 - 1. Provide abatement workers with adequate respiratory protection during PCB BPW removal. At a minimum, half face respirators with HEPA cartridges must be used. If removal methods generate heat above 212°F, combination HEPA/organic cartridges must be used.
 - 2. Provide personal protective equipment for protection against dermal exposures including nitrile gloves and Tyvek^R or similar suits.
- E. Maintain at each job site and post the following documents:
 - 1. Employee respiratory protection program.
 - 2. Michigan Right-To-Know poster.
 - 3. Material Safety Data Sheet locator.
 - 4. Company standard operating procedure.
 - 5. This specification Section.
 - 6. Material Safety Data Sheets for products used on job.
- F. Do not use any of the following equipment or work practices, regardless of measured exposure levels:

1. Dry sweeping or use of compressed air to clean work surfaces.
2. Removal of caulk using abrasive grinding wheels, wire wheels, sanding or other means that generate excessive dust.
3. Use of ordinary vacuums to clean up dust and debris. Vacuums with HEPA filtration must be used.

3.2 PCB BPW REMOVAL BY HAND METHODS

- A. Preparation of the Work Area: Complete the following preparation work prior to beginning removal operations using hand methods (utility knife, hammer and chisel, putty knife etc.).
 1. Seal intake and exhaust vents and duct seams within the regulated area with 1 layer of 6-mil polyethylene sheeting.
 2. Protect all surfaces near removal activity. Remove moveable objects from the work area, and cover fixed objects with impermeable dropcloths or plastic sheeting with edges securely sealed with tape.
 3. All floor and wall areas adjacent to the work area shall have a layer of 6 mil fire retardant polyethylene sheeting, attached to the interior wall and on floor surfaces below the abatement work area, at least 5 feet wide.
 4. Close all windows during interior and exterior removal projects.
 5. Regardless of method of removal, if dust is noted during removal activities, stop removal and adjust work practices or engineering controls. If dust generation continues, a full enclosure is required. See Section 3.3 "PCB Removal by Mechanical Methods."
- B. PCB BPW Removal Operations: Comply with the following requirements for removal operations:
 1. Remove PCB BPW using misting methods to assist in dust settling.
 2. Material should be removed in intact sections if possible.
 3. Adjust mechanical ventilation and or work practices accordingly to eliminate visible dust levels.
 4. Place PCB BPW in labeled 6-mil polyethylene bags.
 5. Place all bagged PCB BPW in owner provided drums or dumpsters.
- C. Post-Removal Operation Requirements: After completion of PCB BPW removal and clean-up operations, comply with the following requirements:
 1. HEPA vacuum and wet wipe/mop all areas until area is dust free.
 2. The Contractor representative, in presence of Owner or Owner's Representative shall inspect the entire work area for PCB BPW dust or material.
 3. If any suspect material is found, repeat final cleaning operation, until the visual inspection is satisfactory to the Owner.
- D. Employee Decontamination Requirements:
 1. Employees shall immediately wash hands, face and other potentially exposed surfaces of the body with soap and water each time they leave the regulated area.

2. Change out of work clothes and shower if necessary to prevent bringing PCB contamination home.

ALWAYS RETAIN FULL ARTICLE BELOW

3.3 PCB BPW REMOVAL BY MECHANICAL METHODS

- A. Preparation of the Work Area: Complete the following preparation work prior to beginning removal operations using mechanical means (any method other than hand tools).
 1. Mechanical cutting or grinding of PCB materials is not permitted, unless the equipment has a HEPA filtered exhaust.
 2. Install critical barriers over each opening into the regulated area. The following requirements are in addition to, not in lieu of, other indicated surface and object protection requirements:
 - a. Seal each opening between the work area and adjacent areas with 1 layer of 4-mil polyethylene sheeting. Openings include, but are not necessarily limited to, windows, skylights, doorways, elevator hoistway openings, corridor entrances, drains, ducts, grills, grates, and diffusers.
 - b. Seal intake and exhaust vents and duct seams within the regulated area with 1 layer of 6-mil polyethylene sheeting.
 3. HVAC System Shutdown: Owner's maintenance personnel will shut down heating, cooling, and air conditioning systems when necessary. Coordinate scheduling with Owner's personnel and provide 72 hours notice to the Owner's Representative prior to planned shut-down.
 4. Close all windows during interior and exterior removal projects.
 5. Protection of Surfaces and Objects: The following requirements are in addition to, not in lieu of, indicated work area sealing requirements. Cover the following surfaces and objects as follows:
 - a. Protect all surfaces near removal activity. Remove moveable objects from the work area, and cover fixed objects with impermeable dropcloths or plastic sheeting with edges securely sealed with tape.
 - b. Completely cover walls and floors within the regulated area with a layer of 6-mil polyethylene sheeting. Avoid seams where possible. If seams are necessary, overlap not less than 12 inches and tape joints. Immediately repair punctures and leaks, and clean up seepage.
 - c. Cleaning: Do not use cleaning methods that raise dust, such as sweeping or using vacuum cleaners not equipped with HEPA filters.
 - d. Fully seal floor drains.
 6. Local Exhaust Ventilation: Maintain portable air filtration units in use during PCB BPW removal at interior locations.
 - a. Exhaust directly to building exterior.
 - b. Provide not less than 4 air changes per hour within the enclosure.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

028400 - 4

- c. Within the enclosure, through the period of its use, maintain a pressure differential of not less than minus 0.02" water gage with respect to ambient conditions outside the enclosure.
 - 7. Visually inspect the enclosure for breeches and smoke-test for leaks before work begins, and before the start of each work shift. Make all modifications to the enclosure prior to starting removal work.
- B. PCB BPW Removal Operations: Comply with the following requirements for removal operations:
 - 1. Remove PCB BPW using misting methods to assist in dust settling.
 - 2. Material should be removed in intact sections if possible.
 - 3. Adjust mechanical ventilation and or work practices accordingly to minimize visible dust levels.
 - 4. Place PCB BPW in labeled 6-mil polyethylene bags.
 - 5. Place all bagged PCB BPW in owner provided drums or dumpsters.
- C. Post-Removal Operation Requirements: After completion of PCB BPW removal and clean-up operations, comply with the following requirements:
 - 1. HEPA vacuum and wet wipe/mop all areas until area is dust free.
 - 2. The Contractor representative, in presence of Owner or Owner's Representative shall inspect the entire work area for PCB BPW dust or material.
 - 3. If any suspect material is found, repeat final cleaning operation, until the visual inspection is satisfactory to the Owner.
- D. Employee Decontamination Requirements: Comply with the following requirements:
 - 1. Access the work area only through an approved decontamination system. Lock or block other entrances. Seal emergency exits (for use during a fire or accident) with polyethylene sheeting and tape.
 - 2. Entrance To The Regulated Area: Employees shall enter the decontamination area through the clean room, remove and store clothing, and put on protective clothing and respiratory protection before passing through to the equipment room.
 - 3. Exit From The Regulated Area: Employees shall exit the regulated area by removing gross contamination and debris from their protective clothing. The clothing shall be removed and disposed of in the equipment room into labeled impermeable bags or containers.
 - 4. Employees shall wash hands, face and other potentially exposed surfaces of the body with soap and water each time they leave the containment.
 - 5. Employees shall change out of work clothes and shower if necessary to prevent bringing PCB contamination home.

3.4 DISPOSAL OF WASTE

- A. PCB BPW shall be disposed of as PCB waste following the requirements listed below:
 - 1. Bag and place PCB BPW in Owner-provided drums or dumpsters. Contact EHS-HMM (734)763-4568 at least two weeks in advance to request containers.
 - 2. All PCB waste must be less than 3 foot x 3 foot prior to bagging or wrapping for disposal.
 - 3. Store waste containers or articles in a secure area.
 - 4. Do not stage containers on lawns, dirt piles, gravel drive areas with mud or basement areas with no elevator access.
 - 5. Ensure that soil, ground water, and drains or sewers within the storage area are protected from possible contamination. Keep containers secure and tightly closed at all times, except when adding waste.
 - 6. Keep abatement waste segregated from other waste and from other Projects. Do not co-mingle waste.
 - 7. Place appropriate labels on all containers. Provide all information required on the label; mark labels using indelible ink. The name of the "Waste Generator" is as follows:
 - a. "Campus Area" 1655 Dean Road, Ann Arbor, Michigan 48109.
 - b. Contact EHS at the start of the project (734-763-4568) for proper generator name and site address.
 - 8. Mark the side of each container with the name and phone number of Owner's Representative knowledgeable about the type of waste contained.
 - 9. Do not remove waste from Project Site.
- B. Disposal of PCB waste shall be done in coordination with EHS-Hazardous Materials Management (HMM).
 - 1. Contact EHS-HMM at least one week in advance to request pick-up of the dumpster.
 - 2. EHS will pickup and dispose of properly packaged and staged PCB waste at no cost to the contractor. Call the EHS-HMM Program at 734-763-4568 to schedule a pickup immediately after PCB waste has been staged.

DIVISION 03 CONCRETE

SECTION 033053 - MISCELLANEOUS CAST-IN-PLACE CONCRETE

END OF CONTENTS TABLE

DIVISION 03 CONCRETE

SECTION 033053 - MISCELLANEOUS CAST-IN-PLACE CONCRETE

THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO VERY SMALL PATCHING-TYPE PROJECTS ONLY. USE AIA MASTERSPEC SECTION 033000 "CAST-IN-PLACE CONCRETE" FOR MORE SUBSTANTIAL PROJECTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 079200 - Joint Sealants

1.2 SUMMARY

- A. Section includes:
 - 1. Cast-in-place concrete, including reinforcement, concrete materials, mixture design, placement procedures, and finishes.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.

INCLUDE BELOW FOR LEED PROJECTS.
- B. Sustainable Design Submittals:
 - 1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.

"PRODUCT CERTIFICATES FOR CREDIT MR 5" SUBPARAGRAPH BELOW APPLIES TO LEED-NC, LEED-CS, AND LEED FOR SCHOOLS.

RETAIN "DESIGN MIXTURES FOR CREDIT ID 1.1" SUBPARAGRAPH BELOW IF FLY ASH, SLAG CEMENT, SILICA FUME, OR OTHER MATERIALS ARE USED AS PORTLAND CEMENT REPLACEMENTS FOR LEED CREDIT ID 1.1. TO ACHIEVE THIS CREDIT, REPLACEMENT MATERIALS MUST BE SUBSTITUTED FOR AT LEAST 40 PERCENT OF THE PORTLAND CEMENT THAT WOULD OTHERWISE BE USED.

- 2. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements. For each design mixture submitted, include an equivalent concrete mixture that does not contain portland cement replacements, to determine amount of portland cement replaced.
- C. Design Mixtures: For each concrete mixture.

1. Submit written report to Architect for each proposed concrete mix at least 15 days prior to start of work. Do not begin concrete production until mixes have been reviewed and are acceptable to Architect.
- D. Laboratory Reports: Submit two (2) copies of laboratory test or evaluation reports for concrete materials and mix designs.

1.4 QUALITY ASSURANCE

- A. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94 requirements for production facilities and equipment.

PART 2 - PRODUCTS

2.1 FORMWORK

- A. Form Materials: Plywood, lumber, metal, or another approved material. Provide lumber dressed on at least two edges and one side for tight fit.
1. Wood or metal forms, sufficient to withstand pressure of placed concrete without bow or deflection.

RETAIN BELOW IF DESIRED.

- B. Chamfer Strips: Wood, metal, PVC, or rubber strips, 3/4 by 3/4 inch, minimum, unless otherwise indicated on Drawings.
- C. Form Ties: Factory-fabricated, removable or snap-off metal or glass-fiber-reinforced plastic form ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.

2.2 CONCRETE, GENERAL

- A. Comply with the following sections of ACI 301 unless modified by requirements in the Contract Documents:
1. "General Requirements."
 2. "Formwork and Formwork Accessories."
 3. "Reinforcement and Reinforcement Supports."
 4. "Concrete Mixtures."
 5. "Handling, Placing, and Constructing."
 6. "Lightweight Concrete."
- B. Comply with ACI 117.

2.3 STEEL REINFORCEMENT

- A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
- B. Reinforcing Bars: ASTM A 615, Grade 60, deformed.

- C. Joint Dowel Bars: ASTM A 615, Grade 60, plain-steel bars, cut bars true to length with ends square and free of burrs.
- D. Plain-Steel Wire: ASTM A 1064, as drawn.
- E. Plain-Steel Welded-Wire Reinforcement: ASTM A 1064, plain, fabricated from as-drawn steel wire into flat sheets.

2.4 CONCRETE MATERIALS

- A. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from single source, and obtain admixtures from single source from single manufacturer.

- B. Cementitious Materials:

TYPE I LISTED BELOW (TYPICAL PORTLAND CEMENT), TYPICAL. CONSIDER TYPE III (HIGH EARLY STRENGTH) FOR SELECT APPLICATIONS (COLD WEATHER CONDITIONS AND EARLY LOADING REQUIREMENTS, DOES NOT HELP WITH CURE TIME FOR FLOORING INSTALLATION)

- 1. Portland Cement: ASTM C 150, Type I, unless otherwise indicated.
- 2. Fly Ash: ASTM C 618, Class C or F.
- C. Normal-Weight Aggregate: ASTM C 33, selected and uniformly graded and as follows:
 - 1. Class: Severe weathering region, but not less than 3S for foundations and walls and not less than 4S for flatwork.
 - 2. Nominal Aggregate Size: In accordance with ACI 318.
- D. Air-Entraining Admixture: ASTM C 260.
- E. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and that do not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
 - 1. Water-Reducing Admixture: ASTM C 494, Type A.
 - 2. Retarding Admixture: ASTM C 494, Type B.
 - 3. Water-Reducing and Retarding Admixture: ASTM C 494, Type D.
- F. Water: ASTM C 94; potable.

TYPICALLY INCLUDE FOR EXTERIOR WORK AND INTERIOR TRENCHING. FIBER HELPS TO REDUCE SHRINKING AND CRACKING.

- G. Synthetic Fiber: Monofilament non-metallic polypropylene fibers engineered and designed for use in concrete, complying with ASTM C 1116/C 1116M, Type III, 1/2 to 1-1/2 inches long.
- H. Prepackaged Concrete Mix for Project Site Mixing: Preblended mixture of Portland cement and aggregates requiring only the addition of water with 28 day compressive strength of 4000 psi.
 - 1. Products:
 - a. Quikrete Concrete Mix No. 1101; Quikrete Companies.
 - b. Sakrete Concrete Mix; King Packaged Materials Company.

2.5 RELATED MATERIALS

EDIT LIST TO BE PROJECT SPECIFIC

- A. Vapor Retarder: Plastic sheet, ASTM E 1745, Class A, polyethylene, minimum 15 mils thick. Include manufacturer's recommended pressure-sensitive tape.
- B. Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber, or ASTM D 1752, cork or self-expanding cork.
- C. Self-Expanding Bentonite Strip Waterstops: Manufactured rectangular or trapezoidal strip, butyl rubber with sodium bentonite, for adhesive bonding to concrete, 3/4 by 1 inch.
 - 1. Products:
 - a. Carlisle Coatings & Waterproofing, Inc.; MiraSTOP.
 - b. Colloid Environmental Technologies Company; Volclay Waterstop-RX.
 - c. Greenstreak; Swellstop.
- D. Bonding Agent: ASTM C 1059, Type I, acrylic emulsion.
 - 1. Product: Polyweld; Chem-Masters, or equivalent.
- E. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces:

SELECT TYPES FROM TWO OPTIONS IN SUBPARAGRAPH BELOW BASED ON SERVICE LOADINGS.

- 1. Types IV and V, for bonding hardened or freshly mixed concrete to hardened concrete.
- 2. Product: EUCO 352 or 452; Euclid Chemical Company, or equivalent.

2.6 CURING MATERIALS

- A. Water: Potable.

BELOW IS CURING ONLY.

- B. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, dissipating.
 - 1. VOC Content: 200 g/L or less.
 - 2. Products:
 - a. Dayton Superior Corporation; Clear Cure WB (J7WB).
 - b. Euclid Chemical Company (The); Tammscure WB 30.
 - c. Meadows, W. R., Inc.; 1100 Clear.

BELOW IS CURING AND SEALING COMPOUND. CONSIDER SEALING EXPOSED CONCRETE TO PROVIDE A MORE DURABLE FINISH.

- C. Clear, Waterborne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
 - 1. VOC Content: 100 g/L or less.
 - 2. Products:
 - a. Dayton Superior Corporation; Clear & Seal EF 1315
 - b. Euclid Chemical Company (The); Super Aqua Clear VOX.
 - c. Meadows, W. R., Inc.; Vocomp-30.

2.7 CONCRETE MIXTURES

- A. Comply with ACI 301.
- B. Normal-Weight Concrete:
 - 1. Minimum Compressive Strength: 3000 psi at 28 days.
 - 2. Maximum W/C Ratio: 0.48.
 - 3. Fly Ash: Maximum 25 percent by weight of cementitious material.
 - 4. Slump Limit: 8 inches for concrete with verified slump of 2 to 4 inches before adding high-range water-reducing admixture, plus or minus 1 inch.
 - 5. Air Content: Use air-entraining admixture in all concrete; maintain within range permitted by ACI 301.
 - a. Do not allow air content of trowel-finished floor slabs to exceed 3 percent.
 - b. Provide not less than 4 percent nor more than 8 percent entrained air for concrete exposed to freezing and thawing.
 - c. Provide from 2 percent to 4 percent for all other concrete.
- C. Synthetic Fiber: Uniformly disperse in concrete mix at manufacturer's recommended rate but not less than a rate of 1.5 lb/cu. yd.

2.8 CONCRETE MIXING

- A. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94, [**and ASTM C 1116/C 1116M (for fiber reinforced concrete)**] and furnish batch ticket information.
 - 1. When material temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.
 - 2. When material temperature exceeds 95 deg F, material is unsuitable for installation.
- B. Project-Site Mixing: Use prepackaged concrete mix that requires only the addition of water at project site. Mix prepackaged concrete mix and water in appropriate drum-type batch machine mixer.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Notify Owner's Representative 48 hours before placing concrete. Do not place concrete before Architect has approved completed reinforcement installation.

3.2 FORMWORK INSTALLATION

- A. Design, construct, erect, brace, and maintain formwork according to ACI 301.

INCLUDE BELOW IF DESIRED.

1. Provide chamfer strips in the corners of concrete forms to produce beveled corners on walls and columns which will be exposed to view in finished construction.

3.3 FORMWORK REMOVAL

- A. Forms may be removed after cumulatively curing at not less than 50 deg F for 24 hours after placing concrete, if concrete is hard enough to not be damaged by form-removal operations and curing and protection operations are maintained. And as follows:
 1. Do not remove formwork until cylinder break test indicates concrete has reached 2500 psi strength.

3.4 EMBEDDED ITEM INSTALLATION

- A. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by cast-in-place concrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

3.5 VAPOR-RETARDER INSTALLATION

- A. Install, protect, and repair vapor retarders according to ASTM E 1643; place sheets in position with longest dimension parallel with direction of pour.
 1. Lap joints 6 inches and seal with manufacturer's recommended adhesive or joint tape.

3.6 STEEL REINFORCEMENT INSTALLATION

- A. Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
 1. Do not cut or puncture vapor retarder. Repair damage and re-seal vapor retarder before placing concrete.

3.7 JOINTS

- A. General: Construct joints true to line with faces perpendicular to surface plane of concrete.
- B. Construction Joints: Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect.
- C. Contraction Joints in Slabs-on-Grade: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of concrete thickness, as follows:
 1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8 inch. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces.

2. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action does not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.
- D. Isolation Joints in Slabs-on-Grade: After removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
1. Extend joint-filler strips full width and depth of joint, terminating flush with finished concrete surface unless otherwise indicated.

3.8 CONCRETE PLACEMENT

- A. Comply with ACI 301 for placing concrete.
- B. Do not add water to concrete during delivery, at Project site, or during placement.
- C. Consolidate concrete with mechanical vibrating equipment according to ACI 301.

INCLUDE BELOW IF BONDING AGENT REQUIRED

- D. Application of Bonding Agent: Clean existing surfaces free of dirt, oil, grease and cleaning agents. Apply bonding agent in accordance with manufacturer's directions. Do not allow bonding agent to puddle in low spots. Place new concrete within time limits recommended by bonding agent manufacturer.

3.9 FINISHING FORMED SURFACES

- A. Rough-Formed Finish: As-cast concrete texture imparted by forming material with tie holes and defects repaired and patched. Remove fins and other projections exceeding 1/2 inch.
 1. Apply to concrete surfaces not exposed to public view.
- B. Smooth-Formed Finish: As-cast concrete texture imparted by forming material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defective areas. Remove fins and other projections exceeding 1/8 inch.
 1. Apply to concrete surfaces exposed to public view.
- C. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces unless otherwise indicated.

3.10 FINISHING UNFORMED SURFACES

- A. General: Comply with ACI 302.1R for screeding, restraightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.

- B. Screed surfaces with a straightedge and strike off. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane before excess moisture or bleedwater appears on surface.
 - 1. Do not further disturb surfaces before starting finishing operations.
- C. Float Finish: Apply float finish to surfaces indicated, to surfaces to receive trowel finish, and to floor and slab surfaces to be covered with fluid-applied or sheet waterproofing, fluid-applied or direct-to-deck-applied membrane roofing, or sand-bed terrazzo.
- D. Trowel Finish: Apply a hard trowel finish to surfaces indicated and to floor and slab surfaces exposed to view or to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin film-finish coating system.
- E. Floor Slab Flatness: Finish surfaces to the following tolerances, according to ASTM E 1155, for a randomly trafficked floor surface:

SELECT ONE OF THE FOLLOWING TWO PARAGRAPHS.

- 1. Specified overall values of flatness, F(F) 35; and of levelness, F(L) 25; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 17; for slabs-on-grade.

CRITERIA ABOVE APPLY TO FLOORS TO RECEIVE THINSET TILE OR RESILIENT FLOORING. CRITERIA BELOW APPLY TO CARPETED FLOORS. USUALLY SELECT ABOVE AND DELETE BELOW. SEE MASTERSPEC EVALUATION SHEETS FOR ADDITIONAL EXPLANATION. NOTE THAT EVEN USING THE ABOVE CRITERIA THERE MAY STILL BE A NEED FOR FLOOR LEVELING FOR THINSET OR RESILIENT TILE DUE TO CONCRETE CURLING AND RIGID ACCEPTANCE CRITERIA BY FLOORING CONTRACTORS. CONSIDER INCLUDING AN ALLOWANCE IN DIV. 03 OR 09 SECTIONS FOR FLOOR PREPARATION.

- 2. Flatness and Levelness Criteria: overall values F(F) 25, and minimum levels of flatness F(F) 17 flatness tolerance; overall values of levelness F(L) 20, and minimum values of levelness F(L) 15 levelness tolerance, when tested in accordance with ASTM E 1155.

3.11 CONCRETE PROTECTING AND CURING

- A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 308, ACI 306.1 for cold-weather protection and with ACI 305 for hot-weather protection during curing.
- B. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
- C. Curing Methods: Cure formed and unformed concrete for at least seven days by one or a combination of the following methods:

1. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period, using cover material and waterproof tape.
2. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
3. Curing and Sealing Compound: Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Repeat process 24 hours later and apply a second coat. Maintain continuity of coating and repair damage during curing period.

3.12 CONCRETE SURFACE REPAIRS

- A. Defective Concrete: Repair and patch defective areas when approved by Architect. Remove and replace concrete that cannot be repaired and patched to Architect's approval.
- B. Patching Mortar: Mix dry-pack patching mortar, consisting of one part portland cement to two and one-half parts fine aggregate passing a No. 16 sieve, using only enough water for handling and placing.
- C. Immediately after form removal, cut out honeycombs, rock pockets, and voids more than 1/2 inch in any dimension in solid concrete, but not less than 1 inch in depth. Make edges of cuts perpendicular to concrete surface. Clean, dampen with water, and brush-coat holes and voids with bonding agent. Fill and compact with patching mortar before bonding agent has dried. Fill form-tie voids with patching mortar or cone plugs secured in place with bonding agent.
- D. Repair defects on surfaces exposed to view by blending white portland cement and standard portland cement so that, when dry, patching mortar will match surrounding color. Patch a test area at inconspicuous locations to verify mixture and color match before proceeding with patching. Compact mortar in place and strike off slightly higher than surrounding surface.
- E. Repair defects on concealed formed surfaces that affect concrete's durability and structural performance as determined by Architect.

3.13 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- B. Tests: Perform according to ACI 301.

1. Testing Frequency: Obtain at least one composite sample for each 100 cu. yd. or fraction thereof of each concrete mixture placed each day.

3.14 CONCRETE WASHOUT

- A. Perform washout using proper disposal and washout practices. Perform washing of concrete trucks in designated areas or off site. Do not discharge concrete washout into storm drains, catch basins or to the sanitary sewer system.

SPECIFICATION DIVISION 3

NUMBER SECTION DESCRIPTION

DIVISION 03 CONCRETE

SECTION 035416 - HYDRAULIC CEMENT UNDERLAYMENT

END OF CONTENTS TABLE

DIVISION 03 CONCRETE
SECTION 035416 - HYDRAULIC CEMENT UNDERLAYMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections apply to this Section.

1.2 SUMMARY

- A. Section includes the following underlayments for application below interior floor coverings:
 - 1. Poured, self-leveling underlayment.
 - 2. Trowel-on underlayment for sloped applications.
- B. Where uneven floor levels or holes occur, fill, patch, and provide underlayment as required to level surface to indicated standard prior to installation of finished floor material.

REQUIREMENT BELOW IS INTENDED TO LIMIT CLAIMS FOR EXTRAS.

- 1. Required for the following percentage of the gross floor area of the Project:

MODIFY PERCENTAGES BELOW BASED ON YOUR JUDGMENT.

- a. Approximately 20 percent.
- b. Approximately 50 percent.
- c. Approximately 75 percent.
- d. Full area.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

INCLUDE BELOW FOR LEED PROJECTS

- B. LEED Submittals:

"PRODUCT DATA FOR CREDIT IEQ 4.2" SUBPARAGRAPH BELOW APPLIES TO LEED-NC, LEED-CI, AND LEED-CS; COORDINATE WITH REQUIREMENTS SELECTED IN PART 2 FOR PAINTS AND COATINGS.

- 1. Product Data for Credit IEQ 4.2: For priming and sealing coatings, documentation including printed statement of VOC content.

1.4 INFORMATIONAL SUBMITTALS

- A. Product Certificates: Signed by manufacturers of underlayment and floor-covering systems certifying that products are compatible.

1.5 QUALITY ASSURANCE

- A. Product Compatibility: Manufacturers of underlayment and floor-covering systems certify in writing that products are compatible.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials to comply with manufacturer's written instructions to prevent deterioration from moisture or other detrimental effects.

1.7 PROJECT CONDITIONS

- A. Environmental Limitations: Comply with manufacturer's written instructions for substrate temperature, ventilation, ambient temperature and humidity, and other conditions affecting underlayment performance.
 - 1. Place hydraulic-cement-based underlayments only when ambient temperature and temperature of substrates are between 50 and 80 deg F.

1.8 COORDINATION

- A. Coordinate application of underlayment with requirements of floor-covering products and adhesives, to ensure compatibility of products.

PART 2 - PRODUCTS

2.1 SELF-LEVELING UNDERLAYMENTS

- A. Underlayment: Hydraulic-cement-based, polymer-modified, self-leveling product that can be applied at a minimum thickness of 1/4 inch up to 1-1/2 inch over large areas neat, and up to 4 inches with the addition of proper aggregate and can be featheredged to match existing floor elevations.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Ardex Engineered Cements; Ardex K-15.
 - b. Dayton Superior; LeveLayer.
 - c. Euclid Chemical Company; Super Flo-Top.
 - d. Maxxon Corporation; Level-Right.
 - 2. Cement Binder: ASTM C 150, portland cement, or hydraulic or blended hydraulic cement as defined by ASTM C 219.
 - 3. Compressive Strength: Not less than 4000 psi at 28 days when tested according to ASTM C 109.
- B. Primer: Product of underlayment manufacturer recommended in writing for substrate, conditions, and application indicated.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Ardex Engineered Cements; Ardex P 51 Primer, Ardex P 82 Ultra Prime.
 - b. Dayton Superior; J42, J42RTU.

- c. Euclid Chemical Company; Tammsweld.
- d. Maxxon Corporation; Maxxon Floor Primer.
- 2. Primer shall have a VOC content of 200 g/L or less when calculated according to 40 CFR 59, Subpart D.

2.2 SLOPED-FLOOR TROWELABLE UNDERLAYMENTS

- A. Sloped-Floor Underlayment: Trowelable, cement-based, polymer-modified, repair mortar that can be applied in minimum uniform thickness of 1/2 inch.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Ardex Engineered Cements; Ardex TRM.
 - b. Dayton Superior; Polyfast FS.
 - c. Euclid Chemical Company; Concrete-Top Supreme.
 - 2. Cement Binder: ASTM C 150, portland cement, or hydraulic or blended hydraulic cement as defined by ASTM C 219.
 - 3. Compressive Strength: Not less than 9000 psi at 28 days when tested according to ASTM C 109.
- B. Primer: Product of sloped-floor underlayment manufacturer recommended in writing for substrate, conditions, and application indicated.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - a. Ardex Engineered Cements; Ardex BACA, Ardex P 71.
 - b. Euclid Chemical Company; Duralprep AC.
 - c. Saturated Surface Dry (SSD) existing concrete surface with a scrub coat of sloped-floor underlayment.
 - 2. Primer shall have a VOC content of 200 g/L or less when calculated according to 40 CFR 59, Subpart D.

2.3 MISCELLANEOUS MATERIALS

- A. Aggregate: Well-graded, washed gravel, 1/8 to 1/4 inch; or coarse sand as recommended by underlayment manufacturer.
 - 1. Provide aggregate when recommended in writing by underlayment manufacturer for underlayment thickness required.
- B. Water: Potable and at a temperature of not more than 70 deg F.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, with Installer present, for conditions affecting performance.
 - 1. Proceed with application only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Prepare and clean substrate according to manufacturer's written instructions.

1. Treat nonmoving substrate cracks according to manufacturer's written instructions to prevent cracks from telegraphing (reflecting) through underlayment.
2. Fill substrate voids to prevent self-leveling underlayment from leaking.

DELETE SUBSTRATE MATERIALS THAT DO NOT APPLY TO PROJECT.

- B. Concrete Substrates: Mechanically remove, according to manufacturer's written instructions, laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants that might impair underlayment bond.

INCLUDE BELOW FOR NEW SLABS.

1. Moisture Testing: Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates do not exceed a maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.
- C. Wood Substrates: Mechanically fasten loose boards and panels to eliminate substrate movement and squeaks. Sand to remove coatings that might impair underlayment bond and remove sanding dust.
1. Install underlayment reinforcement recommended in writing by manufacturer.
- D. Metal Substrates: Mechanically remove, according to manufacturer's written instructions, rust, foreign matter, and other contaminants that might impair underlayment bond. Apply corrosion-resistant coating compatible with underlayment if recommended in writing by underlayment manufacturer.
- E. Nonporous Substrates: For ceramic tile, quarry tile, and terrazzo substrates, remove waxes, sealants, and other contaminants that might impair underlayment bond, and prepare surfaces according to manufacturer's written instructions.
- F. Adhesion Tests: After substrate preparation, test substrate for adhesion with underlayment according to manufacturer's written instructions.

3.3 APPLICATION

- A. General: Mix and apply underlayment components according to manufacturer's written instructions.
1. Close areas to traffic during underlayment application and for time period after application recommended in writing by manufacturer.
 2. Coordinate application of components to provide optimum underlayment-to-substrate and intercoat adhesion.
 3. At substrate expansion, isolation, and other moving joints, allow joint of same width to continue through underlayment.
- B. Apply primer over prepared substrate at manufacturer's recommended spreading rate.
1. For Sloped-Floor Underlayments, provide either a Saturated Surface Dry (SSD) concrete face or primer as recommended in writing by the Sloped-Floor Underlayment Manufacturer.

- C. Apply underlayment to produce uniform, level surface.
 - 1. Apply a final layer without aggregate to product surface.
 - 2. Feather edges to match adjacent floor elevations.
- D. Cure underlayment according to manufacturer's written instructions. Prevent contamination during application and curing processes.
- E. Do not install floor coverings over underlayment until after time period recommended in writing by underlayment manufacturer.
- F. Remove and replace underlayment areas that evidence lack of bond with substrate, including areas that emit a "hollow" sound when tapped.

3.4 PROTECTION

- A. Protect underlayment from concentrated and rolling loads for remainder of construction period.

3.5 CONCRETE WASHOUT

- A. Perform washout using proper disposal and washout practices. Perform washing of concrete trucks in designated areas or off site. Do not discharge concrete washout into storm drains, catch basins or to the sanitary sewer system.

NUMBER SECTION DESCRIPTION

DIVISION 04 MASONRY

SECTION 042000 - UNIT MASONRY

END OF CONTENTS TABLE

DIVISION 04 MASONRY
SECTION 042000 - UNIT MASONRY

THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO VERY SMALL INTERIOR PROJECTS. USE AIA MASTERSPEC SECTION OF SAME NAME AND NUMBER FOR EXTERIOR OR LOADBEARING MASONRY CONSTRUCTION.

FOR MINOR PATCHING OF CMU, REFER TO SECTION 042010 "UNIT MASONRY ASSEMBLIES (LIMITED APPLICATIONS)".

PART 1 - GENERAL

1.1 SUMMARY

EDIT LIST BELOW TO SUIT PROJECT.

- A. Types of masonry work include the following:
1. Face brick.
 2. Structural Glazed Facing Tile.
 3. Concrete masonry units.
 4. Prefaced concrete masonry units.

INCLUDE THE FOLLOWING IF APPLICABLE.

- B. Related Sections include the following:
1. Division 01 Section "Allowances" for face brick allowance.
 2. Division 08 Section "Louvers and Vents" for through-wall louvers and vents.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's data indicating that each type of masonry unit and accessory complies with specified requirements.

INCLUDE PARAGRAPH BELOW IF FACE BRICK IS INCLUDED.

- B. Brick Certification: Submit manufacturer's certification that face brick meets requirements of ASTM C 216, with exceptions indicated in "Quality Assurance" article of this Section.
- C. Samples: Provide the following samples:
1. Face Brick: Submit 12-inch by 12-inch face brick sample cards including entire range of color for preliminary selection.
 - a. Submit first set of face brick sample cards within two weeks from award of Contract.
 - b. As many as three separate manufacturers/color ranges may be selected by the Architect to be built into mock-up panels.

DELETE ABOVE OR BELOW OR BOTH AS APPLICABLE.

2. Structural Glazed Facing Tile (SGFT): Submit sample card for Architect's preliminary color selection. Submit one full size sample each, of as many as four separate colors selected by Architect.

1.3 QUALITY ASSURANCE

- A. Standards: Comply with recommendations of Brick Institute of America (BIA), National Concrete Masonry Association (NCMA) and with ACI 530/ASCE 5 and ACI 530.1/ASCE 6.

DELETE BELOW IF NO FACE BRICK.

- B. Face brick Standard: ASTM C 216, except as follows:
 - 1. Provide cored brick only; frogged brick is not acceptable.

INCLUDE BELOW FOR EXTERIOR PROJECTS.

- C. Cold Weather and Hot Weather Construction: Comply with requirements specified in ACI unit masonry standard.

INCLUDE BELOW FOR PROJECTS WITH FACE BRICK.

- D. Job Mock-up: Before ordering face brick, erect sample wall panel mock-up using materials, bond, mortar and joint tooling required for final work. Build mock-up panel at site, in location indicated by Owner, of approximately 4 feet by 4 feet, indicating proposed range of color and workmanship expected in completed work.
 - 1. Obtain Architect's acceptance of visual qualities of the mock-up and during construction use mock-up as a standard for judging completed masonry work.
 - 2. Do not alter, move or destroy mock-up until directed by Owner.
 - 3. Provide one brick mock-up panel for each selected brick mfr/color range selected by Architect.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Store cementitious materials off the ground and under cover in a dry location.
- B. Store masonry accessories to prevent corrosion and accumulation of dirt and oil.

DELETE BELOW IF NO FACE BRICK.

- C. Brick Storage: Store brick on platforms or pallets above ground. Cover with canvas or similar weatherproof material to dirt and water away from brick.

PART 2 - PRODUCTS

2.1 FACE BRICK

- A. Face Brick: ASTM C 216, Grade SW, Type FBX, cored except as follows:
 - 1. In locations where top or bottom of brick units will be exposed weather or view in completed construction, provide noncored units.

USE AIA BASIC IN LIEU OF THESE IF BRICK DOES NOT NEED TO SIMPLY MATCH EXISTING.

2. Manufacturer/Style: Match existing face brick size, color, texture, and strength as closely as possible.

DELETE BELOW IF NO SGFT. BELOW IS ONE EXAMPLE. ADD OTHERS AS REQUIRED TO SUIT PROJECT.

2.2 STRUCTURAL GLAZED FACING TILE

- A. Structural Glazed Facing Tile (SGFT): ASTM C 126; standard and special shapes; and as follows:

1. Size: 12-inch by 5-1/2-inch, to match existing; thickness as indicated.
2. Cores: Horizontal or vertical.
3. Facing: Type I (single side).
4. Base: Non-recessed, coved to match existing.
5. Color: Match existing as closely as possible.
6. Manufacturer/Style: Except where otherwise indicated, or where required to match existing adjacent conditions, provide bull-nose shapes at outside corners. Provide products of the following:
 - a. Stark Ceramics Inc.; No. *insert cat no. and select color.*

DELETE BELOW IF NO CMU.

2.3 CONCRETE MASONRY UNITS

GRADE N-I BELOW IS ONLY UNIT LIKELY TO BE AVAILABLE LOCALLY.

- A. Concrete Masonry Units (CMU): Grade N-I, "medium weight" units (min. 105 pcf). Provide units which have been cured not less than 28 days prior to delivery. In addition, comply with the following:

DELETE TYPES BELOW NOT RELEVANT TO PROJECT.

1. Hollow loadbearing CMU: ASTM C 90.
2. Size: Provide units that are 15-5/8 inches by 7-5/8 inches by width indicated on drawings, or if not indicated as follows:
 - a. Width: 11-5/8 inches.
 - b. Width: 9-5/8 inches.
 - c. Width: 7-5/8 inches.
 - d. Width: 5-5/8 inches.
 - e. Width: 3-5/8 inches.

SELECT ONE OF THE 2 FOLLOWING.

3. Ends and Corner Units: Finished and bull nosed.
4. Ends and Corner Units: Finished and square cornered.
5. Block Lintels: Provide pre-cast masonry lintels reinforced with 4 bars, two top and two bottom sized as follows:

EDIT BELOW TO SUIT PROJECT.

- a. No. 4 bars for spans to 4 feet, 8 inches.
- b. No. 5 bars for spans to 6 feet.

- c. No. 6 bars for spans to 7 feet, 4 inches.

DELETE BELOW IF NO PATTERNED UNITS.

- 6. Patterned Concrete Masonry Units: Provide units with the following pattern:
 - a. Single-score units (nominal 8-inch by 8-inch pattern).
 - b. Double-score units (nominal 5.33-inch by 8-inch pattern).

DELETE BELOW IF NO PREFACED CONCRETE BLOCK.

- 7. Prefaced Concrete Block: Lightweight concrete units indicated below with manufacturer's standard smooth resinous tile facing complying with ASTM C 744:

REVISE BELOW TO SUIT PROJECT.

- a. Color/Pattern No.: "Spectra-Glaze II", "Standard Colors" No. select color name and number; and as follows:
 - 1) Nonscored units.
 - 2) Single-score units (nominal 8-inch by 8-inch pattern).
 - 3) Double-score units (nominal 5.33-inch by 8-inch pattern).
- b. Products: Subject to compliance with requirements, provide one of the following:
 - 1) Spectra-Glaze II; Burns and Russell Co.
 - 2) Astra-Glaze; Trenwyth Industries.

DELETE BELOW IF NO SOUND-ABSORBING BLOCK UNITS - REFER TO CATALOG FOR ADDITIONAL OPTIONS/FEATURES.

- 8. Sound-Absorbing Concrete Masonry Units: Provide units with NRC range of 0.60 to 0.70, of indicated thickness, and capable of providing indicated fire-rated assembly.
 - a. Products: Subject to compliance with requirements, provide "Type RR" (or other as required to achieve indicated fire rating); the Proudfoot Co.

2.4 STONE

- A. Limestone: ASTM C 568, of the following classification and variety:
 - 1. Oolitic limestone/Category II (medium density) quarried in Lawrence, Monroe, and Owens counties, IN, of the grade, color, and finish matching existing, adjacent units.

DELETE ABOVE AND SELECT BELOW WHEN NOT SPECIFYING UNITS TO MATCH EXISTING.

- 2. Oolitic limestone/Category II (medium density) quarried in Lawrence, Monroe, and Owens counties, IN, of the following grade, color, and finish matching standards established by the Indiana Limestone Institute (ILI):

REFER TO AIA MASTERSPEC FOR INSTRUCTIONS ON IDENTIFYING CHARACTERISTICS BELOW.

- a. Grade: insert.
- b. Color: insert.

c. Finish: insert.

2.5 MORTAR MIX

GENERALLY, TYPE N MORTAR BELOW IS SUITABLE FOR INTERIOR APPLICATIONS. USE TYPE S FOR EXTERIOR FACE BRICK APPLICATIONS. USE TYPE N OR SEALANT JOINTS WITH EXTERIOR LIMESTONE. REFER TO AIA MASTERSPEC OR OTHER REFERENCES FOR FULL SELECTION.

- A. Mortar: Comply with ASTM C 270, Type N, and the following:
1. Masonry Cement: ASTM C 91, Type II; or, at Contractor's option, the following:
 - a. Portland Cement: ASTM C 150 or ASTM C 175 (air-entraining).
 - b. Hydrated lime: ASTM C 207, Type S.
 2. Sand: ASTM C 144.
- INCLUDE BELOW ONLY WITH LIMESTONE.*
- a. For white pointing mortar, use selected natural white sand or ground white stone sand.
 3. Water: Clean and potable.
- B. The use of calcium chloride or admixtures containing calcium chloride in mortar is not permitted.

2.6 ACCESSORIES

- A. Horizontal Joint Reinforcing: Provide galvanized reinforcing, with coating thickness as required by specified masonry standard for application indicated, and as follows:
1. Interior Walls and Partitions: Ladder or truss type; 9 gage side rods and cross rods.
 2. Exterior Face Brick with Block Back-Up: Ladder design (truss not permitted); 9 gage side and cross rods. Fabricate units in 10 foot lengths, with one side rod for each face shell of hollow concrete masonry units more than 4-inches in width, and one side rod for face brick wythe ("tri-rod").
- DELETE BELOW IF NO CORRUGATED TIES.*
- B. Corrugated Wall Ties: 0.8 oz. hot-dipped galvanized in lengths shown on drawings. Equal to Dur-O-Wall "D/A CWT" ties.
- DELETE BELOW IF NO LIMESTONE.*
- C. Limestone Accessories: Comply with the following:
1. Where in direct contact with stone, provide ASTM A 666, AISI Type 304 stainless steel anchors and attachments, of temper required to support loads imposed by limestone elements.
 2. Setting Buttons: Plastic or lead.
 3. Dampproofing: Cementitious or bituminous formulations recommended by ILI, non-staining to stone, compatible with joint sealants, and noncorrosive to anchors and attachments.

DELETE BOTH BELOW IF MORTAR JOINTS ARE SPECIFIED.

4. Sealant for Vertical Joints: One-part low modulus nonacid curing silicone sealant, as specified in Division 07 Section "Joint Sealants".
5. Sealant for Filling Kerfs: One-part high modulus nonacid curing silicone sealant.

DELETE BELOW IF NO WEEP HOLES REQUIRED.

- D. Weeps: Form by omission of head joints. Cotton wicks and plastic tubes are not permitted.

2.7 FLASHING

- A. Rubberized Asphalt Sheet Flashing: Manufacturer's standard composite flashing product consisting of 32-mil-thick pliable and highly adhesive rubberized asphalt compound bonded completely and integrally to 8-mil-thick, high-density, cross-laminated polyethylene film to produce an overall thickness of 40 mils.
- B. Adhesive for Flashings: Of type recommended by manufacturer of flashing material for use indicated.
- C. Products: Subject to compliance with requirements, provide one of the following:
 1. Rubberized Asphalt Sheet Flashing:
"Perm-A-Barrier Wall Flashing," W.R. Grace & Co.

2.8 INSULATION

- A. Extruded Polystyrene Board Insulation: Rigid cellular polystyrene thermal insulation with closed cells and integral high-density skin, formed by the expansion of polystyrene base resin in an extrusion process to comply with ASTM C 578, Type IV; in manufacturer's standard lengths and widths; and as follows:
 1. Thickness: 2-inches.

2.9 MASONRY CLEANERS

- A. Job-Mixed Detergent Solution: Trisodium phosphate (1/2 cup dry measure) and laundry detergent (1/2 cup dry measure) dissolved in one gallon of water. Muriatic acid cleaners are not acceptable.

DELETE BELOW IF NO LIMESTONE.

2.10 LIMESTONE FABRICATION

- A. Comply with recommendations of ILI for tolerances, holes and sinkages for anchors, fasteners, lifting devices and supports. Provide chases, reveals, reglets, and openings for continuous work. Control depth of stones and back check to maintain minimum clearances between backs of stones and backup walls or other work behind stones.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Layout walls in advance for accurate spacing of surface bond patterns and with uniform joint widths and to accurately locate openings, movement-type joints, returns and offsets. Avoid use of less-than-half-size units at corners, jambs and wherever possible at other locations.
- B. Lay up walls to comply with specified construction tolerances, with courses accurately spaced and coordinated with other work.
- C. Install (lay) masonry units as indicated:

SELECT 1 BOND PATTERN BELOW.

- 1. Pattern: Bond pattern matching existing units.
- 2. Pattern: Common running bond.
- 3. Pattern: Stack bond.

SELECT 1 COURSING PATTERN BELOW.

- 4. Coursing: Match existing adjacent units.
- 5. Coursing: As shown on drawings.

- D. Cut exposed masonry units, where necessary, with a power saw.
- E. Bond intersecting walls with masonry units or provide anchors spaced 24 inches on center.

DELETE BELOW IF NO SUCH CONDITION.

- 1. Where new masonry walls abut existing masonry construction, tooth into existing masonry and provide cross-bonding, or anchor new masonry work to existing nonmasonry structure with corrugated ties at 16-inches on-center vertically.
- F. Cavities: Strike mortar on cavity side of masonry work smooth. Keep cavity spaces between wythes free of mortar droppings and debris; use follower board if necessary.
- G. Joints: Do not align vertical joints from course to course. Hold uniform joint sizes to suit modular size of masonry units. Cut joints flush and tool slightly concave.
- H. Reinforcing: Install every second course and immediately above and below openings, for a distance of 2 feet beyond jambs of opening. Do not bridge control and expansion joints in the wall system.
 - 1. Overlap adjacent ladder type reinforcing sections not less than 14 inches.
 - 2. At corners, lap 9 gage round deformed galvanized wire with ladder type joint reinforcing not less than 14 inches.
- I. Install concealed flashings where indicated and continuously at shelf angles, lintels and similar obstructions. Comply with Brick Institute of America recommendations for forming, anchoring, joining and adhering flashing.
- J. Install weeps, located as indicated, or if not indicated, 24 inches o.c.

1. Form weep holes by keeping head joints free and clear of mortar.
 2. Fill cavities and air spaces with clean, sharp mason's sand to a height equal to height of first course but not less than 2 inches immediately above flashing embedded in the wall, as masonry construction progresses.
- K. Build other work into the masonry work as shown, fitting masonry units around other work, and grouting for secure anchorage.
- L. Masonry Patching and Infill: Where infill of existing masonry openings is indicated, comply with the following:
1. Vertical Joints: Tooth into adjacent existing block walls; do not vertically align joints at interface of existing and new masonry work.
 2. Horizontal Joints: Align coursing to match existing, adjacent units.

DELETE BELOW IF NO LIMESTONE. REMEMBER, THIS IS FOR VERY LIMITED STONE WORK (SUCH AS REPLACING A SILL). DO NOT USE FOR MORE EXTENSIVE WORK.

- M. Install limestone in accordance with drawings, complete with anchors, supports, fasteners and other attachments to secure stonework in place. Set stones on setting buttons or shims to maintain uniform width of joints. Apply dampproofing to backs of limestone surfaces.
1. Sealant Joints: Set stone with sealant joints. Fill anchor holes with sealant.
 2. Mortar Joints: Set stones in mortar. Fill anchor holes with mortar. Rake out joints and point with white mortar. Tool joints concave.

3.2 CLEANING

MOST ACIDIC CLEANERS, EVEN PROPRIETARY PRODUCTS LISTED AS "MILD", ARE ACTUALLY QUITE STRONG. THEY MAY CAUSE DAMAGE TO MASONRY AND ADJACENT SURFACES AND ARE DIFFICULT TO COLLECT AND DISPOSE OF PROPERLY.

GOOD MASONRY PRACTICE INCLUDES REMOVING MORTAR FROM EXPOSED MASONRY FACES BEFORE SETTING. IF THIS IS NOT DONE, USE OF ACIDIC CLEANERS MAY BE NECESSARY. REFER TO AIA MASTERSPEC SECTION 042000 FOR LISTING OF PROPRIETARY ACIDIC CLEANERS AND READ PRODUCT LITERATURE BEFORE SPECIFYING. INCLUDE IN SPECIFICATION A PROVISION FOR TESTING A SMALL AREA BEFORE GENERAL CLEANING. CONTACT OSEH FOR INFORMATION REGARDING PROPER DISPOSAL.

- A. Clean excess mortar as work progresses.
- B. Remove large mortar particles by hand using non-metallic scrapers or paddles.
- C. Final cleaning: Clean masonry with stiff non-metallic brushes, clean water, and a mild non-acidic soap or detergent, if required. Do not use acids without prior written approval.

- D. Dispose of wash water by methods described in Division 01 Section "Closeout Procedures."

END OF SECTION 042000

The Description of the Project
P00000000 0000

SPECIFICATION DIVISION 4

NUMBER SECTION DESCRIPTION

DIVISION 04 MASONRY

SECTION 042010 - UNIT MASONRY ASSEMBLIES (LIMITED APPLICATIONS)

END OF CONTENTS TABLE

DIVISION 04 MASONRY

SECTION 042010 - UNIT MASONRY ASSEMBLIES (LIMITED APPLICATIONS)

THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO INTERIOR MASONRY WORK LIMITED TO MODIFYING EXISTING CMU ASSEMBLIES. USE MASTERSPEC SECTION 042000 "UNIT MASONRY ASSEMBLIES" OR AIA MASTERSPEC SECTION OF SAME NAME AND NUMBER FOR MORE SUBSTANTIAL PROJECTS.

12/1/2017 - ADDED IDENTIFICATION REQUIREMENTS.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of masonry work consists of modifying existing concrete masonry unit structures and is indicated on drawings and by provisions of this Section.
- B. Section Includes:
 - 1. Concrete masonry units (CMU's).
 - 2. Steel reinforcement.
- C. Related Sections Includes:
 - 1. Division 05 Section "Metal Fabrications" for steel lintels.

1.2 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For reinforcing steel. Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement."

1.3 QUALITY ASSURANCE

- A. Masonry Standard: Comply with ACI 530.1/ASCE 6/TMS 602 unless modified by requirements in the Contract Documents.

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.
- B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.

1.5 PROJECT CONDITIONS

- A. Stain Prevention: Prevent grout and mortar from staining the face of masonry. Immediately remove grout and mortar that come in contact with masonry.

1. Protect floor and base of walls from mortar splatter by spreading coverings on floor and over wall surface.
2. Protect sills, ledges, and projections from mortar droppings.
3. Protect floors and adjacent walls from mortar droppings.
4. Protect surfaces of window and door frames, as well as similar products with painted and integral finishes, from mortar droppings.

PART 2 - PRODUCTS

2.1 MASONRY UNITS, GENERAL

- A. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to contain chips, cracks, or other defects exceeding limits stated in the standard. Do not use units where such defects will be exposed in the completed Work.
- B. Fire-Resistance Ratings: Where indicated, provide units that comply with requirements for fire-resistance ratings indicated as determined by testing according to ASTM E 119, by equivalent masonry thickness, or by other means, as acceptable to authorities having jurisdiction.

2.2 CONCRETE MASONRY UNITS

SECTION IS PRE-EDITED FOR NEW BLOCK IN AREAS WITH EXISTING BLOCK. IF NO EXISTING BLOCK, SECTION WILL REQUIRE ADDITIONAL INFORMATION.

- A. Concrete Masonry Units: Provide new concrete masonry units, mortar, and accessories that match the existing installation in every respect, including size, texture and strength.
- B. Concrete Masonry Units: ASTM C 90
 1. Unit Compressive Strength: Provide units with minimum average net-area compressive strength of 1900 psi.
 2. Density Classification: Medium weight.

INDICATE NOMINAL WIDTHS ON DRAWINGS.

 3. Size: Nominal face dimension of 16 inches long x 8 inches high (15-5/8 inches x 7-5/8 inches actual) x 3/8 inch less than nominal widths indicated on Drawings.
- C. Shapes: Provide shapes indicated and for lintels, corners, jambs, control joints and other special conditions.

2.3 MORTAR AND GROUT MATERIALS

BELOW ARE TYPICAL SELECTIONS FOR INTERIOR APPLICATIONS.

- A. Portland Cement: ASTM C 150, Type I.
- B. Hydrated Lime: ASTM C 207, Type S.
- C. Portland Cement-Lime Mix: Packaged blend of portland cement and hydrated lime containing no other ingredients.

- D. Masonry Cement: ASTM C 91.
- E. Mortar Cement: ASTM C 1329.
- F. Aggregate for Mortar: ASTM C 144.
- G. Aggregate for Grout: ASTM C 404.
- H. Water: Potable.

2.4 CONCRETE AND MASONRY LINTELS

- A. General: Provide the following:

SELECT ONE OF THE FOLLOWING OR EDIT ABOVE TO STATE "ONE OF THE FOLLOWING" AND ALLOW CONTRACTOR TO SELECT.

FOR CONCRETE MASONRY UNIT WALLS WHERE LINTEL IS EXPOSED TO VIEW, USE PREFABRICATED OR BUILT-IN-PLACE BOND BEAM LINTELS.

FOR CONCRETE MASONRY UNIT WALLS WHERE LINTEL IS NOT EXPOSED TO VIEW, USE EITHER CONCRETE LINTELS OR BOND BEAM LINTELS

- 1. Concrete Lintels: ASTM C 1623, matching CMUs in color, texture, and density classification; and with reinforcing bars indicated. Provide lintels with net-area compressive strength not less than CMUs.
- 2. Masonry Lintels: Prefabricated or built-in-place masonry lintels made from bond beam CMUs with reinforcing bars placed as indicated and filled with coarse grout.

2.5 REINFORCEMENT

- A. Masonry Joint Reinforcement, General: ASTM A 951.

INTERIOR WALLS EXPOSED TO A MEAN RELATIVE HUMIDITY LESS THAN OR EQUAL TO 75% USE MILL GALVANIZED.

INTERIOR WALLS EXPOSED TO A MEAN RELATIVE HUMIDITY GREATER THAN OR EQUAL TO 75% USE HOT-DIPPED GALVANIZED.

USE 0.187 INCH DIAMETER WIRE SIZE FOR 1/2 INCH THICK JOINTS

EDIT BELOW.

- 1. Interior Walls: [Mill-] [Hot-dip galvanized], carbon steel
 - 2. Wire Size for Side Rods: [0.148-inch (9 gage)] [0.187-inch] diameter.
 - 3. Wire Size for Cross Rods: [0.148-inch (9 gage)] [0.187-inch] diameter.
 - 4. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches o.c.
 - 5. Provide in lengths of not less than 10 feet, with prefabricated corner and tee units.
- B. Masonry Joint Reinforcement for Single-Wythe Masonry: Either ladder or truss type with single pair of side rods.

2.6 MORTAR AND GROUT MIXES

- A. Mortar for Unit Masonry: Comply with ASTM C 270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated.
 - 1. For interior non-load-bearing partitions: Type N.
 - 2. For interior load-bearing walls: Type S.
- B. Grout for Unit Masonry: Comply with ASTM C 476.
 - 1. Use grout of type (fine or coarse) that will comply with Table 1.15.1 in ACI 530.1/ASCE 6/TMS 602 for dimensions of grout spaces and pour height.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Lay masonry units with bond pattern matching existing adjacent units, with face shells fully bedded in mortar and with head joints of depth equal to bed joints and as follows:
 - 1. Vertical Joints: Tooth into adjacent existing block walls; do not vertically align joints at interface of existing and new masonry work.
 - 2. Horizontal Joints: Align coursing to match existing, adjacent units.
- B. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.
- C. Cut joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint) unless otherwise indicated.
- D. Cut exposed masonry units, where necessary, with a power saw. Allow units to dry before laying. Install cut units with cut surfaces and, where possible, cut edges concealed. Avoid the use (by proper layout) of less than half-size units.
- E. Bond intersecting walls with masonry units or provide anchors spaced 24 inches on center.
- F. Reinforcing: Install entire length of longitudinal side rods in mortar with a minimum cover of 1/2 inch on interior walls. Lap reinforcement a minimum of 6 inches. Do not bridge control and expansion joints in the wall system.

INCLUDE BELOW IF APPROPRIATE.

*REVISE SUBPARAGRAPHS BELOW IF DIFFERENT SPACING IS REQUIRED;
DELETE IF SHOWN ON DRAWINGS.*

- 1. Space reinforcement not more than 16 inches o.c.
 - 2. Provide reinforcement not more than 8 inches above and below wall openings and extending 12 inches beyond openings in addition to continuous reinforcement.
- G. Build other work into the masonry work as shown, fitting masonry units around other work, and grouting for secure anchorage.

3.2 LINTELS

- A. Provide concrete or masonry lintels where shown and where openings of more than 24 inches are shown without steel or other supporting lintels.
- B. Provide minimum bearing of 8 inches at each jamb.

3.3 IDENTIFICATION

- A. Provide permanent identification of all assemblies requiring opening protectives including fire walls, fire barriers, fire partitions, and smoke barriers.
- B. Install in accordance with the requirements of Michigan Building Code chapter 7.
- C. Location:
 - 1. Locate in accessible concealed spaces above finished ceiling. In locations without accessible concealed location, coordinate location with architect.
 - 2. Locate within 15 feet of the end of each wall and at intervals not exceeding 30 feet measured horizontally along the assembly.
- D. Signage requirements:
 - 1. Lettering:
 - a. 3-inch minimum; 3/8-inch stroke width.
 - b. Color: Red on white background
 - 2. Verbiage incorporating project specific hourly rating. Refer to life safety plan for rating requirements:
 - a. FIRE RATED ASSEMBLY (___HR) - PROTECT ALL OPENING
 - b. SMOKE BARRIER - PROTECT ALL OPENINGS

3.4 CLEANING

MOST ACIDIC CLEANERS, EVEN PROPRIETARY PRODUCTS LISTED AS "MILD", ARE ACTUALLY QUITE STRONG. THEY MAY CAUSE DAMAGE TO MASONRY AND ADJACENT SURFACES AND ARE DIFFICULT TO COLLECT AND DISPOSE OF PROPERLY.

GOOD MASONRY PRACTICE INCLUDES REMOVING MORTAR FROM EXPOSED MASONRY FACES BEFORE SETTING. IF THIS IS NOT DONE, USE OF ACIDIC CLEANERS MAY BE NECESSARY. REFER TO AIA MASTERSPEC SECTION 42010 FOR LISTING OF PROPRIETARY ACIDIC CLEANERS AND READ PRODUCT LITERATURE BEFORE SPECIFYING. INCLUDE IN SPECIFICATION A PROVISION FOR TESTING A SMALL AREA BEFORE GENERAL CLEANING. CONTACT OSEH FOR INFORMATION REGARDING PROPER DISPOSAL.

- A. Clean concrete masonry by cleaning method indicated in NCMA TEK 8-2A applicable to type of stain on exposed surfaces.
- B. Clean excess mortar as work progresses.
- C. Remove large mortar particles by hand using non-metallic scrapers or paddles.
- D. Final cleaning: Clean masonry with stiff non-metallic brushes, clean water, and a mild non-acidic soap or detergent, if required. Do not use acids without prior written approval.

E. Dispose of wash water by methods described in Division 01 Section
"Closeout Procedures."

DIVISION 05 METALS

SECTION 051200 - STRUCTURAL STEEL FRAMING

END OF CONTENTS TABLE

DIVISION 05 METALS

SECTION 051200 - STRUCTURAL STEEL FRAMING

USE THIS MASTER FOR SMALL PROJECTS ONLY. SIGNIFICANT STRUCTURAL WORK SHOULD BE SPECIFIED USING AIA MASTERSPEC SECTION OF SAME NAME AND NUMBER.

EDIT THIS SECTION WITH STRUCTURAL DRAWINGS IN HAND.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of structural steel is shown on drawings.

1.2 SUBMITTALS

- A. Shop Drawings: Show complete details for fabrication, assembly and erection.

1.3 QUALITY ASSURANCE

- A. Codes and Standards: AISC "Code of Standard Practice for Steel Buildings and Bridges"; AISC "Specifications for the Design, Fabrication, and Erection of Structural Steel for Buildings including "Commentary"; AWS "Structural Welding Code"; comply with applicable provisions except as otherwise indicated.

PART 2 - PRODUCTS

2.1 MATERIALS

THE FOLLOWING LIST OF MATERIALS HAS BEEN EDITED FOR BREVITY. WHERE ADDITIONAL ITEMS ARE REQUIRED, AND FOR ALL BUT THE SIMPLEST STEEL STRUCTURES SUBSTITUTE THE AIA BASIC SECTION.

- A. Structural Steel Shapes: ASTM A 572, Grade 50, unless otherwise indicated.
- B. Structural Steel Plates and Bars: ASTM A 36, unless otherwise indicated.
- C. Cold-Formed Structural Steel Tubing: ASTM A 500, Grade B.
- D. Hot-Formed Structural Steel Tubing: ASTM A 501.
- E. Steel Pipe: ASTM A 53, Type E or S, Grade B; Schedule 40 and as follows:

SELECT ONE BELOW.

- 1. Black finish.
- 2. Galvanized.

SELECT FASTENERS BELOW IN CONSULTATION WITH STRUCTURAL ENGINEER. HIGH STRENGTH, ASTM A 325, TYPE 1 ARE COMMONLY USED.

- F. Nonhigh-Strength Bolts, Nuts, and Washers: ASTM A 307, Grade A (ASTM F 568, Property Class 4.6); carbon-steel, hex-head bolts; carbon-steel nuts; and flat, unhardened steel washers.

SELECT 1 BELOW.

1. Finish: Plain, uncoated.
2. Finish: Hot-dip zinc-coating, ASTM A 153, Class C.
3. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50.

- G. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers.

SELECT 1 BELOW.

1. Finish: Plain, uncoated.
2. Finish: Hot-dip zinc-coating, ASTM A 153, Class C.
3. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50.

RETAIN COMPRESSIBLE-WASHER, DIRECT-TENSION INDICATORS BELOW IN CONSULTATION WITH ENGINEER.

4. Direct-Tension Indicators: ASTM F 959, Type 325.
 - a. Finish: Plain, uncoated.
 - b. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50.
 - c. Finish: Mechanically deposited zinc-coating, ASTM B 695, Class 50, epoxy coated.

- H. High-Strength Bolts, Nuts, and Washers: ASTM A 490, Type 1, heavy hex steel structural bolts, heavy hex carbon-steel nuts, and hardened carbon-steel washers, uncoated.

RETAIN COMPRESSIBLE-WASHER DEVICES BELOW IN CONSULTATION WITH ENGINEER.

1. Direct-Tension Indicators: ASTM F 959, Type 490, uncoated.

DELETE BELOW IF NO WELDING.

- I. Welding Electrodes: Comply with AWS requirements.

DELETE BELOW IF NO PRIME PAINTING. UNITS EMBEDDED IN CONCRETE ARE USUALLY NOT PRIMED.

- J. Shop Paint: Fast-curing, lead- and chromate-free universal modified -alkyd primer with good resistance to normal atmospheric corrosion, complying with performance requirements of FS TT-P-664.

DELETE BELOW IF NO GALVANIZED STEEL.

- K. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in galvanized steel, with dry film containing not less than 93 percent zinc dust by weight, and complying with SSPC Paint 20.

BELOW FOR HEAVY-DUTY APPLICATIONS NOT EXPOSED TO MOISTURE

- L. Metallic Shrinkage-Resistant Grout: Premixed factory-packaged ferrous aggregate grout complying with ASTM C 1107, of consistency suitable for application, and with minute working time.

BELOW FOR APPLICATION EXPOSED TO MOISTURE

- M. Nonmetallic Shrinkage-Resistant Grout: Premixed, nonmetallic, noncorrosive, nonstaining product containing selected silica sands, portland cement, shrinkage compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, of consistency suitable for application, and with a 30-minute working time.

2.2 FABRICATION

- A. In general, comply with AISC "Specifications" and final shop drawings. Mark and match-mark units for field assembly.
- B. Connections: Use high-strength bolts for field connections.
 - 1. Comply with AWS Code for procedures, appearance, and quality of welds.
- C. Fabricate architecturally exposed structural steel with exposed surfaces smooth, square and free of surface blemishes, including pitting, rust, scale seam marks, roller marks, rolled trade names, and roughness.
 - 1. Remove blemishes by filling, grinding, or by welding prior to cleaning, treating, and shop priming.
- D. Holes: Provide holes required for securing other work to structural steel framing and for passage of other work through steel framing members, as shown on shop drawings.
 - 1. Cut, drill or punch holes perpendicular to metal surfaces. Do not flame-cut holes or enlarge holes by burning. Drill holes in bearing plates.
 - 2. Weld threaded nuts to framing and other specialty items as indicated to receive other work.
- E. Shop Priming: Comply with the following requirements for preparation and application of priming:
 - 1. Preparation for Shop Priming: Prepare uncoated ferrous metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:

BOTH OF BELOW APPLY TO LOCATIONS THAT WOULD NORMALLY REMAIN DRY IN SERVICE.

