit during an AC power failure unless an alarm condition occurs or there is keypad activity.
  2. The display shall support both upper and lower case letters. Lower case letters shall be used for soft key titles and for prompting the user. Uppercase letters shall be used for system status information. A cursor shall be visible when entering information.
- D. A panel audible signal shall sound during alarm, supervisory, or trouble conditions. This audible signal shall sound differently during each condition to distinguish one condition from another. The audible signal shall also sound differently during each key press to provide audible feedback (chirp) indicating that the key has been pressed properly.
- E. The system program shall be stored in a non-volatile flash EPROM memory within the panel. Loss of primary and secondary power shall not erase the program stored in memory.
1. The program shall be capable of selective input/output control functions.
  2. The program shall enable initiating devices to be individually configured on site to provide either alarm and trouble, supervisory and trouble, alarm only, supervisory only, trouble only, current limited alarm, no alarm, normally closed device monitoring, a non-latching circuit or an alarm verification circuit.
  3. The program shall enable initiating devices to be disabled or enabled individually.
- F. The panel or the field devices shall determine the alarm decision for each detector by comparing the detector value to stored values.
1. The panel shall automatically maintain a constant smoke obscuration sensitivity in percent of smoke obscuration format for each detector.
  2. The panel shall maintain a moving average of each smoke detector's smoke chamber value to automatically compensate for dust and dirty conditions that could affect detection operation.
  3. The smoke obscuration sensitivity shall be adjustable to within 0.3 percent of either limit of the UL window (0.5 percent to 4.0 percent) to compensate for any environment.
  4. When a detector's average value reaches a predetermined value, a "MAINTENANCE ALERT" condition shall be audibly and visually indicated at the panel. The LED on the detector base shall glow steady giving a visible indication at the detector location. If a dirty detector is left unattended and its average value increases to a second predetermined value, a "TROUBLE" condition shall be indicated at the panel. To prevent nuisance alarms, these dirty conditions shall in no way decrease the amount of smoke obscuration necessary for system activation.

5. The panel shall continuously perform an automatic self-test routine on each detector which shall functionally check detector electronics and ensure the accuracy of the obscuration values being transmitted to the panel. Any detector that fails this test shall indicate a "SELF TEST ABNORMAL" or "TROUBLE" condition at the panel.
6. Each detector shall be scanned by the panel for its type identification to prevent inadvertent substitution of another detector type. The panel shall operate with the installed device but shall initiate a "WRONG DEVICE" or "TROUBLE" condition until the proper type is installed or the programmed detector type is changed.
7. An operator at the panel, having a proper access level, shall have the ability to manually access the following information for each detector.
  - a. Device type.
  - b. Device status.
  - c. Present average value.
  - d. Peak detection values.
  - e. Present sensitivity selected.
  - f. Detector range (normal, dirty, etc.).
8. An operator at the panel, having a proper access level, shall have the ability to perform the following for each detector:
  - a. Enable or disable the point.
  - b. Clear peak detection values.
  - c. Clear verification tally.
  - d. Control a detector's relay driver output.
9. The panel shall be programmable to automatically change the sensitivity settings of each detector based on time-of-day and day-of-week (for example, to be more sensitive during unoccupied periods and less sensitive during occupied periods). There shall be seven sensitivity settings available for each detector.
10. The panel shall be programmable for a pre-alarm or two-stage function. This function allows an indication to occur when, for example, a detector with a 3 percent set point reaches a threshold of 1.5 percent smoke obscuration.
11. Smoke detectors shall be provided with the ability for alarm verification. When in alarm verification mode, only a verified alarm shall initiate the alarm sequence operation.
  - a. The activation of a smoke detector shall initiate an alarm verification operation whereby the panel resets the activated detector and waits for a second alarm activation. If, within an adjustable time delay, a second alarm is reported from the same or any other smoke detector, the system shall process the alarm. If no second alarm occurs within the time delay, the system shall resume normal operation.
  - b. The alarm verification shall operate only on smoke detector alarms. Other activated initiating devices shall be processed immediately. The alarm verification operation shall be selectable by device.
  - c. The panel shall have the capability to display the number of times a device has gone into a verification mode.

- d. Detectors in alarm verification mode shall have the ability of being divided into different groups whereby any two activations from a group shall cause the panel to follow its programmed alarm sequence.
- G. The panel shall have four pass code controlled access levels. Pass codes shall be entered using the panel key pad.
- 1. To maintain security when entering a pass code, the digits entered shall not be displayed.
  - 2. When a correct pass code is entered, an "ACCESS GRANTED" message shall be displayed. The access level shall be in effect until the keypad is inactive for 10 minutes or the operator logs out.
  - 3. Should an invalid code be entered, the operator shall be notified with a message and shall be allowed up to two more chances to enter a valid code. After three unsuccessful tries, an "ACCESS DENIED" message shall be displayed.
  - 4. Access to a level shall only allow the operator to perform actions within that level and actions of lower levels, not actions of higher levels.
  - 5. Access levels shall be associated with the following functions:
    - a. Alarm silence.
    - b. System reset.
    - c. Set time and date.
    - d. On/Off/Auto control selection.
    - e. Manual control.
    - f. Disable and enable circuits and devices.
    - g. Clear historical logs.
    - h. Walk test.
    - i. Change alarm verification.
    - j. Change detector sensitivity.
    - k. Function keys.
  - 6. An access level shall also be associated with acknowledge keys. If the operator presses an Acknowledge key with insufficient access, an error message shall be displayed. The points on the log shall scroll with each key press, but the points shall not be acknowledged.
- H. The panel shall have the ability to store a minimum of 300 events in an alarm log plus a minimum of 300 events in a separate trouble log. These events shall be stored in a battery protected random access memory. Real time and date shall accompany history event recordings.
- I. The panel shall supervise subordinate module LED's for burnout or disarrangement. Should a problem occur, the panel shall display the module and LED location numbers to facilitate location of that LED.
- J. The panel shall have function keys programmed as follows for disabling and enabling circuits or groups of devices for maintenance or testing purposes. While circuits or devices are disabled, the panel shall indicate "TROUBLE".

**DELETE THE FUNCTION KEYS THAT DON'T APPLY TO THIS PROJECT. DO NOT RENUMBER THE REMAINING FUNCTION KEYS.**

- 1. F1: Disable smoke detectors by floor.
- 2. F2: Disable duct smoke detectors.
- 3. F3: Disable sprinkler system flow switches.
- 4. F4: Disable horns/strobes or speakers/strobes by floor.

5. F5: Disable beam detectors.
6. F6: Disable smoke detector sounder bases.
7. F7: Disable hood suppression systems.
8. F8: Disable elevator recall.

- K. The system shall be capable of being walk tested by one person.
1. The activation of an initiating device under test shall be silently logged as an alarm or supervisory condition in the historical log. The panel shall automatically reset itself after logging the abnormal condition.
  2. The momentary disconnection of an initiating device or notification appliance shall be silently logged as a trouble condition in the historical log. The panel shall automatically reset itself after logging the trouble condition.
  3. The walk test sequence shall have the ability to activate the notification appliances for a maximum of 2 seconds upon the activation of an initiating device under test. If this option is selected, any momentary opening of the initiating device circuit or a notification appliance circuit shall cause the notification appliances to sound for 4 seconds to indicate the trouble condition.
  4. Should the walk test mode be on for an inappropriate amount of time, the panel shall automatically revert to normal mode.
  5. Should an abnormal condition occur from an active point not in walk test mode, the system shall perform its standard programmed alarm, supervisory or trouble sequences.
- L. The panel enclosure shall be equipped with opaque door panels and locks providing security from tampering.

#### **2.4 NODE AND NAC PANELS**

- A. Node and NAC panels shall be modular with solid state, microprocessor based electronics, operator interfaces, power supplies, audio generators, amplifiers, battery chargers and batteries as required. All components shall be supervised.

#### **2.5 BATTERIES**

- A. Batteries shall be lead calcium and supervised so that a failure produces a "TROUBLE" signal.

#### **2.6 REMOTE ANNUNCIATOR**

- A. The remote annunciator shall duplicate the backlit LCD display; the alarm acknowledge, supervisory acknowledge, trouble acknowledge, alarm silence, and system reset pushbuttons; the alarm, supervisory, and trouble audible signals; the alarm, supervisory, trouble, and power "on" LED's; and the programmable function keys of the fire alarm control panel. A key "enable" switch or door lock, keyed to match the fire alarm control panel door lock, shall permit activating or deactivating the controls.

- B. A remote microphone shall be included when the fire alarm system includes emergency voice/alarm communications, along with the same pushbuttons as the fire alarm control panel for selecting pre-recorded voice messages, and the same controls to choose total building or selected areas communications.

**2.7 ADDRESSABLE SPOT DETECTOR BASES**

- A. Spot detector mounting bases shall be individually addressable, suitable for two wire operation, with a twist-lock head locking feature a DIP switch or electronic addressing means, and an LED that provides power "on", alarm and trouble indications. The bases shall be listed for ceiling and wall mounting. Removal of the detector head shall cause a trouble condition at the panel.
- B. Where shown, the bases shall include an auxiliary relay that is controlled from the panel.
- C. In sleeping rooms, the base shall include a piezoelectric sounder that is controlled from the panel.

**ADD TAMPER-RESISTANT CAGES TO SPOT DETECTORS LOCATED IN HOUSING FACILITY RESIDENT CORRIDORS AND IN ATHLETIC FACILITY PUBLIC AND ATHLETE SPACES.**

- D. In corridors outside of sleeping rooms, the base with its head shall be protected by a vandal-resistant cage.
- E. In corridors, locker rooms and meeting rooms of athletic facilities, the base with its head shall be protected by a vandal-resistant cage.
- F. When bases are not in plain view, bases shall be connected to remote alarm indicators mounted in plain view at 48 inches above the floor.

**2.8 MULTISENSOR SMOKE DETECTOR HEADS**

- A. Multi-sensor type smoke detector heads shall include sampling and reference ionization chambers with a single radioactive source, a photoelectric sensor and a programmable heat detector. The detectors shall support at least four levels of sensitivity selectable at the panel and 360 degree smoke entry.

**2.9 PHOTOELECTRIC SMOKE DETECTOR HEADS**

- A. Photoelectric type smoke detector heads shall include a pulsed LED light source and a silicon photodiode receiver, at least seven levels of sensitivity selectable at the panel, an integral insect screen and 360 degree smoke entry. This type of detector shall be installed in all duct detectors.

**2.10 HEAT DETECTOR HEADS**

- A. Heat detector heads shall include combination rate-of-rise and rate compensated fixed temperature sensing, two levels of rate-of-rise sensitivity selectable at the panel, and an independent 135 degrees F fixed temperature set point. Heat detector heads shall be self-restoring.

- B. Heat detector heads for steam tunnels, cage wash areas and dish machine areas shall have a 135 degrees F fixed temperature set point and shall be self-restoring.

**2.11 DUCT DETECTORS**

- A. Duct detectors shall be individually addressable and consist of a housing, sampling tubes, a baffle and a detachable detector head. Duct detectors shall include an alarm LED, a local test switch, and an auxiliary SPDT relay for ventilation system control. Duct detectors shall be resettable by actuating the panel reset pushbutton. The sampling tubes shall be capable of being cleaned through the housing cover.
- B. The detector heads shall be photoelectric as specified above, but shall be capable of accepting ionization detector heads.
- C. When not in plain view, duct detectors shall include remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.

**2.12 BEAM DETECTORS**

- A. Photoelectric projected beam detectors shall be individually addressable and consist of separate transmitter and receiver units capable of long range coverage of up to 350 feet. Beam detectors shall include alarm and trouble dry auxiliary contacts, and normal, alarm and trouble LED status indicators. Beam detectors shall include internal bore sights, automatic calibration, six sensitivity settings, automatic compensation for temperature and lens contamination, and a trouble indication upon either a total obscuration or an obscuration of 50 percent of the alarm set point. Beam detectors shall be suitable for four wire operation utilizing 24 volt DC power from the panel, and resettable by actuating the panel reset pushbutton.

**2.13 MANUAL PULL STATIONS**

***CHANGE LEXAN TO METAL AND ADD CLEAR PLASTIC TAMPER-RESISTANT COVERS TO MANUAL PULL STATIONS IN HOUSING FACILITY RESIDENT CORRIDORS AND IN ATHLETIC FACILITY PUBLIC AND ATHLETE SPACES.***

- A. Manual pull stations shall be individually addressable, suitable for two wire operation, with a high impact red Lexan body and raised white lettering. Stations shall include an ADA compliant single action operating mechanism with a mechanical latch to hold an operated station open until reset.
- B. Reset shall be accomplished through use of a key common to the panel or a small flat-blade screwdriver. Stations which use allen wrenches or special tools to reset are not acceptable. The point of reset shall be front accessible so stations with tamper-resistant covers can be reset easily.

**2.14 MONITOR MODULES**

- A. Monitor modules for individual two wire contact monitoring shall be individually addressable, suitable for two wire operation, with a DIP switch or electronic addressing means, and a programmable latch feature for monitoring momentary contacts. Monitor modules shall monitor a single normally open dry contact using a Class B, Style B, initiating device circuit.
- B. Monitor modules for zone or four wire device monitoring shall be individually addressable, suitable for four wire operation utilizing 24 volt DC power from the panel, and with a DIP switch or electronic addressing means. Zone monitor modules shall monitor multiple normally open dry contacts using a Class B, Style B, two wire initiating device circuit, or monitor a four wire device using a Class B, Style D, four wire initiating device circuit.

**2.15 CONTROL MODULES**

- A. Control modules shall be individually addressable with DIP switches or electronic addressing means. Control modules shall provide either one normally open and one normally closed contact or a Form C contact per digital output. Control modules may have more than one digital output per module if each output has a unique address. Contacts shall be rated 0.5 amps at 120 volts AC or 2 amps at 28 volts DC resistive and shall be controlled by the panel.

**2.16 HORNS**

- A. Horns shall be electronic, rated 24 volts DC, with a piezoelectric driver set to produce a three-pulse temporal pattern evacuation tone with a sound level of 101 dBA at 10 feet, a red, semi-flush body capable of wall or ceiling mounting.

*DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.*

- B. Horns in rodent rooms shall be set to generate a slow whoop or warble sound with a peak frequency below 500 Hz. Horns shall be of heavy-duty industrial construction and shall be UL listed for indoor and outdoor applications. EST Model 5530MD-24AW only.

**2.17 SPEAKERS**

- A. Speakers shall be rated 125 to 12,000 Hertz, include four taps rated at from 1/4 to 2 watts, produce a sound level of 82 dBA at 10 feet when set at the 1/2 watt tap, and with a semi-flush body capable of wall or ceiling mounting..
- B. Speakers for locations with high ambient noise may be high efficiency horns rated 500 to 6,000 Hertz minimum, 10 watts minimum, include four or more taps, produce a sound level of 106 dBA minimum at 1 meter when set at the 1 watt tap, and be capable of wall or ceiling mounting.

**2.18 STROBES**

- A. Strobes shall be rated 15, 30, 60, 75, 110, or 177 candela as shown for proper illuminance, with a 1 Hertz flash rate, Xenon flash tube, white body, clear Lexan lens with red "FIRE" or international fire symbol lettering, capable of being synchronized, and capable of wall or ceiling mounting.

**2.19 COMBINATION HORN/STROBES AND SPEAKER/STROBES**

- A. Combination horn/strobes and speaker/strobes shall consist of the horns, speakers and strobes specified above, but combined on a single mounting plate. Combination units used outdoors and in wet areas shall be waterproof and mounted to waterproof back boxes.

**2.20 DOOR HOLD-OPEN POWER SUPPLY**

- A. The door hold-open power supply shall produce 24 volts DC of sufficient amperage to provide 0.4 amps of current to every door hold-open device being controlled. The power supply shall be supervised and capable of withstanding the inrush current that will occur when the door hold-open devices are energized.
- B. The output of the power supply shall be distributed by individually fused circuits. Fuse each circuit at 5 amps.
- C. The power supply shall release the held open doors upon a fire alarm or an AC power failure.

**2.21 EMERGENCY VOICE/ALARM COMMUNICATIONS**

- A. Emergency voice/alarm communications shall include audio control modules for evacuation tone and voice message generation, controls to choose total building or selected areas communications, audio amplifiers, a local microphone, and a remote microphone at each remote annunciator. All of the components except for the remote microphones shall be located in or adjacent to the fire alarm control panel.
- B. The audio control module default mode shall provide for automatic total building fire alarm evacuation. The evacuation tone shall consist of a three-pulse temporal pattern followed by a pre-recorded fire alarm voice message. At the end of each voice message, the evacuation tone shall resume. The evacuation tone and voice message shall sound alternately until the alarm silence pushbutton at the fire alarm control panel or remote annunciator has been pressed. Audio tones and voice messages shall be digitally transmitted between nodes.
- C. The audio control modules shall provide for manual total building or selected area live voice communications. Upon keying of the local or a remote microphone, a three second continuous alert tone shall sound over the speakers indicating a live voice message will occur.
- D. The evacuation and alert tones shall be digitally generated by programmable software so that changes can be made without component rewiring. The pre-recorded voice messages shall be stored digitally in non-volatile EPROM memory.

**DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.**

- E. The evacuation tone for rodent rooms only shall be produced by a separate audio control module and amplifier that generate a slow whoop or warble sound with a peak frequency below the hearing range of rodents (i.e. 500 Hz).
- F. Audio amplifiers shall have a frequency response of 125 Hz to 12,000 Hz minimum.
- G. Microphones shall be of a hand-held, push-to-talk, noise-canceling type with a frequency range of 200 Hz to 4000 Hz and a self-winding five foot coiled cable. An LED shall indicate the microphone push-to-talk pushbutton has been pressed and the speaker circuits are ready for transmission.
- H. Remote microphones shall be enclosed in remote annunciator cabinets with lockable doors.
  - 1. Remote microphones shall duplicate the manual voice transmission capability of the local microphone at the fire alarm control panel. The fire alarm control panel microphone shall have priority over any remote microphones.
  - 2. The remote microphone cabinets shall include controls for total building or selected areas communications.
- I. Should a Fire Department telephone communication system be provided, the telephones system shall be capable of being patched to the emergency voice/alarm communications system and controlled at the fire command center.

**2.22 FIRE DEPARTMENT TELEPHONE COMMUNICATIONS**

- A. Fire Department telephone communications shall consist of a minimum of eight dedicated communications circuits between a fire command center communications panel and remotely located emergency telephone jacks, a master telephone handset and five pluggable telephone handsets.
- B. The communications panel shall include a master telephone controller for processing of two-way communications. This module shall include a circuit selector switch and "Call" and "Trouble" LED indicators for each circuit, an audible device for call and trouble signaling, a trouble silence switch with ring-back, and an LED trouble indicator. Circuit supervision modules shall be included to electrically supervise for shorts, opens, and grounds of circuit wiring.
- C. The system shall be capable of handling single or simultaneous conversations with all telephones connected into the system. The circuits shall be so designed to prevent static, hum, or other interferences to clear, intelligible two-way conversations. The communications shall be transported digitally between devices.

- D. The act of plugging a handset into an emergency telephone jack shall cause the appropriate circuit indicator LED to flash and a distinctive audible device to sound at the communications panel. The subsequent picking up of the master telephone and selection of the proper circuit shall silence the pulsing sound, cause the circuit indicator LED to latch on, and couple the remote telephone to the master telephone. Two or more telephones shall be capable of being connected into an active conversation at the discretion of the operator.
- E. Attempting to use a subsequent telephone on the same circuit shall not cause the pulsing sound to activate if any two-way communications are already established. Any new circuits activated shall, however, cause their circuit indicator LED's to flash until acknowledged.
- F. Unplugging the handsets in use and returning the related circuit selector switches to the normal position shall cause the restoration of normal supervisory functions. If any remote telephone remains plugged in, the appropriate circuit indicator LED shall flash and the pulsing sound shall resume at the communications panel.
- G. The master telephone handset shall be recessed within a protective enclosure at the communications panel.
- H. A single line circuit shall be provided to a jack in each stairwell at each floor, in each elevator car, in each elevator lobby, at each area of refuge, at the emergency generator location and at the fire pump location. Emergency telephone jacks shall be mounted on a stainless steel single gang plate engraved with the words "Fire Emergency Telephone".
- I. Furnish an emergency telephone jack for installation in each elevator car. Wiring from the elevator controls to each elevator car and installation of the jacks will be provided by the elevator contractor.
- J. Provide five pluggable emergency telephone handsets with self-winding five foot cords within a storage cabinet mounted at the fire command center. Key the cabinet to match the fire alarm control panel.

**2.23 ADD ALTERNATE FOR BUILDING-WIDE MASS NOTIFICATION**

*WHEN THE PROJECT SCOPE INCLUDES AN ADD ALTERNATE FOR BUILDING-WIDE MASS NOTIFICATION, INCLUDE THIS LANGUAGE. ADD A SUMMARY OF THIS LANGUAGE AS A GENERAL NOTE ON THE FIRE ALARM DRAWINGS.*

- A. If the Add Alternate is accepted, add any necessary equipment, initiating devices, notification appliances, conduit, wiring, programming, and appurtenances to the base fire alarm system scope of work to incorporate building-wide mass notification into the fire alarm system.
  - 1. Comply fully with National Fire Alarm Code NFPA 72 emergency communications systems requirements including Annex and Supplement requirements.
  - 2. The system and its components shall be UL listed.

3. Provide speakers for audible notification appliances in lieu of horns if the base fire alarm system scope of work specifies horns. Provide sufficient speakers to meet NFPA 72 voice intelligibility requirements.
4. Provide combination amber lens (for alert) and clear lens (for fire alarm) strobe lights for visual notification appliances in lieu of providing the base bid clear lens (for fire alarm) strobe lights.
5. Provide the following additional features in the main fire alarm control panel and in each remote fire alarm annunciator panel.
  - a. Emergency voice/alarm communications and a microphone for DPSS and OSEH Fire Marshal use if not required by the base bid scope of work.
  - b. The ability to generate a building-wide three second continuous alert tone. This alert tone shall be significantly different from the fire alarm system's three-pulse temporal pattern evacuation tone.
  - c. A minimum of 8 pushbuttons to initiate the amber alert strobe lights and the building-wide evacuation or alert tone followed by a unique pre-recorded voice message.
    - 1) Actuation of any pushbutton shall override any fire alarm notification and instead initiate the amber alert strobe lights and the building-wide evacuation or alert tone over the fire alarm system speakers. The associated pre-recorded voice message shall alternate with the tone.
    - 2) Alarm and supervisory signals shall be sent through MOSCAD to DPSS.
    - 3) At any time during the alert, actuation of any microphone shall permit building-wide live voice announcements to be made. If at any time a remote annunciator panel microphone is keyed simultaneously with the main fire alarm control panel microphone, the main fire alarm control panel microphone shall have priority.
    - 4) The strobe lights shall continue to flash and the tone and pre-recorded voice message shall continue to sound until the fire alarm system is reset.
  - d. The tone and pre-recorded voice message shall be as follows for each pushbutton:
    - 1) Alert tone alternating with "Your attention please - A tornado warning has been issued. Take shelter in this building now. Remain calm and do not run. Take shelter now."
    - 2) Alert tone alternating with "Your attention please - An armed intruder has been reported in this area. Lockdown now."
    - 3) Alert tone alternating with "Your attention please - An active shooter has been reported in this area. Lockdown now."
    - 4) Evacuation tone alternating with "Your attention please - An emergency has occurred. Evacuate the building now. Remain calm and do not run. Evacuate now."

- 5) Alert tone alternating with "Your attention please - An emergency has occurred. Please remain in place until further notice. Please remain where you are."
  - 6) Alert tone alternating with "Your attention please - This is an all clear. The emergency has been resolved. Resume normal operations."
  - 7) Alert tone alternating with "Your attention please - This is a test of the building mass notification system. This is only a test."
  - 8) (Spare for project-specific use.)
6. Provide a remote microphone cabinet with microphone for Facility Manager use at the location shown on the drawings. The cabinet shall include the following features:
- a. Provide a minimum of 8 pushbuttons. These pushbuttons shall be identical to those in the main fire alarm panel and in each remote fire alarm annunciator panel. Each pushbutton shall be capable of initiating the building-wide evacuation or alert tone followed by the same unique pre-recorded voice message.
    - 1) Actuation of any pushbutton shall override any fire alarm notification and instead initiate the amber alert strobe lights and the building-wide tone over the fire alarm system speakers. The associated pre-recorded voice message shall alternate with the tone.
    - 2) Alarm and supervisory signals shall be sent through MOSCAD to DPSS.
    - 3) At any time during the alert, actuation of the facility manager's microphone shall permit building-wide live voice announcements to be made. If at any time the facility manager's microphone is keyed simultaneously with the main fire alarm control panel or any remote fire alarm annunciator panel microphone, the fire alarm panel microphone(s) shall have priority.
    - 4) The strobe lights shall continue to flash and the tone and pre-recorded voice message shall continue to sound until the fire alarm system is reset.
  - b. Provide a uniquely keyed cabinet door lock and special facility manager keys so a fire alarm panel key or a special facility manager key can access this cabinet, but a facility manager's key cannot access the other fire alarm panels.
7. Provide the capability inside the main fire alarm control panel to add a future interface module or circuit card. This interface shall permit DPSS to actuate the amber alert strobe lights, actuate the building-wide evacuation or alert tone, actuate any of the pre-recorded voice messages, and make live voice announcements from a head end device located at one or more DPSS remote locations. This capability shall include:
- a. Physical space inside the fire alarm control panel.
  - b. Power supply capacity.
  - c. Battery capacity.
  - d. Means to plug the interface into the fire alarm control panel circuitry.
8. Provide system interconnecting raceways, wiring and routing in compliance with the system "survivability" requirements contained in NFPA 72.

**BuildingName**

**The Description of the Project**

**P00000000 0000 Issued for: BID 283100 - - 24**

**PART 3 - EXECUTION**

**3.1 SYSTEM INTERRUPTIONS**

- A. Coordinate with the U-M Fire Protection Shop (734-647-2046) before performing any work affecting an existing fire alarm system. Operating, programming, modifying, or impairing an existing system without approval of the U-M Fire Protection Shop is strictly prohibited.
- B. When renovating a fire alarm system, test the system to document its condition before changes are made. Maintain operation of fire alarm system devices outside of the work area.
- C. When replacing a fire alarm system, maintain operation of the existing system until acceptance of the new system. If operation of the existing system cannot be maintained and the building is occupied, provide a 24 hour/day fire watch until the new system is accepted.
  - 1. Notify the U-M Fire Protection Shop (734-647-2046), the U-M DPSS (734-763-1131), the U-M Fire Marshal (734-647-1143) and the Michigan Bureau of Fire Services (if applicable) when a fire watch is being performed.
  - 2. Perform the fire watch in accordance with U-M Fire Marshal and Michigan Bureau of Fire Services requirements.
- D. Coordinate with the U-M Key Office (734-764-3481) before performing any work affecting existing electrically controlled doors.

**3.2 INSTALLATION**

*FOR NEW FIRE ALARM PROJECTS, SELECT ONE OF THE FOLLOWING THREE PARAGRAPHS (A, B OR C) AS DIRECTED BY THE PROJECT MANAGER. FOR FIRE ALARM RENOVATION PROJECTS, SELECT THE PARAGRAPH THAT MATCHES THE EXISTING INSTALLATION.*

- A. Provide wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- B. Provide wiring in conduit or provide fire alarm-rated MC cables in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Provide wiring and raceways as follows and in accordance with Sections 260533 and 260513 and Manufacturer's instructions.
  - 1. Concealed in walls, exposed on walls up to 8' AFF, and above non-accessible ceilings - provide wiring in conduit.
  - 2. Above accessible ceilings and above 8' AFF in unfinished spaces - provide open wiring in J-hooks. Provide conduit sleeves where open wiring penetrates walls and floors.
- D. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, protect power supply and notification appliance circuits from attack by fire until they enter the notification zone they serve. Provide 2-hour rated cable assemblies or protect circuits in 2-hour rated shafts, enclosures or sprinklered stairwells in accordance with Sections 260533 and 260513.