- a. Exteriors (SSPC Zone 1B): SSPC-SP 6 "Commercial Blast Cleaning."
- b. Interiors (SSPC Zone 1A): SSPC-SP 3 "Power Tool Cleaning."
- 2. Shop Priming: Shop prime surfaces, except the following:

DELETE INAPPLICABLE ITEMS BELOW.

- a. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.
- b. Surfaces to be field welded.

- c. Surfaces to receive sprayed-on fire proofing.
- d. Galvanized surfaces.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Prior to beginning erection, verify elevations of bearing surfaces and locations of anchorages. Do not proceed until unsatisfactory conditions have been corrected.
- B. Provide temporary supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads.

3.2 ERECTION

- A. Set structural steel accurately in locations and to elevations indicated and according to AISC specifications referenced in this Section.

ADD LEVELING PLATES TO PARA BELOW IF REQUIRED.

- B. Base and Bearing Plates: Clean concrete and masonry bearing surfaces of bond-reducing materials and roughen surfaces prior to setting base and bearing plates. Clean bottom surface of base and bearing plates.
 - 1. Set base and bearing plates for structural members on wedges, shims, or setting nuts as required.
 - 2. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of base or bearing plate prior to packing with grout.
 - 3. Pack grout solidly between bearing surfaces and plates so no voids remain. Finish exposed surfaces, protect installed materials, and allow to cure.
 - a. Comply with manufacturer's instructions for proprietary grout materials.
- C. Maintain erection tolerances of structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges."

RETAIN BELOW WHEN ARCHITECTURALLY EXPOSED STRUCTURAL STEEL IS REQUIRED.

- 1. Maintain erection tolerances of architecturally exposed structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges."
- D. Align and adjust various members forming part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
 - 1. Level and plumb individual members of structure.

REVIEW SUBPARA BELOW WITH STRUCTURAL ENGINEER AND REVISE AS REQUIRED. DELETE TEMPERATURE ALLOWANCES IF NOT REQUIRED.

2. Establish required leveling and plumbing measurements on mean operating temperature of structure. Make allowances for difference between temperature at time of erection and mean temperature at which structure will be when completed and in service.

E. Splice members only where indicated.

RETAIN PARA BELOW WHEN WELDED, ARCHITECTURALLY EXPOSED STRUCTURAL STEEL IS REQUIRED.

- F. Remove erection bolts on welded, architecturally exposed structural steel; fill holes with plug welds; and grind smooth at exposed surfaces.
- G. Finish sections thermally cut during erection equal to a sheared appearance.
- H. Do not enlarge unfair holes in members by burning or by using drift pins. Ream holes that must be enlarged to admit bolts.

3.3 FIELD CONNECTIONS

EDIT BELOW IN CONSULTATION WITH STRUCTURAL ENGINEER.

- A. Install and tighten nonhigh-strength bolts, except where high-strength bolts are indicated.

DELETE ABOVE IF NO NONHIGH-STRENGTH BOLTING.

- B. Install and tighten high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."

DELETE ABOVE AND BELOW IF NO HIGH STRENGTH BOLTING. IF H.S. BOLTING IS REQUIRED, SELECT ABOVE, BELOW OR BOTH IN CONSULTATION WITH ENGINEER.

- C. Install and tighten high-strength bolts according to RCSC's "Load and Resistance Factor Design Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."

RETAIN SUBPARAS BELOW WITH EITHER H.S. BOLT TYPE ABOVE.

1. Bolts: ASTM A 325 high-strength bolts, unless otherwise indicated.

SELECT ABOVE OR BELOW.

2. Bolts: ASTM A 490 high-strength bolts, unless otherwise indicated.
3. Connection Type: Snug tightened, unless indicated as slip-critical, direct-tension, or tensioned shear/bearing connections.

SELECT ABOVE OR BELOW IN CONSULTATION WITH ENGINEER.

4. Connection Type: Slip-critical, direct-tension, or tensioned shear/bearing connections as indicated.

- D. Weld Connections: Comply with AWS D1.1 for procedures, appearance and quality of welds, and methods used in correcting welding work.
 - 1. Comply with AISC specifications referenced in this Section for bearing, adequacy of temporary connections, alignment, and removal of paint on surfaces adjacent to field welds.

DELETE BELOW IF BUILT-UP SECTIONS ARE NOT REQUIRED.

- 2. Assemble and weld built-up sections by methods that will maintain true alignment of axes without warp.

RETAIN BELOW WHEN ARCHITECTURALLY EXPOSED STRUCTURAL STEEL IS REQUIRED.

- 3. Verify that weld sizes, fabrication sequence, and equipment used for architecturally exposed structural steel will limit distortions to allowable tolerances. Prevent surface bleeding of back-side welding on exposed steel surfaces. Grind smooth exposed fillet welds 1/2 inch and larger. Grind flush butt welds. Dress exposed welds.

3.4 CLEANING

- A. Touchup Painting: Clean and touchup paint of field welds, bolted connections, and abraded areas of shop paint on structural steel.

SPECIFICATION DIVISION 5

NUMBER SECTION DESCRIPTION

DIVISION 05 METALS

SECTION 053100 - STEEL DECKING

END OF CONTENTS TABLE

DIVISION 05 METALS
SECTION 053100 - STEEL DECKING

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes steel deck units for roof repair.

1.2 SUBMITTALS

- A. Product data including manufacturer's specifications and installation instructions for each type of decking and accessories.
1. Provide test data for mechanical fasteners used in lieu of welding for fastening deck to supporting structures.
- B. Shop drawings showing layout of deck units, anchorage details, and sump pans, cut openings, special jointing, and other accessories.
- C. Submit the following to Factory Mutual for plan review at least three weeks prior to commencing installation: completed FM application, shop drawings and product data complying with the requirements listed under "Quality Assurance" article in this section. Include sufficient information on drawings to ensure compliance with FM fastening requirements for both field areas and perimeter areas.

1.3 QUALITY ASSURANCE

- A. Codes and Standards: Comply with provisions of the following codes and standards, except as otherwise indicated:
1. American Iron and Steel Institute (AISI), "Specification for the Design of Cold-Formed Steel Structural Members."
2. American Welding Society (AWS), D1.3 "Structural Welding Code - Sheet Steel."
3. Steel Deck Institute (SDI), "Design Manual for Composite Decks, Form Decks and Roof Decks."
- B. Qualification of Field Welding: Use qualified welding processes and welding operators in accordance with "Welder Qualification" procedures of AWS.
- C. Underwriters' Label: Provide metal floor deck units listed in Underwriters' Laboratories "Fire Resistance Directory", with each deck unit bearing the UL label and marking for specific system detailed.
- D. FM Listing: Provide steel roof deck units that have been evaluated by Factory Mutual System and are listed in "Factory Mutual Approval Guide" for "Class 1" fire-rated construction.

SELECT THE APPROPRIATE FM CLASS FOR ROOF CONSTRUCTION IN THE FOLLOWING PARAGRAPH

- E. FM Standards: Comply with FM Global Standards, the FM Research Approval Guide and all applicable FM data sheets, including but not limited to, Property Loss Prevention Data Sheets 1-28, 1-29, 1-49, and 1-54. Roof assembly shall meet the requirements of FM Class 1-60 1-90 1-120.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:

Bowman Metal Deck Div., Cyclops Corp.
Consolidated Systems, Inc.
Roll Form Products, Inc.
Roof Deck, Inc.
United Steel Deck, Inc.
Vulcraft Div., Nucor Corp.
Wheeling Corrugating Co.

2.2 MATERIALS

- A. Steel for Galvanized Metal Deck Units: ASTM A 446, grade as required to comply with SDI specifications.
- B. Sheet Metal Accessories: ASTM A 526, commercial quality, galvanized.

REVISE BELOW IF HEAVIER GALVANIZING (G90) REQUIRED.

- C. Galvanizing: ASTM A 525, G60.
- D. Galvanizing Repair: Where galvanized surfaces are damaged, prepare surfaces and repair in accordance with procedures specified in ASTM A 780.

2.3 FABRICATION

- A. General: Form deck units in lengths to span three or more supports, with flush, telescoped, or nested 2-inch laps at ends and interlocking or nested side laps, of metal thickness, depth, and width as indicated.
- B. Roof Deck Units: Provide deck configurations that comply with SDI "Specifications and Commentary for Steel Roof Deck."
- C. Roof Sump Pans: Fabricate from single piece of 0.071-inch min. (14 gage) galvanized sheet steel with level bottoms and sloping sides to direct water flow to drain. Provide sump pans of adequate size to receive roof drains and with bearing flanges not less than 3 inches wide. Recess pans not less than 1-1/2 inches below roof deck surface unless otherwise shown or required by deck configuration. Holes for drains will be cut in the field by others.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install deck units and accessories in strict accordance with manufacturer's recommendations, shop drawings, Factory Mutual standards and as specified herein.
- B. Place deck units on supporting steel framework and adjust to final position with ends accurately aligned and bearing on supporting members before being permanently fastened. Do not stretch or compress side lap interlocks.
- C. Place deck units flat and square, secured to adjacent framing without warp or deflection.
- D. Coordinate and cooperate with structural steel erector in locating decking bundles to prevent overloading of structural members.
- E. Fastening Deck Units:
 - 1. Fasten roof deck units to steel supporting members by not less than 1/2-inch-diameter puddle welds or elongated welds of equal strength, spaced not more than 12 inches at every support, and at closer spacing where indicated. In addition, secure deck to each supporting member in ribs where side laps occur.
 - 2. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used in correcting welding work.
 - a. Use welding washers where recommended by deck manufacturer.
 - 3. Mechanical fasteners, either powder-actuated or pneumatically driven, may be used in lieu of welding. Locate mechanical fasteners and install in accordance with deck manufacturer's instructions.
 - 4. Mechanically fasten side laps of adjacent deck units between supports, at intervals not exceeding 36 inches o.c., using self-tapping No. 8 or larger machine screws.
 - 5. Uplift Loading: Install and anchor roof deck units to resist gross uplift loading of 45 lbs. psf at eave overhang and 30 lbs. psf for other roof areas.
- F. Cutting and Fitting: Cut and neatly fit deck units and accessories around other work projecting through or adjacent to the decking, as shown.
- G. Reinforcement at Openings: Provide additional metal reinforcement and closure pieces as required for strength, continuity of decking, and support of other work shown.
- H. Roof Sump Pans: Place over openings provided in roof decking and weld to top decking surface. Space welds not more than 12 inches o.c. with at least one weld at each corner.
- I. Touch-Up Painting: After decking installation, wire brush, clean, and paint scarred areas, welds, and rust spots on top and bottom surfaces of decking units and supporting steel members.
 - 1. Touch-up galvanized surfaces with galvanizing repair paint applied in accordance with manufacturer's instructions.

SPECIFICATION DIVISION 5

NUMBER SECTION DESCRIPTION

DIVISION 05 METALS

SECTION 055000 - METAL FABRICATIONS

END OF CONTENTS TABLE

DIVISION 05 METALS
SECTION 055000 - METAL FABRICATIONS

NOV 2004 - CHANGED LADDER RUNGS PER ROOFING DEPT. REQUEST.

PART 1 - GENERAL

1.1 SUMMARY

- A. Types of metal fabrications include the following:

EDIT BELOW TO SUIT PROJECT

1. Rough hardware.
2. Steel ladders.
3. Loose bearing and leveling plates.
4. Loose steel lintels.
5. Railings and guards.
6. Metal stairs.
7. Metal bar gratings.
8. Miscellaneous framing and supports.
9. Miscellaneous steel trim.
10. Structural steel door frames.

1.2 SUBMITTALS

- A. Product data indicating compliance with requirements for the following:

EDIT BELOW TO SUIT PROJECT

1. Grout.
 2. Metal grating.
- B. Shop drawings detailing fabrication and erection of each metal fabrication indicated. Include plans, sections, and details of metal fabrications and their connections. show anchorage and accessory items. Provide templates for anchors and bolts installed under other Sections.
- C. Welder certificates signed by the Contractor and indicating that welders comply with requirements specified under "Quality Assurance" Article.

1.3 QUALITY ASSURANCE

- A. Codes and Standards: AISC "Specifications for the Design, Fabrication and Erection of Structural Steel for Buildings"; AWS "Structural Welding Code"; comply with applicable provisions.
- B. Welding Standards: Comply with applicable provisions of AWS D1.1 "Structural Welding Code - Steel," AWS D1.2 "Structural Welding Code - Aluminum," and AWS D1.3 "Structural Welding Code - Sheet Steel."
1. Certify that each welder has satisfactorily passed AWS qualification tests for welding processes involved and if pertinent, has undergone recertification.

1.4 PROJECT CONDITIONS

- A. Where field measurements cannot be made without delaying The Work, guarantee dimensions and proceed with fabricating products without field measurements. Coordinate construction to ensure that actual dimensions correspond to guaranteed dimensions. Allow for trimming and fitting.

PART 2 - PRODUCTS

2.1 FERROUS MATERIALS

- A. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials selected for their surface flatness, smoothness, and freedom from surface blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.
- B. Steel Plates, Shapes, Bars: ASTM A 36.
- C. Rolled Steel Floor Plates: ASTM A 786.
- D. Steel Tubing: Product type (manufacturing method) as follows:
 - 1. Cold-Formed Steel Tubing: ASTM A 500.
 - 2. Hot Formed Steel Tubing: ASTM A 501.

REVISE BELOW AS REQUIRED.

- a. For exterior installations and where indicated, provide tubing with hot-dip galvanized coating per ASTM A 53.
- E. Steel Pipe: ASTM A 53, standard weight (schedule 40), unless otherwise indicated, or another weight required by structural loads.
 - 1. Black finish, unless otherwise indicated.

DELETE ABOVE OR BELOW IF NOT APPLICABLE.

- 2. Galvanized finish for exterior installations and where indicated.
- F. Welding Rods and Bare Electrodes: Select according to AWS specifications for the metal alloy to be welded.

2.2 PAINT

DELETE BELOW IF NO SHOP PRIMING REQUIRED.

- A. Shop Primer for Ferrous Metals: Fast-curing, lead- and chromate-free universal modified-alkyd primer with good resistance to normal atmospheric corrosion, complying with performance requirements of FS TT-P-664. Select paint for compatibility with finish paint systems indicated, and for capability to provide a sound foundation for field-applied topcoats, despite prolonged exposure.

DELETE BELOW IF NO GALVANIZING.

- B. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in galvanized steel, with dry film containing not less than 94 percent zinc dust by weight, and complying with SSPC Paint 20.

2.3 FASTENERS

BELOW IS GENERAL ONLY. IF SPECIFIC FASTENERS ARE REQUIRED AND NOT INDICATED ON DRAWINGS, ADD REQUIREMENTS HERE.

- A. General: Provide plated fasteners complying with ASTM B 633, Class Fe/Zn 25 for electrodeposited zinc coating, for exterior use or where built into exterior walls. Provide fasteners as indicated on drawings, or if not indicated, select fasteners for the type, grade, and class required to provide a complete, secure installation.

2.4 GROUT AND ANCHORING CEMENT

RETAIN BELOW FOR HEAVY-DUTY STRUCTURAL GROUTING APPLICATIONS. DO NOT USE IN WET AREAS OR ON EXTERIOR.

- A. Nonshrink, Metallic Grout: Factory-packaged, ferrous-aggregate grout complying with ASTM C 1107, specifically recommended by manufacturer for heavy-duty loading applications. Subject to compliance with requirements, provide one of the following:

Hi Mod Grout; Euclid Chemical Co.
Embeco 885 and 636; Master Builders Technologies, Inc.
Ferrolith G Redi-Mix and G-NC; Sonneborn Building Products-ChemRex, Inc.

RETAIN BELOW FOR GROUTING APPLICATIONS WHERE NONSTAINING GROUT IS REQUIRED.

- B. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications. Subject to compliance with requirements, provide one of the following:

Construction Grout; W. R. Bonsal Co.
Sure-grip High Performance Grout; Dayton Superior Corp.
Euco N-S Grout; Euclid Chemical Co.
Five Star Grout; Five Star Products.
Vibropruf #11; Lambert Corp.
Crystex; L & M Construction Chemicals, Inc.
Masterflow 928 and 713; Master Builders Technologies, Inc.
Sealtight 588 Grout; W. R. Meadows, Inc.
SonogROUT 14; Sonneborn Building Products-ChemRex, Inc.

BELOW FOR SETTING HANDRAILS AT INTERIOR APPLICATIONS ONLY.

- C. Interior Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. Use for interior applications only. Subject to compliance with requirements, provide one of the following:

Ankertite Cement; Dayton Superior Corp.
Por-Rok; Minwax Construction Products Division.

BELOW SETTING HANDRAILS AT BOTH INTERIOR AND EXTERIOR APPLICATIONS.

- D. Erosion-Resistant Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. Provide formulation that is resistant to erosion from water exposure without need for protection by a sealer or waterproof coating and is recommended for exterior use by manufacturer. Subject to compliance with requirements, provide one of the following:

Bonsal Anchor Cement; W.R. Bonsal Co.
Super Por-Rok; Minwax Construction Products Division.
Thorogrip; Thoro Systems Products.

2.5 FABRICATION, GENERAL

- A. Form metal fabrications from materials of size, thickness, and shapes indicated but not less than that needed to comply with performance requirements indicated. Work to dimensions indicated or accepted on shop drawings, using proven details of fabrication and support. Use type of materials indicated or specified for various components of each metal fabrication.
- B. Form exposed work true to line and level with accurate angles and surfaces and straight sharp edges.

BELOW IS INTENDED FOR EXTERIOR METALWORK. REVISE TO SUIT PROJECT CONDITIONS AND METALWORK EXPOSURE.

- C. Allow for thermal movement resulting from the following maximum change (range) in ambient temperature in the design, fabrication, and installation of installed metal assemblies to prevent buckling, opening up of joints, and overstressing of welds and fasteners. Base design calculations on actual surface temperatures of metals due to both solar heat gain and nighttime sky heat loss.

1. Temperature Change (Range): 100 deg F.

- D. Shear and punch metals cleanly and accurately. Remove burrs.
- E. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
- F. Remove sharp or rough areas on exposed traffic surfaces.
- G. Weld corners and seams continuously to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.
 4. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing, and contour of welded surface matches those adjacent.
- H. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners wherever possible. Use exposed fasteners of type indicated or, if not indicated, Phillips flat-head (countersunk) screws or bolts. Locate joints where least conspicuous.
- I. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
- J. Shop Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
- K. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
- L. Fabricate joints that will be exposed to weather in a manner to exclude water, or provide weep holes where water may accumulate.

BELOW FOR SUPPORTING AND ATTACHING WOODWORK.

2.6 ROUGH HARDWARE

- A. Furnish bent, or otherwise custom-fabricated, bolts, plates, anchors, hangers, dowels, and other miscellaneous steel and iron shapes as required for framing and supporting woodwork, and for anchoring or securing woodwork to concrete or other structures. Straight bolts and other stock rough hardware items are specified in Division 06 Sections.
- B. Fabricate items to sizes, shapes, and dimensions required. Furnish malleable-iron washers for heads and nuts that bear on wood structural connections, and furnish steel washers elsewhere.

2.7 STEEL LADDERS

SEE AIA MASTERSPEC FOR SAFETY CAGES AND SHIP'S LADDERS, IF REQUIRED.

- A. General: Fabricate ladders for the locations shown, with dimensions, spacings, details, and anchorages as indicated. Comply with requirements of ANSI A14.3.

DELETE REQUIREMENTS BELOW IF LADDERS ARE DETAILED ON DRAWINGS.

- B. Side Rails: Continuous, steel, 1/2-by-2-1/2-inch flat bars, with eased edges, spaced 18 inches apart.

- C. Rungs: Steel 13 ga. HRPO rungs with cold-formed closely spaced perforated buttons for slip resistance.
- D. Fit rungs in centerline of side rails, plug weld and grind smooth on outer rail faces.
- E. Support each ladder at top and bottom and at intermediate points spaced not more than 5 feet o.c. with welded or bolted steel brackets.
 - 1. Size brackets to support design dead and live loads indicated and to hold centerline of ladder rungs clear of the wall surface by not less than 7 inches.
 - 2. Extend side rails 42 inches above top rung, and return rails to wall or structure unless other secure handholds are provided. If the adjacent structure does not extend above the top rung, goose-neck the extended rails back to the structure to provide secure ladder access.
- F. Galvanize ladders, including brackets and fasteners, in exterior locations.

2.8 LOOSE BEARING AND LEVELING PLATES

- A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction, made flat, free from warps or twists, and of the required thickness and bearing area. Drill plates to receive anchor bolts and for grouting as required. Galvanize after fabrication.

2.9 LOOSE STEEL LINTELS

- A. Fabricate loose structural steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated.
- B. Weld adjoining members together to form a single unit where indicated.

DELETE BELOW IF BEARING LENGTHS ARE INDICATED ON DRAWINGS OR SCHEDULES.

- C. Size loose lintels for equal bearing of 1 inch per foot of clear span but not less than 8 inches bearing at each side of openings, unless otherwise indicated.
- D. Galvanize loose steel lintels located in exterior walls.

2.10 RAILINGS AND GUARDS

- A. Railings, General: Fabricate tube handrails with dimensions, spacing, and anchorages indicated. Comply with requirements of Michigan Building Code, unless otherwise indicated.

- B. Railings: Interconnect railing members by butt-welding. Notch ends of intersecting members to fit contour of tube to which end is joined and weld all around at tee and cross intersections. Form curves by bending tube in jigs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross-section of tube throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of tube.
1. Shape for Handrails: Round.
 2. Shape for Members Other Than Handrails: Round, unless otherwise indicated on drawings.
 3. Outside Diameter of Tube for Handrails: 1-1/2 inches.
 4. Dimensions of Members Other Than Handrails: As indicated on drawings.
 5. Tube Wall Thickness: 11 gage.
 6. 1-1/4-inch O.D. pipe is not acceptable for use as a handrail.
 7. Rail Ends: Provide wall returns at ends of wall-mounted handrails. Weld 3/16-inch thick steel plate at ends of tube, except where clearance between tube end and adjoining wall surface is less than 1/4-inch.
 8. Supports: Space support posts or brackets as shown on drawings, but not more than 6 feet on center.
 9. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnections of tube attachment of railings and handrails to other work. Furnish inserts and other anchorage devices for connecting railings and handrails to concrete or masonry work.

MODIFY BELOW FOR VERTICAL BARS OR TUBES.

- C. Guards: Provide infill panels where indicated for interior stairs. Fabricate units from 10 gage flattened, expanded carbon steel sheet with 3/4 inch diamond pattern and weighing approximately 1.7 lbs per sq. ft. Provide each panel with a continuous "U" shaped perimeter frame fabricated of 18 gage sheet metal, lapping both sides of panel 1-inch, and with mitered corners. Include mounting tabs indicated on drawings.
- D. Finish: As follows:
1. Interior Handrails and Components: Black finish.
 2. Exterior Handrails and Components: Galvanized after fabrication.

2.11 METAL STAIRS

- A. Metal Stairs: Construct stairs to conform to sizes and arrangements indicated. Join pieces together by welding, unless otherwise indicated. Provide complete stair assemblies, including metal framing, hangers, columns, railings, newels, balusters, struts, clips, brackets, bearing plates, and other components necessary for the support of stairs and platforms, and as required to anchor and contain the stairs on the supporting structure.

1. Comply with NAAMM "Metal Stair Manual" "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" for Commercial class stair, except where more stringent requirements are indicated.
2. Framing: Fabricate stringers of structural steel shapes shown. Provide closures for exposed stringer ends. Construct platforms of structural steel channel headers and miscellaneous framing members as shown. Weld headers to strings and framing members to strings and headers.
3. Metal Pan Risers, Subtreads, and Subplatforms: Uncoated, 12 gage, cold-rolled steel sheet metal formed into risers and subtreads to conform to configuration shown. Weld brackets to stringers and metal pans to brackets.
4. Stair Railings and Handrails: Comply with applicable requirements specified elsewhere in this Section. Connect to stair framing by direct welding.

BELOW IS LIGHT-DUTY UNIT FOR PEDESTRIAN TRAFFIC. REFER TO AIA MASTERSPEC FOR MORE COMPLETE SELECTION OF GRATING TYPES AND MATERIALS.

2.12 METAL BAR GRATINGS

- A. Welded Steel Gratings: Fabricate welded steel gratings to comply with requirements of "Standard Specifications for Metal Bar Grating and Metal Bar Grating Treads" published in ANSI/NAAMM A202.1 "Metal Bar Grating Manual" and as indicated below:

1. Mark/Size: W-19-4 (welded with bearing bars 1-3/16 inch o.c. and cross bars 4 inches o.c.)/bearing bar sizes as indicated.
2. Bearing bar size: 1-1/2" by 3/16".
3. Traffic Surface: Plain.

SELECT ABOVE OR BELOW.

4. Traffic Surface: Applied abrasive finish consisting of aluminum oxide aggregate in an epoxy resin adhesive.
5. Steel Finish: Hot-dip galvanized with a coating weight of not less than 1.8 oz. per sq. ft. of coated surface.
6. Fabricate removable grating sections with banding bars attached by welding to entire perimeter of each section. Include anchors and fasteners of type recommended by manufacturer, for attachment to supports.
 - a. Provide not less than 4 saddle clips for each grating section and spaced not less than 15/16 inch o.c, with each clip designed and fabricated to fit over 2 bearing bars.
 - b. Furnish threaded bolts with nuts and washers for each clip required.
7. Fabricate cutouts in grating sections for penetrations indicated. Arrange layout of cutouts to permit grating removal without disturbing items penetrating gratings.
 - a. Edge band openings in grating that interrupt 4 or more bearing bars with bars of same size and material as bearing bars.
 - b. Do not notch bearing bars at supports to maintain elevation.

8. Manufacturers: Subject to compliance with requirements, provide metal bar gratings by one of the following:
Alabama Metal Industries Corp.
Barnett/Bates Corp.
Blaw-Knox Grating Div., Blaw-Knox Corp.
IKG Industries
Klemp Corp.
Ohio Gratings, Inc.
Reliance Steel Products, Inc.
Seidelhuber Metal Products, Inc.
Trueweld, Inc.

2.13 MISCELLANEOUS FRAMING AND SUPPORTS

- A. General: Provide steel framing and supports for applications indicated that are not a part of structural steel framework as required to complete the Work.
- B. Fabricate units to sizes, shapes, and profiles indicated and required to receive other adjacent construction retained by framing and supports. Fabricate from structural steel shapes, plates, and steel bars of welded construction using mitered joints for field connection. Cut, drill, and tap units to receive hardware, hangers, and similar items.
 1. Equip units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units must be installed after concrete is placed.
 - a. Except as otherwise indicated, space anchors 24 inches o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches wide by 1/4 inch thick by 8 inches long.

REVISE BELOW TO SUIT SPECIFIC PROJECT REQUIREMENTS. ADD SIMILAR PROVISIONS FOR OTHER SUPPORTS, SUCH AS FOR OPERABLE PARTITIONS, OVERHEAD DOORS, ETC.

- C. Toilet Partition Supports: Fabricate support for suspended toilet partitions as follows:
 1. Beams: Continuous steel shapes as shown on drawings, or if not shown, of size required to limit deflection to L/360 between hangers, but use not less than C8 by 11.5 channels or another shape with equivalent structural properties.
 2. Hangers: Steel rods as shown on drawings, or if not shown, 1/2-inch minimum diameter, spaced not more than 36 inches o.c. Thread rods to receive anchor and stop nuts. Fit hangers with wedge-shaped washers for full bearing on sloping flanges of support beam.
 3. Braces and Angles: Steel angles of size required for rigid support of beam and for secure anchorage.

DELETE BELOW IF NO EXTERIOR FRAMING AND SUPPORTS.

- D. Galvanize miscellaneous framing and supports in exterior locations.

2.14 MISCELLANEOUS STEEL TRIM

- A. Unless otherwise indicated, fabricate units from structural steel shapes, plates, and bars of profiles shown with continuously welded joints, and smooth exposed edges. Miter corners and use concealed field splices wherever possible.
- B. Provide cutouts, fittings, and anchorages as required to coordinate assembly and installation with other work. Provide anchors, welded to trim, for embedding in concrete or masonry construction, spaced not more than 6 inches from each end, 6 inches from corners, and 24 inches o.c., unless otherwise indicated.
- C. Galvanize miscellaneous steel trim in exterior locations.

2.15 STRUCTURAL STEEL DOOR FRAMES

- A. Fabricate steel door frames from structural shapes and bars of size and to dimensions indicated, fully welded together, with 5/8-by-1-1/2-inch steel bar stops, unless otherwise indicated. Plug-weld built-up members and continuously weld exposed joints. Secure removable stops to frame with countersunk machine screws, uniformly spaced at not more than 10 inches o.c. Reinforce frames and drill and tap as required to accept finish hardware.
- B. Provide steel strap anchors for securing door frames into adjoining concrete or masonry, using 1/8-by-2-inch straps of the length required for a minimum 8-inch embedment, unless otherwise indicated. Weld anchors to frame jambs no more than 12 inches from both bottom and head of frame and space anchors not more than 30 inches apart.

DELETE BELOW IF NOT REQUIRED. DOOR FRAMES CONNECTED TO STRUCTURAL STEEL FRAMING ARE SPECIFIED WITH THAT WORK IN ANOTHER DIVISION 05 SECTION.

- C. Extend bottom of frames to floor elevation indicated with steel angle clips welded to frames for anchoring frame to floor with expansion shields and bolts.
- D. Galvanize frames and anchors in exterior locations.

2.16 STEEL AND IRON FINISHES

- A. Galvanizing: For those items indicated for galvanizing, apply zinc coating by the hot-dip process complying with the following requirements:
 - 1. ASTM A 153 for galvanizing iron and steel hardware.
 - 2. ASTM A 123 for galvanizing both fabricated and unfabricated iron and steel products made of uncoated rolled, pressed, and forged shapes, plates, bars, and strip 0.0299 inch thick or thicker.
- B. Preparation for Shop Priming: Prepare uncoated ferrous metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:

BOTH OF BELOW APPLY TO LOCATIONS THAT WOULD NORMALLY REMAIN DRY IN SERVICE.

1. Exteriors (SSPC Zone 1B): SSPC-SP 6 "Commercial Blast Cleaning."
 2. Interiors (SSPC Zone 1A): SSPC-SP 3 "Power Tool Cleaning."
- C. Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finishes or to be embedded in concrete, sprayed-on fireproofing, or masonry, unless otherwise indicated. Comply with requirements of SSPC-PA 1 "Paint Application Specification No. 1" for shop painting.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Coordinate and furnish anchorages, setting drawings, diagrams, templates, instructions, and directions for installing anchorages, including concrete inserts, sleeves, anchor bolts, and miscellaneous items having integral anchors that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.
- B. Set sleeves in concrete with tops flush with finish surface elevations. Protect sleeves from water and concrete entry.

3.2 INSTALLATION, GENERAL

- A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing miscellaneous metal fabrications to in-place construction. Include threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws, and other connectors as required.
- B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing miscellaneous metal fabrications. Set metal fabrication accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete masonry or similar construction.
- D. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop-welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are intended for bolted or screwed field connections.
- E. Field Welding: Comply with the following requirements:
 1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
 2. Obtain fusion without undercut or overlap.
 3. Remove welding flux immediately.

4. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing, and contour of welded surface matches those adjacent.

DELETE ARTICLES BELOW NOT APPLICABLE TO PROJECT.

3.3 SETTING LOOSE PLATES

- A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of bearing plates.
- B. Set loose leveling and bearing plates on wedges or other adjustable devices. After the bearing members have been positioned and plumbed, tighten the anchor bolts. Do not remove wedges or shims, but if protruding, cut off flush with the edge of the bearing plate before packing with grout.
 1. Use nonshrink, metallic grout in concealed locations where not exposed to moisture; use nonshrink, nonmetallic grout in exposed locations, unless otherwise indicated.

DELETE BELOW IF NOT REQUIRED.

2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.4 INSTALLING SUPPORTS FOR TOILET PARTITIONS

- A. Anchor supports securely to and rigidly brace from overhead building structure.

3.5 ADJUSTING AND CLEANING

- A. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of the shop paint on miscellaneous metal is specified in Division 09 Section "Painting."
- B. For galvanized surfaces, clean welds, bolted connections, and abraded areas, and apply galvanizing repair paint to comply with ASTM A 780.

SPECIFICATION DIVISION 5

NUMBER SECTION DESCRIPTION

DIVISION 05 METALS

SECTION 055800 - FORMED-METAL FABRICATIONS

END OF CONTENTS TABLE

DIVISION 05 METALS
SECTION 055800 - FORMED-METAL FABRICATIONS

PART 1 - GENERAL

THIS SECTION INCLUDES A LIMITED LIST OF SHEET METAL ITEMS. OTHER POSSIBILITIES INCLUDE LIGHTING TROUGHS, COLUMN COVERS, EXTERIOR OR INTERIOR CLOSURE STRIPS, VARIOUS CANOPIES, HOODS AND OTHER ARCHITECTURAL STRUCTURES.

1.1 SUMMARY

- A. This Section includes the following:

EDIT BELOW TO SUIT PROJECT.

1. Pockets for window treatment.
2. Filler panels.

1.2 SUBMITTALS

- A. Shop drawings detailing fabrication and installation of sheet metal fabrications. Include plans, elevations, sections, details of components, and attachments to other units of Work. Indicate jointing, fasteners, anchorage, accessory items, and finishes.
- B. Samples for initial selection in the form of manufacturer's color charts showing the full range of colors, textures, and patterns available for each type of sheet metal fabrication indicated.

1.3 PROJECT CONDITIONS

- A. Field Measurements: Check actual dimensions of other construction by accurate field measurements before fabrication of sheet metalwork; show recorded measurements on final shop drawings.
1. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabricating sheet metalwork without field measurements. Coordinate other construction to ensure that actual dimensions correspond to guaranteed dimensions.

PART 2 - PRODUCTS

2.1 SHEET METAL

- A. General: Provide sheet metal selected for surface flatness, smoothness, and freedom from surface blemishes where exposed to view in the finished unit. Do not use materials with pitting, seam marks, roller marks, variations in flatness exceeding those permitted by referenced standards for stretcher-leveled metal sheet, stains, discoloration, or other imperfections.

SELECT MATERIALS FROM THE FOLLOWING, DELETE OTHERS, OR REVISE AS NEEDED.

- B. Steel Sheet: Commercial-quality, cold-rolled, stretcher-leveled, carbon-steel sheet, complying with the following requirements:
 - 1. Electrolytic Zinc-Coated Steel Sheet: ASTM A 591, with Class C zinc coating; chemically treated in mill with phosphate solution and light chromate rinse.
 - 2. Uncoated Steel Sheet: ASTM A 366, Class I, matte finish.
- C. Aluminum Sheet: Not less than the strength and durability properties specified in ASTM B 209 for 5005-H15.

2.2 MISCELLANEOUS MATERIALS

- A. Sound-Deadening Insulation: Unfaced, mineral-fiber blanket or batt insulation complying with ASTM C 665 for Type I and passing ASTM E 136 test.
- B. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AWS specifications, and as required for strength and compatibility in the fabricated items.
- C. Fasteners: Of same basic metal and alloy as fastened metal, unless otherwise indicated. Do not use metals that are corrosive or incompatible with metals joined.
 - 1. Provide concealed fasteners for interconnection of sheet metal fabrications and for attaching them to other work except where exposed fasteners are unavoidable or are the standard fastening method.
 - 2. Provide Phillips flat-head machine screws for exposed fasteners, unless otherwise indicated.
- D. Anchors: For applications not indicated to comply with design loadings, provide anchors of type, size, and material required for type of loading and installation indicated.

BELOW IS AN EXAMPLE ONLY. REVISE TO SUIT INSTALLATION INDICATED.

- E. Flexible Cellular Neoprene Gaskets: ASTM D 1056, Type 1, Class A, grade as recommended by gasket manufacturer to obtain airtight seal for application indicated.
- F. Bituminous Paint: Cold-applied asphalt mastic complying with SSPC-Paint 12, except containing no asbestos fibers.
- G. Joint Sealants for Concealed Joints: Butyl sealant.

2.3 FABRICATION, GENERAL

- A. Coordinate dimensions and attachment methods of sheet metal fabrications with those of adjoining products and construction to produce integrated assemblies with closely fitting joints and with edges and surfaces aligned with one another in the relationship indicated.

- B. Increase metal thickness or reinforce metal with concealed stiffeners, backing materials, or both, as required to produce surfaces whose variations in flatness do not exceed those permitted by referenced standards for stretcher-leveled metal sheet and to impart sufficient strength for indicated use.
 - 1. Support joints with concealed stiffeners as required to hold exposed faces of adjoining sheets in flush alignment.
 - 2. Fill space between stiffeners with sound-deadening insulation attached to face sheet with cold-applied asphalt mastic.
- C. Assemble sheet metal fabrications in the shop to the greatest extent possible to minimize field splicing and assembly.
- D. Form sheet metal fabrications to profiles indicated in maximum lengths to minimize joints and without exposed cut edges. Fold back exposed ends of unsupported sheet metal to form a 1/2-inch-wide hem on the concealed side, or ease exposed edges with backing to a radius of approximately 1/32 inch. Produce flat, flush surfaces without cracking or grain separation at bends.
- E. Continuously weld joints and seams, except where other methods of joining are indicated. Grind, fill, and dress welds to produce smooth flush exposed surfaces in which welds are not visible after final finishing is completed.
- F. Build in straps, plates, and brackets as required for supporting and anchoring fabricated items to adjoining construction. Reinforce sheet metal units as required to attach and support other construction.

2.4 BLIND AND DRAPERY POCKETS

DELETE THIS ARTICLE IF NO BLIND OR DRAPERY POCKETS. REVISE TITLE ABOVE AND TERMS BELOW IF ONLY ONE, BLIND OR DRAPERY POCKET, APPLIES.

- A. Form pockets from sheet metal of type and thickness indicated below, with end closures. Coordinate dimensions and attachment methods with blind and drapery equipment, window frames, ceiling suspension system, and other related construction to produce a coordinated, closely fitting assembly.
 - SELECT 1 REQUIREMENT FROM BELOW, OR REVISE TO SPECIFY ANOTHER METAL OR THICKNESS.*
 - 1. Steel sheet, 0.0478 inch.
 - 2. Galvanized-steel sheet, 0.0516 inch.
 - 3. Aluminum sheet, 0.0625 inch.
- B. Reinforce pockets for attaching window treatment equipment and hardware, or increase metal thickness.
- C. Divide continuous pockets with built-in partitions located to separate adjoining drapery and blind units, coincide with window mullions, and receive filler panels at ends of partitions.

2.5 FILLER PANELS

DELETE THIS ARTICLE IF NO FILLER PANELS, OR IF FILLER PANELS ARE SPECIFIED IN DIVISION 06 SECTION (CLEAR ACRYLIC PLASTIC), OR IN DIVISION 09 SECTION WITH PARTITIONS.

- A. Form filler panels for closing ends of partition systems and for other applications indicated from sheet metal of type and thickness indicated. Incorporate reveals, trim, and concealed anchorages for attachment to adjacent surfaces.

SELECT 1 REQUIREMENT FROM BELOW, OR REVISE TO SPECIFY ANOTHER METAL OR THICKNESS.

- 1. Steel sheet, 0.0598 inch.
- 2. Galvanized-steel sheet, 0.0635 inch.
- 3. Aluminum sheet, 0.0625 inch.

- B. Adhesively attach gaskets to filler panel edges that abut glass. Use 1-inch-square material, unless otherwise indicated, set approximately 1/4 inch into channeled edge of filler panel.

DELETE ABOVE OR BELOW IF NOT REQUIRED, OR REVISE TO SUIT PROJECT.

- C. Attach gaskets to all edges of panels that abut adjacent surfaces to form a continuous seal. Use compressible gaskets or mastic sealing tape, applied to center of panel edges to be concealed from view, unless otherwise indicated.

DELETE BELOW IF NOT REQUIRED.

- D. Fill interior of panel with sound-deadening insulation permanently attached to inside panel faces.

2.6 ALUMINUM FINISHES

DELETE THIS ARTICLE IF NO ALUMINUM. RETAIN FINISHES BELOW APPLICABLE TO PROJECT.

- A. Finish designations prefixed by AA conform to the system established by the Aluminum Association for designating aluminum finishes.
- B. Class I, Clear Anodic Finish: AA-M12C22A41 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.7 mil or thicker) complying with AAMA 607.1.
- C. Class I, Color Anodic Finish: AA-M12C22A42/A44 (Mechanical Finish: nonspecular as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.7 mil or thicker) complying with AAMA 606.1 or AAMA 608.1.

RETAIN COLOR REQUIREMENT BELOW WITH EITHER CLASS OF COLOR ANODIC FINISH RETAINED ABOVE.

- 1. Color: Dark bronze.
- 2. Color: Black.

D. Baked-Enamel Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Apply baked enamel complying with paint manufacturer's specifications for cleaning, conversion coating, and painting.

1. Organic Coating: Thermosetting, modified-acrylic enamel primer/topcoat system standard with manufacturer, with minimum dry film thickness of 1.5 mils, medium gloss.

RETAIN 1 COLOR REQUIREMENT FROM BELOW.

2. Color: As indicated by manufacturer's standard color designations.

3. Color: Match Architect's samples.

4. Color: As selected by Architect from manufacturer's full range of colors.

2.7 STEEL SHEET FINISHES

DELETE THIS ARTICLE IF NO UNCOATED OR ELECTROLYTIC ZINC-COATED STEEL SHEET.

A. Surface Preparation: Solvent-clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair paint bond. Remove mill scale and rust, if present, from uncoated steel to comply with SSPC-SP 5 (White Metal Blast Cleaning) or SSPC-SP 8 (Pickling).

B. Pretreatment: Immediately following surface preparation, apply a conversion coating of type suited to organic coating applied over it.

C. Factory Priming for Field-Painted Finish: Apply shop primer specified below immediately following surface preparation and pretreatment.

1. Shop Primer for Ferrous Metal: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with performance requirements of FS TT-P-664 selected for good resistance to normal atmospheric corrosion, compatibility with finish paint systems indicated, and capability to provide a sound foundation for field-applied topcoats despite prolonged exposure.

DELETE BELOW IF NO FACTORY-APPLIED BAKED-ENAMEL FINISH FOR STEEL SHEET.

D. Baked-Enamel Finish: Immediately after cleaning and pretreating, apply manufacturer's standard 2-coat, baked-enamel finish consisting of prime coat and thermosetting topcoat. Comply with paint manufacturer's instructions for applying and baking to achieve a minimum dry film thickness of 2.0 mils.

RETAIN 1 COLOR REQUIREMENT FROM BELOW.

1. Color and Gloss: As indicated by manufacturer's standard color and gloss designations.

2. Color and Gloss: Match Architect's sample.

3. Color and Gloss: As selected by Architect from manufacturer's full range of choices for color and gloss.

TO ENSURE OBTAINING EXACT FINISH DESIRED, INSERT PRODUCT AND MFRS' NAMES OF COATING SYSTEM OR SYSTEMS.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Locate and place sheet metal fabrications plumb, level, and in alignment with adjacent construction. Use concealed anchorages where possible. Form tight joints with exposed connections accurately fitted together. Provide reveals and openings for sealants and joint fillers as indicated.
- B. Install concealed gaskets, joint fillers, insulation, and flashings as the work progresses to make work soundproof or lightproof as required.
- C. Corrosion Protection: Coat concealed surfaces of aluminum, zinc-coated, and nonferrous metals that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

3.2 ADJUSTING AND PROTECTION

- A. Restore finishes damaged during installation and construction period so that no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units as required.
- B. Protect finishes of sheet metal fabrications from damage during construction period. Remove temporary protective coverings at the time of Substantial Completion.

SPECIFICATION DIVISION 6

NUMBER SECTION DESCRIPTION

DIVISION 06 WOOD, PLASTICS AND COMPOSITES

SECTION 061000 - ROUGH CARPENTRY

END OF CONTENTS TABLE

DIVISION 06 WOOD, PLASTICS AND COMPOSITES
SECTION 061000 - ROUGH CARPENTRY

*JAN, 2005 - UPDATED TO REMOVE ARSENIC- AND CHROMIUM-CONTAINING
WOOD PRESERVATIVES AND TO ADD CORROSION-RESISTANT FASTENERS.*

PART 1 - GENERAL

1.1 SUMMARY

*NOTE THAT ROUGH CARPENTRY REQUIRED FOR INSTALLATION OF
ARCHITECTURAL CASEWORK IS USUALLY INCLUDED IN SECTION 064023 -
"INTERIOR ARCHITECTURAL WOODWORK."*

EDIT BELOW TO SUIT PROJECT

- A. Types of work in this section include the following:
 - 1. Wood framing.
 - 2. Wood blocking.
 - 3. Telephone backboard panel.
 - 4. Plywood reinforcement panels within gypsum drywall walls.
- B. "Interior Architectural Woodwork" is specified in another Division 06 Section.

*DELETE ABOVE IF NO FINISH CARPENTRY. DELETE BELOW IF THIS
SECTION DOES NOT INCLUDE REINFORCING OF DRYWALL PARTITIONS*

- C. Drywall partitions are specified in Division 09 Section "Gypsum Board Assemblies."

1.2 SUBMITTALS

- A. Wood treatment data, including instructions for handling, storing, installing, and finishing treated materials, and the following:
 - 1. Certification by treating plant stating type of preservative solution and pressure process used, net amount of preservative retained, and compliance with applicable standards.
 - 2. Statement that moisture content of treated materials was reduced to levels indicated before shipment to Project site.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Lumber Standards: Manufacturer lumber to comply with PS 20 "American Softwood Lumber Standard" and with applicable grading rules of inspection agencies certified by American Lumber Standards Committee's (ALSC) Board of Review.

- B. Grade Stamps: Factory-mark each piece of lumber with grade stamp of inspection agency evidencing compliance with grading rule requirements and identifying grading agency, grade, species, moisture content at time of surfacing, and mill.
1. For exposed lumber apply grade stamps to ends or back of each piece, or omit grade stamps entirely and issue certificate of grade compliance from inspection agency in lieu of grade stamp.
- C. Nominal sizes are indicated, except as shown by detail dimensions. Provide actual sizes as required by PS 20, for moisture content specified for each use.
1. Provide seasoned lumber with 19 percent moisture content at the time of dressing and shipment, for sizes 2 inches or less in thickness.

DELETE THIS ARTICLE IF NOT APPLICABLE.

- D. Preservative Treated Materials: Comply with applicable requirements of AWPA C2 (lumber), except that lumber that is not in contact with the ground and is continuously protected from liquid water may be treated according to AWPA C31 with inorganic boron (SBX) and AWPA C9 (plywood). Mark each treated item with the Quality Mark Requirements of an inspection agency approved by ALSC's Board of Review.
1. Preservative Chemicals shall contain no arsenic or chromium.
 2. Treat indicated items and the following:

MODIFY LIST BELOW TO SUIT PROJECT.

- a. Wood cants, nailers, curbs, equipment support bases, blocking, stripping, and similar members in connection with roofing, flashing, vapor barriers, and waterproofing.
 - b. Wood sills, sleepers, blocking, furring, stripping, and similar concealed members in contact with masonry or concrete.
 - c. Wood framing members less than 18 inches (460 mm) above grade.
 - d. Wood floor plates installed over concrete slabs directly in contact with earth.
3. Approved Manufacturers: Provide treatment chemicals produced by one of the following:
Arch Wood Protection, Inc.
Baxter: J. H. Baxter Co.
Chemical Specialties, Inc.
Hickson Corp.
Hoover Treated Wood Products, Inc.
Osrose Wood Preserving, Inc.
 4. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent.
 5. Complete fabrication of treated items before treatment, where possible. If cut after treatment, apply field treatment complying with AWPA M4 to cut surfaces. Inspect each piece of lumber or plywood after drying and discard damaged or defective pieces.

INCLUDE BELOW IF REQUIRED

- E. Fire Resistant Treated Lumber and Plywood: Where indicated, provide "Osmose" "Flame Proof LHC" or equal.

DELETE BELOW IF NOT APPLICABLE]

1. Provide fire resistant lumber in each application, unless otherwise indicated.
- F. Dimension Lumber: Provide lumber of the following product classification and species indicated:

BELOW FOR LIGHT FRAMING (2" TO 4" THICK, 2" TO 6" WIDE, 10 FEET LONG AND SHORTER). SPECIFY NO. 2 GRADE FOR STRUCTURAL APPLICATIONS

1. Concealed Boards: Standard grade, any species graded under WPA rules or No. 3 grade Southern Pine graded under SPIB rules.
2. Lumber for Miscellaneous Uses: Standard grade lumber for support of other work, including bucks, nailers, blocking, furring, stripping and similar members.

EDIT BELOW TO SUIT PROJECT

- G. Plywood: Provide plywood of APA grade B-C, exterior glue, southern pine veneer for use in concealed locations.
1. Plywood Backing Panels: For mounting electrical equipment, provide fire-retardant treated plywood panels with grade designation APA C-D PLUGGED INT with exterior glue, and in thickness indicated, or if not otherwise indicated, not less than 23/32-inch.
 2. Plywood Reinforcing Panels: For concealed installation within drywall partitions, provide fire-retardant treated panels with grade designation APA STRUC I RATED SHEATHING. Provide units of thickness shown, or if not shown, of thickness matching drywall.
- H. Fasteners and Anchorages: Provide size, type, material and finish as indicated and as recommended by applicable standards, complying with applicable Federal Specifications for nails, staples, screws, bolts, nuts, washers and anchoring devices. Provide metal hangers and framing anchors of the size and type recommended by the manufacturer for each use including recommended nails.
1. Where rough carpentry work is exposed to weather, in ground contact, or in area of high relative humidity, provide connectors, fasteners and anchorages with a G185 hot-dip zinc coating (ASTM A 153 for fasteners and ASTM A123 for individual connectors).

THE NEWER NON-CCA PRESERVATIVE TREATMENTS HAVE SHOWN EVIDENCE OF INCREASED CORROSIVENESS. FOR FASTENERS USED WITH THIS MATERIAL, USE TYPE 304 STAINLESS STEEL FASTENERS. FOR NON-AMMONIA-CONTAINING PRESERVATIVES WITH A RETENTION LEVEL OF 0.40 PCF OR LESS, HOT-DIP GALVANIZED COATING WITH A MINIMUM THICKNESS OF 185 MILS MAY SUFFICE. THE NEWER NON-CCA PRESERVATIVE TREATMENTS HAVE SHOWN EVIDENCE OF INCREASED CORROSIVENESS. FOR FASTENERS USED WITH THIS MATERIAL, USE

TYPE 304 STAINLESS STEEL FASTENERS. FOR NON-AMMONIA-CONTAINING PRESERVATIVES WITH A RETENTION LEVEL OF 0.40 PCF OR LESS, HOT-DIP GALVANIZED COATING WITH A MINIMUM THICKNESS OF 185 MILS MAY SUFFICE.

FOR LESS SEVERE CONDITIONS DESCRIBED ABOVE SELECT ABOVE PARAGRAPH AND DELETE PARAGRAPH BELOW.

2. Where rough carpentry work is exposed to weather, in ground contact, or in area of high relative humidity, provide connectors, fasteners and anchorages of Type 304 or Type 316 stainless steel.
- I. Insulation: "Dow", "Styrofoam-SM"; 24 inch wide by 2 inch thick boards.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Discard units of material with defects which might impair quality of work, and units which are too small to use in fabricating work with minimum joints or optimum joint arrangement.
- B. Set carpentry work to required levels and lines, with members plumb and true to line and cut and fitted.
- C. Install rough carpentry work to comply with recommendations of mfr of product involved for use intended. Set carpentry work to required levels and lines, with members plumb and true and cut to fit.
- D. Securely attach carpentry work. Install fasteners without splitting wood: fasten panel products to allow for expansion at joints unless otherwise indicated.
 1. Countersink nail heads on exposed carpentry work and fill holes.
- E. Install plywood backing panels for telephone equipment to substrate as indicated, or if not indicated, with 3/8-inch diameter expansion bolts or toggle bolts spaced 18-inches on center around panel perimeters and on 24-inch centers within panels.

SPECIFICATION DIVISION 6

NUMBER SECTION DESCRIPTION

DIVISION 06 WOOD, PLASTICS AND COMPOSITES

SECTION 064023 - INTERIOR ARCHITECTURAL WOODWORK

END OF CONTENTS TABLE

DIVISION 06 WOOD, PLASTICS AND COMPOSITES
SECTION 064023 - INTERIOR ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 SUMMARY

EDIT FOLLOWING LIST TO SUIT PROJECT.

A. Work specified in this Section includes:

Plastic laminate casework.
Hardwood veneer plywood casework.
Plastic laminate counter tops.
Cast plastic counter tops.
Plastic laminate shelving.
Glass shelving.
Acrylic plastic shelving.
Hardwood veneer plywood shelving.
Hardwood door frames.
Hardwood moldings and trim.

B. Related work of other Sections:

DELETE BELOW IF BLOCKING AND NAILERS WILL BE INCLUDED IN THIS SECTION.

1. Blocking, nailers and other carpentry work that is not exposed to view is specified in Section 061000, "Rough Carpentry".

DELETE BELOW IF WOOD WILL BE FACTORY FINISHED.

2. Field finishing of exposed wood is specified in Section 099100, "Painting".

1.2 SUBMITTALS

A. Product Literature: Submit manufacturer's product literature indicating compliance with requirements for each specified hardware item.

B. Shop Drawings: Submit shop drawings showing dimensioned plans and elevations, large scale details, attachment devices and other components for the following:

1. Casework.
2. Counter tops.
3. Shelves.
4. Door frames.
5. Miscellaneous trim.

INCLUDE BELOW WHERE WOOD SAMPLES ARE REQUIRED. MODIFY AS NEEDED.

C. Samples: Submit the following samples for Architect's initial selection:

1. Submit 3 samples of each specified species and cut of hardwood as follows:

- a. Submit 2 samples showing extremes of grain and coloration range to be expected; submit 1 sample showing typical piece of wood.
2. Submit 3 flitches of each specified hardwood veneer, not less than 12 inches by 12 inches.

1.3 QUALITY ASSURANCE

- A. Standards: Except as otherwise shown or specified, comply with specified provisions of the latest edition of Architectural Woodwork Institute (AWI) "Architectural Woodwork Quality Standards."
 1. When an AWI quality grade is not specified, fabricate items in accordance with requirements of AWI "Premium" grade, where applicable.

MODIFY SHOP DRAWING REQUIREMENTS TO SUIT PROJECT.

PART 2 - PRODUCTS

2.1 MATERIALS

MODIFY LIST BELOW TO SUIT ANTICIPATED MATERIAL REQUIREMENTS FOR PROJECT

- A. General: Provide materials that comply with requirements of the referenced AWI woodworking standard, and as follows:
 1. Hardboard: ANSI/AHA A135.4
 2. High Pressure (Plastic) Laminate: NEMA LD 3.
 3. Particleboard: ANSI A208.1; Grade M-2.

THE FOLLOWING PRODUCT IS A GREEN SUBSTITUTE FOR PARTICLEBOARD OR PLYWOOD. IT USES WASTE STRAW AND FORMALDEHYDE-FREE RESINS AND EQUALS THE PERFORMANCE OF PARTICLEBOARD, BUT IS LIGHTER IN WEIGHT. COST MAY BE SLIGHTLY HIGHER.

4. Particleboard: Straw-based particleboard complying with requirements of ANSI A208.1, Grade M-2, except for density.
 5. Softwood Plywood: PS 1.
 6. Veneered Plywood: HPVA HP-1 Clear, selected for grain and color compatible with exposed solid lumber, no defects.
- DELETE BELOW IF NO PLASTIC LAMINATE IN PROJECT.*
7. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated, or if not indicated, as required by indicated woodwork quality standard.

A COLOR/STYLE COULD BE INCLUDED HERE FOR SIMPLE PROJECTS, OR IN SPECIFIC PRODUCT DESCRIPTION FOR MORE DIFFICULT PROJECT, OR ON DRAWINGS FOR VERY COMPLEX PROJECTS.

- a. Approved Manufacturers: Subject to compliance with requirements, provide products of one of the following:
 - 1) Formica Corporation
 - 2) Laminart.
 - 3) Nevamar Corp.

4) Ralph Wilson Plastics Co.

DELETE BELOW IF NO CHEMICAL-RESISTANT LAMINATE REQUIRED. FORMICA COMES ONLY IN BLACK BUT HAS HIGHER CHEMICAL RESISTANCE THAN VARIETY OF WILSONART COLORS.

8. Chemical-Resistant, High-Pressure Decorative Laminate: NEMA LD 3, Grade PF-42.

FORMICA AVAILABLE ONLY IN BLACK, BUT HAS BETTER CHEM. RESISTANCE THAN VARIETY OF WILSONART COLORS.

- a. Approved Products: Subject to compliance with requirements, provide products of one of the following:
- 1) Lab Grade 840 Black; Formica Corporation
 - 2) Chemsurf; Ralph Wilson Plastics Co.

DELETE BELOW IF NO PLASTIC LAMINATE.

9. Adhesive for Bonding Plastic Laminate: Contact cement; except use urea-formaldehyde for bonding chemical-resistant laminates.

MODIFY BELOW IF ROUGH CARPENTRY WILL CONTAIN THESE REQUIREMENTS.

B. Installation Materials: Provide fire-resistant furring, blocking and hanging strips of softwood or hardwood lumber, kiln dried to less than 15 percent moisture content, and as follows:

1. Screws: Select material, type, size, and finish required for each use. Comply with ASME B18.6.1 for applicable requirements.
2. Nails: Select material, type, size, and finish required for each use. Comply with FS FF-N-105 for applicable requirements.
3. Anchors: Select material, type, size, and finish required for each substate for secure anchorage. Provide nonferrous metal or hot-dipped galvanized anchors and inserts on inside face of exterior walls and elsewhere where required for corrosion resistance. Provide toothed steel or lead expansion anchors for drilled-in-place anchors.

2.2 FABRICATION, GENERAL

A. Measures: Before proceeding with fabrication of woodwork required to be fitted to other construction, obtain measurements and verify dimensions and shop drawing details as required for accurate fit.

DELETE BELOW IF NO WOOD OR WOOD VENEERS.

B. Exposed Wood and Veneer Materials: The following are not permitted in surfaces exposed-to-view in finished construction:

1. Knots.
2. Pinhole knots.
3. Surfaces of lighter-than-average color joined with exposed surfaces of darker-than-average color.
4. Adjacent surfaces which are noticeably dissimilar in grain, figure and natural character markings.

DELETE BELOW IF NOT APPLICABLE.

- C. Smooth edges of cutouts and, where located in countertops and similar exposures, seal edges on cutouts with a water-resistant coating.

DELETE BELOW IF NO PLASTIC LAMINATE CLAD CASEWORK.

2.3 PLASTIC LAMINATE CLAD CASEWORK

- A. Quality Standard: AWI Section 400 and its Division 400B "Laminate Clad Cabinets".

USUALLY SELECT CUSTOM FOR P.LAM. WORK.

- 1. Grade: Custom.
- 2. Grade: Premium.
- 3. AWI Type of Cabinet Construction: Provide cabinet construction of type indicated on drawings, or if not indicated, as follows:

SELECT ONE OF THE FOLLOWING.

- a. Type: Flush overlay (door and drawer faces partially cover body members with spaces sufficient for clearance only).
 - b. Type: Reveal overlay (door and drawer faces cover body members or face frames and create reveals).
 - c. Type: Exposed face frame (door and drawer faces set flush with face frame).
- B. Laminate Cladding: High pressure decorative laminate, with selections of colors, patterns, and finishes made by Architect from laminate manufacturer's full range of standard colors and finishes. Provide laminate cladding complying with the following requirements for type of surface and grade:
 - 1. Horizontal Surfaces Other Than Tops: GP-50 (0.050 inch nominal thickness).
 - 2. Vertical Surfaces: GP-28 (0.028 inch nominal thickness).
 - 3. Edges: GP-28 (0.028 inch nominal thickness).
 - 4. Semiexposed Surfaces: High Pressure Laminate, GP-28.

DELETE BELOW IF DESIRED - NOT REQUIRED BY AWI STANDARD.

- C. Provide dust panels of 1/4 inch tempered hardboard above compartments and drawers except where located directly under tops.

DELETE BELOW IF NO TRANSPARENT FINISHED PLYWOOD CASEWORK.

2.4 WOOD CASEWORK

- A. Quality Standard: Comply with AWI Section 400 and its Division 400A "Wood Cabinets".

SELECT ONE BELOW: CUSTOM PERMITS GRAIN ON DOORS AND DRAWERS TO RUN IN DIFFERENT DIRECTIONS - PREMIUM REQUIRES GRAIN TO RUN IN SAME DIRECTION.

- 1. Grade: Custom.
- 2. Grade: Premium.

B. AWI Type of Cabinet Construction: Provide cabinet construction of type indicated on drawings, or if not indicated, as follows:

SELECT ONE OF THE FOLLOWING.

1. Type: Flush overlay (door and drawer faces partially cover body members with spaces sufficient for clearance only).
2. Type: Reveal overlay (door and drawer faces cover body members or face frames and create reveals).
3. Type: Exposed face frame (door and drawer faces set flush with face frame).

C. Wood Species for Exposed Surfaces: Provide the following species and cut:

USUAL SELECTION IS RED OAK, PLAIN SLICED.

1. Red oak (quercus rubra), plain sliced.
2. Red oak (quercus rubra), rift sawn.
3. Red oak (quercus rubra), quarter sawn.

SELECT ONE OF THE FOLLOWING FOR PREMIUM CASEWORK - DELETE IF NO PREMIUM CASEWORK IS INCLUDED.

4. Grain Matching: Run and match grain vertically for drawer fronts, doors, and fixed panels.
5. Grain Matching: Run and match grain horizontally for drawer fronts, doors, and fixed panels.
6. Grain Matching: As indicated on drawings.

SELECT ONE OF THE FOLLOWING FOR PREMIUM CASEWORK - DELETE IF NO PREMIUM CASEWORK IS INCLUDED. NOTE THAT BOOK MATCH REQUIRES OPPOSING SIDES OF VENEER TO BE EXPOSED - POSSIBLY CREATING "BARBER POLE" EFFECT.

7. Matching of Veneer Leaves: Book match.
8. Matching of Veneer Leaves: Slip match.
9. Matching of Veneer Leaves: Random match.
10. Matching of Veneer Leaves: End match.

SELECT ONE OF THE FOLLOWING FOR PREMIUM CASEWORK - DELETE IF NO PREMIUM CASEWORK IS INCLUDED. CENTER MATCH CAN RESULT IN SIGNIFICANT COST INCREASE.

11. Veneer Matching within Panel Face: Running match.
12. Veneer Matching within Panel Face: Slip match.
13. Veneer Matching within Panel Face: Center match.

D. Wood Species for Semiexposed Surfaces: Match species and cut indicated for exposed surfaces.

RETAIN BELOW IF DESIRED; NOT REQUIRED BY AWI STANDARD.

E. Provide dust panels of 1/4 inch plywood or tempered hardboard above compartments and drawers except where located directly under tops.

DELETE BELOW IF NO LAMINATE CLAD COUNTERTOPS.

2.5 LAMINATE CLAD COUNTERTOPS

A. Quality Standard: Comply with AWI Section 400 and its Division 400C.

1. AWI Grade: Premium.
- B. Tops, General: Plastic laminate clad with backing sheet on concealed or semi-concealed surfaces. Provide units with the following features:
1. Edge Treatment: Same laminate cladding as on horizontal surfaces.
- USUALLY SELECT ABOVE AND DELETE BELOW EDGE TREATMENT.*
2. Edges: Clear anodized aluminum angle fastened with countersunk aluminum screws.
 3. Back-Splash (Curb): Applied type, fabricated of materials matching top. Fabricate to dimensions shown, or if not shown, 4 inches high and 3/4-inch thick.
 4. Subtop: 45 pound-per-cu. ft. particle board, of thickness shown, or if not shown, 1-1/8-inch.
- C. Laminate Cladding for Horizontal Surface: High pressure decorative laminate, with colors, patterns, and finishes selections made by Architect from manufacturer's full range of standard colors and finishes.
1. Grade: GP-50 (0.050 inch nominal thickness).

DELETE BELOW IF NO CAST PLASTIC COUNTERTOPS.

2.6 CAST PLASTIC COUNTERTOPS

- A. Type of Top: Solid plastic top, trim and curb of dimensions and configuration shown on drawings, and as follows:
1. Composition: Cast acrylic plastic.
 2. Composition: Cast polyester-acrylic resin.
 3. Composition: Filled methyl methacrylate.
- EITHER SELECT ONE OF ABOVE AND DELETE BELOW, OR DELETE ALL ABOVE AND RETAIN BELOW FOR OPEN SPEC.*
4. Composition: Manufacturer's standard formulation of cast plastic materials.
- SELECT ONE OF THE FOLLOWING.*
5. Edge Treatment: Plain.
 6. Edge Treatment: Plain with drip groove on underside of overhang.
 7. Edge Treatment: As indicated on drawings.
- SELECT ONE OF THE FOLLOWING.*
8. Thickness: 1/4-inch.
 9. Thickness: 1/2-inch.
 10. Thickness: 3/4-inch.
 11. Color/Pattern: Solid White.
- EDIT ABOVE FOR SPECIFIC SELECTION OR DELETE ABOVE AND RETAIN BELOW.*
12. Color/Pattern: To be selected from manufacturer's standard range of solids and patterns.

13. Back-Splash (Curb): Applied type, fabricated of materials matching top. Fabricate to dimensions shown, or if not shown, 4 inches high and 3/4-inch thick.