- E. Circuits may be T-tapped only where shown on the manufacturer's wiring diagrams.
- F. Provide waterproof back boxes with gaskets for devices and appliances installed outdoors or in wet or wash-down areas.
- G. Paint fire alarm junction boxes, covers and fittings red or provide red conduit throughout, except fire alarm raceways exposed in finished areas may be painted to match wall color.
- H. Modifications to fire alarm control panels, node panels, NAC panels and remote annunciator panels shall be made by a Manufacturer's Representative.
- I. Final connections to the fire alarm system components and system programming shall be performed by Fire Alarm Technicians with NICET Level II or higher certification.
- J. Label fire alarm panels with the room numbers, electrical panel numbers, and circuit breaker numbers feeding them.
- K. Paint the handles of circuit breakers feeding fire alarm panels red, and install handle locks.
- L. Smoke and heat detectors shall not be installed until after construction clean-up is completed.
  - 1. When renovating an existing system, remove and store existing detectors during construction activities.
  - 2. Detectors installed prior to construction clean-up shall be cleaned by the manufacturer or replaced.

**3.3 TESTING**

- A. Demonstrate complete operation of the fire alarm system in accordance with NFPA 72, NFPA 101 (classroom, in-patient medical, and Housing projects only), the Michigan Building Code, and Manufacturer's instructions. Notify the Owner's Representative 3 working days in advance of the test.
  - 1. The test shall be witnessed by a U-M Fire Marshal, a U-M Electrical Inspector, and the U-M Fire Protection Shop.
  - 2. Especially on fire alarm renovation projects, the U-M Fire Protection Shop may participate in or direct the testing activities.
  - 3. On classroom, in-patient medical, and Housing projects, also include an Inspector from the Michigan Bureau of Fire Services.
- B. Submit a signed and dated NFPA 72 test report to the Electrical Inspector prior to acceptance of the fire alarm system by the Owner.
- C. On classroom, in-patient medical, and Housing projects, also submit a signed and dated FS-12A Form to the Michigan Bureau of Fire Services.

**3.4 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

### 3.5 TRAINING

- A. Provide the Owner's Fire Alarm Technicians with classroom training on the operation and maintenance of this model of system. This training shall be by the Manufacturer and shall be the same training as given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received operations and maintenance training from the manufacturer on this model of system, this training requirement will be waived.
- B. Provide the Owner's Fire Alarm Technicians with classroom training on the programming of this model of system. This training shall be by the Manufacturer and shall be the same training given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received programming training on this model of system, this training requirement will be waived.
- C. Train the Owner's Fire Alarm Technicians on unfamiliar components installed in this system.
- D. Walk the Owner's Fire Alarm Technicians through the building and identify the locations of fire alarm devices hidden from plain view.

*DELETE THE FOLLOWING TWO PARAGRAPHS WHEN EMERGENCY VOICE/ALARM COMMUNICATIONS IS NOT INCLUDED.*

- E. Train DPSS, Housing Security if applicable, and the U-M Fire Marshal on the basic operation of the system, including how to acknowledge audible notification appliances after an alarm.
- F. Train DPSS, Housing Security if applicable, and the U-M Fire Marshal on how to override the smoke control systems, on how to use the emergency voice/alarm communications, and on how to use the Fire Department telephone communications systems. Invite representatives from the Ann Arbor Fire Department to this training.
- G. Train the Facility Manager on how to use the emergency voice/alarm communications system, and how to use the mass notification system if provided.

**1.2 SUMMARY**

*DUPLICATE PARAGRAPH 1.2.A IN THE GENERAL NOTES ON THE FIRST SHEET OF THE ELECTRICAL DRAWINGS.*

- A. The project delivery method for fire detection and alarm systems shall be by design-build. This specification section and accompanying drawings establish the minimum requirements and boundary for the design-build scope of work. Provide all equipment, devices, appliances, wiring and materials necessary for a complete and expandable system which adheres to applicable codes, standards and University of Michigan requirements.
1. The quantities, locations, types, conditions and manufacture of existing fire alarm equipment, devices and appliances shown are for information only and shall be field verified.

2. The quantities, locations and types of new fire alarm equipment, devices and appliances shown are minimum requirements. Provide all additional equipment, devices, appliances, materials and labor required to meet applicable codes.
3. Coordinate with and provide submittals to the Michigan Bureau of Fire Services, Ann Arbor Fire Department, U-M Fire Marshal and FM Global as required. Coordinate room occupancy and space utilization with the building's Facility Manager.

*IF THE BUILDING WILL REMAIN OCCUPIED DURING THIS WORK, INCLUDE THE FOLLOWING PARAGRAPH.*

4. Maintain the existing fire alarm system in service while the new work is installed, tested and made operational.

*ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.2.B AND THE NON-APPLICABLE PARAGRAPHS OF 1.2.C.*

B. Provide a new fire alarm system with the following features:

1. A main fire alarm control panel (FACP).
2. Node and notification appliance circuit (NAC) panels.
3. Automatic and manual initiating devices.
4. Audible and visual notification appliances.
5. Control inputs and outputs to ventilation systems.
6. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
7. Alarm, supervisory, trouble, fire pump running and maintenance alerts outputs including addresses and locations of initiating devices to the University of Michigan Hospitals and Health Centers (UMHHC) Facility Command Center (UHFCC) located in University Hospital Building Room 1A203.
8. Remote alarm silence and remote emergency voice/alarm communications capability from the UHFCC.
9. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
10. System programming in accordance with the system's sequence of operation.
11. System programming and testing required for the system to communicate with the operator interfaces in UHFCC.

*ON PROJECTS PROVIDING A NEW FIRE ALARM SYSTEM, DELETE ALL OF 1.2.C.*

C. Renovate the existing fire alarm system by providing the following:

1. A pre-renovation test of the existing system to document the condition of the system before it is changed.
2. A main fire alarm control panel (FACP).
3. Node and notification appliance circuit (NAC) panels.
4. Automatic and manual initiating devices.
5. Audible and visual notification appliances.
6. Control inputs and outputs to ventilation systems.
7. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.

8. Alarm, supervisory, trouble, fire pump running and maintenance alerts outputs including addresses and locations of initiating devices to the University of Michigan Hospitals and Health Centers (UMHHC) Facility Command Center (UHFCC) located in University Hospital Building Room 1A203.
9. Remote alarm silence and remote emergency voice/alarm communications capability from the UHFCC.
10. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
11. System programming as required to incorporate changes to the system's sequence of operation.

**EDIT 1.2.D AND E TO MAKE THEM PROJECT-SPECIFIC.**

- D. Provide the following additional work where shown on the drawings:
  1. Remote annunciators.
  2. Control outputs to smoke control system devices.
  3. Status lights indicating the current status of smoke control system devices.
  4. Auxiliary controls to manually override the control outputs to smoke control system devices.
  5. Control outputs to interrupt power to electrically operated access control door hardware devices.
  6. Non-battery backed power to door hold-open devices.
  7. Emergency voice/alarm communications.
  8. Remote microphone cabinets.
  9. Fire Department telephone communications.
- E. The following work is not included unless shown otherwise:
  1. Smoke and heat detectors that initiate an elevator recall.
  2. Smoke and heat detectors that actuate a fire suppression system.
  3. Electrically operated door hardware devices.
  4. Power to electrically operated door hardware devices.
  5. Door hold-open devices.

**1.3 RELATED SECTIONS**

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the other Division 26 specification sections, including the following, apply to this section.
  1. Section 260500, "Basic Electrical Materials and Methods".
  2. Section 260513, "Cables and Wires".
  3. Section 262700, "Service and Secondary Distribution".
  4. Section 260526, "Grounding".
  5. Section 260800, "Electrical Acceptance Tests".

**1.4 REFERENCES**

- A. Comply with the current versions of the following codes and standards as applicable:
  1. ANSI/IEEE C2, "National Electrical Safety Code".

2. MBC, "Michigan Building Code".
  3. MEC, "Michigan Electrical Code".
  4. MMC, "Michigan Mechanical Code".
  5. "Michigan Rehabilitation Code".
  6. "Michigan Residential Code".
  7. NFPA 13, "Standard for the Installation of Sprinkler Systems".
  8. NFPA 20, "Standard for the Installation of Centrifugal Fire Pumps".
  9. NFPA 72, "National Fire Alarm Code", except as follows:
    - a. Smoke detectors that initiate an elevator recall shall not be connected to the fire alarm system.
    - b. Smoke and heat detectors shall not be required above suspended ceilings.
    - c. Horns or speakers shall not be installed in elevator machine rooms. Horns shall not be installed in elevator cars.
    - d. Fire alarm system shall not shut down power to the elevators.
    - e. Optional smoke detectors in rooms with beam pockets should be spaced as shown on the plan drawings.
  10. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems".
  11. UL 217, "Single and Multiple Station Smoke Detectors".
  12. UL 268, "Smoke Detectors for Fire Protective Signaling Systems".
  13. UL 268A, "Smoke Detectors for Duct Applications".
  14. UL 464, "Audible Signal Appliances".
  15. UL 521, "Heat Detectors for Fire Protective Signaling Systems".
  16. UL 864, "Control Units for Fire Protective Signaling Systems".
  17. UL 1480, "Speakers for Fire Protective Signaling Systems".
  18. UL 1971, "Signaling Devices for the Hearing Impaired".
- B. For classroom, in-patient medical and Housing projects, comply with the applicable sections of NFPA 101, "Life Safety Code" as adopted and amended by the Michigan Bureau of Fire Services.
- C. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, comply with the NFPA 72 requirements related to survivability from attack by fire.
1. Designate each notification appliance circuit to serve no more than one notification zone.
  2. Protect power supply and notification appliance circuits from fire until they enter the notification zone they serve.
  3. Monitor the integrity of audible and visual notification appliance power supplies, audio generators, amplifiers and circuits.
  4. Monitor the integrity of Fire Department telephone communications circuits.

#### 1.5 SYSTEM DESIGN REQUIREMENTS

- A. The system shall be power limited.
- B. Provide a fire alarm control panel with the following:
  1. Digital display.

2. Multiple pushbutton keypad.
  3. LED status indicating lights.
  4. Audible status signals.
  5. Output relays.
  6. Battery charger and batteries.
  7. RS-232 communications card.
- C. Provide Class B, Style 3, signaling line circuits.
1. Provide sufficient spare capacity on each signaling line circuit for an additional 25 percent of initiating and control devices.
- D. Provide Class B, Style Y, notification appliance circuits.
1. Size the control panel power supplies, amplifiers and batteries for 25 percent spare capacity calculated with 40 ma horn loads, 1 watt speaker loads and 150 ma strobe light loads.
  2. Provide sufficient spare capacity on each notification appliance circuit for an additional 25 percent of notification appliances.
- E. The system shall supervise the following circuits and components:
1. Initiating device circuits.
  2. Signaling line circuits.
  3. Notification appliance circuits.
  4. Addressable initiating and control devices.
  5. Control output wiring.
  6. Auxiliary control switches.
  7. System node panels, NAC panels, remote annunciators and remote microphone panels.
  8. Primary power supply.
  9. Secondary power supply.
- F. The system shall be capable of being programmed by the Owner on site to accommodate expansion or sequence of operation changes.
- G. Provide 120 volts AC primary power to the system from a dedicated emergency power branch circuit.
- H. Provide a control panel battery charger capable of fully charging a 200 amp-hour battery within 24 hours.
- I. Provide sufficient secondary power battery capacity to operate the entire system (except the door hold-open devices) upon the loss of primary power for a period of 24 hours in a normal supervisory mode followed by 5 minutes of evacuation alarm operation.
1. When emergency voice/alarm communications is provided, provide sufficient battery capacity for 24 hours of operation in a normal supervisory mode followed by 15 minutes of voice/alarm operation.
  2. The system shall automatically transfer to and from the secondary power batteries upon an interruption of primary power without initiating a nuisance alarm.
  3. The system shall delay initiating a trouble condition for two seconds upon a transfer to or from primary power to avoid nuisance trouble conditions during emergency generator testing.

- J. Provide smoke and heat detectors as required by code and as shown, including the following.
1. Provide smoke detectors in each elevator lobby and in each elevator machine room to duplicate the elevator recall detectors provided as part of the elevator system. Do not provide smoke or heat detectors in elevator shafts.
  2. Provide two heat detectors, one in front and one behind, each unit substation transformer.
  3. Provide smoke detectors in each mechanical, electrical, telecommunications, trash collection and recycling room.
  4. Provide smoke detectors in residence hall corridors, each sleeping room, and immediately outside each sleeping room located within a suite or apartment.
  5. Provide duct smoke detectors where required by code. When not in plain view or more than 10 feet above the floor, provide duct detector remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.
- K. Provide sufficient audible notification appliances to achieve a sound level of 15 dBA above ambient sound level, but not less than 60 dBA nor more than 110 dBA. The sound level in mechanical rooms shall be not less than 90 dBA, and in sleeping rooms shall be not less than 75 dBA measured at pillow level. The sound shall be a temporal code three slow whoop or pulsed evacuation signal.
1. In rodent rooms, the sound shall be a slow whoop or warble with a peak frequency below 500 Hz.
  2. Do not provide horns or speakers in exit stair enclosures.
  3. Do not provide horns or speakers in elevator machine rooms or in elevator cars.
  4. Provide a speaker in each sleeping room and a sounder base in each sleeping room smoke detector. The speaker shall provide the general alarm and the sounder base shall alarm upon smoke in the room.
- L. Provide visual notification appliances in accordance with the intensity and spacing requirements of NFPA 72.
1. Provide strobes in all public areas including multi-person offices, but not in exit stair enclosures and animal rooms.
  2. Combine horns or speakers with strobes when both are required at the same location.
  3. Synchronize strobes when more than two appliances are in any point of view and are less than 55 feet apart.
  4. Provide strobes in elevator machine rooms.
  5. Provide strobes in accessible sleeping rooms and in living spaces of accessible suites or apartments.
  6. Provide strobes in mechanical rooms and other areas that have an average ambient noise level exceeding 60 dBA.

**DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.**

- M. Provide a waterproof horn/strobe or speaker/strobe with waterproof back box on the exterior of the building between 8 and 12 feet above the fire department connection. Audible sound shall be 90 dBA minimum at 10' and visual intensity shall be 110 candela. Program this device to alarm upon sprinkler system water flow only, and to cease operation upon termination of water flow.

- N. Provide individually addressable monitor modules to monitor non-addressable initiating devices and status contacts of other systems.
  - 1. Monitor modules shall use Class B, Style B initiating device circuits to monitor the initiating devices and status contacts.
  - 2. When interconnecting with an existing fire alarm system control panel, provide monitor modules as required so new and existing control panels function as a single system.
- O. Provide panel auxiliary relay contacts and individually addressable control module contacts to interface with control circuits of other systems and equipment.
  - 1. Provide normally closed duct smoke detector contacts to shut down ventilation systems.
  - 2. Provide normally open auxiliary relay or control module contacts to start smoke control systems.
  - 3. Provide normally closed auxiliary relay or control module contacts to release electrically held door locks and door hold-opens, and to disable electrically operated door proximity sensors.
  - 4. When interconnecting with an existing fire alarm system control panel, provide control modules as required so new and existing control panels function as a single system.
- P. Provide control panel On/Off/Auto switches with "On" and "Off" or "Open" and "Closed" LED indicators for overriding the normally open contacts that start smoke control systems.
  - 1. In the Auto position, the contacts shall operate in accordance with the fire alarm system program. In the Off position, the contacts shall remain open. In the On position, the contacts shall close to test the controlled equipment.
  - 2. The LED indicators shall indicate the status of the controlled equipment in accordance with the MMC.
  - 3. Turning any switch out of the Auto position shall initiate a system trouble condition.
- Q. Assign each initiating device a unique device address.
- R. Develop a custom location label for each initiating device that describes the type, floor, room number and exact location of the device.
  - 1. If the device is in a corridor or similar large space, state device is by Room (NAME/NUMBER).
  - 2. If room numbers are not available, provide compass directions and references to unique building features.
- S. Provide transient voltage surge suppression for the system.

**1.6 SYSTEM PERFORMANCE REQUIREMENTS**

- A. Under normal conditions, the control panel digital display shall display a "SYSTEM NORMAL" message and the current time and date.
- B. Should an abnormal condition be detected, the appropriate alarm, supervisory, or trouble panel LED shall flash and the appropriate panel audible signal shall sound.

- C. The appropriate panel alarm, supervisory, trouble or supervisory maintenance alert outputs including addresses and locations of initiating devices shall be sent via fiber-optic cable (by others) for viewing at the University Hospital Facility Command Center (UHFCC).
- D. The fire alarm control panel shall manage all input and output signals through software programming and hardware configuration. In addition to managing and supervising the fire alarm devices, the control panel shall be configured to trigger an alarm when the fire pump runs.
- E. The panel shall display the following information relative to the abnormal condition:
  - 1. Custom location label (40 characters minimum).
  - 2. Type of initiating device.
  - 3. Type of abnormal condition (alarm, supervisory or trouble).
- F. If the abnormal condition is an alarm, the following actions shall occur:
  - 1. Audible notification appliances shall sound throughout the building.
  - 2. Visible notification appliances shall flash throughout the building.
  - 3. Control outputs to mechanical systems shall perform their programmed functions.
  - 4. Control outputs shall interrupt power to electrically operated door hardware devices.
  - 5. Power to door hold-open devices shall de-energize.
- G. Pressing the appropriate Acknowledge pushbutton shall acknowledge the alarm, supervisory or trouble condition unless the system is in the silence inhibit mode. Once acknowledged, the appropriate LED shall latch on and the panel audible signal shall be silenced.
- H. If the abnormal condition is an alarm, pressing the Silence pushbutton shall silence the audible notification appliances and stop the visual notification appliances from flashing.
- I. In addition to the Acknowledge and Silence pushbuttons available on the fire alarm control panel, the fire alarm system head end equipment in the UHFCC shall be capable of acknowledging and silencing the system remotely.
- J. Upon a subsequent abnormal condition from another device, the appropriate panel LED shall flash, the panel audible signal shall again pulse and the panel display shall show the new abnormal condition.
- K. After all of the points have been acknowledged and silenced, the LED's shall glow steady and the panel audible signals shall be silenced. The total number of alarms, supervisory, and trouble conditions shall be displayed along with a prompt to review each list chronologically. The end of the list shall be indicated.
- L. Pressing the System Reset pushbutton shall return the system to its normal state if the abnormal conditions have been remedied.

1. The display shall step the user through the reset process with simple English language messages. Messages including "IN PROCESS", "RESET COMPLETED", and "SYSTEM NORMAL" shall provide operator assurance of the sequential steps as they occur.
  2. The ventilation system motors shall restart sequentially.
  3. The outputs to control circuits of other systems and equipment shall return to normal.
  4. When interconnecting with an existing fire alarm system control panel, resetting shall not require the simultaneous operation of reset pushbuttons or switches on multiple control panels, or the disconnection of wiring.
- M. Should an abnormal condition continue to exist, the system shall remain in an abnormal state. The system control relays shall not reset. The panel LED's shall remain on. The display shall indicate the total number of alarm, supervisory and trouble conditions present in the system along with a prompting to review the points. These points shall not require acknowledgment if they were previously acknowledged.
- N. Should a trouble condition continue to exist, the trouble audible signal shall resound at preprogrammed time intervals to act as a reminder that the fire alarm system is not 100 percent operational. Both the time interval and the trouble audible signal shall be programmable to suit the Owner's application.
- O. Should the Alarm Silence Inhibit function be active, the System Reset pushbutton shall be ignored and a "RESET INHIBITED" message shall be displayed for a short time to indicate that action was not taken. For operator assurance, a "RESET NO LONGER INHIBITED" message shall be displayed when the inhibit function times out.

#### **1.7 ITEMIZED QUOTATION**

- A. Submit with your bid an itemized cost breakdown listing all major component costs, labor costs (including subcontractor labor and material costs), and engineering costs, for base bid and for each alternate, for the entire fire alarm system scope of work. When requested, provide an itemized breakdown to the Owner post-bid for review and approval.

#### **1.8 SUBMITTALS**

- A. Submit for approval copies of the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the project name and number. Submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked and incomplete submittals will be rejected.
1. Plan drawings showing the locations (with room numbers) of the system components, including any adjustments in the quantities and locations of initiating devices and notification appliances to meet code requirements.
  2. Riser diagram showing system components, interconnecting wiring and connections to other building systems and equipment.

3. Wiring diagrams showing manufacturer and field connections at component terminals, complete with conductor color codes and wire numbers.
4. System configuration list showing inputs, outputs, device addresses and custom location labels, device configurations and program logic.
5. Bill of materials.
6. Catalog pages showing system components.
7. System battery sizing calculations.
8. Power supply, amplifier and circuit sizing calculations.
9. Door hold-open power supply sizing calculations.

*ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.9.*

#### **1.9 EXTRA MATERIALS**

- A. Provide to the Owner the following extra materials matching the products installed, packaged in protective coverings for storage, and identified with labels clearly describing the contents. Provide 1 percent of the installed amount of each with a minimum of one of each.
  1. Fuses: Each size and type used in the system.
  2. Manual Pull Stations.
  3. Detector Bases.
  4. Detector Heads: Each type used in the system.
  5. Addressable Monitor and Control Modules: Each type used in the system.
  6. Notification Appliances: Each size and type used in the system.
  7. Output Relays.
- B. Provide one data cable for connecting a lap top computer to the fire alarm control panel's RS-232 communications card so that the Owner can perform panel programming.

#### **1.10 RECORD DOCUMENTS**

- A. Submit four copies of record drawings showing the locations of fire alarm devices and appliances, the locations of end-of-line resistors and junction boxes, the addresses of addressable devices, the tap settings of audible notification appliances, the intensity ratings of visual notification appliances, the sizes of conduits and conductors, circuit numbers, and deviations from the design.
- B. Submit four printed copies of the final system configuration list showing inputs, outputs, addresses, custom location labels, device configurations and program logic.
- C. Submit electronic, Windows based files with the following final system software:
  1. The master program generic to the model of system being provided.
  2. The building specific program containing the unique information for the system being provided.
  3. A software license and the system passwords required by the Owner to perform programming changes.

**1.11 OPERATIONS AND MAINTENANCE MANUALS**

- A. Submit for approval four copies of operations and maintenance manuals for the specified system and equipment prior to startup. The manuals shall be the same manuals used by the Manufacturer's field service technicians. The manuals shall be marked to indicate the specific models, sizes, types and options that were provided. Manuals not so marked will be rejected.

**1.12 QUALITY ASSURANCE**

- A. The fire alarm system shall be the standard product of a single fire alarm system manufacturer who has been producing this type of equipment for at least 10 years, and has a fully equipped service organization within 150 miles of the Owner. Each component shall display the manufacturer's name.
- B. Each fire alarm system component shall be listed under the appropriate standard of Underwriters Laboratories and shall bear a UL label.
- C. The fire alarm system shall be UL labeled as a system and approved by FM Global.

*DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.*

- D. For classroom, in-patient medical and Housing projects, the fire alarm system shall also be approved by the State of Michigan Bureau of Fire Services.
  - 1. Submit shop drawings to the Michigan Bureau of Fire Services for approval.
  - 2. Arrange for a Michigan Bureau of Fire Services Inspector to inspect the system installation and testing.
  - 3. Submit to the Owner a copy of the FS-12A Form submitted to the Michigan Bureau of Fire Services.
- E. The fire alarm system shall comply with the requirements of the National Fire Alarm Code, the Owner's Inspection Authorities and with the Manufacturer's instructions.

**1.13 WARRANTY**

- A. Provide a complete parts and labor warranty for twelve months from the date of final acceptance of the system by the Owner.
- B. Provide a telephone response to Owner's questions within 4 hours and on-site assistance within 24 hours.
- C. Permit Owner's Fire Alarm Technicians to perform temporary bypasses and emergency repairs on the system without voiding the warranty.

**PART 2 - PRODUCTS**

**2.1 MANUFACTURERS**

- A. Acceptable Manufacturers and Models:
  - 1. EST Model EST-3 represented by Riverside Integrated Systems.
  - 2. Honeywell Model XLS3000.
  - 3. SimplexGrinnell Model 4100 Series.

**2.2 SYSTEM COMMUNICATIONS**

- A. The fire alarm control panel shall communicate with each addressable initiating and control device individually via shielded twisted pair signaling line circuits. EST SIGA-Loop, Honeywell Eclipse or FlashScan, or SimplexGrinnell MAPNET II or IDNET.
- B. Each signaling line circuit shall be capable of accessing up to 127/250 addressable devices.
- C. Each signaling line circuit shall allow up to 10,000 feet of wire length to the furthest addressable device.
- D. Communications shall use a broadcast polling protocol to allow tapping of the circuit except where Class A wiring is required. T-taps shall be limited to 64 per loop.
- E. Communications shall be completely digital and shall include parity data bit error checking routines for address codes and check sum routines for the data transmission protocol.
- F. Each device shall be uniquely identified by a device address.
- G. There shall be no limit to the number of initiating devices which may be activated simultaneously.
- H. Each device shall be individually annunciated at the panel. Annunciation shall include the following conditions for each device.
- I. Alarm, supervisory or trouble condition.
  - 1. Open, short or ground.
  - 2. Device failure or incorrect device installed.

**2.3 FIRE ALARM CONTROL PANEL**

- A. The fire alarm control panel shall be modular with solid state, microprocessor based electronics. EST 3, Honeywell XLS3000, or SimplexGrinnell 4100 Series.
- B. The panel shall display only those primary controls and displays essential to operation during a fire alarm condition.
- C. The panel shall include a LCD digital display, with a minimum of 80 characters.
  - 1. The display shall be backlit for enhanced readability. It shall not be lit during an AC power failure unless an alarm condition occurs or there is keypad activity.

2. The display shall support both upper and lower case letters. Lower case letters shall be used for soft key titles and for prompting the user. Uppercase letters shall be used for system status information. A cursor shall be visible when entering information.
- D. A panel audible signal shall sound during alarm, supervisory or trouble conditions. This audible signal shall sound differently during each condition to distinguish one condition from another. The audible signal shall also sound differently during each key press to provide audible feedback (chirp) indicating that the key has been pressed properly.
- E. The system program shall be stored in a non-volatile flash EPROM memory within the panel. Loss of primary and secondary power shall not erase the program stored in memory.
1. The program shall be capable of selective input/output control functions based upon AND'ing, OR'ing, NOT'ing, timing and special coded operations.
  2. The program shall enable initiating devices to be individually configured on site to provide either alarm and trouble, supervisory and trouble, alarm only, supervisory only, trouble only, current limited alarm, no alarm, normally closed device monitoring, a non-latching circuit or an alarm verification circuit.
  3. The program shall enable initiating devices to be disabled or enabled individually.
- F. The panel or the field devices shall determine the alarm decision for each detector by comparing the detector value to stored values.
1. The panel shall automatically maintain a constant smoke obscuration sensitivity in percent of smoke obscuration format for each detector.
  2. The panel shall maintain a moving average of each smoke detector's smoke chamber value to automatically compensate for dust and dirty conditions that could affect detection operation.
  3. The smoke obscuration sensitivity shall be adjustable to within 0.3 percent of either limit of the UL window (0.5 percent to 4.0 percent) to compensate for any environment.
  4. When a detector's average value reaches a predetermined value, a "MAINTENANCE ALERT" condition shall be audibly and visually indicated at the panel. The LED on the detector base shall glow steady giving a visible indication at the detector location. If a dirty detector is left unattended and its average value increases to a second predetermined value, a "TROUBLE" condition shall be indicated at the panel. To prevent nuisance alarms, these dirty conditions shall in no way decrease the amount of smoke obscuration necessary for system activation.
  5. The panel shall continuously perform an automatic self-test routine on each detector which shall functionally check detector electronics and ensure the accuracy of the obscuration values being transmitted to the panel. Any detector that fails this test shall indicate a "SELF TEST ABNORMAL" or "TROUBLE" condition at the panel.

6. Each detector shall be scanned by the panel for its type identification to prevent inadvertent substitution of another detector type. The panel shall operate with the installed device but shall initiate a "WRONG DEVICE" or "TROUBLE" condition until the proper type is installed or the programmed detector type is changed.
  7. An operator at the panel, having a proper access level, shall have the ability to manually access the following information for each detector.
    - a. Device type.
    - b. Device status.
    - c. Present average value.
    - d. Peak detection values.
    - e. Present sensitivity selected.
    - f. Detector range (normal, dirty, etc.).
  8. An operator at the panel, having a proper access level, shall have the ability to perform the following for each detector:
    - a. Enable or disable the point.
    - b. Clear peak detection values.
    - c. Clear verification tally.
    - d. Control a detector's relay driver output.
  9. The panel shall be programmable to automatically change the sensitivity settings of each detector based on time-of-day and day-of-week (for example, to be more sensitive during unoccupied periods and less sensitive during occupied periods). There shall be seven sensitivity settings available for each detector.
  10. The panel shall be programmable for a pre-alarm or two-stage function. This function allows an indication to occur when, for example, a detector with a 3 percent set point reaches a threshold of 1.5 percent smoke obscuration.
  11. Smoke detectors shall be provided with the ability for alarm verification. When in alarm verification mode, only a verified alarm shall initiate the alarm sequence operation.
    - a. The activation of a smoke detector shall initiate an alarm verification operation whereby the panel resets the activated detector and waits for a second alarm activation. If, within an adjustable time delay, a second alarm is reported from the same or any other smoke detector, the system shall process the alarm. If no second alarm occurs within the time delay, the system shall resume normal operation.
    - b. The alarm verification shall operate only on smoke detector alarms. Other activated initiating devices shall be processed immediately. The alarm verification operation shall be selectable by device.
    - c. The panel shall have the capability to display the number of times a device has gone into a verification mode.
    - d. Detectors in alarm verification mode shall have the ability of being divided into different groups whereby any two activations from a group shall cause the panel to follow its programmed alarm sequence.
- G. The panel shall have four pass code controlled access levels. Pass codes shall be entered using the panel key pad.
1. To maintain security when entering a pass code, the digits entered shall not be displayed.

2. When a correct pass code is entered, an "ACCESS GRANTED" message shall be displayed. The access level shall be in effect until the keypad is inactive for 10 minutes or the operator logs out.
  3. Should an invalid code be entered, the operator shall be notified with a message and shall be allowed up to two more chances to enter a valid code. After three unsuccessful tries, an "ACCESS DENIED" message shall be displayed.
  4. Access to a level shall only allow the operator to perform actions within that level and actions of lower levels, not actions of higher levels.
  5. Access levels shall be associated with the following functions:
    - a. Alarm silence.
    - b. System reset.
    - c. Set time and date.
    - d. On/Off/Auto control selection.
    - e. Manual control.
    - f. Disable and enable circuits and devices.
    - g. Clear historical logs.
    - h. Walk test.
    - i. Change alarm verification.
    - j. Change detector sensitivity.
    - k. Function keys.
  6. An access level shall also be associated with acknowledge keys. If the operator presses an Acknowledge key with insufficient access, an error message shall be displayed. The points on the log shall scroll with each key press, but the points shall not be acknowledged.
- H. The panel shall have the ability to store a minimum of 300 events in an alarm log plus a minimum of 300 events in a separate trouble log. These events shall be stored in a battery protected random access memory. Real time and date shall accompany history event recordings.
- I. The panel shall supervise subordinate module LED's for burnout or disarrangement. Should a problem occur, the panel shall display the module and LED location numbers to facilitate location of that LED.
- J. The panel shall have function keys programmed as follows for disabling and enabling circuits or groups of devices for maintenance or testing purposes. While circuits or devices are disabled, the panel shall indicate "TROUBLE".

**DELETE THE FUNCTION KEYS THAT DON'T APPLY TO THIS PROJECT. DO NOT RENUMBER THE REMAINING FUNCTION KEYS.**

1. F1: Disable smoke detectors by floor.
  2. F2: Disable duct smoke detectors.
  3. F3: Disable sprinkler system flow switches.
  4. F4: Disable horns/strobes or speakers/strobes by floor.
  5. F5: Disable beam detectors.
  6. F6: Disable smoke detector sounder bases.
  7. F7: Disable hood suppression systems.
- K. The system shall be capable of being walk tested by one person.

1. The activation of an initiating device under test shall be silently logged as an alarm or supervisory condition in the historical log. The panel shall automatically reset itself after logging the abnormal condition.
  2. The momentary disconnection of an initiating device or notification appliance shall be silently logged as a trouble condition in the historical log. The panel shall automatically reset itself after logging the trouble condition.
  3. The walk test sequence shall have the ability to activate the notification appliances for a maximum of 2 seconds upon the activation of an initiating device under test. If this option is selected, any momentary opening of the initiating device circuit or a notification appliance circuit shall cause the notification appliances to sound for 4 seconds to indicate the trouble condition.
  4. Should the walk test mode be on for an inappropriate amount of time, the panel shall automatically revert to normal mode.
  5. Should an abnormal condition occur from an active point not in walk test mode, the system shall perform its standard programmed alarm, supervisory or trouble sequences.
- L. The panel enclosure shall be equipped with locks and transparent door panels providing freedom from tampering yet allowing full view of the various lights and controls.

#### **2.4 NODE AND NAC PANELS**

- A. Node and NAC panels shall be modular with solid state, microprocessor based electronics, operator interfaces, power supplies, audio generators, amplifiers, battery chargers and batteries as required. All components shall be supervised. EST 3, Honeywell XLS3000, or SimplexGrinnell V4100.

#### **2.5 BATTERIES**

- A. Batteries shall be lead calcium and supervised so that a failure produces a "TROUBLE" signal.

#### **2.6 REMOTE ANNUNCIATOR**

- A. The remote annunciator shall duplicate the backlit LCD display; the alarm acknowledge, supervisory acknowledge, trouble acknowledge, alarm silence, and system reset pushbuttons; the alarm, supervisory, and trouble audible signals; the alarm, supervisory, trouble, and power "on" LED's; and the programmable function keys of the fire alarm control panel. A key "enable" switch or door lock, keyed to match the fire alarm control panel door lock, shall permit activating or deactivating the controls. EST 3-ANN, Honeywell XLS-NCA, or SimplexGrinnell 4603-9101.
- B. A remote microphone shall be included when the fire alarm system includes emergency voice/alarm communications, along with the same pushbuttons as the fire alarm control panel for selecting pre-recorded voice messages, and the same controls to choose total building or selected areas communications.

**2.7 ADDRESSABLE SPOT DETECTOR BASES**

- A. Spot detector mounting bases shall be individually addressable, suitable for two wire operation, with a twist-lock head locking feature a DIP switch or electronic addressing means, and an LED that provides power "on", alarm and trouble indications. The bases shall be listed for ceiling and wall mounting. Removal of the detector head shall cause a trouble condition at the panel. EST SIGA-SB, Honeywell 14507371-001, or SimplexGrinnell 4098-9792.
- B. Where shown, the bases shall include an auxiliary relay that is controlled from the panel. EST SIGA-RB, Honeywell B244RB, or SimplexGrinnell 4098-9791 base with 2098-9737 relay.
- C. In sleeping rooms, the base shall include a piezoelectric sounder that is controlled from the panel. EST SIGA-AB4, Honeywell B501BHT, or SimplexGrinnell 4098-9794.
- D. When bases are not in plain view, bases shall be connected to remote alarm indicators mounted in plain view at 48 inches above the floor.

**2.8 MULTISENSOR SMOKE DETECTOR HEADS**

- A. Multi-sensor type smoke detector heads shall include sampling and reference ionization chambers with a single radioactive source, a photoelectric sensor and a programmable heat detector. The detectors shall support at least four levels of sensitivity selectable at the panel and 360 degree smoke entry. EST SIGA-IPHS, Honeywell TC806B1084, or SimplexGrinnell 4098-9754.

**2.9 PHOTOELECTRIC SMOKE DETECTOR HEADS**

- A. Photoelectric type smoke detector heads shall include a pulsed LED light source and a silicon photodiode receiver, at least seven levels of sensitivity selectable at the panel, an integral insect screen and 360 degree smoke entry. This type of detector shall be installed in all duct detectors. EST SIGA-PS or SIGA-SD, Honeywell TC806B1076, or SimplexGrinnell 4098-9714.

**2.10 HEAT DETECTOR HEADS**

- A. Heat detector heads shall include combination rate-of-rise and rate compensated fixed temperature sensing, two levels of rate-of-rise sensitivity selectable at the panel, and an independent 135 degrees F fixed temperature set point. Heat detector heads shall be self-restoring. EST SIGA-HRS, Honeywell TC808B1066, or SimplexGrinnell 4098-9733.
- B. Heat detector heads for steam tunnels, cage wash areas and dish machine areas shall have a 135 degrees F fixed temperature set point and shall be self-restoring. EST SIGA-HFS, Honeywell TC808B1041 or SimplexGrinnell 4098-9733.

**2.11 DUCT DETECTORS**

- A. Duct detectors shall be individually addressable and consist of a housing, sampling tubes, a baffle and a detachable detector head. Duct detectors shall include an alarm LED, a local test switch, and an auxiliary SPDT relay for ventilation system control. Duct detectors shall be resettable by actuating the panel reset pushbutton. The sampling tubes shall be capable of being cleaned through the housing cover. EST SIGA-SD DH100ACLP, Honeywell TC806D1056, SimplexGrinnell 4098-9756, or System Sensor BK-DH100ACLP.
- B. The detector heads shall be photoelectric as specified above, but shall be capable of accepting ionization detector heads.
- C. When not in plain view, duct detectors shall include remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.

**2.12 BEAM DETECTORS**

- A. Photoelectric projected beam detectors shall be individually addressable and consist of separate transmitter and receiver units capable of long range coverage of up to 350 feet. Beam detectors shall include alarm and trouble dry auxiliary contacts, and normal, alarm and trouble LED status indicators. Beam detectors shall include internal bore sights, automatic calibration, six sensitivity settings, automatic compensation for temperature and lens contamination, and a trouble indication upon either a total obscuration or an obscuration of 50 percent of the alarm set point. Beam detectors shall be suitable for four wire operation utilizing 24 volt DC power from the panel, and resettable by actuating the panel reset pushbutton. EST EC50R, Honeywell TC847A1004, or SimplexGrinnell Fire Ray Series.

**2.13 MANUAL PULL STATIONS**

- A. Manual pull stations shall be individually addressable, suitable for two wire operation, with a high impact red Lexan body and raised white lettering. Stations shall include an ADA compliant single action operating mechanism with a mechanical latch to hold an operated station open until reset. EST SIGA-270, Honeywell S464G1007, or SimplexGrinnell 4099-9001.
- B. Reset shall be accomplished through use of a key common to the panel or a small flat-blade screwdriver. Stations which use allen wrenches or special tools to reset are not acceptable. The point of reset shall be front accessible so stations with tamper-resistant covers can be reset easily.

**2.14 MONITOR MODULES**

- A. Monitor modules for individual two wire contact monitoring shall be individually addressable, suitable for two wire operation, with a DIP switch or electronic addressing means, and a programmable latch feature for monitoring momentary contacts. Monitor modules shall monitor a single normally open dry contact using a Class B, Style B, initiating device circuit. EST SIGA-CT1 or SIGA-CT2, Honeywell TC809A1059, or SimplexGrinnell 4090-9001.
- B. Monitor modules for zone or four wire device monitoring shall be individually addressable, suitable for four wire operation utilizing 24 volt DC power from the panel, and with a DIP switch or electronic addressing means. Zone monitor modules shall monitor multiple normally open dry contacts using a Class B, Style B, two wire initiating device circuit, or monitor a four wire device using a Class B, Style D, four wire initiating device circuit. EST SIGA-UM, Honeywell TC809, or SimplexGrinnell 2190-9156 or 4090-9101.

**2.15 CONTROL MODULES**

- A. Control modules shall be individually addressable, with a DIP switch or electronic addressing means. Control modules shall provide a Form C contact rated .5 amps at 120 volts AC or 2 amps at 28 volts DC resistive that are controlled by the panel. EST SIGA-CR, Honeywell TC801N1013, or SimplexGrinnell 4090-9002.

**2.16 HORNS**

- A. Horns shall be electronic, rated 24 volts DC, with a piezoelectric driver set to produce a slow whoop sound level of 101 dBA at 10 feet, with a red, semi-flush body capable of wall or ceiling mounting. EST 757-1A or Genesis Series, Honeywell HR, or SimplexGrinnell 4901-9820.

**DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.**

- B. Horns in rodent rooms shall be set to generate a slow whoop or warble sound with a peak frequency below 500 Hz. Horns shall be of heavy-duty industrial construction and shall be UL listed for indoor and outdoor applications. EST Model 5530MD-24AW.

**2.17 SPEAKERS**

- A. Speakers shall be rated 125 to 12,000 Hertz, include four taps rated at from 1/4 to 2 watts, produce a sound level of 82 dBA at 10 feet when set at the 1/2 watt tap, and with a semi-flush body capable of wall or ceiling mounting. EST 757-1A-S25W or Genesis Series, Honeywell SP, or SimplexGrinnell 4902-9703 (wall mount) or 4902-9721 (ceiling mount).
- B. Speakers for locations with high ambient noise may be high efficiency horns rated 500 to 6,000 Hertz minimum, 10 watts minimum, include four or more taps, produce a sound level of 106 dBA minimum at 1 meter when set at the 1 watt tap, and be capable of wall or ceiling mounting. EST/GE HPSA15, Honeywell/GE HPSA15, or SimplexGrinnell EA0012 ABS.

**2.18 STROBES**

- A. Strobes shall be rated 15, 30, 60, 75, 110 or 177 candela as shown for proper illuminance, with a 1 Hertz flash rate, Xenon flash tube, white body, clear Lexan lens with red "FIRE" or international fire symbol lettering, capable of being synchronized, and capable of wall or ceiling mounting. EST Genesis Series, Honeywell SR/SCR, or SimplexGrinnell 4906 Series.

**2.19 COMBINATION HORN/STROBES AND SPEAKER/STROBES**

- A. Combination horn/strobes and speaker/strobes shall consist of the horns, speakers and strobes specified above, but combined on a single mounting plate. Combination units used outdoors and in wet areas shall be waterproof and mounted to waterproof back boxes. EST Genesis Series, Honeywell SpectrAlert Advance Series, or SimplexGrinnell 4906 Series.

**2.20 DOOR HOLD-OPEN POWER SUPPLY**

- A. The door hold-open power supply shall produce 24 volts DC of sufficient amperage to provide 0.4 amps of current to every door hold-open device being controlled. The power supply shall be supervised and capable of withstanding the inrush current that will occur when the door hold-open devices are energized.
- B. The output of the power supply shall be distributed by individually fused circuits. Fuse each circuit at 5 amps.
- C. The power supply shall release the held open doors upon a fire alarm or an AC power failure.

**2.21 EMERGENCY VOICE/ALARM COMMUNICATIONS**

- A. Emergency voice/alarm communications shall include audio control modules for alarm tone and voice message generation, a minimum of six pushbuttons for selecting pre-recorded voice messages, controls to choose total building or selected areas communications, audio amplifiers, a local microphone, and remote microphones in remote annunciators and cabinets. All of the components except for the remote microphones shall be located in or adjacent to the fire alarm control panel.
- B. The audio control module default mode shall provide for automatic total building fire alarm evacuation. The audible evacuation alarm signal shall consist of three slow whoop alarm tones followed by a fire alarm voice evacuation message. At the end of each voice evacuation message, the alarm tones shall resume. The alarm tones and voice evacuation message shall sound alternately until the alarm silence pushbutton at the fire alarm control panel or remote annunciator has been pressed. All audio signals and messages shall be digitally transmitted between nodes.
- C. The audio control modules shall provide for manual total building or selected area pre-recorded voice message generation by pushing a pre-recorded voice message pushbutton. One pushbutton shall initiate the fire alarm voice evacuation message, and the other pushbuttons shall initiate Owner-defined pre-recorded voice messages.

- D. The audio control modules shall provide for manual total building or selected areas communications. Upon keying of the microphone, a three second continuous alert tone shall sound over the speakers indicating a voice message will occur.
- E. The alarm tones shall be digitally generated by programmable software so that changes can be made without component rewiring. The voice messages shall be stored digitally in non-volatile EPROM memory.

**DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.**

- F. The alarm tone for rodent rooms only shall be produced by a separate audio control module and amplifier that generate a slow whoop or warble sound with a peak frequency below the hearing range of rodents (i.e. 500 Hz).
- G. Audio amplifiers shall have a frequency response of 125 Hz to 12,000 Hz minimum.
- H. Microphones shall be of a hand-held, push-to-talk, noise-canceling type with a frequency range of 200 Hz to 4000 Hz and a self-winding five foot coiled cable. An LED shall indicate the microphone push-to-talk pushbutton has been pressed and the speaker circuits are ready for transmission.
- I. Remote microphones shall be enclosed in remote annunciator cabinets or wall-mounted cabinets as shown on the plan drawings, with the same pushbuttons for selecting pre-recorded voice messages, and lockable doors. Remote microphones shall duplicate the manual voice transmission capability of the local microphone at the fire alarm control panel. The fire alarm control panel microphone shall have priority over any remote microphones.

The remote microphone in a remote annunciator cabinet shall provide for total building or selected areas communications.

The remote microphone and cabinet at the fire alarm system head end equipment in the UHFCC shall provide for total building or selected areas communications.

- J. Should a Fire Department telephone communication system be provided, the telephones system shall be capable of being patched to the emergency voice/alarm communications system. Manual operation shall be controlled at the fire command center.

**2.22 FIRE DEPARTMENT TELEPHONE COMMUNICATIONS**

- A. Fire Department telephone communications shall consist of a minimum of eight dedicated communications circuits between a fire command center communications panel and remotely located emergency telephone jacks, a master telephone handset and five pluggable telephone handsets.

- B. The communications panel shall include a master telephone controller for processing of two-way communications. This module shall include a circuit selector switch and "Call" and "Trouble" LED indicators for each circuit, an audible device for call and trouble signaling, a trouble silence switch with ring-back, and an LED trouble indicator. Circuit supervision modules shall be included to electrically supervise for shorts, opens, and grounds of circuit wiring.
- C. The system shall be capable of handling single or simultaneous conversations with all telephones connected into the system. The circuits shall be so designed to prevent static, hum, or other interferences to clear, intelligible two-way conversations. The communications shall be transported digitally between devices.
- D. The act of plugging a handset into an emergency telephone jack shall cause the appropriate circuit indicator LED to flash and a distinctive audible device to sound at the communications panel. The subsequent picking up of the master telephone and selection of the proper circuit shall silence the pulsing sound, cause the circuit indicator LED to latch on, and couple the remote telephone to the master telephone. Two or more telephones shall be capable of being connected into an active conversation at the discretion of the operator.
- E. Attempting to use a subsequent telephone on the same circuit shall not cause the pulsing sound to activate if any two-way communications are already established. Any new circuits activated shall, however, cause their circuit indicator LED's to flash until acknowledged.
- F. Unplugging the handsets in use and returning the related circuit selector switches to the normal position shall cause the restoration of normal supervisory functions. If any remote telephone remains plugged in, the appropriate circuit indicator LED shall flash and the pulsing sound shall resume at the communications panel.
- G. The master telephone handset shall be recessed within a protective enclosure at the communications panel.
- H. A single line circuit shall be provided to a jack in each stairwell at each floor, in each elevator car, in each elevator lobby, at each area of refuge, at the emergency generator(s) and at the fire pump location. Emergency telephone jacks shall be mounted on a stainless steel single gang plate engraved with the words "Fire Emergency Telephone".
- I. Furnish an emergency telephone jack for installation in each elevator car. Wiring from the elevator controls to each elevator car and installation of the jacks will be provided by the elevator contractor.
- J. Provide five pluggable emergency telephone handsets with self-winding five foot cords within a storage cabinet mounted at the fire command center. Key the cabinet to match the fire alarm control panel.

**PART 3 - EXECUTION**

**3.1 SYSTEM INTERRUPTIONS**

- A. Coordinate with the UMHHC Facility Command Center (734-936-4000) before performing any work affecting an existing fire alarm system. Operating, programming, modifying or impairing an existing system without approval of the UMHHC Facility Command Center is strictly prohibited.
- B. When renovating a fire alarm system, test the system to document its condition before changes are made. Maintain operation of fire alarm system devices outside of the work area.
- C. When replacing a fire alarm system, maintain operation of the existing system until acceptance of the new system. If operation of the existing system cannot be maintained and the building is occupied, provide a 24 hour/day fire watch until the new system is accepted.

**3.2 INSTALLATION**

*FOR NEW FIRE ALARM PROJECTS, SELECT ONE OF THE FOLLOWING THREE PARAGRAPHS (A, B OR C) AS DIRECTED BY THE PROJECT MANAGER. FOR FIRE ALARM RENOVATION PROJECTS, SELECT THE PARAGRAPH THAT MATCHES THE EXISTING INSTALLATION.*

- A. Provide wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- B. Provide wiring in conduit or provide fire alarm-rated MC cables in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Provide wiring and raceways as follows and in accordance with Sections 260533 and 260513 and Manufacturer's instructions.
  - 1. Concealed in walls, exposed on walls up to 8' AFF, and above non-accessible ceilings - provide wiring in conduit.
  - 2. Above accessible ceilings and above 8' AFF in unfinished spaces - provide open wiring in J-hooks. Provide conduit sleeves where open wiring penetrates walls and floors.
- D. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, protect power supply and notification appliance circuits from attack by fire until they enter the notification zone they serve. Provide 2-hour rated cable assemblies or protect circuits in 2-hour rated shafts, enclosures or sprinklered stairwells in accordance with Sections 260533 and 260513.
- E. Circuits may be T-tapped only where shown on the manufacturer's wiring diagrams.
- F. Provide waterproof back boxes with gaskets for devices and appliances installed outdoors or in wet or wash-down areas.
- G. Paint fire alarm junction boxes, covers and fittings red or provide red conduit throughout, except fire alarm raceways exposed in finished areas may be painted to match wall color.

- H. Modifications to fire alarm control panels, node panels, NAC panels and remote annunciator panels shall be made by a Manufacturer's Representative.
- I. Final connections to the fire alarm system components and system programming shall be performed by Fire Alarm Technicians with NICET Level II or higher certification.
- J. Label fire alarm panels with the room numbers, electrical panel numbers and circuit breaker numbers feeding them.
- K. Paint the handles of circuit breakers feeding fire alarm panels red, and install handle locks.
- L. Smoke and heat detectors shall not be installed until after construction clean-up is completed.
  - 1. When renovating an existing system, remove and store existing detectors during construction activities.
  - 2. Detectors installed prior to construction clean-up shall be cleaned by the manufacturer or replaced.

**3.3 TESTING**

- A. Demonstrate complete operation of the fire alarm system in accordance with NFPA 72, NFPA 101 (classroom, in-patient medical and Housing projects only), the Michigan Building Code, and Manufacturer's instructions. Notify the Owner's Representative 3 working days in advance of the test.
  - 1. The test shall be witnessed by a U-M OSEH Fire Inspector, a U-M Electrical Inspector, and the U-M Fire Protection Shop.
  - 2. Especially on fire alarm renovation projects, the U-M Fire Protection Shop may participate in or direct the testing activities.
  - 3. On classroom, in-patient medical and housing projects, also include an Inspector from the Michigan Bureau of Fire Services.
- B. Submit a signed and dated NFPA 72 test report to the Electrical Inspector prior to acceptance of the fire alarm system by the Owner.
- C. On classroom, in-patient medical and Housing projects, also submit a signed and dated FS-12A Form to the Michigan Bureau of Fire Services.

**3.4 COMMISSIONING**

- A. Perform Commissioning activities per Related Sections above.

**3.5 TRAINING**

**DELETE A AND B IF IT IS KNOWN IN ADVANCE THAT THIS TRAINING HAS ALREADY OCCURRED.**

- A. Provide the Owner's Fire Alarm Technicians with classroom training on the operation and maintenance of this model of system. This training shall be by the Manufacturer and shall be the same training as given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received operations and maintenance training from the manufacturer on this model of system, this training requirement will be waived.
- B. Provide the Owner's Fire Alarm Technicians with classroom training on the programming of this model of system. This training shall be by the Manufacturer and shall be the same training given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received programming training on this model of system, this training requirement will be waived.
- C. Train the Owner's Fire Alarm Technicians on unfamiliar components installed in this system.
- D. Walk the Owner's Fire Alarm Technicians through the building and identify the locations of fire alarm devices hidden from plain view.
- E. Train UMHHC Security and the OSEH Fire Inspectors on the basic operation of the system, including how to acknowledge audible notification appliances after an alarm.

***DELETE THE FOLLOWING TWO PARAGRAPHS WHEN EMERGENCY VOICE/ALARM COMMUNICATIONS IS NOT INCLUDED.***

- F. Train UMHHC Security and the OSEH Fire Inspectors on how to override the smoke control systems, on how to use the emergency voice/alarm communications, and on how to use the Fire Department telephone communications systems. Invite representatives from the Ann Arbor Fire Department to this training.
- G. Train the Facility Manager on how to use the emergency voice/alarm communications system.

The Description of the Project  
P00000000 0000

**SPECIFICATION DIVISION 31**

NUMBER            SECTION DESCRIPTION

**DIVISION 31 EARTHWORK**

SECTION 312000 - EARTH MOVING

**END OF CONTENTS TABLE**

**DIVISION 31 EARTHWORK**  
**SECTION 312000 - EARTH MOVING**

*THIS SECTION IS FOR VERY LIMITED EXCAVATION AND BACKFILL PROJECTS. FOR BUILDING ADDITIONS AND OTHER SIGNIFICANT STRUCTURES, USE THE AIA MASTERSPEC SECTION OF SAME NUMBER AND NAME.*

*2/07 - SUBBASE COMPACTION CHANGED TO FROM 95% TO 98%*

**PART 1 - GENERAL**

**1.1 SUMMARY**

- A. This Section includes the following:
1. Preparing sub-grades for slabs-on-grade and walks.
  2. Excavating.
  3. Drainage and moisture-control fill course for slabs-on-grade.
  4. Sub-base course for walks.
  5. Subsurface drainage backfill for walls and trenches.
  6. Excavating and backfilling trenches within building lines.
  7. Excavating and backfilling for underground mechanical and electrical utilities and appurtenances.

**1.2 DEFINITIONS**

- A. Unauthorized excavation consists of removing materials beyond indicated sub-grade elevations or dimensions without direction by the Architect. Unauthorized excavation, as well as remedial work directed by the Architect, shall be at the Contractor's expense.

**PART 2 - PRODUCTS**

**2.1 SOIL MATERIALS**

- A. General: Provide approved borrow soil materials from off-site when sufficient approved soil materials are not available from excavations.
- B. Satisfactory Soil Materials: ASTM D 2487 soil classification groups GW, GP, GM, SW, SP, and SM; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation and other deleterious matter.
- C. Unsatisfactory Soil Materials: ASTM D 2487 soil classification groups GC, SC, ML, MH, CL, CH, OL, OH, and PT.
- D. Backfill Materials: Satisfactory soil materials.
- E. Sub-base Material: MDOT Class II; washed, graded sand, ASTM C 136, with 100 percent passing a 3-inch sieve, not less than 60 percent passing a 1-inch sieve, and not more than 30 percent passing a No. 100 sieve.

- F. Drainage Fill: Washed, evenly graded mixture of crushed stone, or crushed or uncrushed gravel, ASTM D 448, coarse aggregate grading size 57, with 100 percent passing a 1-1/2-inch sieve and not more than 5 percent passing a No. 8 sieve.
- G. Filtering Material: Evenly graded mixture of natural or crushed gravel or crushed stone and natural sand, with 100 percent passing a 1-1/2-inch sieve and 0 to 5 percent passing a No. 50 sieve.
- H. Impervious Fill: Clayey gravel and sand mixture capable of compacting to a dense state.

**PART 3 - EXECUTION**

**3.1 PREPARATION**

- A. Protect structures, utilities, sidewalks, pavements, and adjacent plant materials from damage caused by earthwork operations.

**3.2 EXCAVATION**

- A. Excavate to indicated elevations and dimensions within a tolerance of plus or minus 0.10 foot.
  - 1. Excavations for Footings: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.
  - 2. Excavation for Walks: Excavate surfaces under walks to indicated cross sections, elevations, and grades.
  - 3. Excavation for Utility Trenches: Excavate trenches to indicated slopes, lines, depths, and invert elevations.
    - a. Excavate trenches to uniform widths to provide a working clearance on each side of pipe or conduit.
    - b. Trench Bottoms: Excavate and shape trench bottoms to provide uniform bearing and support of pipes and conduit.