B. Product: Subject to compliance with requirements, one of the following:

EITHER SELECT ONE OR RETAIN ALL FOR OPEN SPEC.

1. Fountainhead (cast acrylic); Nevamar Corp.
2. Gibraltar (cast polyester-acrylic resin); Wilson Art.
3. Corian (filled methyl methacrylate); E.I. DuPont de Nemours and Co.

DELETE BELOW IF NO PLASTIC LAMINATE SHELVING.

2.7 LAMINATE CLAD SHELVING

A. Quality Standard: Comply with AWI Section 400 and its Division 400B.

USUALLY SELECT CUSTOM GRADE BELOW.

1. Grade: Custom.
2. Grade: Premium.

B. Laminate Cladding: High pressure decorative laminate with colors, patterns, and finishes selections made by Architect from laminate manufacturer's full range of standard colors and finishes.

1. Horizontal Surfaces Other Than Tops: GP-50 (0.050 inch nominal thickness).
2. Edges: GP-50 (0.050 inch nominal thickness).

C. Shelving Material: Particle board as follows:

1. Thickness: As shown or, if not shown, 3/4 inch.
2. Width: As shown or, if not shown, 12 inches.

DELETE BELOW IF NO TRANSPARENT FINISHED PLYWOOD SHELVING.

2.8 WOOD SHELVING FOR TRANSPARENT FINISH

A. Quality Standard: Comply with AWI Section 400 and its Division 400A.

1. Grade: Custom.
2. Grade: Premium.

B. Wood Species: Provide plywood shelves with both faces veneered for use in exposed condition, of the following species and cut:

MODIFY TO SUIT PROJECT.

1. Red oak (quercus rubra).

C. Wood Species for Solid Hardwood Edges: Match species and cut indicated for exposed surfaces.

DELETE BELOW IF NO GLASS SHELVING.

2.9 GLASS SHELVING

- A. Glass for Shelving: Clear tempered float glass, ASTM C 1048 Condition A (uncoated surfaces), Type I (transparent glass, flat), Class I (clear), Quality q3 (glazing select), Kind FT (fully tempered).

SELECT ONE OF THE FOLLOWING: NOTE THAT NO STANDARD THICKNESS-STRENGTH RELATIONSHIP HAS BEEN DEVELOPED FOR GLASS SHELVES, AND THAT TEMPERED GLASS HAS BEEN KNOWN TO SPONTANEOUSLY SHATTER.

- 1. Thickness: 1/4 inch.
- 2. Thickness: 1/2 inch.

GRINDING BELOW PRODUCES GLASS WITH "FROSTED" EDGES. FLAME POLISHING PRODUCES CLEAR, BUT GREEN EDGES.

- 3. Grind edges smooth.
- 4. Flame-polish edges.

DELETE BELOW IF NO PLASTIC SHELVING.

2.10 ACRYLIC PLASTIC SHELVING

- A. Construct shelves of clear, cast methacrylic plastic to comply with ASTM D 702, and with special scratch and abrasion resistant (SAR) formulation.

DELETE BELOW IF NO SITE-BUILT DOOR FRAMES.

2.11 WOOD DOOR FRAMES

- A. Quality Standard: AWI Section 900 and its Division 900B "Interior Door Frames".
 - 1. Grade: Premium.
- B. Wood Species for Exposed Surfaces: Plain sawn with narrow heart and without character markings. Panel products are not permitted. Provide wood of the following species:

DELETE OR RETAIN BELOW TO SUIT PROJECT.

- 1. Transparent Finish: Red oak (*quercus rubra*).
- 2. Opaque Finish: Yellow poplar (*liriodendron tulipifera*), natural hard maple (*acer saccharum*), or yellow birch (*betula alleghaniensis*).

2.12 MISCELLANEOUS TRIM

- A. Quality Standard: Comply with AWI Section 700.

CUSTOM AND ECONOMY GRADES NOT AVAILABLE.

- 1. Grade: Premium.
- B. Lumber Species: Provide miscellaneous trim for use in exposed condition, of the following species:

DELETE OR RETAIN BELOW TO SUIT PROJECT.

- 1. Transparent Finish: Red oak (*quercus rubra*).

2. Opaque Finish: Yellow poplar (*liriodendron tulipifera*), natural hard maple (*acer saccharum*), or yellow birch (*betula alleghaniensis*).

2.13 ACCESSORIES

- A. Hardware Schedule: Refer to schedule at end of this section for hardware required for architectural woodwork.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Quality Standard: Install woodwork to comply with AWI Section 1700 for same grade specified in Part 2 of this Section for type of woodwork involved.
- B. Install woodwork plumb, level true and straight with no distortions. Shim as required using concealed shims. Install to a tolerance of 1/8 inch in 8 feet for plumb and level (including tops); and with no variations in flushness of adjoining surfaces.
- C. Scribe and cut woodwork to fit adjoining work, and refinish cut surfaces or repair damaged finish at cuts.
- D. Anchor woodwork as indicated. Secure with countersunk, concealed fasteners and blind nailing as required for a complete installation. Use fine finishing nails for exposed nailing, countersunk and filled flush with woodwork, and matching final finish where transparent finish is indicated.
- E. Cabinets: Install without distortion so that doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete the installation of hardware and accessory items as indicated.
- F. Tops: Anchor securely to base units and other supporting systems as indicated.
- G. Install work plumb, level, true and straight with no distortions. Scribe and cut work to fit adjoining work.
- H. Repair or replace damaged and defective woodwork as directed by Architect. Adjust joinery for uniform appearance. Clean woodwork.

3.2 CLEANING, ADJUSTING AND PROTECTION

- A. Clean and Prepare for Finishing: Comply with AWI Quality Standards, Section 1500, for preparations for finishing.
- B. Clean, lubricate and adjust hardware.
- C. Clean woodwork on exposed and semiexposed surfaces. Touch-up shop-applied finishes to restore damaged or soiled areas.

- D. Provide final protection and maintain conditions, in a manner acceptable to Fabricator and Installer, which ensures architectural woodwork being without damage or deterioration at time of Substantial Completion.

3.3 HARDWARE SCHEDULE

THE FOLLOWING ARE COMMON SELECTIONS, BUT NOT OFFICE STANDARDS. MODIFY TO SUIT PROJECT.

A. Cabinet Drawers

1. Drawer Slides: Accuride No. 3832 by length required to permit drawer to open to full extension; 1 pair per drawer; or equivalent products of Grant or Stanley.

SELECT ONE OF THE FOLLOWING PULLS OR MODIFY TO SUIT PROJECT.

2. Pulls: Stanley No. 4484 satin anodized aluminum with matching grommets, or equivalent products of EPCO.
3. Pulls: HEWI No. nylon plastic with fasteners concealed by escutcheon.
4. Pulls: Sugatsune America Lamp 2-61/64-inch solid brass oval profile pulls, as follows:
 - a. "Oval-80DCR" (dull chrome finish).
 - b. "Oval-80SMK" (smoke finish).
 - c. "Oval-80PB" (polished brass finish).

B. Cabinet Doors

1. Hinges: Blum "Clip" or "Modul" concealed, screw-attached, 110 deg opening, self-closing hinges, or equivalent products of Grass.
2. Pulls: Stanley No. 4484 satin anodized aluminum with matching grommets.
3. Pulls: HEWI No. nylon plastic with fasteners concealed by escutcheon.
4. Pulls: Sugatsune America Lamp 2-61/64-inch solid brass oval profile pulls, as follows:
 - a. "Oval-80DCR" (dull chrome finish).
 - b. "Oval-80SMK" (smoke finish).
 - c. "Oval-80PB" (polished brass finish).

C. Shelving in Casework

1. Support Standards: Knape-Vogt No. 255ZC recessed, slotted standards, or equivalent products of Stanley.
2. Support Clips: Knape-Vogt No. 256R rubber tipped clips, or equivalent products of Stanley.

D. Wall Mounted Shelving:

1. Support Standards: Knape-Vogt No. 85-185 double slotted standards, or equivalent products of Stanley.
2. Support Brackets: Knape-Vogt No. 185 support brackets, or equivalent products of Stanley.

E. Computer Cable Grommets:

NOTE THAT OTHER SIZES AND CHROME PLATED UNITS ARE ALSO AVAILABLE.

1. Black plastic units 2-1/2-inches in diameter complete with cover plates. Suggested source:
Baer Supply Company
Forest Edge Drive
Vernon Hills, Illinois
Phone: 1-800-289-2237

F. Sliding-Door Hardware for Wood Cabinet Doors:

1. EPCO No. 821 extruded aluminum bottom track, No. 752 nylon roller assembly, and No. 48A34 extruded aluminum top guide; or equivalent products of Stanley.

SPECIFICATION DIVISION 7

NUMBER SECTION DESCRIPTION

DIVISION 07 THERMAL AND MOISTURE PROTECTION

SECTION 075316 - CHLOROSULFONATE-POLYETHYLENE (CSPE) ROOFING

END OF CONTENTS TABLE

DIVISION 07 THERMAL AND MOISTURE PROTECTION
SECTION 075316 - CHLOROSULFONATE-POLYETHYLENE (CSPE) ROOFING

UPDATED 2/1/2002 TO REVISE FM APPLICATION PROCEDURES AND STANDARDS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes single-ply membrane roofing system as follows:
 - 1. System Type: Mechanically fastened.
 - 2. Membrane Type: Chlorosulfonated polyethylene (CSPE).
- B. Roof insulation related to flexible sheet roofing is specified in this section.
- C. Wood nailers, blocking and other related items are specified in this section.

INCLUDE OR DELETE ELEMENTS LISTED BELOW, OR ADD NEW ELEMENTS TO SUIT PROJECT.

- D. Removal of existing roofing system is specified in Division 02 Section "Selective Demolition".
- E. Concrete for patching work is specified in Division 03 Section "Miscellaneous Cast-In-Place Concrete".
- F. Structural steel required for equipment supports and framing members is specified in Division 05 Section "Structural Steel Framing".
- G. Steel deck units are specified in Division 05 Section "Steel Decking".
- H. Wood sheathing and framing is specified in Division 06 Section "Rough Carpentry".

1.2 SUBMITTALS

- A. Comply with submittal requirements indicated in Standard General Conditions, Division 01 Section "Submittal Procedures" and requirements of this Article.
 - 1. Submit product data, test data, samples, and shop drawings not less than 3 weeks prior to beginning roofing work.
 - 2. In addition to Owner's routine submittal process indicated in Standard General Conditions, submit design information and Factory Mutual roof acceptance form simultaneously and directly to Factory Mutual for review and approval at the following address:
 - FM Global
 - 25050 Great Northern Corporate Center, Suite 300
 - North Olmsted, OH 44070
 - Attn: Ms. Dawn Peger

3. Upon completion of Factory Mutual review the Contractor is responsible for providing the Owner with a copy of the review comments and corresponding actions taken.
- B. Product data, installation instructions, and general recommendations from manufacturer of single ply roofing membrane system for type of roofing required. Include data substantiating that materials comply with requirements.
1. For each of the following items, provide manufacturer's name, product name or model number:
 - a. Roofing membrane.
 - b. Insulation.
 - c. Flashing.
 - d. Adhesive.
 - e. Fasteners and Plates.
 - f. Vapor/Air Retarder (if applicable).

USUALLY DELETE THE FOLLOWING, UNLESS UNFAMILIAR MATERIALS ARE SPECIFIED.

- C. Samples of finished roofing sheets, including T-shaped side and end-lap seam. Also include the following:
1. Samples of required insulation.
- D. Shop drawings showing roof configuration, dimensions, height above grade, sheet layout, seam locations, flashing details, attachment details, membrane color (as applicable), details at perimeter, and special conditions.
1. Indicate insulation fastening rate in the field, at corners, and around perimeter of the roof. Include width of perimeter and corners.
 2. Indicate layout of tapered insulation materials.

INCLUDE BELOW WHERE FASTENING THROUGH QUESTIONABLE SUBSTRATES.

- E. Test data for pullout resistance of fastening systems.

1.3 QUALITY ASSURANCE

- A. Manufacturer: Obtain primary flexible sheet roofing from a single manufacturer. Provide secondary materials as recommended by manufacturer of primary materials.
- B. Installer: Engage an Installer to apply single ply membrane roofing who has not less than 3 years experience in application of roofing systems similar to those required for this project. Installer must be acceptable to or licensed by manufacturer of primary roofing material.
1. Work associated with single ply membrane roofing, including (but not limited to) insulation, flashing, and counterflashing, expansion joints, and joint sealers, is to be performed by Installer of this work.

- C. Pre-Roofing Conference: One week prior to installation of roofing and associated work, meet at project site, or other mutually agreed location, with Installer, roofing sheet manufacturer, installers of related work, and other entities concerned with roofing performance, including Owner's insurer, test agencies, Owner's Representative, and Architect. Owner's Representative will conduct meeting, record discussions and agreements reached, and furnish a copy of meeting record to each participant.
 - 1. Provide at least 24 hours' advance notice to Owner's Representative prior to performing roofing installation.
- D. UL Listing: Provide labeled materials that have been tested and listed by UL in "Building Materials Directory" with "Class A" rated materials and system for roof slopes shown.

SELECT CLASS 1-60 OR 1-90 (OR OTHER CLASSIFICATION) AS APPROPRIATE.

- E. Factory Mutual: Provide materials with fuel contribution permitted for FM Class I Rating. Installation shall comply with recommendations of applicable FMRC data sheets and "Approval Guide." Comply with standards for FM Class 1-60 (1-90).
- F. Final Inspection: Require a factory representative of the membrane manufacturer to perform a final inspection of the roof installation, and to submit to the Owner a written report, signed by the manufacturer.

1.4 PROJECT CONDITIONS

- A. Weather: Proceed with roofing work only when existing and forecasted weather conditions permit work to be performed in accordance with manufacturers' recommendations and warranty requirements.
- B. Substrate Conditions: Do not begin roofing installation until substrates have been inspected by Owner's Roofing Department and are determined to be in satisfactory condition.

1.5 WARRANTY

- A. Special Project Warranty: Submit two executed copies of single source warranty, signed by manufacturer of roofing membrane, agreeing to replace or repair defective materials and workmanship on the total system, including leakage of water, abnormal aging or deterioration of materials, and other failures of sheet roofing system within warranty period. Repairs and replacements required because of acts of God and other events beyond Contractor's, Installer's, and manufacturer's control (and which exceed performance requirements) shall be completed by Contractor and Installer, and paid for by Owner, at prevailing rates.
 - 1. Warranty Period: 15 years after date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Performance: Provide roofing materials recognized to be of generic type indicated and tested to show compliance with indicated performances, or provide other similar materials certified in writing by manufacturer to be equal to, or better than, materials specified in every significant respect and acceptable to Architect.
- B. Compatibility: Provide products that are recommended by manufacturers to be fully compatible with indicated substrates, or provide separation materials as required to eliminate contact between incompatible materials.

2.2 CHLOROSULFONATED POLYETHYLENE (CSPE) MEMBRANE

- A. General: Hypalon synthetic rubber as produced by E. I. du Pont de Nemours & Co., formed into uniform flexible sheets, complying with the following:
 - 1. Tensile Strength (ASTM D 412): 1000 psi.
 - 2. Ultimate Elongation (ASTM D 412): 350 percent.
 - 3. Brittleness Temperature (ASTM D 746): Minus 40 deg F (minus 40 deg C).
 - 4. Resistance to Heat Aging (ASTM D 573): Retains 100 percent of tensile strength (14 days at 212 deg F/100 deg C).
 - 5. Thickness: 45 mils, minimum.
 - 6. Reinforcing Scrim: Polyester or nylon.
 - 7. Exposed Face Color: White.
- B. Mechanically Fastened CSPE Membrane: Manufacturer's standard installation.
- C. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
Carlisle SynTec Systems, Carlisle Corporation
Stevens Roofing Systems Div., JPS Elastomerics Corp.

2.3 AUXILIARY MATERIALS

SELECT PERLITE BOARD FOR NEW ROOFS AND TEAR-OFFS. SELECT "RECOVERY" BOARD FOR ROOFING OVER EXISTING ROOFING MATERIALS.

- A. Gypsum Board: Fire rated, complying with ASTM C 36, Type X; 5/8 inch thick.
- B. "Recovery" Board: Manufacturer's standard board, recommended for application indicated.
- C. Sheet Seaming System: Manufacturer's standard materials for sealing lapped joints, including edge sealer to cover exposed spliced edges as recommended by membrane manufacturer.
 - 1. Provide solvent splice wash, splicing primer, splicing cement, night seal, and pourable seal products recommended by the membrane manufacturer and compatible with the materials with which they are is used.

- D. Cant Strips Tapered Edge Strips, and Flashing Accessories: Types recommended by membrane manufacturer, including adhesive tapes, flashing cements, and sealants.
- E. Nailing Strips and Fasteners: Extruded nailing strips and fasteners recommended by membrane manufacturer.
- F. Wood Nailers: Spruce-pine-fir dimensional lumber, preservative treated.
- G. Flashing Material: Manufacturer's standard systems compatible with flexible sheet membrane, "Hypalon" coated metal where recommended by manufacturer.
- H. Metal Gravel Stop: As recommended by membrane manufacturer for indicated installation.

SELECT ONE OF THE WALKWAY PROTECTION TYPES LISTED BELOW, OR DELETE IF NOT REQUIRED.

- I. Walkway Protection: "Hypalon" rubber membrane as approved by the membrane manufacturer. Locate as indicated on drawings.
 - 1. Thickness: Not less than 100 mil.
- J. Walkway Protection: Prefabricated concrete pavers designed specifically for ballasting single ply membranes. Provide interlocking units with subsurface drainage channels, weighing approximately 12 psf with minimum 2500-psi compressive strength.
 - 1. Products: Subject to compliance with requirements, provide one of the following:
 - "Roofcap Paver"; IDR Div. National Concrete Masonry Assoc.
 - "Roofblock Ballast System"; Roofblok Ltd.
- K. Slip Sheet: Type recommended by membrane manufacturer for protecting membrane from incompatible substrates.
- L. Protective Coating: Liquid-applied "Hypalon" finish coat for application to exposed membrane, in color selected by Architect from manufacturer's standard colors.
- M. Mechanical Fasteners: Metal plates, caps, battens, accessory components, fastening devices, and adhesives to suit substrate and as recommended by manufacturer.

2.4 INSULATING MATERIALS

- A. General: Provide insulating materials to comply with requirements indicated for materials and compliance with referenced standards in sizes to fit applications indicated, selected from manufacturer's standard thicknesses, widths, and lengths.
 - 1. Provide tapered boards where indicated for sloping to drain. Fabricate with indicated taper, unless otherwise indicated.

DESIGN FOR SLOPE OF ¼ INCH PER FOOT IF POSSIBLE.

SELECT MAXIMUM POSSIBLE SLOPE PERMITTED BY SITE CONDITIONS.

- a. Slope: 1/16 inch per foot.
- b. Slope: 1/8 inch per foot.
- c. Slope: 1/4 inch per foot.

SELECT ONE OF THE FOLLOWING INSULATION TYPES, OR INCLUDE BOTH AS "CONTRACTOR'S OPTION" - COORDINATE K FACTOR VARIATION OF MATERIALS WITH RESULTING EQUIVALENT THICKNESSES AND SITE CONDITIONS BEFORE SELECTING VALUES.

- B. Extruded Polystyrene Board Insulation: Rigid, cellular thermal insulation with closed cells and integral high-density skin, complying with ASTM C 578 for Type IV and as follows:
1. Compressive Strength: 25-psf min. per ASTM D 1621.
 2. 5-Year Aged k Factor: 0.20 at 75 deg F, and 0.185 deg F per ASTM C 518-76.
 3. Surface Burning Characteristics: Maximum flame spread and smoke developed values of 5 and 165, respectively.

REVISE THICKNESS VALUE INDICATED BELOW. USUALLY KEEP MINIMUM THICKNESS OF 1-1/2 INCHES, UNLESS NOT PERMITTED BY SITE CONDITIONS.

4. Thickness: 1-1/2 inch, exclusive of tapered insulation course.
 5. Product: Provide units recommended and approved by membrane manufacturer, with aged R-value equal to Dow Chemical Co. "Styrofoam SM or TG".
- C. Polyisocyanurate Board Roof Insulation: Rigid cellular thermal insulation with polyisocyanurate closed-cell foam core and manufacturer's standard matt facing laminated to both sides; complying with FS HH-I-1972/2, Class 1.

REVISE THICKNESS VALUE INDICATED BELOW. USUALLY KEEP MINIMUM THICKNESS OF 1-1/2 INCHES, UNLESS NOT PERMITTED BY SITE CONDITIONS.

1. Minimum Compressive Strength: 25 psi.
2. Thickness: 1-1/2 inch, exclusive of tapered insulation course.
3. Product: Provide units recommended and approved by membrane manufacturer, with aged R-value equal to Celotex Corp. "Energy-Lok".

2.5 AUXILIARY INSULATION MATERIALS

- A. Adhesive for Bonding Insulation: Where required, type recommended by insulation manufacturer, approved by the membrane manufacturer and complying with fire resistance requirements.
- B. Mastic Sealer: Type recommended by insulation manufacturer for bonding edge joints and filling voids, if required.
- C. Mechanical Anchors: Corrosion-resistant type as recommended by membrane manufacturer for deck type and complying with fire and insurance uplift rating requirements.

SELECT ONE OF THE FOLLOWING THREE.

1. Fasten insulation into concrete decks.
2. Fasten insulation through metal decks.
3. Fasten insulation through wood decks.

ALWAYS INCLUDE BELOW.

4. Provide system tested and approved for the following Factory Mutual wind uplift rating:

SELECT ONE OF THE FOLLOWING BASED ON FM RECOMMENDATIONS.

PART 3 - EXECUTION

3.1 PREPARATION OF SUBSTRATE

- A. General: Comply with manufacturer's instructions for preparation of substrate to receive single ply membrane system.
 1. Verify that penetrations, expansion joints, and blocking are placed and secured and that roof drains are properly clamped into position.
- B. Clean substrate of dust debris, and other substances detrimental to single ply roofing system work. Remove sharp projections.
- C. Install flashings and accessory items as shown, and as recommended by manufacturer if not shown.

3.2 INSPECTION OF SUBSTRATE

- A. Inspection: Inspect substrate and conditions under which roofing work is to be performed in presence of Installer. Notify Owner in writing of unsatisfactory conditions. Do not proceed with roofing work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.3 INSULATION INSTALLATION

REVISE THE FOLLOWING PARAGRAPH TO SELECT EITHER ONE OR MULTIPLE LAYERS. AS WRITTEN, PARAGRAPH GIVES CONTRACTOR THE OPTION TO DO EITHER.

- A. General: Extend insulation full thickness in one layer, or in multiple layers over entire surface to be insulated, cutting and fitting tightly around obstructions. Form cant strips, crickets, saddles, and tapered areas with additional material as shown and as required for proper drainage of membrane.
 1. Stagger joints in one direction for each course. For multiple layers, stagger joints in both directions between courses with no gaps, to form a complete thermal envelope. Use the largest sheets possible as determined by job conditions to minimize the amount of joints.

INCLUDE THE FOLLOWING IF VAPOR BARRIER IS INCLUDED.

2. Install vapor barrier under insulation. Lap edges min. 3 inches and tape seams.
- B. Do not install more insulation each day than can be covered with membrane before the end of day or before start of inclement weather. Insulation shall be clean and dry when installed.

C. Secure roof insulation to substrate with mechanical anchors of type and spacing recommended by manufacturer, but in no case provide less than required by the latest version of FM "Loss Prevention Data Sheet 1-29," including perimeter and corner enhancements.

1. Tar Kettle/Pots are required to be equipped with fume recovery system.

3.4 MEMBRANE INSTALLATION

A. General: If required for warranty, start installation only in presence of manufacturers technical representative. Use only installation techniques and details acceptable to the membrane manufacturer and that qualify installation for required warranty.

1. Cut out and repair membrane defects at end of each day's work.

B. Mechanically Fastened Membrane: Install membrane by unrolling over prepared substrate, lapping adjoining sheets as recommended by manufacturer, and bonding and sealing seams. Install mechanical fasteners at spacing recommended by manufacturer, covering with adhesive-applied membrane so that no fastenings are exposed. Install flashings and counterflashings, as shown or recommended by manufacturer.

1. Splicing: Splice in accordance with the manufacturer's recommendations. Clean membrane and counterflashing splices with a solvent wash and prime with splicing primer prior to application of adhesive.
2. Perimeter Nailing: Mechanically fasten nailing strips through the membrane and into the roof deck. Seal with flashing at the perimeter, curb flashing, expansion joints, and obstructions. Provide 6 inch wide separations where water flow is interrupted.
3. Flashing: Use longest pieces possible for perimeter flashing and flashing around penetrations, mechanical systems, and similar obstructions. Fabricate flashings and terminations in accordance with standard details. Flash items passing through the membrane. Flash pipes with molded pipe flashing. Where installation of molded pipe flashing is not possible, install field fabricated pipe seals. Do not allow flashing to bridge any change in direction.
4. Clusters of Pipes: Seal unusual shaped penetrations using pitch pocket type seal as shown in manufacturer's standard details.
5. Expansion Joints: Comply with roof manufacturer's recommendations.
6. Daily Seal: Exercise care to ensure that the water does not flow beneath any completed sections of roof. Temporarily seal loose edge of membrane according to manufacturer's recommendations at the end of each working day provide edge weighting. When work is resumed, pull sheet free before continuing installation. Provide seals to existing deck and to existing roofing to prevent water bypass into new roofing system.

7. Laps: No buck water laps are permitted, and no field seams within 3 feet of a roof sump will be allowed.

SELECT ONE OF THE FOLLOWING TO SUIT PROJECT, OR DELETE BOTH IF NO WALKWAY PROTECTION INCLUDED.

- C. Walkway Protection: Adhere "Hypalon" walkway membrane to roof membrane in accordance with manufacturer's written instructions.
- D. Walkway Protection: Install paver units at locations shown and where required for access to roof-mounted equipment. Place protection boards carefully to avoid damage to roofing system.

3.5 PROTECTION OF ROOFING

- A. Upon completion of roofing (including associated work), institute appropriate procedures for surveillance and protection of roofing during remainder of construction period. At end of construction period, or at time when remaining construction will in no way affect or endanger roofing, make a final inspection of roofing and prepare a written report to Owner, describing nature and extent of deterioration or damage found.
- B. Repair or replace deteriorated or defective work found at time of final inspection, as required to provide a condition free of damage and deterioration at time of Substantial Completion and in accordance with requirements of specified warranty.

NUMBER SECTION DESCRIPTION

DIVISION 07 THERMAL AND MOISTURE PROTECTION

SECTION 075323 - ETHYLENE-PROPYLENE-DIENE-MONOMER (EPDM) ROOFING

END OF CONTENTS TABLE

DIVISION 07 THERMAL AND MOISTURE PROTECTION
SECTION 075323 - ETHYLENE-PROPYLENE-DIENE-MONOMER (EPDM) ROOFING

UPDATED 2/1/2002 TO REVISE FM APPLICATION PROCEDURES AND STANDARDS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes single-ply membrane roofing system as follows:
 - 1. System Type: Fully adhered.
 - 2. Membrane Type: Ethylene propylene diene monomer (EPDM).
- B. Roof insulation related to flexible sheet roofing is specified in this section.
- C. Wood nailers, blocking and other related items are specified in this Section.

INCLUDE OR DELETE ELEMENTS LISTED BELOW, OR ADD NEW ELEMENTS TO SUIT PROJECT.

- D. Removal of existing roofing system is specified in Division 02 Section "Selective Demolition".
- E. Concrete for patching work is specified in Division 03 Section "Miscellaneous Cast-In-Place Concrete".
- F. Structural steel required for equipment supports and framing members is specified in Division 05 Section "Structural Steel Framing".
- G. Steel deck units are specified in Division 05 Section "Steel Decking".
- H. Wood sheathing and framing is specified in Division 06 Section "Rough Carpentry".

1.2 SUBMITTALS

- A. Comply with submittal requirements indicated in Standard General Conditions, Division 01 Section "Submittals," and requirements of this Article.
 - 1. Submit product data, test data, samples, shop drawings and Factory Mutual roof acceptance form not less than 3 weeks prior to beginning roofing work.
 - 2. In addition to Owner's routine submittal process indicated in Standard General Conditions, submit design information and Factory Mutual roof acceptance form simultaneously and directly to Factory Mutual for review and approval at the following address:
 - FM Global
 - 25050 Great Northern Corporate Center, Suite 300
 - North Olmsted, OH 44070
 - Attn: Ms. Dawn Peger

3. Upon completion of Factory Mutual review the Contractor is responsible for providing the Owner with a copy of the review comments and corresponding actions taken.
- B. Product data, installation instructions, and general recommendations from manufacturer of single ply roofing membrane system for type of roofing required. Include data substantiating that materials comply with requirements.
1. For each of the following items, provide manufacturer's name, product name or model number:
 - a. Roofing membrane.
 - b. Insulation.
 - c. Flashing.
 - d. Adhesive.
 - e. Fasteners and Plates.
 - f. Vapor/Air Retarder (if applicable).

USUALLY DELETE THE FOLLOWING, UNLESS UNFAMILIAR MATERIALS ARE SPECIFIED.

- C. Samples of finished roofing sheets, including T-shaped side and end-lap seam. Also include samples of required insulation.
- D. Shop drawings showing roof configuration, dimensions, height above grade, sheet layout, seam locations, flashing details, attachment details, membrane color (as applicable), details at perimeter, and special conditions.
1. Indicate insulation fastening rate in the field, at corners, and around perimeter of the roof. Include width of perimeter and corners.
 2. Indicate layout of tapered insulation materials.

INCLUDE BELOW WHERE FASTENING THROUGH QUESTIONABLE SUBSTRATES.

- E. Test data for pullout resistance of fastening systems.

1.3 QUALITY ASSURANCE

- A. Manufacturer: Obtain primary flexible sheet roofing from a single manufacturer. Provide secondary materials as recommended by manufacturer of primary materials.
- B. Installer: Engage an Installer to apply single ply membrane roofing who has not less than 3 years experience in application of roofing systems similar to those required for this project. Installer must be acceptable to or licensed by manufacturer of primary roofing material.
1. Work associated with single ply membrane roofing, including (but not limited to) insulation, flashing, and counterflashing, expansion joints, and joint sealers, is to be performed by Installer of this Work.

- C. Pre-Roofing Conference: One week prior to installation of roofing and associated work, meet at project site, or other mutually agreed location, with Installer, roofing sheet manufacturer, installers of related work, and other entities concerned with roofing performance, including Owner's insurer, test agencies, Owner's Representative, and Architect. Owner's Representative will conduct meeting, record discussions and agreements reached, and furnish a copy of meeting record to each participant.
 - 1. Provide at least 24 hours' advance notice to Owner's Representative prior to performing roofing installation.
- D. UL Listing: Provide labeled materials that have been tested and listed by UL in "Building Materials Directory" with "Class A" rated materials and system for roof slopes shown.

SELECT CLASS 1-60 OR 1-90 (OR OTHER CLASSIFICATION) AS APPROPRIATE.

- E. Factory Mutual: Provide materials with fuel contribution permitted for FM Class 1 Rating. Installation shall comply with recommendations of applicable FMRC data sheets, and "Approval Guide." Comply with standards for FM Class 1-60 (1-90).
- F. Final Inspection: Require a factory representative of the membrane manufacturer to perform a final inspection of the roof installation, and to submit to the Owner a written report, signed by the manufacturer.

1.4 PROJECT CONDITIONS

- A. Weather: Proceed with roofing work only when existing and forecasted weather conditions permit work to be performed in accordance with manufacturers' recommendations and warranty requirements.
- B. Substrate Conditions: Do not begin roofing installation until substrates have been inspected by Owner's Roofing Department and are determined to be in satisfactory condition.

1.5 WARRANTY

- A. Special Project Warranty: Submit two executed copies of single source warranty, signed by manufacturer of roofing membrane, agreeing to replace or repair defective materials and workmanship on the total system, including leakage of water, abnormal aging or deterioration of materials, and other failures of sheet roofing system within warranty period. Repairs and replacements required because of acts of God and other events beyond Contractor's, Installer's, and Manufacturer's control (and which exceed performance requirements) shall be completed by Contractor and Installer, and paid for by Owner, at prevailing rates.
 - 1. Warranty Period: 15 years after date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Performance: Provide roofing materials recognized to be of generic type indicated and tested to show compliance with indicated performances, or provide other similar materials certified in writing by manufacturer to be equal to, or better than, materials specified in every significant respect and acceptable to Architect.
- B. Compatibility: Provide products that are recommended by manufacturers to be fully compatible with indicated substrates, or provide separation materials as required to eliminate contact between incompatible materials.

2.2 EPDM MEMBRANE

- A. General: Ethylene propylene diene monomers formed into uniform, flexible sheets, complying with ASTM D 4637, Type 1.
 - 1. Class U: Unreinforced.
 - 2. Thickness: 60 mils, nominal.
 - 3. Exposed Face Color: Black.
- B. Fully Adhered EPDM Membrane: Manufacturer's standard installation.
- C. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
Carlisle SynTec Systems, Carlisle Corporation
Firestone RubberGard Roofing Systems, Firestone Building Products Co.
Genflex Roofing Systems, Building Systems Div., GenCorp Polymer Products
Johns Manville Corp.
Versigard Roofing Systems, Versico Incorporated

2.3 AUXILIARY MATERIALS

SELECT PERLITE BOARD FOR NEW ROOFS AND TEAR-OFFS. SELECT "RECOVERY" BOARD FOR ROOFING OVER EXISTING ROOFING MATERIALS.

- A. Gypsum board: Fire rated, complying with ASTM C 36, Type X; 5/8 inch thick.
- B. "Recovery" Board: Manufacturer's standard board, recommended for application indicated.

INCLUDE THE FOLLOWING WHERE IT HAS BEEN DETERMINED THAT DEW POINT WILL OCCUR BENEATH MEMBRANE.

- C. Provide 4 mil thick polyethylene sheet vapor-proof membrane.
- D. Sheet Seaming System: Manufacturer's standard materials for sealing lapped joints, including edge sealer to cover exposed spliced edges as recommended by membrane manufacturer.

1. Provide solvent splice wash, splicing primer, splicing cement, night seal, and pourable seal products recommended by the membrane manufacturer and compatible with the materials with which they are used.
- E. Cant Strips Tapered Edge Strips, and Flashing Accessories: Types recommended by membrane manufacturer, including adhesive tapes, flashing cements, and sealants.
 - F. Nailing Strips and Fasteners: Extruded nailing strips and fasteners recommended by membrane manufacturer.
 - G. Wood Nailers: Spruce-pine-fir dimensional lumber, preservative treated.
 - H. Flashing Material: Manufacturer's standard systems compatible with flexible sheet membrane, including molded pipe flashing and uncured neoprene flashing.
 1. Provide uncured neoprene flashing material not less than 60 mils thick. Minimize use of uncured neoprene to greatest extent possible.
 - I. Metal Gravel Stop: As recommended by membrane manufacturer for indicated installation.
 - J. Walkway Protection: EPDM rubber pads as approved by the membrane manufacturer. Locate as indicated on drawings.
 1. Thickness: Not less than 100 mil.
 - K. Slip Sheet: Type recommended by membrane manufacturer for protecting membrane from incompatible substrates.
 - L. Membrane Adhesive: As recommended by membrane manufacturer for particular substrate and project conditions, formulated to withstand min. 90-psf uplift force.

2.4 INSULATING MATERIALS

- A. General: Provide insulating materials to comply with requirements indicated for materials and compliance with referenced standards in sizes to fit applications indicated, selected from manufacturer's standard thicknesses, widths, and lengths.
 1. Provide tapered boards where indicated for sloping to drain. Fabricate with indicated taper, unless otherwise indicated.

DESIGN FOR SLOPE OF ¼ INCH PER FOOT IF POSSIBLE.

SELECT MAXIMUM POSSIBLE SLOPE PERMITTED BY SITE CONDITIONS.

 - a. Slope: 1/16 inch per foot.
 - b. Slope: 1/8 inch per foot.
 - c. Slope: 1/4 inch per foot.
- B. Polyisocyanurate Board Roof Insulation: Rigid cellular thermal insulation with polyisocyanurate closed-cell foam core and manufacturer's standard matt facing laminated to both sides; complying with FS HH-I-1972/2, Class 1.

REVISE THICKNESS VALUE INDICATED BELOW. USUALLY KEEP MINIMUM THICKNESS OF 1-1/2 INCHES, UNLESS NOT PERMITTED BY SITE CONDITIONS.

1. Thickness: 1-1/2 inch, exclusive of tapered insulation course.
2. Provide material with a minimum compressive strength of 25 psi.
3. Manufacturer/Product: Provide units recommended and approved by membrane manufacturer, with aged R-value equal to Celotex Corp. "Energy-Lok".

2.5 AUXILIARY INSULATION MATERIALS

- A. Adhesive for Bonding Insulation: Where required, type recommended by insulation manufacturer, approved by the membrane manufacturer and complying with fire resistance requirements.
- B. Mastic Sealer: Type recommended by insulation manufacturer for bonding edge joints and filling voids, if required.
- C. Mechanical Anchors: Corrosion-resistant type as recommended by membrane manufacturer for deck type and complying with fire and insurance uplift rating requirements.

SELECT ONE OF THE FOLLOWING THREE.

1. Fasten insulation into concrete decks.
2. Fasten insulation through metal decks.
3. Fasten insulation through wood decks.

ALWAYS INCLUDE BELOW.

4. Provide system tested and approved for the following Factory Mutual wind uplift rating:

SELECT ONE OF THE FOLLOWING BASED ON FM RECOMMENDATIONS.

PART 3 - EXECUTION

3.1 PREPARATION OF SUBSTRATE

- A. General: Comply with manufacturer's instructions for preparation of substrate to receive single ply membrane system.
 1. Verify that penetrations, expansion joints, and blocking are placed and secured and that roof drains are properly clamped into position.
- B. Clean substrate of dust debris, and other substances detrimental to single ply roofing system work. Remove sharp projections.
- C. Install flashings and accessory items as shown, and as recommended by manufacturer if not shown.

3.2 INSPECTION OF SUBSTRATE

- A. Inspection: Inspect substrate and conditions under which roofing work is to be performed in presence of Installer. Notify Owner in writing of unsatisfactory conditions. Do not proceed with roofing work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.3 INSULATION INSTALLATION

REVISE THE FOLLOWING PARAGRAPH TO SELECT EITHER ONE OR MULTIPLE LAYERS. AS WRITTEN, PARAGRAPH GIVES CONTRACTOR THE OPTION TO DO EITHER.

- A. General: Extend insulation full thickness in one layer, or in multiple layers over entire surface to be insulated, cutting and fitting tightly around obstructions. Form cant strips, crickets, saddles, and tapered areas with additional material as shown and as required for proper drainage of membrane.
 - 1. Stagger joints in one direction for each course. For multiple layers, stagger joints in both directions between courses with no gaps, to form a complete thermal envelope. Use the largest sheets possible as determined by job conditions to minimize the amount of joints.

INCLUDE THE FOLLOWING IF VAPOR BARRIER IS INCLUDED.

- 2. Install vapor barrier under insulation. Lap edges min. 3 inches and tape seams.
- B. Do not install more insulation each day than can be covered with membrane before the end of day or before start of inclement weather. Insulation shall be clean and dry when installed.
- C. Secure roof insulation to substrate with mechanical anchors of type and spacing recommended by manufacturer, but in no case provide less than required by the latest version of FM "Loss Prevention Data Sheet 1-29," including perimeter and corner enhancements.
 - 1. Tar Kettle/Pots are required to be equipped with fume recovery system.

3.4 MEMBRANE INSTALLATION

- A. General: If required for warranty, start installation only in presence of manufacturers technical representative. Use only installation techniques and details acceptable to the membrane manufacturer and that qualify installation for required warranty.
 - 1. Cut out and repair membrane defects at end of each day's work.

- B. Fully Adhered Membrane: Install membrane by rolling over prepared substrate, lapping adjoining sheets as recommended by manufacturer. Apply adhesive to surfaces to be bonded and roll into place when adhesive has properly cured; roll out spray-applied adhesive to ensure even coverage. Treat seams with special cement and apply sealant to exposed sheet edges, tapering application as recommended by manufacturer. Install flashings and counterflashings, and accessories at locations and as recommended by manufacturer.
1. Splicing: Splice in accordance with the manufacturer's recommendations. Clean membrane and counterflashing splices with a solvent wash and prime with splicing primer prior to application of adhesive.
 2. Perimeter Nailing: Mechanically fasten nailing strips through the membrane and into the roof deck. Seal with flashing at the perimeter, curb flashing, expansion joints, and obstructions. Provide 6 inch wide separations where water flow is interrupted.
 3. Flashing: Use longest pieces possible for perimeter flashing and flashing around penetrations, mechanical systems, and similar obstructions. Fabricate flashings and terminations in accordance with standard details. Flash items passing through the membrane. Flash pipes with molded pipe flashing. Where installation of molded pipe flashing is not possible, install field fabricated pipe seals. Do not allow flashing to bridge any change in direction.
 4. Clusters of Pipes: Seal unusual shaped penetrations using pitch pocket type seal as shown in manufacturer's standard details.
 5. Expansion Joints: Comply with roof manufacturer's recommendations.
 6. Daily Seal: Exercise care to ensure that the water does not flow beneath any completed sections of roof. Temporarily seal loose edge of membrane according to manufacturer's recommendations at the end of each working day, and provide edge weighting. When work is resumed, pull sheet free before continuing installation. Provide seals to existing deck and to existing roofing to prevent water bypass into new roofing system.
 7. Laps: No buck water laps are permitted, and no field seams within 3 feet of a roof sump will be allowed.
- C. Walkway Protection: Install EPDM rubber pads at locations shown and where required for access to roof-mounted equipment. Install in accordance with manufacturer's recommendations.

3.5 CLEANING

- A. Remove excess materials, packaging, and other debris from roof surface upon completion of work. Hose down roofing surfaces to remove remaining dust and dirt.

3.6 PROTECTION OF ROOFING

- A. Upon completion of roofing (including associated work), institute appropriate procedures for surveillance and protection of roofing during remainder of construction period. At end of construction period, or at time when remaining construction will in no way affect or endanger roofing, make a final inspection of roofing and prepare a written report to Owner, describing nature and extent of deterioration or damage found.
- B. Repair or replace deteriorated or defective work found at time of final inspection, as required to provide a condition free of damage and deterioration at time of Substantial Completion and in accordance with requirements of specified warranty.

SPECIFICATION DIVISION 7

NUMBER SECTION DESCRIPTION

DIVISION 07 THERMAL AND MOISTURE PROTECTION

SECTION 078413 - PENETRATION FIRESTOPPING

END OF CONTENTS TABLE

DIVISION 07 THERMAL AND MOISTURE PROTECTION
SECTION 078413 - PENETRATION FIRESTOPPING

THIS NEW SECTION REPLACES THE BRIEF DESCRIPTION OF FIRE-STOPPING WHICH WAS FORMERLY INCLUDED IN SECTION 079200 JOINT SEALANTS. INCLUDE THIS SECTION FOR ALL PROJECTS WHERE PIPING, DUCTWORK OR ELECTRICAL CONDUIT IS BEING MODIFIED OR INSTALLED OR WHERE IMPROPERLY INSTALLED CONCEALED OR EXPOSED PENETRATIONS ARE BEING REPAIRED. EXISTING CONDITIONS SHOULD BE SURVEYED AT THE BEGINNING OF A PROJECT, AND INADEQUACIES (I.E., UNPROTECTED OPENINGS IN WALLS AND FLOORS, IMPROPER PENETRATIONS, ETC.) SHOULD BE IDENTIFIED AND CORRECTED WHENEVER FUNDING CAN BE OBTAINED FOR THIS PURPOSE.

1.1 SUMMARY

- A. This Section includes through-penetration firestop systems for penetrations through fire-resistance-rated constructions, including both empty openings and openings containing penetrating items.

ALWAYS INCLUDE THE FOLLOWING WHEN THERE ARE MECHANICAL AND ELECTRICAL PENETRATIONS.

SLEEVES ARE RECOMMENDED FOR FLOOR PENETRATIONS TO PROTECT CONTENTS ON THE FLOOR BELOW THE PENETRATION FROM LEAKAGE OR FLOODING CAUSED BY PIPE BREAKS, SPRINKLER DISCHARGE, ETC. EVALUATE LEVEL OF PROTECTION DESIRED BY OWNER AND THE LIKELIHOOD OF WATER DAMAGE IN CONSULTATION WITH MECHANICAL ENGINEER. SLEEVES ARE TYPICALLY SHOWN ON MECHANICAL AND ELECTRICAL DRAWINGS SINCE THEY ARE USUALLY THE RESPONSIBILITY OF THE CONTRACTOR MAKING THE PENETRATION. ALTHOUGH THE SLEEVE ITSELF IS NOT PART OF THE FIRESTOP SYSTEM, IT MAY AFFECT WHICH FIRESTOPPING SYSTEM IS SELECTED, SINCE THE ENTIRE ASSEMBLY MUST BE TESTED AND NOT ALL SYSTEMS HAVE BEEN TESTED WITH SLEEVES.

- B. Related Sections include the following:
1. Division 21, 22 and 23 Sections specifying duct and piping penetrations.
 2. Division 26, 27 and 28 Sections specifying cable and conduit penetrations.

1.2 REFERENCES

- A. ASTM E 84 Test Method for Surface Burning Characteristics of Building Materials.
- B. ASTM E 119 Test Method for Fire Test of Building Construction and Materials.
- C. ASTM E 814 Fire Tests of Through-Penetration Fire Stops.
- D. Firestop Contractors International Association (F.C.I.A.) Manual of Practice (M.O.P.).

1.3 PERFORMANCE REQUIREMENTS

A. General: For penetrations through fire-resistance-rated constructions, including both empty openings and openings containing penetrating items, provide through-penetration firestop systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of construction penetrated.

1. For through-penetration firestop systems in non-rated walls, a fire-resistance rating shall not be required.

B. Rated Systems: Provide through-penetration firestop systems with the following ratings determined per ASTM E 814:

1. F-Rated Systems: Provide through-penetration firestop systems with F-ratings indicated, but not less than that equaling or exceeding fire-resistance rating of constructions penetrated.

AS A GENERAL RULE, T-RATED SYSTEMS ARE REQUIRED WHERE PENETRATING ITEMS PASS THROUGH OCCUPIABLE AREAS WHERE THEY MAY CONTACT COMBUSTIBLE MATERIALS. DELETE PARAGRAPHS BELOW IF T-RATED SYSTEMS ARE NOT REQUIRED.

2. T-Rated Systems: For the following conditions, provide through-penetration firestop systems with T-ratings indicated, as well as F-ratings, where systems protect penetrating items exposed to potential contact with adjacent materials in occupiable floor areas:

- a. Penetrations located outside wall cavities.
b. Penetrations located outside fire-resistance-rated shaft enclosures.

C. For through-penetration firestop systems exposed to view, traffic, moisture, and physical damage, provide products that, after curing, do not deteriorate when exposed to these conditions both during and after construction.

THREE SUBPARAGRAPHS BELOW ARE EXAMPLES OF SPECIAL REQUIREMENTS. DELETE THOSE NOT APPLICABLE; INSERT OTHERS TO SUIT PROJECT.

1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.

2. For floor penetrations with annular spaces exceeding 4 inches (100 mm) in width and exposed to possible loading and traffic, provide firestop systems capable of supporting floor loads involved, either by installing floor plates or by other means.

3. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.

DELETE PARAGRAPH BELOW IF NOT APPLICABLE. VERIFY THAT THROUGH-PENETRATION FIRESTOP SYSTEMS SELECTED USE A FILL MATERIAL THAT COMPLIES WITH THE REQUIREMENT BELOW.

- D. For through-penetration firestop systems exposed to view, provide products with flame-spread and smoke-developed indexes of less than 25 and 450, respectively, as determined per ASTM E 84.

1.4 SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For each through-penetration firestop system, submit documentation, including illustrations, from a qualified testing and inspecting agency, showing each type of construction condition penetrated, relationships to adjoining construction, and type of penetrating item.
- C. Product Test Reports: From a qualified testing agency indicating through-penetration firestop system complies with requirements, based on comprehensive testing of current products.

1.5 QUALITY ASSURANCE

- A. Fire-Test-Response Characteristics: Provide through-penetration firestop systems that comply with the following requirements and those specified in Part 1 "Performance Requirements" Article:
 - 1. Firestopping tests shall be performed by Underwriters Laboratories (UL), Omega Point Laboratories or Intertek Warnock/Hersey.
 - 2. Through-penetration firestop systems are identical to those tested per testing standard referenced in "Part 1 Performance Requirements" Article. Provide rated systems bearing testing agency's classification marking.
- B. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to specified requirements.

1.6 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install through-penetration firestop systems when ambient or substrate temperatures are outside limits permitted by through-penetration firestop system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.
- B. Ventilate through-penetration firestop systems per manufacturer's written instructions by natural means or, where this is inadequate, forced-air circulation.

1.7 ENVIRONMENTAL REGULATIONS

- A. All materials shall be asbestos free.
- B. Disposal of hazardous firestop materials: Contact UM Occupational Safety and Environmental Health Hazardous Materials (734-763-4568) for instructions regarding disposal.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide products of one of the following manufacturers:
 - 1. A/D Fire Protection Systems Inc.
 - 2. Hilti, Inc.
 - 3. Johns Manville.
 - 4. Rectorseal Corporation
 - 5. Specified Technologies Inc. (STI)
 - 6. 3M; Fire Protection Products Division.
 - 7. Tremco; Sealant/Weatherproofing Division.
 - 8. USG Corporation.

2.2 FIRESTOPPING

- A. Compatibility: Provide through-penetration firestop systems that are compatible with one another; with the substrates forming openings; and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.
- B. Accessories: Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with Part 1 "Performance Requirements" Article. Use only components specified by through-penetration firestop system manufacturer and approved by qualified testing and inspecting agency for firestop systems indicated.

PART 3 - EXECUTION

3.1 THROUGH-PENETRATION FIRESTOP SYSTEM INSTALLATION

- A. Examination: Examine substrates and conditions for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of firestopping. Notify the Owner's Representative in writing if unsatisfactory conditions are present. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed upon completion of Work. Remove tape as soon as it is possible to do so without disturbing the firestopping seal with substrates.
- C. General: Install through-penetration firestop systems to comply with Part 1 "Performance Requirements" Article and with firestop system manufacturer's written installation instructions and published drawings for products and applications indicated.
- D. Install forming/damming/backing materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

DELETE SUBPARAGRAPH BELOW IF NONE OF THE SYSTEMS SPECIFIED REQUIRES USING REMOVABLE FORMING MATERIALS AND OTHER ACCESSORIES.

1. After installing fill materials and allowing them to fully cure, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.
- E. Install fill materials for firestop systems by proven techniques to produce the following results:
1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.
 2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

INCLUDE IDENTIFICATION REQUIREMENT BELOW FOR ALL BFS JURISDICTION BUILDINGS. CONSIDER FOR INCLUDING FOR NON-BFS BUILDINGS.

3.2 IDENTIFICATION

- A. Identify through-penetration firestop systems with preprinted metal or plastic labels. Attach labels permanently to surfaces adjacent to and within 6 inches of edge of the firestop systems so that labels will be visible to anyone seeking to remove penetrating items or firestop systems. Use mechanical fasteners for metal labels. For plastic labels, use self-adhering type with adhesives capable of permanently bonding labels to surfaces on which labels are placed and, in combination with label material, will result in partial destruction of label if removal is attempted. Include the following information on labels:
1. The words "Warning - Through-Penetration Firestop System - Do Not Disturb. Notify Building Management of Any Damage."
 2. Contractor's name, address, and phone number.
 3. Through-penetration firestop system designation of applicable testing and inspecting agency.
 4. Date of installation.
 5. Through-penetration firestop system manufacturer's name.
 6. Installer's name.

3.3 CLEANING AND PROTECTION

- A. Clean off excess fill materials and sealants adjacent to opening and joints as Work progresses. Use methods approved by manufacturer of firestopping products.
- B. Protect firestopping during and after curing period from contact with contaminating substances.

SPECIFICATION DIVISION 7

NUMBER SECTION DESCRIPTION

DIVISION 07 THERMAL AND MOISTURE PROTECTION

SECTION 079200 - JOINT SEALANTS

END OF CONTENTS TABLE

DIVISION 07 THERMAL AND MOISTURE PROTECTION
SECTION 079200 - JOINT SEALANTS

MAY 2012 - REVISED TO ADD REQUIREMENTS FOR LOW VOC PRODUCTS AND TO UPDATE PRODUCT LISTINGS.

REVISED TO DELETE FIRESTOPPING, WHICH IS NOW IN A SEPARATE SECTION, 078413. FIRE-RATED JOINT SEALERS REMAIN IN THIS SECTION (6/04).

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of each type of joint sealant is indicated on drawings and by provisions of this Section.

EDIT THE FOLLOWING TO SUIT PROJECT REQUIREMENTS.

- B. Types of sealants include:
1. Weather-proofing joint sealants.
 2. Interior joint and seam sealers.
 3. Sanitary joint sealers.
 4. Fire-proofing joint sealers.

1.2 SUBMITTALS

- A. Submit product data for each product indicating compliance with requirements.

USUALLY DELETE BELOW. A NOTE REGARDING ADHESION: THE ONLY WAY TO BE ENSURE A GIVEN SEALANT PRODUCT WILL ADHERE TO VARIOUS SUBSTRATES (WITH OR WITHOUT A PRIMER) IS TO DO AN ADHESION TEST. ONE STANDARD TEST CONSISTS OF APPLYING THE ADHESIVE (PRIMED AS REQUIRED) TO EACH MATERIAL IN CONTACT WITH SEALANT. THE SEALANT IS ALLOWED TO CURE, AND THEN A DRY ADHESION TEST IS PERFORMED (PEELING). IF THE TEST IS PASSED, THE SAMPLE (OR ANOTHER) IS SOAKED IN WATER FOR A 24 HOUR PERIOD, AND A SIMILAR WET TEST IS PERFORMED.

- B. Submit one sample tube of each approved sealant product specified for exterior applications. The Architect will perform adhesion testing.

DELETE BELOW IF NO FIRE-PROOF SEALANTS REQUIRED.

- C. Fire-Proofing Sealant Schedule: Submit a schedule indicating, for each application (penetration condition or joint type), the manufacturer, product name, and UL Design number of the proposed fire-proofing sealant system to be used.

1. Submit manufacturer's data and certification as required in the "Quality Assurance" Article of this Section.

- D. Product Data: For sealants and sealant primers used inside the weatherproofing system, documentation including printed statement of VOC content.

1.3 **QUALITY ASSURANCE**

DELETE THIS ARTICLE IF NO FIRE-PROOF SEALANTS REQUIRED.

- A. Fire-Proof Sealant Design and Test Criteria: Unless a specific product or system is otherwise indicated, select fire-proof sealant system recommended by the manufacturer for each specific application indicated, and to comply with requirements indicated in the "Fire-Proofing Sealant Systems" Article of this Section. Provide only fire-proofing systems that have been tested and listed by Underwriter's Laboratories (UL) in the applications indicated.
 - 1. Provide fire-proof sealant systems with fire-ratings equal to the fire-rated assembly into which the sealant system is incorporated.
 - 2. Coordinate fire-proof sealant system selections with the construction detail and opening size of the fire-rated assembly; and the size, location, configuration, and material of the penetrating element (if any), to ensure full compliance with each detail of each UL Design.
 - 3. Where an indicated application has not been tested and listed, provide a written proposal, prepared by the manufacturer of the fire-proofing system, showing materials and methods to be used, and certifying that fire-resistance rating of the fire-proofing sealant system will not be less than that of the surrounding assembly.

PART 2 - PRODUCTS

2.1 **SEALANTS, GENERAL**

- A. Compatibility: Provide joint sealers, fillers and related materials compatible with one another and with joint substrates under conditions of service and application.
- B. Colors: Provide color of exposed joint sealers indicated or, if not indicated, as selected by Owner from manufacturer's standard colors.

SEALANTS LISTED IN PART TWO COMPLY WITH THE VOC REQUIREMENTS BELOW. USE VOC COMPLIANT SEALANTS UNLESS THERE IS A SPECIFIC PROJECT REQUIREMENT THAT CAN ONLY BE SATISFIED USING NON-COMPLIANT PRODUCTS.

- C. VOC Content of Interior Sealants: Sealants and sealant primers used inside the weatherproofing system shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
 - 1. Architectural Sealants: 250 g/L.
 - 2. Sealant Primers for Nonporous Substrates: 250 g/L.
 - 3. Sealant Primers for Porous Substrates: 775 g/L.

2.2 ELASTOMERIC JOINT SEALANTS

- A. Elastomeric Sealant Standard: Provide manufacturer's standard chemically curing elastomeric sealants that comply with ASTM C 920 and other requirements indicated, including those requirements referencing ASTM C 920 classifications for Type, Grade, Class, and Uses.

USE THE FOLLOWING FOR TOILET ROOMS AROUND FIXTURES AND OTHER HIGH HUMIDITY AREAS; SILICONE CAULK IS NOT PAINTABLE; FOOD PREP AREAS REQUIRE SPECIAL SEALANTS.

- B. One-Part Mildew-Resistant Silicone Sealant: Subject to compliance with requirements, provide one of the following, or manufacturer's equivalent two-part sealant:

Dow Corning 786; Dow Corning Corp.
SCS 1700 Sanitary; General Electric Co.
No. 898 ; Pecora Corp.
Tremsil 200; Tremco Inc.

USE THE FOLLOWING AS A CLEAR SILICONE SEALANT FOR USE IN CONJUNCTION WITH GLAZING INSTALLATIONS -NOTE THAT THE PRODUCTS BELOW ARE RATED FOR +/- 25% MOVEMENT AND THAT THEY ARE NOT SUITABLE FOR STRUCTURAL GLAZING.

- C. One-Part Clear Building and Glazing Sealant: Subject to compliance with requirements, provide one of the following:

Bostik Chem-Calk 1200; Bostik, Inc.
Dow Corning 999A; Dow Corning Corp.
SCS 1200; General Electric Co.
No. 860; Pecora Corp.
Proglaze; Tremco

USE THE FOLLOWING AS A GENERAL EXTERIOR CAULK - SEE OTHER REFERENCES FOR SPECIFIC LIMITATIONS OF PRODUCT.

- D. One-Part Nonsag Urethane Sealant: Subject to compliance with requirements, provide one of the following, or manufacturer's equivalent two-part sealant:

Chem-Calk 900; Bostik, Inc.
Sikaflex-1a; Sika Corp.
Dymonic; Tremco Inc.
Sonolastic NP 1; BASF Construction Chemicals LLC

2.3 LATEX JOINT SEALANTS

- A. General: Provide manufacturer's standard one-part, nonsag, mildew-resistant, paintable latex sealant of formulation indicated that is recommended for exposed applications on interior and protected exterior locations and that accommodates indicated percentage change in joint width existing at time of installation without failing either adhesively or cohesively.

USE THE FOLLOWING AS GENERAL PURPOSE INTERIOR CAULK, IN LOW-MOVEMENT CONDITIONS. USE BUTYL FOR NON-MOVEMENT SEAMS IN METALS SUCH AS FILLER PANELS, CLOSURES AND SIMILAR WORK.

- B. Siliconized Acrylic-Latex Sealant: Provide product complying with ASTM C 834 that accommodates joint movement of not more than 5 percent in both extension and compression for a total of 10 percent.
- C. Products: Subject to compliance with requirements, provide one of the following:
 - 1. Siliconized Acrylic-Latex Sealant:
 - AC-20 + Silicon; Pecora Corp.
 - Sonolac; BASF Construction Chemicals LLC
 - Tremflex; Tremco, Inc.

2.4 PREFORMED FOAM SEALANTS

USE THE FOLLOWING SEALANTS FOR SEALING LARGE GAPS BETWEEN BUILDING ELEMENTS. SUITABLE FOR BOTH ABOVE- AND BELOW-GRADE APPLICATIONS.

- A. Preformed Foam Sealants: Manufacturer's standard preformed, precompressed, impregnated open-cell foam sealant manufactured from high-density urethane foam impregnated with a nondrying, water repellent agent; factory-produced in precompressed sizes and in roll or stick form to fit joint widths indicated and to develop a watertight and airtight seal when compressed to the degree specified by manufacturer; and complying with the following requirements:
 - 1. Properties: Permanently elastic, mildew-resistant, nonmigratory, nonstaining, and compatible with joint substrates and other joint sealants.
 - 2. Impregnating Agent: Manufacturer's standard.
 - 3. Density: Manufacturer's standard.
 - 4. Backing: Pressure-sensitive adhesive factory applied to one side with protective wrapping.
 - 5. Products: Subject to compliance with requirements, provide one of the following:
 - Emseal Backerseal (Greyflex); Emseal Corp.
 - Sealtite; Schul International Co.
 - Illmod 600; Tremco Inc.

2.5 JOINT SEALANT BACKING

- A. General: Provide sealant backings of material and type that are nonstaining; are compatible with joint substrates, sealants, primers and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

BELOW REQUIRED FOR THROUGH-JOINTS, DEEP JOINTS AND WITH FIRE-STOPPING SEALANTS. DELETE IF CAULKING SMALL, SHALLOW JOINTS (AROUND INTERIOR DOOR FRAMES AND PLUMBING FIXTURES FOR EXAMPLE).

- B. Plastic Foam Joint Fillers: Preformed, compressible, resilient, nonstaining, nonwaxing, nonextruding strips of flexible plastic foam of material indicated below, of size, shape, and density to control sealant depth and otherwise contribute to producing optimum sealant performance; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing:

SELECT ONE OR BOTH TYPES OF JOINT BACKER BELOW. CONFIRM COMPATIBILITY WITH SEALANT SELECTED. OPEN CELL MATERIAL IS MORE COMPRESSIBLE AND DOES NOT EMIT GAS, BUT WILL ABSORB AND RETAIN MOISTURE. CLOSED CELL MATERIAL DOES NOT ABSORB MOISTURE BUT CAN EMIT GAS. IT IS THE PREFERRED BACKING MATERIAL IN MOST CASES.

1. Open-cell polyurethane foam with impervious surface: ASTM C1330 Type O.
2. Closed-cell polyethylene foam: ASTM C1330 Type C.

USUALLY RETAIN BELOW FOR EXTERIOR JOINTS OR INTERIOR MOVEMENT JOINTS. BOND-BREAKER TAPE MAY BE USED IN CONJUNCTION WITH SOME BACKER ROD AND FOR FILLET-TYPE JOINTS.

- C. Bond-Breaker Tape: Polyethylene tape or other plastic tape as recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape where applicable.

2.6 MISCELLANEOUS MATERIALS

USUALLY RETAIN BELOW - MAY BE REQUIRED FOR PROPER SEALANT ADHESION TO SUBSTRATE.

- A. Primer: Material recommended by joint sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint sealant-substrate tests and field tests.
- B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable of staining or harming in any way joint substrates and adjacent nonporous surfaces, and formulated to promote optimum adhesion of sealants with joint substrates.
- C. Masking Tape: Nonstaining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

2.7 FIRE-PROOF SEALANT SYSTEMS

DELETE PARA AND SUBPARA BELOW IF NO FIRE-PROOF SEALANT SYSTEMS.

- A. Fire-Proofing Sealant System(s): Unless otherwise indicated, provide only the manufacturer's UL tested and listed sealant and accessory system(s) designed for use in each indicated application.

1. For applications subject to movement, including joints between structural elements, walls, floors, and curtain walls, and adjacent elements, provide elastomeric sealants capable of sustaining the expected range of movement without failure.
2. For application to backs of switch and outlet boxes, provide intumescent pads.
3. Approved Manufacturers: Listed manufacturers do not necessarily provide all products required. Subject to compliance with requirements, provide applicable systems of one of the following:
Bio-Fire Shield.
Hilti, Inc. Metacaulk; Rectorseal Corp.
3M Corp.
Tremco Inc.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine joints indicated to receive joint sealers, with installer present, for compliance with requirements for joint configuration, installation tolerances and other conditions affecting joint sealer performance. Do not proceed with installation of joint sealers until unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean out joints immediately before installing joint sealers to comply with recommendations of joint sealer manufacturers and the following requirements:
 1. Remove all foreign material from joint substrates which could interfere with adhesion of joint sealer.
 2. Clean masonry, unglazed surfaces of ceramic tile and similar porous joint substrate surfaces. Remove loose particles remaining from above cleaning operations by vacuuming or blowing out joints with oil-free compressed air.
 3. Clean metal, glass, porcelain enamel, surfaces of ceramic tile; and other nonporous surfaces by chemical cleaners or other means which are not harmful to substrates or leave residues capable of interfering with adhesion of joint sealers.
- B. Joint Priming: Prime joint substrates where indicated or where recommended by joint sealer manufacturer based on prior experience. Apply primer to comply with joint sealer manufacturer's recommendations.
- C. Masking Tape: Use masking tape where required to prevent contact of sealant with adjoining surfaces.

3.3 SEALANT INSTALLATION

- A. Installation: Comply with joint sealer manufacturer's printed installation instructions applicable to products and applications indicated, except where more stringent requirements apply.

EDIT FOLLOWING 3 TYPES TO INCLUDE STANDARDS FOR RELEVANT PRODUCTS.

B. Elastomeric Sealant Installation Standard: ASTM C 962.

ABOVE FOR SILICONES, URETHANES, AND POLYSULFIDES.

C. Acrylic Emulsion Sealant Installation Standard: ASTM C 790.

D. Installation of Sealant Backings: Install sealant backings to comply with the following requirements:

1. Provide support of sealants during application and at position required to produce the cross-sectional shapes and depths of installed sealants relative to joint widths which allow optimum sealant movement capability.

PROVIDE BELOW ONLY WHERE REQUIRED.

2. Remove absorbent joint fillers which have become wet prior to sealant application and replace with dry material.

PROVIDE BELOW ONLY WHERE REQUIRED.

E. Install bond breaker tape between sealants and joint fillers, compression seals, or back of joints where adhesion of sealant to surfaces at back of joints would result in sealant failure.

F. Install sealants to directly contact and fully wet joint substrates, completely fill recesses, and providing uniform, cross-sectional shapes and depths relative to joint widths which allow optimum sealant movement capability.

G. Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated. Remove excess sealants; do not use tooling agents which discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

1. Provide concave joint configuration per Figure 6A in ASTM C 962, unless otherwise indicated.

H. Clean off excess sealants of sealant smears adjacent to joints as work progresses by methods and with cleaning materials approved by manufacturers of joint sealers and of products in which joints occur.

I. Protect joint sealers during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes. Cut out and remove damaged or deteriorated joint sealers immediately and reseal joints with new materials to produce repaired areas indistinguishable from original work.

DELETE BELOW IF NO FIRE-PROOFING SEALANTS.

3.4 FIRE-PROOFING SEALANT SYSTEM INSTALLATION

- A. Installation of Fire-Proof Sealant Systems: Install sealant system, including forming, packing, and other accessory materials to fill openings in fire-rated assemblies. Comply with installation requirements of the relevant UL Design number, and in accordance with manufacturer's recommendations.

3.5 JOINT SEALER SCHEDULE

EDIT THE FOLLOWING LIST TO SUIT PROJECT. DELETE IF NO EXTERIOR JOINTS.

- A. Exterior Joints(Exposed to Weather): Install indicated sealants at each scheduled joint condition:
 - 1. Perimeter joints between concrete or masonry and metal frames of louvers and windows:
 - a. One-part nonsag urethane.
 - 2. Perimeter joints between masonry and wood door and window frames:
 - a. One-part nonsag urethane.
 - 3. Other joints as indicated.
 - a. As indicated, or if not indicated, provide nonsag urethane sealant.

EDIT THE FOLLOWING LIST TO SUIT PROJECT.

- B. Interior Joints (In Conditioned Spaces): Install indicated sealants at each scheduled joint condition:
 - 1. Perimeter joints of exterior openings where shown, or if not shown, where exterior caulking is indicated:
 - a. One- or two-part nonsag urethane.
 - b. Acrylic emulsion sealant.
 - 2. Perimeter joints between interior wall surfaces and frames of interior doors, and windows.
 - a. Acrylic emulsion sealant.
 - 3. Perimeter joints of toilet fixtures and urinals, at pipe penetrations through ceramic tile, and similar applications:
 - a. One-part mildew resistant silicone sealant.
 - 4. Other joints as indicated.
 - a. As indicated, or if not indicated, provide acrylic emulsion sealant.

3.6 FIRE-PROOFING SEALANT SYSTEM SCHEDULE

ADD TO OR DELETE ITEMS LISTED BELOW.

- A. Provide manufacturer's UL tested and approved sealant systems in each of the following applications:
 - 1. Joints between the tops of new fire-rated walls and structural deck above.
 - 2. Joints between fire-rated walls and floors and exterior building curtain wall.
 - 3. Joints between fire-rated assemblies or within fire-rated assemblies as required to maintain indicated fire-rating of the assembly.

4. At the backs of switch and outlet boxes within fire-rated drywall walls.
5. Other joints as shown on drawings.

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 081113 - HOLLOW METAL DOORS AND FRAMES

END OF CONTENTS TABLE

DIVISION 08 OPENINGS

SECTION 081113 - HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of steel doors and frames is indicated on drawings and in schedules.
 - B. Types of hollow metal work includes:
 - 1. Steel doors.
 - 2. Steel door frames.
 - 3. Steel window frames.
- USUALLY OMIT BELOW AND INCLUDE LOUVERS IN THIS SECTION, OR ELIMINATE IF NONE.*
- C. Work of Other Sections: Door louvers provided under Division 08 Section "Louvers and Vents".

1.2 SUBMITTALS

- A. Product Data: Mfr's standard details and specifications for steel doors and door and window frames.
- B. Shop Drawings: Indicate application of products to project.

1.3 QUALITY ASSURANCE

- A. Standards: Comply with Steel Door Institute (SDI) "Recommended Specifications for Standard Steel Doors and Frames" for materials quality, metal gages, and construction details for Grades and Models indicated in Part 2 of this Section.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:
 - Amweld Building Products, Inc.
 - Ceco Corp.
 - Curries Co.
 - Pioneer Builders. Products Corp./Div. CORE Industries, Inc.
 - Republic Builders Products
 - Steelcraft/Div. American Standard Co.

2.2 STEEL DOORS AND FRAMES

- A. Materials: Steel doors and frames; hot-rolled, pickled and oiled per ASTM A 569 and A 568; cold-rolled per ASTM A 366 and A 568.

**DELETE BELOW IF NO EXTERIOR DOORS/FRAMES OR INTERIOR FRAMES
REQUIRING CORROSION PROTECTION**

1. Steel for exterior doors and frames, including their anchors, and interior doors and frames indicated as galvanized: ASTM A653/A653M, commercial quality, G90 coating designation.
- B. Steel Doors, General: Provide doors complying with material and construction requirements of ANSI/SDI-100 for the indicated Grades and Models:

**GENERALLY SELECT GRADE BELOW - NOTE THAT GRADE I CAN BE
SUBSTITUTED FOR CHEAPNESS, OR TEMPORARY OR VERY LIGHT-DUTY
USE.**

1. Grade II, heavy-duty (Level B); 1-3/4-inch thick; min. 18 gage face sheets.

INCLUDE BELOW ONLY FOR VERY HEAVY-DUTY USE.

2. Grade III, Extra Heavy-duty (Level A); 1-3/4-inch thick; min. 16 gage face sheets.

USUALLY SELECT MODEL BELOW

3. Model 3, Seamless - Hollow Steel Construction; or Model 4, Seamless - Composite Construction as standard with door manufacturer or to comply with other specified requirements of this Section.

CONSIDER MODEL BELOW FOR RAPID-DELIVERY, OR CHEAPER DOOR

4. Model 1, Full Flush - Hollow Steel Construction, except vertical edge seams shall be of mechanical interlock type.

INCLUDE BELOW FOR EXTERIOR DOORS

5. Provide steel doors located in exterior walls (exposed to weather) with thermally insulating core.

- C. Steel Frames, General: Provide frames complying with material and construction requirements of ANSI/SDI-111A, and as follows:

1. Metal Thickness: Min. 16 gage.

**USUALLY SELECT ABOVE AND DELETE BELOW. SDI RECOMMENDS 18 GAGE
ONLY FOR USE WITH GRADE I DOORS.**

2. Metal Thickness: Min. 18 gage.
3. Type: Welded (masonry walls and partitions).

DELETE EITHER ABOVE OR BELOW, OR RETAIN BOTH TO SUIT PROJECT

4. Type: Drywall Slip-On (drywall walls and partitions).

DELETE BELOW IF NO FIRE-RATED ASSEMBLIES

- D. Fire-rated Assemblies: Provide units that are labeled and listed for rating indicated, by Underwriters' Laboratories or Warnock-Hersey.

- E. Anchors and Accessories: Manufacturer's standard units. Use galvanized items for units built into exterior walls, complying with ASTM A 153.

2.3 FABRICATION

- A. Fabricate units to be rigid, neat in appearance, and free from defects, warp or buckle. Weld exposed joints continuously, grind, dress, and make smooth, flush and invisible.

THE FOLLOWING IS A MICHIGAN BARRIER FREE CODE REQUIREMENT (REF. 4.13.14).

- B. Cut-Outs: Regardless of cut-out locations shown on Drawings, provide flush panel at the bottom 10 inches of each door, in compliance with State of Michigan barrier-free requirements.
- C. Prepare steel doors and frames to receive mortised and concealed finish hardware, including cutouts, reinforcing, drilling and tapping, complying with ANSI A 115 "Specifications for Door and Frame Preparation for Hardware".
1. Prepare frames to receive 3 silencers on strike jambs of single-swing frames and on heads of double-swing frames.
 2. Provide 26-gage steel mortar boxes, welded to frame, at back of hardware cutouts where installed in concrete, masonry or plaster openings.
- D. Locate finish hardware per DHI "Recommended Locations for Builder's Hardware".
- E. Shop paint exposed surfaces of doors and frame units, including galvanized surfaces, using mfr's standard baked-on rust inhibitive primer.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Placing Frames: Comply with provisions of SDI 105, unless otherwise indicated. Set frames, with spreaders, accurately in position, plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is completed, remove temporary braces and spreaders, leaving surfaces smooth and undamaged.

1. Except for frames located in existing concrete, masonry, or gypsum board assembly construction, place frames before constructing enclosing walls and ceilings.

DELETE BELOW IF NO NEW MASONRY CONSTRUCTION.

2. In masonry construction, install at least 3 wall anchors per jamb adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Acceptable anchors include masonry wire anchors and masonry T-shaped anchors.

DELETE BELOW IF NO EXISTING MASONRY CONSTRUCTION.

3. At existing concrete or masonry construction, install at least 3 completed opening anchors per jamb adjacent to hinge location on hinge jamb and at corresponding heights on strike jamb. Set frames and secure to adjacent construction with bolts and masonry anchorage devices.

DELETE BELOW IF NO NEW STEEL STUD/GYPSUM BOARD PARTITIONS.

4. In steel-stud partitions, install at least 3 wall anchors per jamb at hinge and strike levels; attach wall anchors to studs with screws.

DELETE BELOW IF NO EXISTING STEEL STUD/GYPSUM BOARD PARTITIONS.

5. In in-place gypsum board partitions, install knock-down, slip-on, drywall frames.

DELETE BELOW IF NO FIRE-RATED FRAMES.

6. Install fire-rated frames according to NFPA 80.

- B. Door Installation: Fit hollow-metal doors accurately in frames, within clearances specified in ANSI/SDI 100.

1. Fitting Clearances for Non-Rated Doors: Provide 1/8-inch at jambs and heads; 1/16-inch per leaf at meeting stiles for pairs of doors; and 1/2-inch from bottom of door to top of decorative floor finish or covering. Where threshold is shown or scheduled, provide 1/8-inch clearance from bottom of door to top of threshold.

DELETE BELOW IF NOT APPLICABLE.

2. Fire-Rated Doors: Smoke and draft control door assemblies must be tested in accordance with UL 1784. Provide fitting clearances as required to meet the testing requirements of UL 1784 without the use of applied gasketing. Installation and clearances shall be in accordance with NFPA 80.
3. Smoke-Control Doors: Comply with NFPA 105.

3.2 ADJUSTING AND CLEANING

- A. Prime Coat Touchup: Immediately after erection, sand smooth any rusted or damaged areas of prime coat and apply touchup of compatible air-drying primer.
- B. Protection Removal: Immediately before final inspection, remove protective wrappings from doors and frames.

SECTION 081416 - FLUSH WOOD DOORS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 081416 - FLUSH WOOD DOORS

PART 1 - GENERAL

SEPTEMBER, 2005 - EXTENSIVE REVISIONS TO UPDATE QUALITY STANDARDS AND MANUFACTURERS, REALIGN STANDARDS FOR DOOR VENEERS, AND MODIFY INFORMATION ABOUT CORE CONSTRUCTION.

1.1 SUMMARY

- A. Work of this Section includes new solid core wood flush doors.

DELETE BELOW IF FACTORY FINISH IS DESIRED - FACTORY FINISH REQUIRES PRE-FIT DOORS.

- B. Work of Other Sections:

1. Hollow metal door frames are provided under Division 08 Section "Hollow Metal Doors and Frames."
2. Door hardware is provided under Section Division 08 Section "Door Hardware".

OMIT BELOW IF NO OTHER GLAZING IS INCLUDED IN PROJECT. IF ONLY INTERIOR GLAZING IS INCLUDED, CHANGE SECTION 088000 "GLAZING" AND SECTION 088010 "GLAZING (INTERIOR APPLICATIONS)."

3. Glass view panels in doors provided under Division 08 Section "Glazing".
4. Field finishing of wood doors is included in Division 09 Section "Painting".

USUALLY OMIT BELOW AND INCLUDE LOUVERS IN THIS SECTION, OR ELIMINATE IF NONE.

5. Door louvers provided under Division 08 "Louvers and Vents".

1.2 QUALITY ASSURANCE

- A. Woodworking Standards: In addition to requirements specified, comply with the latest edition of AWI "Architectural Woodwork Quality Standards Illustrated".

RETAIN PARAGRAPH BELOW IF FIRE-RATED DOORS ARE REQUIRED.

- B. Fire-Rated Wood Doors: Doors complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at as close to neutral pressure as possible according to NFPA 252.
- C. Manufacturer: Obtain doors from a single manufacturer to ensure uniformity in quality of appearance and construction, unless otherwise indicated.

1.3 SUBMITTALS

- A. Product Data: Mfr's literature indicating compliance with requirements and installation instructions.

- B. Shop Drawings: Provide schedules and drawings indicating location, size, fire ratings, face materials, core construction, finishes, and elevations for each door required.

DELETE BELOW IF NO GLASS LITES OR OTHER CUTOUTS IN WOOD DOORS.

- 1. Coordination Drawings: Provide coordination drawings for each wood door. Indicate size and location of mortises and cut-outs, including those required for door hardware preparation, glass lites, louvers, and similar openings. Indicate any conditions that would violate manufacturer's special product warranty.
- C. Provide AWI Quality Certification Labels or an AWI letter of licensing for Project indicating that doors comply with requirements of grades specified.
- D. Samples for Verification: Factory finishes applied to actual door materials, approximately 8 by 10 inches, for each material and finish. For each wood species and transparent finish, provide set of 3 samples sharing typical range of color and grain to be expected in the finished work.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Protect wood doors during transit, storage, and handling to prevent damage, soiling and deterioration. Comply with requirements of referenced ANSI standard, as well as with manufacturer's instructions.

1.5 PROJECT CONDITIONS

- A. Environmental limitations: Do not deliver or install doors until conditions for temperature and relative humidity have been stabilized and will be maintained in storage and installation areas during the remainder of the construction period to comply with requirements of the referenced quality standard.

1.6 SPECIAL PRODUCT WARRANTY

- A. Provide the following special product warranty:
 - 1. On door mfr's standard form, signed by mfr, Installer and Contractor, agreeing to repair or replace defective doors as defined by referenced standards.
 - 2. Warranty shall be in effect during life of installation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
 - Algoma Hardwoods Inc.
 - Eggers Industries, Architectural Products Div.
 - Haley Brothers, Inc.
 - Ipik Door Co.

Marshfield Door Systems Inc.
Mohawk Flush Doors Inc.
Oshkosh Architectural Door Co.
VT Industries, Inc.
Custom millwork firm complying with indicated requirements.

2.2 WOOD DOORS, GENERAL

BELOW FOR DOORS WITH TRANSPARENT FINISH. INCLUDE "B" BELOW FOR DOORS WITH PAINT GRADE FACES.

A. Provide solid core interior flush doors for transparent finish and as follows:

1. Construction: AWI Custom, unless noted otherwise.
2. Exposed Surfaces: Same veneer on both faces of each door, and as follows:

SELECTIONS BELOW REPRESENT COMMONLY AVAILABLE VENEERS WITH A REASONABLE BALANCE BETWEEN APPEARANCE AND COST. SELECT ONE OR MORE PARAGRAPHS BELOW OR MODIFY SPECIES FOR A DIFFERENT APPEARANCE, BUT BE AWARE THAT UPGRADES MAY SIGNIFICANTLY ADD TO COST. BALANCED IN LIEU OF RUNNING MATCH CAUSES SUBSTANTIAL UPCHARGE DUE TO WASTE; AND RIFT OR QUARTER SAWN IN LIEU OF PLAIN SLICED OR ROTARY CUT MAY RESULT A SIGNIFICANT UPCHARGE.

- a. Faces: Plain sliced Red Oak veneer, A Grade; running; book or slip matched.
- b. Faces: Plain sliced White Maple, A Grade; running; book or slip matched.
- c. Faces: Plain sliced Walnut, A Grade; running; book or slip matched.
- d. Faces: Rotary cut White Birch (all sapwood); running; book or slip matched).

SELECT ONE OF THE FOLLOWING EDGE TYPES.

- e. Edges: Manufacturer's standard hardwood.
- f. Edges: Hardwood species matching faces.

SELECT APPROPRIATE CORE CONSTRUCTION TYPES FROM LIST BELOW. NOTE SPECIAL DOOR FOR LARGE CUT-OUTS LISTED BELOW.

3. Core Construction: Provide doors fabricated with core construction types as follows:

SELECT BELOW FOR MOST PROJECTS FOR SMOOTHER FACES, STANDARD MATCHING HARDWOOD EDGES, FINER EDGE DETAIL (2-PLY SKIN VS 3-PLY SKIN), AND BONDED CORE.

- a. Core Construction: PC-5 (Particleboard core, 5 ply); ANSI A208.1, Grade 1-LD-2.

DELETE ABOVE AND SELECT BELOW IF ECONOMY IS OF PARAMOUNT IMPORTANCE FOR PROJECT. PC-7 IS CONSIDERED TO BE LOWER QUALITY CONSTRUCTION.

- b. Core Construction: PC-5 or -7 (Particleboard core, 5-ply or 7-ply, at Contractor's option); ANSI A208.1, Grade 1-LD-2.

- c. Provide doors with structural-composite-lumber cores instead of particleboard cores for doors indicated to receive exit devices.

FOR DOORS WITH LARGE GLASS LITES SELECT CORE BELOW AND VERIFY AVAILABILITY WITH MANUFACTURERS. MOST PARTICLEBOARD CORE DOORS HAVE LIMITED GLASS SIZES AS A REQUIREMENT TO MAINTAIN WARRANTY.

- d. Core Construction: SCL-5 with special warranty for full glass application (Structural Composite Lumber, 5-ply).

BELOW FOR HOSPITAL PROJECTS ONLY.

- e. Core Construction: SCL-5 or -7 (Structural Composite Lumber, 5 or 7 ply).

DELETE BELOW IF NO WOOD FIRE DOORS.

- f. Fire Door Core Construction: Noncombustible mineral product complying with requirements of referenced quality standard and testing and inspecting agency for fire-protection rating indicated.
 - 1) Blocking: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated as needed to eliminate through-bolting hardware.
 - 2) Edge Construction: At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

DELETE ANY PARAGRAPHS BELOW WHICH DO NOT APPLY.

- 3) Fire Core Construction: FD 1-1/2 (90 min. fire door).
- 4) Fire Core Construction: FD 3/4 (45 min. fire door).
- 5) Fire Core Construction: FD 1/3 (20 min. fire door).

INCLUDE BELOW FOR PAINT-GRADE DOORS.

- B. Provide solid core interior flush doors for painted finish and as follows:

- 1. AWI Grade: Paint.
- 2. Exposed Surfaces: Medium Density Overlay.
- 3. Core Construction: PC-5 or -7 (Particleboard core, 5 or 7-ply).

DELETE BELOW IF NO FIRE-RATED PAINT-GRADE DOORS.

- 4. Fire Door Core Construction: Noncombustible mineral product complying with requirements of referenced quality standard and testing and inspecting agency for fire-protection rating indicated.
 - a. Blocking: Provide composite blocking with improved screw-holding capability approved for use in doors of fire-protection ratings indicated as need to eliminate through-bolting hardware.

- b. Edge Construction: At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

DELETE ANY PARAGRAPHS BELOW WHICH DO NOT APPLY.

- 1) Fire Core Construction: FD 1-1/2 (90 min. fire door).
- 2) Fire Core Construction: FD 3/4 (45 min. fire door).
- 3) Fire Core Construction: FD 1/3 (20 min. fire door).

2.3 LOUVERS AND LIGHT FRAMES

DELETE THE FOLLOWING IF NO LOUVERS OR LIGHT FRAMES ARE REQUIRED. RETAIN APPLICABLE TYPES. COORDINATE DRAWINGS IF MORE THAN ONE TYPE IS REQUIRED.

- A. Wood Louvers: Door manufacturer's standard solid wood louvers, species and finish to match door veneer, unless otherwise indicated, and of size indicated.
- B. Metal Louvers: Size, type, and profile shown and fabricated from the following:

SELECT APPLICABLE MATERIAL. DELETE OTHERS.

- 1. Galvanized Steel: 0.0396 inch (1.0 mm) thick; hot dip, zinc coated, and factory primed for paint finish.
- 2. Natural Aluminum: Extruded aluminum with natural-anodized finish complying with AA-M12C22A31, Class II.
- 3. Color-Anodized Aluminum: Extruded aluminum with AA-M12C22A32/34, Class II finish.
 - a. Color: Standard aluminum industry color(s) as indicated.

RETAIN APPLICABLE COLOR SELECTION ABOVE OR BELOW, OR DELETE BOTH AND INSERT SELECTED FINISH.

- b. Color: Match Architect's sample.

INSERT REQUIREMENTS FOR OTHER KINDS OF LOUVERS, GRILLES, AND VENTS AS REQUIRED.

- C. Metal Frames for Light Openings in Fire-Rated Doors: Manufacturer's standard frame formed of 0.0478-inch- (1.2-mm-) thick cold-rolled steel sheet, factory primed for paint finish, and approved for use in doors of fire-protection rating indicated.

DELETE ABOVE OR BELOW OR BOTH IF NO LIGHT OPENINGS. IF FRAMES FOR NON-FIRE-RATED DOORS ARE REQUIRED, INSERT REQUIREMENTS. OTHER TYPES OF FRAMES ARE AVAILABLE FROM SOME MFRS. SEE EVALUATIONS.

- D. Wood-Veneered Beads for Light Openings in Fire-Rated Doors: Manufacturer's standard wood-veneered non-combustible beads matching veneer species of door faces and approved for use in doors of fire-protection rating indicated.

2.4 FABRICATION

A. Fabricate flush wood doors in sizes indicated. Produce doors complying with following requirements:

1. Produce doors for job-site fitting, except as otherwise required for fire-rating labeling.

RETAIN BELOW FOR PREFINISHED DOORS AND FIRE-RATED DOORS. FOR NON-RATED NON-PREFINISHED DOORS, FACTORY FITTING IS OPTIONAL.

IF BOTH JOB-SITE FITTED AND FACTORY-PREFIT AND PREMACHINED DOORS ARE INCLUDED, BE SURE TO SPECIFY TYPE FOR EACH DOOR IN THE DOOR SCHEDULE.

2. Factory-prefit and premachine fire-rated doors and other doors as indicated to fit frame opening sizes indicated.
 - a. Comply with requirements in NFPA 80 for fire-rated doors. Smoke and draft control door assemblies must be tested in accordance with UL 1784. Provide fitting clearances as required to meet the testing requirements of UL 1784 without the use of applied gasketing.

COORDINATE SIZES OF LIGHT OPENINGS WITH REQUIREMENTS OF MANUFACTURERS' WARRANTY. USE SCL CORE FOR OPENINGS EXCEEDING THE FOLLOWING:

DOOR LITE IS LESS THAN 42-INCHES ABOVE FLOOR AND DOOR STILE IS LESS THAN 10-INCHES WIDE.

CUT-OUT IS MORE THAN 40 PERCENT OF THE DOOR SURFACE AREA.

ANY CUT-OUT IS MORE THAN 54-INCHES IN LENGTH.

3. Openings: Cut and trim openings through doors in factory to comply with applicable requirements of referenced standards for kinds of doors required. Trim light openings with hardwood moldings of species matching door veneer and mfr's standard profile, except where metal trim is required for indicated fire rating.

FOR FIRE-RATED DOORS, ALWAYS RETAIN PARAGRAPH BELOW. FOR NON-RATED DOORS, FACTORY GLAZING IS RECOMMENDED.

- a. Factory install glazing.

THE FOLLOWING IS A MICHIGAN BARRIER FREE CODE REQUIREMENT.

- b. Regardless of cut-out locations shown on Drawings, provide flush panel at the bottom 10 inches of each door, in compliance with State of Michigan barrier-free design requirements.

RETAIN THIS ARTICLE IF FACTORY-FINISHING IS NOT REQUIRED FOR OPAQUE DOORS. FACTORY FITTING IS RECOMMENDED TO MINIMIZE DAMAGE TO SHOP-PRIMED DOORS.

2.5 SHOP PRIMING

- A. Doors for Opaque Finish: Shop prime doors with one coat of wood primer specified in Division 09 Section "Painting". Seal all four edges, edges of cutouts, and mortises with primer.

DELETE ARTICLE BELOW IF FACTORY FINISHING IS NOT REQUIRED. FACTORY PRE-FINISH CAN RESULT IN SUPERIOR QUALITY AND COVERAGE.

2.6 FACTORY FINISHING

- A. General: Comply with referenced quality standard for factory finishing. Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.
 - 1. Finish faces, all four edges, edges of cutouts and mortises. Stains and fillers may be omitted on bottom edges, edges of cutouts and mortises.
- B. Finish wood doors at factory.

BELOW IS FOR TRANSPARENT FINISH. OPAQUE FINISH ALSO AVAILABLE - SEE AIA MASTERSPEC.

- C. Transparent Finish: Comply with requirements indicated for grade, finish system, staining effect, and sheen.
 - 1. Grade: Custom.
 - 2. Finish: AWI System TR-6 catalyzed polyurethane.

SELECT 1 REQUIREMENT FROM 2 BELOW.
 - 3. Staining: None required.
 - 4. Staining: Match approved sample for color.

SELECT 1 REQUIREMENT FROM 2 BELOW. USUALLY RETAIN FILLED FINISH.
 - 5. Effect: Open-grain finish.
 - 6. Effect: Filled finish.

SELECT 1 REQUIREMENT FROM 2 BELOW.
 - 7. Sheen: Satin.
 - 8. Sheen: Semigloss.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine doors and installed door frames before hanging doors.
 - 1. Verify that frames comply with indicated requirements for type, size, location and swing characteristics and have been installed with level heads and plumb jambs.
 - 2. Reject doors with defects.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Hardware: For installation, see Division 08 Section "Door Hardware."
- B. Install wood doors to comply with manufacturer's instructions, referenced AWI standard, and as indicated.
 - 1. Install doors after installation of carpeting or other flooring materials.
 - 2. Install fire-rated doors in corresponding fire-rated frames according to NFPA 80.

INCLUDE THE FOLLOWING FOR MOST PROJECTS.

- C. Job-Fit Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer. Machine doors for hardware. Seal cut surfaces after fitting and machining.

RETAIN BELOW IF NON-FIRE-RATED DOORS ARE INCLUDED IN PROJECT.

- 1. Fitting Clearances for Non-Rated Doors: Provide 1/8-inch maximum at jambs, heads and at meeting stiles for pairs of doors; 1/2-inch maximum from bottom of door to top of decorative floor finish or covering; and 3/4-inch maximum from top of non-combustible floor unless otherwise indicated. Where threshold is shown or scheduled, provide 3/8-inch clearance from bottom of door to top of threshold.
- 2. Bevel non fire-rated doors 1/8 inch in 2 inches at lock and hinge edges.
- 3. Fitting Clearances for Fire-Rated Doors: Smoke and draft control door assemblies must be tested in accordance with UL 1784. Provide fitting clearances as required to meet the testing requirements of UL 1784 without the use of applied gasketing. Installation and clearances shall be in accordance with NFPA 80.

USUALLY DELETE BELOW - RETAIN IF DOORSE VERY RARE FOR UNIVERSITY WORK.

- D. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.
- E. Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

3.3 ADJUSTING AND PROTECTION

- A. Operation: Rehang or replace doors which do not swing or operate freely.
- B. Protect doors as recommended by door manufacturer to ensure that wood doors will be without damage or deterioration at time of Substantial Completion.

DIVISION 08 OPENINGS

SECTION 083113 - ACCESS DOORS AND FRAMES

END OF CONTENTS TABLE

DIVISION 08 OPENINGS

SECTION 083113 - ACCESS DOORS AND FRAMES

THIS SECTION DOES NOT INCLUDE ALL AVAILABLE PRODUCTS. FIRE-RATED AND NON FIRE-RATED CEILING PANELS ARE AVAILABLE, AS WELL AS A WIDE VARIETY OF PANELS FOR SPECIAL APPLICATIONS. REFER TO MANUFACTURER'S CATALOGS FOR FULL PRODUCT LINES.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of access doors is indicated on drawings.
- B. Type of access doors include:
 - 1. Standard metal units (for masonry and drywall walls).
 - 2. Flush metal units (for drywall walls).
 - 3. Fire-rated metal units (for masonry and drywall walls).

1.2 SUBMITTALS

- A. Product Literature: Provide manufacturer's product literature indicating compliance with requirements.
- B. Shop Drawings: Indicate application of access doors to project, including door sizes and locations, and details of construction and installation not otherwise included in product literature.

INCLUDE BELOW IF FIRE-RATED UNITS ARE SPECIFIED.

1.3 QUALITY ASSURANCE

- A. Fire-Resistance Ratings: Provide each fire rated access door assembly with panel, door, frame, hinge and latch from manufacturer listed in Underwriter's Laboratories Inc's, "Building Materials Directory" for rating shown.
 - 1. Provide UL label on each fire rated access door.

PART 2 - PRODUCTS

2.1 METAL ACCESS DOORS

UNIT BELOW SUITABLE FOR INSTALLATIONS IN MASONRY OR DRYWALL WALLS.

- A. Standard Metal Access Door: Provide standard units for mounting in masonry or drywall with integral one-piece frame, and as follows:

SELECT STEEL OR STAINLESS STEEL BELOW.

- 1. Door: Minimum 16 gage steel.
- 2. Door: Minimum 16 gage stainless steel.

SELECT FRAME MATERIAL.

3. Frame: Minimum 16 gage steel.
4. Frame: Minimum 16 gage stainless steel.

MODIFY DIMENSIONS BELOW TO SUIT PROJECT - REFER TO CATALOG.

5. Door Size: 24-inches wide by 24-inches high.
6. Hinges: Concealed spring type, removable from chase side only.

INCLUDE APPLICABLE TYPE BELOW.

7. Lock: Screwdriver operated steel cam type.
8. Lock: Phillips head screwdriver operated steel cam type.
9. Lock: Allen wrench operated steel cam type.
10. Lock: Key operated cam type with removable cylinder core.

SELECT APPLICABLE TYPE BELOW.

11. Finish: Prime painted.
12. Finish: Satin finish stainless steel.

SUBSTITUTE STYLE "MS" FOR LISTED STYLE "M" BELOW IF STAINLESS STEEL UNITS SELECTED.

13. Manufacturer/Model: Provide Milcor style "M", or subject to compliance with requirements, equivalent units of Bar-Co, Cesco Products, J.L. Industries, Karp Associates Inc., or Nystrom Inc.

UNIT BELOW SUITABLE FOR INSTALLATION IN DRYWALL WHERE LESS OBTRUSIVE APPEARANCE IS DESIRED. NYSTROM MANUFACTURES A PRODUCT WITH RECESSED DOOR ALLOWING PLASTER OR DRYWALL TO COVER DOOR.

- B. Flush Panel Metal Access Door: Provide flush panel units for mounting in drywall with integral drywall bead configuration outer frame, and as follows:

1. Door: Minimum 16 gage stainless steel.
2. Drywall Bead: Galvanized steel.

SELECT FROM BELOW TO SUIT PROJECT.

3. Door Size: 10-inches wide by 10-inches high.
4. Door Size: 14-inches wide by 14-inches high.
5. Door Size: 22-inches wide by 22-inches high.
6. Door Size: 24-inches wide by 24-inches high.

RETAIN HINGE TYPE BELOW.

7. Hinges: Double-acting concealed spring type.

INCLUDE APPLICABLE TYPE BELOW.

8. Lock: Screwdriver operated steel cam type.
9. Lock: Phillips head screwdriver operated steel cam type.
10. Lock: Allen wrench operated steel cam type.
11. Lock: Key operated cam type with removable cylinder core.

SELECT APPLICABLE TYPE BELOW.

12. Finish: Prime painted.

13. Manufacturer/Model: Provide Milcor style "DW", or subject to compliance with requirements, equivalent units of Bar-Co, Cesco Products, J.L. Industries, Karp Associates Inc., or Nystrom Inc.

UNIT BELOW IS FIRE RATED.

- C. Fire-rated Metal Access Door: Provide UL listed and labeled fire-rated units with integral one-piece frame, automatic panel closers, and as follows:

1. Fire-rating: B-label (1-1/2 hr.)

SELECT ONE MATERIAL BELOW.

2. Door: Minimum 20 gage steel.
3. Door: Minimum 20 gage stainless steel.

SELECT ONE MATERIAL BELOW.

4. Frame: Minimum 16 gage steel.
5. Frame: Minimum 16 gage stainless steel.

MODIFY DIMENSIONS BELOW TO SUIT PROJECT - REFER TO CATALOG

6. Door Size: Approximately 24-inches wide by 24-inches high.
7. Hinges: Continuous steel hinge with stainless steel pin, removable from chase side only.

INCLUDE APPLICABLE TYPE BELOW.

8. Latch: Self-latching type with knurled knob.
9. Lock: Cylinder lockset with self-latching action and with removable cylinder core.

SELECT APPLICABLE TYPE BELOW.

10. Finish: Prime painted.
11. Finish: Satin finish stainless steel.
12. Manufacturer/Model: Provide products of Milcor, or subject to compliance with requirements, equivalent products of Bar-Co, Cesco Products, J.L. Industries, Karp Associates Inc., or Nystrom Inc.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with manufacturer's installation instructions for application indicated.
 1. Install fire-rated units in compliance with applicable codes and regulations to provide fully fire-rated finished assembly.
- B. Anchor frame to existing construction with expansion anchors to masonry substrate. Position anchors in concealed frame flange.
- C. Test and adjust doors after installation to eliminate rubbing and binding. Remove and reinstall units if necessary to provide proper door operation.

DIVISION 08 OPENINGS

SECTION 083313 - COILING COUNTER DOORS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 083313 - COILING COUNTER DOORS

PART 1 - GENERAL

EDIT SECTION TO ELIMINATE REFERENCES TO FIRE-RATED UNITS IF NONE IN PROJECT.

1.1 SUMMARY

- A. This Section includes the following.
 - 1. Rolling counter doors.
 - 2. Fire-rated rolling counter doors.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's literature and installation instructions.
- B. Shop Drawings: Indicate elevation, sizes, trim and installation details.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide units of one of the following mfrs:
The Cookson Company
Cornell Iron Works Inc.
Mahon Door Corporation
Raynor Garage Doors
Wilson Corp.

2.2 ROLLING COUNTER DOORS

- A. Overhead Rolling Counter Fire Doors: Manually operated, spring counterbalanced, push-up type rolling counter door for face of wall type mounting.
 - 1. Fire Rating: UL labeled; Class B; 1-1/2 hours.
- B. Materials: Fabricate units as follows:
 - 1. Curtain: 22 gage, galvanized steel, 1-1/4 inch "midget" slats.
 - 2. Bottom Bar: Mfr's standard, tubular section, galvanized steel, with thumb-turn type locking device and fiber weather strip.
 - 3. Guides: Mfr's standard box section fabricated from galvanized steel.
 - 4. Hood: 24 gage galvanized steel.
 - 5. Automatic Closing Device: Mfr's standard release device with closing speed governor, and as follows:

- a. Include time delay release device to allow connection of, and coordination with, automatic closing device and building smoke alarm system.

C. Finish: Baked polyester prime coat on surfaces exposed to view.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation: Install in strict accordance with mfr's installation instructions and NFPA 80.
- B. Final Adjustment: Inspect and adjust units for proper operation. Repair defective materials and installation, or replace defective work as directed by Architect.

SECTION 084113 - ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS

SECTION 084113 - ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:
 - 1. Division 07 Section: Air Barriers.
 - 2. Division 07 Section: Flashing and Sheet Metal.
 - 3. Division 08 Section "Glazed Aluminum Curtain Walls".

1.2 SUMMARY

- A. Section Includes:

DELETE PRODUCT TYPES NOT REQUIRED FROM THE LIST BELOW.

- 1. Storefront-type framing system.
- 2. Exterior entrance doors.
- 3. Vestibule doors matching entrance doors.
- 4. Flush Panel FRP Doors

DELETE BELOW IF CURTAIN WALL IS INCLUDED IN PROJECT TO INSURE THAT THE CURTAIN WALL INSTALLER IS THE PRIME CONTRACTOR.

- B. Work Provided Under This Section But Specified Under Other Sections:
 - 1. The Work of this Section and applicable portions of the work of the following Sections, that are related to this Section, shall be performed by a Prime contractor providing aluminum storefront products, to establish single source responsibility for aluminum storefront products and associated components.
 - a. Division 07 Section "Joint Sealants".
 - b. Division 08 Section "Aluminum Windows".
 - c. Division 08 Section "Door Hardware".
 - d. Division 08 Section "Glazing".

1.3 SUBMITTALS

- A. Product data for each aluminum entrance and storefront system required, including:
 - 1. Manufacturer's standard details and fabrication methods.
 - 2. Data on finishes.
 - 3. Hardware and accessories.
 - 4. Recommendations for maintenance and cleaning of exterior surfaces.
- B. Shop drawings for each aluminum entrance and storefront system required, including:

1. Layout and installation details, including relationship to adjacent work.
2. Plans at 1/4-inch scale.
3. Elevations at 1/4-inch scale.
4. Detail sections of typical composite members.
5. Anchors and reinforcement.
6. Hardware mounting heights.
7. Provisions for expansion and contraction.
8. Glazing details.
9. Locations of field glazing where permitted.

COORDINATE HARDWARE WITH FINISH HARDWARE SECTION. THRESHOLDS, HINGES, WEATHERSTRIPPING, AND REMOVABLE MULLIONS, ARE USUALLY PROVIDED WITH ALUMINUM FRAMING. OTHER HARDWARE SHOULD BE SPECIFIED IN SECTION 087100 "DOOR HARDWARE".

- C. Hardware Schedule: Submit hardware schedule organized into sets for hardware specified in this section. Coordinate hardware with Door Hardware Section to ensure proper function, and finish. Include item name, name of the manufacturer and complete designations of every item required for each door opening.
- D. Samples for Initial Selection: Indicating factory-applied color finishes.

DELETE "SAMPLES FOR INITIAL SELECTION" PARAGRAPH ABOVE IF COLORS AND OTHER CHARACTERISTICS ARE PRESELECTED AND SPECIFIED OR SCHEDULED. ALWAYS RETAIN FOLLOWING 2 PARAGRAPHS WITH OR WITHOUT ABOVE PARAGRAPH.

- E. Samples for Verification: For each type of exposed finish required, in minimum 8-inch lengths.
1. Include 3 or more units in each sample set showing the extreme limits of variations expected in color and texture of finish.

RETAIN PARAGRAPH BELOW TO VERIFY DETAILS OF ASSEMBLY.

- F. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch lengths of full-size components and showing details of the following:

REVISE LIST BELOW TO SUIT PROJECT.

1. Joinery, including concealed welds.
 2. Anchorage.
 3. Expansion provisions.
 4. Glazing.
 5. Flashing and drainage.
- G. Delegated-Design Submittal: Submit analysis data signed and sealed by the qualified Professional Engineer employed by the curtain wall manufacturer who is responsible for their preparation.
1. Show section moduli of wind-load-bearing members and calculations of stresses and deflections. Provide material properties and other information needed for structural analysis including computations.

2. Submit statement by the Professional Engineer attesting that all materials provided under this section, and related Sections, meet specified requirements.
- H. Energy Performance Certificates: Forstorefront, accessories, and components, from manufacturer.
 1. Basis for Certification: NFRC-certified energy performance values for glazed aluminum storefront.
 - I. Test Reports: Provide certified test reports from a nationally recognized qualified independent testing laboratory showing that aluminum entrance and storefront systems have been tested in accordance with specified test procedures and comply with performance characteristics indicated.
 - J. Field quality-control reports are submitted by Owner's Independent testing Agency.
 - K. Warranties: Signed original warranty documents from the curtain wall manufacturer indicating the specified terms and conditions for each curtain wall and component.
 - L. Maintenance Data for Curtain walls to include in maintenance manuals.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards and test methods contained in the following documents; latest editions, unless noted otherwise.
 1. Applicable standards of the American Architectural Manufacturers Association (AAMA), including but not limited to:
 - a. AAMA/WDMA/CSA 101/I.S.2/A440 Voluntary Performance Specification for Windows, Skylights and Glass Doors - A North American Fenestration Standard.
 - b. AAMA 2605 Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels.
 - c. AAMA 611 Voluntary Specification for Anodized Architectural Aluminum.
 - d. AAMA 910 Voluntary Life Cycle Specifications and Test Methods for AW Class Architectural Windows and Doors.
 - e. AAMA 1503 Voluntary Test Method for Thermal Transmittance and Condensation Resistance of Windows, Doors and Glazed Wall Sections
 2. Glass Association of North America (GANA) "Glazing Manual."
 3. Standards of ASTM International which are referenced in other Articles in this Section.
 4. National Fenestration Rating Council (NFRC) Documents and Rating System, including, but not limited to:

- a. NFRC 100 Procedure for Determining Fenestration Product U-factors.
 - b. NFRC 200 Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence.
 - c. NFRC 500-2010 Procedure for Determining Fenestration Product Condensation Resistance Values.
- C. Delegated Design: A qualified Professional Engineer registered in Michigan, employed by the storefront manufacturer, shall design storefront assemblies, including aluminum windows where applicable, doors, glazing and all accessories for this project. The storefront assembly shall be manufactured, assembled and installed to withstand the structural load requirements as specified in this Section, the Building Code, and expected loads calculated for the building, based data indicated on the Drawings. Refer to Part 2 Performance Requirements for additional information.
- D. Installer Qualifications: Engage an experienced Installer who has completed installation of aluminum storefront framing similar in design and extent to those required for the project and whose work has resulted in construction with a record of successful in-service performance.
- E. Manufacturer's Preconstruction Testing Agency Qualifications: Qualified according to ISO/IEC 17025 and accredited by ICC-ES for preconstruction testing indicated.
- F. Field Testing: The Owner's Testing Laboratory will validate testing of installed storefront in the building walls.
- G. Single Source Responsibility: Obtain aluminum entrance and storefront systems from one source and from a single manufacturer.

1.5 MANUFACTURER TESTING

REVISE EXAMPLE TEST METHODS AND SEQUENCE IN SUBPARAGRAPH BELOW TO SUIT PROJECT AND COORDINATE WITH TESTS REQUIRED IN "PERFORMANCE REQUIREMENTS" ARTICLE. CONSULT MANUFACTURERS AND TESTING AGENCIES FOR GUIDANCE ON APPROPRIATE REQUIREMENTS FOR PROJECT.

- A. Preconstruction Testing Program: Perform tests specified in "System Performance Requirements" Article on manufacturer's laboratory samples in the following order:
- 1. Structural-performance preloading at 50 percent of the specified wind-load design pressure when tested according to ASTM E 330.
 - 2. Air infiltration when tested according to ASTM E283.
 - 3. Water penetration under static pressure when tested according to ASTM E 331.
 - 4. Structural performance at design load when tested according to ASTM E 330.
 - 5. Repeat air filtration when tested according to ASTM E 283.
 - 6. Repeat water penetration under static pressure when tested according to ASTM E 331.

7. Structural performance at maximum 150 percent of positive and negative wind-load design pressures when tested according to ASTM E 330.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Check openings by accurate field measurement before fabrication. Show recorded measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of the work.
 1. Where necessary, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit.

REVISE WARRANTY PER PROJECT AND SPECIFIED MANUFACTURERS. KAWNEER PROVIDES A LIMITED LIFETIME WARRANTY ON ENTRANCE DOORS. FOLLOWING WARRANTY ON FRAMING IS OFFERED BY KAWNEER.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of two years from the date of Substantial Completion.
- B. Refer to Glazing Section for glass warranties.
- C. Fluoropolymer Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied fluoropolymer finishes within specified warranty period.

COORDINATE COLOR FADING AND CHALKING LIMITS WITH FINISHES RETAINED IN PART 2.

1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

VERIFY AVAILABLE WARRANTIES AND WARRANTY PERIODS FOR FINISHES WITH MANUFACTURERS LISTED IN PART 2 ARTICLES. FLUOROPOLYMER FINISHES ARE ELIGIBLE FOR 10 YEAR WARRANTIES.

2. Warranty Period: 10 years from date of Substantial Completion.
- D. Anodized Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied anodized finishes within specified warranty period. Any forming or welding must be done prior to finishing.

COORDINATE COLOR FADING AND CHALKING LIMITS WITH FINISHES RETAINED IN PART 2.

1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Delta-E Hunter units (square root of the sum of square Delta L, Delta a, and Delta b) as determined by ASTM D 2244.

- b. Chalking in excess of a No.8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, flaking, or blistering.
2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

USUALLY RETAIN ALL MANUFACTURERS LISTED IN EACH APPLICABLE CATEGORY BELOW. DELETE INAPPLICABLE CATEGORIES.

A. Entrance Door and Storefront Manufacturers:

- 1. EFCO Corporation.
- 2. Kawneer Company, Inc.
- 3. Oldcastle BuildingEnvelope
- 4. Tubelite Inc.
- 5. Wausau Window and Wall Systems.

B. Flush Panel FRP Door Manufacturers:

- 1. Commercial Door Systems
- 2. Kawneer Company, Inc.
- 3. Rebco, Inc.
- 4. Special-Lite, Inc.

C. Fluoropolymer Coating Manufacturers:

- 1. PPG Industries.
- 2. Valspar Corp.
- 3. Akzo Nobel.

REVISE "SYSTEM PERFORMANCE REQUIREMENTS" ARTICLE BELOW IF ENTRANCES WILL BE INSTALLED IN BUILDING INTERIORS ONLY.

2.2 SYSTEM PERFORMANCE REQUIREMENTS

- A. Provide aluminum entrance and storefront assemblies that comply with performance characteristics specified, as demonstrated by testing the manufacturer's corresponding stock assemblies according to test methods indicated.
- B. Thermal Movement: Design the aluminum entrance and storefront framing systems to provide for expansion and contraction of the component materials. Entrance doors shall function normally over the specified temperature range.
 - 1. The system shall be capable of withstanding a metal surface temperature range of 180 deg F (100 deg C) without buckling, failure of joint seals, undue stress on structural elements, damaging loads on fasteners, reduction of performance, stress on glass, or other detrimental effects.
- C. Structural Design: Provide aluminum entrance and storefront systems that comply with structural performance, air infiltration, and water penetration requirements indicated.

VERIFY WIND LOAD FOR CONDITIONS AT UM. WIND LOADS SHOULD BE CALCULATED BY THE STRUCTURAL ENGINEER AND INDICATED ON THE DRAWINGS.

1. Structural Loads: As indicated on Drawings.
2. Structural Performance: Conduct tests for structural performance in accordance with ASTM E 330.
 - a. Uniform Load: At the static air design load applied in the positive and negative direction in accordance with ASTM E 330, there shall be no deflection in excess of L/175 of the span of any framing member.
 - b. At a structural test load equal to 1.5 times the specified design load, no glass breakage or permanent deformation of main framing members in excess of 0.2 percent of their clear spans shall occur.

D. Energy Performance

1. Air leakage for framing and doors shall be tested and determined in accordance with NFRC 400 and ASTM E 283.
 - a. Air Infiltration Storefront Framing System: Air leakage shall not exceed 0.06 CFM per sq. ft. at minimum static-air-pressure difference of 6.24 psf.
 - b. Air Infiltration Aluminum Entrance Doors: Air leakage shall not exceed 1.0 CFM per sq. ft. at a static-air-pressure differential of 6.24 psf.
2. Water Penetration under Static Pressure: No evidence of water penetration through fixed glazing and framing areas, as defined in AAMA 501, when tested according to ASTM E 331 at a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 12 pounds per square foot.
3. Thermal Transmittance: Provide systems which comply with the following criteria. Test in accordance with NFRC 100.
 - a. Framing Systems: Overall U-factor of not more than 0.45 BTU/hr. x sq. ft. x deg. F.
 - b. Entrance Doors (glazed): Overall U-factor of not more than 0.80 BTU/hr. x sq. ft. x deg. F.

DELETE PARAGRAPH BELOW IF NO OPAQUE ENTRANCE DOORS.

- c. Entrance Doors (opaque): Overall U-factor of not more than 0.70 BTU/hr. x sq. ft. x deg. F.
 - d. Operable Window Glazing and Framing Areas: Overall U-factor of not more than 0.55 BTU/hr. x sq. ft. x deg. F.
4. Solar Heat Gain Coefficient (SHGC): Fixed glazing and framing areas shall have a solar heat gain coefficient of no greater than 0.40 as determined according to NFRC 200.

CRF SHOWN IS MINIMUM VALUE BASED ON PRODUCTS MEETING OTHER SPECIFICATION REQUIREMENTS. ESTABLISH CRF BASED ON BUILDING OCCUPANCY FACTORS ACCORDING TO MECHANICAL DESIGN GUIDELINES. VERIFY AVAILABILITY FROM MANUFACTURERS. IF HIGHER CRF IS NEEDED, CONSIDER USING CURTAIN WALL.

5. Condensation Resistance: Provide units tested for thermal performance in accordance with AAMA 1503 showing condensation resistance factor (CRF) of not less than 56.
6. Air Infiltration:
 - a. Not more than 1.0 cfm/sq. ft. for glazed swinging entrance doors.

- b. Not more than 0.4 cfm/sq. ft. for all other locations.
7. Labeling: Per ANSI/ASHRAE 90.1-2007, provide a permanent nameplate, installed by the manufacturer, listing the U-factor, SHGC, and air leakage rate. The label may be the NFRC energy performance label or the AAMA performance label.

2.3 MATERIALS

DELETE MATERIALS NOT REQUIRED FOR FABRICATION OR INSTALLATION FROM THIS ARTICLE.

- A. Aluminum Members: Alloy and temper recommended by the manufacturer for strength, corrosion resistance, and application of required finish; comply with ASTM B 221 for aluminum extrusions, ASTM B 209 for aluminum sheet or plate, and ASTM B 211 for aluminum bars, rods and wire.

USE WHEN REQUIRED. SYSTEMS SHALL BE NO HIGHER THAN 12 FEET.

- B. Carbon steel reinforcement of aluminum framing members shall comply with ASTM A 36 for structural shapes, plates and bars, ASTM A 611 for cold rolled sheet and strip, or ASTM A 570 for hot rolled sheet and strip.
- C. Panel Core Material: Rigid, closed-cell polyurethane insulation.
- D. Fasteners: Provide fasteners of nonmagnetic stainless steel, compatible with aluminum components, hardware, anchors and other components.
1. Reinforcement: Where fasteners screw-anchor into aluminum members less than 0.125 inches thick, reinforce the interior with aluminum or nonmagnetic stainless steel to receive screw threads, or provide standard noncorrosive pressed-in splined grommet nuts.
 2. Exposed Fasteners: Do not use exposed fasteners except for application of hardware. For application of hardware, use Phillips flat-head machine screws that match the finish of member or hardware being fastened.
- E. Concealed Flashing: 0.0187-inch (26 gage) minimum dead-soft stainless steel, or 0.026-inch-thick minimum extruded aluminum of alloy and type selected by manufacturer for compatibility with other components.
- F. Brackets and Reinforcements: Provide high-strength aluminum brackets and reinforcements; where use of aluminum is not feasible provide nonmagnetic stainless steel or hot-dip galvanized steel complying with ASTM A 123.
1. Concrete and Masonry Inserts: Provide hot-dip galvanized steel inserts complying with ASTM A 123.

2.4 FRAMING SYSTEMS

THE FRAMING SYSTEM IN THE NEXT PARAGRAPH MAY BE USED FOR BOTH STOREFRONT AND ENTRANCE FRAMES. EXTERIOR GLAZING IS MORE COMMON BECAUSE REGLAZING FROM THE INTERIOR IS DIFFICULT AFTER THE BUILDING IS COMPLETED.

- A. Storefront Framing System: Provide storefront and entrance framing systems fabricated from extruded aluminum members of size and profile indicated. Include subframes and other reinforcing members of the type indicated. Provide for flush glazing storefront from the exterior on all sides without projecting stops. Shop-fabricate and preassemble frame components where possible. Provide storefront frame sections without exposed seams.
 - 1. Mullion Configurations: Provide pockets at the inside glazing face to receive resilient elastomeric glazing. Mullions and horizontals shall be one piece. Make provisions to drain moisture accumulation to the exterior.
 - 2. Exterior Locations: Provide manufacturer's thermal break construction with two separations consisting of a two-part chemically curing, high-density polyurethane, which is mechanically and adhesively joined to aluminum storefront sections.
 - 3. Interior Locations: Where indicated, provide non-thermal break construction.

FOLLOWING ARE TYPICAL FRAMING DIMENSIONS AND GLAZING DETAIL.

- 4. System Dimensions - Nominal face width and Depth: 2 inches by 4-1/2 inches.

SELECT GLAZING OPTIONS FROM AVAILABLE FRAMING SYSTEMS.

- 5. Glass: Center Plane.
- 6. Glass: Inside Glazed.
- 7. Glass: Outside.

- B. Entrance Door Frames: Provide tubular and channel frame entrance door frame assemblies, as indicated, with welded or mechanical joints in accordance with manufacturer's standards. Reinforce as necessary to support required loads. Provide units with applied stops; blade stops are not acceptable.
 - 1. Exterior Doors: Manufacturer's standard replaceable compressible weatherstripping molded expanded EPDM or neoprene gaskets complying with ASTM C 509, Grade 4 or molded PVC complying with ASTM D 2287.
 - 2. Interior Doors: Provide manufacturer's bulb gasket weatherstripping on stops to prevent metal-to-metal contact.

2.5 GLAZING

- A. Glazing: As specified in Glazing section.

2.6 ENTRANCE DOOR SYSTEMS

- A. Stile-and-Rail Type Entrance Doors: Provide tubular frame members, fabricated with mechanical joints using heavy inserted reinforcing plates and concealed tie-rods or j-bolts.

SELECT STILE AND DOOR DESIGN. COORDINATE EXIT DEVICE SELECTION IN FINISH HARDWARE SECTION WITH STILE WIDTH AND DOOR DESIGN.

GENERALLY SPECIFY MEDIUM STILE DOORS UNLESS APPROVED BY DESIGN MANAGER.

- 1. Door Design: Medium stile; 3-1/2-inch nominal width.

2. Door Design: Wide stile; 5-inch nominal width.

KICK SURFACE BELOW IS A REQUIREMENT OF THE ADA AND MICHIGAN BUILDING CODE. DO NOT REVISE OR DELETE.

3. Kick Surface: Provide an insulated-core, smooth surface, flush aluminum panel, extending the full width of the door, 10 inches high measured from the bottom of the door. Fabricate panel from not less than 0.125-inch thick aluminum sheet and finish to match door framing members.
4. Glazing: Fabricate doors to facilitate replacement of glass or panels, without disassembly of stiles and rails.
5. Provide manufacturer's snap-on extruded aluminum glazing stops, preformed gaskets, with exterior stops anchored for nonremoval.

B. FRP Flush Panel Doors

FLUSH PANEL DOORS ARE PREFERRED BY HOUSING FOR MANY APPLICATIONS. MANUFACTURER OF FOLLOWING SPECIFIED MATERIAL IS SPECIAL-LITE.

1. Flush Panel-Type FRP Skin Doors: Provide flush panel-type doors fabricated with tubular or extruded frame members with reinforced mechanical or welded joints; limit frame exposure to 1/2-inch maximum width on door faces. Fill core with foamed-in-place urethane.

DELETE BELOW IF NO FRP FACE SHEETS

- a. Face Sheets: Provide 0.120-inch thick fiberglass reinforced polyester (FRP) face sheets with mechanically interlocked with frame members and laminated to framing with waterproof glue.

BELOW IS OPTIONAL FOR ADDED VANDAL RESISTANCE

- 1) FRP Sheet Surface Texture: Embossed in manufacturer's standard random (stucco) pattern.

SELECT COLOR BELOW: SPECIAL-LITE STANDARD COLORS INCLUDE WHITE, BLACK, LIGHT GRAY, DARK GRAY, BEIGE, BLUE, AND GREEN

- 2) Face Sheet Color: Dark Bronze.

DELETE THE NEXT PARAGRAPH IF NO LIGHTS ARE INCLUDED IN THE DESIGN.

- b. Lights: Provide glazed openings as indicated, with aluminum moldings and stops. Provide nonremovable stops on the exterior.

C. Door sweeps:

1. Exterior Doors: Provide EPDM or vinyl-blade gasket weatherstripping in bottom door rail, adjustable for contact with threshold.

D. Reinforcing: Provide hardware reinforcing as required by the finish hardware scheduled in Division 08 Section "Door Hardware".

2.7 **HARDWARE**

- A. Provide hardware units as indicated, scheduled, or required for operation of each door as specified in Division 08 Section "Door Hardware". Include sizes, number, and types recommended by manufacturer for service required; finish to match door.

2.8 **FABRICATION**

- A. General: Fabricate aluminum entrance and storefront components to designs, sizes and thicknesses indicated and to comply with indicated standards. Sizes and profile requirements are indicated on the drawings. Variable dimensions are indicated, with maximum and minimum dimensions required, to achieve design requirements and coordination with other work. Provide thermal break construction at exterior locations, and where indicated. Provide non thermal break construction only at interior locations where indicated.
 - 1. Thermal Break Construction: Fabricate storefront framing system with an integrally concealed, low-conductance thermal barrier, located between exterior materials and exposed interior members to eliminate direct metal-to-metal contact. Use manufacturer's standard construction that has been in use for similar projects for period of not less than 3 years.
- B. Prefabrication: Complete fabrication, assembly, finishing, hardware application, and other work to the greatest extent possible before shipment to the Project site. Disassemble components only as necessary for shipment and installation.
 - 1. Perform fabrication operations, including cutting, fitting, forming, drilling and grinding of metal work to prevent damage to exposed finish surfaces. Complete these operations for hardware prior to application of finishes.
 - 2. Do not drill and tap for surface-mounted hardware items until time of installation at project site.
 - 3. Preglaze door and frame units to greatest extent possible.
- C. Welding: Comply with AWS recommendations. Grind exposed welds smooth to remove weld spatter and welding oxides. Restore mechanical finish.
 - 1. Welding behind finished surfaces shall be performed in such a manner as to minimize distortion and discoloration on the finished surface.
- D. Reinforcing: Install reinforcing as required for hardware and as necessary for performance requirements, sag resistance and rigidity.
- E. Dissimilar Metals: Separate dissimilar metals with bituminous paint, or a suitable sealant, or a nonabsorptive plastic or elastomeric tape, or a gasket between the surfaces. Do not use coatings containing lead.
- F. Continuity: Maintain accurate relation of planes and angles with hairline fit of contacting members.

1. Uniformity of Metal Finish: Abutting extruded aluminum members shall not have an integral color or texture variation greater than half the range indicated in the sample pair submittal.

G. Fasteners: Conceal fasteners wherever possible.

2.9 FINISHES, GENERAL

A. Comply with referenced AAMA Voluntary Specifications for detailed finish requirements.

DELETE BELOW IF NO CURTAIN WALL

TYPICALLY SPECIFY FINISHES IN CURTAIN WALL SECTION.

B. Finish aluminum entrance and storefront to match other adjacent glazed aluminum curtain wall components, when applicable. Refer to Division 08 Section "Glazed Aluminum Curtain Walls" for finish requirements.

DELETE 2 ARTICLES BELOW IF SPECIFIED IN CURTAIN WALL SECTION.

2.10 FLUOROPOLYMER ALUMINUM FINISHES

RETAIN AND EDIT FINISHES IN PARAGRAPHS BELOW TO SUIT PROJECT. FLUOROPOLYMER FINISHES ARE PREFERRED BY THE U OF M.

IF RETAINING MORE THAN ONE, INDICATE LOCATION OF EACH ON DRAWINGS BY TYPE. COORDINATE WITH DESIGNATIONS IN THIS SECTION. ALUMINUM-FRAMING SYSTEMS ARE AVAILABLE WITH DUAL FINISHES, ALLOWING DIFFERENT INTERIOR AND EXTERIOR COLOR FINISHES. REFER TO STOREFRONT FRAMING MANUFACTURER'S DATA FOR ADDITIONAL INFORMATION.

RETAIN ONE OF TWO PARAGRAPHS BELOW; IF BOTH ARE REQUIRED, INDICATE LOCATION OF EACH SYSTEM ON DRAWINGS, IN SCHEDULES, OR BY INSERTS. IF SPECIFIC PRODUCTS ARE REQUIRED, NAME COATING MANUFACTURERS AND PRODUCTS.

A. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to metal surfaces to comply with coating and resin manufacturers' written instructions.

USUALLY SPECIFY 3-COAT SYSTEM FOR ENTRANCE FRAMING AND DOORS IN AREAS OF HUMAN CONTACT. INCLUDE LESS EXPENSIVE 2-COAT SYSTEM FOR FRAMING ELEMENTS NOT IN CONTACT WITH PEOPLE.

B. High-Performance Organic Finish: Three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's written instructions.

SELECT COLORS AS APPROVED BY THE OWNER.

- C. Color and Gloss: Non-metallic solid color, dark bronze; low gloss, as selected by the Owner.
- D. Field Touch-up Materials: Fluoropolymer coating produced specifically for field touch-up work by same manufacturer as shop applied coating.

2.11 ANODIC ALUMINUM FINISHES

- A. Class I Clear Anodized Finish: Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil) complying with AAMA 611.

RETAIN THE PARAGRAPH ABOVE IF CLEAR FINISH IS REQUIRED, OR THE PARAGRAPH BELOW IF A COLOR ANODIZED FINISH IS DESIRED.

- B. Class I Color Anodized Finish: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color, complying with AAMA 611.
 - 1. Color: Dark bronze.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates and supports, with the Installer present, for compliance with requirements indicated, installation tolerances, and other conditions that affect installation of aluminum entrances and storefronts. Correct unsatisfactory conditions before proceeding with the installation.
 - 1. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 INSTALLATION

- A. Comply with manufacturer's instructions and recommendations for installation.
- B. Set units plumb, level, and true to line, without warp or rack of framing members, doors, or panels. Install components in proper alignment and relation to established lines and grades indicated. Provide proper support and anchor securely in place.
- C. Construction Tolerances: Install aluminum entrance and storefront to comply with the following tolerances:
 - 1. Variation from Plane: Do not exceed 1/8 inch in 12 feet of length or 1/4 inch in any total length.
 - 2. Offset from Alignment: The maximum offset from true alignment between two identical members abutting end to end in line shall not exceed 1/16 inch.
 - 3. Diagonal Measurements: The maximum difference in diagonal measurements shall not exceed 1/8 inch.
 - 4. Offset at Corners: The maximum out-of-plane offset of framing at corners shall not exceed 1/32 inch.

- D. Separate aluminum and other corrodible metal surfaces from sources of corrosion or electrolytic action at points of contact with other materials.
 - 1. Zinc or cadmium plate steel anchors and other unexposed fasteners after fabrication.
 - 2. Paint dissimilar metals where drainage from them passes over aluminum.
 - 3. Paint aluminum surfaces in contact with mortar, concrete or other masonry with alkali resistant coating.
 - 4. Paint wood and similar absorptive material in contact with aluminum and exposed to the elements or otherwise subject to wetting, with two coats of aluminum house paint. Seal joints between the materials with sealant as specified in the Joint Sealants section.
- E. Drill and tap frames and doors and apply surface-mounted hardware items. Comply with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.
- F. Set sill members and other members in bed of sealant as indicated, or with joint fillers or gaskets as indicated to provide weathertight construction. Comply with requirements of Division 07 for sealants, fillers, and gaskets.
- G. Install thresholds by field scribing around frame members, including door stops, to provide a continuous surface between across the full width of each opening from jamb to jamb.
- H. Refer to the Division 08 Section "Glazing" for installation of glass and other panels indicated to be glazed into doors and framing. Preglaze door and frame units to greatest extent possible.

REVIEW WHETHER THE AMOUNT OF STOREFRONT FRAMING REQUIRES FIELD TESTING. DELETE ARTICLE BELOW IF STOREFRONT WORK IS LIMITED TO DOORS.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified testing agency for witnessing field testing, determining that the tests are performed correctly and making the final determination whether the storefront framing system has successfully passed the tests.
- B. Testing Activities: Testing and inspecting of representative areas of aluminum entrance and storefront system as installation proceeds to determine compliance of installed assemblies with specified requirements. Owner will determine locations and timing of testing.
- C. Contractor shall coordinate with Testing Agency and provide the materials, equipment and labor necessary to complete the testing.

EDIT TEST AREAS AS REQUIRED.

- D. The following tests will be performed in accordance with the methods and standards specified in the Performance Requirements article in Part Two of this Section:

1. Air Infiltration Tests.
 2. Water Penetration Tests.
 3. Water Spray Test: Before installation of interior finishes has begun.
- E. Storefront framing will be considered defective if it does not pass tests and inspections.
- F. If test area fails to meet the specified air infiltration or water penetration requirements, Contractor shall submit description of proposed remedial work for Owner and Architect's information.
1. Remedial work shall be incorporated into the test specimen for retesting.
 2. For each area which fails field testing, one additional area of equal size shall be tested for both air infiltration and water penetration.
 3. Cost of retesting shall be responsibility of Contractor.
- G. Testing agency shall submit copies of test reports to Owner, Architect and Contractor within 48 hours after date of test.
- H. The Owner reserves the right to select additional test areas as required, without limitation, subject to correction and remediation as specified herein.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section "Full Project Commissioning" or "Project Commissioning for Small Projects" and other requirements of the Contract Documents.

3.5 ADJUSTING, CLEANING, PROTECTION

- A. Adjust operating hardware to function properly, for smooth operation without binding, and for weathertight closure.
- B. Clean the completed system, inside and out, promptly after installation, exercising care to avoid damage to coatings.
- C. Clean glass surfaces after installation, complying with requirements contained in the Glazing Section for cleaning and maintenance. Remove excess glazing and sealant compounds, dirt and other substances from aluminum surfaces.
- D. Institute protective measures required throughout the remainder of the construction period to ensure that aluminum entrances and storefront will be without damage or deterioration, other than normal weathering, at time of acceptance.