**ALWAYS INCLUDE NEXT TWO PARAGRAPHS FOR PROJECTS REQUIRING EXCAVATION.**

- B. During Work activities if suspect contaminated soil, groundwater, or other unknown material is encountered contact both University of Michigan Construction Management Representative and UM OSEH Hazardous Materials and Remediation Services Program (phone no. 743-763-6973) immediately. Suspect contaminated soil may exhibit chemical or unusual odors, staining, unusual coloring, and/or contain man-made debris. Suspect contaminated groundwater may exhibit chemical or unusual odors, unusual coloring, and/or sheen.
- C. Immediately cease all excavation, dewatering, transport, or disturbance of the suspect material until given direction by University of Michigan Construction Management Representative.
- D. Fill unauthorized excavation under foundations by extending indicated bottom elevation of concrete foundation or footing to excavation bottom.

**3.3 UTILITY TRENCH BACKFILL**

- A. Place and compact initial backfill of satisfactory soil material or sub-base material, free of particles larger than 1 inch, to a height of 12 inches over the utility pipe or conduit.
- B. Coordinate backfilling with utilities testing.
- C. Place and compact final backfill of satisfactory soil material to final sub-grade.

*INCLUDE BELOW FOR BACKFILLING AT FOOTING DRAINS.*

**3.4 SUBSURFACE DRAINAGE BACKFILL**

- A. Drainage Backfill: Place and compact drainage backfill of filtering material over subsurface drain, in width indicated, to within 12 inches of final sub-grade. Overlay drainage backfill with one layer of filter fabric, overlapping edges at least 6 inches.
- B. Impervious Fill: Place and compact impervious fill material over drainage backfill to final sub-grade.

**3.5 COMPACTION**

- A. Place backfill materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- B. Place backfill materials evenly on all sides of structures to required elevations. Place backfill and fill uniformly along the full length of each structure.
- C. Compact soil to not less than 95 percent maximum dry density according to ASTM D 1557.

**3.6 SUBBASE COURSE**

- A. Under walks, place sub-base course material on prepared sub-grades.
  - 1. Compact sub-base course at optimum moisture content to required grades, lines, cross sections and thickness to not less than 98 percent of ASTM D 4254 relative density.
  - 2. When thickness of compacted sub-base course exceeds 6 inches, place materials in equal layers, with no layer more than 6 inches thick or less than 3 inches thick when compacted.

**3.7 DRAINAGE FILL**

- A. Under slabs-on-grade, place drainage fill course on prepared sub-grade.
  - 1. Compact drainage fill to the required cross sections and thickness.
  - 2. When compacted thickness of drainage fill exceeds 6 inches thick place materials in equal layers, with no layer more than 6 inches thick; less than 3 inches thick when compacted.

3.8 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off the Owner's property.

DIVISION 31 EARTHWORK

SECTION 312323 - FILL

END OF CONTENTS TABLE

**DIVISION 31 EARTHWORK**  
**SECTION 312323 - FILL**

**PART 1 - GENERAL**

**THIS SECTION SPECIFIES ENGINEERED COMPACTED GRANULAR FILL MATERIAL. USE ONLY WHEN FILL MUST BE ENGINEERED, NOT FOR ORDINARY BELOW-SLAB USE.**

**1.1 SUMMARY**

- A. Extent of engineered granular fill indicated on drawings.
- B. Type of engineered granular fill is compacted sand and gravel, installed in layers and tested for compliance with requirements.

**1.2 QUALITY ASSURANCE**

- A. Employ an approved Geotechnical Testing Laboratory to evaluate and confirm compaction effort by testing for moisture content, and density of materials in place. For each 6 inch lift, test 6 locations at intervals not exceeding 25 feet. Immediately obtain test results, and re-compact and re-test areas not conforming to specified compaction requirements prior to placing additional fill materials.

**PART 2 - PRODUCTS**

**2.1 MATERIALS**

- A. Comply with the following Michigan Department of Transportation "1984 Standard Specifications for Construction" Section 8.02.06 for Granular Material Class I:
  - 1. Sieve Analysis: ASTM C 136
  - 2. Total Percent Passing - Dry Weights:
    - a. For 2-inch: 100 percent.
    - b. For 1/2-inch: 45-85 percent.
    - c. For No. 4: 20-85 percent.
    - d. For No. 30: 5-3 percent.
  - 3. Percent Loss by Washing - Dry Weights: ASTM C 117; 0-5 percent.
- B. Provide Granular Materials consisting of one, or any combination of, the following:
  - 1. Sand; gravel; crushed stone; foundry sand; iron blast-furnace slag; reverberatory-furnace slag.
  - 2. Provide foundry sand free of combustible materials and containing negligible quantities of iron.
- C. The following materials are not permitted:
  - 1. Cementitious shale.
  - 2. Crushed concrete.

**PART 3 - EXECUTION**

**3.1 PLACEMENT AND COMPACTION**

- A. Place fill materials in layers not exceeding 6 inches and compacted with portable pneumatic tampers and vibratory compactors to not less than 95 percent of maximum dry density as determined in accordance with ASTM D 1557 (modified Proctor).

SECTION 312326 - FLOWABLE FILL

**END OF CONTENTS TABLE**

**DIVISION 31 EARTHWORK**  
**SECTION 312326 - FLOWABLE FILL**

**PART 1 - GENERAL**

***THIS SECTION SPECIFIES A PUMPABLE CONCRETE GROUT MATERIAL WITH LIMITED SHRINKAGE - USED IN SPECIAL CIRCUMSTANCES ONLY.***

**1.1 SUMMARY**

- A. Work Included: Class A Compacted Fill as indicated on drawings.
  - 1. In addition, install embedded items furnished under Division 05 Section "Metal Fabrication".

**1.2 SUBMITTALS**

- A. Submittals: In addition to product data, submit proposed mix design, including slump and weight data; and copy of laboratory test report showing strengths achieved and expected curing time.

**PART 2 - PRODUCTS**

**2.1 ACCEPTABLE MANUFACTURERS**

- A. Manufacturer: Provide materials manufactured by the following:
  - 1. Flo-Fill Co., 1008 Scheurmann St., Essexville, Mi 48732; phone no. (517)-893-1493.
    - a. "Flo-Fill" compacted, class A, fill; complying with the following:
  - 2. Fly Ash: approximately 1950 pounds per cubic yard.
  - 3. Portland cement: approximately 85 pounds per cubic yard.
    - a. Water: 60 to 70 gallons per cubic yard.
  - 4. Minimum Cured Strength: 6000 pounds per square foot.
  - 5. Dry Weight: 60 to 70 pounds per cubic foot.

**2.2 MIXING**

- A. Mix material on site in strict accordance with manufacturer's instructions.

**PART 3 - EXECUTION**

**3.1 INSTALLATION**

- A. Placing: Pump mixture into place in fluid state to eliminate compaction effort. Spread and level to grades indicated on drawings.
- B. Curing: Cure by drying for a minimum of 7 calendar days before placing additional construction over fill material.

SECTION 312500 - EROSION AND SEDIMENTATION CONTROLS

**END OF CONTENTS TABLE**

**DIVISION 31 EARTHWORK**

**SECTION 312500 - EROSION AND SEDIMENTATION CONTROLS**

*AUGUST, 2005 - UPDATED TO REFLECT CURRENT REQUIREMENTS OF UM OSEH.*

*DUE TO REGULATORY REQUIREMENTS, DO NOT EDIT THIS SECTION OTHER THAN WHERE INDICATED BY COMMENTARY.*

*CONSULT WITH OSEH ON ALL PROJECTS FOR WHICH SOIL EROSION AND SEDIMENTATION CONTROL MIGHT BE REQUIRED IN ORDER TO DETERMINE IF THE PROJECT DOES REQUIRE SESC AND TO DETERMINE APPROPRIATE SESC MEASURES FOR THE PROJECT. IF THE PROJECT QUALIFIES FOR SESC, SUBMIT A PROJECT NOTIFICATION FORM TO OSEH. FORM CAN BE DOWNLOADED FROM WEB SITE WWW.OSEH.UMICH.EDU/SESCAPPA.PDF*

*IF THIS SECTION IS INCLUDED IN THE SPECIFICATIONS, ALSO INCLUDE ACCOMPANYING SOIL EROSION AND SEDIMENTATION CONTROLS SUPPLEMENTAL CONDITIONS IN THE FRONT END DOCUMENTS.*

**PART 1 - GENERAL**

**1.1 SUMMARY**

- A. This Section includes conducting earthwork and earth change activity operations in a manner to protect Waters of the State (of Michigan), storm drains, and adjacent properties from soil erosion and sedimentation.

**1.2 DEFINITIONS**

- A. "Waters of the State" includes the Great Lakes and their connecting waters, lakes, ponds and streams which may or may not be serving as a County drain as defined by the drain code; or any other body of water that has definite banks, a bed and visible evidence of a continued flow or continued occurrence of water or wetlands regulated under Part 303.

**1.3 SUBMITTALS**

- A. Submit product information for materials proposed for use.

**1.4 QUALITY CONTROL**

- A. Requirements of Regulatory Agencies: For earth changes, comply with the following:

*DELETE BELOW IF SITE IS LESS THAN ONE ACRE AND MORE THAN 500 FEET FROM WATERS OF THE STATE.*

- 1. Part 91, Soil Erosion and Sedimentation Control (SESC) of the Natural Resource & Environmental Protection Act, 1994 PA 451, as amended (Part 91).

*ALWAYS INCLUDE BELOW.*

2. The University of Michigan Soil Erosion & Sedimentation Control Procedures.

### 1.5 PERFORMANCE REQUIREMENTS

- A. Implement the soil erosion and sedimentation control plan including required maintenance during construction and final removal as directed in the plans, and as needed per site conditions and as required by site inspections by University of Michigan Occupational Safety and Environmental Health (OSEH).
- B. Control runoff, soil erosion, and sedimentation. No sediment should leave the site.
- C. Prevent wind erosion. No visible emissions (dust) should leave the site.
- D. Comply with The University of Michigan Soil Erosion and Sedimentation Control Procedures.

### 1.6 REFERENCES

- A. The University of Michigan Soil Erosion & Sedimentation Control Procedures.  
<http://www.oseh.umich.edu/stormwater/emsec.html>
- B. Guidebook of Best Management Practices for Michigan Watersheds

## PART 2 - MATERIALS (NOT APPLICABLE)

## PART 3 - EXECUTION

### 3.1 GENERAL

- A. Where the following events result in the need for additional or modified soil erosion and sedimentation control installations to meet the objective of the referenced procedures, provide remedial installations on a timely basis.
  1. Unanticipated alterations to the construction schedule.
  2. Unanticipated site conditions except Acts of God such as a tornado or fire.
- B. Install temporary erosion and sedimentation control measures prior to or upon commencement to earthwork activities.
  1. Install an entrance anti-tracking pad with a minimum of 50 feet in length. A geotextile filter fabric should be placed under 6 inches of limestone aggregate.
  2. Install temporary inlet protection at all adjacent and down-gradient storm water inlets, catch basins and manholes that may be impacted.

**BELOW IS ONE EXAMPLE OF A PERIMETER BARRIER. MODIFY TO SUIT PROJECT.**

3. Install silt fence with stakes on the side down gradient from the disturbed area. Toe in six inches of the fencing material.
  4. Place stockpiles and other spoil piles away from the drainage system to minimize sediment transport. Keep as few stockpiles as possible during the course of the project. If the stockpile and/or spoil pile must remain on-site overnight, or if the weather conditions indicate the chance for precipitation,
    - a. cover the pile with water repellent material to prevent erosion or
    - b. install silt fencing around the base of the pile to prevent transport of sediment to the storm water system and wet the pile as needed to prevent wind erosion, or
    - c. apply other control methods as appropriate to the site.
  5. Where runoff enters the existing storm water system, protect the storm system from sedimentation.
    - a. Temporary inlet protection must prevent the release of sediment and allow for proper drainage.
      - 1) Use of burlap is not acceptable as a SESC measure.
      - 2) If filter fabric is used on drains, ensure the filter fabric is placed over (not under) the storm grates to facilitate maintenance (cleaning) of the controls.
      - 3) If high storm water flows are expected, use silt sacks in lieu of filter fabric for drain protection. Based on site conditions select regular or high flow silt sacks as appropriate.
- C. Utilize a water truck as needed for dust control.
- D. Utilize a sweeping machine to remove sediment tracked onto the pavement on a daily basis at minimum. Use sweeper more frequently as dictated by site conditions.
- E. Maintain erosion and sedimentation controls on a daily basis until the contract has been completed and accepted. Maintenance shall include:
1. Repair of damaged installations.
  2. Replacement of lost soil erosion & sedimentation control measures.
  3. Periodic removal of collected silt and sedimentation as required or directed to maintain effectiveness of the silt traps, filters and basins.
- F. Correct non-conforming soil erosion and sedimentation control Work on a timely basis within 24 hours, if Waters of the State are being impacted or within 5 days if not impacting Waters of the State.
- G. Complete permanent soil erosion control measures for all slopes, channels, ditches, or any disturbed land area within 5 calendar days after final grading or the final earth change has been completed. Maintain temporary control measures until permanent soil erosion control measures are in place and the area is stabilized.

**3.2 CLEAN UP**

- A. Remove temporary erosion control measures after permanent soil erosion measures are in place and the area is stabilized, unless ordered by the Owner's Representative to remain in place. Care shall be taken during removal to prevent soil erosion and sedimentation.

**SPECIFICATION DIVISION 32**

NUMBER            SECTION DESCRIPTION

**DIVISION 32 EXTERIOR IMPROVEMENTS**

SECTION 329210 - LAWN REPAIR

**END OF CONTENTS TABLE**

**DIVISION 32 EXTERIOR IMPROVEMENTS**  
**SECTION 329210 - LAWN REPAIR**

*THIS SECTION SPECIFIES LAWN REPAIR FOR DUMPSTER AND TRUCK TIRE DAMAGE. REFER MORE EXTENSIVE LAWN WORK TO LANDSCAPE ARCHITECT.*

*2/07 - ADDED NOTE TO REQUIRE 4" MIN. TOPSOIL*

**PART 1 - GENERAL**

**1.1 SUMMARY**

- A. Extent of lawn repair includes areas damaged by construction operations, including movement of heavy equipment, dumpster locations and similar operations.
- B. Types of lawn repair include the following:
  - 1. Grading and fine raking.
  - 2. Seeding.
  - 3. Mulching.

**1.2 SUBMITTALS**

- A. Product data or certificates of conformance indicating that products used comply with requirements.

**PART 2 - PRODUCTS**

**2.1 MATERIALS**

- A. Seed: Fresh, clean, dry, new-crop seed composed of varieties, in equal proportions, tested for minimum percentages by weight of purity and germination as follows:
  - 1. Baron Kentucky Bluegrass; 98% purity; 80% germ.
  - 2. Nugget Kentucky Bluegrass; 98% purity; 90% germ.
  - 3. Touchdown Kentucky Bluegrass; 98% purity; 90% germ.
  - 4. Pennlawn Red Fescue; 98% purity; 90% germ.
  - 5. Manhattan Ryegrass; 97% purity; 90% germ.

**PART 3 - EXECUTION**

**3.1 PREPARATION**

- A. Thoroughly loosen and grade soil to true lines, free from unsightly variation, lumps, ridges and depressions. Remove sticks, stones, roots and other objectionable material over 1 inch in any dimension that might interfere with the formation of a finely pulverized seed bed.
- B. Level displaced soil around perimeter of ruts and depressions.

- C. Distribute topsoil on damaged lawn areas in quantity sufficient to provide repaired areas that are level and uniform with adjacent undisturbed lawn areas.
- D. Spread, cultivate and lightly compact a minimum of 4" topsoil to prevent future settlement; drag and grade to finished grade.

**3.2 APPLICATION**

- A. Rake seed uniformly to an average depth of 1/4 inch, and at a rate of 2.3 lb. per 1000 sq. ft. Lightly roll the seed bed to provide good moisture contact between the seed and soil.
- B. Mulch seeded areas with straw.
- C. Water thoroughly and immediately with a fine mist until straw is compacted and soil is soaked to a depth of 3 inches.

## 8.0 PREFERRED MANUFACTURERS LIST

Preferred List of Manufacturers (PML) contains specific manufacturers that are acceptable for use on U of M projects This section is divided by CSI number. When the A/E uses U-M Master Specifications for a project, adding manufacturers from the PML as approved manufacturers in the specification is optional.

**For University of Michigan Hospitals and Health Centers (UMHHC) funded projects, click here for a list of [Preferred Manufacturers Lists](#) specific to work at UMHHC.**

CONTRACTS & AGREEMENTS

CONTRACTOR RESOURCES

OTHER LINKS

## **DESIGN GUIDELINE 8.1** **SUBSTITUTIONS**

**(Formerly Owner's Option)**

### **General**

The University requires that specific vendor's products be used to assure job quality through reliability, ease of maintenance, manufacturers proven maintenance and warranty support, control of stock and value. This process is controlled by disallowing the Contractor from making substitutions for specified products. The Contractor is typically permitted to propose Owner's Options (voluntary alternates) at the time of bid only. It is unusual for the University to consider a substitution after bids have been awarded and during the construction phase.

### **Related Documents**

[Project Manual, Instructions to Bidders](#)

Preferred Manufacturers List (PML)

### **Specifications**

Include language explicitly prohibiting substitutions.

Do not use the phrase "or equal" after any specific vendor's product identification in the specification sections or on the drawings (including details).

For all specification sections that are included in the PML, restrict product selections to those manufacturers listed in the PML. Where none are listed, select manufacturers utilizing the criteria in the "General" paragraph of this document. The University encourages the largest number of PML listed manufacturers be included in the specification. However, if there are concerns with a particular manufacturer, it is not required they be included, provided a minimum of three are listed as approved in the specification. If it is believed manufacturers other than those listed in the PML should be considered, discuss this issue with the Design Manager prior to release of the construction documents.

## **DESIGN GUIDELINE 8.2** **ARCHITECTURAL PREFERRED MANUFACTURERS LIST**

### **General**

This list is a compilation of products approved for use on University of Michigan projects. Where specific manufacturers or products are listed for a given building element, limit selection to the products listed. When, in your opinion, an unlisted product should be considered for inclusion in a project, consult with the Design Manager. Do not substitute this list for your professional judgment concerning appropriate products and materials.

Where specific products are not listed for a given building element (i.e. curtain walls), base the selection of manufacturers, types, styles, or models on your professional judgment. Wherever possible, select the products of at least 3 manufacturers. Avoid the use of open ended "or equal" statements.

This list is updated as needed.

### **Table of Contents**

Section 075316	Chlorosulfonate-Polyethylene (CSPE) Roofing
Section 075323	Ethylene-Propylene-Diene-Monomer (EPDM) Roofing
Division 8	Aluminum Fluoropolymer Coatings

Section 123553	Laboratory Casework
Section 122000	Window Treatment
Section 132100	Controlled Environment Rooms

### **Preferred Manufacturers**

#### **Section 075316 - Chlorosulfonate-Polyethylene (CSPE) Roofing**

- Carlisle SynTec Systems
- Stevens Roofing Systems, Dow Building Solutions.

## **Section 075323 - Ethylene-Propylene-Diene-Monomer (EPDM)**

EPDM Systems:

- Carlisle SynTec Systems, Carlisle Corporation
- Firestone RubberGard EPDM Roofing Systems, Firestone Building Products Co.
- Genflex Roofing Systems, GenCorp. Polymer Products, Building Systems Div.
- Johns Manville Roofing Systems, Johns Manville Corp.
- Versiguard Roofing Systems, Versico Incorporated.

## **Division 8 (applies to sections 08410, 08520, 08911) - Aluminum Fluoropolymer Coatings**

- PPG Industries.
- Valspar Corp.
- Akzo Nobel.

## **Section 084113 - Aluminum Framed Entrances and Storefronts**

Entrances, Doors and Storefront Systems:

- EFCO Corp., a Pella company.
- Kawneer North America; an Alcoa company
- Oldcastle Building Envelope.
- Tubelite Company, Inc.
- Wausau Window and Wall Systems

Flush Panel FRP Doors (Doors only, not framing):

- Commercial Door Systems
- Kawneer North America; an Alcoa companyRebco, Inc.
- Special-Lite, Inc.

## **Section 084413 - Glazed Aluminum Curtain Wall**

- EFCO, Corp.; a Pella company.
- Graham Architectural Products
- Harmon, Inc.
- Kawneer North America; an Alcoa company.
- Oldcastle Building Envelope.
- Wausau Window and Wall Systems.

## **Section 085113 - Aluminum Windows**

Architectural Grade Windows (subject to availability of project-applicable products):

- Graham Architectural Products
- Kawneer North America; an Alcoa company.
- Wausau Window and Wall Systems.

## Section 087100 - Door Hardware

### Butt Hinges:

- Hager Companies
- Ives, Allegion
- McKinney Products Company
- Stanley

### Continuous Geared Hinges:

- Hager Companies
- Ives, Allegion
- Pemko
- Select Products Limited

### Locksets (mechanical and electrified):

- Corbin Russwin ML2200
- Sargent 8200 Series
- Schlage L Series

### Electric Strike:

- Von Duprin 6000 Series
- HES 1006, 9400 and 9600 Series

### Small Format Interchangeable Cores (SFIC):

In existing buildings, match existing core type for ease of keying.

- Best Access Systems
- Medeco Keymark
- Schlage Everest

### Exit Devices (mechanical and electrified):

- Sargent
- Von Duprin

### Digital Locks (Standalone battery operated, not connected to campus access control system):

- Schlage only
  - Keypad type (programmable at door without additional hardware/software): CO-100-MS-70-KP
  - Keypad type type (programmable at door with additional hardware/software): CO-200-MS-70-KP
  - Mag stripe card reader (programmable at door with additional hardware/software): CO-200-MS-70-MSK

### Closers: specify arm specific closers; do not specify closers with multiple arms

- LCN 4000 Series only
- Sargent 281 Series with heavy duty arm

### Overhead Holders and Stops:

- Concealed heavy duty type by any BHMA member

Local Exit Alarms (not connected to fire alarm or campus access control systems):

- Detex

Flush Bolts (Automatic, Constant Latching and Manual):

- Door Controls International (DCI)
- Ives
- Rockwood

Flatgoods: Any BHMA member

Weatherstripping /Thresholds: Any BHMA member

Concealed Power Transfer:

- Securitron
- Von Duprin

### **Section 088000 - Glazing**

Primary Glass:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Pilkington North America, Inc.
- PPG Industries, Inc.

Laminated Glass:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Oldcastle Glass Group.
- Viracon, Inc.

Insulating Glass Units:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Oldcastle Glass Group.
- Viracon, Inc.

Fire-Rated Glazing:

- AGC Glass Company. Pyrosafe
- Nippon Electric Glass Co., Ltd. Firelite
- Pilkington Group, Pyrostop.
- Vetrotech Saint-Gobain USA.

### **Section 102113 - Toilet Compartments**

- All American Metal Corp.
- Bradley Corporation; Mills Partitions.
- Flush-Metal Partitions LLC.
- Hadrian Manufacturing, Inc.

## **Section 102800 - Toilet and Bath Accessories**

- American Specialties, Inc. (ASI).
- Bobrick Washroom Equipment, Inc.
- Bradley Corp.
- Elcoma Metal Fabricating (grab bars and shower seats only).
- Gamco, a division of Bobrick Washroom Equipment (except for shower seats and counter mounted soap dispensers).
- Koala Kare Products (baby changing stations only), a division of Bobrick Washroom Equipment.

Note: Toilet paper dispensers, paper towel dispensers (roll-type), and wall mounted soap dispensers are provided by UM, but installed by the Contractor. Coordinate with Design Manager.

## **Section 115313 - Laboratory Chemical Fume Hoods**

Chemical Fume Hoods: All types except reduced face velocity

- Air Master Systems Corp.
- BMC Laboratory Cabinets & Fume Hoods
- Hamilton Scientific
- Kewaunee Scientific Corp.
- Labconco Corp.
- Mott Manufacturing Ltd.
- Lab Crafters, Inc.

Chemical Fume Hoods: Reduced face velocity

- Kewaunee Scientific Corp.; Supreme Air LV
- Lab Crafters, Inc.; Air Sentry
- Labconco Corp. ; Protector XStream

Base Cabinets for Fume Hoods: Refer to approved laboratory casework manufacturers list.

## **Section 123553 - Laboratory Casework**

Metal Casework; associated distributors:

- Air Master Systems Corp.
- BMC Laboratory Cabinets & Fume Hoods,; RD Landstra Associates.
- Jamestown Metal Products; Farnell Contracting
- Kewaunee Scientific Equip. Corp.; Farnell Equipment Co.

- Laboratory Design & Supply, Inc.
- Mott Manufacturing, Ltd.; Detroit Technical Equipment Company

Flammable Storage: Produced in accordance with NFPA 30 and FM or UL labeled.

Wood Casework; associated distributors:

- Kewaunee Scientific Equip. Corp.; Farnell Equipment Co.
- Laboratory Design & Supply, Inc. (Flush overlay only; lipped overlay not available)
- Mid Canada Millwork
- Mott Manufacturing, Ltd.; Detroit Technical Equipment Company
- Conditional Approval: The following manufacturers are new to the PML and are approved for use on small projects (estimated casework cost less than \$100,000):
  - CIFLab L-Line (lipped overlay) and E-line (full overlay); Stonecreek Interior Systems, LLC
  - Diversified Casework; RD Landstra Associates.
  - Wood-Metal Industries; Divisions of Wood-Mode; Farnell Contracting

Epoxy Resin Tops and Sinks:

- Kemresin (Kewaunee Scientific Corp.)
- Durcon, Inc.
- Epoxyn; Epoxyn Products

Stainless Steel Sinks and Tops:

- Elkay Co.
- Just Manufacturing

Fiberglass Sinks:

- Kreolab, Inc.

Shelf Standards and Brackets:

- Cooper B-Line, Inc.
- Flex-Strut, Inc.
- Kewaunee Scientific Equip. Corp.
- Nu-Strut framing channel system, Kumar Industries, Inc.
- Unistrut Corp.

Service Fittings:

- Chicago Faucets, a Geberit Company.
- T & S Brass and Bronze Works, Inc.
- Watersaver Faucet Company
- Wolverine Brass, Inc.

## **Section 122000 - Window Treatment**

Review specific window treatment requirements with Design Manager. Small renovation projects will typically match established building standard. New buildings and major renovations will select window treatments based on performance requirements, including solar transmission and thermal properties.

### Aluminum Horizontal Blinds

- Levolor Window Fashions
- Hunter Douglas
- Springs Window Fashions; Bali

### Roller Shade Hardware:

- Springs Window Fashions; Bali
- Draper Inc.; Flexshade
- OpenLight
- MechoShade Systems, Inc.
- Roll Ease, Skyline Series
- SRF Enterprises, Inc.

Shade Fabric: Tested in accordance with NFPA 701.

## **Section 132100 – Controlled Environment Rooms**

### Environmental Rooms:

- Bahnsen Environmental Specialties, an EMCOR company
- Environmental Growth Chambers
- Harris Environmental Systems, Inc.
- Insulated-Structures, Ltd.
- Nor-Lake, Inc.

## **DESIGN GUIDELINE 8.3** **MECHANICAL PREFERRED MANUFACTURERS LIST**

SECTION 238220 - HORIZONTAL FAN COIL UNITS (15764)  
SECTION 238221 - BLOWER COIL UNITS (15765)

## **INTRODUCTION:**

Manufacturers on this list fall into three categories:

**Preferred Manufacturer:** Listed manufacturer's product may be used on U-M projects. However, manufacturer's product must be listed as approved in the project's contract documents or specifications. Listing in the PML does not guarantee a product will automatically be listed in a project's documents or specifications.

**Conditional Approval:** Listed manufacturer's product may be used on select U-M projects, however approval from the respective A & E Technical Committee must first be obtained. If approved, it may be listed as approved in the project's contract documents or specifications. Manufacturers in the Conditional Approval category have gone through successful preliminary review, but Technical Committee requires additional in-service input prior to final category listing.

**Under Consideration:** Listed manufacturer's product is being evaluated. The product should not be included in U-M projects.