DIVISION 08 OPENINGS

SECTION 084413 - GLAZED ALUMINUM CURTAIN WALLS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 084413 - GLAZED ALUMINUM CURTAIN WALLS

SEPTEMBER 2011

DETERMINE EARLY IN DESIGN WHETHER TO USE UNITIZED OR STICK-BUILT CONSTRUCTION. UNITIZED PROVIDES BETTER QUALITY CONTROL AND FASTER ERECTION (MUCH LESS SITE LABOR REQUIRED) BUT IS CONSIDERABLY MORE EXPENSIVE AND DIFFICULT TO OBTAIN ON SMALLER PROJECTS. CONSIDER UNITIZED CONSTRUCTION IF THERE IS 40,000 SQ. FT. OR MORE OF CURTAIN WALL (NOT FLOOR AREA) AND ELEVATION IS A REGULAR PATTERN WHICH LENDS ITSELF TO PREFABRICATED COMPONENTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:

FIRST TWO SECTIONS BELOW ARE NOT PART OF AEC MASTERSPEC. DELETE UNLESS SECTIONS ARE ADDED TO PROJECT SPECIFICATIONS.

- 1. Division 07 Section: Air Barriers.
- 2. Division 07 Section: Flashing and Sheet Metal.
- 3. Division 07 Section "Penetration Firestopping"

1.2 SUMMARY

SYSTEM SPECIFIED BELOW IS TYPICAL. EDIT IF CUSTOM ASSEMBLIES ARE REQUIRED.

- A. Section includes:
 - 1. Conventionally glazed pressure equalized aluminum curtain walls installed as [unitized] [stick-built] assemblies.
 - 2. Delegated Design: Curtain walls shall be designed by the manufacturer to comply with specified performance requirements and design criteria.

EDIT APPLICABLE SECTIONS TO SUIT PROJECTS.

- B. Work Provided Under This Section But Specified Under Other Sections:
 - 1. The Work of this Section and applicable portions of the work of the following Sections that are related to this Section, shall be performed by a Prime contractor providing window and curtain wall products, to establish single source responsibility for glazed aluminum curtain walls and associated components.
 - a. Division 07 Section "Joint Sealants."

- b. Division 08 Section "Aluminum-Framed Entrances and Storefronts."
- c. Division 08 Section "Aluminum Windows."
- d. Division 08 Section "Door Hardware."
- e. Division 08 Section "Glazing."

1.3 SUBMITTALS

- A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
- B. Shop Drawings: Include plans, elevations, sections, full-size details, adjacent construction and attachments to other work.
 - 1. Include details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
 - 2. Include full-size isometric details of each vertical-to-horizontal intersection of curtain walls, showing the following:
 - a. Joinery, including concealed welds.
 - b. Anchorage.
 - c. Expansion provisions.
 - d. Glazing.
 - e. Flashing and drainage.

CURTAIN WALL IS REQUIRED TO WITHSTAND THE DESIGN LOADS WHICH ARE DETERMINED BY THE STRUCTURAL ENGINEER. RESPONSIBILITY FOR THE DESIGN OF CURTAIN WALL SYSTEM MEETING THOSE DESIGN LOADS AND OTHER PERFORMANCE CRITERIA HAVE BEEN DELEGATED TO THE CURTAIN WALL MANUFACTURER.

- C. Delegated-Design Submittal: Submit analysis data signed and sealed by the qualified Professional Engineer employed by the curtain wall manufacturer who is responsible for their preparation.
 - 1. Show section moduli of wind-load-bearing members and calculations of stresses and deflections. Provide material properties and other information needed for structural analysis including computations.
 - 2. Submit statement by the Professional Engineer attesting that all materials provided under this section, and related Sections, meet specified requirements.
- D. Samples for Initial Selection: Indicating factory-applied color finishes.

DELETE "SAMPLES FOR INITIAL SELECTION" PARAGRAPH ABOVE IF COLORS AND OTHER CHARACTERISTICS ARE PRESELECTED AND SPECIFIED OR SCHEDULED. ALWAYS RETAIN FOLLOWING 2 PARAGRAPHS WITH OR WITHOUT ABOVE PARAGRAPH.

- E. Samples for Verification: For each type of exposed finish required, in minimum 8-inch lengths.
 - 1. Include 3 or more units in each sample set showing the extreme limits of variations expected in color and texture of finish.

RETAIN PARAGRAPH BELOW TO VERIFY DETAILS OF ASSEMBLY.

- F. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch lengths of full-size components and showing details of the following:

REVISE LIST BELOW TO SUIT PROJECT.

- 1. Joinery, including concealed welds.
 - 2. Anchorage.
 - 3. Expansion provisions.
 - 4. Glazing.
 - 5. Flashing and drainage.
- G. Qualification Data for curtain wall installer demonstrating that installer is qualified for the Project.
 - H. Qualification Data for curtain wall manufacturer's preconstruction testing agency indicating specified certifications and experience.
 - I. Qualification Data for the Professional Engineer employed by the curtain wall manufacturer who is responsible for curtain wall design.

RETAIN PARAGRAPH BELOW IF RETAINING PROCEDURES FOR WELDER CERTIFICATION IN "QUALITY ASSURANCE" ARTICLE.

- J. Certificates for AWS certified welders.
- K. Energy Performance Certificates: For curtain walls, accessories, and components, from manufacturer.
 - 1. Basis for Certification: NFRC-certified energy performance values for each glazed aluminum curtain wall.

RETAIN PARAGRAPH BELOW FOR STANDARD ASSEMBLIES TO VERIFY COMPLIANCE WITH PERFORMANCE REQUIREMENTS. REVISE FOR CUSTOM ASSEMBLIES.

- L. Product Test Reports: Indicating compliance with structural and performance requirements based on comprehensive tests performed by preconstruction testing agency, on curtain wall units matching the system proposed for this Project.
- M. Field quality-control reports are submitted by Owner's Independent testing Agency.
- N. Warranties: Signed original warranty documents from the curtain wall manufacturer indicating the specified terms and conditions for each curtain wall and component.
- O. Maintenance Data for Curtain walls to include in maintenance manuals.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
1. Glass Association of North America (GANA) "Glazing Manual."
 2. Applicable standards of the American Architectural Manufacturers Association (AAMA), including but not limited to:
 - a. AAMA 1503 Voluntary Test Method for Thermal Transmittance and Condensation Resistance of Windows, Doors and Glazed Wall Sections
 - b. AAMA 2605 Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels.
 - c. AAMA 611 Voluntary Specification for Anodized Architectural Aluminum.
 3. Standards of ASTM International which are referenced in other Articles of this Section.
 4. National Fenestration Rating Council (NFRC) Documents and Rating System, including, but not limited to:
 - a. NFRC 100 Procedure for Determining Fenestration Product U-factors
 - b. NFRC 200 Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence
 - c. NFRC 500-2010 Procedure for Determining Fenestration Product Condensation Resistance Values
- C. Delegated Design: A qualified Professional Engineer registered in Michigan, employed by the curtain wall manufacturer, shall design curtain wall assemblies, including aluminum windows where applicable, doors, glazing and all accessories for this project. The curtain wall assembly shall be manufactured, assembled and installed to withstand the structural load requirements as specified in this Section, the Building Code, and expected loads calculated for the building, based data indicated on the Drawings. Refer to Part 2 Performance Requirements for additional information.
- D. Manufacturer's Preconstruction Testing Agency Qualifications: Qualified according to ISO/IEC 17025 and accredited by ICC-ES for preconstruction testing indicated.
- E. Curtain Wall Manufacturer Qualifications: A manufacturer capable of fabricating curtain walls that meet or exceed specified energy performance requirements and of documenting this performance.
- F. Curtain Wall Installer Qualifications: Installer who has had successful experience with installation of the same or similar systems required for the project and other projects of similar size and scope.

RETAIN PARAGRAPH BELOW IF WELDING IS REQUIRED. IF RETAINING, ALSO RETAIN "WELDING CERTIFICATES" PARAGRAPH IN "SUBMITTALS" ARTICLE.

- G. Welding Qualifications: Qualify procedures and personnel according to the following:

RETAIN APPLICABLE SUBPARAGRAPHS BELOW.

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."

PARAGRAPH AND SUBPARAGRAPHS BELOW DESCRIBE MOCKUPS WHICH ARE CONSTRUCTED AS PART OF THE BUILDING. IF A SEPARATE MOCKUP IS NEEDED REVISE LANGUAGE BELOW.

- H. Mockups: Build mockups in the building wall to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.

INDICATE PORTION OF WALL REPRESENTED BY MOCKUP ON DRAWINGS OR DRAW MOCKUP AS SEPARATE ELEMENT. COORDINATE REQUIREMENTS WITH THOSE IN OTHER SECTIONS SPECIFYING GLAZING AND CLADDING MATERIALS INSTALLED WITH CURTAIN WALLS.

1. Build mockup of wall area as shown on Drawings.
2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

RETAIN SUBPARAGRAPH EITHER ABOVE OR BELOW AS APPROPRIATE FOR PROJECT.

3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Owner and Architect specifically approve such deviations in writing.

RETAIN PARAGRAPH BELOW IF WORK OF THIS SECTION IS EXTENSIVE OR COMPLEX ENOUGH TO JUSTIFY A PREINSTALLATION CONFERENCE.

- I. Preinstallation Conference: Conduct conference at Project site. Coordinate meeting with Owner's representative.
- J. Field Testing: The Owner's Testing Laboratory will validate testing of installed curtain wall in the building walls.
- K. Source Limitations for Glazed Aluminum Curtain Walls and other Work provided under this section: Obtain from single source from single manufacturer.

1.5 MANUFACTURER TESTING

REVISE EXAMPLE TEST METHODS AND SEQUENCE IN SUBPARAGRAPH BELOW TO SUIT PROJECT AND COORDINATE WITH TESTS REQUIRED IN "PERFORMANCE REQUIREMENTS" ARTICLE. CONSULT MANUFACTURERS AND TESTING AGENCIES FOR GUIDANCE ON APPROPRIATE REQUIREMENTS FOR PROJECT.

- A. Preconstruction Testing Program: Perform tests specified in "Performance Requirements" Article on manufacturer's laboratory samples in the following order:
1. Structural-performance preloading at 50 percent of the specified wind-load design pressure when tested according to ASTM E 330.
 2. Air infiltration when tested according to ASTM E283.
 3. Water penetration under static pressure when tested according to ASTM E 331.

4. Structural performance at design load when tested according to ASTM E 330.
5. Repeat air filtration when tested according to ASTM E 283.
6. Repeat water penetration under static pressure when tested according to ASTM E 331.
7. Structural performance at maximum 150 percent of positive and negative wind-load design pressures when tested according to ASTM E 330.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Verify actual locations of structural supports for curtain walls by field measurements before fabrication, and indicate measurements on Shop Drawings.

1.7 WARRANTY

VERIFY AVAILABLE WARRANTIES AND WARRANTY PERIODS FOR CURTAIN WALLS WITH MANUFACTURERS LISTED IN PART 2 ARTICLES. INSTALLER WARRANTIES ARE USUALLY LIMITED TO TWO YEARS; VERIFY AVAILABILITY FOR LONGER PERIODS.

- A. Assembly Warranty Terms: Provide a complete parts and labor warranty for a minimum of 10 years from the date of Substantial Completion according to the following terms.
1. Manufacturer agrees to repair or replace components of curtain walls that do not comply with requirements or that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
 - a. Structural failures including, but not limited to, excessive deflection.
 - b. Noise or vibration created by wind and thermal and structural movements.
 - c. Water penetration through fixed glazing and framing areas.
 - d. Failure of operating components.
 - e. Glazing failure, including gasket shrinkage.
- B. Fluoropolymer Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied fluoropolymer finishes within specified warranty period.

COORDINATE COLOR FADING AND CHALKING LIMITS WITH FINISHES RETAINED IN PART 2.

1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

VERIFY AVAILABLE WARRANTIES AND WARRANTY PERIODS FOR FINISHES WITH MANUFACTURERS LISTED IN PART 2 ARTICLES. FLUOROPOLYMER FINISHES ARE ELIGIBLE FOR 10 YEAR WARRANTIES.

2. Warranty Period: 10 years from date of Substantial Completion.

- C. Anodized Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied anodized finishes within specified warranty period. Any forming or welding must be done prior to finishing.

COORDINATE COLOR FADING AND CHALKING LIMITS WITH FINISHES RETAINED IN PART 2.

1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Delta-E Hunter units (square root of the sum of square Delta L, Delta a, and Delta b) as determined by ASTM D 2244.
 - b. Chalking in excess of a No.8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, flaking, or blistering.
2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

SELECT CURTAIN WALL PRODUCTS BASED ON SYSTEM TYPE AND PERFORMANCE WITHIN THE LISTED MANUFACTURERS. NOTE THAT THE FOLLOWING MANUFACTURERS HAVE VARYING PERFORMANCE LEVELS IN THEIR PRODUCT LINES, NOT ALL OF WHICH MEET SECTION PERFORMANCE REQUIREMENTS. BE SURE TO SELECT ONLY THOSE PRODUCT LINES THAT ARE PRESSURE EQUALIZED, UNITIZED CONSTRUCTION.

- A. Curtain Wall Manufacturers:

1. EFCO
2. Graham Architectural Products.
3. Harmon, Inc.
4. Kawneer North America; an Alcoa company.
5. Oldcastle BuildingEnvelope.
6. Wausau Window and Wall Systems.

- B. Fluoropolymer Coating Manufacturers:

1. PPG Industries.
2. Valspar Corp.
3. Akzo Nobel.

2.2 MATERIALS

- A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Sheet and Plate: ASTM B 209.
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221
3. Extruded Structural Pipe and Tubes: ASTM B 429.
4. Structural Profiles: ASTM B 308.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 084413 - - 7

RETAIN SUBPARAGRAPH BELOW FOR WELDING.

- B. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

RETAIN PARAGRAPH BELOW FOR INTERNAL STEEL REINFORCEMENT OF ALUMINUM FRAMING MEMBERS; REVISE TO SUIT PROJECT.

- C. Steel Reinforcement components: Provide steel reinforcement as necessary to meet specified performance requirements. Finish steel reinforcement as specified in the "Finishes" article.
1. Structural Shapes, Plates, and Bars: ASTM A 36.
 2. Cold-Rolled Sheet and Strip: ASTM A1008.
 3. Hot-Rolled Sheet and Strip: ASTM A1011.
- D. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum, or nonmagnetic stainless steel units.
- E. Provide nonstaining, nonferrous shims for installation and alignment of curtain wall work.
- F. Fasteners and Accessories: Provide manufacturer's standard non-corrosive fasteners and accessories compatible with materials used in the framing system and with exposed portions, when unavoidable, that match finish of the curtain wall system. Where movement is expected, provide slip-joint linings of sheets, pads, shims, or washers of fluorocarbon resin or a similar material recommended by the manufacturer.
1. Where fasteners anchor into aluminum less than 0.125-inch thick, provide noncorrosive pressed-in splined grommet nuts or other type reinforcement to receive fastener threads.
- G. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.

RETAIN SUBPARAGRAPH BELOW IF APPLICABLE, OR REVISE TO SUIT PROJECT.

1. Concrete and Masonry Inserts: Hot-dip galvanized steel inserts complying with ASTM A 123 or ASTM A 153 requirements.

2.3 FRAMING

- A. Framing Members: Manufacturer's standard extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
- B. Construction:
1. Thermally broken.
 2. Pressure equalized.
 3. Glazing System:
 - a. Retained mechanically with gaskets on four sides.
 - b. Glazing Plane: Front.

SELECT EITHER UNITIZED OR STICK-BUILT AFTER EVALUATING WHICH IS MORE SUITABLE FOR PROJECT. SEE EDITOR'S NOTES AT BEGINNING OF SECTION.

4. Fabrication Method: [Field-fabricated stick system]
[Factory-fabricated unitized system.]

C. Pressure Caps: Manufacturer's standard aluminum components that mechanically retain glazing.

1. Include snap-on aluminum trim that conceals fasteners.

D. Concealed Flashing: Dead-soft, 0.018-inch (0.457-mm) thick stainless steel, ASTM A 240 of type recommended by manufacturer.

E. Framing Sealants: Manufacturer's standard sealants according to the Joint Sealants section.

REVIEW PERFORMANCE WITH RESPECT TO U OF M DESIGN GUIDELINES FOR DESIGN AND CONSTRUCTION SID-D "ENERGY AND WATER CONSERVATION" AND RELATED STANDARDS. VALUES INDICATED ARE MINIMUM VALUES FROM ASHRAE 90.1-2007.

2.4 PERFORMANCE REQUIREMENTS

A. General Performance: Provide curtain walls that are designed, manufactured and installed to comply with specified performance requirements. The independent testing laboratory employed by the curtain wall manufacturer shall test curtain walls representing those indicated for this Project in the laboratory. There shall be no failure due to defective manufacture, fabrication, installation, or other defects in construction.

1. Curtain wall shall withstand movements of supporting structure indicated on Drawings, including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.

2. Failure includes but is not limited to the following:

a. Thermal stresses transferring to building structure.

b. Glass breakage.

c. Noise or vibration created by wind and thermal and structural movements.

d. Loosening or weakening of fasteners, attachments, and other components.

e. Failure of operating units.

NOTE THAT THE FOLLOWING INFORMATION AS DETERMINED BY PROJECT'S STRUCTURAL ENGINEER MUST BE SHOWN ON DRAWINGS.

B. Structural Loads: As indicated on Drawings.

VERIFY THAT MANUFACTURERS HAVE TESTED ASSEMBLIES ACCORDING TO SPECIFIED TEST METHODS AND CAN MEET CRITERIA SPECIFIED. ASSEMBLIES SHALL BE TESTED FOR STRUCTURAL PERFORMANCE, AIR INFILTRATION, AND WATER PENETRATION UNDER STATIC PRESSURE.

C. Structural Performance

1. Structural-Test Performance: Test according to ASTM E 330 as follows:

a. No evidence of deflection exceeding specified limits when tested at positive and negative wind-load design pressures.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 084413 - - 9

- b. No evidence of material failures, structural distress, and permanent deformation of main framing members exceeding 0.2 percent of span when assemblies, including anchorages, are tested at 150 percent of positive and negative wind-load design pressures, assemblies, including anchorage.

VERIFY DURATION OF TEST PERFORMANCE WITH STRUCTURAL ENGINEER.

- c. Test Duration: As required by design wind velocity, but not less than 10 seconds.

BASED ON PROJECT CONDITIONS, MORE STRINGENT DEFLECTION CRITERIA THAN SPECIFIED IN SUBPARAGRAPHS BELOW MAY BE REQUIRED.

- 2. Deflection of Framing Members: At design wind pressure, as follows:
 - a. Deflection Normal to Wall Plane: No deflection of any unsupported span L of test specimen (framing rails, muntins, mullions, etc.) in excess of L/175 when tested according to ASTM E330 (maximum L/240 plus 1/4 inch at spans over 13 feet 6 inches; 2L/175 at unsupported cantilevers).

OPTION IN SUBPARAGRAPH BELOW IS BASED ON TYPICAL DEFLECTION CRITERIA FOR GLASS.

- b. Deflection Parallel to Glazing Plane: Limited to L/360 of clear span or 1/8 inch, whichever is smaller.

DELETE SUBPARAGRAPH BELOW IF NO OPERABLE WINDOWS OR DOORS.

- c. Operable Units: Provide a minimum 1/16-inch clearance between framing members and operable units.

RETAIN PARAGRAPH BELOW IF REQUIRED BY PROJECT. WIND EVENTS MAY CREATE OVERTURNING MOMENTS THAT CAUSE DIFFERENTIAL LATERAL DISPLACEMENT (DEFLECTION) OF MULTISTORY BUILDINGS. STRUCTURAL ENGINEER SHALL CALCULATE DESIGN DISPLACEMENT AND INDICATE ON THE DRAWINGS.

- 3. Story Drift: Accommodate design displacement of adjacent stories indicated.
 - a. Design Displacement: As indicated on structural Drawings.

REVISE SUBPARAGRAPH BELOW TO SUIT PROJECT.

- b. Test Performance: Meeting criteria for passing based on building occupancy type when tested according to AAMA 501.4 at design displacement and 1.5 times the design displacement.

RETAIN PARAGRAPH BELOW FOR STATIC-PRESSURE METHOD, WHICH IS MOST FREQUENTLY SPECIFIED. BOTH STATIC AND DYNAMIC TESTING MAY BE REQUIRED OR DESIRED FOR CERTAIN DESIGNS, PARTICULARLY THOSE INCORPORATING SPECIAL WATER-DRAINAGE FEATURES SUCH AS RAIN SCREEN WALLS. REVIEW AND EDIT PRESSURE LIMITS BASED ON PROJECT CONDITIONS AND WALL DESIGN.

D. Energy Performance

1. Water Penetration under Static Pressure: No evidence of water penetration through fixed glazing and framing areas, as defined in AAMA 501, when tested according to ASTM E 331 at a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 12 pounds per square foot
2. Thermal Movements: Allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures:
 - a. Temperature Change (Range): 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.
 - b. Test Interior Ambient-Air Temperature: 75 deg F.
3. Solar Heat Gain Coefficient (SHGC): No greater than 0.40 for the assembly as determined according to NFRC 200.

CR SHOWN BELOW IS VALUE USED ON RECENT HOSPITAL PROJECT. ESTABLISH CR BASED ON BUILDING OCCUPANCY FACTORS ACCORDING TO MECHANICAL DESIGN GUIDELINES.

4. Condensation Resistance: Provide units tested for thermal performance according to AAMA 1503 showing a condensation resistance factor (CR) of 60.

SELECT ABOVE OR BELOW. ABOVE PUTS RESPONSIBILITY ON DESIGNER. BELOW PUTS RESPONSIBILITY ON MANUFACTURER. ESTABLISH CR (ABOVE) OR DESIGN VALUES (BELOW) BASED ON BUILDING OCCUPANCY FACTORS ACCORDING TO MECHANICAL DESIGN GUIDELINES.

5. Condensation Resistance: Provide units tested for thermal performance according to AMMA 1503 showing a condensation resistance (CR) such that there shall be no formation of condensation in any form on glazing and framing.

INSERT PROJECT SPECIFIC DESIGN VALUES BELOW. CONSULT WITH MECHANICAL ENGINEER FOR PROJECT TEMPERATURE AND HUMIDITY REQUIREMENTS.

- a. Design temperature:
 - 1) Winter: []
 - 2) Summer: []
- b. Humidity:
 - 1) Winter: []
 - 2) Summer: []
6. Thermal Transmittance (U-factor) for Assembly:
 - a. Fixed glazing and framing areas: U-factor of not more than 0.45 Btu/sq. ft. x h x deg F as determined according to NFRC 100.
 - b. Operable window glazing and framing areas: U-factor of not more than 0.55 Btu/sq. ft. x h x deg F as determined according to NFRC 100.
7. Air Infiltration: Air infiltration shall not exceed 0.06 cfm per sq. ft. of wall area when tested in accordance with ASTM E 283 at a minimum pressure differential of 6.24 psf.

RETAIN PARAGRAPH AND SUBPARAGRAPH BELOW ONLY IF REQUIRED FOR PROJECT. NOT NECESSARY FOR MOST PROJECTS.

8. Sound Transmission: Provide curtain wall with fixed glazing and framing areas having the following sound-transmission characteristics:

EDIT TO BE PROJECT SPECIFIC - VALUES ARE EXAMPLES ONLY.

- a. Outdoor-Indoor Transmission Class: Minimum [26] [30] [34] <Insert number> when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 1332.

2.5 GLAZING

- A. General: Comply with the Division 08 Section "Glazing".

WET/DRY GLAZING SYSTEM IS PREFERRED FOR SUPERIOR WEATHER PERFORMANCE.

- B. Provide manufacturer's standard glazing system which has been tested to meet performance requirements
 - 1. Glazing Gaskets:
 - a. Manufacturer's standard sealed-corner pressure-glazing system of black, resilient elastomeric glazing gaskets, setting blocks, and shims or spacers.
 - b. Non-shrinking, weather-resistant, and compatible with all materials in contact.

2.6 SPANDRELS

- A. Provide spandrel glass in insulating units as specified in the Division 08 Section "Glazing".

2.7 OPERABLE WINDOWS AND DOORS

RETAIN THIS ARTICLE IF OPERABLE WINDOWS OR ALUMINUM ENTRANCE DOORS ARE REQUIRED BY PROJECT.

- A. Operable Windows: Comply with Division 08 Section "Aluminum Windows."
- B. Aluminum Entrance Doors: Comply with Division 08 Section "Aluminum-Framed Entrances and Storefronts."

2.8 ACCESSORY MATERIALS

- A. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil (0.762-mm) thickness per coat.

2.9 FABRICATION

- A. Form or extrude aluminum shapes before finishing.

RETAIN PARAGRAPH BELOW FOR WELDING.

- B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
- C. Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members. If a poured thermal break is utilized, install back-up mechanical attachment of the two halves of the frame.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Provisions for field replacement of glazing for vision glass and spandrel glazing.

REVISE SUBPARAGRAPH BELOW FOR SAFETY RAILINGS, IF ANY. INCLUDE LOAD REQUIREMENTS. INDICATE ON DRAWINGS.

6. Provisions for safety railings mounted [on interior face of mullions] [between mullions at interior].
7. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Fabricate components that have the following characteristics:

1. Pressure-equalized system with primary air and vapor barrier at interior side of glazed aluminum wall and secondary seal weeped and vented to exterior.

E. Curtain-Wall Framing: Fabricate components for assembly using manufacturer's pressure plate with snap-on covers.

DELETE PARAGRAPH AND SUBPARAGRAPHS BELOW IF STICK-BUILT SYSTEM IS SELECTED.

F. Factory-Assembled Frame Units:

1. Rigidly secure nonmovement joints.
2. Seal joints watertight unless otherwise indicated.
3. Install glazing to comply with requirements in the "Glazing" Section.

G. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

INSERT INTEGRAL STABILIZATION REQUIREMENTS FOR DESCENT-CONTROL EQUIPMENT USED FOR MAINTENANCE, IF ANY.

2.10 FINISHES, GENERAL

A. Comply with referenced AAMA Voluntary Specifications for detailed finish requirements.

COORDINATE THE FOLLOWING PARAGRAPH WITH THE ALUMINUM ENTRANCES AND STOREFRONTS AND ALUMINUM WINDOWS SECTIONS. SPECIFY FINISH REQUIREMENTS FOR ALUMINUM ENTRANCES AND STOREFRONTS, AND ALUMINUM WINDOWS, IN THIS SECTION. DELETE IF THERE ARE NO ENTRANCES AND STOREFRONTS, OR ALUMINUM WINDOWS.

B. Finish aluminum windows and entrances to match the curtain wall system. Division 08 Sections "Aluminum-Framed Entrances and Storefronts" and "Aluminum Windows" shall comply with this Section for finish requirements.

2.11 FLUOROPOLYMER ALUMINUM FINISHES

RETAIN FINISHES IN PARAGRAPHS BELOW TO SUIT PROJECT. FLUOROPOLYMER FINISHES ARE PREFERRED BY THE U OF M.

IF RETAINING MORE THAN ONE, INDICATE LOCATION OF EACH ON DRAWINGS BY TYPE. COORDINATE WITH DESIGNATIONS IN THIS SECTION. ALUMINUM-FRAMING SYSTEMS ARE AVAILABLE WITH DUAL FINISHES, ALLOWING DIFFERENT INTERIOR AND EXTERIOR COLOR FINISHES. REFER TO CURTAIN WALL MANUFACTURER'S DATA FOR ADDITIONAL INFORMATION.

RETAIN ONE OF TWO PARAGRAPHS BELOW; IF BOTH ARE REQUIRED, INDICATE LOCATION OF EACH SYSTEM ON DRAWINGS, IN SCHEDULES, OR BY INSERTS. IF SPECIFIC PRODUCTS ARE REQUIRED, NAME COATING MANUFACTURERS AND PRODUCTS.

- A. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to metal surfaces to comply with coating and resin manufacturers' written instructions.

TYPICALLY, ONLY USE THREE-COAT FLUOROPOLYMER FINISH WITH METALLIC FINISHES.

- B. High-Performance Organic Finish: three-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's written instructions.

RETAIN COLOR BELOW, OR SELECT OTHER COLOR AS APPROVED BY THE OWNER.

- C. Color and Gloss: Non-metallic solid color, dark bronze; low gloss, as selected by Architect from manufacturer's standards.
- D. Field Touch-Up Materials: Fluoropolymer coating produced specifically for field touch-up work by same manufacturer as shop applied coating.

2.12 ANODIC ALUMINUM FINISHES

- A. Class I Clear Anodized Finish: Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil, complying with AAMA 611.

RETAIN THE PARAGRAPH ABOVE IF CLEAR FINISH IS REQUIRED, OR THE PARAGRAPH BELOW IF A COLOR ANODIZED FINISH IS DESIRED.

- B. Class I Color Anodized Finish: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color, complying with AAMA 611.

SELECT COLOR BELOW OR MODIFY WHEN APPROVED BY THE OWNER.

- 1. Color: Dark bronze.
- C. Perform any forming or welding prior to applying finishes.

2.13 STEEL FINISHES

- A. Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. General:
 - 1. Comply with manufacturer's written instructions.
 - 2. Do not install damaged components.
 - 3. Fit joints to produce hairline joints free of burrs and distortion.
 - 4. Rigidly secure nonmovement joints.
 - 5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration, and to prevent impeding movement of moving joints.
 - 6. Seal joints watertight, unless otherwise indicated or required by installation conditions.
- B. Metal Protection:
 - 1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or by applying sealant or tape or installing nonconductive spacers as recommended by manufacturer for this purpose.
 - 2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.
- C. Install components to provide continuous water and condensate drainage to exterior.
- D. Install components plumb and true in alignment with established lines and grades and located in reference to column lines and floor levels.

RETAIN PARAGRAPH BELOW FOR OPERABLE UNITS (DOORS AND WINDOWS).
- E. Install operable units level and plumb, securely anchored, and without distortion. Adjust weather-stripping contact and hardware movement to produce proper operation.

RETAIN PARAGRAPH BELOW ONLY IF SOME OR ALL OF THE CURTAIN WALL WILL BE FIELD GLAZED. FACTORY GLAZING IS COVERED IN PART 2.

- F. Install glazing as specified in the Division 08 Section "Glazing" and as recommended by the Curtain Wall Manufacturer. Install glazing gaskets without gaps to eliminate shrinkage.

3.3 ERECTION TOLERANCES

- A. Erection Tolerances: Install curtain wall to comply with the following maximum tolerances:

ERECTION TOLERANCES IN SUBPARAGRAPHS BELOW ARE EXAMPLES ONLY THAT ARE BASED ON VARIOUS AAMA REFERENCES. COORDINATE WITH TOLERANCES FOR SUPPORT SYSTEMS AND REVISE TO SUIT PROJECT.

1. Plumb: 1/8 inch in 10 feet); 1/4 inch in 40 feet.
2. Level: 1/8 inch in 20 feet; 1/4 inch in 40 feet.
3. Alignment:
 - a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.
 - b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
 - c. Where surfaces are separated by reveal or protruding element of 1 inch wide or more, limit offset from true alignment to 1/4 inch.
 - d. Location: Limit variation from plane to 1/8 inch in 12 feet; 1/2 inch over total length.

3.4 FIELD QUALITY CONTROL

RETAIN PARAGRAPHS BELOW TO DESCRIBE TESTS AND INSPECTIONS PERFORMED BY THE INDEPENDENT TESTING AGENCY EMPLOYED BY THE OWNER. RETAIN "FIELD QUALITY-CONTROL REPORTS" PARAGRAPH IN "SUBMITTALS" ARTICLE.

- A. Testing Agency: Owner will engage a qualified testing agency for witnessing field testing, determining that the tests are performed correctly and making the final determination whether the curtain wall has successfully passed the tests.
- B. Testing Activities: Testing and inspection of representative areas of curtain wall as installation proceeds to determine compliance of installed assemblies with specified requirements. Owner will determine locations and timing of testing.
- C. Contractor shall coordinate with Testing Agency and provide the materials, equipment and labor necessary to complete the testing.

EDIT TEST AREAS AS REQUIRED.

- D. The following tests will be performed in accordance with the methods and standards specified in the Performance Requirements article in Part Two of this Section:
 1. Air Infiltration Tests.
 2. Water Penetration Tests.

- 3. Water Spray Test: Before installation of interior finishes has begun.
- E. Test Area: Three locations as determined by Owner; one bay wide, but not less than 30 feet, by one story of glazed aluminum curtain wall.
- F. Curtain walls will be considered defective if they do not pass tests and inspections.
- G. If test area fails to meet the specified air infiltration or water penetration requirements, Contractor shall submit description of proposed remedial work for Owner and Architect's information.
 - 1. Remedial work shall be incorporated into the test specimen for retesting.
 - 2. For each area which fails field testing, one additional area of equal size shall be tested for both air infiltration and water penetration.
 - 3. Cost of testing of additional areas shall be responsibility of Contractor.
- H. Remedial work which results in successful retesting of test specimen shall be incorporated in installed system for entire Project.
- I. Testing agency shall submit copies of test reports to Owner, Architect and Contractor within 48 hours after date of test.
- J. The Owner reserves the right to select additional test areas as required, without limitation, subject to correction and remediation as specified herein.

3.5 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section "Full Project Commissioning" or "Project Commissioning for Small Projects" and other requirements of the Contract Documents.

3.6 ADJUSTING, CLEANING, PROTECTION

- A. Clean the completed system, inside and out, promptly after erection and installation of glass and sealants, allowing for nominal curing of liquid sealants. The installer shall advise the Contractor of proper and adequate procedures for protection and cleaning during the remainder of the construction period so that the system will be without damage and deterioration at the time of acceptance.
- B. At the time of Final Acceptance, clean curtain wall system thoroughly and polish glass. Demonstrate proper cleaning methods and materials to the Owner's maintenance personnel.
- C. Protect completed curtain wall system throughout construction period through Final Acceptance.

SPECIFICATION DIVISION 8

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 085113 - ALUMINUM WINDOWS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 085113 - ALUMINUM WINDOWS

REVISED JUNE 2011 TO TIGHTEN PERFORMANCE REQUIREMENTS TO MEET ASHRAE.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.

INSERT SPECIAL WINDOW TYPES SUCH AS SOUND INSULATING WINDOWS, SOLAR SHADING WINDOWS OR EMERGENCY ACCESS/EGRESS WINDOWS IF REQUIRED FOR SPECIAL PROJECT APPLICATIONS.

REVISE LIST BELOW TO SUIT PROJECT.

- B. Related Sections:
1. Division 07 Section: Air Barriers.
 2. Division 07 Section: Flashing and Sheet Metal.
 3. Division 08 Section "Aluminum-Framed Entrances and Storefronts."
 4. Division 08 Section "Glazed Aluminum Curtain Walls."

1.2 SUMMARY

- A. Section includes:
1. Architectural Performance Class AW aluminum window units and related work as indicated on the Drawings.

WINDOW TYPES LISTED BELOW ARE COMMONLY USED AT THE UNIVERSITY. CONSULT MANUFACTURER'S LITERATURE AND AAMA 101 FOR ADDITIONAL TYPES.

DELETE WINDOW TYPES THAT ARE NOT REQUIRED.

- a. Casement windows.
 - b. Double-hung windows.
 - c. Top-hinged windows.
 - d. Projected windows.
 - e. Fixed windows.
2. Delegated Design: Aluminum windows designed by the manufacturer to comply with specified performance requirements and design criteria, including structural analysis data signed and sealed by the qualified Professional Engineer
- B. Work Provided Under This Section But Specified Under Other Sections:

1. The Work of this Section and applicable portions of the work of the following Sections, that are related to this Section, shall be performed by a Prime contractor providing window products, to establish single source responsibility for aluminum windows and associated components.
 - a. Division 07 Section "Joint Sealants."
 - b. Division 08 Section "Glazing."

1.3 SUBMITTALS

USUALLY RETAIN ALL BELOW.

- A. Product data for each type of window required, including:
 1. Construction details and fabrication methods.
 2. Profiles and dimensions of individual components.
 3. Data on hardware, accessories, and finishes.
 4. Recommendations for maintenance and cleaning of exterior surfaces.

USUALLY RETAIN ALL BELOW.

- B. Shop drawings for each type of window required. Include information not fully detailed in manufacturer's standard product data and the following:

DELETE REQUIREMENTS FROM THE LIST BELOW THAT ARE NOT REQUIRED.

1. Layout and installation details, including anchors.
 2. Elevations at 1/4-inch = 1 foot scale and typical window unit elevations at 3/4-inch = 1 foot scale.
 3. Full-size section details of typical composite members, including reinforcement and stiffeners.
 4. Location of weep holes.
 5. Panning details
 6. Hardware including operators.
 7. Glazing details.
 8. Accessories.
- C. Delegated-Design Submittal: For windows indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified Professional Engineer responsible for their preparation.

EDIT FOR OTHER COLOR SELECTIONS.

EDIT FOR FINISHES SELECTED. DELETE FINISHES THAT ARE NOT USED.

- D. Samples for Initial Color Selection: Submit samples of each specified finish as indicated below.
 1. Fluoropolymer Coatings: Submit samples consisting of actual coating chips and displaying manufacturer's range of colors for initial selection, including black and 3 additional non-metallic color choices closely approximating dark bronze anodized finish. Photographs or color printing are not acceptable.

2. Anodized Coatings: Submit pairs of samples of the specified finish on 4-inch-long sections of aluminum extrusions. Include sample sets showing the full range of variations in color normally expected.
- E. Energy Performance Certificates: For windows, accessories, and components, from manufacturer.
 1. Basis for Certification: NFRC-certified energy performance values for each window type.
 - F. Test reports: Provide certified test reports from a qualified independent testing agency indicating that each type and size of window unit has been tested in accordance with specified test procedures and complies with each performance requirement indicated. Test results based on use of down-sized test units will not be accepted.
 - G. Manufacturer's certification of compliance with requirements of the specified performance requirements of this Section.
 - H. Field quality-control reports are submitted by Owner's Independent testing Agency.
 - I. Signed original warranty documents from the window manufacturer indicating the specified terms and conditions for each window and component.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. Applicable standards of the American Architectural Manufacturers Association (AAMA), including but not limited to:
 - a. AAMA/WDMA/CSA 101/I.S.2/A440 Voluntary Performance Specification for Windows, Skylights and Glass Doors - A North American Fenestration Standard.
 - b. AAMA 1503- Voluntary Test Method for Thermal Transmittance and Condensation Resistance of Windows, Doors and Glazed Wall Sections
 - c. AAMA 2605 Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels.
 - d. AAMA 611 Voluntary Specification for Anodized Architectural Aluminum.
 - e. AAMA 901 Voluntary Specification for Rotary & Linear Operators in Window Applications.
 - f. AAMA 902 Voluntary Specification for Sash Balances.
 - g. AAMA 910 Voluntary Life Cycle Specifications and Test Methods for AW Class Architectural Windows and Doors.
 - h. AAMA 505 Dry Shrinkage Performance and Composite Thermal Cycling Test Procedure.

2. Standards of ASTM International which are referenced in other Articles in this Section.
3. National Fenestration Rating Council (NFRC) Documents and Rating System, including, but not limited to:
 - a. NFRC 100 Procedure for Determining Fenestration Product U-factors.
 - b. NFRC 200 Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence.
 - c. NFRC 500-2010 Procedure for Determining Fenestration Product Condensation Resistance Values.

THE WIND PRESSURES ACTING ON THE WALLS MUST BE CALCULATED BY THE STRUCTURAL ENGINEER AND INDICATED ON THE DRAWINGS AT CORNERS AND CENTERS OF WALLS FOR PROPER WALL, WINDOW AND CURTAIN WALL DESIGNS, AS APPLICABLE.

- C. Delegated Design: A qualified Professional Engineer registered in Michigan, employed by the window manufacturer, shall design aluminum windows, and all accessories, for this project. The windows shall be manufactured, assembled and installed to withstand the structural load requirements as specified in this Section, and according to the Building Code. Expected loads calculated for the building, based on the wind load data indicated on the Drawings. Refer to Part 2 Performance Requirements for additional information.
- D. Installer Qualifications: Engage an experienced Installer who has completed installation of aluminum windows similar in design and extent to those required for the project and whose work has resulted in construction with a record of successful in-service performance.
- E. Single-Source Responsibility: Obtain aluminum window units from one source and by a single manufacturer.
- F. Manufacturer Qualifications: A manufacturer capable of fabricating aluminum windows that meet or exceed specified performance requirements and of documenting this performance by certification and labeling.
- G. Manufacturer's Preconstruction Testing Agency Qualifications: Qualified according to ISO/IEC 17025 and accredited by ICC-ES for preconstruction testing indicated.
- H. Product Options: The drawings indicate the size, profiles, and dimensional requirements, and aesthetic effects of aluminum windows and are based on products of a specific manufacturer. Aluminum windows by indicated approved manufacturers will be considered, provided deviations in dimensions and profiles are minor and do not alter the aesthetic effect as judged by the Owner and Architect. The burden of proof of equality is on the proposer.
- I. Tested Units: Provide window units that were successfully tested by a qualified independent testing laboratory, for the window manufacturer, to demonstrate compliance with specified standards.
- J. Field Testing: The Owner's independent Testing Laboratory will validate testing of windows installed in the building.

1.5 MANUFACTURER TESTING

REVISE EXAMPLE TEST METHODS AND SEQUENCE IN SUBPARAGRAPH BELOW TO SUIT PROJECT AND COORDINATE WITH TESTS REQUIRED IN "PERFORMANCE REQUIREMENTS" ARTICLE. CONSULT MANUFACTURERS AND TESTING AGENCIES FOR GUIDANCE ON APPROPRIATE REQUIREMENTS FOR PROJECT.

- A. Preconstruction Testing Program: Perform tests specified in "System Performance Requirements" Article on manufacturer's laboratory samples in the following order:
 - 1. Structural-performance preloading at 50 percent of the specified wind-load design pressure when tested according to ASTM E 330.
 - 2. Air infiltration when tested according to ASTM E283.
 - 3. Water penetration under static pressure when tested according to ASTM E 331.
 - 4. Structural performance at design load when tested according to ASTM E 330.
 - 5. Repeat air filtration when tested according to ASTM E 283.
 - 6. Repeat water penetration under static pressure when tested according to ASTM E 331.
 - 7. Structural performance at maximum 150 percent of positive and negative wind-load design pressures when tested according to ASTM E 330.

1.6 PROJECT CONDITIONS

- A. Field Measurements: Check actual window openings by accurate field measurements before fabrication and show recorded measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of the Work.
 - 1. Where field measurements cannot be made without delaying the Work, guarantee opening dimensions and proceed with fabricating aluminum windows without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to guaranteed dimensions.

GLASS WARRANTY IS SPECIFIED IN THE GLAZING SECTION.

NOTE THAT STANDARD WARRANTY IS FREQUENTLY 5 YEARS, WITH 10 YEARS BEING AN OPTION AVAILABLE AT ADDITIONAL CHARGE.

1.7 WARRANTY

- A. Assembly Warranty: Provide a complete parts and labor warranty for a minimum of 10 years from the date of Substantial Completion according to the following terms.
 - 1. Manufacturer agrees to repair or replace components of aluminum windows that do not comply with requirements or that fail in materials or workmanship within specified warranty period. Failures include, but are not limited to, the following:
 - a. Structural failures including, but not limited to, excessive deflection.

- b. Noise or vibration created by wind and thermal and structural movements.
- c. Water penetration through fixed glazing and framing areas.
- d. Failure of operating components.
- e. Glazing failure, including gasket shrinkage.
- f. Glass defects and failure as specified in the Glazing Section.

RETAIN APPLICABLE WARRANTIES FOR PROJECT.

- B. Fluoropolymer Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied fluoropolymer finishes within specified warranty period.
 - 1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
 - b. Chalking in excess of a No.8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

VERIFY AVAILABLE WARRANTIES AND WARRANTY PERIODS FOR FINISHES WITH MANUFACTURERS LISTED IN PART 2 ARTICLES. FLUOROPOLYMER FINISHES ARE ELIGIBLE FOR 10 YEAR WARRANTIES.

- 2. Warranty Period: 10 years from date of Substantial Completion.
- C. Anodized Finish Warranty: Manufacturer agrees to repair finishes or replace aluminum that shows evidence of deterioration of factory-applied anodized finishes within specified warranty period. Any metal forming or welding must be done prior to finishing.
 - 1. Deterioration includes, but is not limited to, the following:
 - a. Color fading more than 5 Delta-E Hunter units (square root of the sum of square Delta L, Delta a, and Delta b) as determined by ASTM D 2244.
 - b. Chalking in excess of a No.8 rating when tested according to ASTM D 4214.
 - c. Cracking, checking, flaking, or blistering.
 - 2. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Window Manufacturers:

SELECT WINDOW DESIGN BASED ON PERFORMANCE WITHIN THE LISTED MANUFACTURERS. THE FOLLOWING MANUFACTURERS OFFER FIXED AND OPERABLE WINDOW UNITS THAT MEET SPECIFIED PERFORMANCE LEVELS. VERIFY PERFORMANCE LEVELS FOR VARIOUS UNIT TYPES AND SIZES IN

THE PROJECT BECAUSE NOT ALL PRODUCT LINES AND SIZES FROM THE MFRS BELOW MEET THE PERFORMANCE SPECIFICATIONS.

REVIEW NFRC WEBSITE FOR LISTING OF WINDOWS CERTIFIED TO MEET PERFORMANCE STANDARDS.

1. Graham Architectural Products.
2. Kawneer Company, Inc.
3. Wausau Window and Wall Systems.
4. Traco.

B. Acceptable Fluoropolymer Coating Manufacturers:

1. PPG Industries.
2. Valspar Corp.
3. Akzo Nobel.

2.2 PERFORMANCE REQUIREMENTS

PRIMARY ENERGY PERFORMANCE REQUIREMENTS INCLUDE THERMAL TRANSMITTANCE (U-FACTOR), SOLAR HEAT GAIN COEFFICIENT, AND AIR INFILTRATION AS DEFINED BY ASHRAE/IESNA 90.1-2007. RELATED AND ADDITIONAL ENERGY PERFORMANCE CONSIDERATIONS INCLUDE CONDENSATION RESISTANCE AND VISIBLE LIGHT TRANSMITTANCE. OPTIONS IN SUBPARAGRAPHS BELOW ARE EXAMPLES ONLY. REVISE VALUES TO SUIT BUILDING ENVELOPE AS DEFINED BY ASHRAE/IESNA 90.1-2007. REVIEW PERFORMANCE WITH RESPECT TO U OF M DESIGN GUIDELINES FOR DESIGN AND CONSTRUCTION SID-D "ENERGY AND WATER CONSERVATION" AND RELATED STANDARDS. COORDINATE WITH DIVISION 08 SECTION "GLAZING".

A. Provide aluminum windows engineered, fabricated, and installed to withstand normal thermal movement, wind loading, and impact loading without failure, as demonstrated by testing manufacturer's standard window assemblies representing types, classes, grades, and sizes required for Project according to test methods indicated.

CONSULT WITH STRUCTURAL ENGINEER TO DETERMINE PROPER PERFORMANCE GRADE, WHICH IS BASED UPON WIND SPEED AND EXPOSURE CATEGORY.

B. Provide aluminum windows that comply with AAMA/WDMA/CSA 101 Performance Class AW and Performance Grade [].

ALWAYS RETAIN PARAGRAPH BELOW.

C. Factory testing indicated in paragraphs below shall demonstrate compliance with requirements indicated in AAMA 101 for air infiltration, water penetration, structural, and thermal performance for type, grade, and performance class of window units required. Where required design pressure exceeds the minimum for the specified window grade, comply with requirements of AAMA 101, Section 3, "Optional Performance Classes," for higher than minimum performance class.

D. Air infiltration: Maximum 0.4 cfm per square foot at 6.24 psf pressure differential when tested in accordance with ASTM E283.

E. Water Penetration:

1. No uncontrolled water leakage at 12.00 psf static pressure differential, with water application rate of 5 gallons/hr/sq ft when tested in accordance with both ASTM E331 and ASTM E547. Repeat static water test after application of design test pressures.

NOTE THAT THE FOLLOWING INFORMATION AS DETERMINED BY PROJECT'S STRUCTURAL ENGINEER MUST BE SHOWN ON DRAWINGS.

F. Structural:

1. Structural Loads: As indicated on Drawings.
2. Uniform Load Deflection Test
 - a. No deflection of any unsupported span L of test unit (framing rails, muntins, mullions, etc.) in excess of L/175 at both a positive and negative load of design test pressure psf) when tested in accordance with ASTM E330.
3. Uniform Load Structural Test:
 - a. Unit to be tested at 1.5 times design test pressure, both positive and negative, acting normal to plane of wall in accordance with ASTM E330.
 - b. No glass breakage; permanent damage to fasteners, hardware parts, or anchors; damage to make windows inoperable; or permanent deformation of any main frame or ventilator member in excess of 0.2 percent of its clear span.

G. Thermal:

1. Thermal Transmittance (U-factor) Fixed glazing and Framing Areas: U-factor of not more than 0.55 Btu/sq. ft. x h x deg F as determined according to NFRC 100.
2. Thermal Transmittance (U-factor) Operable Window Glazing and Framing Areas: U-factor of not more than 0.55 Btu/sq. ft. x h x deg F as determined according to NFRC 100.
3. Solar Heat Gain Coefficient (SHGC): Fixed glazing and framing areas shall have a solar heat gain coefficient of no greater than 0.40 as determined according to NFRC 200.
4. Condensation Resistance: Provide units tested for thermal performance according to AAMA 1503 showing a condensation resistance factor (CR) of 60.

SELECT ABOVE OR BELOW. ABOVE PUTS RESPONSIBILITY ON DESIGNER AND NEEDS TO BE CONFIRMED BASED UPON BUILDING OCCUPANCY FACTORS AND SHOULD BE VERIFIED WITH MECHANICAL ENGINEER. BELOW PUTS RESPONSIBILITY ON MANUFACTURER.

CRF CALCULATOR TOOL IS AVAILABLE AT:

[HTTP://AAMANET.ORG/CRFCALCULATOR/1/334/CONDENSATION-RESISTANCE-FACTOR-TOOL](http://AAMANET.ORG/CRFCALCULATOR/1/334/CONDENSATION-RESISTANCE-FACTOR-TOOL)

5. Condensation Resistance: Provide units tested for thermal performance according to AMMA 1503 showing a condensation resistance factor (CRF) such that there shall be no formation of condensation in any form on glazing and framing.

INSERT PROJECT SPECIFIC DESIGN VALUES BELOW.

- a. Indoor design temperature:
 - 1) Winter: []
 - 2) Summer: []
- b. Indoor humidity:
 - 1) Winter: []
 - 2) Summer: []
- 6. Thermal Movements: Provide window units that allow thermal movement resulting from the following maximum change (range) in ambient temperature when engineering, fabricating, and installing aluminum windows to prevent buckling, opening of joints, and overstressing of components, connections, and other detrimental effects. Base engineering calculation on actual surface temperatures of materials due to solar heat gain and nighttime sky heat loss.
 - a. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

H. Operable window units shall successfully pass operating force and deglazing test requirements of AAMA 101 and life-cycle test requirements specified in AAMA 910.

INCLUDE BELOW IF PROJECT CONTAINS THE FOLLOWING OPERABLE WINDOW TYPES

- 1. Projected casement window units shall successfully pass the following test requirements as specified in AAMA 101:
 - a. Torsion test on an unglazed ventilator.
 - b. Horizontal and vertical concentrated load tests on latch rail of each ventilator.
 - c. Torsion load test on intermediate frame rails.
 - d. Vertical concentrated load test on intermediate frame rails over each ventilator.
 - e. Balance arm load test.
- 2. Projected awning window units shall successfully pass the following test requirements as specified in AAMA 101:
 - a. Hold-open arm or stay-bar load test.
 - b. Torsion test.
 - c. Horizontal concentrated load test.
 - d. Vertical concentrated load test.

I. Labeling: Per ANSI/ASHRAE 90.1-2007, provide a permanent nameplate, installed by the manufacturer, listing the U-factor, SHGC, and air leakage rate. The label may be the NFRC energy performance label or the AAMA performance label.

2.3 DESIGN REQUIREMENTS

INCLUDE THE PARAGRAPH BELOW TO CONTROL THE RELATIONSHIP OF VISION AND SPANDREL PANELS WHEN BOTH ARE INCLUDED IN THE PROJECT.

- A. Uniform Glass Plane Requirement: Within the same wall opening, fabricate windows to align the exterior surface planes of vision glass with spandrel panels.
 - 1. Maximum out-of-plane dimension for vision and spandrel panels: 1/8-inch.
 - 2. Where applicable, align metal filler panels in the same plane as adjacent spandrel panels.

2.4 MATERIALS

- A. Aluminum Extrusions: Provide alloy and temper recommended by the window manufacturer for the strength, corrosion resistance, and application of required finish, but not less than 22,000-psi ultimate tensile strength and of the following thickness and depth at any location for main frame and sash members.

BELOW ARE 2 COMMONLY USED SIZES. 2-1/4-INCH DIMENSION IS NOT RECOMMENDED FOR VENTILATORS OVER 15 SQUARE FEET IN AREA, OR WITH VERTICAL DIMENSION GREATER THAN 78-INCHES.

- 1. Main Frame Depth: 2-1/4 inches.
- 2. Main Frame Depth: 3-1/4 inches.

DELETE BELOW FOR SINGLE- AND DOUBLE-HUNG UNITS, OR FOR OTHER TYPES IF NOT REQUIRED.

- a. Provide ventilator members of depth matching main frame.

- B. Fasteners: Provide aluminum, nonmagnetic stainless steel, epoxy adhesive, or other materials warranted by the manufacturer to be noncorrosive and compatible with aluminum window members, trim, hardware, anchors, and other components of window units.

RETAIN THE PARAGRAPH BELOW.

- 1. Reinforcement: Where fasteners screw-anchor into aluminum less than 0.125 inch thick, reinforce the interior with aluminum or nonmagnetic stainless steel to receive screw threads or provide standard, noncorrosive pressed-in splined grommet nuts.

GENERALLY RETAIN THE PARAGRAPH BELOW. MODIFY AS APPROPRIATE IF USE OF EXPOSED FASTENERS IS PERMITTED.

- 2. Exposed Fasteners: Except where unavoidable for application of hardware, do not use exposed fasteners. For application of hardware, use fasteners that match the finish of the member or hardware being fastened, as appropriate.

- C. Anchors, Clips, and Window Accessories: Fabricate anchors, clips, and window accessories of aluminum, nonmagnetic stainless steel, or hot-dip zinc-coated steel complying with the requirements of ASTM A 123; provide sufficient strength to withstand design pressure indicated.

CONSIDER INCLUDING BELOW FOR STRUCTURAL STRENGTH, OR TO CLOSE OFF OPENINGS THROUGH CONSTRUCTION

- 1. Provide continuous structural anchor clips.

- D. Sealant: For sealants required within fabricated window units, provide type recommended by the manufacturer for joint size and movement. Sealant shall remain permanently elastic, nonshrinking, and nonmigrating. Comply with Division 07 Section "Joint Sealants" of the Specifications for selection and installation of sealants.

2.5 HARDWARE

- A. General: Provide the manufacturer's standard hardware fabricated from aluminum, stainless steel, or other corrosion-resistant material compatible with aluminum and of sufficient strength to perform the function for which it is intended.

DELETE BELOW IF NO PROJECTED WINDOWS.

- B. Cam Handles: Provide manufacturer's standard cam-action sweep lock/handle of solid white bronze.
 - 1. Finish: Polished (chrome white).
 - 2. Finish: Oxidized (dark bronze).

DELETE BELOW IF NO DOUBLE HUNG WINDOWS.

- C. Handles: Provide manufacturer's standard stainless steel wire pull.
 - 1. Stainless Steel Finish: Satin, natural.
 - 2. Aluminum Finish: Match window frame.

RETAIN THE NEXT PARAGRAPH WITH CASEMENT AND PROJECTED WINDOWS. SPECIAL EGRESS TYPE FOUR-BAR FRICTION HINGES ARE ALSO AVAILABLE FOR CASEMENT WINDOWS WHERE WINDOWS ARE ALSO USED FOR EMERGENCY EGRESS.

- D. Four-Bar Friction Hinges: Comply with AAMA 904.
 - 1. Provide concealed four-bar friction hinges with adjustable slide shoes of nylon or other nonabrasive, nonstaining, noncorrosive, durable material.

RETAIN FOR LARGE VENTS IN CASEMENT WINDOWS. VERIFY WITH WINDOW MANUFACTURERS.

- E. Butt Hinges: Provide heavy-duty 5-knuckle butt hinges with nylon bushings complying with AAMA 904. Finish and color to match frames.

RETAIN ROTARY OPERATORS BELOW IF DESIRED FOR AWNING, AND CASEMENT TYPE WINDOWS.

- F. Gear-Type Rotary Operators: Comply with AAMA 901 for rotary operators. Comply with ASTM E 405, Method A, when subjected to operating moments and closing torques indicated in AAMA 101.
 - 1. Operator shall operate all ventilators simultaneously, securely closing them at both jambs without use of additional manually controlled locking devices.

DELETE TWO PARAGRAPHS BELOW IF NO CASEMENT WINDOWS.

- G. Single Point Locks: Provide manufacturer's standard cam-action lift lock of solid white bronze. Color to match ventilator frame.

BELOW FOR LARGE CASEMENTS REQUIRING TWO LATCHING POINTS (NOTE THAT CASEMENT WIDTH MUST BE OVER 2.5 FEET FOR MULTI-POINT LATCH).

H. Two-Point Locks: Provide manufacturer's standard 2-point, cam-action lift lock of solid white bronze. Color of exposed parts to match ventilator frame.

DELETE BELOW IF NO SINGLE- OR DOUBLE-HUNG WINDOWS.

I. Cam Action Lock: Sweep lock and keeper on the meeting rail.

SELECT BELOW FOR HOUSING PROJECTS.

J. Limit Device: Heavy-duty, concealed arm, custodial-key operated limit device designed to restrict occupant operation of ventilator, but permit full operation with custodial key. Provide Truth 99 series or equivalent by window manufacturer. Provide in residential applications, and where indicated.

INCLUDE BELOW WITH EITHER LIMIT DEVICE SPECIFIED ABOVE. MODIFY VALUE BELOW TO SUIT PROJECT.

1. Set devices to limit opening to 6 inches, clear, from window frame member to vent frame.

RETAIN THE NEXT PARAGRAPH WITH DOUBLE-HUNG WINDOWS.

K. Counterbalancing Mechanism: Comply with AAMA 902.

RETAIN ONLY ONE OF THE TYPES OF SASH BALANCES BELOW.

1. Sash Balance Type: Concealed spiral type of size and capacity to hold sash stationary at any open position.
2. Sash Balance Type: Concealed tape spring type of size and capacity to hold sash stationary at any open position.

2.6 ACCESSORIES

A. General: Provide the manufacturer's standard accessories that comply with indicated standards.

DELETE OPTIONAL OR ACCESSORY ITEMS IN THIS ARTICLE THAT ARE NOT REQUIRED. COORDINATE ITEMS RETAINED WITH PROVISIONS CONTAINED IN THE "MATERIALS" ARTICLE.

B. Panning and Trim: Provide panning and trim as shown with anchors as required to securely fasten trim and panning items to window units and adjacent substrates. Provide concealed anchors where possible. Provide units of profile and dimensions indicated, but not less than 0.062-inch-thick extruded aluminum. Miter and cope corners, and dress smooth. Finish to match window units.

ANCHOR CLIPS REFERENCED BELOW ARE FOR 2-PIECE SNAP-ON TRIM. DELETE BELOW IF ONLY ADHESIVELY APPLIED "L"-SHAPED TRIM IS INCLUDED.

1. Interior Trim: Provide 2-piece extruded aluminum box type trim with continuous anchor clips for trim exceeding 36 inches in length.

DELETE BELOW IF NO ADHESIVELY APPLIED "L"-SHAPED TRIM.

2. Interior Trim: Anchor "L"-shaped trim pieces with continuous adhesive tape strip applied to surface in contact with adjacent wall/partition substrate only.

COORDINATE BELOW WITH WINDOW SCHEDULE

- C. Insect Screens: Provide insect screens for each operable exterior sash or ventilator. Locate screens on the inside or outside of the window sash or ventilator, depending upon window type. Design windows and hardware to accommodate screens in a tight-fitting removable arrangement, with a minimum of exposed fasteners and latches.

RETAIN ONLY ONE OF THE NEXT TWO PARAGRAPHS IF SCREENS ARE REQUIRED. COMBINE THE PARAGRAPHS IF THE CONTRACTOR IS TO HAVE AN OPTION IN SELECTING SCREEN FRAME MATERIAL.

- 1. Screen Frames: Fabricate frames of tubular-shaped extruded or formed aluminum members of 0.040-inch minimum wall thickness, with mitered or coped joints and concealed mechanical fasteners. Finish frames to match window units.
 - a. Provide removable PVC spline-anchor concealing the edge of the screen frame.
- 2. Wire Fabric Insect Screen: Provide 18 by 16, mesh of 0.011-inch-diameter black anodized aluminum wire, complying with FS RR-W-365, Type VII.

- D. Compression-Type Glazing Strips and Weatherstripping: Unless otherwise indicated, and at manufacturer's option, provide compressible stripping for glazing and weatherstripping such as molded PVC gaskets complying with ASTM D 2287, or molded expanded EPDM gaskets complying with ASTM C 509, Grade 4.

SLIDING-TYPE WEATHERSTRIPPING BELOW IS FOR DOUBLE-HUNG WINDOW UNITS.

- E. Sliding-Type Weatherstripping: Provide woven-pile weatherstripping of nylon pile and resin-impregnated backing fabric. Comply with AAMA 701.2.
 - 1. Provide stripping with integral centerline barrier fin of semirigid plastic sheet of polypropylene.
 - 2. Provide weatherstripping locked in to extruded grooves in the sash.
 - 3. Provide sliding-type weatherstripping where sash rails slide vertically along the unit frame. Provide compression-type weatherstripping at the head and sill of each operating sash.

CONSIDER INCLUDING BELOW.

- F. Insulation: Blanket or batt type meeting ASTM C 665, Type III, Class A, fiberglass.

2.7 FABRICATION

- A. General: Fabricate aluminum window units to comply with indicated standards. Include a complete system for assembly of components and anchorage of window units.
 - 1. Provide units that are reglazable without dismantling sash or ventilator framing.
 - 2. Prepare window sash or ventilators for glazing except where preglazing at the factory is indicated.

REVISE BELOW TO SUIT PROJECT.

3. Provide units that are capable of being reglazed from the building interior, except at spandrels or other inaccessible conditions.

INCLUDE THERMAL BREAK CONSTRUCTION FOR ALL PROJECTS.

- B. Thermal-Break Construction, General: Fabricate window units with an integral, concealed low-conductance thermal barrier, located between exterior materials and window members, in a manner that eliminates direct metal-to-metal contact; and that complies with the following:
1. Products comprising the system shall have been in use for not less than 5 years.
 2. Systems shall have been tested to demonstrate resistance to thermal conductance and condensation, and to show adequate strength and security of glass retention.
 3. Systems shall be capable of transferring shear during bending under design loads by promoting composite action between the exterior and interior extrusions.
- C. Weepholes: Provide weepholes and internal passages to conduct infiltrating water to the exterior.

DELETE THE PARAGRAPH BELOW IF THERE ARE NO LINES WHERE VENT FRAMES LAP THE WRONG WAY TO SHED WATER.

- D. Provide water-shed members above side-hinged ventilators and similar lines of natural water penetration.

DELETE THE NEXT PARAGRAPH IF SUBFRAMES ARE NOT REQUIRED. SUBFRAMES PROVIDE A NEAT, SEALABLE PERIMETER FOR RENOVATION WORK. THEY ARE USUALLY NOT REQUIRED FOR WINDOWS IN NEW SURROUNDING CONSTRUCTION.

- E. Subframes: Provide subframes with anchors for window units, where shown, of profile and dimensions indicated but not less than 0.062-inch-thick extruded aluminum. Miter or cope corners, and weld and dress smooth with concealed mechanical joint fasteners. Finish to match window units.

MODIFY PARAGRAPHS BELOW TO SUIT PROJECT REQUIREMENTS.

1. Provide subframes at all wall openings to receive window units.
2. Locate subframes at sill, head and jambs of openings.

DELETE THE PARAGRAPH BELOW IF MULLIONS ARE NOT REQUIRED.

- F. Mullions: Provide mullions and cover plates as shown, matching window units, complete with anchors for support to structure and installation of window units. Allow for erection tolerances and provide for movement of window units due to thermal expansion and building deflections, in the manner indicated.

DELETE THE NEXT PARAGRAPH IF GLAZING STOPS ARE NOT REQUIRED (AT STRUCTURAL-GLAZED TYPE WINDOW SYSTEMS FOR EXAMPLE).

- G. Glazing Stops: Provide screw-applied or snap-on glazing stops, coordinated with glass selection and glazing system indicated. Finish glazing stops to match window units.

DELETE THE PARAGRAPH BELOW IF PREGLAZING IS IMPRACTICAL. GLASS SIZES LARGER THAN 60 TO 100 UNITED INCHES MAY BE DIFFICULT TO HANDLE WITHOUT DAMAGE. IT IS ALSO POSSIBLE THAT THE INSTALLATION OR ANCHORAGE SYSTEM WILL NOT PERMIT PREGLAZING. VERIFY WITH WINDOW MANUFACTURER.

- H. Preglazed Fabrication: Preglaze window units at the factory. Comply with glass and glazing requirements of the Division 08 Section "Glazing" of these specifications and AAMA 101.

2.8 FINISHES, GENERAL

- A. Comply with referenced AAMA Voluntary Specifications for detailed finish requirements.

DELETE BELOW IF NO CURTAIN WALL

TYPICALLY SPECIFY FINISHES IN CURTAIN WALL SECTION.

- B. Finish aluminum windows to match other adjacent glazed aluminum curtain wall components, when applicable. Refer to Division 08 Section "Glazed Aluminum Curtain Walls" for finish requirements.