## **SECTION 211313 (15300) - WET-PIPE SPRINKLER SYSTEMS**

### **Preaction Systems**

Siemens (Pyrotronics), Notifier, Viking

### **Piping - Grooved**

Tyco Grinnell, Victaulic

### **Sprinkler Heads**

Reliable  
Tyco  
Viking  
Victaulic

### **Tamper Switches**

Grinnell, System Sensor, Victaulic

### **Valves - Fire Protection, Detector Check**

Grinnell  
Reliable  
Viking  
Victaulic  
Hersey-Anvil  
Ames

### **Valves - Fire Protection, Zone Control**

Grinnell  
Victaulic  
Milwaukee  
Nibco  
Stockham

## SECTION 213113 (15320) - FIRE PUMPS

### Pumps - Fire

Allis-Chalmers  
Aurora  
Peerless

## SECTION 220000 - UNDERGROUND PIPING IN CONDUIT SYSTEM

### Piping Systems - Underground

Perma-Pipe, Rovanco, Under Consideration: Urecon

## SECTION 220500 (15010) - COMMON WORK RESULTS FOR MECHANICAL

### Fasteners

Refer to UM Master Specification

### Fire Stopping

3M, Hilti, Tremco, Manville

### Roof Curbs

Pate  
Creative Metals  
Roof Curbs Engineered and Manufactured by the Manufacturer of the Equipment to be supported

## SECTION 220513 (15170) - MOTORS

### Motors - General, Premium Efficiency Type Only - 1/2 HP and above

Reliance, Baldor, Dayton, GE, Toshiba, Leeson, Marathon, U.S. Motors

## SECTION 220514 (15960) - VARIABLE FREQUENCY DRIVES

### Variable Frequency Drives (and variable speed controllers)

Danfoss-Graham, Toshiba, ABB

## SECTION 220516 (15125) - PIPE EXPANSION JOINTS

### Expansion Joints - Bellow Type

Flexonics, Metraflex, Microflex, Twin City Hose

### Expansion Joints - Externally Pressurized

Hyspan, ATS

## SECTION 220519 (15130) – THERMOMETERS, PRESSURE GAUGES, AND ACC'S

### Pressure Gauges

Dwyer, H.O. Treice, Weksler, Marsh, Ashcroft, Weiss, Miljoco

### Pressure & Temperature Plugs

Pete's Plug, Schrader, Sisco, Miljoco

### Thermometers

Industrial Glass: H. O. Treice, Weksler, Marsh, Ashcroft, Weiss, Miljoco  
Electronic Digital (light powered): Weiss, Techcontrols, Miljoco

## SECTION 220523 (15100)- VALVES

**Flow Measuring & Balancing Equipment - Manual Hydronic**

PSE Inc.  
ITT Bell & Gossett Circuit Setter  
Taco  
Ellison Annubar  
Accuset  
Armstrong  
T & A (part of Victaulic)  
Flow Design Inc

**Valves - Automatic Hydronic Regulating/Balancing**

Auto-Flow (press. indep.)  
Griswold (press. indep.)  
B & G (press. indep.)

**Valves - Manual Hydronic Regulating**

B & G  
T & A  
Armstrong  
Taco  
Flow Design

**Valves - Ball With Lever Handle**

Pegler  
Crane  
Grinnell

Watts  
Jomar  
Milwaukee  
American Valve  
Nibco  
Apollo  
Hammond

**Valves - High Performance Butterfly**

Bray  
Crane Flowseal  
Dezurik,  
Fisher Not specified in MS 220523  
Grinnell-GHP,  
Jamesbury  
Milwaukee  
Tri-Seal-Valve-Contromatics (formerly Watts/KF Contromatics)  
Xomox.

**Valves - Lubricated Plug**

Honestead, Milliken, Resun

**Valves - Gas (UL Approved)**

Pegler  
Jomar  
Watts  
Grinnell

Crane  
Milwaukee "Butter Ball" MS 15100 "Butter Ball" not specified.  
Nibco  
Hammond  
Jamesbury  
Apollo  
American Valve

**Valves - Gate**

Watts  
Crane  
Milwaukee  
Grinnell  
Stockham  
Nibco  
Hammond

**Valves - Swing Check**

Milwaukee  
Crane  
Grinnell  
Nibco

**Valves - Silent Check**

(except tunnels) Milwaukee, APCO, Mueller, Metraflex  
Utility tunnels:  
a. 2" and under: Check All  
b. over 2" - Durabula, stainless body

**Valves - City Water Main (Ann Arbor) (formerly OS&Y)**

Kennedy 4068  
Mueller A-2380  
East Jordan Series A  
Other valves specifically approved by the City of Ann Arbor for this application  
3 piece full port ball valve: Conbraco (rep. J.O. Galloup)

**SECTION 220533 (15128)– HEAT TRACING FOR PIPING**

**Heat Tracing**

Raychem, Thermon

**SECTION 220548 (15240) - VIBRATION CONTROL**

**Vibration Isolators**

Amber Booth, Korfund, Mason, Vibration Eliminator, Vibration Isolation Co.

**SECTION 220553 (15190)- MECHANICAL IDENTIFICATIONS**

**Pipe Markers**

Brady Co. (Signmark Div.), Brimer, Craftmark, Kolbi, MSI (Marking Services Inc.),  
Seton Name Plate

**SECTION 220719 (15250)- MECHANICAL SYSTEMS INSULATION**

**Insulation - Duct/Pipe/Equipment - Fiberglass**

Owens Corning  
Knauf  
Schullers (Johns Manville)  
Armstrong  
Pittsburg-Corning  
Certaineed  
Johns-Manville

**Insulation - Flexible/Elastomeric/Polyolefin**

AP Armaflex, IMCOA, Nomaco K-Flex, Rubatex

**Insulation - PVC Covering, Elbows and Fittings**

Proto  
Zeston  
Ceelco

**Insulation - Removable Jackets**

Q-Master by ESI  
Insulation Tech. Inc.

**SECTION 221113 (15060) - PIPING MATERIALS & METHODS**

**Grooved Joints for Copper and Steel Piping (except tunnels):**

Victaulic, Tyco Grinnell.

**Grooved Joints for Copper Piping In Tunnels:**

Victaulic Style 607

**Dielectric Fittings**

Refer to UM Master Specification

**Flexible Metal Hose Connectors (Stainless)**

Flex Hose Co., Flexonics, Mason, Metraflex  
Under Consideration: Twin City Hose

**Flexible Metal Hose Connectors (Copper)**

Anaconda, Flex Hose Co., Flexonics, Mason, Metraflex

**Flexible Connectors (Rubber)**

Flex Hose Co., Flexonics, Garlock, Mason, Mercer Rubber Co., Metraflex

**Pipe Hangers and Mechanical Supports**

Anvil, Cooper B-Line, Carpenter & Paterson, PHD Manufacturing, Unistrut,  
Powerstrut

**Thermal Hanger Shield Inserts**

Cooper B-Line, ERICO International Corp, Pipe Shields Inc., Rilco Manufacturing  
Company, Value Engineered Products, American Mechanical Insulation Sales

**Piping - Lab Waste and Vent (Polypropylene)**

Enfield, Orion, Zurn

**Strainers - Steam & Water**

Keckley  
Yarway  
Mueller  
Spirex-Sarco

Metraflex  
Watts  
Armstrong  
Victaulic (grooved water piping only)  
Tyco Grinnell (grooved water piping only)

**Valves - Safety Relief**

Spirax-Sarco  
Watts  
Leslie  
Anderson-Greenwood  
Conbraco  
Keckley

**SECTION 221119 (15411) - DOMESTIC WATER PIPING SPECIALITIES**

**Backflow Preventers**

Ames  
Conbraco  
Febco  
Watts  
Zurn-Wilkins

**Hydrants - Wall Type**

Woodford  
Zurn  
Chicago  
J.R. Smith

**Vacuum Breakers - Backflow Prevention**

Kewaunee  
Chicago Water Saver  
Bell & Gossett  
Watts  
Conbraco

**Valves - Water Pressure Regulating**

Bell & Gossett, Conbraco, Hoffman, Keckley, Leslie, Spirax Sarco, Watts

**Water Hammer Arrestors**

Zurn  
Watts  
Josam  
J.R. Smith  
Sioux Chief  
Wade

**SECTION 221319 (15420)- DRAINAGE SPECIALITIES**

**Drains - Roof, Floor and Trench, Grease Interceptors**

Josam  
J.R. Smith  
Zurn

Wade  
Watts  
Sioux Chief  
Under Consideration: MIFAB (V.E. Sales Co.)

### SECTION 221500 (15481) - COMPRESSED AIR ACCESSORIES

#### Air Compressors - Screw Type (1800 RPM)

Atlas - Copco  
Quincy QSI Series

#### Air Compressors - Reciprocating

Quincy  
Gast  
Devilbliss

#### Air Dryers and Related Filters

Wilkinson  
Zeks  
Van-Aire  
Hankison

#### Air Pressure Reducing Stations

Van-Aire  
Zeks  
Parker-Hannifin  
Fisher  
Siemens  
Wilkerson

### SECTION 223116 (15455) - WATER SOFTENER

#### Deionized Water and Reverse Osmosis Water Suppliers

Crown Solutions (Veolia)  
Siemens/U.S. Filter  
Ionpure  
Millipore

#### Water Treatment Equipment - Softeners

Crown Solutions (Veolia)  
Burmah / Venture (H.V. Burton)  
Bruner (K.L. McCoy)

#### Water Treatment Equipment

Refer to U-M Master Specifications

### SECTION 224200 (15440) - PLUMBING FIXTURES

#### Domestic Water Heaters - Gas Fired Or Electric

Lochinvar  
A.O. Smith  
State  
Rheem

Raypak  
Under Consideration: Copper Fin (Quality water & air)

**Emergency Shower And Eyewash**

Bradley, Haws, Speakman

**Faucets - Automatic, Battery and Electric Type**

American Standard, Chicago Faucets, Sloan, Zurn

**Faucets - Manual**

American Standard, Chicago Faucets, Moen

**Plumbing Fixtures - Water Closets, Lavatories, Urinals And Sinks**

Lavatories:

American Standard, Crane, Kohler, Sloan, Zurn

Urinals:

American Standard, Kohler, Sloan, Zurn

Water Closets:

American Standard, Crane, Kohler, Sloan

**Shower Heads**

American Standard, Chicago Faucet, Kohler, Speakman, Symmons

**Toilet Room Fixture Supports**

Josam , J.R. Smith, Wade, Watts, Zurn

**Toilet Seats**

Bemis, Centoco, Church

**Valves - Flush Including Automatic Flushing System**

Sloan, Kohler, Zurn

**Valves - Shower Control Valves**

American Standard, Chicago Faucet, Kohler, Powers, Speakman, Symmons

**Valves - Thermostatic Mixing for Handwashing**

Powers, Symmons, Wilkins

**Water Coolers**

Halsey Taylor, Haws, Oasis International

**Water Filters - Inline Type**

Cuno  
Filtrine  
Honeywell  
Culligan  
Dollinger  
Bruner

**SECTION 230000 - AIR COOLED CONDENSING UNITS**

**Air Cooled Condensers**

Bohn, Dunham Bush, McQuay, Trane, York

**Refrigeration Compressors**

Copeland, Dunham Bush, McQuay, Tecumseh, Trane, York

**SECTION 230000 - AIR COOLED PACKAGED CHILLERS**

**Chillers - Reciprocating, Air-Cooled**

Trane, York by Johnson Controls  
Under Consideration: Carrier.

**Chillers - Process Cooling**

Filtrine, Liebert, Trane, Neslab

**Refrigeration Compressors**

Tecumseh, Copeland, Trane, York, McQuay

**SECTION 230000 - DUCTLESS SPLIT ROOM AIR CONDITIONERS- AIR COOL**

**Air Conditioning Units - Ductless, Spot Coolers**

Daikin, Friedrich, Liebert, Mitsubishi, Sanyo, Trane

**SECTION 230000 - HEAT EXCHANGERS & CONVERTERS**

**Dry Coolers**

McQuay, Trane, York, Bohn

**Convertors (Shell & Tube) - Steam To Hot Water**

Bell & Gossett, Taco, Armstrong, Mueller

**Heat Exchanger - Plate & Frame**

Alpha-Laval, Armstrong, Bell & Gossett, Mueller, Tranter

**Laser Heat Exchangers - Water Cooled**

Haskris  
Remcor  
Neslab  
Laser Pure (Coherent)

**SECTION 230000 - HUMIDIFIERS**

Armstrong, Cemline, Dri-Steem, Herrmidifier, Nortec, Pure, Spirax-Sarco, Stulz

**SECTION 230000 – HVAC WATER TREATMENT**

**Chemical Service Providers**

Chemtreat  
Crown Solutions  
GE Water  
Kroff  
Mitco  
Nalco  
Rochester Midland

**HVAC Water Treatment Equipment**

Refer to U-M Master Specifications

**SECTION 230000 - MULTIMEDIA FILTRATION SYSTEM**

**Acceptable Manufacturers**

Crown Equipment Systems, PEP Filters, Everfilt

**SECTION 230000 - PACKAGED COMPUTER ROOM AIR CONDITIONING SYSTEM**

**Air Conditioning Units - Computer Room**

APC, Liebert, Stulz

**SECTION 230000 - PACKAGED HEAT TRANSFER UNITS**

Bell & Gossett

**SECTION 230000 - PACKAGED TERMINAL AIR CONDITIONERS, AIR-COOLED**

**Air Conditioning Units - Package Type (thru the wall self-contained DX)**

IslandAire, McQuay, Trane, York

**Air Conditioning Units - Window Type (Flush installation with wall exterior)**

Comfort-Aire, Fedders, White Westinghouse

**SECTION 230000 - STEAM ABSORPTION CHILLER**

**Chillers - Absorption**

Trane, York by Johnson Controls

**SECTION 230000 - STEAM CONDENSATE RETURN UNITS**

**Condensate Meters - Gravity Type - no longer used**

**Condensate Receiver**

ITT Domestic, Skidmore, Shipco, Spirax-Sarco

**Condensate Meters - Magnetic Induction**

Refer to U-M Master Specification 230900

**Pumps - Boiler Feed**

Skidmore, Spirax-Sarco, Shipco, Weinman

**Pumps - Condensate (Condensate Receiver Must Be Cast Iron)**

ITT Domestic (Hoffman), Skidmore, Spirax-Sarco, Shipco, Weinman

**Pumps - Condensate, Steam Or Air Pressure Powered**

Sarco, Armstrong

**SECTION 230000 - TERMINAL UNITS**

**Baseboard Radiation, Finned Tube Radiation**

Dunham-Bush, Rittling, Slantfin, Sterling Radiator, Trane, Vulcan Radiator

**Panel Radiators**

Jaga, Runtal Radiator, Sterling

**Convectors**

Dunham-Bush, Rittling, Sterling, Trane

**Unit Heaters**

Dunham-Bush, McQuay, Modine, Reznor, Rittling, Sterling, Trane, Wing

**Cabinet Heaters**

Dunham-Bush, McQuay, Modine, Rittling, Sterling, Trane

**Unit Ventilators**

American Air Filter, Trane

**Electric Cabinet Heaters**

Berko, Qmark, Trane

**Electric Heating Coils**

Brasch, Chromalux, Indeeco, Trane

**Gas Fired Duct Furnaces**

Modine, Reznor, Sterling, Trane

**Radiant Ceiling Panel - Hot Water**

Aero-Tech, Air-TEX, Sun-El, Sterling/TWA

**SECTION 230593 (15990) - TESTING, ADJUSTING AND BALANCING**

**TAB Sub-Contractors**

Absolut, Air Flow Testing, Enviroaire - Total Balance

**SECTION 230900 (15975)- MECHANICAL SYSTEMS CONTROLS**

Because of the extensive amount of control components, approved manufacturers are listed in U-M Master Specification 230900.

**SECTION 230910 (digital) , 230920 (15910- analog) - LABORATORY TERMINAL AIR FLOW UNITS & CONTROLS**

**Fume Hood Monitors**

Phoenix,

**Laboratory Terminal Airflow Units (LTAUs)**

Phoenix

**SECTION 230930 (15635) - REFRIGERANT DETECTION AND ALARM**

**Acceptable Manufacturers**

MSA Corporation

**SECTION 231123 (15488) – FACILITY NATURAL GAS PIPING**

**Master Gas Valve Boxes**

Ohmeda  
Mueller

**SECTION 232116 (15515) - HYDRONIC PIPING SPECIALTIES**

**Automatic & Manual Air Vents**

Armstrong, B & G, Hoffman, Wheatley, Taco

**Suction Diffusers**

Armstrong, B & G, Grinnell, Taco, Victaulic, Wheatley

**Triple Duty Valves**

Armstrong, B & G, Taco, Wheatley

**Water Pressure Relief Valve**

ITT B & G, ITT McDonnell Miller, Consolidated, Watts

**Water Pressure Regulating/Reducing Valve**

B & G, Hoffman, Watts

**Air Separators**

Amtrol, Armstrong, B & G, Spirotherm, Wheatley

**Coalescing Separator**

Spirotherm (Spirovent Dirt HV)

**Expansion Tank**

Amtrol, Armstrong, Bell and Gossett, Wessels, Taco CA

**Centrifugal Separator**

Griswold Controls, Lakos

**In-Line Filters**

Bruner, Culligan, Cumo Dollinger, Honeywell

**Glycol Feed Packages**

Advantage Control Inc., Burmah, Crown Engineering, J.L. Wingert Co., Neptune Chemical Pump Co., Wessel Co.

**Inhibited Ethylene Glycol**

Dowtherm SR-1

**SECTION 232123 (15160) – PLUMBING AND HYDRONIC PUMPS**

**Pumps - Condensate Waste**

Little Giant, Hartell, Marsh, Bekette

**Pumps - Double Suction - Base Mounted**

Bell & Gossett (ITT), Allis-Chalmers, Weinman, Armstrong, Paco

**Pumps - End Suction , Close Coupled - Base Mounted**

Bell & Gossett (ITT), Allis-Chalmers, Weinman, Armstrong, Taco

**Pumps - End Suction , Flexibly Coupled - Base Mounted**

Bell & Gossett (ITT), Allis-Chalmers, Weinman, Armstrong, Taco

**Pumps - In-Line Circulators**

Bell & Gossett (ITT), Armstrong, Grundfos, Weinman, Taco

**Pumps - In-Line Close Coupled - Hanger Supported**

Bell & Gossett (ITT) Series 60, Grundfos, Armstrong, Weinman, Taco 1600

**Pumps - In-Line Split Coupled - Base Mounted**

Bell & Gossett (ITT) Series 80-SC, Grundfos, Armstrong, Weinman, Taco KS Vertical Split Coupled

**Pumps - Sump Pumps**

Vertiflo (B&G), Allis Chalmers, Weinman, Armstrong, Zoller, Weil  
Under Consideration: Aurora / Hydromatic (K.L. McCoy)

**Pumps - Vacuum**

Nash  
Domestic  
Sehi

Shipco

Under Consideration: Skidmore (K.L.McCoy), Busch (Kerr pump & supply)

### SECTION 232216 (15525) - STEAM AND CONDENSATE PIPING SPECIALTIES

#### Steam Pressure Reducing Stations

Armstrong, Jordan, Leslie, Spence, Spirax-Sarco, Watts Anderson-Greenwood

#### Steam Traps - All Types

Armstrong, Spirax Sarco, Hoffman (ITT), Watson McDaniels

#### Flash Tank, Vacuum Breaker, Drip Pan Elbow, Pressure Reducing Valve

Refer to U-M Master Specification

### SECTION 232300 (15530)- REFRIGERANT PIPING

#### Valves - Refrigeration

Asco, Hansen, Henry Valve, Parker, Sporlan

### SECTION 232519 (15188)- STEAM BOILER CHEMICAL WATER TREATMENT

Refer to master specification 232519

Seton

### SECTION 233100 (15890) - HVAC DUCTS & CASINGS

#### Exhaust Ductwork - PVC Coated

United McGill, Tangent, Foremost, Semco

#### Exhaust Ductwork - Teflon Coated Stainless Steel

Fab-Tech (PermaShield Pipe)

#### Exhaust Ductwork - FRP

Perry, Spunstrand, Tangent

#### Flexible Non-Metallic Duct

Atco (Flex-Aire), Flexmaster, Hart & Cooley (Genflex)

#### Double-Walled Panels, Plenums, and Duct at Outside Air Intake Plenums

McGill Airflow LLC., Semco Mfg Co., VAW Systems, Vibro-Acoustics

#### Clothes Dryer Vent Ductwork

Intended for heavy use clothes dryer applications such as resident hall laundry rooms with multiple dryers where access to disassemble duct for periodic cleaning may be challenging. For simple dryer applications, specifying conventional duct may be more appropriate.

Nordfab Quick-Fit/ACS of Fenton, Missouri

#### Duct Sealants

Hardcast, McGill Airflow LLC. , Polymer Adhesives, Ductmate, Childers/Foster

### SECTION 233300 (15895)- AIR DUCT ACCESSORIES & RGDS

#### Duct Flexible Connectors

Ductmate, Duro-Dyne, Fanair, Pathway, United McGill, Ventglas

#### Dampers - Fire, Smoke, Combination Fire/Smoke

Air Balance, American Warming & Vent, Greenheck, Nailor, Ruskin, Vent Products

**Dampers - Balance (manual volume control)**

American Warming & Vent, Arrow, Flexmaster (for round ducts, single branch takeoff only), Ruskin, Greenheck, Krueger, Vent Products, Young Regulator

**Dampers - Iris**

Continental Fan Manufacturing Inc.

**Dampers - Backdraft**

Young Regulator Company.  
American Warming & Ventilating Co.  
Vent Products Co., Inc.  
Arrow United Industries.

**Sound Attenuators**

IAC, Semco, Ruskin, United McGill, VAW Systems, Vibro-Acoustics, Price

**Registers, Grilles and Diffusers**

Carnes, E.H. Price, Krueger, MetalAire, Nailor, Titus, Tuttle & Bailey

**Louvers**

American W. & V., Ruskin, Vent Products

**Ductwork Cleaning Specialist**

Sani-Vac, Power Vac, High Tec Vacuum, Aero Filters Inc., Stanley Steamer Great Lakes Inc.

**SECTION 233400 (15870)- FANS**

**Fans: All types except Vane and Tube Axial, FRP, High-Plume Induction Lab Type**

Aerovent, Acme, Barry Blower, Buffalo, Carnes, Greenheck, Loren Cook, Penn, Trane, Twin City

**Fans - High-Plume Induction-Type Lab Exhaust**

Greenheck - Vektor , Strobic,

**Fans -FRP Construction**

M.K. Plastics  
Under Consideration: Harrington

**Fans -Vaneaxial, TubeAxial**

Buffalo, Cook, Greenheck, Joy, Trane, Woods

**SECTION 233600 (15896)- AIR TERMINAL UNITS**

**VAV, CAV, Dual Duct, and Retrofit Terminal Air Flow Units**

Carnes, Titus, Krueger, Metalaire, Nailor Industries, Inc., Price Industries, Tuttle and Bailey

**SECTION 234000 (15885)- HVAC AIR CLEANING DEVICES**

**Primary Filters, Secondary Filters and Filter Housing Rack**

American Air Filter, Camfarr, Eaton, Flanders, Purolator, Tri-Dim

**HEPA Filters**

Camfarr, Eaton, Flanders

**Gas Adsorption Filters**

American Air Filter, Camfarr, Charcoal Service Corp., Flanders, Purolator

**Filter Gauges**

Bacharach Instrument Co., Deiterich Standard Corp., Dwyer, Moeller Instrument Co.

**SECTION 235100 (15575)- BREECHINGS, CHIMNEYS, AND STACKS**

**Boiler Stack**

Metalbestos, Metal-Fab, Van Packer, Schebler, AMP Co

**SECTION 235240 (15558)- FIRE TUBE BOILERS (STEAM)**

**Boilers**

Bryan, Unilux, Burnham, Cleaver Brooks, Johnston

**SECTION 236416 - CENTRIFUGAL WATER CHILLERS**

**Chillers - Centrifugal**

Trane, York by Johnson Controls

**Chillers - Screw or Scroll**

Dunham-Bush  
York by Johnson Controls  
Trane

**SECTION 236500 (15710)- COOLING TOWERS**

**Cooling Towers**

Baltimore Air Coil, Marley, EVAPCO

**SECTION 237213 - ROTARY AIR TO AIR ENERGY RECOVERY WHEELS**

Semco, Desicant Rotors International

**SECTION 237323 (15854) - CUSTOM AIR HANDLING UNITS**

**Air Handlers**

Air Enterprises, Air Flow Equipment, Buffalo Air Handling, Governair LLC,  
Mafna Air Conditioning, Inc., TMI Custom Air Systems, Ventrol.

**Air Blenders**

Blender Products Inc., R.M. Products

**Gas Fired Make-Up Air Units (direct and indirect)**

Rapid, Reznor, Sterling, Trane  
Under Consideration: Modine (Air Design), Greenheck

**SECTION 237324 (15855) - SEMI-CUSTOM AIR HANDLING UNITS**

**Air Handlers**

Air Flow Equipment, Buffalo Air Handling, Governair LLC,  
Mafna Air Conditioning, Inc., McQuay, Thermal Corporation,

TMI Custom Air Systems, Trane, Ventrol

**Air Blenders**

Blender Products Inc., R.M. Products

**SECTION 238216 (15820) - COILS AND DRAIN PANS**

Aerofin, Heatcraft, Marlo, McQuay, Trane, USA Coil, Ventrol, York, Coil Replacement Co

**SECTION 238219 (15763)- FLOOR MOUNTED FAN COIL UNITS (UN-DUCTED)**

Airtherm, Enviro-Tec by Johnson Controls, International Environmental Corporation, Zehnder Rittling

**SECTION 238220 (15764) - HORIZONTAL FAN COIL UNITS**

Airtherm, Enviro-Tec by Johnson Controls, International Environmental Corporation, Mcquay International, Price, Trane, Zehnder Rittling

**SECTION 238221 (15765) - BLOWER COIL UNITS**

Airtherm, Enviro-Tec by Johnson Controls, International Environmental Corporation, Mcquay International, Price, Trane

**DESIGN GUIDELINE 8.4**  
**ELECTRICAL PREFERRED MANUFACTURERS LIST**

**SCOPE**

The Electrical Trades Preferred Manufacturers List identifies manufacturers and suppliers who are known to provide good quality products, meet specification and schedule requirements, provide technical support, and provide service after the sales. This list is intended to regulate product quality, standardize electrical designs, and simplify maintenance activities. It is not intended to limit competition. It is not all inclusive. It is a list of manufacturers whose products are well known to the University due to their frequent and successful use.

This List shall be used by A/E's when selecting manufacturers for specification in electrical designs. **A/E'S SHALL SPECIFY ONLY THE LISTED MANUFACTURERS THAT MEET THEIR PROJECT'S REQUIREMENTS, AND SHOULD SPECIFY A MINIMUM OF THREE MANUFACTURERS WHENEVER POSSIBLE.** A/E's may specify manufacturers not on this list to satisfy project requirements, **BUT SHALL OBTAIN UNIVERSITY APPROVAL IN ADVANCE.**

This List **SHALL NOT** be used by Contractors to justify making substitutions for products specified in the construction documents. **CONTRACTORS SHALL PROVIDE THE PRODUCTS SPECIFIED IN THE CONSTRUCTION DOCUMENTS UNLESS THE UNIVERSITY APPROVED THEIR PROPOSED SUBSTITUTIONS AT THE TIME OF BID IN ACCORDANCE WITH THE PROJECT'S STANDARD GENERAL CONDITIONS.**

**THIS LIST DOES NOT APPLY** to purchases by the University Plant Department of replacement electrical products required to match or maintain existing installations.

This List is revised as needed. Before using it, check the AEC Website for the latest revision.