DELETE 2 ARTICLES BELOW IF SPECIFIED IN CURTAIN WALL SECTION.

2.9 FLUOROPOLYMER ALUMINUM FINISHES

RETAIN FINISHES IN PARAGRAPHS BELOW TO SUIT PROJECT. FLUOROPOLYMER FINISH IS PREFERRED BY THE U OF M.

IF RETAINING MORE THAN ONE, INDICATE LOCATION OF EACH ON DRAWINGS BY TYPE. COORDINATE WITH DESIGNATIONS IN THIS SECTION. ALUMINUM-FRAMING SYSTEMS ARE AVAILABLE WITH DUAL FINISHES, ALLOWING DIFFERENT INTERIOR AND EXTERIOR COLOR FINISHES.

IF SPECIFIC PRODUCTS ARE REQUIRED, NAME COATING MANUFACTURERS AND PRODUCTS.

- A. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to metal surfaces to comply with coating and resin manufacturers' written instructions.

TYPICALLY, ONLY USE THREE-COAT FLUOROPOLYMER FINISH WITH METALLIC FINISHES.

- B. High-Performance Organic Finish: Three coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 085113 - - 15

BELOW IS TYPICAL COLOR CHOICE.

- C. Color and Gloss: Non-metallic solid color, dark bronze; low gloss, as selected by the Owner.
- D. Field Touch-Up Materials: Fluoropolymer coating produced specifically for field touch-up work by same manufacturer as shop applied coating.

2.10 ANODIC ALUMINUM FINISHES

USUALLY RETAIN ONLY ONE OF THE FINISH SYSTEMS SPECIFIED BELOW. IF MORE THAN ONE IS REQUIRED, INDICATE THE LOCATION OF EACH ON DRAWINGS OR INSERT A DESCRIPTION OF THE LOCATION OF EACH SEPARATE FINISH.

- A. Class I Clear Anodized Finish: Anodic Coating: Class I Architectural, clear film thicker than 0.7 mil, complying with AAMA 611.

RETAIN THE PARAGRAPH ABOVE IF CLEAR FINISH IS REQUIRED, OR THE PARAGRAPH BELOW IF A COLOR ANODIZED FINISH IS DESIRED.

- B. Class I Color Anodized Finish: Class I Architectural, film thicker than 0.7 mil with integral color or electrolytically deposited color, complying with AAMA 611.

SELECT COLOR BELOW OR MODIFY WHEN APPROVED BY THE OWNER.

- 1. Color: Dark bronze.
- C. Finish Appearance: Variations in appearance of butting or adjacent anodized aluminum elements are acceptable if within 1/2 the range indicated in approved samples. Noticeable variation in the same element is not acceptable.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Inspect openings before beginning installation. Verify that rough or masonry opening is correct and the sill plate is level.

EDIT PARAGRAPHS TO SUIT PROJECT FROM THE OPTIONS BELOW.

- 1. Masonry surfaces shall be visibly dry and free of excess mortar, sand, and other construction debris.
- 2. Metal surfaces shall be dry; clean; free of grease, oil, dirt, rust and corrosion, and welding slag; without sharp edges or offsets at joints.

3.2 INSTALLATION

DELETE THE NEXT PARAGRAPH IF THERE IS NO CURTAIN WALL OR ALUMINUM STOREFRONT WORK CONTAINING ALUMINUM WINDOW UNITS.

- A. Refer to the Division 08 Sections "Glazed Aluminum Curtain Walls" or "Aluminum-Framed Entrances and Storefronts" for installation requirements of aluminum window units in [glazed curtain walls] [aluminum entrances and storefronts.

COORDINATE THE NEXT THREE PARAGRAPHS AND DRAWINGS IF ALL WINDOW UNITS ARE INCLUDED IN GLAZED CURTAIN WALL WORK.

- B. Comply with manufacturer's specifications and recommendations for installation of window units, hardware, operators, and other components of the work.
- C. Set window units plumb, level, and true to line, without warp or rack of frames or sash. Provide proper support and anchor securely in place.
1. Separate aluminum and other corrodible surfaces from sources of corrosion or electrolytic action at points of contact with other materials by complying with the requirements specified under paragraph "Dissimilar Materials" in the Appendix to AAMA 101.
- D. Set sill members and other members in a bed of joint sealant or gaskets, as shown, to provide weathertight construction. Refer to the Division 07 Section "Joint Sealants" for compounds, fillers, and gaskets to be installed concurrently with window units. Coordinate installation with wall flashings and other components of the work.
1. Compounds, joint fillers, and gaskets to be installed after installation of window units are specified as work in the "Joint Sealants" section.

ALWAYS RETAIN BELOW FOR NEW CONSTRUCTION. FOR WINDOW REPLACEMENT PROJECTS MODIFY OR DELETE BELOW DEPENDING UPON EXISTING CONDITIONS.

- E. Refer to the Division 07 Section "Air Barrier" for coordination with air barrier terminations around windows.
- F. Loosely pack cavities around window perimeter between existing construction and window frame or subframe members with fiberglass insulation; pack accessible cavities of window frame with fiberglass, according to window manufacturer's instructions.

3.3 FIELD QUALITY CONTROL

RETAIN PARAGRAPHS BELOW TO DESCRIBE TESTS AND INSPECTIONS PERFORMED BY THE INDEPENDENT TESTING AGENCY EMPLOYED BY THE OWNER. RETAIN "FIELD QUALITY-CONTROL REPORTS" PARAGRAPH IN "SUBMITTALS" ARTICLE. EDIT TO SPECIFY PROJECT SPECIFIC TESTING REQUIREMENTS.

- A. Testing Agency: Owner will engage a qualified testing agency for witnessing field testing, determining that the tests are performed correctly and making the final determination whether the aluminum windows have successfully passed the tests.

- B. Testing Activities: Testing and inspecting of representative areas of window shall take place as installation proceeds to determine compliance of installed assemblies with specified requirements. Owner will determine locations and timing of testing.
- C. Test Area: One window at corner and center of wall, per each wall elevation, including surrounding wall construction, at heads, jambs and sills.
 - 1. Perform at least three tests, prior to 35, and 70 percent completion, and before installation of interior walls and finishes.
- D. Windows will be considered defective if they do not pass tests and inspections.
- E. If test area fails to meet the specified air infiltration or water penetration requirements, Contractor shall submit description of proposed remedial work for Owner and Architect's information.
 - 1. Remedial work shall be incorporated into the test specimen for retesting.
 - 2. Cost of retesting shall be responsibility of Contractor.
- F. Remedial work which results in successful retesting of test specimen shall be incorporated in installed system for entire Project.
- G. For each area which fails field testing, 1 additional area of equal size shall be tested for both air infiltration and water penetration.
 - 1. Cost of testing of additional areas shall be responsibility of Contractor.
- H. When installation is 50 percent complete, Owner and Architect will select 1 additional location for testing in accordance with AAMA 501, as specified above.
 - 1. For each area which fails field testing, 1 additional area of equal size shall be tested for both air infiltration and water penetration.
 - 2. Cost of testing of additional areas shall be responsibility of Contractor.
- I. Testing agency shall submit copies of inspection and test reports to Owner, Architect and Contractor within 48 hours after date of test.
- J. The Owner reserves the right to select additional test areas as required, without limitation, subject to correction and remediation as specified herein.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section "Full Project Commissioning" or "Project Commissioning for Small Projects" and other requirements of the Contract Documents.

3.5 ADJUSTING, CLEANING, PROTECTION

- A. Adjust operating sash and hardware to provide a tight fit at contact points and at weatherstripping for smooth operation and a weathertight closure.
- B. Clean aluminum surfaces promptly after installation of windows. Exercise care to avoid damage to protective coatings and finishes. Remove excess glazing and sealant compounds, dirt, and other substances. Lubricate hardware and other moving parts.
- C. Clean glass of preglazed units promptly after installation of windows. Comply with requirements of the Division 08 Section "Glazing" for cleaning and maintenance.
- D. Provide final protection and maintain conditions, in a manner acceptable to aluminum window manufacturer, that ensure window units are without damage or deterioration at the time of Substantial Completion.

REVISE BELOW TO SUIT PROJECT AND COORDINATE WITH DRAWINGS.

3.6 WINDOW SCHEDULE

- A. Double-hung windows
 - a. Counterbalancing mechanism.
 - b. Cam Action Lock.
 - c. Lift Handle: Applied sash lifts on bottom rail of lower sash (2 per sash).
- B. Projected casement windows
 - 1. Hardware: Provide the following operating equipment and hardware:

DELETE THE NEXT PARAGRAPH IF IT IS NOT REQUIRED.

- a. Rotary Operator.
- b. Friction Hinges: 2 per ventilator.

SELECT HINGE TYPE ABOVE OR BELOW. CONSIDER ADDING A REQUIREMENT FOR LIMIT STOPS TO PREVENT PROJECTION BEYOND WALL SURFACES WHERE THIS IS DESIRABLE.

- c. Butt Hinges: 2 per ventilator.

RETAIN BELOW FOR EITHER HINGE TYPE

- 1) Provide ventilator operation that permits inside cleaning of the outside glass face from the interior.
- 2) Provide 3 hinges on units over 4 feet high or 4 feet wide.

SELECT ONE OF THE SASH LOCKS BELOW BASED ON WINDOW SIZE / LOCATION. NOTE: MODIFY TEXT IF NECESSARY TO PROVIDE FOR 2 LOCKS ON UNITS OVER 3 FEET, 6 INCHES WIDE.

- d. Sash Lock: Cam action lock.

RETAIN BELOW FOR WINDOW UNITS WITH VENTILATORS OVER 6 FEET ABOVE THE FLOOR.

- e. Sash Lock: Pole-operated cam action lock.

SPECIFY BELOW FOR SLEEPING ROOMS.

- f. Limit Device.

PROVIDE INSECT SCREENS IN HOUSING PROJECTS AND FOOD PREPARATION AREAS ONLY. SCREENS ARE GENERALLY NOT REQUIRED FOR UNIVERSITY PROJECTS

- 2. Insect screens

C. Projected awning windows

- 1. Hardware: Provide the following operating hardware and equipment:
 - a. Rotary operator
 - b. Friction Hinges: 2 per ventilator.

SELECT HINGE TYPE ABOVE OR BELOW. CONSIDER ADDING A REQUIREMENT FOR LIMIT STOPS TO PREVENT PROJECTION BEYOND WALL SURFACES WHERE THIS IS DESIRABLE.

- c. Butt Hinges: 2 per ventilator.

RETAIN BELOW FOR EITHER HINGE TYPE

- 1) Provide ventilator operation that permits inside cleaning of the outside glass face from the interior.
- 2) Provide 3 hinges on units over 4 feet high or 4 feet wide.
- d. Hold-Open Device: Automatic locking hold-open arms (2 per ventilator).

SPECIFY BELOW FOR SLEEPING ROOMS.

- e. Limit Device.

PROVIDE INSECT SCREENS IN HOUSING PROJECTS AND FOOD PREPARATION AREAS ONLY. SCREENS ARE GENERALLY NOT REQUIRED FOR UNIVERSITY PROJECTS

- 2. Insect screens

D. Fixed windows

SPECIFICATION DIVISION 8

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 087100 - DOOR HARDWARE

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 087100 - DOOR HARDWARE

REVISION HISTORY

APRIL 2005 - UPDATED SWEEP SEALS, JAMB SEALS AND THRESHOLDS.

FEBRUARY 2007 - UPDATED TO REMOVE SPECIFIC REFERENCES TO RICK HADDEN. QUESTIONS REGARDING CORE TYPE, KEYING, AND BUILDING STANDARDS SHOULD BE DIRECTED TO A LOCKSMITH AT THE KEY OFFICE. IN GENERAL, AVOID USE OF SPECIFIC CONTACT NAMES IN SPECIFICATION.

DECEMBER 2008 - ADDED SUBMITTAL REQUIREMENTS, ADDED ACCESS CONTROL PRODUCTS AND UPDATED PRODUCT NUMBERS.

JANUARY 2013 REVISED FORMATTING AND CONTENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.

EDIT BELOW TO SUIT PROJECT.

- B. Related Sections:
1. Division 6 Section: Architectural Woodwork.
 2. Division 8 Section: Aluminum Entrances and Storefront.
 3. Division 12 Section: Laboratory Casework and Fixtures.
 4. Division 28 Section: Access Control and Monitoring System.

1.2 SUMMARY

- A. Section Includes: Door hardware as indicated on drawings and in schedules

EDIT BELOW TO SUIT PROJECT.

Hinges.
Closers.
Double-acting closer/pivot sets.
Door Operators.
Small Format Interchangeable Cores (SFIC).
Locks and latches.
Strikes.
Latches.
Stops.
Silencers.
Push/pull sets.
Exit device (panic set).
Astragals.
Flush bolts.

Coordinators.
Trim protector bars.
Kickplates.
Sweep seals.
Jamb seals.
Automatic door bottoms.
Electrically activated hold-open devices.
Thresholds.
Removable Mullion.
Concealed power transfer.
Door position switch.
Request to exit sensor.

TYPICALLY DELETE BELOW. INCLUDE FOR PROJECTS WITH ALUMINUM ENTRANCES AND STOREFRONT.

- B. Products specified under this section but provided under sections:
1. 08410: Aluminum Entrances and Storefront.

1.3 SUBMITTALS

A. Submittals: Submit the following:

1. Manufacturer's product literature.
2. Schedule of hardware showing application to project.
3. Furnish templates to each fabricator of doors and frames, as required for preparation to receive hardware.

INCLUDE PARAGRAPHS 4 & 5 BELOW FOR PROJECTS WITH ELECTRIFIED HARDWARE.

4. Wiring Diagrams: For power, signal, and control wiring and including the following:
 - a. Details of interface of electrified door hardware and building safety and security systems.

RETAIN FOUR SUBPARAGRAPHS BELOW IF ELECTRIFIED DOOR HARDWARE IS COMPLEX. IF ONLY ELECTRIC STRIKES ARE REQUIRED, THIS LEVEL OF DETAIL MIGHT NOT BE NECESSARY.

- b. Schematic diagram of systems that interface with electrified door hardware.
 - c. Point-to-point wiring.
 - d. Risers.
 - e. Elevations doors controlled by electrified door hardware.
5. Operation Narrative: Describe the operation of doors controlled by electrified door hardware. Include description of how the opening is to function at all times, including normal operation, upon activation of the building fire alarm system, and upon loss of power.

TYPICALLY DELETE BELOW -- INCLUDE FOR PROJECTS IN BFS BUILDINGS WITH SPECIAL LOCKING ARRANGEMENTS THAT IMPEDE EGRESS (I.E. DELAYED EGRESS, DOOR INTERLOCKS)

6. Special locking arrangements in buildings under the jurisdiction of the State of Michigan Bureau of Fire Services (BFS) require submission of the following documents to BFS for door locking review:
 - a. Floor plan showing door locations to be locked and type of hardware and equipment scheduled for installation.
 - b. A description of the "sequence of operations" of the door locking system outlining operation during normal operation, upon activation of the building fire alarm system, and upon loss of primary power the fire alarm system.
 - c. Product literature for the door hardware and related equipment, including locks, control equipment, accessory equipment, power supplies, and any other hardware used.

1.4 QUALITY ASSURANCE

*INCLUDE PARAGRAPHS A AND B IN EVERY SPECIFICATION SECTION.
EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.*

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. NFPA 70: National Electrical Code.
 2. NFPA 80: Standard for Fire Doors and Other Opening Protectives
 3. NFPA 252: Standard Methods of Fire Tests of Door Assemblies.
 4. ANSI A 156 series standards applicable to each particular type of hardware.

PART 2 - PRODUCTS

THE HARDWARE INCLUDED IN THIS SECTION MAY NOT BE SUITABLE FOR SPECIALIZED FIRE-RATED DOORS - I.E. FRP DOORS, LARGE WOOD DOORS, EXTENSIVE GLASS, ETC. CONSULT WITH DOOR AND HARDWARE MFRS TO DETERMINE UL LISTED HARDWARE. COORDINATE SPECIALIZED HARDWARE WITH KEY OFFICE TO ENSURE MAINTAINABILITY.

2.1 HARDWARE, GENERAL

- A. Standards: Where base material and quality of finish are not otherwise specified, comply with ANSI A 156 series standards applicable to each particular type of hardware.
- B. Fire-Rated Door Assemblies: Where fire-rated door assemblies are indicated, provide door hardware rated for use in assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252 or UL 10C, unless otherwise indicated.

- C. Electrified Door Hardware: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

2.2 HINGES

- A. Provide 5-knuckle, 2 ball-bearing hinges; swaged; inner leaf beveled; with square corners; nonremovable pin, complete with set screw (knurled pin not acceptable); and as follows:

SELECT FULL MORTISE UNLESS OTHERWISE REQUIRED.

1. Type: Full-mortise.
2. Type: Half-surface.
3. Type: Half-mortise.
4. Type: Full surface.

TYPICALLY SELECT STEEL FOR INTERIOR DOORS AND FOR ALL FIRE RATED OPENINGS. STEELS IS APX HALF THE COST OF BRASS

SELECT BRASS FOR EXTERIOR DOORS, OR WHERE CORROSION IS EXPECTED (HIGH HUMIDITY, POOL AREAS, ETC.) BRASS IS MORE DURABLE THAN STAINLESS FOR THESE EXPOSURES.

5. Base Metal: Steel.
6. Base Metal: Stainless Steel.
7. Base Metal: Brass.

SELECT FROM VARIOUS FINISHES, OR RETAIN THE FOLLOWING. FINISH METALS ARE PLATED OVER STEEL OR BRASS, OR IN THE CASE OF STAINLESS STEEL AND BRASS, THE BASE METAL MAY BE FINISHED.

8. Finish: To match "Finishes" requirements of this Section.
9. Size and Weight: Provide hinges sized as follows:

BELOW FOR MOST STANDARD DOORS.

- a. Doors not wider than 3 feet 6 inches nor taller than 7 feet 6 inches:
 - 1) Size: 4-1/2 inches by 4-1/2 inches; 0.180-inch thick.

ABOVE FOR HEAVY, HIGH-FREQUENCY DOORS. BELOW IS ECONOMICAL HINGE FOR MEDIUM WEIGHT, AVERAGE FREQUENCY DOORS.

- 2) Size: 4-1/2 inches by 4-1/2 inches; 0.134-inch thick.

BELOW FOR EXTRA LARGE DOORS.

- b. Doors wider than 3 feet 6 inches or taller than 7 feet 6 inches:
 - 1) Size: 5 inches by 4-1/2 inches; 0.190-inch thick.

ABOVE FOR HEAVY, HIGH-FREQUENCY DOORS. BELOW IS ECONOMICAL HINGE FOR MEDIUM WEIGHT, AVERAGE FREQUENCY DOORS.

- 2) Size: 5 inches by 4-1/2 inches; 0.145-inch thick.

DELETE BELOW UNLESS 1-3/8 INCH THICK INCLUDED. NOTE THAT BELOW SELECTION IN FOR AVERAGE FREQUENCY SERVICE DOORS - MODIFY VALUE TO .180 FOR HIGH FREQUENCY DOORS

- c. Doors 1-3/8 inches thick and not wider than 3 feet nor taller than 7 feet: 4-1/2 inches by 4 inches; 0.134-inch thick.
10. Manufacturer: Hager, Ives, McKinney, or Stanley.

USE BELOW FOR ALL ALUMINUM STOREFRONT DOORS, EXTERIOR HOLLOW METAL DOORS AND VERY HIGH FREQUENCY AND/OR HEAVY INTERIOR DOORS. ALSO USE AS STANDARD FOR HOUSING WORK.

- B. Continuous Gear Hinges: Provide units designed for heavy-duty, high-traffic use in new applications. Fabricate units of Class I anodized, 6063 T6 aluminum alloy with polyacetal thrust bearings.

- 1. Color: Clear anodized
- 2. Color: Dark bronze anodized.

BELOW IS STANDARD. ALSO AVAILABLE ARE RETROFIT UNITS THAT COVER BUTT CUT OUTS ON EXISTING FRAMES, AND A VARIETY OF FULL- AND HALF-SURFACE UNITS - SEE PRODUCT CATALOGS

- 3. Manufacturer/Model: Select Products Limited, SL-11HD, or equivalent products of Hager-Roton or Pemko.

2.3 CLOSERS

- A. Provide closers with field-adjustable, full-range sizing feature capable of complying with manufacturer's size recommendations for application indicated; and complying with applicable portions of the Americans with Disabilities Act (ADA).

- 1. Manufacturer/Model: LCN, 4000 Series "Smoothee" or Sargent no substitutions.

- a. Interior doors:

- 1) Closer mounted on pull side of door:
 - a) Regular: LCN 4011 REG or Sargent 281 O
 - b) Hold open: LCN 4011 H or Sargent 281 H
- 2) Closer mounted on the push side of door
 - a) Regular: LCN 4110 EDA or Sargent 281 P10
 - b) Hold open: LCN 4110 H-EDA or Sargent 281 PH10
 - c) Stop arm: LCN 4110 CUSH or Sargent 281 PS
- 3) Closer mounted on the non-door side of the frame:
 - a) Regular: LCN 4021 REG or Sargent 281 OZ

- b. Exterior doors

- 1) Closer mounted on push side of door
 - a) Regular: LCN 4021 REG or Sargent 281 OZ

- B. Unless otherwise indicated, mount closer bodies on room side (not corridor side) of doors. Refer doubtful conditions to Architect for decision.

THE FOLLOWING CLOSER/PIVOT SET CAN BE USED TO HANG AND CONTROL DOUBLE-ACTING DOORS OF WOOD, ALUMINUM OR HOLLOW METAL CONSTRUCTION. SIMPLE DOUBLE-ACTING HINGES CAN ALSO BE USED, BUT REQUIRE LARGE CLEARANCES TO WORK PROPERLY.

2.4 DOUBLE-ACTING CLOSER/PIVOT SETS

- A. Provide concealed, double-acting closer for installation in hollow metal frame, and adequately sized in accordance with manufacturer's recommendations to suit door type, size and application.
 - 1. Provide units with manufacturer's standard adjustable auxiliary stops.
 - 2. Manufacturer/Model:
 - a. LCN No. 6030. No substitutions.
- B. Accessory Hinges: Provide manufacturer's standard center pivot sets designed specifically for use with indicated closer.
 - 1. Manufacturer/Model: Ives No. 7255. No substitutions.

THE FOLLOWING IS THE UNIVERSITY STANDARD ADA DOOR OPERATOR. NOTE THE FOLLOWING:

IF A DOOR OPERATOR IS USED IN LIEU OF PHYSICAL OPERATING CLEARANCES ON THE EGRESS SIDE, IT MUST BE CONNECTED TO EMERGENCY POWER (I.E. BUILDING GENERATOR). BATTERY BACKED OPTIONS ARE NOT AVAILABLE. (NFPA 80)

ON ALL FIRE RATED DOORS, DOOR OPERATORS ARE REQUIRED TO BE CONNECTED TO THE BUILDING FIRE ALARM SYSTEM (NFPA 80). IF DOOR IS TIED TO BUILDING FIRE ALARM SYSTEM, COMMUNICATE RELATED OPERATIONAL ISSUES TO BUILDING MANAGER. COORDINATE WITH DESIGN MANAGER.

2.5 DOOR OPERATORS

- A. General: Of size recommended by manufacturer for door size, weight, and movement; for condition of exposure; and for long-term, maintenance-free operation under normal traffic load for type of occupancy indicated.
 - 1. Type: Low-energy power operated, complying with ANSI/BHMA A156.19.
 - 2. Connections: For power and control wiring.
 - 3. Adjustment Features: Fully adjustable without removing entrance doors, including
 - 4. On/Off Feature: On/off/hold-open switch controls electric power to operator.
- B. Electromechanical Operators: Self-contained overhead units, with closing speed controlled by gear train and dynamic braking action of electric motor and with manual operation and spring closing when power is off.
 - 1. Closing Mechanism: Power-assisted spring operated.
 - 2. Mounting: Surface mounted
 - 3. Manual Operation: Requires less than 15 lbf to set door in motion when power is off, according to ANSI/BHMA A156.19.
 - 4. Activation Device: Manufacturer's standard 4-inch diameter round stainless steel push-plate switch with contrasting-colored, engraved message. International symbol of accessibility and "Push to Open."

EDIT BELOW TO BE PROJECT SPECIFIC.

- C. Manufacturer/Model: LCN, Model 4642 (for push side mount) or 4631 (for pull side mount). No substitutions.

INCLUDE THE FOLLOWING FOR DOORS CONNECTED TO BUILDING FIRE ALARM SYSTEM.

- D. Provide acrylic sign adjacent to door actuator:
 - 1. Copy: "Push button disabled during fire alarm"
 - 2. Color, font, and details to match building standard room signs.

2.6 SMALL FORMAT INTERCHANGABLE CORES (SFIC)

RETAIN BELOW IF DEMOLISHING EXISTING DOORS

- A. Salvage existing cores and reinstall in new devices.

FOR CONSISTENCY AND EASE IN KEYING IN EXISTING BUILDINGS, VERIFY WHICH MANUFACTURER'S CORES ARE USED IN THAT BUILDING. SPECIFY CORES FROM SAME MANUFACTURER AND KEYWAY FOR NEW DOORS. CALL KEY OFFICE TO OBTAIN CORE TYPE AND KEYWAY INFORMATION.
- B. Provide small format 7-pin removable cores to match building standard.
 - 1. Manufacturers:
 - a. Best.
 - b. Medeco Keymark.
 - c. Schlage Everest.
- C. Provide keying in a masterkey system to be designed by Owner. Keying is the responsibility of the Contractor; and shall be performed by the cylinder supplier. Deliver keyed cores to the University of Michigan Key Office for installation by Owner. Contact the Owner's Key Office (764-3481) for questions concerning keying.

RETAIN BELOW FOR PROJECTS WITH EXTERIOR DOORS OR LARGE INTERIOR AREAS. COORDINATE WITH CM.

- D. Construction Locks: In each exterior door, provide temporary cylinders, installed simultaneously with the lock. Temporary cylinders shall remain for the duration of construction.

2.7 LOCKS AND LATCHES

- A. General:
 - 1. BHMA A156.13 (mechanical); A156.25 (electromechanical), grade 1.
 - 2. Provide mortise type, lever handle locksets equipped to receive SFIC.
 - 3. Manufacturer/Model of Locksets: Unless noted otherwise for specific function noted, provide one of the following:
 - a. Sargent 8200 Series.
 - b. Corbin Russwin ML2200 series.
 - c. Schlage L Series.

BELOW IS TYPICAL OF MANY BUILDINGS BUT NOT ALL, CONFIRM BUILDING STANDARD WITH KEY OFFICE

4. Lever style: Sargent J-style tubular lever or equivalent by or equivalent model by Schlage or Corbin Russwin
5. Rose style: 2" diameter
6. Thumbturn: For all locksets with thumb turn functionality, provide oversized ADA style thumb turns.
 - a. Sargent LB thumbturn
 - b. Schlage EZ turn: L583-363
 - c. Corbin Russwin Ergonomic Thumbturn: 707F58
7. Knurled handle: Provide on locksets to hazardous areas, including mechanical rooms, elevator machine rooms, electrical closets and substation rooms, and stairways.

B. Mechanical Locksets:

BELOW ARE EXAMPLES OF TYPICAL UNITS. VERIFY TRIM STYLE DESIRED. LNJ NOTED BELOW IS TUBULAR LEVER ARM WITH SMALL ROUND ETCHUTSION. GENRALLY, MATCH STYLES IN ADJACENT PORTIONS OF BUILDING. CONTACT A LOCKSMITH AT THE KEY OFFICE FOR INFORMATION ON EXISTING LOCK STYLES.

ANSI FUNCTION CODES LISTED BELOW IF AVAILABLE. USE CODE TO DETERMINE EQUIVALENCE BETWEEN MANUFACTURERS DURING SUBMITTAL PHASE.

- a. Office Lockset with thumb turn: ANSI function F04
 - 1) Sargent 8205.
 - 2) Schlage L9050
 - 3) Corbin Russwin ML2054

ALL CLASSROOMS SHOULD BE LOCKABLE FROM INSIDE THE ROOM AND PROVIDE VISUAL INDICATION OF DOOR STATUS ON CLASSROOM SIDE. REVIEW DESIRED FUNCTION WITH USER - SHOULD THE DOOR REVERT TO LOCKED OR REVERT TO UNLOCKED STATE AFTER IT IS OPENED?

- b. Office Locksets for Classroom use:
 - 1) Office Lockset: ANSI function F04; Schlage L9050 with locked/unlocked indicator on room side L283-711 or equivalent model by Sargent or Corbin Russwin.
 - 2) Office Lockset with Automatic unlocking: Schlage L9056 with locked/unlocked indicator on room side L283-711 or equivalent model by Sargent or Corbin Russwin.
- c. Passage Lockset: ANSI function F01
 - 1) Sargent 8215.
 - 2) Schlage L9010.
 - 3) Corbin Russwin ML2010.

THE FOLLOWING SPACES SHOULD HAVE STORE ROOM FUNCTION SETS: PHONE CLOSETS AND TELECOMMUNICATION ROOMS, MECHANICAL ROOMS, ELEVATOR MACHINE ROOMS, SUBSTATIONS AND TUNNEL DOORS.

- d. Service/Store Room Lockset: ANSI function F07
 - 1) Sargent 8204.
 - 2) Schlage L9080
 - 3) Corbin Russwin ML2057.
- e. Privacy Lockset with "Occupied" Indicator and coin turn override: Schlage L9044 with L283-722 indicator or equivalent model by Sargent or Corbin Russwin.

- C. Electromechanical Locks: Solenoid driven; mortise latchbolt; with strike that suits frame; keyed override, with request to exit and door position switches.

BELOW IS ELECTRICALLY UNLOCKED DEVICE FOR ACCESS CONTROL INSTALLATIONS - FAIL SECURE (LOCKED). MECHANICAL EGRESS ALWAYS AVAILABLE. INCLUDES REQUEST TO EXIT SWITCH (RX) AND DOOR POSITION SENSOR (DPS). COORDINATE WITH ELECTRICAL FOR RELATED WORK.

1. Electromechanical (Fail Secure): Schlage L9092 RX DPS or equivalent model by Sargent or Corbin Russwin.

- D. Digital Locksets

USE BELOW FOR ALL ANIMAL HOLDING ROOM APPLICATIONS. FOR OTHER USES, ANOTHER LOCK FUNCTION MAY BE NEEDED. PROGRAMMING IS DONE AT THE LOCKSET; SPECIAL HANDHELD PROGRAMMER/SOFTWARE IS NOT NEEDED.

1. Battery-powered, self-contained electronic locks; consisting of complete lockset, mounting hardware, SFIC, strike, and with features and accessories indicated. Provide key override, low-battery detection and warning, LED status indicators, and ability to program at the lock.

PART NUMBER BELOW IS KEYPAD ONLY WITH LEVER STYLE TO MATCH SARGENT J-STYLE LEVER.

- a. Manufacturer/Model: Schlage only; Model CO-100-MS-70-KP with TLR Tubular lever style. No substitutions.

USE BELOW FOR LSA CLASSROOM AND SOME LAB APPLICATIONS. COORDINATE FUNCTION WITH LSA REP AND CLASSROOM OPERATIONS. PROGRAMMING IS DONE AT THE DOOR VIA SOFTWARE AND HANDHELD PROGRAMMER. HAS INCREASED FUNCTIONALITY OVER CO-100 DEVICE ABOVE. VERIFY WITH USER THAT THEY HAVE THE PROGRAMMING DEVICE

2. Battery-powered, self-contained electronic locks; consisting of complete lockset, mounting hardware, SFIC, strike, and with features and accessories indicated. Provide key override, low-battery detection and warning, LED status indicators, and ability to program at the lock.

NOTE THAT SCHLAGE OFFERS BOTH CO-200 AND AD-200 LOCKSETS. THE AD LOCKSET PROVIDES FUTURE NETWORKING CAPABILITY AND IS THE CURRENT STANDARD.

PART NUMBERS BELOW INCLUDES LEVER STYLE TO MATCH SARGENT J-STYLE LEVER.

PART NUMBER BELOW IS KEYPAD ONLY

- a. Manufacturer/Model: Schlage only; Model AD-200-MS-70-KP with TLR Tubular lever style. No substitutions.

PART NUMBER BELOW IS MAG STRIPE AND KEYPAD. NOTE THAT THIS DOES NOT AUTOMATICALLY REQUIRE USERS TO USE BOTH KEYPAD AND CARD.

- b. Manufacturer/Model: Schlage only; Model AD-200-MS-70-MGK with TLR Tubular lever style. No substitutions.

2.8 STRIKES

- A. General: With each lockset, furnish companion strike as indicated, for installation on door jamb.
- B. Mechanical Strikes: Provide handed-type strike plates with curved lip; flat (non-handed) strikes are not permitted.

USUALLY RETAIN THE FOLLOWING UNLESS CERTAIN THAT EXTENDED LIPS ARE NOT REQUIRED.

- 1. Provide strike plates with extended lips where required to protect door frame and trim from being marred by latchbolt. Provide strike plates that project not more than 1/8 inch beyond door frame trim at single doors; and flush with face of doors at double (pair) door applications.
- 2. Provide custom-fabricated strike plates at existing door frames if required for compatibility with new lockset or latchset units. Fabricate units of base metal and finish specified. Provide units manufactured by Accurate Hardware Inc., or equivalent.

USE THE FOLLOWING ELECTRIC STRIKE FOR SINGLE ACCESS CONTROL DOORS THAT ARE NOT RATED. TYPICALLY KEY OFFICE PREFERS USE OF ELECTROMECHANICAL MORTISE LOCKSET OR PANIC DEVICE.

NOTE THAT ELECTRIC STRIKES REQUIRE USE OF PASSIVE INFRARED REQUEST TO EXIT DEVICE (PIR RTE). COORDINATE WITH ELECTRICAL.

- C. Electric Strikes: Provide electric door strikes of the appropriate model for the associated door's lock.
 - 1. Manufacturer/Models:
 - a. Von Duprin, 6000 series (6112 or 6215).
 - b. HES, 1006, 9600, and 9400 series.

BELOW FOR LOW FREQUENCY CLOSET DOORS ONLY.

2.9 LATCHES

- A. Touch latches: Latch unit consists of concealed, integral latching mechanism and spring that releases and springs door into open position when face of door is pushed.
 - 1. Manufacturer/Model: Ives No. CL12, complete with related strike.
- B. Roller latches: Forged bronze roller latches with rubber roller. Furnish units designed to be mortised into door, and with adjusting screws on face of latch. With each roller latch, furnish companion strike for installation on jamb.
 - 1. Manufacturer/Model: Ives model no. RL30, or equivalent products of Rockwood or Door Controls International.

2.10 STOPS

- A. Provide rubber exposed resilient parts; size and mount units to comply with manufacturer's recommendations for the exposure condition. Reinforce the substrate as recommended.

SELECT ONE OF THE FOLLOWING.

1. Color of Resilient Parts: Black.
2. Color of Resilient Parts: Gray.
3. Manufacturer/Model: Rockwood model indicated, or equivalent products of Brookline, Builder's Brass Works, Ives, Stanley, Door Controls International.

SELECT ONE OF THE FOLLOWING TO SUIT PROJECT AND SUBSTRATE.

- a. Model No.: 442 (floor mounted).
- b. Model No.: 440 (floor mounted, limited door bottom clearance).
- c. Model No.: 409 (wall mounted, hollow wall expansion anchor).
- d. Model No.: 410 (wall mounted, plastic).
- e. Model No.: 411 (wall mounted, expansion shield).

CONSIDER BELOW FOR APPLICATIONS WHERE FIXED STOP IS IMPRACTICAL. TYPICALLY RETAIN FOR HOSPITAL PROJECTS.

VERIFY THAT STOP IS COMPATIBLE WITH CLOSER SPECIFIED. NOTE THAT INTEGRAL STOPS ARE AN OPTION FOR SOME CLOSERS.

B. Concealed overhead door stops: BHMA A156.8

1. Manufacturers/Models:
 - a. Glynn-Johnson 410 series.
 - b. Rixson 6 series.
 - c. Rockwood 14000 series.

2.11 SILENCERS

A. Provide manufacturer's standard profile silencers of 1/8-inch thick hard rubber for metal door frames as follows:

1. Manufacturer: Ives or Rockwood.

2.12 PUSH/PULL SET

A. Provide pull handles and push plates with concealed mounting fasteners wherever possible, and as follows:

SELECT BELOW AS APPROPRIATE TO PROJECT.

1. Material: Solid stainless steel.
2. Material: Solid brass.
3. Material: Solid nylon plastic.

SELECT ONE FINISH BELOW.

4. Finish: Satin.
5. Finish: Polished.
6. Finish: Gloss.

SELECT ONE COLOR OPTION BELOW.

7. Color: Clear and transparent.
8. Color: INSERT COLOR
9. Manufacturers:
 - a. Rockwood models indicated.
 - b. Baldwin.
 - c. Brookline.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

087100 - 11

- d. Builder's Brass Works.
- e. Corbin Russwin.
- f. Ives
- g. Stanley.

BELOW ARE EXAMPLE ONLY, NOT UM STANDARDS

- 10. Model numbers:
 - a. Push Plates: Rockwood; No. 71 (6 inches by 15 inches)
 - b. Pull: Rockwood; No. 112 (13 inches by 1 inch diameter).
 - c. Pull: No. 71 (6 inches by 15 inches) base plate.

EXIT DEVICES BELOW ARE TOUCH PAD STYLE FOR STEEL AND WOOD DOORS ONLY. DEVICES LISTED MAY NOT BE APPROPRIATE FOR ALUMINUM DOORS. REVIEW MANUFACTURER CATALOGS PRIOR TO SELECTION. TUBULAR STYLE DEVICES ARE ALSO ACCEPTABLE (VONDUPRIN 55/88 SERIES).

FOR ACCESS CONTROL APPLICATIONS, TYPICALLY SPECIFY VON DUPRIN QEL TYPE DEVICES OR EQUIVALENT FROM SARGENT. QEL DEVICES OBTAIN POWER FROM POWER SUPPLIES AT THE ACCESS CONTROL PANEL ASSEMBLIES AND DO NOT NEED LOCAL POWER SUPPLIES.

2.13 EXIT DEVICE (PANIC SET)

EXIT DEVICES LISTED BELOW ARE APPROVED BY PLANT DEPARTMENT. USE RIM TYPE DEVICES EXCEPT AT MULLIONLESS DOUBLE DOOR OPENINGS.

APPLICATION: SINGLE DOOR OR DOUBLE DOOR WITH MULLION, WOOD OR STEEL, NON-FIRE-RATED.

- A. Non-Fire-Rated Rim Type Exit Device: Rim type units activated by a partial-width touch-bar, complete with accessories, including strike and hex-key operated dogging device mounted on mechanism housing to hold the touch-bar depressed and the latch bolt in the open position.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE KEY CYLINDER RETRACTING LATCH BOLT, AND WITH OPTIONAL PULL HANDLE. POSSIBLE USE IN PUBLIC BUILDING ENTRANCE AND SECURE CORRIDOR-TO-ROOM ENTRANCE.

- a. Manufacturer/Model of Exit Devices: Von Duprin model 98NL with 990NL-R trim; or equivalent products of Sargent only.

BELOW IS UNIT WITH NO OUTSIDE CYLINDER, BUT WITH PULL HANDLE. POSSIBLE USE IN SERIES OF MULLIONED OPENINGS WHERE ANOTHER DOOR HAS CYLINDER FOR ENTRY.

- b. Manufacturer/Model of Exit Devices: Von Duprin model 98DT with 990DT trim; or equivalent products of Sargent only.

BELOW IS UNIT WITH NO OUTSIDE CYLINDER AND NO PULL HANDLE. POSSIBLE USE IN SECURED EXIT ONLY FOR BUILDING.

- c. Manufacturer/Model of Exit Devices: Von Duprin model 98EO; or equivalent products of Sargent only.

BELOW IS UNIT WITH OUTSIDE CYLINDER. PULL HANDLE MUST BE SPECIFIED SEPARATELY (OPTIONAL VON DUPRIN OR HEWI, FOR EXAMPLE). USE SIMILAR TO FIRST EXAMPLE ABOVE.

- d. Manufacturer/Model of Exit Devices: Von Duprin model 98NL-OP with 110NL trim; or equivalent products of Sargent only.

BELOW IS ELECTROMECHANICAL UNIT WITH OUTSIDE CYLINDER AND RIGID LEVER TRIM. OTHER OPTIONS ARE AVAILABLE. NOTE THAT THIS DEVICE CANNOT BE USED FOR FIRE RATED DOORS. SELECT 98 SERIES E-TYPE DEVICE.

- 2. Electromechanical exit device
 - a. Manufacturer/Model of Exit Devices:
 - 1) Von Duprin model 35A series as follows:
 - a) QEL latch retraction
 - b) Less dogging
 - c) Request to exit switch
 - d) Dummy trim 03 lever trim.
 - 2) Equivalent products of Sargent only.

APPLICATION: SINGLE DOOR OR DOUBLE DOOR WITH MULLION, WOOD OR STEEL, FIRE-RATED.

- B. Fire-Rated Rim Type Exit Device: Fire-rated, UL listed, rim type units activated by a partial-width touch-bar, complete with accessories including strike.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE CYLINDER RETRACTING LATCH BOLT, AND WITH OPTIONAL (RIGID) LEVER HANDLE. POSSIBLE USE IN ELECTRICAL SUBSTATIONS.

- a. Manufacturer/Model of Exit Devices: Von Duprin model 98NL-F, 992L-rigid trim, and optional no. 03 lever; or equivalent products of Sargent only.

BELOW IS UNIT WITH DOUBLE CYLINDER. POSSIBLE USE IN RATED, SECURED, CORRIDOR-TO-ROOM ENTRANCE.

- b. Manufacturer/Model of Exit Devices: Von Duprin model 98L-F, 992L-double cylinder function trim and standard no. 06 lever; or equivalent products of Sargent only.

BELOW IS UNIT WITH NO OUTSIDE CYLINDER. POSSIBLE USE IN STAIR DOOR APPLICATIONS.

- c. Manufacturer/Model of Exit Devices: Von Duprin model 98L-F-BE, 992L-R with optional no. 03 lever; or equivalent products of Sargent only.

APPLICATION: DOUBLE DOORS WITHOUT MULLION, WOOD OR STEEL, NON-FIRE-RATED.

- C. Non-Fire-Rated Surface Mounted Vertical Rod Type Exit Device: Surface mounted, vertical rod type units activated by a partial-width touch-bar, complete with accessories including strike. Equip units with hex-key operated dogging device mounted on mechanism housing to hold the touch-bar depressed and the latch bolt in the open position. Omit bottom rods unless otherwise indicated.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE CYLINDER RETRACTING LATCH BOLT (NIGHT LATCH FUNCTION) AND STANDARD PULL HANDLE. LIMIT USE TO MECHANICAL, ELECTRICAL OR SIMILAR SERVICE ROOMS THAT CAN ACCEPT NIGHT-LATCH FUNCTION - OTHERWISE USE MORTISE TYPE DEVICE WITH DOUBLE CYLINDER (SEE SUBSEQUENT PARA BELOW). USE IN CONJUNCTION BLANK ESCUTCHEON FUNCTION DEVICE BELOW ON OTHER DOOR OF PAIR.

- a. Manufacturer/Model of Exit Devices: Von Duprin model 9827NL, 990NL-V trim; or equivalent products of Sargent only.

BELOW IS UNIT WITH BLANK ESCUTCHEON AND STANDARD PULL HANDLE. USE IN CONJUNCTION WITH NIGHT LATCH FUNCTION UNIT ABOVE.

- b. Manufacturer/Model of Exit Devices: Von Duprin model 9872NL-BE, 990NL-V trim; or equivalent products of Sargent only.

BELOW IS UNIT WITH BLANK ESCUTCHEON AND OPTIONAL LEVER HANDLE. USE IN CONJUNCTION WITH NON-FIRE-RATED MORTISE UNIT (SEE SUBSEQUENT PARA BELOW).

- c. Manufacturer/Model of Exit Devices: Von Duprin model 9827L-BE, 992L-rigid trim; or equivalent products of Sargent only.

APPLICATION: DOUBLE DOORS WITHOUT MULLION, WOOD OR STEEL, FIRE-RATED.

- D. Fire-Rated Surface Mounted Vertical Rod Type Exit Device: Fire-rated, UL listed, surface mounted, vertical rod type units activated by a partial-width touch-bar, complete with accessories including strike.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE CYLINDER RETRACTING LATCH BOLT, AND WITH OPTIONAL (RIGID) LEVER HANDLE (PULL COULD ALSO BE USED - SPEC 9827NL-F). LIMIT USE TO MECHANICAL, ELECTRICAL OR SIMILAR SERVICE ROOMS THAT CAN ACCEPT NIGHT-LATCH FUNCTION - OTHERWISE USE MORTISE TYPE DEVICE WITH DOUBLE CYLINDER (SEE SUBSEQUENT PARA BELOW). USE IN CONJUNCTION WITH EXIT ONLY FUNCTION DEVICE (9827EO-F) ON OTHER DOOR OF PAIR.

- a. Manufacturer/Model of Exit Devices: Von Duprin model 9827L-F, 992L-rigid trim with optional no. 03 lever; or equivalent products of Sargent only.

BELOW IS UNIT WITH NO OUTSIDE TRIM FOR EXIT ONLY. USE THIS UNIT IN CONJUNCTION WITH EITHER VERTICAL SURFACE ROD DEVICE IMMEDIATELY ABOVE OR MORTISE UNIT WITH DOUBLE CYLINDER DESCRIBED IN SUBSEQUENT PARA BELOW.

- b. Manufacturer/Model of Exit Devices: Von Duprin model 9827EO-F; or equivalent products of Sargent only.

APPLICATION: DOUBLE DOORS WITHOUT MULLION, WOOD OR STEEL, NON-FIRE-RATED. THE ONLY SANCTIONED USE OF THE MORTISE DEVICE BELOW IS IN A MULLIONLESS OPENING AS PART OF A PAIR, WITH THE OTHER DEVICE A VERTICAL SURFACE ROD TYPE.

- E. Non-Fire-Rated Mortise Type Exit Device: Surface mounted, vertical rod type units activated by a partial-width touch-bar, complete with accessories including strike. Equip units with hex-key operated dogging device mounted on mechanism housing to hold the touch-bar depressed and the latch bolt in the open position. Omit bottom rods unless otherwise indicated.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE CYLINDER RETRACTING LATCH BOLT, AND WITH OPTIONAL DOUBLE CYLINDER INSTALLED INSIDE ON LATCH HEAD. THIS COMBINATION IMPROVES LOCKING FUNCTION FLEXIBIITY AND IS PREFERRED BY PLANT. USE AS ONE OF A PAIR IN A MULLIONLESS OPENING, WITH THE OTHER DOOR EQUIPPED WITH DEVICE HAVING VERTICAL SURFACE RODS AND BLANK ESCUTCHEON FUNCTION INDICATED IN NON-FIRE-RATED DEVICE PARA ABOVE (9827NL-BE OR 9872L-BE).

- a. Manufacturer/Model of Exit Devices: Von Duprin model 9875L, 992L-M-double cylinder trim, and with optional no. 03 lever; or equivalent products of Sargent only.

BELOW IS UNIT SAME AS ABOVE, EXCEPT FOR APPLICATIONS THAT DO NOT REQUIRE SECURED (LOCKABLE) DOORS. USE AS ONE OF A PAIR IN A MULLIONLESS OPENING, WITH THE OTHER DOOR EQUIPPED WITH DEVICE HAVING VERTICAL SURFACE RODS AND BLANK ESCUTCHEON FUNCTION INDICATED ABOVE (9827NL-BE OR 9872L-BE).

- b. Manufacturer/Model of Exit Devices: Von Duprin model 9875L-F-BE, and with optional no. 03 lever; or equivalent products of Sargent only.

APPLICATION: DOUBLE DOORS WITHOUT MULLION, WOOD OR STEEL, FIRE-RATED. THE ONLY SANCTIONED USE OF THE MORTISE DEVICE BELOW IS IN A MULLIONLESS OPENING AS PART OF A PAIR, WITH THE OTHER DEVICE A VERTICAL SURFACE ROD TYPE. WHERE THE SELECTIONS INDICATED WOULD INTERFERE WITH TWO-WAY CORRIDOR TRAFFIC, AND A MULLIONED OPENING CANNOT BE SUBSTITUTED, CONSIDER PROVIDING ELECTRIC HOLD-OPEN DEVICES.

- F. Fire-Rated Mortise Type Exit Device: Fire-rated, UL listed, mortise type units activated by a partial-width touch-bar, complete with accessories including strike.

IT IS STRONGLY RECOMMENDED THAT YOU SELECT APPROPRIATE UNITS AND TRIM FROM CATALOG. USE CHOICES BELOW ONLY FOR VERY SIMPLE PROJECTS.

BELOW IS UNIT WITH OUTSIDE CYLINDER RETRACTING LATCH BOLT, AND WITH OPTIONAL DOUBLE CYLINDER INSTALLED INSIDE ON LATCH HEAD. THIS COMBINATION IMPROVES LOCKING FUNCTION FLEXIBIITY AND IS PREFERRED BY PLANT. USE AS ONE OF A PAIR IN A MULLIONLESS OPENING, WITH THE OTHER DOOR EQUIPPED WITH DEVICE HAVING VERTICAL SURFACE RODS AND EXIT-ONLY FUNCTION (9827EO-F).

- a. Manufacturer/Model of Exit Devices: Von Duprin model 9875L-F, 992L-M-double cylinder trim, and with optional no. 03 lever; or equivalent products of Sargent only.

BELOW IS UNIT SAME AS ABOVE, EXCEPT FOR APPLICATIONS THAT DO NOT REQUIRE SECURED (LOCKABLE) DOORS. USE AS ONE OF A PAIR IN A MULLIONLESS OPENING, WITH THE OTHER DOOR EQUIPPED WITH DEVICE HAVING VERTICAL SURFACE RODS AND EXIT-ONLY FUNCTION (9827EO-F).

- b. Manufacturer/Model of Exit Devices: Von Duprin model 9875L-F-BE, 992L-M trim and with optional no. 03 lever; or equivalent products of Sargent only.

2.14 ASTRAGALS

- A. Manufacturer/Model of Astragals: EXAMPLE Pemko; No. 357SP, or equivalent products of National Guard, Reese, Zero.

2.15 FLUSH BOLTS

DO NOT EDIT WITHOUT PRODUCT CATALOG.

- A. Manual Flush Bolts: Mortise units, UL listed and rated for indicated application, with spring loaded snap action levers for manual operation.

USE BELOW ON RATED DOORS WHERE INACTIVE LEAF NOT REQUIRED FOR EGRESS.

1. Manufacturer/Model of Manual Flush Bolts: Provide Ives model numbers indicated or equivalent products of Rockwood or Door Controls International, as follows:

DELETE INAPPROPRIATE TYPES BELOW.

- a. Metal Doors: FB458, both top and bottom bolts.
b. Wood Doors: FB358, both top and bottom bolts.

SELECT ONE OF THE FOLLOWING.

- c. Dust Proof Strike: DP1 (threshold mounting).
d. Dust Proof Strike: DP2 (floor or threshold mounting).

USE BELOW FOR EASIER OPERATION AND WHERE INACTIVE LEAF IS NOT REQUIRED FOR EGRESS.

B. Constant Latching Flush Bolts: Mortise units, UL listed and rated for indicated application, with automatically retracting bottom bolt, and manually released top bolt when active leaf is opened.

1. Manufacturer/Model of Constant Latching Flush Bolts: Provide Ives model numbers indicated or equivalent products of Rockwood or Door Controls International, as follows:

DELETE INAPPROPRIATE TYPES BELOW.

- a. Metal Doors: FB51P (includes both top and bottom bolts).
- b. Wood Doors: FB61P (includes both top and bottom bolts).

SELECT ONE OF THE FOLLOWING

- c. Dust Proof Strike: DP1 (threshold mounting).
- d. Dust Proof Strike: DP2 (floor or threshold mounting).

USE BELOW WHERE INACTIVE LEAF IS REQUIRED FOR EGRESS.

C. Automatic Flush Bolts: Mortise units, UL listed and rated for indicated application, automatically retracting when active leaf is opened.

1. Manufacturer/Model of Automatic Flush Bolts: Provide Ives model numbers indicated or equivalent products of Rockwood or Door Controls International, as follows:

DELETE INAPPROPRIATE TYPES BELOW.

- a. Metal Doors: FB31P, (includes both top and bottom bolts).
- b. Wood Doors: FB41P, (includes both top and bottom bolts).

SELECT ONE OF THE FOLLOWING.

- c. Dust Proof Strike: DP1 (threshold mounting).
- d. Dust Proof Strike: DP2 (floor or threshold mounting).

2.16 COORDINATOR

DO NOT EDIT WITHOUT PRODUCT CATALOG.

A. Device coordinating pair of doors with astragals ensuring proper closing sequence. Provide coordinators complete with carry-bar and UL listed and rated for indicated application.

1. Manufacturer/Model of Coordinator: Ives model numbers indicated, or equivalent products of Rockwood or Door Controls International, as follows:

MODEL NUMBERS BELOW ARE FOR TYPICAL APPLICATIONS. CONSULT PRODUCT CATALOG FOR SIZES NOT LISTED BELOW.

USE BELOW FOR PAIR OF 2'-6" DOORS IN 5'-0" OPENING OR UNEQUAL PAIR OF DOORS IN 4'-0" OPENING (3'-0" ACTIVE LEAF WITH 1'-0" INACTIVE LEAF).

- a. Model: COR-42.

USE BELOW FOR PAIR OF 3'-0" DOORS IN 6'-0" OPENING.

- b. Model: COR-52.

USE BELOW FOR PAIR OF 3'-6" DOORS IN 7'-0" OPENING.

- c. Model: COR-60.

2.17 TRIM PROTECTOR BARS

- A. Provide type 304 stainless steel bent bar shape fabricated of 3/8-inch thick, 1-1/2-inch wide stock. Fabricate units 12-inches long overall with 4-inch long straight section for under-lever mounting.

MOST COMMON UNITS LISTED BELOW - OTHER SHAPES AND MOUNTING CONDITIONS ARE AVAILABLE.

- 1. Manufacturer/Model of Trim Protector Bars: Subject to compliance with requirements provide the following:
 - a. Solid Core Wood Doors: R110LPB; Rockwood Products Incorporated.
 - b. Hollow Metal Doors: R111LPB; Rockwood Products Incorporated.
 - c. Hollow Core Wood Doors: R112LPB; Rockwood Products Incorporated.

2.18 KICKPLATES

- A. Provide solid metal units as follows:

SELECT ONE MATERIAL BELOW.

- 1. Material: Stainless steel.
- 2. Material: Brass satin.

SELECT ONE FINISH BELOW.

- 3. Finish: Polished.
- 4. Finish: Satin.
- 5. Size: 1 1/2 inches less than door width on push side, 1/2 inch less than door width on pull side, by 8 inches high, by 0.050-inch thick.
- 6. Manufacturer/Model of Kickplates: EXAMPLE Rockwood K1050 series, 8 inches high or equivalent by any BHMA member.

THE FOLLOWING PRODUCT IS NOT UL LISTED FOR FIRE RATED DOORS.

- B. Provide non-colored, transparent acrylic plastic units as follows:

- 1. Size: 1 1/2 inches less than door width on push side, 1/2 inch less than door width on pull side, by 8 inches high, by 1/4 inch thickness.
- 2. Manufacturer/Model of Kickplates: EXAMPLE Rockwood K4125, 8 inches high or equivalent products by any BHMA member.

2.19 SWEEP SEALS

- A. Provide manufacturer's standard weatherstripping of type, size and profile indicated, continuous at bottom edges of each indicated door. Provide non-corrosive fasteners.

SUFFIX BELOW IS FOR CLEAR ANODIZED ALUMINUM FINISH. CHANGE SUFFIX TO "D" FOR DARK BRONZE ANODIZED ALUMINUM.

1. Manufacturer/Model Sweep Seals: EXAMPLE Pemko; No. 18062CNB, or equivalent products by any BHMA member.

2.20 JAMB SEALS

BELOW FOR STANDARD LIGHT-TIGHT DOORS - CONSIDER INCLUDING THRESHOLD FOR ADDITIONAL LIGHT-TIGHTNESS.

- A. Provide manufacturer's standard weatherstripping of type, size and profile indicated, continuous at head and jamb edges of each indicated door opening. Provide non-corrosive fasteners.

"CR" SUFFIX BELOW IS FOR CLEAR ANODIZED ALUMINUM FINISH. CHANGE TO "DR" SUFFIX FOR DARK BRONZE ANODIZED ALUMINUM.

1. Manufacturer/Model Jamb Seals: EXAMPLE Pemko; No. 315CR, or equivalent products by any BHMA member.

BELOW FOR SOUND-PROOFING - CONSIDER INCLUDING THRESHOLD TO ASSIST SOUND-PROOFING.

- B. Provide manufacturer's standard sound attenuating jamb and head seals of type, size, and profile indicated, continuous at head and jamb edges of scheduled door openings. Provide units with noncorrosive fasteners.

1. Manufacturer/Model: Pemko No. 350 CSR, or equivalent products by any BHMA member.

2.21 AUTOMATIC DOOR BOTTOM

NOTE THAT AUTOMATIC DOOR BOTTOMS CAN INCREASE DOOR OPENING FORCE REQUIREMENTS AND IMPEDE LATCHING IF NOT PROPERLY ADJUSTED. USE ONLY WHEN REQUIRED FOR SOUND ATTENUATION, RODENT ROOMS AND OTHER SPECIFIC APPLICATIONS. TYPICALLY, LIGHT SEALS CAN BE SATISFACTORILY ACCOMPLISHED USING A SWEEP SEAL/THRESHOLD COMBINATION. AVOID SPECIFYING FULLY MORTISED UNITS (DIFFICULT TO MAINTAIN) AND SURFACE MOUNTED UNITS (NOT ADA COMPLIANT)

- A. Provide manufacturer's standard units of type, size and profile indicated, continuous at bottom of indicated door opening. Provide non-corrosive fasteners.

BELOW IS NON-HANDED SEMI-MORTISED UNIT WITH SPONGE NEOPRENE SEAL. BE SURE TO INCLUDE LOW PROFILE THRESHOLD WHEN SPECIFYING A DOOR BOTTOM OVER CARPET.

"C" SUFFIX BELOW IS FOR CLEAR ANODIZED ALUMINUM FINISH. CHANGE TO "D" SUFFIX FOR DARK BRONZE ANODIZED ALUMINUM.

1. Manufacturer/Model Automatic Door Bottoms: EXAMPLE Semi-mortised Pemko; No. 4301CRL, or equivalent products by any BHMA member.

2.22 ELECTRICALLY ACTIVATED MAGNETIC HOLD-OPEN DEVICE

COORDINATE THIS EQUIPMENT WITH ELECTRICAL ENGINEER. ELECTRICAL SHEETS SHOULD SHOW WIRING, CONDUIT AND BOXES REQUIRED FOR AUTOMATIC HOLD-OPEN DEVICES.

A. Provide units consisting of a silently-operating wall-mounted electromagnet in electrical box with cover plate and door-mounted contact plate. Provide contact plate with swivel adjustment that adjusts to door contact angle indicated on drawings. Provide units that UL and FM listed.

- 1. Minimum holding force: 25 lbs.
- 2. Operating Voltage: 24 V. AC.
- 3. Finish: Brushed zinc on all visible components.

SELECT ONE OF THE FOLLOWING.

- 4. Manufacturer/Model:
 - a. Surface-mounted: LCN model SEM7830, Sargent 1560, Rixson 900 series.
 - b. Flush-mounted: LCN model SEM7840, Sargent 1561, Rixson 900 series.

2.23 THRESHOLDS

A. Provide manufacturer's standard, extruded, anodized aluminum units of type, size, and profile indicated, and complying with applicable portions of the Americans with Disabilities Act (ADA). Provide units continuous across bottom of door openings. Provide noncorrosive fasteners.

MODEL NUMBER BELOW IS FOR A LATCHING PANIC THRESHOLD. LATCHING PANIC THRESHOLDS ARE DESIGNED TO WORK IN CONJUNCTION WITH SURFACE APPLIED VERTICAL ROD EXIT DEVICES. THEY ARE ALSO USED TO PROVIDE A DOOR STOP AND SEAL AT THE BOTTOM OF THE DOOR FOR LIGHT AND SOUND ATTENUATION.

CONSULT MANUFACTURER'S CATALOG FOR OTHER APPLICATIONS: CHANGE IN FLOOR LEVEL, THERMAL BARRIER, ETC

- 1. Manufacturer/Model: Pemko No. 2005AT, or equivalent products by any BHMA member.

MODEL NUMBER BELOW IS A LOW PROFILE THRESHOLD FOR USE WITH AN AUTOMATIC DOOR BOTTOM OVER CARPET.

- 2. Manufacturer/Model: Pemko No. 2364A, or equivalent products by any BHMA member.

CONSIDER REMOVABLE MULLIONS BELOW WHERE FIXED MULLIONS CANNOT BE PROVIDED. COORDINATE WITH ALUMINUM ENTRANCES AND STOREFRONTS SECTION.

2.24 REMOVABLE MULLION

BELOW IS NON-KEYED REMOAVABLE MULLION FOR ALUMINUM ENTRANCES. MODEL LISTED IS NOT COMPATIBLE WITH ELECTRIC STRIKES.

- A. Aluminum mullion: Provide removable mullion with weatherstripping, stabilizer set, and indicated door strikes.

SELECT FINISH. DARK BRONZE ANODIZED IS TYPICALLY APPLICABLE TO ALUMINUM ENTRANCES.

1. Finish: 313AN dark bronze anodized.
2. Manufacturer/Model:

BELOW IS NON-RATED DEVICE

- a. Von Duprin 5654, with weatherstripping and 154 stabilizer set or equivalent by Sargent.

BELOW IS KEYED ROBUST MULLION FOR HIGH TRAFFIC OPENINGS. IT DOES NOT HAVE WEATHERSTRIPPING FOR INFILTRATION/NOISE REDUCTION.

- B. Galvanized steel mullion: Provide units with keyed mechanism for quick removal of mullion; mortised cylinder equipped with space for building standard 7-pin SFIC. Unit shall self-lock upon reinstallation.

SELECT FINISH. DARK BRONZE COLOR AND FLUOROPOLYMER IS APPLICABLE TO ALUMINUM ENTRANCES

1. Finish: SP313 dark bronze painted finish.
2. Finish: Two-coat fluoropolymer finish as selected by Architect to match framing.
3. Manufacturer/Model:

BELOW IS NON-RATED DEVICE

- a. Von Duprin KR4954, with 154 stabilizer set or equivalent by Sargent.

BELOW IS RATED DEVICE. NOTE THAT THIS MULLION IS NOT EASILY REMOVED.

- b. Von Duprin KR9954, with 154 stabilizer set or equivalent by Sargent.

2.25 CONCEALED POWER TRANSFER

INCLUDE BELOW TO TRANSFER POWER FROM FRAME TO DOOR FOR DOORS WITH ELECTRIFIED MORTISE LOCKSET OR EXIT DEVICE. ELECTRIFIED HINGES ARE TYPICALLY NOT USED. COORDINATE WITH ELECTRICAL ENGINEER.

NOTE THAT EPT WILL VOID RATING OF EXISTING RATED DOOR / FRAME ASSEMBLY. IF RATING IS REQUIRED, SHOULD BE SPECIFIED WITH NEW DOORS AND FRAMES ONLY.

- A. Provide mortised electric power transfer device that is completely concealed when the door is in the closed position. Device shall be equipped with sufficient number and gage of conductors to accommodate function for hardware specified.

1. Manufacturer/Model:
Securitron EPT
Von Duprin EPT
- B. Armored door cords, electric hinges and other power transfer devices are not permitted.

2.26 WIRING HARNESS

INCLUDE BELOW TO CONNECT POWER FROM CONCEALED POWER TRANSFER TO ELECTROMECHANICAL LOCKSET.

- A. Provide manufacturer's quick connect wiring harness between concealed power transfer and electromechanical locking device. Harness shall have connectors on the lockset end, crimped pins on the other. Size harness as needed for door.
 1. Manufacturer/Model:
Allegion Connect

2.27 DOOR POSITION SWITCH

TYPICALLY DELETE BELOW - SPECIFIED IN DIV 28 ACCESS CONTROL SPEC. COORDINATE WITH ELECTRICAL.

- A. Provide low voltage recessed position sensor with ABS plastic enclosure.
 1. Manufacturer/Model: UTC Interlogix 1078 Series only.

2.28 FINISHES

- A. Provide finishes complying with BHMA A156.18 as follows.

SELECT FINISHES FROM LIST BELOW, OR REVISE TO SUIT PROJECT. GENERALLY MATCH HARDWARE FINISH OF ADJACENT WORK IN BUILDING. CONTACT A LOCKSMITH AT THE KEY OFFICE WITH QUESTIONS REGARDING SPECIFIC FINISH FOR EACH BUILDING.

1. US 10 (satin bronze).
 2. US 10B (oil rubbed bronze)
 3. US 26D (dull chrome).
 4. US 32D (satin stainless).
- B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
 - C. Appearance of Finished Work: Noticeable variations in the same piece are not acceptable.
 - D. Standards: Where base material and quality of finish are not otherwise specified, comply with ANSI A 156 series standards applicable to each particular type of hardware.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install each hardware item to comply with manufacturer's printed installation instructions and recommendations for application indicated, unless otherwise indicated by referenced standard or by provisions of this Section.
- B. Hardware Mounting Heights: Door and Hardware Institute "Recommended Locations for Builder's Hardware for Custom Steel Doors and Frames".

DELETE THE FOLLOWING IF NO NEW HARDWARE INSTALLED ON EXISTING DOORS OR ON NEW DOORS IN EXISTING FRAMES.

- C. Hardware at Existing Doors and Frames:
 - 1. Match existing hardware preparation heights on door or frame to be reused.