## **SECTION 260513 - MEDIUM, LOW & CONTROL VOLTAGE CABLES**

### **Cables (Medium Voltage)**

General Cable  
Kerite  
Okonite  
Prysmian

### **Cables and Wire (600 Volts)**

Alan Wire  
Alan Wire and Cable  
American Insulated Wire  
Cerro Wire  
Encore  
General Cable  
Republic Wire  
Rockbestos-Surprenant  
Service Wire  
Southwire  
United Copper Industries

### **Type MC Cables (600 Volts)**

AFC  
Encore  
Kaf-Tech  
Rockbestos-Surprenant  
Service Wire  
Southwire  
United Copper Industries

### **2-Hour Fire Rated Cables (600 Volts)**

Pyrotenax Mineral Insulated (Type MI) by Pentair

### **Control Cables and Wire**

Belden  
Coleman

### **Cable Splices for Medium Voltage Cable**

Raychem

### **Cable Terminations for Medium Voltage Cable**

Raychem

## **SECTION 260526 - GROUNDING & BONDING FOR ELECTRICAL**

### **Ground Connections**

Burndy Hyground (Proper dies must be used)  
Cadweld  
Thermoweld  
Thomas & Betts Blackburn (Above grade only)

## **SECTION 260533 - ELECTRICAL MATERIALS AND METHODS**

**Cable Trays - Center Spline and Wall Mount Types (Use only where ladder and wire basket trays cannot be used, and only with ITCS (Campus projects) or MCIT (UMHHC projects) approval)**

B-Line  
Legrand/Wiremold  
Mono-Systems  
Thomas & Betts

### **Cable Trays - Ladder Type**

B-Line  
Chalfant  
Cope  
Globetrax (GS Metals)  
Husky  
Legrand Cablofil  
Mono-Systems  
Thomas & Betts

**Cable Trays – Wire Basket Type (Use only with ITCS (Campus projects) or MCIT (UMHHC projects) approval)**

B-Line  
Chalfant  
Legrand Cablofil EZTray  
Mono-Systems

### **Conduits, Raceways and Accessories -**

**EMT, liquid-tight flexible metallic conduit, and/or non-liquid-tight flexible metallic conduit/raceway; plus associated accessories, fittings, junction and pull boxes, and related products**

Products of all manufacturers are acceptable as long as they are electro-galvanized steel, have a smooth interior, and are NRTL labeled for the application.

**Rigid (galvanized metal), and IMC (intermediate metal) conduits/raceway, plus associated accessories, fittings, junction and pull boxes, and related products**

Products of all manufacturers are acceptable, as long as they are hot-dipped galvanized steel inside and out, have a smooth interior, and are NRTL labeled for the application. Boxes shall be cast, not formed. IMC may only be used when tools specifically designed for IMC are used.

**PVC conduit/raceway (Type DB, Schedule 40, and Schedule 80), plus associated accessories, fittings, junction and pull boxes, and related products**

Products of all manufacturers are acceptable as long as they are sunlight resistant, and NRTL labeled for the application. Products from manufacturers making both the conduit and the fittings are preferred whenever possible.

**Fiberglass Reinforced Epoxy (FRE) conduit/raceways, accessories, fittings, and related products**

Champion  
FRE

### **Cord Reels**

Appleton  
Hubbell  
Reel-O-Matic Systems  
Woodhead

**Electrical Enclosures**

Carlson (For use with PVC raceways)  
Hammond  
Hauffman  
Park Metal  
Rittal

**Fire Stop Compounds**

A. D. Fire Protection Systems  
Flame Safe  
Hilti  
Nelson  
STI SpecSeal  
3M Company

**Structural Support Materials**

Aickinstrut (Fiberglass)  
B-Line  
Champion (Fiberglass)  
Hilti  
Powerstrut  
Unistrut

**Surface and Underfloor Wireways**

Carlson  
Hubbell  
Legrand Evolution Floor Boxes  
Legrand (Wiremold)  
Panduit

**SECTION 260543 - UNDERGROUND SERVICES FOR ELECTRICAL****Underground Hand Holes, Junction Boxes and Pull Boxes**

Carson-Brooks  
CDR Systems  
Quazite

**SECTION 260800 - ELECTRICAL ACCEPTANCE TESTS****Nationally Recognized Testing Laboratory Services**

CSA  
ETL  
MET Laboratories  
UL (Northbrook, IL)

**Testing Services**

Bisbee Infrared Services (Penny Wilson, (517) 787-4620)  
Northern Electrical Testing (Lyle Detterman, (810) 689-8980)  
Utilities Instrumentation Services (David Wheeler, (734) 482-1450)

## **SECTION 261100 - UNIT SUBSTATIONS**

### **Non-Current Limiting Fuses (Primary)**

Eaton/Cutler-Hammer Type RBA-400 (With high interrupting capacity adapter)  
S & C Type SM-5SS (With high interrupting capacity adapter)

### **Current Limiting Fuses (Primary)**

Eaton/Cutler-Hammer Type CLE  
Ferraz-Shawmut, Type CL-14  
General Electric Type EJO

### **KWHR/Demand Meters**

Power Measurement Limited (PML) 7330 ION (With options per Master Spec 16313)

### **15 kV Fused and Unfused Primary Switches (5kV rated switches may only be used for 5 kV (4,160 volt) class motors)**

Eaton/Cutler-Hammer  
Powercon  
Square D

### **15kV Metal Clad Switchgear and/or Circuit Breakers (5kv rated circuit breakers may only be used for 5 kV (4,160 volt) class motors)**

Eaton/Cutler-Hammer  
General Electric  
Square D

### **Circuit Breakers for 600-volt Class Secondary Switchgears and Switchboards**

Asea Brown Boveri  
Eaton/Cutler-Hammer  
General Electric  
Square D

### **Transformers**

Asea Brown Boveri  
Eaton/Cutler-Hammer  
General Electric  
MGM  
Olsun  
Square D

**Substation Assemblers (Using components from Preferred Manufacturers only)**

Controlled Power Corporation  
Eaton/Cutler-Hammer  
Electrical Product Sales  
General Electric  
Park Metal  
Pederson Power Products  
Powercon  
Shallbetter  
Square D

**Addresses of above Assemblers**

Controlled Power Corporation  
295 Wetmore Ave SE  
Massillon, Ohio 44646  
Phone: 800 321 0414  
FAX: 330 834 3201

Eaton/Cutler-Hammer  
McNaughton-McKay Electric Co.  
4670 Runway Blvd, Ann Arbor, MI 48108  
Phone: 734-327-6251  
Fax: 734-327-6285

Eaton/Cutler-Hammer

## **SECTION 262000 - LOW VOLTAGE ELECTRICAL DISTRIBUTION**

### **Bus Ducts**

Eaton/Cutler-Hammer  
General Electric  
Siemens  
Square D

### **Fuses (600 Volts and Below)**

Bussmann  
Ferraz-Shawmut  
Littlefuse

### **Surge Protective Devices**

Current Technology  
Eaton/Cutler-Hammer-Tycor  
Intermatic (For protection of individual loads and receptacle panels only)  
Leviton (For protection of individual loads and receptacle panels only)  
Liebert  
L.E.A. Dynatech  
Square D

### **Switchboards, Panelboards and Circuit Breakers**

Eaton/Cutler-Hammer (Only with U of M Lugs - confirm on shop drawings)  
General Electric  
Industrial Electrical Manufacturing (For custom and retrofit applications only)  
Siemens  
Square D

**Time Switches**

Intermatic  
Paragon  
Sangamo  
Tork

**Transformers (Liquid Filled and Dry Pad-Mounted Type)**

Eaton/Cutler-Hammer  
General Electric  
Olsun Electric  
Pennsylvania  
Pioneer

**Transformers (Distribution Dry Type)**

Acme  
Eaton/Cutler-Hammer  
General Electric  
Hammond Power Systems  
Hevi-Duty  
MGM  
Olsun Electric  
Siemens  
Square D

**SECTION 262726 - WIRING DEVICES****Dimmer Switches**

Leviton  
Lithonia  
Lutron

**Occupancy Sensors (Infrared, Ultrasonic, Combination Infrared/Microphonic Dual Technology and Combination Infrared/Ultrasonic Dual Technology)**

Hubbell  
Leviton  
Lutron  
Sensor Switch  
Tork  
Watt Stopper

**Pin & Sleeve Connectors**

Crouse-Hinds  
Hubbell  
Killark  
Leviton  
Pass & Seymour

**Power Poles**

Hubbell  
Mono-Systems  
Steelcase  
Wiremold

### **120-volt, 20-ampere Receptacles and Plugs**

Arrow Hart (Cooper)  
Bryant  
Hubbell  
Leviton  
Pass & Seymour

### **120-volt, 20-ampere Receptacles (GFCI, Hospital Grade, TVSS & Child Resistant)**

Arrow Hart (Cooper)  
Bryant  
Hubbell  
Leviton  
Pass & Seymour

### **Special Power Receptacles and Plugs**

Arrow Hart (Cooper)  
Bryant  
Hubbell  
Leviton  
Pass & Seymour

### **USB Charging Port Receptacles**

Leviton

### **120/277 Volt, 20-Ampere Light Switches**

Arrow Hart (Cooper)  
Bryant  
Hubbell  
Leviton  
Pass & Seymour

## **SECTION 262900 - MOTOR CONTROLS**

### **Capacitors for Power Factor Correction**

Aerovox  
Eaton/Cutler-Hammer  
General Electric  
Myron Zucker  
Siemens  
Square D

### **Motor Controls (MCC's, Starters, Contactors, Disc. Switches and Control Devices)**

Allen-Bradley  
Eaton/Cutler-Hammer  
General Electric  
Siemens  
Square D

### **Motor Starters (Electronic Soft Starter Type)**

Allen-Bradley  
Eaton/Cutlet-Hammer  
Sprecher & Schuh

## **SECTION 263000 - ENGINE-GENERATOR SYSTEMS**

### **Natural Gas Fired Engine-Generator Sets (Only those which require inlet gas pressures of 14 inches of water column or less)**

Caterpillar  
Cummins  
Generac Industrial Power (up through 300 kW)  
Kohler  
Olympian

### **Automatic and Manual Transfer Switches (Open and Closed Transition Types)**

ASCO  
Cummins  
Eaton/Cutler-Hammer  
GE Zenith Controls  
Kohler

### **Automatic Transfer Switches (Soft-Loading Type)**

ASCO  
Eaton/Cutler-Hammer  
Kohler

### **Resistive Load Banks**

Avtron  
Sephco  
Simplex

## **SECTION 263300 - BATTERY EQUIPMENT**

### **Batteries**

C & D Technologies  
Chloride Plante  
Energys  
Johnson Controls

### **Battery Chargers**

C & D Technologies  
Energys  
Hi-Tran  
LaMarche  
SCI

### **Uninterruptible Power Supply Systems (Battery type)**

A.P.C  
Best (Individual small load units only)  
Controlled Power  
Liebert  
MGE  
Mitsubishi (Totally solid-state)  
Toshiba

### **Rotary UPS Systems**

Designed Power Solutions International (DPSI)

## **SECTION 264100 - FACILITY LIGHTNING PROTECTION**

### **Lightning Protection Services**

Guardian Equipment, Novi, MI (248) 449-5200  
Michigan Lightning Protection, Grand Rapids, MI (616) 453-1174  
Orion Services, Wixom, MI (248) 624-2120  
Sleeping Bear Lightning Protection, Maple City, MI (231) 228-4112

## **SECTION 265100 - INTERIOR LIGHTING**

### **Ballasts (Electronic Compact Fluorescent)**

Aculite  
Advance Smart Mate  
Lightolier  
Prescolite

### **Ballasts (Electronic Rapid Start T-8 Fluorescent)**

Advance Optanium  
Bodine (For emergency lighting only)  
Osram/Sylvania Quicktronic Professional  
Universal AccuStart

### **Ballasts (Electronic Dimming T-8 Fluorescent)**

Advance Mark X (5% dimming type)  
Lightolier (1% dimming type)  
Osram/Sylvania (10% dimming type)

### **Emergency Power Ballasts (Electronic Rapid Start T-8 Fluorescent)**

Bodine (For emergency lighting only)  
Lithonia

### **Ballasts (H.I.D.)**

Advance  
MagneTek  
Universal

### **Dimming Systems**

AMX  
Crestron Electric, Inc.  
E.T.C.  
Leviton (Small single room systems only)  
Lithonia  
Lutron  
Strand (Stage lighting only)

### **Emergency Lights**

Chloride  
Dual-Lite  
Emergi-Lite  
Exide Lightguard  
Lightalarms  
Lithonia  
Sure-Lite

**Exit Signs (LED)**

Chloride  
Dual-Lite  
Emergi-Lite  
Exide Lightguard  
Lightalarms  
Lithonia  
LSI Industries  
Morlite (High abuse areas) (Philips)  
Prescolite  
Sure-Lites

**Lamps**

General Electric Ecolux  
Osram/Sylvania Ecologic  
Philips Alto  
Venture (H.I.D. only)

**Lighting Fixtures (Fluorescent)**

Alkco (Philips)	Kenall
Bartco	Kirlin
Columbia	Lightolier (Philips)
Cooper (Metalux)	Linear Lighting
Day-Brite (Philips)	Lithonia (Acuity)
Fail-Safe (Cooper)	LSI Industries
Finelite	Peerless (Acuity)
Focal Point	Prudential
Guth (Philips)	Quality (Philips)
Harris	Visa
Holophane (Acuity)	Williams
Hubbell	Zumtobel
Keene	

**Lighting Fixtures (H.I.D.)**

Best	Kenall
Crouse-Hinds (Cooper)	Lightolier (Philips)
Day-Brite (Philips)	Lithonia (Acuity)
Fail-safe (Cooper)	LSI Industries
General Electric	Lumark (Cooper)
Guth (Philips)	McGill
Harris	Quality (Philips)
Holophane	SPI
Hubbell	

**Lighting Fixtures (Compact Fluorescent and Incandescent)**

Globe	Lithonia (Acuity)
Gotham (Acuity)	LSI Industries
Halo	Omega (Philips)
Harris	Prescolite (Hubbell)
Kenall	Quality (Philips)
Kirlin	Swivelier
Lightolier (Philips)	

**Lighting Fixtures (LED) (To Be Updated Every June 1 and December 1)**

CREE

Man-D-Tec (Elevator cab and space lighting)

**SECTION 265600 - EXTERIOR LIGHTING**

**Lighting Fixtures (Outdoor Building, Parking Lot and Roadway with poles by fixture supplier)**

BEGA (Conditional Approval)

Gardco

Holophane

Kim (Hubbell) (Conditional Approval)

Lithonia Hi-Tek

LSI Industries

McGraw-Edison

Sterner

Wide-Lite (Philips)

**Lighting Fixtures (Outdoor Pedestrian Area with poles by fixture supplier)**

Lumec

**Photoelectric Lighting Controls**

Crouse-Hinds

Holophane

Hubbell

Intermatic

Tork

**SECTION 274000 - AUDIO-VIDEO SYSTEMS**

**Wireless Microphone Systems**

Shure

**SECTION 275116 - PUBLIC ADDRESS & MASS NOTIFICATION SYSTEMS**

**Public Announcement and Sound Systems**

Aiphone Communications Systems

Atlas/Soundolier

Dukane

Rauland-Borg

**SECTION 275126 - ASSISTIVE LISTENING SYSTEM**

**Hearing Assistance Systems**

Phonic Ear (for classroom applications)

Sound Associates (for auditorium and theater applications)

**SECTION 275313 - CLOCK SYSTEMS**

**Central Clock Systems**

Primex (GPS synchronous wireless)

Simplex Time Recorder (through Simplex/Grinnell)

**Clocks (Battery Powered)**

Edwards

Franklin

Howard Miller

Primex (GPS synchronous wireless)

## **SECTION 281300 - ACCESS CONTROL & MONITORING SYSTEMS**

### **Card Access Control Systems**

Diebold/CBORD (for Housing facilities)  
Software House (for Campus buildings)

### **Card Access Control System Designers/Installers**

Cabling Concepts (Tim Grady, 248 363-4200)  
Electronic Security Systems, Inc. (Steven Maniaci, 586 756-8400)  
Johnson Controls  
Siemens (Mike Atzenhofer, 734 456-3800)  
Simplex/Grinnell (John Keith, 248 427-5050)  
TTI (John Rademaker, 586 864-1110)

## **SECTION 281600 - SECURITY SYSTEMS**

### **Closed Circuit TV Systems**

Diamond Electric  
Panasonic  
Sensormatic  
Vicon Industries

### **Security Systems**

ADT Security Systems  
Faraday  
Radionics (For small systems only)  
Simplex Time Recorder

## **SECTION 283100 - FIRE DETECTION & ALARM SYSTEMS**

### **Fire Alarm Systems**

EST (through Riverside Fire and Security only)  
Honeywell (UMHHC only)  
Simplex Time Recorder (through Simplex/Grinnell)  
Vesda (For smoke sampling systems only)

**FIGURE 1****FIGURE 2****INSTALLATION NOTES**

1. INSTALL FOUNDATION BOLTS IN NEW CONCRETE HOUSEKEEPING PAD (SEE FIGURE 1).
2. PLACE PUMP ON HOUSEKEEPING PAD SUPPORTING IT WITH SHIMS TOTALING 1" IN THICKNESS. SHIMS SHOULD BE PUT ON BOTH SIDES OF EACH ANCHOR BOLT AS A MEANS OF LEVELING THE BASE. (SEE FIGURE 2)
3. AFTER PUMP HAS BEEN LEVELED, SECURELY BOLTED TO FLOOR AND PROPERLY ALIGN PER SPECIFICATION. NON-SHRINKING GROUT IS TO BE POURED INTO PUMP BASE. TO HOLD SHIMS IN PLACE ALLOW THE GROUT TO FLOW AROUND THEM. (SEE FIGURE 2).

**DESIGNER NOTES (DELETE FROM CONTRACT DRAWINGS)**

- A. FOR A CONDENSER WATER SYSTEM WITH MULTIPLE CHILLERS AND CONDENSER WATER PUMPS, EACH SUPPLY PIPE BETWEEN THE PUMPS AND THE CHILLERS REQUIRES A TAP WITH A BALL VALVE AND CHECK VALVE.
- B. THE COOLING TOWER DRAIN AND OVERFLOW DRAIN SHOULD BE CONNECTED BEFORE THE BLOWDOWN METER.
- C. IF THE CONDENSER WATER SYSTEM INCLUDES A CENTRIFUGAL OR COALESCING SEPARATOR, THE BLOWDOWN CONNECTION SHOULD BE FROM THE SEPARATOR DRAIN TO PROVIDE PERIODIC SOLIDS BLOWDOWN.
- D. PROVIDE LOCKABLE 120V SWITCH LOCATED AT/NEAR CITY WATER MAG METERS.
- E. PROVIDE 110V DEDICATED CIRCUIT FOR CHEMICAL PANEL AND CITY BLOWDOWN MAG METER.
- F. CONTROL DRAWINGS SHOWN SHOULD BE INCLUDED WITH CONTROL DRAWING SHEETS.
- G. REFER TO SCHEDULE BELOW FOR REQUIRED BLOWDOWN PIPE SIZES. INDICATE PIPE SIZES ON PROJECT DRAWINGS.

**SCHEDULE**

SYSTEM TONS	PIPE SIZE
<500	3/4"
1000	1"
1500	1 1/2"
2000	1 1/2"
>2000	2"

**SEQUENCE**

- DDC MONITORS GENERAL FAULT ALARM AND WATER CONDUCTIVITY.

## PHOENIX LAB DDC ARCHITECTURE

## SIEMENS LAB DDC ARCHITECTURE

### LAB DDC ARCHITECTURE AND SCOPE OF WORK

1. GENERIC DDC ARCHITECTURE IS IDENTIFIED FOR CONNECTION BETWEEN LAN/ALN AND UM BAS. SEE PROJECT SPECIFIC LABORATORY AIRFLOW CONTROLS DIAGRAMS FOR REQUIREMENTS WITHIN EACH LABORATORY.
2. SEE MASTER SPECIFICATION 230910 LABORATORY AIRFLOW CONTROL-DDC FOR ADDITIONAL INFORMATION.

## TYPICAL LAB DDC ARCHITECTURE

NO SCALE

IN ALL CASES, HIGHEST POINT OF ΔP TRANSMITTER PIPING SHALL INCLUDE MANUAL AIR VENTS (TYPICAL)

ALL FITTINGS FROM THIS POINT, AFTER SHUT-OFF VALVE, TO BE COMPRESSION TYPE. INSULATE FIRST 12" OF EACH TAP WITH 1/2" ARMAFLEX INSULATION.

- NOTES: 1. ALL PIPING SIZE IS 3/8" DIAMETER MINIMUM.  
 2. ALL INSTRUMENTATION PIPING TO BE FURNISHED AND INSTALLED BY CONTROLS CONTRACTOR

## FIRE SERVICE SYSTEM DETAIL

NO SCALE

D 15300 001 01 14.dgn

DESIGNER'S NOTE: REVISE NOTE ① AND ⑤ SPECIFY A RPZ OR A DOUBLE CHECK ASSEMBLY, AS REQUIRED BY THE CITY OF ANN ARBOR BASED ON THE BUILDING HAZARD LEVEL.

**NOTE:**  
 DETAIL DOES NOT SHOW ALL  
 REQUIRED COMPONENTS.  
 PROVIDE ALL PIPING AND  
 COMPONENTS REQUIRED BY  
 NFPA STANDARDS.

- ① OS&Y GATE VALVE
- ② BALL VALVE
- ③ CHECK VALVE
- ④ FIRE PUMP
- ⑤ JOCKEY PUMP
- ⑥ PRESSURE GAUGE
- ⑦ INDICATING BUTTERFLY OR OS&Y GATE VALVE
- ⑧ TEST HEADER CONNECTION HOSE VALVE MANIFOLD ASSEMBLY
- ⑨ AUTOMATIC BALL DRIP AT LOW POINT

## FIRE PUMP SYSTEM DETAIL

NO SCALE (GENERAL ARRANGEMENT)

- ① U.L. APPROVED DOUBLE CHECK DETECTOR ASSEMBLY OR REDUCED PRESSURE ZONE DETECTOR ASSEMBLY, AS REQUIRED BY CITY OF ANN ARBOR. PROVIDE WITH OS&Y GATE VALVES.
- ② HIGH PERFORMANCE BUTTERFLY VALVE
- ③ WATER METER (OBTAINED FROM CITY OF ANN ARBOR, INSTALLED BY CONTRACTOR)
- ④ PRESSURE GAUGE AND BALL VALVE
- ⑤ REMOTE READOUT (OBTAINED FROM CITY OF ANN ARBOR, INSTALLED BY CONTRACTOR)

- ⑥ 1/2" EMT CONDUIT WITH 3 WIRE PHONE CABLE. CABLE FURNISHED BY CITY OF ANN ARBOR. CONTRACTOR SHALL FURNISH AND INSTALL CONDUIT AND INSTALL CABLE. CONTACT CITY FOR MAX. CABLE LENGTH.
- ⑦ TERMINATION OF DUCTILE IRON PIPE SHALL BE THREADED AND EQUIPPED WITH SCREW-ON MACHINE TIGHTENED, DUCTILE IRON FLANGE COMPLYING WITH ANSI/AWWA C110 AND C115.
- ⑧ PROVIDE ALL CONNECTIONS, VALVES AND FITTINGS REQUIRED TO PROPERLY TEST THE BACKFLOW PREVENTION DEVICE.

## DOMESTIC WATER SERVICE SYSTEM DETAIL

NO SCALE

DESIGNER'S NOTE: REVISE NOTE ① TO SPECIFY A RPZ OR A DOUBLE CHECK ASSEMBLY, AS REQUIRED BY THE CITY OF ANN ARBOR BASED ON THE BUILDING HAZARD LEVEL.

ALUMINUM WIRE TERMINATION  
TO DRILLED BUS

ALUMINUM WIRE TERMINATION  
TO MECHANICAL CLAMP CONNECTOR

**NOTES:**

1. ALUMINUM WIRES SHALL BE TERMINATED TO BUS BARS USING 2-HOLE COMPRESSION LUGS AND TO MECHANICAL CLAMP CONNECTORS USING COPPER WIRE PIGTAIL COMPRESSION LUGS. ALUMINUM WIRES SHALL NOT BE CLAMPED DIRECTLY IN MECHANICAL CLAMP CONNECTORS.
2. ONLY THE SPECIFIED BRANDS AND MODELS OF COMPRESSION LUGS ARE ACCEPTABLE.
3. COMPRESSION LUGS SHALL BE PRE-FILLED WITH AN OXIDE INHIBITOR.
4. ONLY THE CRIMPING TOOLS AND DIES RECOMMENDED BY THE LUG MANUFACTURER ARE ACCEPTABLE. DIE AND CRIMP TOOL NUMBERS SHALL BE CLEARLY VISIBLE FOR INSPECTION AFTER THE LUGS ARE CRIMPED.
5. ALUMINUM WIRES HAVE LARGER MINIMUM BEND RADII THAN EQUIVALENT COPPER WIRES, AND COMPRESSION LUGS INCREASE BEND RADII EVEN MORE. OVERSIZE SUBSTATION SECONDARY GEAR, ELECTRICAL ENCLOSURES, AND PANEL WIRING GUTTERS ACCORDINGLY.
6. VERIFY THAT OVERSIZED EQUIPMENT FITS IN AVAILABLE SPACE.

**ALUMINUM WIRE TERMINATIONS**

**CONSTRUCTION NOTES (CASING):**

- AUGERS OR SIMILAR DEVICES USED FOR PIPE IMPLACEMENT SHALL BE PROVIDED WITH MECHANICAL ARRANGEMENT THAT WILL PREVENT THE CUTTING HEAD FROM LEADING THE PIPE SO THAT THERE WILL BE NO UNSUPPORTED EXCAVATION AHEAD OF PIPE.
- THE USE OF WATER OR OTHER LIQUIDS TO FACILITATE THE CASING IMPLACEMENT AND SOIL REMOVAL IS PROHIBITED.
- WHEN AN OBSTRUCTION IS ENCOUNTERED DURING INSTALLATION, AND IT BECOMES EVIDENT THAT IT IS IMPOSSIBLE TO ADVANCE THE PIPE, ALL OPERATIONS WILL CEASE. THE CASING PIPE SHALL BE ABANDONED IN PLACE AND FILLED COMPLETELY WITH 1:6 GROUT.
- AFTER CONDUIT IS PULLED INTO PLACE VIA THE CONDUIT SLED, CASING PIPE IS TO BE COMPLETELY FILLED WITH PRESSURE GROUTING WITH A UNIFORM 1:6 MIXTURE.
- GROUT PUMP TO BE MONITORED BY PRESSURE GAUGE, PRESSURE NOT TO EXCEED 100 PSI.
- CONTRACTOR MAY SUBSTITUTE SLED AND SPACERS WITHIN CASING PIPE WITH BORING SPACERS MANUFACTURED BY UNDERGROUND DEVICES, CONTRACTOR MUST FOLLOW MANUFACTURERS INSTALLATION GUIDELINES.

**CASING PIPE**

**PREFIX (ADD WHEN APPROPRIATE):**

**A. Campus Projects**

**E** - Panel or equipment backed up by generator or battery inverter, e.g. ERP-1050

**B. Hospital and Health Care Projects**

**C** - Critical Branch, as defined by N.E.C. 517, e.g. CRP-1050  
**E** - Equipment System, as defined by N.E.C. 517, e.g. ERP-1050  
**L** - Life Safety Branch, as defined by N.E.C. 517, e.g. LRP-1050

**ELECTRICAL PANELS:**

**A. Panel Type**

**DP** - Distribution Panel (panel primarily feeding other panels)  
**IPS** - Interruptible Power Supply (battery inverter)  
**LP** - Lighting Panel (typically a 480/277V panel feeding lighting)  
**MCC** - Motor Control Center  
**PP** - Power Panel (panel primarily feeding loads directly)  
**RP** - Receptacle Panel (typically a 208/120V panel feeding receptacles)  
**UPS** - Uninterruptable Power Supply

**B. Add the Substation Number** - If more than 1 substation exists

**C. Insert a hyphen and identify the room number**

**D. Insert a hyphen and add sequence # if there is more than one of that type Panel/MCC in a room**

**Example:**

**ELECTRICAL EQUIPMENT:**

**Transformers:**

T - (Location Room #), e.g. **T-380**. If more than one transformer in room, add sequence # after room #, e.g. T-380-1

**Disconnects (Safety Switches):**

A. Fused: DF - (Location Room #), e.g., **DF-380**. If more than one in room, add sequence #, e.g. **DF-380-1**.  
B. Non-Fused: D - (Location Room #), e.g. **D-380**. If more than one in room, add sequence #, e.g. **D-380-2**.

**SPECIAL NOTE:**

**THE UNIVERSITY IS TRANSITIONING FROM METAL HALIDE TO LED FIXTURES. USE THIS SCHEDULE ONLY WHEN ADDING A FEW FIXTURES TO AN EXISTING METAL HALIDE INSTALLATION. OTHERWISE, USE LED FIXTURES PER DETAIL 26560026.**

**GENERAL NOTES:**

1. THE CONTRACTOR SHALL PROVIDE THE PEDESTRIAN LIGHTING FIXTURES, POLES, LAMPS AND STANDARD ANCHOR BOLTS.
2. THE ANCHOR BOLTS SHALL BE 3/4" X 20" X 3" ELL, HOT DIPPED FULL GALVANIZED STEEL. EACH ANCHOR BOLT SHALL INCLUDE 2 FLAT WASHERS AND 2 HEX NUTS.
3. WHEN POLES ARE LOCATED ON WALLS, IN PLANTERS OR ON OTHER ARCHITECTURAL FEATURES, ORDER SPECIAL HEIGHT POLES SO THAT THE FIXTURES' LUMINOUS CENTER (BAND OF GLOBE) IS AT THE SAME HEIGHT AS THOSE OF SURROUNDING FIXTURES.
4. PROVIDE A THIRD (SPARE) 1 1/4" CONDUIT STUBBED OUT 3' FROM BASE AT FIXTURES INDICATED BY "STUB SPARE C." ON PLAN DRAWINGS FOR FUTURE EXTENSION OF THE LIGHTING CIRCUIT.
5. LOCATE BASES ON CENTER LINES WHERE CENTER LINES ARE SHOWN ON PLANS, OR CENTER BASES 30" BACK FROM THE CURB OR SIDEWALK WHERE CENTER LINES ARE NOT SHOWN.
6. ROUTE UNDERGROUND CONDUITS AS CLOSE TO CURBS AND SIDEWALKS AS POSSIBLE TO AVOID INTERFERENCES WITH FUTURE LANDSCAPING.
7. CONTRACTOR SHALL STAKE ALL SITE LIGHTING FIXTURES AND RECEIVE APPROVAL FROM ARCHITECTURE & ENGINEERING (764-3414) BEFORE INSTALLING ANY LIGHT BASES.

### CONTROL WIRING FOR CONTACTOR

**NOTE 1:**  
LABEL LIGHTING CONTACTOR  
"BUILDING EXTERIOR LIGHTING CIRCUIT E-XXXX-X"  
BUILDING NUMBER  
SEQUENCE NUMBER

## TYPICAL RISER FOR BUILDING-MOUNTED EXTERIOR LIGHTING POWER SOURCE

PART 1 - GENERAL

- A. Contact Miss Dig (1-800-482-7171) before performing any excavation work.
- B. Contact the University Electrical Inspectors for an inspection before backfilling any sleeves, conduits and junction boxes, and before energizing any circuits.
- C. During the installation of new wall lighting, the existing wall and Detroit Edison lighting shall be kept operational at the Contractor's expense. Coordinate with the University Electric Shop (Duane Briggs at 310-1041) for repairs to existing lighting.
- D. The University will provide the fixtures, lamps and base covers for the wall lighting. The contractor must pick them up from a North Campus warehouse on Baxter Road. Contact the University Electric Shop (Duane Briggs at 310-1041) to arrange for pick-up of these items.

PART 2 - PRODUCTS

- A. Fixture mounting components shall be as detailed on the drawings.
- B. Sleeves for underground site lighting installations shall be 6" Schedule 40 PVC, UL Labeled for use with 90 Deg.C cables, Cantex or Carlon.
- C. Conduits shall be Schedule 40 PVC, UL Labeled for use with 90 Deg.C cables, Cantex or Carlon.
- D. Junction boxes shall be pre-cast polymer concrete or polymer foam, heavy duty rated, one size larger than required by the NEC, bottomless, with a single piece cover engraved "UM Outside Lighting" and attached with pentahed stainless steel bolts. CDR Systems, Carson-Brooks or Quartzite.
- E. Marking tape shall be plastic, vinyl or mylar, 6" wide, red for electrical and orange for telephone circuits, and labeled to indicate the type of circuit buried below.
- F. Wire shall be single conductor stranded copper, with Type XHHW Insulation rated 90 Deg.C in dry locations and 75 Deg.C in wet locations, 600 volts. American Insulated Wire, Rockbestos, Rome, Service Wire, Southwire or Triangle.
- G. Terminations
  - 1. Connectors for splicing and terminating lighting conductors in junction boxes shall be Homac No. RAB4 or RAB6 "Flood Seal" only.
  - 2. Connectors for terminating lighting conductors in fixture bases shall be copper split bolt connectors with full tin plating. Blackburn 1HPW for #3 AWG wire and 4HPW for #6 AWG ground wire.
- H. Fuse holders for lighting fixtures shall be Bussmann TRON No. HEB-AA In-Line, waterproof fuse holders rated 300 volts, 30 amps.
- I. Fuses for lighting fixtures shall be Bussmann No. KTK-5 rated 5 amps.

PART 3 - EXECUTION

- A. Sleeves
  - 1. Sleeves shall be buried at a minimum depth of 24" to their top. Sleeves shall extend a minimum of 12" beyond the pavement they pass under.
  - 2. Sleeves shall be taped closed at both ends with duct tape.
  - 3. Sleeve ends shall be marked with steel stakes, pipes or conduits that are 3' long minimum, driven vertically down at the sleeve ends to a depth of 6" below grade to their top.
- B. Conduits
  - 1. Conduit bends shall not be smaller than the radius of standard manufactured elbows (7-1/4" bend radius for 1-1/4" conduit).
  - 2. Locate underground conduits as close to curbs, sidewalks and walls as possible to avoid interferences with future landscaping.
  - 3. Where conduits can not be installed at a minimum depth of 24", install rigid steel conduits or pour concrete over the conduits in accordance with NEC Table 300-5.
- C. Junction Boxes
  - 1. Keep the number of junction boxes to a minimum. Splice inside fixtures wherever possible. Stagger splices as required to fit.
  - 2. Locate junction boxes in mulched areas wherever possible. The top of the junction box shall be level with the existing grade.
  - 3. Install junction boxes on a base of pea gravel or Class 2 sand at least 1'-0" deep.
  - 4. Provide metal barriers in junction boxes containing circuits of two different voltages or containing both power and telephone circuits.
- D. Sleeves and conduits shall be marked for their entire length with a marking tape buried 12" above them.
- E. Fixture bases shall be plumb.
- F. Lighting fixtures shall be aligned so that one spoke of the globe basket is perpendicular to the wall.
- G. The center band of lighting fixtures shall be level.
- H. Terminations
  - 1. Provide one fuse holder and fuse for each globe.
  - 2. Provide adequate slack in the fixture conductors so that the conductors can be pulled out for maintenance.

I. Grounding

- 1. Provide a 1/2" minimum diameter copper ground rod 8' minimum long for each light fixture.
- 2. Provide exothermic weld type ground connections or acorn clamps for concealed, underground and concrete encased ground connections, splices and taps.
- 3. Coordinate carefully with general contractor to insure needed conduits, wire, backfill, fixture mounting components and other materials are scheduled and installed to allow for required electrical inspections and proper long term operation of the lighting systems.

**NOTES:**

- 1. LED OR METAL HALIDE FIXTURE. REFER TO FIXTURE SCHEDULE.
- 2. TEMPORARILY PLUG CONDUIT ENDS WITH DUX-SEAL DURING CONCRETE POURING TO KEEP CONDUITS FROM FILLING WITH CONCRETE.
- 3. CONNECT FIXTURES TO ALTERNATE PHASES OF POWER CIRCUIT TO BALANCE LOAD.
- 4. ADJUST ANCHOR BOLT HEX NUTS UNTIL LIGHT FIXTURE BASE IS PLUMB. TIGHTEN SET SCREWS TO SECURE BASE EXTENSION OR FIXTURE SPIDER.

**GENERAL NOTES:**

1. THE CONTRACTOR SHALL PROVIDE THE LIGHTING FIXTURES, POLES, LAMPS AND ANCHOR BOLTS.
2. THE ANCHOR BOLTS SHALL BE 1" X 42" X 4" ELL. HOT DIPPED GALVANIZED STEEL. EACH ANCHOR BOLT SHALL INCLUDE 2 FLAT WASHERS AND 2 HEX NUTS.
3. ROUTE UNDERGROUND CONDUITS AS CLOSE TO CURBS AND SIDEWALKS AS POSSIBLE TO AVOID INTERFERENCES WITH FUTURE LANDSCAPING.
4. PROVIDE A THIRD (SPARE) 1 1/2" C. CONDUIT STUBBED OUT 3' FROM BASE AT FIXTURES INDICATED BY "STUB SPARE C." ON PLAN DRAWINGS FOR FUTURE EXTENSION OF THE LIGHTING CIRCUIT.

# TYPICAL BUILDING ELEVATION TELECOMMUNICATION ROOM ARRANGEMENTS

NO SCALE

## TYPICAL ELEVATION COMMUNICATION DETAIL

NO SCALE

27200002.dgn

**PLAN VIEW**

**ELEVATION**

**NOTES:**

- 1 PROVIDE WIREMOLD #V24GB506 POWER STRIP ON BACK SIDE OF CABLE MANAGER. WIRE AS SHOWN. (TYPICAL FOR ALL RACKS)
- 2 PROVIDE NEMA L5-30R RECEPTACLE IN OUTLET BOX ON BACK SIDE OF CABLE MANAGER 6" TO 12" A.F.F. . WIRE AS SHOWN. (ONLY ON ONE OF THE RACKS. WHEN 2 OR 3 RACKS STAND SIDE BY SIDE)
- 3 EQUIPMENT CAN PROJECT 6" IN FRONT AND 30" BEHIND RACK. PROVIDE N.E.C. WORKING SPACE FRONT AND REAR.

1. TELCOM RACK, CABLE MANAGER AND TELCOM EQUIPMENT BY UM ITSCoM.
2. COORDINATE WITH ITSCoM BEFORE INSTALLATION.

**TELECOMMUNICATION RACK POWER DETAIL**

NO SCALE

27200003.dgn

**BASE PLAN VIEW**

**FRONT VIEW**

**RIGHT SIDE VIEW**

**NOTES:**

1. TELEPHONE STANCHION, TELEPHONE BACK BOX, BEACON, STANCHION LIGHT, PHONE AND PHONE LINE FURNISHED AND INSTALLED BY UM ITCOM.
2. CONTRACTOR TO PROVIDE CONCRETE BASE, GROUND ROD, POWER AND PHONE CONDUITS, 4" SQ. BOX AND ASSOCIATED FITTINGS AS REQUIRED.
3. CONTRACTOR TO PROVIDE POWER WIRING AND CONNECTIONS TO STANCHION LIGHT AND BEACON AS SHOWN ON DETAIL #1675006.
4. BOTH CONDUITS AND GROUND WIRE MUST BE STUBBED UP WITHIN THE 4" DIA. CIRCLE AS SHOWN ON PLAN VIEW.
5. PROVIDE CLASS II SAND BACKFILL COMPACTED TO 95% IN EXCAVATED AREAS. SEE SPECIFICATIONS.
6. PROVIDE 6" OF TOP SOIL IN LAWN AREAS. GRADE AND SEED TO MATCH EXISTING.
7. ANCHOR BOLTS FURNISHED BY ITCOM AND POURED IN BASE BY CONTRACTOR.
8. TRANSITION TO 1 1/2" RIGID GALVANIZED STEEL CONDUIT AT BUILDING WALL PENETRATION TO ITCOM CLOSET, SWEEPS ONLY (10X OUTSIDE DIAMETER OF CONDUIT), NO LB'S ALLOWED.
9. PROVIDE 12" SQUARE (MIN.) PULL BOX EVERY 180° OF BEND. IN PVC/RGS CONDUIT RUN TO ITCOM CLOSET.

**TYPICAL U OF M EMERGENCY TELEPHONE KIOSK DETAIL**

# EMERGENCY TELEPHONE NEAR WALKWAY SURFACE MOUNTED TO BUILDING

NO SCALE

27200007.dgn

# MOUNTING OF #293SL TELEPHONE

NO SCALE

27200008.dgn

**NOTES:**

1. EMERGENCY TELEPHONE MANUFACTURED BY GAI-TRONICS CORP., MODEL 397-001. TELEPHONE AND TELEPHONE CABLE FURNISHED AND INSTALLED BY ITSComm. BACKBOX FURNISHED BY ITSComm AND INSTALLED BY CONTRACTOR.
2. TELEPHONE IS 10" TALL X 8.5" WIDE X 2.5' DEEP AND INCLUDES A FLUSH MOUNT BACK BOX. FLUSH MOUNT TELEPHONE UNLESS SURFACE MOUNTING IS SHOWN ON PLAN DRAWING. TO SURFACE MOUNT, REQUEST OPTIONAL GAI-TRONICS MODEL 238 BACK BOX FROM ITSComm.
3. MOUNT TELEPHONE SO TOP OF RED EMERGENCY CALL BUTTON IS CLOSE TO BUT NO MORE THAN 48" ABOVE FINISHED FLOOR.
4. PROVIDE TELECOM CONDUIT AND ASSOCIATED FITTINGS.
5. BOND THE TELECOM CONDUIT AT THE TELECOM CABLE TRAY OR TELECOM ROOM GROUND BUS BAR.
6. PROVIDE 24" WIDE X 13" TALL LAMINATED PLASTIC SIGN WITH BLACK TEXT AND GRAPHIC ON WHITE BACKGROUND AS SHOWN. TEXT SHALL COMPLY WITH ADA SECTION 703.5. BRAILLE SHALL COMPLY WITH ADA SECTION 703.3. MOUNT SIGN IN COMPLIANCE WITH ADA SECTIONS 703.5.5 AND 703.5.6 SO BASELINE OF CHARACTERS IS A MINIMUM OF 40" ABOVE FINISHED FLOOR.
7. UM PROJECT MANAGER SHALL ARRANGE FOR ITSComm TO PROVIDE A DEDICATED TELEPHONE IN THE BUILDING'S FIRE COMMAND CENTER (IF FIRE COMMAND CENTER EXISTS). EACH AREA OF REFUGE TWO-WAY COMMUNICATION DEVICE SHALL BE PROGRAMMED BY ITSComm TO RING DIRECTLY TO THE BUILDING FIRE COMMAND CENTER PHONE. IF THE CALL IS NOT ANSWERED IN 3 RINGS, THE CALL SHALL AUTOMATICALLY BE TRANSFERRED TO THE U OF M DPSS COMMAND CENTER.
8. IF THE PROJECT DOES NOT INCLUDE A FIRE COMMAND CENTER, EACH AREA OF REFUGE TWO-WAY COMMUNICATION DEVICE SHALL BE PROGRAMMED TO RING DIRECTLY TO THE UM DPSS COMMAND CENTER.

**AREA OF REFUGE TWO-WAY COMMUNICATION SYSTEM**

PROPERTY OF THE UNIVERSITY OF MICHIGAN.  
 NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT  
**TYPICAL CARD READER PEDESTAL DETAIL**

NO SCALE

28130012.dgn

## GENERAL NOTES

1. RACEWAYS TO MOST CARD READERS, ETC., NOT SHOWN HERE, TYPICALLY MINIMUM 1" (AS NOTED ON ELEVATION ABOVE) TO EACH CARD READER LOCATION.
2. ALTERNATE MOUNTING CONFIGURATIONS MAY BE REQUIRED FOR PANEL INSTALLATIONS IN EXISTING CLOSETS. SUBMITTALS REQUIRED.
3. MOUNT PANEL ASSEMBLY TO  $\frac{3}{4}$ " PLYWOOD BACKING BY ARCHITECTURAL TRADES.
4. REFER TO SPECIFICATION SECTION 281300 ACCESS CONTROL AND MONITORING SYSTEM FOR DETAILED INFORMATION REGARDING ASSEMBLY COMPONENTS.

## REFERENCE NOTES

- ① PROVIDE MINIMUM OF (2) DEDICATED 120V, 20A CIRCUITS TO POWER SUPPLIES FOR ACCESS CONTROL PANELS AND LOCKS. INSTALL LOCKS ON BREAKERS. PROVIDE ADDITIONAL CIRCUITS AS MAY BE REQUIRED FROM SYSTEM REQUIREMENTS.
- ② 4"x4" METAL LAY-IN NEMA 1 TYPE HINGE COVER WIREWAY FOR LOW VOLTAGE, INTER-PANEL WIRING. PROVIDE IN LIGHT GRAY. HOFFMAN F44G SERIES.
- ③ INSTALL BUSHINGS IN PANEL SIDES AS NEEDED TO ALLOW WIRING TO REACH WIREWAY.
- ④ CLEAR SPACE FOR CONDUIT EXITS. CONDUITS MAY EXIT ABOVE OR BELOW.
- ⑤ PROVIDE ONE POWER SUPPLY WITH BATTERY BACK-UP SIZED PER SPECIFICATION.
- ⑥ PROVIDE POWER SUPPLY FOR READER HEAT.
- ⑦ PROVIDE POWER SUPPLY FOR ACCESS CONTROL PANEL.

PROPERTY OF THE UNIVERSITY OF MICHIGAN.  
NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT

## TYP. INSTALLATION FOR CARD READER PANEL IN BUILDING

**NOTE:** NEW DOOR CONNECT TO EXISTING LEVEL ACCESS CONTROL SYSTEM. ELECTRICAL CONTRACTOR SHALL PROVIDE COMPOSITE CABLE FROM ACCESS CONTROL PANEL TO EACH DOOR. PROVIDE CONDUIT AND/OR CABLE SUPPORT AS REQUIRED PER NEC. RUN CABLES IN UNBROKEN LENGTHS FROM CONTROL PANEL TO EACH DOOR. COORDINATE SPECIFIC CABLE REQUIREMENTS WITH SECURITY CONTRACTOR. SECURITY CONTRACTOR SHALL PROVIDE FINAL CONNECTIONS, PROGRAMMING AND CONTROL PANEL MODIFICATION. APPROVED SECURITY CONTRACTOR: D/A CENTRAL, 13155 CLOVERDALE, OAK PARK MI. 48237 (248) 399-0600 TERRY WOYCIK x116

## GENERAL NOTES

1. ALL RACEWAYS INCLUDING JUNCTION BOXES TO BE RECESSED UNLESS OTHERWISE NOTED.
2. DETERMINE EXACT RACEWAY ROUTING BASED ON FIELD CONDITIONS.
3. POWER FOR ELECTRIFIED DEVICES OBTAINED FROM POWER SUPPLIES AT ACCESS CONTROL PANEL ASSEMBLY UNLESS OTHERWISE NOTED.
4. PROVIDE WEATHER-PROOF (WP) JUNCTION BOXES
5. WIRE SIZES SHALL BE IN ACCORDANCE WITH MANUFACTURERS INSTRUCTIONS.
6. SEE 03710 FOR SEQUENCE OF OPERATIONS.

## LEGEND

CR	CARD READER. MOUNT ON JUNCTION BOX ON UNSECURED SIDE OF DOOR. (CARD READER OWNER FURNISHED, CONTRACTOR INSTALLED)
DM	DOOR MONITOR CONTACT
EM	ELECTRIC MORTISE LOCKSET WITH REQUEST TO EXIT SWITCH
EPT	ELECTRICAL POWER TRANSFER
J	JIC-JUNCTION BOX, 6x6 MINIMUM. MOUNT ABOVE DROPPED CEILING ON SECURED SIDE OF DOOR. IF CEILING IS NOT REMOVABLE, PROVIDE ACCESS PANEL FOR MAINTENANCE.

PROPERTY OF THE UNIVERSITY OF MICHIGAN.  
NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT

## N.C.R.C - TYP. RACEWAY INSTALLATION AT SINGLE DOOR WITH ELECTRIC MORTISE DEVICE

NO SCALE

28130014.dgn

**NOTES:**

1. PROVIDE ALARM JUNCTION BOX, HOFFMAN NO. A-14N124 WITH NO. A-14N2LP PANEL, AND STANDARD SLOTTED FLUSH LATCH.
2. FINAL LOCATION OF ANTENNA TO BE SELECTED BY U OF M RADIO SHOP.
3. ANTENNA CONDUIT SHALL HAVE A MAXIMUM OF TWO 90 DEGREE BENDS. WITH A MINIMUM BEND RADIUS OF 6". IF THIS IS NOT POSSIBLE, INSTALL 6"x6"x4" JB'S AT BENDS TO MEET THIS REQUIREMENT. COAX RUN FROM RTU TO ANTENNA SHALL NOT EXCEED 50'.
4. PROVIDE A GREENLEE CONDUIT MEASURING TAPE: PART # 435 FROM MOSCAD RTU BOX TO ANTENNA.
5. ALL CONDUITS SHALL ENTER RTU BOX WITHIN 6" OF CORNERS TO PREVENT INTERFERENCE WITH RTU ELECTRONICS INSTALLATION.
6. PROVIDE 12 CONDUCTOR (MINIMUM) CABLE COMPATIBLE WITH FIRE ALARM SYSTEM INSTALLED IN BUILDING. CONNECT ONE PAIR OF WIRES TO "BUILDING FIRE ALARM" CONTACTS IN THE FIRE ALARM CONTROL PANEL, ONE PAIR TO "FIRE ALARM SUPERVISORY", ONE PAIR TO "FIRE ALARM SYSTEM TROUBLE" AND ONE PAIR TO "FIRE ALARM SYSTEM MAINTENANCE ALERT". REMAINING CONDUCTORS ARE SPARES. CONTACTS IN THE FIRE ALARM CONTROL PANEL SHALL BE NORMALLY CLOSED SO CIRCUITS CAN BE SUPERVISED.
7. PROVIDE DEDICATED, LOCKING 20A, 1-P CIRCUIT BREAKER & CIRCUIT W/INSULATED GROUND WIRE TO MOSCAD. PROVIDE QUAD RECEPTACLES ON DEDICATED CIRCUIT. INSTALL LOCK ON BRANCH CIRCUIT BREAKER SERVING FIRE ALARM PANEL.
8. U OF M RADIO SHOP PROVIDES MOSCAD RTU BOX, ELECTRONICS IN MOSCAD RTU AND ALARM JUNCTION BOXES, ANTENNA CABLE, ANTENNA, FINAL MOSCAD RTU CONNECTIONS AND PROGRAMMING, FINAL CONNECTIONS IN ALARM JUNCTION BOX AND ANTENNA INSTALLATION & CONNECTIONS.
9. PROVIDE 22AWG, 25 TWISTED PAIR JACKETED CABLE.
10. PROVIDE 6 CONDUCTOR (MINIMUM) CABLE. CONNECT ONE PAIR OF WIRES TO "FIRE PUMP RUNNING" CONTACTS IN FIRE PUMP CONTROLLER AND ONE PAIR TO "FIRE PUMP TROUBLE". REMAINING CONDUCTORS ARE SPARES. CONTACTS IN FIRE PUMP CONTROLLER SHALL BE NORMALLY CLOSED.
11. RF SITES LOCATED AT DENNISON, WOLVERINE TOWER AND NC SERVICE BUILDING #1.

**PROPERTY OF THE UNIVERSITY OF MICHIGAN.  
NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT.**

**NOTES**

1. THE FOLLOWING IS A MATERIAL LIST FOR THE HEARING ASSISTANCE SYSTEM.

- PHONIC EAR MODEL PE-550T FM TRANSMITTER. TRANSMITTERS SHALL BE TUNABLE FOR CHANNELS 33, 35, 36, 37, & 38.
- PHONIC EAR MODEL AT-209A PLUG IN POWER SUPPLY UNITS.
- PHONIC EAR MODEL AT-565 ANTENNA WITH PHONIC EAR MODEL AT-567 GROUNDING PLANE.
- 100 FOOT SECTIONS OF (XLR) CABLE, WITH CONNECTORS, TO GO BETWEEN THE TRANSMITTER AND ANTENNA.
- PHONIC EAR MODEL AT-575 RACK MOUNTING KITS.
- PHONIC EAR PE-350 R SIX CHANNEL FM RECEIVERS TUNABLE FOR CHANNELS 33, 34, 35, 36, 37, & 38.
- PHONIC EAR MODEL AT-541 WALKMAN STYLE HEADPHONE.
- PHONIC EAR MODEL AT-538M MONAURAL EARBUD UNITS.
- PHONIC EAR MODEL AT-538S BINAURAL EARBUD UNITS.
- PHONIC EAR MODEL AT-163-B TELELOOP UNITS WITH PHONIC EAR MODEL AT-1543 CONNECTORS.

2. THE ADA REQUIRES THE NUMBER OF RECEIVERS TO BE NO LESS THAN 4% OF THE NUMBER OF SEATS, AND IN NO CASE LESS THAN TWO RECEIVERS. SO A 100 SEAT ROOM WILL REQUIRE 4 RECEIVERS.

- B** PANEL MOUNTING BNC-BNC FEED THROUGH.
- J** PANEL MOUNTING ¼" PHONE JACK.
- M** PANEL MOUNTING MICROPHONE JACK.
- 1** SPECIAL "TSC" THREADED COAXIAL CONNECTOR. SEE "WIRING DETAIL HEARING ASSISTANCE ANTENNA"

1. VERTICAL SURFACES:  
 PROVIDE MANUFACTURER'S STANDARD, NON-MODIFIED, TWO-OR-MORE-PART, POLY-SULFIDE-BASED, ELASTOMERIC SEALANT; COMPLYING WITH EITHER ASTM C 920 TYPE M CLASS 25, OR FS TT-S-00227E CLASS A; NON-SAG GRADE/TYPE.
2. HORIZONTAL SURFACES:  
 PROVIDE MANUFACTURER'S STANDARD, NON-MODIFIED, TWO-OR-MORE-PART, POLYURETHANE-BASED, ELASTOMERIC SEALANT; COMPLYING WITH EITHER ASTM C 920 TYPE M CLASS 25, OR FS TT-S-00227E CLASS A; SELF-LEVELING GRADE/TYPE.
3. SET UP TIME FOR SEALANT ON WALKING SURFACES SHALL BE NO LONGER THAN 8 HOURS.
4. PROVIDE PRODUCT OF ONE OF THE FOLLOWING MANUFACTURES:
  - a. CONTECH/SONNEBORN
  - b. MAMECO INTERNATIONAL
  - c. W.R. MEADOWS, INC.
  - d. PECORA CORP.
  - e. PRODUCTS RESEARCH & CHEMICAL CORP.
  - f. SIKA CHEMICAL CORP.
  - g. TREMCO, INC.
  - h. TOCH/CARBOLINE
5. DO NOT ALLOW SEALANTS TO OVERFLOW OR SPILL ONTO ADJOINING SURFACES. REMOVE EXCESS AND SPILLAGE OF SEALANTS PROMPTLY.

## **NOTES & SPECIFICATIONS**

---

1. ALL MATERIALS, EQUIPMENT AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH MICHIGAN DEPARTMENT OF TRANSPORTATION SPECIFICATIONS FOR CONSTRUCTION.
2. GRANULAR MATERIAL SHALL BE A MINIMUM OF MDOT CLASS II COMPACTED TO 98% ASTM 1557 VALUE. COMPACTED GRANULAR GRANULAR MATERIAL SHALL EXTEND HORIZONTIALLY FOR MINIMUM DISTANCE OF 6" BEYOND THE EDGES OF NEW CONCRETE.
3. ALL CONCRETE SHALL BE 4000 POUNDS PER SQUARE INCH MINIMUM COMPRESSIVE STRENGTH AT 28 DAYS AND CONSIST OF AIR ENTRAINED PORTLAND CEMENT WITH A TOTAL AIR CONTENT OF NOT LESS THAN 5% AND NOT MORE THAN 7%. CEMENT CONTENT AND SHALL BE A MINIMUM OF SIX (6) SACKS PER CUBIC YARD.  
SLUMP SHALL NOT BE MORE THAN 4" NOR LESS THAN 1 $\frac{1}{2}$ " AS DETERMINED BY THE SLUMP CONE TEST ASTM C-143. ALL FLATWORK SHALL INCLUDE POLYPROPYLENE FIBRILLATED FIBERS WITH A VOLUMN OF 1.5 POUNDS PER CUBIC YARD.
4. CONCRETE CURING COMPOUND SHALL BE CLEAR MEMBRANE CONFORMING TO ASTM C-309, TYPE II AND APPLIED AT A RATE OF NOT LESS THAN ONE GALLON PER 200 SQ. FT. OF CONCRETE SURFACE IMMEDIATELY AFTER FINISHING OPERATIONS ARE COMPLETE.
5. ALL DISTURBED LAWN AREAS SHALL BE FINE GRADED AND RAKED TO AN ELEVATION 4" BELOW FINAL GRADE FOR TOPSOIL AND SEED BY OTHERS.
6. ALL PREPARED GRANULAR FILL BASE SHALL MEET COMPACTION REQUIREMENTS PRIOR TO THE SCHEDULING OF CONCRETE/PAVING MATERIAL DELIVERY.
7. SAWCUTTING REQUIRED FOR REMOVAL SHALL BE INCIDENTAL.