DELETE THE FOLLOWING PARA AND SUBPARAS IF NEW LOCKSETS OR LATCHSETS ARE NOT INSTALLED IN CONJUNCTION WITH EXISTING FRAMES.

- 2. Where new locksets are indicated to be installed at openings with an existing door frame, verify the compatibility of the existing strike plate and cut-out locations with the new hardware.
 - a. Where no existing strike exists, or where the new lockset cannot be located at a height matching the existing strike, cut out metal frames and provide new insert tabs, or rout out wood frames, as required to fully mortise the new strike plate.

DELETE SUBPARA ABOVE OR BELOW IF NOT APPLICABLE TO PROJECT.

- b. Where an existing strike plate and cut-out is not of suitable size or configuration to ensure proper operation of the lockset, including protection of frame finish, modify or replace strike plate, as practicable. Where new strike plates are required, modify frame as required for a fully mortised installation and install custom-fabricated replacement strike plates to accurately fit within existing mortise cut-outs.
- D. Sound-Attenuating Seals and other Acoustic Barrier Components: Install complete length of door edges, with tight joints to components on adjacent door edges. No gaps at any point around the door perimeter are allowed. Coordinate closer selection and installation (if applicable) to ensure compatibility with seals.
- E. Silencers: Install silencers as follows:
 - 1. Single Door Frames: Install three, equally spaced silencers on the latch jamb of new hollow metal door frames.

DELETE ABOVE AND BELOW TO SUIT PROJECT.

- 2. Double Door Frames: Install two silencers on the head of each new hollow metal double door frame.

DELETE BELOW IF NOT APPLICABLE, OR MODIFY TO SUIT PROJECT CONDITIONS.

3. Existing Door Frames: Where new doors are scheduled to be installed in new frames, or where new hardware is scheduled to be installed on existing doors, inspect existing silencers and replace damaged and defective units.

ALWAYS INCLUDE BELOW FOR PROJECTS WITH ACCESS CONTROL AND EXIT DEVICES.

F. Coordination with access control installation:

1. Electrified exit devices:

INCLUDE BELOW FOR RETROFIT APPLICATIONS ONLY

- a. Coordinate installation of electrified exit devices / electrification kits with access control system installation such that system is immediately ready to support electrified locking / unlocking of the device.

RETAIN BELOW IF ADDING ACCESS CONTROL TO EXISTING DOORS WITH EXIT DEVICES.

2. Exit device dogging:
 - a. Remove dogging capability and provide replacement cover plate on existing door hardware added to access control system.

INCLUDE BELOW FOR PROJECTS WITH ACCESS CONTROL.

3.2 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 1 Section titled Commissioning and other requirements of the Contract Documents.

3.3 ADJUSTING

- A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended.

EDIT BELOW TO SUIT PROJECT REQUIREMENTS.

1. Electric Strikes: Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.
2. Door Closers: Adjust sweep period and operating force to comply with accessibility requirements and ensure proper door function.

NOT REQUIRED FOR MOST SMALL PROJECTS. REVIEW WITH KEY OFFICE, CLIENT AND CM IF RETAINED TO ENSURE ENFORCEMENT.

- B. Post occupancy adjustment: Return to project one month after Owner's occupancy, and adjust hardware to proper operation and function. Instruct Owner's personnel in proper maintenance and adjustment.

3.4 **HARDWARE SET SCHEDULE**

EXAMPLES FOLLOW, REVISE TO SUIT PROJECT.

- A. Set No. 1:
Office Lockset
Butt Hinges (1-1/2 pr.)
Closer
Stop
- B. Set No. 2:
Office Lockset with automatic unlocking
Butt Hinges (1-1/2 pr.)
Stop
Kickplate
- C. Set No. 3:
Active Leaf
Classroom Lockset
Butt Hinges (1-1/2 pr.)
Closer
Stop
Astragal
Kickplate
Inactive Leaf
Automatic Flush Bolts (1 pr.)
Butt Hinges (1 1/2 pr)
Closer
Stop
Kickplate

SPECIFICATION DIVISION 8

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 088000 - GLAZING

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 088000 - GLAZING

UPDATED TO INCORPORATE CURRENT MANUFACTURERS AND CURRENT CODES, INCLUDING ENERGY CODES.

USE THIS SECTION FOR EXTERIOR APPLICATIONS. INTERIOR GLAZING IS COVERED IN ANOTHER DIVISION 08 SECTION. THIS SECTION DOES NOT INCLUDE SLOPED GLAZING. ADD IF NEEDED FOR PROJECT.

THIS SECTION WILL ALMOST ALWAYS BE ACCOMPANIED BY SECTIONS 084113, 085113, AND/OR 084413. EDIT THIS SECTION AFTER THE OTHER SECTIONS ARE SUBSTANTIALLY COMPLETE. NOTE THAT THERMAL PERFORMANCE VALUES (U-VALUE AND SOLAR HEAT GAIN COEFFICIENT) ARE SPECIFIED IN THESE OTHER SECTIONS BECAUSE ASHRAE 90.1 REQUIRES THE VALUES TO BE FOR THE ENTIRE ASSEMBLY, NOT JUST FOR CENTER-OF-GLASS.

FOR PROJECTS LIMITED TO REPLACEMENT OF GLASS, SEE EDITOR'S NOTES IN PART 2.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:
 - 1. Division 07 Section "Joint Sealants".
 - 2. Division 08 Section "Aluminum-Framed Entrances & Storefronts"
 - 3. Division 08 Section "Aluminum Windows".
 - 4. Division 08 Section "Glazed Aluminum Curtain Walls".

1.2 SUMMARY

- A. Section Includes: Glass and glazing work for both field and pre-glazed units for the following types:

MODIFY LISTING BELOW TO SUIT PROJECT.

- 1. Window units.
- 2. Glazed curtain wall.
- 3. Storefront framing.
- 4. Entrances and other doors.
- 5. Skylight units.
- 6. Sloped glazing systems.
- 7. Replacement of glazing in existing aluminum framing.

1.3 DEFINITIONS

DELETE DEFINITIONS BELOW IF NOT APPLICABLE TO PRODUCTS RETAINED FOR PROJECT.

- A. Interspace: Space between lites of an insulating-glass unit that contains dehydrated air or a specified gas.
- B. Deterioration of Coated Glass: Defects developed from normal use which are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in metallic coating.
- C. Deterioration of Insulating Glass: Failure of hermetic seal under normal use that is attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.
- D. Deterioration of Laminated Glass: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning laminated glass contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

1.4 SUBMITTALS

- A. Product data including manufacturer's technical data for each glazing material and fabricated glass product required; installation and maintenance instructions.
- B. Samples for initial selection, consisting 12-inch square samples of the full range of manufacturer's standard product line for the following types of glass units:

USUALLY DELETE FIRST EXAMPLE BELOW. RETAIN ONLY IF PROJECT INCLUDES TINTED GLASS.

- 1. Tinted glass.
- 2. Low-emissivity coated glass.
- C. Samples for verification purposes, of 1 set of 12-inch square samples of each type of glass indicated except for clear single pane units.

USUALLY DELETE BELOW.

- 1. Provide 1 set of 12-inch long samples of each color required (except black) for each gasket sample between two strips of material representative of adjoining framing system in color.
- D. Certificate: Submit certificates from respective manufacturers attesting that glass and glazing materials furnished for project comply with requirements.

USUALLY RETAIN BELOW.

- 1. Separate certification will not be required for glazing materials bearing manufacturer's permanent labels designating type and thickness of glass, provided labels represent a quality control program involving a recognized certification agency or independent testing laboratory acceptable to Owner.

DELETE PARAGRAPH BELOW IF NO COMPATIBILITY TESTING IS REQUIRED UNDER "PERFORMANCE REQUIREMENTS" ARTICLE.

- E. Compatibility and Adhesion Test Report: Submit statement from sealant manufacturer indicating that glass and glazing materials have been tested for compatibility and adhesion with glazing sealants and interpreting test results relative to material performance, including recommendations for primers and substrate preparation needed to obtain adhesion.

USUALLY RETAIN PARAGRAPH BELOW.

- F. Delegated-Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

ALWAYS INCLUDE BELOW IF INSULATING GLASS IS TO BE PROVIDED ON PROJECT.

- B. Insulating Glass Manufacturers: Provide insulating glass manufactured by firm with at least 5 years of experience with similar projects and possessing current IGCC membership.
 - 1. Insulating Glass Certification Program: Provide insulating glass units permanently marked either on spacers or at least one component pane of units with appropriate certification label of Insulating Glass Certification Council (IGCC).
- C. Single Source Responsibility for Glass: To ensure consistent quality of appearance and performance, provide materials produced by a single manufacturer or fabricator for each kind and condition of glass indicated and composed of primary glass obtained from a single source for each type and class required.
- D. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, unless more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.

EDIT TO BE PROJECT SPECIFIC

- 1. Glass Association of North America (GANA) Publications: GANA Glazing Manual [and GANA Laminated Glass Reference Manual].
- 2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial and Residential Use."

RETAIN PARAGRAPH AND SUBPARAGRPHS BELOW ONLY FOR GLASS INSTALLED WITH GLAZING SEALANTS.

E. Preconstruction Adhesion and Compatibility Testing: Submit to elastomeric glazing sealant manufacturers, for testing according to ASTM C 1087, samples of each glazing material type, tape sealant, gasket, glazing accessory, and glass-framing member that will contact or affect elastomeric glazing sealants:

1. Use test methods standard with sealant manufacturer to determine if priming and other specific preparation techniques are required for rapid, optimum glazing sealants adhesion to glass and glazing channel substrates.
 - a. Perform tests under normal environmental conditions during installation.
2. Submit not less than nine pieces of each type and finish of glass-framing members and each type, class, kind, condition, and form of glass (monolithic, insulating units) for adhesion testing, as well as one sample of each glazing accessory (gaskets, setting blocks and spacers) for compatibility testing.
3. Schedule sufficient time to test and analyze results to prevent delay in the Work.
4. Investigate materials failing compatibility or adhesion tests and get sealant manufacturer's written recommendations for corrective measures, including using special primers.
5. Testing is not required when glazing sealant manufacturer can submit required preparation data that is acceptable to Architect and is based on previous testing of current sealant products for adhesion to and compatibility with submitted glazing materials.

DELETE BELOW IF NO SAFETY GLAZING IS REQUIRED. COORDINATE WITH PART 2 ARTICLES SPECIFYING MONOLITHIC, INSULATING AND LAMINATED GLASS PRODUCTS.

F. Safety Glazing Standard: Comply with the following:

1. Provide safety glass where indicated and where otherwise required by the Michigan Building Code.

REVISE PARAGRAPH BELOW FROM CATEGORY II MATERIALS TO CATEGORY I MATERIALS IF GLASS PANES ARE STATIONARY OR IN SWINGING DOORS AND ARE LESS THAN 9 SF IN AREA. REFER TO [HTTP://WWW.ACCESS.GPO.GOV/NARA/CFR/WAISIDX_03/16CFR1201_03.HTM](http://www.access.gpo.gov/nara/cfr/waisidx_03/16CFR1201_03.html) FOR COMPLETE DESCRIPTION OF CATEGORY I AND CATEGORY II MATERIALS.

2. Where safety glass is indicated, provide type of products indicated which comply with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for category II materials.
 - a. Subject to compliance with requirements, provide safety glass permanently marked with certification label of Safety Glazing Certification Council (SGCC) or other certification agency acceptable to Owner.

PARAGRAPH BELOW IS USEFUL IN TRYING TO INSURE THAT COLOR OF LOW-E GLAZING DOESN'T VARY EXCESSIVELY FROM PANE TO PANE.

- G. Sealed Insulating Glass Units: In addition to other requirements of this section, comply with ASTM D2244. Obtain written acceptance by the Architect and the Owner's representative of permissible color tolerance between test specimen and reference and the procedure for calculating the color tolerance. Each material and condition of use may require specific color tolerances.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Protect glass and glazing materials during delivery, storage, and handling to comply with manufacturer's directions and as required to prevent edge damage to glass, and damage to glass and glazing materials from effects of moisture including condensation, of temperature changes, of direct exposure to sun, and from other causes.
 - 1. Glass shall be fully identified, and each pane shall be clearly labeled with manufacturer's name and product designation.

1.7 PROJECT CONDITIONS

- A. Environmental Conditions: Do not proceed with glazing when ambient and substrate temperature conditions are outside the limits permitted by glazing material manufacturer or when joint substrates are wet due to rain, frost, condensation or other causes.
 - 1. Install liquid sealants at ambient and substrate temperatures above 40 degrees F (4.4 deg. C).

1.8 WARRANTY

- A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer's standard form, made out to Owner and signed by coated-glass manufacturer agreeing to replace coated-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
 - 1. Warranty Period: Manufacturer's standard but not less than 10 years after date of substantial completion.
- B. Manufacturer's Special Warranty on Insulating Glass: Manufacturer's standard form, made out to Owner and signed by insulating-glass manufacturer agreeing to replace insulating-glass units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
 - 1. Warranty Period: Manufacturer's standard but not less than 10 years after date of substantial completion.

DELETE WARRANTY REQUIREMENT BELOW IF NO LAMINATED GLASS INCLUDED.

C. Manufacturer's Special Warranty on Laminated Glass: Manufacturer's standard form, made out to Owner and signed by manufacturer agreeing to replace units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following manufacturers:

ALWAYS INCLUDE PRIMARY GLASS PARAGRAPH BELOW, SINCE PRIMARY GLASS IS A COMPONENT OF INSULATING GLASS AND LAMINATED GLASS.

B. Primary Glass:

1. AGC Flat Glass North America, Inc.
2. Guardian Industries Corp.
3. Pilkington North America, Inc.
4. PPG Industries, Inc.

DELETE PATTERNED GLASS IF NONE IN PROJECT.

C. Patterned Glass:

1. AGC Flat Glass North America.
2. Guardian Industries Corp.

D. Laminated Glass:

1. AGC Flat Glass North America.
2. Guardian Industries Corp.
3. Oldcastle Glass Group.
4. Viracon, Inc.

E. Insulating Glass Units:

EDIT LIST AFTER SELECTING DESIRED CHARACTERISTICS OF INSULATING GLASS UNITS.

1. AGC Flat Glass North America.
2. Guardian Industries Corp.
3. Oldcastle Glass Group
4. Viracon, Inc.

F. Glazing sealants:

1. Dow Corning Corp.
2. GE
3. Pecora Corp.
4. Tremco, Inc.

REFER TO DELEGATED DESIGN REQUIREMENTS IN THE "ALUMINUM WINDOWS" AND "GLAZED ALUMINUM CURTAIN WALL" SECTIONS.

2.2 PERFORMANCE REQUIREMENTS

- A. General: Provide glazing systems capable of withstanding normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.

FIRST PARAGRAPH AND SUBPARAGRAPHS BELOW ASSUME GLASS THICKNESSES ARE INDICATED ON DRAWINGS OR IN ARTICLE 2.5. IF NOT, REVISE ACCORDINGLY. STRUCTURAL ENGINEER SHALL PERFORM A WIND PRESSURE ANALYSIS PER THE MICHIGAN BUILDING CODE.

- B. Glass Design: Glass thickness designations indicated are minimums and are for detailing only. Confirm glass thicknesses and strengths (annealed or heat treated) by analyzing Project loads and in-service conditions as required to meet or exceed the following criteria:
 - 1. Glass Thicknesses: Comply with ASTM E 1300, according to the following requirements:
 - a. Design Wind Loads: As indicated on Drawings.
 - 2. Normal thermal movement is defined as that resulting from an ambient temperature range of 120 deg. F (67 deg. C) and from a consequent temperature range within glass and glass framing members of 180 deg. F (100 deg. C).

2.3 PRIMARY GLASS PRODUCTS

- A. General: Refer to ["Aluminum Entrances and Storefront"] ["Aluminum Windows"] ["Glazed Aluminum Curtain Wall"] section for performance requirements of assembled units composed of insulating units and aluminum framing.
- B. Clear Annealed Float Glass: ASTM C 1036 Type I (transparent glass, flat), Quality q3 (glazing select), of class indicated and with the following characteristics:

ENTER VALUES FOR VISIBLE LIGHT TRANSMITTANCE AND REFLECTANCE BELOW AFTER REVIEWING PROJECT REQUIREMENTS. DELETE BELOW IF COVERED UNDER INSULATED GLASS SECTION IN PART 2.

- 1. Visible Light Transmittance: []
- 2. Reflectance: []

DELETE BELOW UNLESS PROJECT IS A RETROFIT MATCHING EXISTING TINTED GLAZING. TINTED GLASS IS NOT ACCEPTABLE ON NEW CONSTRUCTION.

- C. Tinted Float Glass: Type I (transparent glass, flat), Class 2 (tinted heat absorbing and light reducing), Quality q3 (glazing select) and as follows:

BELOW IS A GENERAL DESCRIPTION FOR TINTED BRONZE GLASS. OBTAIN SAMPLES AND MATCH TO EXISTING GLAZING AS CLOSELY AS POSSIBLE. CONSIDER LIMITING ACCEPTABLE PRODUCTS IF NOT ALL MANUFACTURERS HAVE A CLOSE MATCH.

- 1. Bronze: Tint matching existing units.

D. Heat-Treated Float Glass

1. Manufacturing Process: Manufacture heat-treated glass by horizontal (roller hearth) process with roll-wave distortion parallel to bottom edge of glass as installed, unless otherwise indicated.

BELOW SPECIFIES BOTH COATED AND UNCOATED CLEAR STRENGTHENED OR TEMPERED GLASS.

PROVIDE KIND HS (HEAT-STRENGTHENED) FLOAT GLASS IN PLACE OF ANNEALED FLOAT GLASS WHERE NEEDED TO RESIST THERMAL STRESSES INDUCED BY DIFFERENTIAL SHADING OF INDIVIDUAL GLASS LITES AND TO COMPLY WITH GLASS DESIGN REQUIREMENTS SPECIFIED IN PART 1 "PERFORMANCE REQUIREMENTS" ARTICLE.

2. Clear Heat-Treated Float Glass: ASTM C 1048 Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select), and with the following characteristics:

SELECT ONE OR BOTH BELOW

- a. For uncoated glass, comply with requirements for Condition A.
- b. For coated vision glass, comply with requirements for Condition C (other coated glass).

DELETE SUBPARAGRAPH BELOW IF LOCATIONS OF KIND FT FLOAT GLASS FOR SAFETY GLASS APPLICATIONS ARE SPECIFIED IN OTHER PART 2 ARTICLES OR ON DRAWINGS.

- c. Provide Kind FT (fully tempered) float glass in place of annealed or Kind HS (heat-strengthened) where safety glass is indicated, required by Code or performance requirements listed elsewhere in this Section.

BELOW SPECIFIES TINTED HEAT-STRENGTHENED OR TEMPERED GLASS. PROVIDE KIND HS (HEAT-STRENGTHENED) FLOAT GLASS WHERE NEEDED TO RESIST THERMAL STRESSES INDUCED BY DIFFERENTIAL SHADING OF INDIVIDUAL GLASS LITES AND TO COMPLY WITH GLASS DESIGN REQUIREMENTS SPECIFIED IN PART 1 "PERFORMANCE REQUIREMENTS" ARTICLE. USE OF TINTED GLASS IS RESTRICTED TO REPLACEMENT OR MATCHING OF EXISTING TINTED UNITS.

3. Tinted Heat-Treated Float Glass: ASTM C 1048; Type I (transparent glass, flat); Class 2 (tinted heat absorbing and light reducing), Quality q3 (glazing select), with tint color and performance characteristics for 1/4 inch thick glass matching those indicated for non-heat-treated float glass; kind as indicated:

- a. For uncoated glass, comply with requirements for Condition A.
- b. For coated vision glass, comply with requirements for Condition C (other uncoated glass).

DELETE SUBPARAGRAPH BELOW IF LOCATIONS OF KIND FT FLOAT GLASS FOR SAFETY GLASS APPLICATIONS ARE SPECIFIED IN OTHER PART 2 ARTICLES OR ON DRAWINGS.

- c. Provide Kind FT (fully tempered) float glass in place of Kind HS (heat-strengthened) where safety glass is indicated.

DELETE BELOW IF NO PATTERNED GLASS REQUIRED. IF USING IN NON-OPAQUE SPANDREL PANEL ALWAYS SPECIFY HEAT STRENGTHENED GLASS.

- E. Patterned Glass: ASTM C 1048 Type II (patterned and wired glass, flat), Form 3 (patterned), Quality q8 (glazing), Finish f1 (patterned one side), of pattern and class indicated below:

BELOW IS THE ONLY PATTERNED GLASS WITH AN OVERALL OBSCURING PATTERN AVAILABLE AS OF AUGUST, 2011, IN ONE QUARTER-INCH THICKNESS. OTHER PATTERNS ARE AVAILABLE IN 3/16" THICKNESS FROM AGC AND GUARDIAN.

1. Pattern p3 (random), Class 1 (translucent).
 - a. Product: Subject to compliance with requirements, provide "Serenity" by AGC Flat Glass North America.

RETAIN THICKNESS HERE OR ON DRAWINGS.

2. Thickness: 1/4-inch.

BELOW SPECIFIES STANDARD OPAQUE SPANDREL COATED GLASS WITH A CERAMIC FRIT APPLIED TO THE INBOARD SURFACE OF THE LITE. DELETE IF NONE IS INCLUDED IN PROJECT. COORDINATE WITH DESIGN MANAGER BEFORE USE.

- F. Ceramic Coated Heat-Treated Spandrel Glass: ASTM C 1048 Condition B (spandrel coated glass, one surface ceramic coated), Type I (transparent glass, flat), Quality q3 (glazing select), and complying with the following requirements:

1. Kind HS (heat strengthened).

ALTHOUGH IT IS POSSIBLE FOR UNBACKED HEAT-STRENGTHENED SPANDREL COATED GLASS TO PASS TEST IN SUBPARAGRAPH BELOW, APPLYING TAPE TO BACK OF SPANDREL COATED GLASS IS NORMALLY REQUIRED.

2. Fallout Resistance: Provide spandrel coated units identical to those passing the fallout-resistance test for spandrel coated glass specified in ASTM C 1048.

- G. Low-E Glazing General: Performance characteristics designated for coated glass products are nominal values based on manufacturer's published test data for 1/4 inch thick glass products, unless otherwise indicated. Refer to primary and heat-treated glass product requirements relating to properties of glass products to which coatings are applied.

1. Provide heat-treated coated float glass of kind and where indicated or, if not otherwise indicated, provide heat-strengthened units where recommended by manufacturer for application indicated, and tempered where coated safety glass is designated or required.

- H. Sputter-Coated Float Glass: ASTM C 1376, (except for provisions regarding color tolerances, which are modified in this Section) float glass with metallic-oxide or -nitride coating deposited by vacuum deposition process after manufacture and heat treatment (if any), and complying with other requirements specified.

DELETE THE FOLLOWING ARTICLE IF NO LAMINATED SAFETY GLASS REQUIRED.

2.4 LAMINATED GLASS PRODUCTS

- A. General: Refer to float glass, heat-treated glass and coated glass requirements relating to properties of glasses making up laminated glass products.
- B. Laminated Glass: ASTM C 1172, and complying with other requirements specified and with the following:
 - 1. Interlayer: Polyvinyl butyral of thickness indicated with a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after laminating glass lites and installation.
 - 2. Products: Subject to compliance with requirements, provide one of the following:
Saflex; Solutia, Inc.
Butacite; E.I. DuPont De Nemours and Co., Inc.
- C. Laminating Process: Fabricate laminated glass using laminator's standard heat-plus-pressure process to produce glass free from foreign substances and air/glass pockets.
- D. Laminated Safety Glass: Two panes of glass of equal thickness, laminated together with not less than [0.030] [0.060] inch thick plastic interlayer and complying with requirements indicated below:
 - 1. Glass Characteristics: Float glass, complying with requirements for class, tint, kind and thickness of each pane (ply) indicated below:
 - a. Class 1 - clear for both panes.

SELECT ONE OF TWO BELOW.

- b. Kind HS (heat-strengthened).
- c. Kind FT (Fully tempered).
- d. Thickness: 1/4 inch.

- 2. Color of Plastic Interlayer: Clear.

COORDINATE REQUIREMENTS SELECTED IN THIS ARTICLE WITH THOSE IN OTHER ARTICLES ON GLASS PRODUCTS WHICH RELATE TO PANES MAKING UP INSULATING UNITS.

2.5 SEALED INSULATING GLASS UNITS

- A. General: Provide factory-assembled units consisting of sealed lites of glass separated by a dehydrated interspace filled with argon gas, and with other requirements specified for glass characteristics, air space, sealing system, sealant, spacer material, corner design and desiccant. Provide insulating glass units complying with and labeled with appropriate certification label of IGCC/IGMA Certification Program.
 - 1. For properties of individual glass panes making up units, refer to product requirements specified elsewhere in this Section applicable to types, classes, kinds and conditions of glass products indicated.

INDICATE LOCATIONS OF HEAT-STRENGTHENED UNITS ON DRAWINGS OR SCHEDULES.

2. Provide Kind HS (heat-strengthened) glass where indicated, or if not indicated, where needed to resist thermal stresses induced by differential shading of individual glass lites and to comply with glass design requirements specified elsewhere in Section.
3. Provide tempered panes where indicated or if not indicated, where safety glass is designated or required.
4. Performance characteristics designated for coated insulating glass are nominal values based on manufacturer's published test data for units with 1/4 inch thick panes of glass and 1/2 inch thick air space filled with argon gas.
5. Sealing System: Dual seal, using butyl primary seal and silicone secondary seal.

BELOW IS SPECIFICATION FOR STANDARD ALUMINUM SPACER. BETTER THERMAL PERFORMANCE CAN BE OBTAINED BY USING "WARM EDGE" SPACERS OF STAINLESS STEEL OR OTHER MATERIALS.

6. Spacer: Fabricated from anodized aluminum, incorporating either molecular sieve, silica gel or combination type dessicant as standard with manufacturer.

SELECT ONE OF THE FOLLOWING.

- a. Color: Clear.
- b. Color: Match finish color of aluminum framing system.
- c. Color: Dark bronze.

SELECT SEALANT SYTEM WITH BEST PERFORMANCE AND WHICH IS ACCEPTABLE TO ALUMINUM FRAMING MANUFACTURERS.

2.6 SEALANT SYSTEMS GENERAL

A. Products:

1. Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.

ALWAYS RETAIN BELOW. IF PROJECT IS LEED, VERIFY VALUE BELOW FOR LEED CREDIT.

2. Sealants used inside the framing and glazing shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Cleaners, Primers and Sealers:** Type recommended by manufacturer of sealants.
- C. Setting Blocks:** Elastomeric material with 80 to 90 Shore, type A durometer hardness.
- D. Spacers:** Elastomeric blocks or continuous extrusions with a Shore, Type A durometer hardness required by glass manufacturer to maintain glass lites in place for installation indicated.
- E. Edge Blocks:** Elastomeric material as required for compatibility with glazing sealant, of size and hardness required to limit lateral movement (side-walking) of glass.

BuildingName

The Description of the Project

P0000000 0000 Issued for: BID 088000 - - 11

WET-DRY SYSTEM USES A TOOLED SEALANT CAP BEAD OVER A GLAZING GASKET ON THE EXTERIOR AND A DRY GASKET ON THE INTERIOR. THIS SYSTEM PROVIDES BETTER WEATHER PROTECTION BUT REQUIRES THAT GLAZING BE DONE FROM THE EXTERIOR. ADDITIONALLY, NOT ALL ALUMINUM FRAMING MANUFACTURERS PRODUCE A FRAMING SYSTEM THAT ACCEPTS WET-DRY GLAZING.

2.7 WET-DRY GLAZING SEALANT SYSTEM MATERIALS

- A. Glazing Gaskets: Manufacturer's standard compression types; replaceable, molded or extruded, of profile and hardness required to maintain watertight seal on interior.

BOND-BREAKER TAPE IS TYPICALLY USED WITH WEATHERSEAL SEALANTS IF CONVENTIONAL SEALANT BACKING CANNOT BE USED BECAUSE OF DIMENSIONAL LIMITATIONS. IT IS ALSO USED TO AVOID THREE-SIDE ADHESION THAT MAY BE DETRIMENTAL TO PROPER SEALANT MOVEMENT.

- B. Bond-Breaker Tape: Manufacturer's standard TFE-fluorocarbon or polyethylene material to which sealants will not develop adhesion.

RETAIN PARAGRAPH BELOW IF USING TAPE INSTEAD OF GASKET.

- C. Glazing Tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C 1281 and AAMA 800 for products indicated below:

1. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.

- D. Glazing Sealants: As recommended by manufacturer for joint type, and as follows:

REVIEW WEATHERSEAL-SEALANT REQUIREMENTS WITH ALUMINUM-FRAMED-SYSTEM MANUFACTURERS. BELOW IS NEUTRAL CURE. CONFIRM WITH MANUFACTURER OF SPECIFIED FRAMING SYSTEM.

1. Silicone Weatherseal Sealant: ASTM C 920 for Type S, Grade NS, Class 50, Uses NT, G, A, and O; single-component neutral-curing formulation that is compatible with structural sealant and other system components with which it comes in contact; recommended by structural-sealant, weatherseal-sealant, and aluminum-framed-system manufacturers for this use.

2.8 DRY GASKET SYSTEM MATERIALS

- A. Dense Compression Gaskets: Molded or extruded gaskets of profile and hardness required to maintain watertight seal, made from one of the following:

RETAIN ONE OR BOTH OF SUBPARAGRAPHS BELOW. USE COMPONENTS COMPLYING WITH WINDOW, STOREFRONT, CURTAIN WALL AND DOOR MANUFACTURER'S REQUIREMENTS. NEOPRENE IS NOT COMPATIBLE WITH SILICONE GLAZING SEALANTS.

1. EPDM complying with ASTM C 864.

2. Silicone complying with ASTM C 1115.

GASKETS IN FIRST PARAGRAPH BELOW ARE FOR USE BETWEEN GLASS AND FRAME (OR FIXED STOP) WHERE THEY WILL BE COMPRESSED BY INSERTING DENSE COMPRESSION GASKETS OR BY PRESSURE-GLAZING STOPS.

- B. Soft Compression Gaskets: Extruded or molded, closed-cell, EPDM or silicone gaskets complying with ASTM C 509, Type II, black; of profile and hardness required to maintain watertight seal.
 1. Application: Use where soft compression gaskets will be compressed by inserting dense compression gaskets on opposite side of glazing or pressure applied by means of pressure-glazing stops on opposite side of glazing.

2.9 FABRICATION OF GLAZING UNITS

- A. Fabricate glazing units in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

2.10 INSULATED-GLASS TYPES

PARAGRAPH AND SUBPARAGRAPHS BELOW DESCRIBE TYPICAL U-M INSULATED GLAZING PANEL.

- A. Clear Low-E Insulating Glass Units for Vertical Applications: Manufacturer's standard units complying with the following requirements:

1. Thickness of Each Pane: 1/4-inch.

SELECT TYPE OF GLASS FOR EACH PANE.

2. Exterior Pane: [Clear float glass] [Heat strengthened float glass] [Fully tempered float glass], low-emissivity coating applied to the second surface.
3. Interior Pane: [Clear float glass] [Heat strengthened float glass] [Fully tempered float glass], uncoated.
4. Air Space Thickness: 1/2-inch.
 - a. Fill air space with argon gas.
5. Composite Thickness: 1-inch.
6. Performance Characteristics: Provide insulating glass units complying with ASTM E 774 for Class A, and the following:

MODIFY AS REQUIRED TO MEET PROJECT REQUIREMENTS.

- a. Visible light transmittance: Not more than 70 percent.
- b. UV Transmittance: 15 percent.
- c. Outdoor reflectance: Not more than 12 percent.

NORMALLY, SPECIFY U-VALUE AND SHGC IN THE ACCOMPANYING ALUMINUM FRAMING SECTION (STOREFRONT, WINDOWS OR CURTAIN WALL).

- d. U-value and Solar Heat Gain Coefficient: As required to achieve specified performance in ["Aluminum Entrances and Storefront"] ["Aluminum Windows"] ["Glazed Aluminum Curtain Wall"] Section[s].

USUALLY DELETE PARAGRAPH AND SUBPARAGRAPHS BELOW. RETAIN ONLY FOR PROJECTS MATCHING EXISTING TINTED GLASS.

- B. Tinted Low-E Insulating Glass Units for Vertical Applications: Manufacturer's standard units complying with the following requirements:

REVISE BELOW AS REQUIRED TO MATCH COLOR OF EXISTING GLAZING.

- 1. Thickness of Each Pane: 1/4-inch.

SELECT TYPE OF GLASS FOR EACH PANE. TYPICALLY USE HEAT STRENGTHENED GLASS WHEN GLASS IS TINTED, ESPECIALLY ON SOUTH AND WEST ELEVATIONS.

- 2. Exterior Pane: [Clear float glass] [Heat strengthened float glass] [Fully tempered float glass], low-emissivity coating applied to the second surface.
 - a. Tint: Bronze.
- 3. Interior Pane: [Clear float glass] [Heat strengthened float glass] [Fully tempered float glass], uncoated.
- 4. Air Space Thickness: 1/2-inch.
 - a. Fill air space with argon gas.
- 5. Composite Thickness: 1-inch.
- 6. Performance Characteristics: Provide insulating glass units complying with ASTM E 774 for Class A, and the following:

MODIFY AS REQUIRED TO MEET PROJECT REQUIREMENTS.

- a. Visible light transmittance: []
- b. UV Transmittance: Not more than 5 percent.
- c. Outdoor reflectance: []

NORMALLY, SPECIFY U-VALUE AND SHGC IN THE ACCOMPANYING ALUMINUM FRAMING SECTION (STOREFRONT, WINDOWS OR CURTAIN WALL).

- d. U-value and Solar Heat Gain Coefficient: As required to achieve specified performance in ["Aluminum-Framed Entrances and Storefronts"] ["Aluminum Windows"] ["Glazed Aluminum Curtain Wall"] Section[s].

BELOW DESCRIBES SEMI-OPAQUE "TRANSOM PANEL" USED TO CONCEAL CEILING SPACES. IT IS A REASONABLY CLOSE MATCH TO VISION PANELS. DELETE IF STANDARD OPAQUE SPANDREL COATED GLASS IS SELECTED, OR IF NO SPANDREL COATED GLASS IS REQUIRED.

- C. Non-Vision Low-E Insulating Glass Units for Vertical Applications: Manufacturer's standard units complying with the following requirements:

- 1. Thickness of Each Pane: 1/4-inch.

SELECT TINTED OR CLEAR GLAZING TO MATCH VISION UNITS. IF USING CLEAR GLASS DELETE THE FOLLOWING PARAGRAPH AND ASSOCIATED SUB-PARAGRAPHS.

TYPICALLY USE HEAT STRENGTHENED GLASS WHEN GLASS IS TINTED, ESPECIALLY ON SOUTH AND WEST ELEVATIONS.

- a. Exterior Pane: [Tinted] [Clear] [float glass] [heat strengthened float glass] [fully tempered float glass], low-emissivity coating applied to the second surface.

REVISE TO MATCH EXISTING TINT COLOR OR ELIMINATE FOR CLEAR GLASS.

- 1) Tint: Bronze.
- b. Interior Pane: Spandrel coated glass.
 - 1) Kind HS (heat strengthened), unless otherwise indicated.
- c. Air Space Thickness: 1/2-inch.
 - 1) Fill air space with argon gas.
- d. Composite Thickness: 1-inch.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Inspection: Inspect work of glass framing erector in presence of Glazier for compliance with manufacturing and installation tolerances, including those for size, squareness, offsets at corners; for presence and functioning of weep system; for existence of minimum required face or edge clearances; and for effective sealing of joinery.
 - 1. Obtain Glazier's written report listing conditions detrimental to performance of glazing work. Do not allow glazing work to proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean glazing channels and other framing members to receive glass, immediately before glazing. Remove coatings which are not firmly bonded to substrates. Remove lacquer from metal surface where elastomeric sealants are indicated for use.

3.3 GLAZING GENERAL

IF IT IS ASSUMED THAT SHOP GLAZING WILL BE IMPOSSIBLE IN SOME LOCATIONS, INDICATE ACCEPTABLE FIELD GLAZED LOCATIONS ON DRAWING.

- A. Unless indicated otherwise, shop glaze aluminum framing specified in "Aluminum-Framed Entrances and Storefronts", "Aluminum Windows" and "Glazed Aluminum Curtain Wall" Sections.
- B. Comply with combined written instructions of manufacturers of aluminum framing, glass, sealants, tapes, and other glazing materials, except where more stringent requirements are indicated, including those of referenced glazing publications.

- C. Protect glass from edge damage during handling and installation. Remove from Project and legally dispose of damaged glass. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.
- D. Glazing channel dimensions, as indicated on Drawings, provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
- E. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
- F. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.
- G. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of sealant which is acceptable for heel bead use.
- H. Provide spacers for glass sizes larger than 50 united inches (length plus height).
 - 1. Locate spacers directly opposite each other on both inside and outside faces of glass. Install correct size and spacing to preserve required face clearances, unless gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and to comply with system performance requirements.
 - 2. Provide 1/8-inch (3-mm) minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
- I. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass unit manufacturer and according to requirements in referenced glazing publications.
- J. Set units of glass in each series with uniformity of pattern, draw, bow and similar characteristics.
- K. Set glass lites with proper orientation so that coatings face exterior or interior as specified.
- L. Install sealants in compliance with ASTM C1193.

COORDINATE GLAZING METHODS BELOW WITH SELECTIONS IN PART 2.

3.4 WET/DRY GLAZING

- A. Follow manufacturer's recommendations and reference standards.
- B. Cut compression gaskets to lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.

- C. Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.

RETAIN BELOW FOR WINDOWS AND STOREFRONT SYSTEMS.

- D. Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer. Apply cap bead of sealant on exterior per manufacturer's instructions.

RETAIN BELOW FOR CURTAIN WALL

- E. Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer. Apply cap bead of sealant on exterior per manufacturer's instructions.

3.5 TAPE GLAZING

- A. Position tapes on fixed stops so that, when compressed by glass, their exposed edges are flush with or protrude slightly above sightline of stops.
- B. Install tapes continuously, but not necessarily in one continuous length. Do not stretch tapes to make them fit opening.
- C. Cover vertical framing joints by applying tapes to heads and sills first and then to jambs. Cover horizontal framing joints by applying tapes to jambs and then to heads and sills.
- D. Place joints in tapes at corners of opening with adjoining lengths butted together, not lapped. Seal joints in tapes with compatible sealant approved by tape manufacturer.
- E. Do not remove release paper from tape until right before each glazing unit is installed.

DELETE PARAGRAPH BELOW IF NOT REQUIRED, OR QUALIFY BY ADDING "WHERE INDICATED" AND SHOW LOCATIONS ON DRAWINGS.

- F. Apply heel bead of elastomeric sealant.
- G. Center glass lites in openings on setting blocks and press firmly against tape by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings.

DELETE PARAGRAPH BELOW IF NOT APPLICABLE OR REVISE; IT ASSUMES FIXED STOP IS LOCATED ON EXTERIOR.

- H. Apply cap bead of elastomeric sealant over exposed edge of tape.

RETAIN BELOW FOR DRY GLAZING WITH GASKETS.

3.6 GASKET GLAZING (DRY):

- A. Fabricate compression gaskets in lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.
- B. Insert soft compression gasket between glass and frame or fixed stop so it is securely in place with joints miter cut and bonded together at corners.
- C. Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Miter cut wedge-shaped gaskets at corners, and install gaskets in manner recommended by gasket manufacturer to prevent pull away at corners. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.
- D. Install gaskets so they protrude past face of glazing stops.

3.7 SEALANT GLAZING (WET)

- A. Install continuous spacers, or spacers combined with cylindrical sealant backing, between glass lites and glazing stops to maintain glass face clearances and to prevent sealant from extruding into glass channel and blocking weep systems until sealants cure. Secure spacers or spacers and backings in place and in position to control depth of installed sealant relative to edge clearance for optimum sealant performance.
- B. Force sealants into glazing channels to eliminate voids and to ensure complete wetting or bond of sealant to glass and channel surfaces.
 - 1. Tool exposed surfaces of sealants to provide a substantial wash away from glass.

3.8 ADJUSTING, CLEANING, PROTECTION

- A. Protect exterior glass from breakage immediately upon installation by use of crossed streamers attached to framing and held away from glass. Do not apply markers to surface of glass. Remove nonpermanent label and clean surfaces.
- B. Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, containment substances do come into contact with glass, remove immediately by method recommended by glass manufacturer.

- C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkali deposits or staining. When examination reveals presence of these forms of residue, remove by method recommended by glass manufacturer.
- D. Remove and replace glass which is broken, chipped, cracked, abraded or damaged in other ways during construction period, including natural causes, accidents and vandalism.
- E. Wash glass on both faces not more than 4 days prior to date scheduled for inspections intended to establish date of substantial completion in each are of project. Wash glass by method recommended by glass manufacturer.

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 088010 - GLAZING (INTERIOR APPLICATIONS)

END OF CONTENTS TABLE

DIVISION 08 OPENINGS

SECTION 088010 - GLAZING (INTERIOR APPLICATIONS)

*UPDATED TO CORRELATE WITH LANGUAGE IN SECTION 088000 AND
MANUFACTURERS UPDATED - 5/05.*

UPDATED TO INCLUDE FIRE-RATED GLAZING PRODUCTS - 5/04.

*THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO SMALL
INTERIOR PROJECTS. USE MASTER SPECIFICATION SECTION 088000
"GLAZING") FOR EXTERIOR GLASS.*

*RATHER THAN USING THIS SECTION, CONSIDER INCLUDING VERY SMALL,
NON-COMPLEX GLASS ITEMS IN RELATED SECTIONS. EXAMPLE: GLASS
LITES IN DOORS IN STEEL OR WOOD DOOR SECTIONS; GLASS LIGHTS IN
SIDELITES IN STEEL FRAME OR FINISH CARPENTRY SECTION.
HOWEVER, IF INCLUDING THIS SECTION FOR ANY APPLICATION,
INCLUDE ALL GLAZING APPLICATIONS WITHIN IT.*

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of glass and glazing work is indicated on drawings.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's technical data for each glazing material and fabricated glass product required, including installation and maintenance instructions.
- B. Certificate: Submit certificates from respective manufacturers attesting that glass and glazing materials furnished for project comply with requirements.

1.3 DEFINITIONS

- A. Deterioration of Laminated Glass and Gel-Filled Dual-Glazed Units: Defects developed from normal use that are attributed to the manufacturing process and not to causes other than glass breakage and practices for maintaining and cleaning glass units contrary to manufacturer's written instructions. Defects include edge separation, delamination materially obstructing vision through glass, and blemishes exceeding those allowed by referenced laminated-glass standard.

1.4 QUALITY ASSURANCE

- A. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, unless more stringent requirements are indicated.
 - 1. GANA Publications:
 - a. GANA's "Glazing Manual."

DELETE OPTION IN SUBPARAGRAPH BELOW IF NO LAMINATED GLASS IS SPECIFIED FOR PROJECT.

- b. GANA Laminated Division's "Laminated Glass Design Guide" and

DELETE BELOW IF NO SAFETY GLAZING IS REQUIRED. COORDINATE WITH PART 2 ARTICLES SPECIFYING MONOLITHIC, INSULATING AND LAMINATED GLASS PRODUCTS.

- B. Safety Glazing Standard: Comply with the following:
 - 1. Provide safety glass where indicated and where otherwise required by the Michigan Building Code.

REVISE PARAGRAPH BELOW FROM CATEGORY II MATERIALS TO CATEGORY I MATERIALS IF GLASS PANES ARE STATIONARY OR IN SWINGING DOORS AND ARE LESS THAN 9 SF IN AREA. REFER TO [HTTP://WWW.ACCESS.GPO.GOV/NARA/CFR/WAISIDX_03/16CFR1201_03.HTML](http://www.access.gpo.gov/nara/cfr/waisidx_03/16CFR1201_03.html) FOR COMPLETE DESCRIPTION OF CATEGORY I AND CATEGORY II MATERIALS.

- 2. Where safety glass is indicated, provide type of products indicated which comply with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for category II materials.
 - a. Subject to compliance with requirements, provide safety glass permanently marked with certification label of Safety Glazing Certification Council (SGCC) or other certification agency acceptable to Owner.
- C. Fire Resistance Rated Wire Glass: Provide wire glass products that are identical to those tested per ASTM E 163 (UL 9) and are labeled and listed by Underwriters Laboratories (UL) or other testing and inspecting agency acceptable to Authorities Having Jurisdiction.
- D. Glazing for Fire-Rated Door Assemblies: Glazing for assemblies that comply with NFPA 80 and that are listed and labeled by UL or Intertek/Warnock Hersey, for fire-protection ratings indicated, based on testing according to NFPA 252.

RETAIN PARAGRAPH ABOVE FOR DOORS AND PARAGRAPH BELOW FOR WINDOWS IF WIRED GLASS OR ANOTHER FIRE-RESISTIVE GLAZING PRODUCT IS SPECIFIED IN PART 2.

- E. Glazing for Fire-Rated Window Assemblies: Glazing for assemblies that comply with NFPA 80 and that are listed and labeled by UL or Intertek/Warnock Hersey, for fire ratings indicated, based on testing according to NFPA 257.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Protect glass and glazing materials during delivery, storage, and handling to comply with manufacturer's directions. Prevent damage to glass and glazing materials.

DELETE THE WARRANTY BELOW UNLESS MULTI-LITE LAMINATED OR GEL-FILLED UNITS IN PART TWO ARE INCLUDED.

1.6 WARRANTY

- A. Manufacturer's Special Warranty on Fire-Rated Laminated Glass and Gel-Filled, Dual-Glazed Units: Manufacturer's standard form, made out to Owner and signed by manufacturer agreeing to replace units that deteriorate as defined in "Definitions" Article, f.o.b. the nearest shipping point to Project site, within specified warranty period indicated below.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

SELECT APPROPRIATE APPLICATIONS BELOW.

- B. Primary Glass:
 - AFG Industries.
 - Guardian Industries Corp.
 - Pilkington Group
 - PPG Industries, Inc.
 - Visteon.
- C. Wire and Patterned Glass:
 - AFG Industries.
 - Guardian Industries.
 - Pilkington Group.
- D. Laminated Glass:
 - AFG Industries.
 - Guardian Industries Corp.
 - Interpane Glass Company.
 - PPG Industries, Inc.
 - Oldcastle Glass Group.
- E. Fire Rated Glazing:
 - EDIT LIST AFTER SELECTING TYPE OF FIRE-RATED GLAZING TO BE USED. NOT ALL TYPES OF PRODUCTS ARE MADE BY EACH OF THE MANUFACTURERS LISTED.**
 - 1. Glaverbel S.A.; distributed by Interedge Technologies.
 - 2. Interedge Technologies.
 - 3. R. Four Ltd.; distributed by Technical Glass Products.
 - 4. Nippon Electric Glass Co., Ltd.; distributed by Technical Glass Products.
 - 5. Pilkington Group; distributed by Technical Glass Products.
 - 6. SAFTI; a Division of O'Keeffe's, Inc.
 - 7. Vetrotech Saint Gobain North America.

2.2 GLASS PRODUCTS

SELECT FROM UNITS BELOW. REFER TO AIA MASTERSPEC FOR ADDITIONAL GLASS TYPES.

- A. Clear Float Glass: ASTM C 1036 Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select).
- B. Tinted Float Glass: ASTM C 1036 Type I (transparent glass, flat), Class 2 (tinted heat absorbing and light reducing), Quality q3 (glazing select) and as follows:
 - 1. Gray: Manufacturer's standard tint.

WIRED GLASS IS NOT RECOGNIZED AS SAFETY GLAZING IN THE 2006 MBC, WHICH REQUIRES SAFETY GLAZING IN DOORS EXCEPT IN OPENINGS THROUGH WHICH A 3-INCH SPHERE IS UNABLE TO PASS.

USE OF WIRED GLASS IS ALSO LIMITED TO OPENINGS WITH A FIRE RATING OF 45 MIN. OR LESS.

THE USE OF WIRE GLASS IS NOT RECOMMENDED, PARTICULARLY IN ATHLETIC AND CHILD CARE FACILITIES.

- C. Wired Glass: ASTM C 1036 Type II (patterned and wired glass, flat), Class 1 (clear), Quality q6; complying with ANSI Z97.1; 1/4 inch thick; of form and mesh pattern indicated below:

SELECT ONE BELOW.

- 1. Polished Wire Glass: Form 1 (wired, polished both sides), Mesh m1 (diamond).
- 2. Polished Wired Glass: Form 1 (wire, polished both sides) Mesh m2 (square).
- D. Patterned Glass: ASTM C 1036 Type II (patterned and wired glass, flat), Form 3 (patterned), Quality q8 (glazing), Finish f1 (patterned one side), of thickness, pattern and class indicated below:

BELOW ARE TWO EXAMPLES. OTHER PATTERNS ARE AVAILABLE FROM MANUFACTURERS LISTED IN 2.1.D.

- 1. Pattern p2 (geometric): 1/4 inch thick; Class 1 (translucent).
 - a. Manufacturer/Product: Subject to compliance with requirements, one of the following: "Burlap"; Hordis Brothers. "Flax"; AFG.
- 2. Pattern p3 (random): 1/4 inch thick; Class 1 (translucent).
 - a. Manufacturer/Product: Subject to compliance with requirements, one of the following: "Industrex"; AFG.

THE FOLLOWING ARE SAFETY GLAZING MATERIALS.

- E. Clear Tempered Float Glass: ASTM C 1048 Condition A (uncoated surfaces), Type I (transparent glass, flat), Class I (clear), Quality q3 (glazing select), Kind FT (fully tempered).

- F. Laminated Safety Glass: ASTM C 1172, two panes of glass of equal thickness, laminated together with interlayer, and complying with requirements indicated below:
1. Thickness: Nominal 1/4 inch.
 2. Glass Characteristics: Float glass, Class 1 and clear for both panes; 1/8 inch thick for both panes.
 3. Interlayer: Clear PVB plastic, not less than 0.030 inches thick, unless specified otherwise in this Section.

2.3 FIRE-RATED GLAZING ASSEMBLIES

IF RETAINING ONE OR MORE PRODUCTS IN THIS ARTICLE, ALSO RETAIN APPLICABLE "GLAZING FOR FIRE-RATED DOOR ASSEMBLIES" OR "GLAZING FOR FIRE-RATED WINDOW ASSEMBLIES" PARAGRAPHS IN PART 1 "QUALITY ASSURANCE" ARTICLE.

NOTE THAT ALL OF THE PRODUCTS LISTED BELOW ARE REQUIRED TO BE INSTALLED AS PART OF AN APPROVED ASSEMBLY, AND THAT THE ASSEMBLY IS TESTED AS A UNIT.

- A. General: Products described in this article consist of tested assemblies containing both glazing material and manufacturer's approved framing systems.

PRODUCTS DESCRIBED IN FIRST PARAGRAPH AND ASSOCIATED SUBPARAGRAPHS BELOW DO NOT QUALIFY AS SAFETY GLAZING.

- B. Assemblies Containing Monolithic Ceramic Glazing Material: Proprietary product in the form of clear flat sheets of 3/16-inch nominal thickness weighing 2.5 lb/sq. ft., and as follows:

MODIFY SPECIFIED FIRE RATING AS REQUIRED FOR PROJECT. PRODUCTS LISTED BELOW CAN HAVE UP TO A 90-MINUTE RATING.

1. Fire-Protection Rating: 45 minutes, and permanently labeled by UL or Intertek/Warnock Hersey.
2. Product: Subject to compliance with requirements, provide one of the following:

DO NOT SELECT "PREMIUM FIRELITE" UNLESS APPEARANCE IS VERY IMPORTANT. PREMIUM IS CONSIDERABLY MORE EXPENSIVE THAN STANDARD, BUT PROVIDES BETTER OPTICAL CLARITY AND CLEARER COLOR.

- a. "Premium FireLite" (polished on both surfaces) by Nippon Electric Glass Co., Ltd., and distributed by Technical Glass Products.
- b. "Standard FireLite" (unpolished on both surfaces) by Nippon Electric Glass Co., Ltd., and distributed by Technical Glass Products.
- c. SGG Keralite FR-R (unpolished on both surfaces) by Vetrotech Saint Gobain North America.

PRODUCTS DESCRIBED IN PARAGRAPH AND ASSOCIATED SUBPARAGRAPHS BELOW DO QUALIFY AS SAFETY GLAZING.

FOR APPLICATIONS WHERE OPTICAL CLARITY IS EXTREMELY IMPORTANT, CHANGE "UNPOLISHED" TO "POLISHED" IN PARAGRAPH BELOW AND

DELETE KERALITE, WHICH IS ONLY AVAILABLE UNPOLISHED. COST FOR POLISHED PRODUCT WILL BE CONSIDERABLY HIGHER.

- C. Assemblies Containing Film-Faced Ceramic Glazing Material: Proprietary Category II safety glazing product in the form of a **3/16-inch**-thick, ceramic glazing material unpolished on both surfaces, faced on one surface with a clear glazing film, and as follows:

MODIFY SPECIFIED FIRE RATING AS REQUIRED FOR PROJECT.

1. Fire-Protection Rating: 45 minutes, and permanently labeled by UL or Intertek/Warnock Hersey.
2. Product: Subject to compliance with requirements, provide one of the following:
 - a. "FireLite NT" by Nippon Electric Glass Co., Ltd., and distributed by Technical Glass Products.
 - b. SGG Keralite FR-F by Vetrotech Saint Gobain North America.

PRODUCTS DESCRIBED IN PARAGRAPH AND ASSOCIATED SUBPARAGRAPHS BELOW ARE LAMINATED AND QUALIFY AS SAFETY GLAZING, WITH SIMILAR PERFORMANCE TO PRODUCTS ABOVE. THEY MAY BE MORE DURABLE BECAUSE THERE IS NO EXPOSED FILM WHICH COULD BE DAMAGED. HOWEVER, THEY ARE MORE EXPENSIVE THAN THE PRODUCTS ABOVE.

- D. Assemblies Containing Laminated Ceramic Glazing Material: Proprietary Category II safety glazing product in the form of 2 lites of clear ceramic glazing material laminated together to produce a laminated lite of **5/16-inch** nominal thickness; polished on both surfaces; weighing **4 lb/sq. ft.**; and as follows:

MODIFY SPECIFIED FIRE RATING AS REQUIRED FOR PROJECT. BOTH ARE AVAILABLE WITH UP TO A 3-HOUR RATING IN DOORS (SIZE LIMITATIONS APPLY) AND UP TO 90 MINUTES IN OTHER LOCATIONS.

1. Fire-Protection Rating: 45 minutes, and permanently labeled by UL or Intertek/Warnock Hersey.
2. Product: Subject to compliance with requirements, provide one of the following:
 - a. "FireLite Plus" (polished on both surfaces) by Nippon Electric Glass Co., Ltd., and distributed by Technical Glass Products.
 - b. SGG Keralite FR-L (unpolished on both surfaces) by Vetrotech Saint Gobain North America.

PRODUCT IN FIRST PARAGRAPH AND SUBPARAGRAPHS BELOW DOES NOT PASS HOSE-STREAM TEST, BUT DOES QUALIFY AS SAFETY GLAZING. CONSIDER USING IN 20-MINUTE DOORS IN LIEU OF WIRED GLASS.

- E. Assemblies Containing Specially Tempered Monolithic Glass: Proprietary Category II safety glazing product in the form of a specially tempered **1/4-inch**-thick monolithic lite, and as follows:

1. Fire-Protection Rating: 20 minutes, and permanently labeled by UL or Intertek/Warnock Hersey.
2. Product: Subject to compliance with requirements, provide one of the following:
 - a. "SuperLite" by SAFTI; a Division of O'Keeffe's Inc.

- b. "PyroEdge-20" by Interedge Technologies.
- c. "Fireglass 20" by Technical Glass Products.
- d. "PyroSwiss Extra" by Vetrattech Saint-Gobain.

THE FOLLOWING TWO CATEGORIES OF FIRE-RESISTANT GLAZING ARE CONSIDERABLY THICKER THAN 1/4" AND WILL REQUIRE SPECIAL FRAMING TO FIT IN A DOOR OR WINDOW. CONSIDER USE ONLY WHERE A BARRIER TO RADIANT HEAT PER ASTM E119 IS REQUIRED.

F. Assemblies Containing Laminated Glass with Intumescent Interlayers: Proprietary Category II safety glazing product in the form of multiple lites of Condition A (uncoated surfaces), Type I (transparent glass, flat), Class 1 (clear), Kind FT (fully tempered) float glass laminated with intumescent interlayers; and as follows:

- 1. Fire-Protection Rating: 60 minutes, and permanently labeled by UL or Intertek/Warnock Hersey.

MODIFY FIRE-PROTECTION RATING ABOVE AND PRODUCT NUMBER BELOW TO CORRESPOND WITH FIRE RATING REQUIRED FOR THE ASSEMBLY. THE THREE PRODUCTS BELOW MAY BE SEPDIIFIED WITH UP TO A 2-HOUR RATING, AND THEY QUALIFY AS A RADIANT AND CONDUCTIVE HEAT BARRIER.

- 2. Product: Subject to compliance with requirements, provide one of the following:
 - a. "PyroStop" by Pilkington Building Products North America and distributed by Technical Glass Products.
 - b. "Pyrobel-60-25" by Glaverbel S.A. and distributed by Interedge Technologies.
 - c. SGG Swissflam 60-N2 by Saint Gobain North America.

G. Assemblies Containing Gel-Filled, Dual-Glazed Units: Proprietary Category II safety glazing product in the form of two lites of Condition A (uncoated surfaces), Type I (transparent flat glass), Class 1 (clear), Kind FT (fully tempered) float glass; with a perimeter metal spacer separating lites and dual-edge seal enclosing a cavity completely filled with clear, fully transparent, heat-absorbing gel.

- 1. Fire-Protection Rating: 60 minutes, and permanently labeled by a testing and inspecting agency acceptable to authorities having jurisdiction.

THE FOLLOWING PRODUCT IS 1 1/8" THICK. MODIFY FIRE-PROTECTION RATING ABOVE AND PRODUCT NUMBER BELOW TO CORRESPOND WITH FIRE RATING REQUIRED FOR ASSEMBLY. ALSO AVAILABLE IN 45-MINUTE, 90-MINUTE AND 120-MINUTE RATINGS.

- 2. Product: Subject to compliance with requirements, "SuperLite II-XL 60 minute" by SAFTI; a Division of O'Keeffe's Inc.

2.4 MISCELLANEOUS GLAZING MATERIALS

- A. General: Provide products of material, size, and shape complying with referenced glazing standard, requirements of manufacturers of glass and other glazing materials for application indicated, and with a proven record of compatibility with surfaces contacted in installation.
- B. Edge Blocks and Setting Blocks: Neoprene, EPDM or silicone as required for compatibility with glazing sealants; of size shape and hardness recommended by manufacturer.
- C. Perimeter Insulation for Fire-Resistive Glazing: Identical to product used in test assembly to obtain fire-resistance rating.

2.5 FABRICATION OF GLAZING UNITS

- A. Fabricate glazing units in sizes required to glaze openings indicated for Project, with edge and face clearances, edge and surface conditions, and bite complying with written instructions of product manufacturer and referenced glazing publications, to comply with system performance requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Require Glazier to inspect work of framing erector for compliance with manufacturing and installation tolerances and for effective sealing of joinery. Do not allow glazing work to proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Clean glazing channels and other framing members to receive glass, immediately before glazing.
- B. Comply with combined printed recommendations of glass manufacturers, of manufacturers of sealants, tapes, and other glazing materials, except where more stringent requirements are indicated, including those of referenced glazing standards.

3.3 GLAZING

- A. General: Comply with combined written instructions of manufacturers of glass, sealants, gaskets and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.
- B. Provide edge and setting blocks to comply with requirements of referenced glazing standard, except where otherwise required by glass unit manufacturer.
- C. Set units of glass in each series with uniformity of pattern, draw, bow and similar characteristics.

- D. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could when installed, could weaken glass and impair performance and appearance.
- E. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
- F. Provide spacers for glass lites where length plus width is larger than 50 inches.
- G. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.

3.4 PROTECTION AND CLEANING

- A. Protect glass from contact with contaminating substances resulting from construction operations.
- B. Remove and replace glass which is broken, chipped, cracked, abraded or damaged in other ways during construction period, including natural causes, accidents and vandalism.
- C. Wash glass on both faces by method recommended by glass manufacturer immediately before date of Substantial Completion.

SPECIFICATION DIVISION 8

NUMBER SECTION DESCRIPTION

DIVISION 08 OPENINGS

SECTION 089000 - LOUVERS AND VENTS

END OF CONTENTS TABLE

DIVISION 08 OPENINGS
SECTION 089000 - LOUVERS AND VENTS

COORDINATE WITH MECHANICAL FOR LOUVER REQUIREMENTS AND LOCATION IN SPECIFICATION. ON SOME PROJECTS, MECHANICAL INCLUDES LOUVERS IN SECTION 233100.

THIS SECTION SPECIFIES EXTERIOR LOUVERS. USUALLY SPECIFY DOOR LOUVERS IN APPROPRIATE WOOD OR METAL DOOR SECTIONS. IF DOOR LOUVERS SPECIFIED HERE, INCLUDE APPROPRIATE CROSS REFERENCES IN BOTH DOOR AND LOUVER SECTIONS.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of louvers is indicated on drawings.
- B. Type of louver is exterior wall mounted, drainable blade louver.

1.2 QUALITY ASSURANCE

- A. Standards: Provide units whose ratings have been determined in compliance with AMCA Standard 500. Comply with "Architectural Sheet Metal Manual" recommendations for fabrication, construction and installation procedures.
- B. Field Measurements: Verify size of louver units prior to fabrication.

1.3 SUBMITTALS

- A. Product Data: Mfr's literature indicating compliance with requirements.
- B. Samples for Initial Selection: Submit manufacturer's brochure indicating full range of manufacturer's standard finishes.

PART 2 - PRODUCTS

COORDINATE PRODUCT SELECTION WITH M/E.

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer/Model: Ruskin Manufacturing Co./ELF 375D, or (subject to compliance with requirements of this Section) products of one of the following:
The Airolite Co.
American Warming and Ventilating Co.
Construction Specialties, Inc.
Industrial Louvers, Inc.
Tuttle and Bailey Co.

2.2 STATIONARY, DRAINABLE BLADE LOUVER

- A. Provide units with aluminum extrusions not less than 0.081" thick, and with the following characteristics:
 - 1. Free Area: Not less than 60 percent for 48 inch by 48 inch size.
 - 2. Maximum Static Pressure Loss: 0.08 inch w.g. at 2100 cfm.

2.3 FABRICATION

- A. Fabricate frames, including sills to suit adjacent construction and provide mullions at spacing no further apart than recommended by mfr.
- B. Louver Screens: Inside mounted, galvanized steel bird screens, 1/2 inch by 1/2 inch grid, mounted in removable anodized aluminum frame.
- C. Flanges: Provide flanged edges for duct connection.
- D. Metal Finishes: Comply with NAAMM "Metal Finishes Manual" to provide uniformly finished products:
 - 1. Inhibitive thermo-cured primer, 0.2 mil dry film thickness; thermo-cured fluorocarbon coating, 1.0 mil min. dry film thickness; "Kynar 500" based coatings. Color as selected by Architect from mfr's standard colors.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install plumb, level, in proper alignment with adjoining work, and in accordance with mfr's instructions. Use non-ferrous metal or galvanized anchors and inserts. Coat surfaces of aluminum in contact with dissimilar metals, concrete, or masonry with zinc chromate primer or bituminous paint.
 - 1. Provide concealed gasket, flashings and joint fillers as indicated, and as required to make installation weather-tight.
- B. Repair damaged finishes leaving no evidence of corrective work.

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 092116 - GYPSUM BOARD ASSEMBLIES

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 092116 - GYPSUM BOARD ASSEMBLIES

THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO SMALL RENOVATION PROJECTS. USE AIA MASTERSPEC SECTION OF SAME NAME AND NUMBER FOR SUCH ASSEMBLIES AS SUSPENDED GYP. CEILINGS HUNG BY MEANS OTHER THAN STUDS, CURVED WALLS, THERMALLY INSULATING WALLS AND WORK IN NEW STRUCTURES. USE SECTION 092913 "GYPSUM BOARD SHAFT-WALL ASSEMBLIES" FOR SHAFT-WALLS AROUND STAIRS AND ELEVATORS.

12/1/2017 - ADDED IDENTIFICATION REQUIREMENTS.

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Gypsum board assemblies, including nonload-bearing steel framing.

DELETE BELOW IF NO WATER-RESISTANT GYPSUM DRYWALL BACKERS FOR TILE.

2. Water-resistant gypsum drywall backer units installed with gypsum board assemblies.

DELETE BELOW IF NO CEMENTITIOUS BACKERS FOR TILE.

3. Cementitious backer units installed with gypsum board assemblies.

DELETE BELOW IF NO SHAFT WALL ASSEMBLIES.

4. Gypsum board shaft-wall assemblies.

1.2 ASSEMBLY PERFORMANCE REQUIREMENTS

DELETE BELOW IF STC-RATED ASSEMBLIES ARE NOT REQUIRED. IF RETAINING PARA, INDICATE STC RATINGS ON DRAWINGS.

A. Sound Transmission Characteristics: Where STC ratings are indicated, provide assemblies with STC ratings determined and classified in accordance with ASTM E 90 and ASTM E 413, respectively.

DELETE BELOW IF NO FIRE-RATED GYPSUM BOARD ASSEMBLIES.

B. Fire Resistance: Provide gypsum board assemblies with fire-resistance ratings indicated.

DELETE BELOW IF NO SHAFT WALL IS INCLUDED IN PROJECT.

- C. Shaft-Wall Performance Requirements: Provide gypsum board shaft-wall assemblies that are composed of proprietary gypsum board panels and metal components designed for erection from outside the shafts, and that comply with performance requirements specified as determined from testing manufacturers' standard assemblies representing those indicated for this Project.