## SOIL EROSION AND SEDIMENTATION CONTROL SEQUENCE

In accordance with rule 1709 promulgated under the authority of Part 91, Soil Erosion and Sedimentation Control, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended, and in addition to the information in the project plans and specifications, the following general conditions apply to the earth change authorized by this document:

- a. Design, construct, and complete the earth change in a manner that limits the exposed area of disturbed land for the shortest period of time.
- b. Remove sediment caused by accelerated soil erosion from runoff water before it leaves the site of the earth change.
- c. Temporary or permanent control measures shall be designed and installed to convey water around, through or from the earth change at a non-erosive velocity.
- d. Install temporary soil erosion and sedimentation control measures before or upon commencement of the earth change activity and maintain the measures on a daily basis. Remove temporary soil erosion and sedimentation control measures after permanent soil erosion measures are in place and the area is stabilized. ("Stabilized" means the establishment of vegetation or the proper placement, grading or covering of soil to ensure its resistance to soil erosion, sliding, or other earth movement.)
- e. Complete permanent soil erosion control measure for the earth change within five (5) calendar days after final grading or upon completion of the final earth change. If it is not possible to permanently stabilize the earth change, then maintain temporary soil erosion and sedimentation control measures until permanent soil erosion control measures are in place and the area is stabilized.
- f. The contractor is responsible for maintaining landscaping during the warranty period. After the warranty has expired, the permanent SESC measures will be maintained by the University of Michigan Plant Operations Grounds & Waste Management Department and the Plumbing Shop as appropriate. The Grounds & Waste Manager will be responsible for maintenance of any permanent landscaping SESC measures. The Plumbing Shop foreman will be responsible for the maintenance of any SESC measures that are part of the storm water drainage system piping.

## SOIL EROSION AND SEDIMENTATION CONTROL MAINTENANCE NOTES

1. Install temporary inlet filters at all adjacent and down-gradient storm water inlets, catch basins and manholes that may be impacted. Catch basin inlet filters shall be maintained clean at all times throughout the construction period. If a filter has holes or is inundated with sediment, the filter will require replacement.
2. Install an anti-tracking pad at the site entry and exit(s). The anti-tracking pad should be constructed of geotextile fabric with limestone over it.
3. Silt fence shall be maintained at all times throughout the construction period. If repair or replacement is necessary, it shall be performed according to the manufacturer's specifications. Maintenance includes the removing of built-up sediment accumulates to ½ the height of the fence. Contractor shall remove, replace, retrench, or re-backfill the fence if it fails. Additionally, the contractor shall reinstall any portion of the fencing damaged by construction machinery.
4. Place stockpiles and other spoil piles away from the drainage system to minimize sediment transport. If the stockpile and/or spoil pile must remain on-site overnight, or if the weather conditions indicate the chance for precipitation, A) cover the pile with water repellent material to prevent erosion and/or B) install silt fencing around the base of the pile to prevent transport of sediment to the storm water system, or apply other control methods appropriate to the site. Control measures to guard against wind erosion must also be employed, such as wetting or covering the stockpiles. Keep as few stockpiles as possible during the course of the project.
5. Throughout the construction period, all mud/silt tracked onto existing roads from the site due to construction shall be immediately removed by the contractor.
6. Seeding or other stabilization shall be required immediately to areas which have been damaged by runoff.
7. The contractor shall maintain dust control on the site throughout the duration of the construction process.
8. Weekly inspections by a University SESC trained Certified Storm Water Management Operator as well as periodic inspections within 24 hours of any rainfall will be required. These inspections may result in recommendations for routine maintenance of the soil erosion control devices, as well as additional controls.

### Stockpiles

Place stockpiles and other spoil piles away from the drainage system to minimize sediment transport. If the stockpile and/or spoil pile must remain on-site overnight, or if the weather conditions indicate the chance for precipitation, A) cover the pile with water repellent material to prevent erosion and/or B) install silt fencing around the base of the pile to prevent transport of sediment to the storm water system, or apply other control methods appropriate to the site. Control measures to guard against wind erosion must also be employed, such as wetting or covering the stockpiles. Keep as few stockpiles as possible during the course of the project.

### Suspect Contaminated Soil, Groundwater, or other Unknown Material

- During work activities if suspect contaminated soil, groundwater, or other unknown material is encountered contact your University of Michigan Construction Management Representative and the UM Occupational Safety & Environmental Health Department (763-6973) immediately. Suspect contaminated soil may exhibit chemical or unusual odors, staining, unusual coloring, and/or contain man-made debris. Suspect contaminated groundwater may exhibit chemical or unusual odors, unusual coloring, and/or sheen.
- Immediately cease all excavation, dewatering, transport, or disturbance of the suspect material until given direction by the UM Construction Management Representative.

### Dewatering

Groundwater and surface water which is free of contamination and sediment may be discharged to a storm drain. Drains must be protected from sediment by using filter fabric or silt sacks. However, if field indicators indicate possible contamination the water cannot be discharged. Immediately cease all discharge and contact your University of Michigan Construction Management Representative and UM Occupational Safety & Environmental Health Department (763-6973) for inspection of the water and disposal determination. Note: suspect contaminated groundwater may exhibit chemical or unusual odors, unusual coloring, sheen, and/or contain man-made debris.

## **RIP-RAP DETAIL**

NO SCALE

1. MATERIAL USED FOR RIP- RAP SHALL BE SOUND, TOUGH, DURABLE AND FREE FROM STRUCTURAL DEFECTS, AND MAY CONSIST OF STONE, ROCK, COBBLESTONE OR BROKEN CONCRETE WITH AT LEAST ONE DIMENSION OF 8 INCHES AND A VOLUME OF NOT LESS THAN  $\frac{1}{3}$  OF A CUBIC FOOT. SMALLER PIECES MAY BE USED FOR FILLING VOIDS AFTER LARGER PIECES HAVE BEEN SET.
2. EACH PIECE OF RIP-RAP SHALL BE LAID INDIVIDUALLY BY HAND, AND SHALL BE BEDDED INTO THE SUB-BASE AND AGAINST ADJOINING STONE.
3. RIP-RAP THICKNESS SHALL BE 8 INCH MINIMUM.
4. RIP-RAP SHALL BE LAID ON GRANULAR SUB-BASE WITH A GEOTEXTILE FABRIC BETWEEN THE RIP-RAP AND THE SUB-BASE.
5. RIP-RAP SHALL BE COMPACTED AS IT IS INSTALLED, AND THE FINISHED SURFACE SHOULD BE EVEN AND TIGHT.
6. VOIDS BETWEEN PIECES OF RIP-RAP SHALL BE FILLED WITH MORTAR GROUT.

SAMPLE TEMPLATE FOR BUILDING SIGNS - SEE NOTES BELOW

-- SIGN # TBD. SIGN FACE DETAIL - SEE OTHER SHEET FOR FULL DETAILS AND DIMENSIONS

- SIGN SIZE VARIES DEPENDING ON NEED AND MAY BE 4', 5' OR 6' IN LENGTH
- LETTERING ON FACE AND SPACING WILL VARY DEPENDING ON BUILDING NAME
- UNIVERSITY PLANNER'S OFFICE (UPO) WILL DETERMINE SIZE OF SIGN(S)
- DESIGN MANAGER TO CONTACT UPO DURING SCHEMATIC DESIGN PHASE FOR DETAILS ON SIZE AND FOR LAYOUT
- CONTRACTOR TO PROVIDE SHOP DRAWING FOR UPO APPROVAL
- CONTACT UPO FOR MICROSTATION OF CAD DRAWINGS. DESIGNER MUST PURCHASE SPECIAL FONT (UNIVERS 67 CONDENSED BOLD) BEFORE USING MICROSTATION OR CAD.
- UPO TO PROVIDE AN IMAGE FILE (NO FONTS) OF THE LOGO (BLOCK M AND WORDS "UNIVERSITY OF MICHIGAN")

- SIGN #TBD LOCATION: (SPECIFY). CONFIRM LOCATION AND ORIENTATION WITH UNIVERSITY PLANNER'S OFFICE.
- CONTRACTOR TO PROVIDE SHOP DRAWING FOR OWNER APPROVAL (UNIVERSITY PLANNER'S OFFICE).
- FABRICATE NEW SIGN WITH STAINLESS STEEL PANELS, THEN PRIME, PAINT, APPLY VINYL LETTERS AND LOGO. INSTALL ON NEW CONCRETE BASE.
- SIGN IS TO BE DOUBLE-SIDED (2 PANELS) - NOTE: TWO STEEL PANELS ARE HUNG ON EITHER SIDE OF THE J-TUBING FRAME AND ARE SEPARATED BY THE FRAME. FRAME MUST BE CAST INTO CONCRETE BASE. REFER TO ADDITIONAL DETAIL SHEET.
- SIGNFACE: 16 GA STAINLESS STEEL PRIMED (2 COATS MINIMUM), PAINTED (2 COATS MINIMUM) WITH MATTHEWS PAINT TO MATCH PMS BLUE 282, SATIN.
- LETTERING FOR BUILDING NAME AND ADDRESS: FONT - UNIVERS 67 CONDENSED BOLD, UPPER AND LOWER CASE; HIGH PERFORMANCE WHITE VINYL.
- LOGO CONSISTS OF BLOCK M AND WORDS "UNIVERSITY OF MICHIGAN." OWNER TO PROVIDE AN IMAGE FILE (NO FONTS). AUTOCAD FILE ALSO AVAILABLE. BLOCK M TO BE HIGH PERFORMANCE SUNFLOWER YELLOW VINYL. WORDS "UNIVERSITY OF MICHIGAN" TO BE HIGH PERFORMANCE WHITE VINYL.
- FILLER STRIP (REVEAL): STAINLESS STEEL PRIMED (2 COATS MINIMUM), PAINTED (2 COATS MINIMUM) WITH MATTHEWS PITCH BLACK SEMI GLOSS.
- J-TUBING: PREPARE SURFACE PER PLANS, PRIME, PAINT WITH MATTHEWS PAINT TO MATCH PMS BLUE 282.
- INSTALL ON NEW CONCRETE BASE W/ RUSTICATION DETAIL. CONCRETE SHOULD BE 4000 PSI WITH 6% AIR ENTRAPMENT. REPAIR CONCRETE/LANDSCAPING/LAWN AS NEEDED. PER U-M STANDARDS AND DETAILS.

Additional signage details

1-1/2" x 1-1/2" stainless steel square tube frame on which the panels are hung

example to show color pattern:

### May 2015

#### Master Specifications

##### [221113 – Piping Materials and Methods](#)

Revised: Revise stainless pipe description to allow 316L only for cold domestic and condenser water due to concern with chlorides in city water corroding 304L.

##### [New 230905 Mechanical Systems Controls \(Hospital Projects\)](#)

New masterspec was based on the campus AEC MS 230900. We have heavily edited Part 1 and Part 3 of the campus masterspec. Much of the Part 2 Products section remains the same, with relatively minor additions/ modifications to reflect work specific to UMH.

Here's a summary of what this new masterspec is allowing us to do:

UMHHC owns and maintains a unified Mechanical Control System (MCS) frontend called Desigo CC. This frontend is the single and only frontend used to monitor, control, alarm and trend DDC points reporting from a variety of DDC systems used in UMHHC facilities, including Johnson Controls, Siemens, Honeywell & ASI.

- The design A/E shall utilize UMHHC's masterspec MS230905 "Mechanical Systems Controls (Hospital Projects)" for all work on hospital funded projects that are to be maintained and monitored by the UMHHC BMS. AE shall be responsible for editing this masterspec so that it is job specific.
- All UMHHC DDC systems, regardless of manufacturer or type, shall report all points back to the Desigo CC frontend. Proprietary, or vendor specific frontends, are not allowed.
- The complete control system work shall be split between the Mechanical Systems Controls Contractor (MSCC), the Systems Integrator (SI) and UMH's Medical Center Information Technology (MCIT) department. See Masterspec 230905 Mechanical Systems Controls (Hospital Projects), Part 1 section for a detailed description on the division of work.
- The MSCC shall provide a fully integrated BACnet MCS incorporating electric, pneumatic, and direct digital control (DDC) components for the control and monitoring of heating, ventilating and air conditioning (HVAC) equipment and other related systems. Controllers shall natively use the most current ANSI/ASHRAE Standard 135 for communications and shall be BTL certified with BTL published PIC statements.
- UMHHC's Desigo CC frontend is installed on virtual servers in MCIT's datacenter. All communication/ integration to the Desigo CC frontend shall be via BACnet IP over the MCIT layer 3 network. UMHC's MCIT department shall be responsible for the design and installation of this primary network. The AE shall coordinate and clearly show on the contract documents all MCIT data drops to all IP based DDC controllers.
- UMHHC wishes to maximize the use of its MCIT network for a) communication to the Desigo CC frontend and b) communication between DDC building controllers. Communication to/ between lower level controllers shall be via a MS/TP secondary field level network (FLN), provided & installed by the Mechanical Systems Controls Contractor (MSCC).
- The SI shall be responsible for BACnet device and object discovery, point instantiation, alarm & trend definitions and creating of all front end graphics. The role of Systems Integrator shall be performed by UMH Systems Monitoring staff, or an integration contractor hired by Systems Monitoring. All contracts for Systems Integration, if needed, shall be at the discretion of UMH Systems Monitoring staff and shall be direct contracts with UMH, external to the construction contract.
- All products to be used as an integral part of the proposed MCS must be contained on the vendor's pre-approved parts list (including BTL PIC statements) on file with the UMHHC Facility Planning and Development (FPD) office.
- The AE shall discuss with the FPD mechanical engineer the approved

control manufacturers to list in the project specifications. We desire to competitively bid all control projects to the approved control manufacturers listed in specification 230905. In general, all terminal unit controls (VAV/ CAV boxes, mixing boxes, FCU's, etc) as well as all brand new stand-alone facility installations shall be competitively bid. However, UMH wishes to standardize controller manufacturers (and programming, sequence of operation, setpoints, alarming, etc) on critical equipment within a given facility. Examples of equipment that UMH may wish to sole source includes modifications to chiller plants, heating plants, AHU plants and Operating Room/ Procedure Room terminal controls.

#### Technical Sections

[DG 6.0 102800 Toilet Accessories](#) – prefer the toilet paper be installed above the grab bar.

[DG 6.0 096500 Resilient Flooring](#) – in general install flooring under cabinetry.

#### April 2015

[SBA 5.11 Fire Command Center](#) and [DG 230900 Mechanical Systems Controls](#)

SBA 5.11 Fire Command Center was revised to clarify certain code requirements for Fire Command Centers that are subject to interpretation, which often results in changes during construction. In particular, the requirements for smoke control panels are now described, as well as the requirements for controlling air distribution systems not related to smoke controls. It is expected that these revisions will reduce costs by avoiding change orders, and because in many cases designers or contractors were including features not required by the code or the U-M AHJ, or were failing to include code requirements such as air distribution system controls for high rises. These revisions were reviewed and approved by the U-M Fire Marshal.

Because revised SBA 5.11 specifies that building controls be used for air distribution system controls (rather than duplicating similar functions in the fire alarm system), DG 230900 Mechanical Systems Controls was revised to describe that requirement, and therefore is also included for approval.

#### Master Specifications

[MS211313 Wet and Dry Pipe Sprinkler Systems](#)

Revisions: Pipe used on dry systems is now specified to be schedule 40 galvanized steel in all sizes. Dry system piping must be installed with the pipe seam above horizontal, must be sloped to drain at all locations and all trapped

seam above horizontal, must be equipped with an air isolation and air trapped sections must be equipped with a drain valve. Added spec for dry pipe valve. Minor format fixes and mfr. updates. Revised spec name to wet and dry pipe sprinkler systems. Changes are due to ongoing problems with microbiological corrosion on dry pipe systems. A tracked version is provided for information.

#### 6.0 Technical Sections

##### [DG210000 Fire Protection](#)

As recommended by the Fire Protection/Plumbing Mech. Tech Team:

Due to significant problems with microbiologically induced corrosion (MIC), dry pipe systems are to be specified with schedule 40 galvanized steel pipe in lieu of schedule 10 steel pipe. This does increase the cost of dry systems somewhat, however U-M is having significant leakage problems with dry pipe systems utilizing the thin-walled schedule 10 pipe within a few years after installation, including incidents at the U-M Museum of Art. Due to the corrosion problems dry pipe systems experience, a thicker wall pipe would now be required. Additionally, galvanized pipe is recommended by FM. This change does not impact wet type sprinkler systems, which are the vast majority of sprinkler systems installed at U-M.

Mains and branch lines are required to be pitched at least 1/2 in. per 10 ft in all locations, regardless if in non-refrigerated areas/areas subject to freezing.

Additionally, antifreeze sprinkler systems are banned due to flammability problems with such systems. The State of Michigan recently banned anti freeze systems.

Formatting improvements were also made to the DG.

##### [1.0 Codes and Regulatory Agencies](#)

– Michigan Electrical Code 2012 on page 11 changed to Michigan Electrical Code 2011.

– Asterisk placed next to Building 108 Lawyers Club due to BFS compartmentalization.

– Removed "Website: <https://www.ashrae.org/news/2013/ashrae-publishes-revised-standard-on-ventilation-in-health-care-facilities->" from ASHRAE Standard 170-2013 on page 20.

– February 2015 changed to March 2015 in footer.

#### 3.0 Sustainability

##### [Design Guideline DG 3.1 Sustainable Design Requirements](#)

This document has been revised to require visual displays for projects over \$10M construction cost. Also, you shall find the AEC Title Block and Sustainable Facts Template.

#### 9.0 Standard Details and Schedules

##### [Tunnel Toolkit](#)

There are two new sheets (TK Cvrsh, TK-9).

Sheet TK-4 was divided into two sheets (TK-4A, TK-4B).

The reference file '2331m101 (reference 1)' was revised and renamed to 'm101'.

The reference file '2331t101 (reference 2)' was revised and renamed to 't101'.

There were numerous changes to the other sheets.

##### [New Mechanical Design Detail 15910002 Laboratory DDC Architecture and Scope of Work](#)

Equal scope of work will now be placed on both of our approved laboratory controls contractors. The scope of Plant DDC work is reduced. And baseline guidance can now be provided for future internal and external design of lab controls.

#### March 2015

University of Michigan AEC has updated the Design Guidelines website. The new Design Guideline format is based on a book of chapters. The book of Design Guidelines has been compiled into 10 Chapters. These chapters originated from previous design guideline titles and categories. The goal of the new format is to create streamlined, adaptable categories of subjects for design professionals. Numbers have replaced letter designations to allow for future expansion, and ease in abbreviation for meeting minutes and comments.

The information contained within the Design Guidelines has not changed.

SID (Special Instructions to Designers) documents are now located within their area of technical interest.

##### [New Design Guideline chapters and a reference list of relocated SID documents](#)

#### Preferred Manufacturers List

##### [Mechanical PML](#)

This is a quick update to remove grooved coupling mfr.s listed in the PML that are no longer approved in U.M.'s master piping specification, and to add

are no longer approved in U-M's master piping specification, and to add approved mfr.s that are listed in the U-M master spec.s to the PML (with an occasional exception).

Outdated expansion joint info revised.

Outdated boiler info deleted.

#### Master Specifications

##### [MS010000 Div 01 General Requirements](#)

The 017823 – Operation and Maintenance Manuals, 019100 – Full Project Commissioning and 019110 – Project Commissioning for Small Projects sections were revised to incorporate the recent AEC reaffirmation that Contractors shall provide 4 paper copies of O&M manuals and all 4 copies are to be submitted to FIC for distribution. Final Contractor payment will be contingent upon FIC receiving 4 paper copies of the O&M manuals.

##### [MS261100 Unit Substation Specification](#)

- The updates include:
- A number of typos and punctuation errors were corrected throughout.
  - 1.2.F – clarified that written certification is required prior to energization.
  - 1.9.A – clarified the warranty requirements. These are now in better alignment with our general warranty requirements.
  - 1.9.A.1 – added a reference to the Substantial Completion date.
  - 2.1.F.3 – revised bolt and washer finish to clear zinc.
  - 2.1.K – revised metal barriers to barriers
  - 2.2.D.6 – clarified the connection between fused switch and transformer
  - 2.2.D.9 – refined the rear door requirements
  - 2.2.D.14 – clarified the viewing window requirements
  - 2.2.E.13 – added position switches for remote indication.
  - 2.2.F.2 – updated fuse manufacturer
  - 2.2.F.3 and 4 – clarified the role of the Engineer-of-Record in fuse specification and sizing
  - 2.3.H.1 – clarified the primary connection type
  - 2.4.B and C – clarified CT and PT requirement
  - 2.4.F – clarified the blank compartments are not permitted
  - 2.4.G.5 – added open and close push buttons
  - 2.4.G.17 – added kirk key interlock requirement for tie breakers
  - 2.4.J.1.c – clarified control power transfer circuit language
  - 2.4.K.1 – revised metering mounting height parameter
  - 2.4.K.2.d – clarified current transformers and shorting blocks
  - 2.4.K.3.d – deleted redundant height requirement.
  - 2.4.K.5 – revised kilowatt meter model number (previous model was discontinued)
  - 2.4.K.6.a.4 – added shorting terminal block description
  - 3.1.E – added 1" chamfered edge to pad. Deleted leveling channels.
  - 3.1.O and P – added one-inch data conduits for metering and position switches
  - 3.2.C – deleted warranty language (clarified in 1.9.A above)
  - 3.2.D – added written certification requirement
  - 3.2.I – clarified study settings required prior to testing
  - 3.4.D – added language to coordinate training sessions and topics

##### [MS283100 Fire Detection and Alarm Specification](#)

- The updates include:
- 1.2.A and 1.2.B – deletion of all text related to a "design-build" concept. There have been a number of internal meetings over the past few months to discuss the "design-build" process. At this time, the majority of projects allot designers several months to design a fire alarm system, bidders a few weeks to pull numbers together, and then onto construction. With this process, the electricians are at the mercy of the designers and how well the set is documented, and so they can only bid what they see on the drawings to be competitive. Instead of a true "design-build" process, we're really structured as "bid-build". Further discussions are anticipated on the overall process, but for now, we are eliminating this text. It's not clear that the text added value or savings to projects, just confusion.
  - 1.5.K – added a designer hidden note to meter and document maximum ambient sound levels in renovation projects. This is a reminder to the designer to properly field verify, with the anticipation of reducing errors/omissions.
  - 1.5.L.1 – added a designer hidden note to include room names on all plans, with offices and multi-person offices differentiated. This is a reminder to the designer to properly document, with the anticipation of reducing errors/omissions.
  - 1.5.N.2 – added a designer hidden note to identify make and model of

- 1.3.11.2 – added a designer hidden note to identify make and model of existing FACPs in order to determine whether a cross-tie is feasible. This is a reminder to the designer to properly field verify, with the anticipation of reducing errors/omissions.
- 2.3 – added a designer hidden note to identify the fire alarm control panel as an "Elevator Recall Control and Supervisory Control Unit" in special circumstances. This complies with the latest Codes.
- 2.13 – corrected spelling of "plastic" within designer hidden note.
- 2.23.A.8 – deleted "2007" from the NFPA 72 reference. Keeping this one "date neutral" will save on revisions down the road.

[MS 260533](#) [Electrical Materials & Methods](#) The updates include:

- 2.3.J.1.c – added MonoSystems as an acceptable manufacturer for metallic raceways.

**February 2015.**

#### Standard Details and Master Specifications

Update our master details to include a radiused bend within the surface raceway (PDF, DGN, and DWG versions for each detail).

#### [26053313 – Dual Channel Raceway Installation](#)

#### [26053315 – Metallic Raceway With Modular Furniture Feed](#)

and update the specifications to accompany the detail revisions (refer to Paragraph 2.3.B).

#### [260533 Electrical Materials and Methods](#)

These revisions should help keep project costs down by easing installation of cables and by minimizing the potential of damage to cables.

#### Master Specifications

Removed 235239 Fire Tube Boilers (Hot Water)

Removed from the U-M web page because it does not reflect current U-M requirements for such boilers. Having it on the website risks it being used by outside A/Es, causing significant issues on projects.

#### Technical Sections

#### [DG 102800 Toilet Accessories](#)

Feminine product dispensers are not supported by building services, if requested review operational impact with department.

Added in dimensions of the trash receptacles design professional should plan for.

#### [265600 Exterior Lighting](#)

This revision switches exterior roadway, parking lot, pedestrian and building-mounted lighting from metal halide and fluorescent to LED. This change will increase energy efficiency and lamp longevity, reduce up-lighting, glare and light trespass, and reduce fixture maintenance. Project initial cost right now will be a little higher or a little lower depending upon multiple factors. Because LED prices are continuing to fall, eventually initial cost will always be lower. Energy and maintenance costs will be much lower. Light level requirements remain unchanged.

#### [Codes and Regulatory Agencies](#)

Updated issue date to February 2015

Page 2

– Changed title on table of contents from "State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Fire Services (BFS)" to "State of Michigan Health Care Safety Rules"

Page 6

– Updated Right of Way A2gov.org URL to the new web link

Page 7

– Changed title from "State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Fire Services (BFS)" to "State of Michigan Health Care Safety Rules"

– Included "Bureau of Fire Services (BFS) ((Filed December 23, 2014) Effective February 3, 2015)" after the title

[NFPA 101 – Life Safety Code updated from 2009 to 2012](#)

– NFPA 101 – Life Safety Code updated from 2006 to 2012

– Added “Note this requires by reference compliance with NFPA 99 Health Care Facilities Code 2012” at the end of the paragraph

– Updated Administrative rules web site to include the link to the new 2012 code

#### January 2015.

New [Underwriter Insurer](#)  Currently under Special Instructions to Designers.

New [Lab Design and Safety](#)  Under Special Building Areas

#### Master Specifications

Remove all four specification sections listed under Division 14 – Conveying systems: 142123, 142423, 144200, 146000.

Add the substantially revised and updated:

- [Master Specification 142123 – Electric Traction Elevator](#) 
- [Master Specification 142423 – Hydraulic Elevator](#) 

Both specifications were substantially revised to reflect current format and latest code and PML revisions. No significant cost change is associated with the revised specs.

#### December 2014.

#### Special Instructions to Designers

##### [SID-L Owner's Review](#)

Updated the format to match our new DG format.

Updated the language to declarative statements.

Updated the reviewers list to incorporate department name changes.

Added the requirement for the A/E to submit for review an updated Energy and Water Conservation Report.

This DG has been updated to match our current Owner's Review process.

No impact on project cost.

##### [SID-G Commissioning](#)

The technical changes include:

Two related documents were added and the name of another was updated,

Spec numbers were updated to match the current 6-digit numbering system.

Revision dates were removed for the reference documents.

Commissioning Authority work scope was clarified.

It has been updated to match our current commissioning processes and updated to match or current DG format.

This revision should have no impact on project cost.

#### Master Specifications

[MS 235716 Steam-To-Water Heat Exchangers](#)  – New

[MS 220523 Valves](#) 

Changes:

- Revised to strike ball valve mfr.s no longer approved or available.
- Add specific Jomar model number ball valve as approved
- Strike Grinnell GHP since it's the same valve as the Keystone that has proven unreliable.
- Restricted use of lead free valves to potable water systems only due to soldering challenges.

[MS 221113 Piping Materials & Methods](#) 

Add George Fischer as approved for PP pressure piping, add material requirements for storm and sanitary pump discharge piping. Add general requirements for plastic pipe hangers/supports. Per Plumbing and FP MTT.

#### Technical Section

[230030 Laboratory Ventilation Design](#) 

Revised: Velocity requirement for snorkels and similar devices added. See page 7. No cost impact.

#### Standard Details

Updated detail – [27200009 – Area of Refuge Two-way Comm System](#)

We had updated the DGN version in November, but the PDF and DWG versions were not updated. The PDF and DWG versions now match the DGN version.

New Tunnel Toolkit drawing: [TK-12 Tunnel Temporary Shoring Detail](#).

#### Procedures and Guidelines for Exterior Elements

[Guidelines for Installing Antennas on University Buildings or Structures](#) 

Contact person was change from Julie Truettner to Tony Catchot.