1.3 SUBMITTALS

- A. Product data for each type of product specified.

1.4 QUALITY ASSURANCE

DELETE BELOW IF NO FIRE-RATED ASSEMBLIES. INDICATE RATING, TESTING AGENCY, AND TESTING AGENCY'S DESIGN DESIGNATION ON DRAWINGS.

- A. Fire-Test-Response Characteristics: Provide assemblies identical to those specified by indicated GA File Numbers in GA-600 "Fire Resistance Design Manual" or design designations in UL "Fire Resistance Directory," and that have been tested for fire resistance according to ASTM E 119 by an independent testing and inspecting agency.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Gypsum Board and Related Products:
 - a. CertainTeed Saint-Gobain
 - b. Georgia-Pacific Corp.
 - c. Lafarge North America.
 - d. National Gypsum Co.
 - e. United States Gypsum Co.
 - 2. Steel Framing and Furring:
 - a. Clark Dietrich Building Systems.
 - b. Jaimes Industries. Inc.

DELETE BELOW IF NO TILE BACKER PANELS.

- 3. Gypsum Backer Units:
 - a. Georgia-Pacific.
- 4. Cementitious Backer Units:
 - a. FinPan, Inc.
 - b. Georgia-Pacific Corp.
 - c. National Gypsum Co.
 - d. United States Gypsum Co.

DELETE BELOW IF NO SHAFT-WALL.

- 5. Gypsum Board Shaft-Wall Assemblies:
 - a. Dietrich Industries, Inc.
 - b. Georgia-Pacific Corp.
 - c. National Gypsum Co.
 - d. United States Gypsum Co.

2.2 STEEL FRAMING FOR SUSPENDED CEILINGS

DELETE ARTICLE IF NO SUSPENDED OR FURRED CEILINGS.

- A. General: Provide components complying with ASTM C 754 for conditions indicated.

DELETE BELOW IF NO STEEL STUDS USED FOR CEILING/SOFFIT FRAMING.

- B. Steel Studs for Ceiling Furring Channels: ASTM C 645, complying with the following requirements:

MODIFY BELOW TO 0.0329 INCH IF DESIRED.

1. Minimum Base (Uncoated) Metal Thickness: 0.027 inch, unless otherwise indicated.
2. Depth: 2-1/2 inches, unless otherwise indicated.
3. Protective Coating: ASTM A 653, G 40 hot-dip galvanized coating.

2.3 STEEL FRAMING FOR WALLS AND PARTITIONS

- A. General: Provide framing shapes as indicated, and with the following finish:

1. Protective Coating: Manufacturer's standard corrosion-resistant coating.

USUALLY RETAIN ABOVE AND DELETE BELOW. RETAIN BELOW IF MOISTURE RESISTANCE IS IMPORTANT (WET LABS, TOILETS, ANIMAL ROOMS, EXTERIOR AREAS, ETC.).

2. Protective Coating: ASTM A 653, G 40 hot-dip galvanized coating.

- B. Steel Studs and Runners: ASTM C 645, Manufacturer's standard profiles, and complying with the following requirements:

MODIFY BELOW TO 0.0329 INCH IF DESIRED.

1. Minimum Base (Uncoated) Metal Thickness: As indicated on drawings, or if not indicated, 0.0329 inch.

REVISE BELOW IF REQUIRED. COMMON ALTERNATIVES INCLUDE 1-5/8", 2-1/2", 4", AND 6".

2. Minimum Depth: 3-5/8 inches, unless otherwise indicated.

BELOW IS PROPRIETARY DEFLECTION-TOLERANT TOP TRACK SYSTEM FOR FIRE-RATED PARTITIONS UP TO UNDERSIDE OF METAL ROOF DECKS, OR OTHER CONDITIONS WHERE DEFLECTION OF MORE THAN ABOUT 1/4-INCH IS EXPECTED. NOTE THAT TYPICAL PERIMETER RELIEF JOINT DETAILS ARE LIMITED TO 1/2-INCH MAXIMUM WIDTH.

- C. Deflection and Firestop Track: Top runner designed to allow partition heads to expand and contract with movement of structure above while maintaining continuity of the assembly. Comply with requirements of ASTM C 645 except configuration, of thickness indicated for studs and width to accommodate depth of studs indicated with flanges offset at midpoint to accommodate gypsum board thickness.

1. Offset Configuration: Shadow-line design with offset projecting out from depth of stud.
2. Product: Subject to compliance with requirements, a product that may be incorporated in the Work includes, but is not limited to, "Fire Trak" manufactured by Fire Trak Corp.

BELOW IS PROPRIETARY TOP TRACK SYSTEM FOR PARTITIONS UP TO UNDERSIDE OF SUSPENDED CEILINGS. DELETE IF WALLS PENETRATE CEILINGS.

- D. Prefinished Top Track: Proprietary, pre-finished stud receptor track mounted to suspended ceiling grid. ASTM C 645, 25 gage galvanized steel; and as follows:
1. Accessories: Manufacturer's standard applied trim accessories for outside corners, wall ends and similar conditions requiring additional trim for a complete, finished appearance.
 2. Finish: Baked-on polyester paint in color to match suspended ceiling grid manufacturer's standard white.
 3. Product: Eliminator Track; Pro Products Mfg.
- E. Steel Rigid Furring Channels: ASTM C 645, hat shaped, depth and 0.0179 inch minimum thickness of base (uncoated) metal, unless otherwise indicated. Provide furring brackets if recommended by manufacturer for application indicated.

INCH DEPTH FOR BELOW IS ALSO AVAILABLE.

1. Depth: 7/8 inch.

RETAIN BELOW IF STEEL SHEET BLOCKING OR BRACING IS REQUIRED. INDICATE LOCATIONS, LENGTHS, AND WIDTHS ON DRAWINGS OR ADD A DETAILED DESCRIPTION TO TEXT.

- F. Steel Flat Strap and Backing Plate: Steel sheet for blocking and bracing, length and width as indicated, complying with ASTM A 653 or ASTM A 568, as follows:
1. Base (Uncoated) Metal Thickness: 0.0598 inch unless otherwise indicated.

2.4 GYPSUM BOARD PRODUCTS

- A. General: Provide gypsum board of types indicated in maximum lengths available that will minimize end-to-end butt joints.
- B. Gypsum Wallboard: ASTM C1396 and regular type for vertical surfaces, sag resistant for horizontal surfaces, Type X where required for fire-resistance-rated assemblies.
1. Thickness: Unless otherwise indicated, provide units that are 5/8 inch thick for all applications except 1/2 inch thick for ceilings and soffits.

DELETE ARTICLE IF NO SHAFT-WALL REQUIRED FOR PROJECT.

- C. Gypsum Liner Panels: Proprietary liner panels as required for the specific fire-resistant-rated gypsum board shaft-wall assemblies indicated, with moisture-resistant paper facings.

DELETE BELOW IF CEMENTITIOUS BACKER UNITS ARE EXCLUSIVELY SPECIFIED AS BASE FOR TILE.

- D. Glass-Mat, Water-Resistant Gypsum Backing Board: ASTM C 1178, of type and thickness indicated below:
 - 1. Type and Thickness: Regular, 1/2 inch (12.7 mm) thick, unless otherwise indicated.
 - 2. Type and Thickness: Type X, 5/8 inch (15.9 mm) thick, where required for fire-resistance-rated assemblies and where indicated.
 - 3. Products: Subject to compliance with requirements, provide "Dens-Shield Tile Backer" manufactured by Georgia-Pacific Corp.

2.5 CEMENTITIOUS BACKER UNITS

DELETE ARTICLE IF CEMENTITIOUS BACKER UNITS ARE NOT REQUIRED FOR PROJECT OR IF SPECIFIED IN ANOTHER SECTION.

- A. Provide cementitious backer units complying with ANSI A118.9 and in maximum lengths available to minimize end-to-end butt joints.
 - 1. Thickness: Manufacturer's standard thickness, but not less than 7/16 inch, unless otherwise indicated.
 - 2. Width: Manufacturer's standard width, but not less than 32 inches.

2.6 TRIM ACCESSORIES

- A. Accessories: Formed steel sheet zinc coated by hot-dip process, or rolled zinc, complying with the requirements of ASTM C 1047 for cornerbead, L, LC, U shapes.
- B. One-piece control joint formed from rolled zinc with V-shaped slot and removable strip covering slot opening.

ADD ACCESSORIES FOR CURVED EDGES HERE, IF ANY - SEE AIABAS.

2.7 JOINT TREATMENT MATERIALS

- A. General: Provide joint treatment materials complying with ASTM C 475 and the recommendations of both the manufacturers of sheet products and of joint treatment materials.

BELOW IS ONLY DRYING TYPE COMPOUND. SPECIFY SETTING-TYPE JOINT COMPOUNDS WHERE FAST ONE-DAY FINISHING IS REQUIRED, OR WHERE RAPID DRYING CONDITIONS WOULD CAUSE DRYING-TYPE JOINT COMPOUNDS TO SHRINK AND LOSE SURFACE STRENGTH. SEE AIABAS FOR LANGUAGE AND DETAILS.

- B. Joint Treatment for Gypsum Board: Provide paper reinforcing tape; and factory-packaged, vinyl-based, jobsite- or factory-mixed products. At Contractor's option, provide either specifically formulated taping and topping compounds or all-purpose compounds.

RETAIN BELOW IF CEMENTITIOUS BACKER UNITS ARE SPECIFIED IN THIS SECTION.

- C. Joint Treatment Cementitious Backer Units: Tape and compound as recommended by cementitious backer unit manufacturer.

2.8 MISCELLANEOUS MATERIALS

DELETE PRODUCTS NOT NEEDED. EDIT PART 3 FIRST AND RETAIN APPLICABLE PRODUCTS IN THIS ARTICLE.

- A. Acoustical Sealant for Exposed and Concealed Joints: Latex sealant complying with ASTM C 834; and subject to compliance with requirements, one of the following products:
 - 1. PL Acoustical Sealant; ChemRex, Inc.; Contech Brands.
 - 2. AC-20 FTR Acoust. and Insul. Sealant; Pecora Corp.
 - 3. SHEETROCK Acoustical Sealant; USG Co.
- B. Laminating Adhesive: Special adhesive or joint compound recommended for laminating gypsum panels.
- C. Spot Grout: ASTM C 475, setting-type joint compound recommended for spot-grouting hollow metal door frames.
- D. Foam Gaskets: Closed-cell vinyl foam adhesive-backed strips, 1/8 inch thick, in width to suit metal stud size.
- E. Sound-Attenuation Blankets: Unfaced mineral-fiber blanket insulation produced by combining glass fibers with thermosetting resins to comply with ASTM C 665 for Type I (blankets without membrane facing).

CHANGE BELOW TO ASTM C 954 IF GYPSUM WILL BE ATTACHED TO COLD-FORMED STEEL FRAMING SPECIFIED IN DIVISION 5.

- F. Fasteners: Provide size and type of screws recommended by manufacturer for application indicated, and as follows:
 - 1. Metal and Gypsum Board: Steel drill screws complying with ASTM C 1002 and of size, corrosion resistance and holding power required to fasten steel framing and furring members securely to substrates involved.

RETAIN BELOW IF CEMENTITIOUS BACKER UNITS ARE SPECIFIED IN THIS SECTION.

- 2. Cementitious Backer Units: Corrosion-resistant screws recommended by panel manufacturer.

BELOW IS FOR ATTACHING STEEL FRAMING INTO CONCRETE.

- 3. Powder-Actuated Fasteners in Concrete: Corrosion-resistant materials suitable for application and capable of sustaining, without failure, a load equal to 5 times that imposed by ceiling construction, as determined by testing according to ASTM E 1190.

DELETE ARTICLE BELOW IF NO SHAFT-WALL.

2.9 SHAFT-WALL BASIC ASSEMBLY DESCRIPTION

- A. Cavity Shaft-Wall Assemblies: Provide assemblies constructed of proprietary gypsum liner panels inserted between steel tracks at each end of studs; with specially shaped steel studs engaged in tracks and fitted between gypsum liner panels; and with gypsum board on finished side or sides applied to studs in the number of layers, thicknesses and arrangement indicated.
 - 1. Gypsum Liner Panel Thickness: As standard with manufacturer for gypsum board shaft-wall assemblies indicated.
 - 2. Stud Shape and Depth and Thickness: As standard with manufacturer for gypsum board shaft-wall assemblies indicated; but not less than 0.0284-inch minimum base metal thickness.
 - 3. Room-Side Finish: As indicated.

PART 3 - EXECUTION

3.1 INSTALLING STEEL FRAMING, GENERAL

- A. Steel Framing Installation Standard: Comply with ASTM C 754 and with ASTM C 840 requirements that apply to framing installation.

DELETE BELOW IF NONE. WHERE ITEMS TO BE SUPPORTED ARE NOT SHOWN ON DRAWINGS (SUCH AS OWNER'S LAB EQUIPMENT AND BINDER BINS FOR MOVABLE FURNITURE), CONSIDER SCHEDULING LOCATIONS AND SIZES OF SUPPORT PANELS IN "SCHEDULING" ARTICLE AT END OF SECTION, OR ON DRAWINGS.

- B. Install supplementary framing, blocking, and bracing at terminations to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction. Comply with details shown or, if not shown, with USG Co.'s "Gypsum Construction Handbook."
- C. Isolate steel framing from building structure at the following locations:

BELOW ARE EXAMPLES ONLY. RETAIN OR REVISE TO SUIT PROJECT.

- 1. In ceilings where building structure abuts ceiling perimeter or penetrates ceiling.
- 2. Where partition framing and wall furring abut structure, except at floor.

INCLUDE DETAILS ON DRAWINGS SHOWING CONTROL- AND EXPANSION-JOINT CONSTRUCTION AND LOCATIONS FOR BOTH FIRE-RESISTANCE-RATED AND NONRATED ASSEMBLIES.

- D. Independently frame both sides of joints at building control and expansion joints.

3.2 INSTALLING STEEL FRAMING FOR SUSPENDED CEILINGS

DELETE THIS ARTICLE IF NO SUSPENDED CEILINGS/SOFFITS.

A. Install suspended steel framing components in sizes and at spacings indicated, but not less than that required by the referenced steel framing installation standard.

1. Do not connect or suspend steel framing from ducts, pipes, or conduit, or attach to steel roof deck.
2. Framing Channel Spacing: 16 inches o.c.

USUALLY DELETE BELOW AND RETAIN ABOVE.

3. Framing Channel Spacing: 24 inches o.c.

B. Installation Tolerances: Install with cross-furring members level to within 1/8 inch in 12 feet as measured both lengthwise on each member and transversely between parallel members.

3.3 INSTALLING STEEL FRAMING FOR WALLS AND PARTITIONS

A. Install runners (tracks) at floors and ceilings, and structural walls and columns where gypsum board stud assemblies abut other construction.

RETAIN BELOW IF STUDS WILL ABUT MASONRY OR DISSIMILAR METALS AT EXTERIOR WALLS.

1. Where studs are installed directly against exterior walls, install foam gaskets between studs and wall.

B. Installation Tolerances: Install each steel framing and furring member so that fastening surfaces do not vary more than 1/8 inch from the plane formed by the faces of adjacent framing.

C. Extend partition framing to height indicated. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.

EDIT PARA BELOW TO SUIT PROJECT CONDITIONS. BE SURE TO SHOW PERIMETER RELIEF DETAIL ON DRAWINGS - ONE CAN BE FOUND IN THE "USE OF MANUAL" CHAPTER OF THE GYPSUM ASSOCIATION "FIRE RESISTANCE AND SOUND CONTROL MANUAL."

1. Terminate partition framing as shown on Drawings; or if not shown, as follows:

SELECT ONE BELOW.

- a. At suspended ceilings.

DELETE IF NOT REQUIRED. SEE DISCUSSION UNDER "PRODUCTS" PART IN THIS SECTION.

- 1) Install proprietary prefinished top track.
- b. 6-inches above exposed face of suspended acoustic ceiling panels.
- c. Full height to structural supports or substrates above suspended ceilings, if any. Cut studs 1/2 inch short of full height to provide perimeter relief.

EDIT BELOW TO SUIT PROJECT, OR DELETE IF NOT REQUIRED. SEE DISCUSSION UNDER "PRODUCTS" PART IN THIS SECTION.

- 1) Install proprietary deflection and firestop track at fire-rated partitions, and as otherwise indicated.

RETAIN, REVISE OR DELETE BELOW TO SUIT PROJECT.

2. For STC-rated and fire-resistance-rated partitions that extend to the underside of floor/roof slabs and decks or other continuous solid structural surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed, to support gypsum board closures needed to make partitions continuous from floor to underside of solid structure.

D. Install steel studs and furring in sizes and at spacings as follows:

1. Maximum spacing between studs: 16-inches o.c., unless otherwise indicated.

SELECT EITHER ABOVE OR BELOW. USE 16-INCH MINIMUM SPACING FOR CEMENTITIOUS BACKER UNITS.

2. Maximum spacing between studs: 24-inches o.c., unless otherwise indicated.

E. Frame openings to comply with GA-219, and with applicable published recommendations of gypsum board manufacturer, unless otherwise indicated. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.

1. Install 2 studs at each jamb, unless otherwise indicated.

ADD REQUIREMENTS FOR INSTALLATION OF THERMAL INSULATION AND VAPOR BARRIERS HERE. SEE AIABAS FOR DETAILS.

3.4 APPLYING AND FINISHING GYPSUM BOARD, GENERAL

- A. Gypsum Board Application and Finishing Standards: Install and finish gypsum panels to comply with ASTM C 840 and GA-216.
- B. Install gypsum panels with face side out.
- C. Locate both edge or end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Avoid joints other than control joints at corners of framed openings where possible.

DELETE BELOW IF HOLLOW METAL DOOR FRAMES ARE NOT USED IN STEEL-FRAMED PARTITIONS.

- D. Spot grout hollow metal door frames for solid-core wood doors, hollow metal doors, and doors over 32 inches wide. Apply spot grout at each jamb anchor clip and immediately insert gypsum panels into frames.
- E. Form control and expansion joints at locations indicated and as detailed, with space between edges of adjoining gypsum panels, as well as supporting framing behind gypsum panels.

- F. Isolate perimeter of gypsum board partitions at structural abutments, except floors, with 1/4- to 1/2-inch-wide spaces and trim edges with LC-bead edge trim where edges of gypsum panels are exposed. Seal joints between edges and abutting structural surfaces with acoustical sealant.

DELETE BELOW IF NO SOUND-RATED PARTITIONS.

- G. Where STC-rated gypsum board assemblies are indicated, seal construction at perimeters, behind control and expansion joints, openings, and penetrations with a continuous bead of acoustical sealant including a bead at both faces of the partitions. Comply with ASTM C 919 and manufacturer's recommendations for location of edge trim and closing off sound-flanking paths around or through gypsum board assemblies, including sealing partitions above acoustical ceilings.
- H. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's recommendations.
 - 1. Space screws a maximum of 12 inches o.c. for vertical applications.

DELETE BELOW IF NO TILE BACKER BOARD.

- I. Space fasteners in tile substrate panels a maximum of 8 inches o.c.

3.5 GYPSUM BOARD APPLICATION METHODS

- A. Install gypsum wallboard panels on ceilings prior to wall/partition board application and at right angles to framing.
- B. On partitions/walls, apply gypsum panels horizontally (perpendicular to framing), unless parallel application is required for fire-resistance-rated assemblies. Use maximum-length panels to minimize end joints. Stagger abutting end joints not less than one framing member in alternate courses of board.
 - 1. On Z-furring members, apply gypsum panels vertically (parallel to framing) with no end joints. Locate edge joints over furring members.

DELETE PARA AND SUBPARAS BELOW IF NONE.

- C. Wall Tile Substrates: For substrates indicated to receive thin-set ceramic tile and similar rigid applied wall finishes, comply with the following:

DELETE BELOW IF WATER-RESISTANT GYPSUM BOARD IS RETAINED BELOW.

- 1. Install cementitious backer units to comply with ANSI A108.11 at showers, and where indicated.

DELETE BELOW IF CEMENTITIOUS BACKER UNITS ARE RETAINED ABOVE. DRAWINGS SHOULD SHOW SEALANT INSTALLED IN 1/4-INCH GAP.

- 2. Install water-resistant gypsum backing board panels at showers, tubs, and where indicated. Install with 1/4-inch open space where panels abut other construction or penetrations.

RETAIN BELOW IF REGULAR GYPSUM BOARD IS ACCEPTABLE AS WALL-TILE SUBSTRATE FOR DRY LOCATIONS.

3. Install gypsum wallboard panels with tapered edges taped and finished to produce a flat surface except at showers, tubs, and other locations indicated to receive water-resistant panels.
- D. Apply gypsum panels to supports with screws.
- E. Direct-Bonding to Substrate: Where gypsum panels are indicated as directly adhered to a substrate (other than studs, joists, furring members, or base layer of gypsum board), comply with gypsum board manufacturer's recommendations, and temporarily brace or fasten gypsum panels until fastening adhesive has set.

3.6 INSTALLING TRIM ACCESSORIES

- A. General: Fasten trim accessories according to accessory manufacturer's directions for type, length, and spacing of fasteners.

BELOW ARE EXAMPLES OF UNIVERSAL SCOPE DEFINITIONS FOR USING TRIM. REVISE AS DESIRED OR SHOW ON DRAWINGS.

- B. Install cornerbead at external corners.
- C. Install edge trim where edge of gypsum panels would otherwise be exposed. Provide edge trim type with face flange formed to receive joint compound, except where other types are indicated.
- D. Install control joints according to ASTM C 840 and manufacturer's recommendations and in specific locations approved by Architect for visual effect.

DELETE BELOW IF NO SHAFT-WALL INCLUDED IN PROJECT.

3.7 INSTALLATION OF GYPSUM BOARD SHAFT-WALL ASSEMBLIES

- A. General: Install gypsum board shaft-wall assemblies to comply with performance and other requirements indicated as well as with manufacturer's installation instructions and ASTM C 754 for installing steel framing.
- B. Do not bridge building expansion joints with shaft-wall assemblies; frame both sides of joints with furring and other support as indicated.
- C. At penetrations in shaft wall, maintain fire-resistance rating of entire shaft-wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices similar items.

3.8 FINISHING GYPSUM BOARD ASSEMBLIES

- A. Levels of Gypsum Board Finish: Provide the following levels of gypsum board finish per GA-214.

DELETE LEVELS BELOW THAT DO NOT APPLY TO PROJECT.

1. Level 1 for ceiling plenum areas, concealed areas, and where indicated, unless a higher level of finish is required for fire-resistance-rated assemblies and sound-rated assemblies.
2. Level 4 for gypsum board surfaces, unless otherwise indicated.

BELOW REQUIRES SKIM COAT OVER ENTIRE SURFACE. RETAIN IF RIGID TRIM IS INSTALLED ON SHORT WALL SEGMENTS TO AVOID GAPS BEHIND TRIM THAT OCCUR BETWEEN TWO CLOSELY SPACED, BUILT UP EDGES.

3. Level 5 for gypsum board the following surfaces where wood, stone, or cast plastic trim or base are indicated:
 - a. At gypsum column enclosures.
 - b. Where wall segments are less than 48-inches wide.
 - c. Where indicated.

- B. Where Level 1 gypsum board finish is indicated, embed tape in joint compound.

PARA BELOW ASSUMES LEVEL 4 FINISH IS DEFAULT REQUIREMENT. IF NOT, REVISE OR DELETE PARA TO SUIT PROJECT.

- C. For Level 4 gypsum board finish, embed tape in joint compound and apply first, fill (second), and finish (third) coats of joint compound over joints, angles, fastener heads, and accessories. Touch up and sand between coats and after last coat as needed to produce a surface free of visual defects and ready for decoration.

DELETE BELOW IF LEVEL 5 IS NOT REQUIRED FOR PROJECT.

- D. Where Level 5 gypsum board finish is indicated, after application of embedding, fill and finish coats, apply a thin, uniform skim coat of joint compound over entire surface. Touch up and sand between coats and after last coat as needed to produce a surface free of visual defects, tool marks, and ridges and ready for decoration.

DELETE BELOW IF NO CEMENTITIOUS BACKER UNITS OR IF SPECIFIED IN DIVISION 9 SECTION "TILE."

- E. Finish cementitious backer units to comply with unit manufacturer's directions.

3.9 IDENTIFICATION

- A. Provide permanent identification of all assemblies requiring opening protectives including fire walls, fire barriers, fire partitions, and smoke barriers.
- B. Install in accordance with the requirements of Michigan Building Code chapter 7.
- C. Location:
 1. Locate in accessible concealed spaces above finished ceiling. In locations without accessible concealed location, coordinate location with architect.
 2. Locate within 15 feet of the end of each wall and at intervals not exceeding 30 feet measured horizontally along the assembly.
- D. Signage requirements:
 1. Lettering:
 - a. 3-inch minimum; 3/8-inch stroke width.

- b. Color: Red on white background
- 2. Verbiage incorporating project specific hourly rating. Refer to life safety plan for rating requirements:
 - a. FIRE RATED ASSEMBLY (__HR) - PROTECT ALL OPENING
 - b. SMOKE BARRIER - PROTECT ALL OPENINGS

3.10 CLEANING AND PROTECTION

- A. Promptly remove any residual joint compound from adjacent surfaces.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 092300 - GYPSUM PLASTERING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 092300 - GYPSUM PLASTERING

*EDIT THIS SECTION ON WET PLASTER WORK IN CONJUNCTION WITH USG
GYPSUM CONSTRUCTION HANDBOOK OR OTHER REFERENCE WORK.*

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of plaster work in indicated on Drawings and in schedules.
- B. Type of plaster work and accessories include:
 - 1. Gypsum plaster.
 - 2. Gypsum board plaster base.
 - 3. Metal lath.

1.2 SUBMITTALS

- A. Submit manufacturer's product literature for each product specified.

1.3 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in original packages bearing brand name and identification of manufacturer.

PART 2 - PRODUCTS

2.1 PLASTER MATERIALS

*SELECT ONE OF THE FOLLOWING OR DELETE IF GYPSUM BOARD LATH IS
USED*

- A. Base Coat Plaster: Comply with ASTM C 28 and Federal Specification SS-P-00402B, Type II.
 - 1. Product: U.S. Gypsum Co.; "Regular Red Top Gypsum Plaster" or equivalent of other approved manufacturer.
- B. Base Coat Plaster: High strength gypsum neat plaster with a minimum average dry compressive strength of 2,800 psi per ASTM C 472 for a mix of 100 lbs. plaster and 2 cu. ft. of sand.
 - 1. Product: Structo-Base; United States Gypsum Co.

SELECT ONE OF THE FOLLOWING

- C. Gypsum Gauging Plaster: Comply with ASTM C28 and Federal Specification SS-P-00402B, Type V.
 - 1. Manufacturer: U.S. Gypsum Co. "Champion", "Star", "Red Top", or equal.
- D. Gypsum Gauging Plaster: High-strength gypsum gauging plaster, ASTM C 28, with a minimum average dry compressive strength of 5,000 psi per ASTM C 472 for a neat mix.

1. Product: Structo-Gauge; United States Gypsum Co.
- E. Finishing Hydrated Limes: ASTM C 206, type as indicated below:
 1. Type S: Special hydrated lime for finishing purposes.
 2. Manufacturer/Product: Provide one of the following:
 - a. "Ivory Finish Lime"; United States Gypsum Co.
 - b. "Snowdrift Finish Lime"; United States Gypsum Co.

DELETE BELOW IF GYPSUM BOARD BASE IS USED

- F. Aggregates for Base Coat Plasters: ASTM C 35, types as indicated below:
 1. Sand aggregate, clean and free of dirt, clay and other deleterious materials.
- G. Aggregates for Finish Coat Plaster with Floated Finish: ASTM C 35; graded per ASTM C 842, type as indicated below.
 1. Sand aggregate, clean and free of dirt, clay and other deleterious materials.

2.2 LATH

SELECT ONE OF THE FOLLOWING LATH TYPES

- A. Gypsum Lath: Gypsum board plaster base to comply with ASTM C37 and Federal Specification SS-L-30D, Type I.
 1. Manufacturer: U.S. Gypsum Co. "Rocklath" or equal.
- B. Metal Lath: Diamond metal mesh (approximately 11,000 meshes per sq yd) complying with Federal Specification QQ-L-101C. Mesh to be composed of expanded sheet steel that has been coated with asphaltum paint. Metal lath to have a weight of 3.4 lbs per sq yd or greater.
 1. Manufacturer: U.S. Gypsum Co. "Junior Diamond Mesh Lath" or equal.
- C. Water for Mixing and Finishing Plaster: Drinkable, free of substances capable of affecting plaster set or of damaging plaster, lath or accessories.

2.3 ACCESSORIES

- A. General: Comply with material provisions of ASTM C 841; coordinate depth of accessories with thicknesses and number of plaster coats required.
- B. Provide metal accessories including casing beads, corner beads, grounds screeds, cornerite and stripite as indicated and as recommended by manufacturer of plaster materials.
- C. Metal Corner Beads: Type as indicated below, fabricated from zinc coated (galvanized) steel.
 1. Type: Bull nose, radius 3/4 inch minimum, with expanded flanges, at locations indicated.

2.4 MIXING

- A. Mechanically mix cementitious and aggregate materials for plasters to comply with applicable referenced application standard and with recommendations of plaster manufacturer.

PART 3 - EXECUTION

3.1 APPLICATION

- A. Prepare monolithic surfaces for bonded base coats and use bonding compound or agent to comply with requirements of referenced plaster application standards for conditioning of monolithic surfaces.
- B. Tolerances: Do not deviate more than 1/8 inch in 10 feet from a true plane unfinished plaster surfaces, as measured by a 10 feet straightedge placed at any location on surface.
- C. Sequence plaster application with the installation and protection of other work, so that neither will be damaged by the installation of the other.
- D. Plaster flush with metal frames and other built-in metal items or accessories which act as a plaster ground, unless otherwise indicated. Where plaster is not terminated at metal by casing beads, cut base coat free from metal before plaster sets and groove finish coat at the junctures with metal.
- E. Apply thicknesses and number of coats of plaster as indicated and to match existing adjacent applications; or as required by referenced standards.
- F. Interior Gypsum Plaster Application Standard: Apply gypsum plaster materials, composition, mixes, and finishes indicated to comply with ASTM C 842.
- G. Number of Coats: Apply gypsum plaster, of composition indicated, to comply with the following requirements.
 - 1. Use two-coat work over concrete masonry units.
- H. Finish Coats: Apply finish coats to comply with the following requirements:
 - 1. Floated finish for gypsum finish coats of type and where indicated; match existing adjacent materials for texture and color.

3.2 CLEANING AND PROTECTION

- A. Remove temporary protection and enclosure of other work. Promptly remove plaster from door frames, windows, and other surfaces which are not to be plastered. Repair floors, walls and other surfaces which have been stained, marred or otherwise damaged during the plastering work. When plastering work is completed, remove unused materials, containers and equipment and clean floors of plaster debris.

- B. Provide final protection and maintain conditions, in a manner suitable to Installer, which ensures plaster work being without damage or deterioration at time of substantial completion.

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 093000 - TILING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 093000 - TILING

THIS SECTION HAS BEEN PRE-EDITED TO APPLY ONLY TO SMALL RENOVATION PROJECTS USING UNGLAZED CERAMIC TILE. EDIT THIS SECTION USING THE TCA HANDBOOK (OR WEBSITE). USE AIA MASTERSPEC SECTION OF SAME NAME AND NUMBER FOR COMPLEX PROJECTS.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of ceramic tile is shown on Drawings.
- B. Types of ceramic tile include:
 - 1. Unglazed ceramic mosaic tile.

1.2 SUBMITTALS

- A. Product Data: Mfr's product data and installation instructions for tile work.
- B. Samples for Initial Selection: Submit 1 sample card for each type of ceramic tile, showing full range of manufacturer's standard colors, textures and patterns.

DELETE BELOW IF NO COLORED GROUT.

- 1. Provide color sample kit for tinted grout.

1.3 QUALITY ASSURANCE

- A. Standards: Comply with referenced ANSI and ASTM materials standards, and with referenced installation methods and materials of referenced Tile Council of America (TCA) Handbook numbers.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers: Subject to compliance with specified performance requirements, provide product of one of the following:

American Olean Tile.
Dal-Tile.
Mannington.
Winburn Tile Mfg. Co.

BELOW FOR UNGLAZED PORCELAIN CERAMIC TILE ONLY. CONSULT MANUFACTURER'S LITERATURE FOR OTHER TILE CHOICES.

2.2 UNGLAZED CERAMIC MOSAIC TILE

- A. Factory-mounted flat tile and as follows:

1. Type: Porcelain.
2. Tile Grade: "Standard".
3. Wearing Surface: Without abrasive content.
4. Face: Plain with all purpose edges.
5. Size and Thickness: Modular 2 inch by 2 inch square; 1/4 inch thick.
6. Trim: Continuous cove base at floor perimeter; bullnose and cove trim where around projections.
 - a. Trim Shapes: Same material, size, color, and texture as field tile.
7. Colors, Textures, and Patterns: Selected by Architect from mfr's standard smooth texture, solid color range.

DELETE FOLLOWING IF NOT REQUIRED. BRASS STRIP AVAILABLE FOR SAME PURPOSE IF DESIRED.

2.3 THRESHOLDS

- A. Marble Thresholds: Group "A"; ASTM C 503, for exterior use with minimum hardness of 10.0 per ASTM C 241; white with honed finish, unless otherwise indicated.

2.4 MORTAR AND GROUT MATERIALS

THE FOLLOWING MATERIALS ARE EXAMPLES ONLY - FIRST EDIT PART 3 TO DETERMINE TCA INSTALLATION METHODS AND THEN EDIT THIS PORTION TO INCLUDE APPROPRIATE MATERIALS.

- A. Comply with the following requirements:
 1. Portland Cement: ASTM C 150 Type 1
 2. Sand: ASTM C 144
 3. Water: Potable

ALSO CONSIDER USING PROPRIETARY PRODUCT SUCH AS MAPEI OR LATICRETE, AS APPLICABLE.

 4. Mortar: As follows:
 - a. Floors: Latex-portland cement conforming to ANSI A118.4.
 - b. Walls, and single unit shower stall floors: Job mixed, material proportions as indicated.
 5. Bond Coat: Dryset mortar or latex-modified portland cement as determined by TCA recommendations.
 6. Grout: ANSI A118.6, Latex modified portland cement.
- B. For indicated application, provide the following additional materials:
 1. Walls:
 - a. Membrane: 4 mil polyethylene.
 - b. Lath: Galvanized or painted metal.
 - c. Lime: ASTM C 206, type S; or ASTM C 207, type S.
 2. Single unit Shower Stalls:
 - a. Reinforcing: ASTM A82 and A185, 2 inch by 2 inch by 16/16 gage welded wire mesh.

PART 3 - EXECUTION

INCLUDE BELOW FOR THINSET TILE.

3.1 PREPARATION

- A. In presence of Installer, inspect substrate conditions for compliance with ceramic tile manufacturer's requirements, and suitability for indicated TCA installation method. Report, in writing, deleterious conditions to Owner's Representative.

USUALLY INCLUDE BELOW.

- 1. Obtain Architect's written approval before beginning installation.

3.2 INSTALLATION

- A. In general, strictly comply with current Tile Council of America Handbook methods as follows:

EDIT FOLLOWING WITH TCA BOOKLET.

- 1. Over new and existing masonry walls: TCA Method W222.
 - 2. Over new and existing concrete floors: TCA method F113.
 - 3. In single shower stall floors: TCA method B414.
- B. Joint Pattern: Use grid pattern with 1/16" wide joints.
 - 1. Floor Installations: Align parallel and perpendicular to walls.
 - 2. Wall Installations: Align vertical and level.
 - C. Install marble thresholds where shown on Drawings, and whether or not shown on Drawings as follows:
 - 1. At edges of ceramic tile installation abutting dissimilar flooring materials (e.g. concrete, carpet, and quarry tile).

3.3 CLEANING AND PROTECTION

- A. Clean tile in accordance with applicable ANSI standard for type of tile and method of installation used and mfr's instructions.
- B. Apply heavy kraft paper or other heavy protective covering to prevent surface damage during construction operations.

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 093033 - STONE TILING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 093033 - STONE TILING

THIS MASTER SPECIFICATION SECTION INCLUDES MANUFACTURED TILE FLOORING ONLY. REFER TO AIA MASTERSPEC FOR OTHER INTERIOR STONework.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of interior stonework is indicated on Drawings.
- B. Interior stonework includes the following:
 - 1. Granite tile flooring.
 - 2. Cast marble tile flooring.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's technical data for each type of stone, stonework accessory and other manufactured product required.
- B. Samples for Initial Selection: Furnish samples of portions of actual stone tile, showing manufacturer's full range of standard products, for Architect's selection. Submit 2 or more samples of each selection representing the full range of color and pattern to be expected in installed material.
- C. Samples for Verification: Provide a 6-inch by 6-inch sample of each selected color for verification purposes. Select samples to represent the full range of color and pattern to be expected in the finished installation.

1.3 QUALITY ASSURANCE

- A. Standards: Comply with referenced ANSI and ASTM materials standards, and with referenced installation methods and materials of referenced Tile Council of America (TCA) Handbook numbers.

PART 2 - PRODUCTS

BELOW ARE EXAMPLES OF TWO TYPES OF FLOOR TILES. MODIFY TO SUIT PROJECT.

2.1 GRANITE FLOOR TILE

- A. Granite Floor Tile: Furnish tiles that have a polished face, and that are sound, durable, and free from pronounced seams or objectionable mineral stains.
 - 1. Size: Nominal 12-inches by 12-inches by 3/8-inch thick.
 - 2. Edges: Slightly beveled.
- B. Product: Provide products of Cold Spring Granite.

1. Color/Pattern: "Charcoal Black".

2.2 CAST MARBLE TILE

- A. Factory cast marble floor tile consisting of not less than 90 percent marble aggregate with polymer binder.
 1. Wearing Surface: Polished, without abrasive content.
 2. Edges: Beveled.
 3. Size: Modular 12-inch by 12-inch by 3/8-inch thick.
 4. Colors, Textures, and Patterns: Selected by Architect from mfr's standard smooth texture, solid color range.
- B. Manufacturer: Provide the following product:
 1. "Armstar", Armstrong World Industries, Inc.

2.3 MORTAR AND GROUT MATERIALS

MODIFY MATERIALS BELOW TO COORDINATE WITH TCA INSTALLATION METHOD SELECTED.

- A. Portland Cement: ASTM C 150 Type 1
- B. Sand: ASTM C 144
- C. Water: Potable
- D. Mortar Bond Coat: Dryset mortar or latex-modified portland cement as determined by TCA recommendations.
- E. Grout: ANSI A118.6, Latex modified portland cement.

2.4 ACCESSORIES

- A. Provide manufacturer's standard carpet thresholds of type, size and profile indicated.
 1. Manufacturer/Model Thresholds: Pemko; No. 174C, or equivalent products of National Guard, Reese, Zero.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Clean adhesive and residue left from previous flooring off concrete floor surface that is to receive new granite floor tile. Before initiating floor tile installation, inspect floor to ensure that it is free of cracks and waxy or oily films. Correct if necessary.
 1. Where uneven floor levels or holes occur, fill, patch, and provide underlayment as required to level surface prior to installation of finished floor material. Underlayment may be latex cement as applicable.
 2. Comply with flooring manufacturer's recommendations for type(s) of materials, project conditions, and intended use.

3.2 INSTALLATION

- A. Installation: In general, strictly comply with Tile Council of America Handbook methods as follows:

BELOW IS EXAMPLE ONLY - MODIFY TO SUIT PROJECT USING TCA HANDBOOK IN SWEET'S.

1. Over existing vinyl composition tile on concrete slab base: TCA method F113-90.

- B. Joint Pattern: Use grid pattern with 1/16-inch wide joints; align parallel and perpendicular to walls.
- C. After floor tile is installed, clean grout off floor tiles to leave a shiny surface.

RETAIN BELOW IF THRESHOLDS ARE INCLUDED.

- D. Install thresholds where shown on Drawings, and whether or not shown on drawings as follows:

MODIFY STATEMENT BELOW TO SUIT PROJECT.

1. At edges of stone tile flooring installation abutting dissimilar flooring materials (e.g. concrete, carpet, and vinyl composition tile).

- E. Attic Stock: Provide 4 full tile for Owner's future use.

3.3 CLEANING AND PROTECTION

- A. Clean tile in accordance with applicable ANSI standard for type of tile and method of installation used and mfr's instructions.
- B. Apply heavy kraft paper or other heavy protective covering to prevent surface damage during construction operations.

3.4 TILE COLOR SCHEDULE

BELOW IS EXAMPLE ONLY.

1. Color No. T1: 8013 "Peppered White".
2. Color No. T2: 8018 "Blued Carnelian".

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 095100 - ACOUSTICAL CEILINGS

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 095100 - ACOUSTICAL CEILINGS

5/19/2014 -- UPDATED TO INCLUDE LATEST PRODUCT INFORMATION.

REMOVED DIRECT ADHERED TILES. CONSULT MANUFACTURER LITERATURE AND AIA MASTERSPEC FOR DIRECT ADHERED ACOUSTICAL TILE APPLICATIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of acoustical ceilings is indicated on Drawings and schedules.

FIRE-RATED CEILINGS ARE NOT INCLUDED IN THIS MASTER. CONSULT CATALOGS FOR PRODUCTS AND INSTALLATION REQUIREMENTS.

- B. Types of acoustical ceiling products include the following:

EDIT BELOW TO SUIT PROJECT REQUIREMENTS.

1. Acoustical lay-in panels of the following types:
 - a. Standard acoustic panels.
 - b. Premium acoustic panels.
 - c. Router-cut patterned acoustic panels.
 - d. Gypsum core acoustic panels.
2. Suspended grid systems, specialty trim and accessories.

INCLUDE ARTICLE BELOW IF DEMOLITION OPERATIONS WILL RECYCLE ACOUSTICAL PANELS. NOTE THAT NOT ALL ACOUSTICAL MATERIAL IS ABLE TO BE RECYCLED. ASBESTOS-CONTAINING PRODUCTS CANNOT BE RECYCLED, AND FOIL-BACKED AND FIBERGLASS PRODUCTS WILL NOT BE ACCEPTED BY MANUFACTURERS FOR RECYCLING.

1.2 RELATED SECTIONS

- A. Refer to Division 02 Section "Selective Demolition" for requirements for recycling demolished acoustical ceiling products.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's literature, including certification by a recognized independent testing laboratory, indicating compliance with requirements.

INCLUDE BELOW FOR ALL PROJECTS.

- B. Affidavits of Compliance to be included in final inspection manual:
1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".

2. Letter shall include project number, project name, and building name.

1.4 QUALITY ASSURANCE

- A. Standards: Comply with the following:
 1. Acoustical Materials: ASTM E 1264.
 2. Suspension Systems: ASTM C 635 for materials; ASTM C 636 for installation.
 3. Surface Burning Characteristics: Flame spread: 25 or less; smoke developed: 50 or less; per ASTM E 84. UL listed and marked.
 4. Seismic Standard: Comply with Ceilings and Interior Systems Contractors Association (CISCA) "Recommendations for Direct-Hung Acoustical Tile and Lay-in Panel Ceilings--Seismic Zones 0-2."
- B. Source Limitations: Obtain each type of acoustic panel and related grid system from one source and by a single manufacturer.

1.5 PROJECT CONDITIONS

DELETE PARAGRAPH BELOW IF ONLY HUMIDITY-TOLERANT ACOUSTICAL MATERIALS (I.E., "CLIMAPLUS" BY USG OR "HUMIGUARD" BY ARMSTRONG) ARE BEING SPECIFIED FOR THE PROJECT.

- A. Do not install ceilings until ambient temperature and humidity conditions can be continuously maintained at values near those intended for final occupancy.
- B. Building areas to receive ceiling shall be free of construction dust and debris.

PART 2 - PRODUCTS

THIS PART IS ORGANIZED BY PANEL AND SUSPENSION GRID TYPE. ALL POSSIBLE COMBINATIONS COULD NOT BE LISTED HERE, SO CONSULT CATALOGS FOR ADDITIONAL POSSIBILITIES WITH DIFFERENT PERFORMANCE, APPEARANCE OR COST.

FIRE-RATED CEILINGS ARE NOT INCLUDED IN THIS MASTER. CONSULT CATALOGS FOR PRODUCTS AND INSTALLATION REQUIREMENTS.

BELOW IS STANDARD PLAIN PANEL AND GRID SYSTEM.

2.1 STANDARD ACOUSTIC PANELS

- A. Smooth surface, humidity-tolerant, mineral composition panels with washable surface; and as follows:
 1. Surface: Perforated.
 2. Edges: Rabbeted for 15/16-inch grid.

SELECT EDGE TYPE ABOVE OR BELOW.
 3. Edges: Square.
 4. Size: 24 inches by 24 inches by 5/8 inch thick.

SELECT PANEL SIZE ABOVE OR BELOW.

5. Size: 24 inches by 48 inches by 5/8 inch thick.
6. LR: Not less than .82.
7. NRC: Not less than .55.
8. CAC: Not less than 33.
9. Color: White.
10. Manufacturer/Style: Provide one of the following:
 - a. "Fine Fissured"; Armstrong World Industries, Inc.
 - b. "Fine Fissured"; CertainTeed Saint-Gobain.
 - c. "Radar ClimaPlus"; U.S. Gypsum.

BELOW IS ROUTINE GRID FOR THIS PANEL TYPE - OTHERS ARE AVAILABLE - CONSULT CATALOGS.

11. Related Suspension Grid: Standard 15/16-inch Panel Suspension System in compliance with requirements of "Suspension Systems" Article of this Section.

2.2 PREMIUM ACOUSTIC PANELS

SELECTIONS BELOW HAVE APPEARANCE SIMILAR TO USG "FROST".

- A. Smooth surface, humidity-tolerant, mineral composition panels with washable surface, and as follows:

1. Surface: Finely perforated.
2. Edges: Rabbeted and beveled for 9/16-inch grid.
3. Size: 24 inches by 24 inches by 3/4 inch thick.
4. Color: White.
5. LR: Not less than .85.
6. NRC: Not less than .70.
7. CAC: Not less than 35.
8. Manufacturer/Style: Provide one of the following:
 - a. "Cirrus"; Armstrong World Industries, Inc.
 - b. "Cashmere High NRC"; CertainTeed Saint-Gobain.
 - c. "Eclipse ClimaPlus"; U.S. Gypsum.

THE ABOVE THREE PRODUCTS ARE WATER FELTED OR NODULAR. "FROST" IS SIMILAR IN APPEARANCE AND ACOUSTICAL PERFORMANCE, BUT IT IS A CAST/MOLDED PRODUCT (MORE DURABLE).

- d. "Frost ClimaPlus"; U.S. Gypsum.

BELOW IS ROUTINE GRID FOR THIS PANEL TYPE - OTHERS ARE AVAILABLE - CONSULT CATALOGS.

9. Related Suspension Grid: Narrow Bolt-Slot 9/16-inch Panel Suspension System in compliance with requirements of "Suspension Systems" Article of this Section.

SPECIALTY TRIM BELOW REFERS TO USG COMPASSO OR SIMILAR SYSTEMS. MODIFY TO SUIT PROJECT REQUIREMENTS OR DELETE IF NONE.

- a. Provide specialty trim systems where indicated on Drawings.

BELOW IS USG "MILLENA" PANEL AND ARMSTRONG COMPETITOR.

- B. Smooth surface, humidity-tolerant, mineral composition panels with washable surface, and as follows:

1. Surface: Finely perforated.
2. Edges: Rabbeted and beveled for 9/16-inch grid.
3. Size: 24 inches by 24 inches by 3/4 inch thick.
4. LR: Not less than .85.
5. NRC: Not less than .70.
6. CAC: Not less than 35.
7. Color: White.
8. Manufacturer/Style: Provide one of the following:
 - a. "Ultima"; Armstrong World Industries, Inc.
 - b. "Symphony m"; CertainTeed Saint-Gobain.
 - c. "Mars ClimaPlus"; U.S. Gypsum.

BELOW IS ROUTINE GRID FOR THIS PANEL TYPE - OTHERS ARE AVAILABLE - CONSULT CATALOGS.

9. Related Suspension Grid: Narrow Bolt-Slot 9/16-inch Panel Suspension System in compliance with requirements of "Suspension Systems" Article of this Section.

SPECIALTY TRIM BELOW REFERS TO USG COMPASSO OR SIMILAR SYSTEMS. MODIFY TO SUIT PROJECT REQUIREMENTS OR DELETE IF NONE.

- a. Provide specialty trim systems where indicated on Drawings.

USE PRODUCT BELOW ONLY WHEN ATTEMPTING TO MATCH EXISTING ACOUSTICAL PANELS. ARMSTRONG IS THE ONLY MFR. WHO IS MAKING THIS PRODUCT.

2.3 ROUTER-CUT PATTERNED PANELS

SPECIFIC PRODUCT NOT LISTED. DOZENS OF PATTERN VARIATIONS ARE AVAILABLE - CONSULT CATALOGS.

- A. Smooth surface, router-cut pattern, mineral composition panels with washable surface; and as follows:

UPDATE BELOW BASED ON TILE SELECTED

1. Surface: Finely perforated.
2. Pattern: Linear scored with border.
3. Edges: Rabbeted for 9/16-inch grid.
4. Size: 24 inches by 24 inches by 3/4 inch thick.
5. LR: Not less than .85.
6. NRC: Not less than .70.
7. CAC: Not less than 35.
8. Color: White.
9. Manufacturer/Style:

INSERT SELECTED TILE MFR AND STYLE

10. Related Suspension Grid: Standard 9/16-inch Panel Suspension System in compliance with requirements of "Suspension Systems" Article of this Section.

2.4 GYPSUM CORE PANELS

BELOW IS USG GYPSUM CORE PANEL AND CELOTEX COMPETITOR (NO ARMSTRONG PRODUCT). THESE ARE SUITABLE FOR USE IN KITCHENS

AND SIMILAR APPLICATIONS, BUT NOT CLEAN ROOMS. DUST-FREE CLEAN ROOM PANELS ARE AVAILABLE FROM ALL THREE MFRS., BUT THEY ARE MUCH MORE EXPENSIVE.

A. Smooth surface, humidity resistant, gypsum core panels with vinyl facing, and as follows:

1. Composition: Gypsum board core with vinyl overlay.
2. Surface: Unperforated.
3. Edges: Square.
4. Size: 24 inches by 24 inches by 1/2 inch thick.

SELECT PANEL SIZE ABOVE OR BELOW.

5. Size: 24 inches by 48 inches by 1/2 inch thick.
6. LR: Not less than .77.
7. CAC: Not less than 35.
8. Color: White.
9. Manufacturer/Style: Provide one of the following vinyl-clad gypsum board panels:
 - a. "Aquarock"; CertainTeed Saint-Gobain.
 - b. "Gridstone"; National Gypsum Co.
 - c. "Sheetrock Lay-In ClimaPlus Ceiling Panels"; U.S. Gypsum.
10. Related Suspension Grid: Moisture-Resistant 15/16-inch Panel Suspension System in compliance with requirements of "Suspension Systems" Article of this Section.

RETAIN OR DELETE BELOW TO SUIT PROJECT REQUIREMENTS SELECT PANEL SIZE ABOVE OR BELOW.

11. Related Accessories: Manufacturer's standard hold-down clips designed to prevent air pressure uplift of acoustic panels.

2.5 SUSPENSION SYSTEMS

A. Suspension Systems, General: As required to support acoustical units, electrical and mechanical fixtures and other components as indicated, including anchorages, hangers, runners, cross runners, splines, clips, moldings, fasteners and other members, devices and accessories. Comply with requirements of ASTM C 635.

1. Hanger Wire: Not less than 12 gage (0.106 inch) galvanized steel.
2. Type: Exposed Direct-Hung Steel Suspension System
3. Structural Class: Medium-Duty System.

BELOW IS STANDARD WIDE FACE, STEEL CAPPED PRODUCT.

B. Standard 15/16-inch Panel Suspension System: Suspension system with exposed faces painted.

1. Face Width: 15/16-inch wide.
2. Product/Manufacturer: Provide the following:
 - a. "Prelude XL 15/16": Armstrong World Industries, Inc.
 - b. "Classic Stab System"; CertainTeed Saint-Gobain.
 - c. "Donn DX"; U.S. Gypsum.

BELOW IS NARROW FACE, STEEL CAPPED PRODUCT. CONSIDER SPECIALLY SHAPED EDGE ANGLES - CONSULT CATALOGS FOR RANGE OF POSSIBILITIES.

C. Standard 9/16-inch Panel Suspension System: Suspension system with exposed faces painted.

1. Face Width: 9/16-inch wide.
2. Product/Manufacturer: Provide the following:
 - a. "Suprafine 9/16"; Armstrong World Industries, Inc.
 - b. "Elite Narrow Stab"; CertainTeed Saint-Gobain.
 - c. "Centricitee DXT"; U.S. Gypsum

BELOW IS STEEL SLOT-TYPE GRID. SLOT WIDTHS VARY AND COLOR INSERTS MAY BE ADDED. CONSULT CATALOGS FOR FULL EXTENT OF POSSIBILITES.

D. Narrow Bolt-Slot 9/16-inch Panel Suspension System: Suspension system with exposed faces painted and slotted.

1. Face Width: 9/16-inch wide with 1/8-inch wide reveal.
2. Product/Manufacturer: Provide the following:
 - a. "Silhouette XL-1/8 Reveal 9/16 Bolt Slot"; Armstrong World Industries, Inc.
 - b. "SmoothLine Bolt Slot System"; CertainTeed Saint-Gobain.
 - c. "Fine-Line 1/8"; U.S. Gypsum

BELOW IS FOR GYPSUM CORE PANELS IN SEMI-WET LOCATIONS (SUCH AS ANIMAL FACILITIES). ALL-ALUMINUM SYSTEMS AND PVC SYSTEMS ARE ALSO AVAILABLE.

E. Moisture-Resistant 15/16-inch Panel Suspension System: Suspension system with G60 hot-dip galvanized exposed faces with rolled, painted, aluminum caps.

1. Face Width: 15/16-inch wide.
2. Product/Manufacturer: Provide the following:
 - a. "Prelude Plus XL Fireguard"; Armstrong World Industries, Inc.
 - b. "Protectone Aluminum Fire-Rated Capped System"; CertainTeed Saint-Gobain.
 - c. "Donn ZXLA"; U.S. Gypsum

2.6 SPECIALTY TRIM SYSTEMS

BELOW IS CUSTOM "FLOATING" APPEARANCE TRIM SYSTEM.

A. Custom Exposed Edge and Perimeter Trim System: Manufacturer's custom designed, painted steel trim system for fully exposed edge conditions; integrated with manufacturer's suspension system to create a free-floating installed appearance. Provide units of depth with 9/16 inch horizontal legs and with hems for attachment to suspension system.

1. Depth: 4-inches unless otherwise indicated.
2. Product/Manufacturer: Provide the following:
 - a. "Axiom"; Armstrong World Industries, Inc.
 - b. "Infinity"; Chicago Metallic Corp.
 - c. "COMPASSO"; U.S. Gypsum

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with ASTM C636 and seismic design requirements indicated, per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
- B. Layout: Balance ceiling borders on opposite sides, using more-than-half width acoustical units, except where otherwise dimensioned or indicated.
 - 1. Tolerance: 1/8 inch in 12 feet level tolerance.
 - 2. Pattern Direction: One-way, align joints.
- C. Suspension System: Secure to building structure, free from contact with objects within the ceiling plenum, with hangers spaced 48 inches on center along supported members; provide hangers not more than 8 inches from ends of each member.
 - 1. Where interference with ducts or suspended equipment prevents direct connection of suspension elements to building structure, provide steel channel members (Unistrut or equivalent) hung from structural members with threaded rods with appropriate fasteners; and adequately sized for suspension system capacity. Secure suspension system to steel channels. Connection to ductwork or equipment is not permitted.
 - 2. Do not fasten ceiling suspension members to metal roof deck.

INCLUDE BELOW FOR RABBETED PANELS.

- D. Rabbeted Panels: Rabbet panel edges that have been field cut to fit non-modular suspension grid shapes at room perimeter, columns, and similar obstructions. Use router or other factory-approved rabbeting method.
- E. Edge Moldings: Secure to substrate with screw anchors spaced 16 inch on center. Set with concealed bead of acoustical sealant. Miter corner joints. Cope exposed flanges of intersecting suspension members for flush intersections.

DELETE ARTICLE BELOW IF NO HOLD-DOWN CLIPS REQUIRED FOR FIRE-RESISTIVE CEILINGS OR AIR-PRESSURE-RESISTANT CEILINGS.

- F. Provide hold-down clips at each acoustic panel in systems indicated for Animal Facility application. Install in accordance with manufacturer's recommendations for an air pressure uplift-resistant installation.

DELETE ARTICLE BELOW IF NO SPECIALTY TRIM INCLUDED.

3.2 SPECIALTY TRIM INSTALLATION

- A. Exposed Edge and Perimeter Trim System: Install units in accordance with manufacturer's printed instructions for specific Project application.

3.3 CLEANING AND REPAIR

- A. Clean suspension grid and panels. Remove and replace panels and grid that are defective, or that have been damaged.
- B. Touch-up paint field-cut edges of factory painted tile that are exposed to view in finished installation, including horizontal and vertical surfaces at perimeter of ceilings where panels are cut for rabbeted edge molding.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 096466 - WOOD ATHLETIC FLOORING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 096466 - WOOD ATHLETIC FLOORING

PART 1 - GENERAL

PRODUCTS AND SYSTEMS DESCRIBED IN THIS SECTION ARE OBSOLETE. IT IS RETAINED ONLY AS A "MODEL" TO ASSIST IN WRITING AN APPROPRIATE SPECIFICATION. CONSIDER OBTAINING THE AIA MASTERSPEC SUPPLEMENTAL SECTION OF THE SAME SECTION NUMBER AND NAME.

1.1 SUMMARY

- A. Extent of gymnasium floor is indicated on Drawings.
- B. Types of gymnasium floors include:
 - 1. Maple strip gym flooring.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's specifications and installation instructions for each gymnasium flooring system. Include instructions for handling, moisture protection, anchorage finishing protection and maintenance. Indicate by copy of transmittal that Installer has received a copy of each instruction.

INCLUDE BELOW FOR ALL PROJECTS.

- B. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

1.3 QUALITY ASSURANCE

- A. Comply with Maple Flooring Manufacturer's Association (MFMA) standards and recommendations for maple flooring.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Deliver and store wood materials after wet operations in building are complete, heating and ventilating equipment is operational, and temperature and humidity conditions have stabilized.

1.5 WARRANTY

- A. Provide 3 year warranty covering the following, in addition to mfr's standard 1 year warranty for finished wood flooring and associated work:

1. Repair or replace flooring which shrinks, cracks, warps, or otherwise deteriorate excessively, or which buckles, delaminates, or breaks anchorage or bond with substrate.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers/Systems: Subject to compliance with requirements of this Section, provide products of one of the following:

AGA Inc.: Duracushion I.
Connor Forest Industries: Rezill-Aire.
Horner Flooring Co.: Thrust-A-Cushion Panel System.
Robbins Inc.: Permacushion II Panel System.
Superior Floor Co: Super-Aire System."

2.2 MATERIALS AND ACCESSORIES

- A. Vapor Barrier: 6 mil polyethylene.
- B. Subfloor: 1/2 inch by 4 feet by 8 feet C-D exterior grade plywood.
- C. Resilient Mounting Pads: Mfr's standard 3/8 inch by 2-1/4 inch by 3 inch PVC.
- D. Wood Flooring: Tongue and grooved and end matched; kiln dried; MFMA grade marked and stamped; and as follows:
 1. Species: Northern Hard Maple (acer saccharum).
 2. Size: 33/32 inches thick by 1-1/2 inch wide.
 3. Grade: Second and Better.
 4. Grain: Flat.
- E. Molding and Base: Manufacturer's standard ventilating, coved, rubber base with pre-molded outside and inside corners.
 1. Color: Black.
 2. Size: 3 inches by 4 inches.
- F. Expansion Joint Covers: One of the following recessed, serrated (fluted), aluminum expansion joint covers for 2" wide joints:

Balco Inc.: Model AFWS-1-2m
Metalines Inc.: Model 1425
MM Systems Corp.: Model X-A2MV
- G. Finish: Polyurethane sealer and finish recommended by flooring mfr.
 1. Game Lines: Enamel paint recommended by flooring mfr, and compatible with floor finish. Colors to selected from paint mfr's standard color range.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine concrete slab substrate for compliance with mfr's tolerance, dryness and cleanliness requirements. Allow excess moisture to dry before proceeding with installation.

3.2 PREPARATION

- A. Clean slab of construction debris, oil, grease and other substances determined by mfr to have a deleterious effect on installation
 - 1. Do not begin installation operations before completion of adjacent masonry work, and overhead mechanical, electrical, and painting work have been completed.

3.3 INSTALLATION

- A. Vapor Barrier: Lap joints 4 inches and cement with cold asphalt.
- B. Flooring System: In general, install flooring system components in strict accordance with mfr's directions. Install self-storing volley ball post hatches and frames (under Alternate No. 6).
- C. Sanding: Machine sand with a progression of coarse, medium and fine papers to produce a smooth, even and uniform surface.
 - 1. After sanding operations are completed, remove dust from entire surface by vacuum or other method.
- D. Finishing: Apply 2 coats sealer and 2 finish coats at manufacturer's recommended rate, but no thinner than 500 square feet per gallon. Buff and clean floor between each coat.
 - 1. Game Lines: Paint basketball and volley ball game lines, and center-court and perimeter graphics. Comply with official NCAA game line rules, and as indicated on Drawings.
- E. Base Installation: Install vent cove base and expansion joint covers as indicated, and to comply with mfr's recommendations.

3.4 CLEANING AND PROTECTION

- A. Clean gym flooring surfaces at the completion of construction operations, in strict accordance with manufacturer's directions.
- B. Protect finished installation from damage caused by continuing building construction operations.
- C. Repair damaged or defective surfaces to the satisfaction of the Architect, or remove and replace damaged or defective surface as directed by the Architect.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 096500 - RESILIENT FLOORING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 096500 - RESILIENT FLOORING

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of resilient flooring and accessories is indicated on Drawings and schedules.
- B. Types of resilient flooring and accessories include the following:

EDIT BELOW TO SUIT PROJECT.

- 1. Vinyl composition tile.
- 2. Sheet vinyl flooring.
- 3. Rubber stair treads.
- 4. Wall base.

1.2 SUBMITTALS

- A. Product Data: Manufacturer's literature and installation instructions.
- B. Samples for Initial Selection: Submit sample of each type, color and pattern of resilient flooring and accessories.

INCLUDE BELOW FOR ALL PROJECTS.

- C. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

PART 2 - PRODUCTS

WARNING: CHECK SAMPLES FOR SUITABILITY BEFORE SELECTING ANY OF THE PRODUCTS LISTED BELOW.

2.1 VINYL COMPOSITION TILE

BELOW DESCRIBES STANDARD VCT - ADD AMTICO, AZROCK, OR KENTILE WHERE "THRU-CHIP" PERFORMANCE (DURABILITY) IS NOT REQUIRED.

- A. Vinyl Composition Tile: ASTM F 1066 Composition 1, Class 2; 12-inch by 12-inch by 1/8-inch thick.
 - 1. Vinyl Composition Tile Manufacturer/Style: Subject to compliance with requirements provide one of the following:

CONSULT SAMPLES FOR COLOR/PATTERN SUITABILITY FOR THE PROJECT. SELECTION BELOW IS MINIMAL AND DOES NOT REPRESENT FULL AVAILABLE RANGE OF TILE.

- a. "Imperial Excelon"; Armstrong, Inc.
- b. "Inspirations"; Mannington, Inc.
- c. "Expressions"; Tarkett, Inc..

RETAIN BELOW UNLESS COLOR AND PATTERN HAS BEEN PRE-SELECTED AND INCLUDED WITH PRODUCT DESCRIPTION ABOVE.

2. Color/Pattern: Selected from manufacturer's standard range for products indicated.

BELOW DESCRIBES STANDARD SHEET VINYL WITH BACKING. ALL LISTED PRODUCTS BELOW ARE ACCEPTABLE TO THE UNIVERSITY'S MAINTENANCE DEPT. MULTI-LAYERED SOLID VINYL (SMARAGD AND ARMSTRONG TRANSLATIONS) AND LINOLEUM HAVE NOT BEEN APPROVED.

2.2 VINYL SHEET FLOORING

BACKED PRODUCTS ARE GENERALLY LESS EXPENSIVE AND MAY BE MORE SUITABLE FOR APPLICATION OVER SLABS-ON-GRADE.

- A. Vinyl Sheet with Backing: Vinyl sheet with pattern and color extending through full thickness, complying with FS L-F-475A, Type II, Grade A. Manufacturer's standard width rolls.

1. Wear Layer Thickness: 0.050-inch.
2. Overall Thickness: Not less than 0.080-inch.
3. Vinyl Sheet Manufacturer/Style: Subject to compliance with requirements, provide one of the following:
 - a. "Classic Corlon"; Armstrong, Inc.

ABOVE IS STANDARD VINYL SUITABLE FOR CHEMICALLY WELDED SEAMING - BELOW HAS CHEMICAL RESISTANCE PERFORMANCE SIMILAR TO REGULAR MEDINTECH BUT WITH BACKING AND CAN HAVE EITHER CHEMICAL- OR HEAT-WELDED SEAMS.

- b. "Medintech Tandem"; Armstrong, Inc.

THE PRODUCTS BELOW MAY HAVE EITHER CHEMICAL- OR HEAT-WELDED SEAMS, BUT DO NOT HAVE MEDINTECH'S CHEMICAL RESISTANCE. CHECK SUITABILITY FOR USE ON SLABS ON GRADE. CHECK SAMPLES TO ENSURE DESIRABILITY OF COLORS/PATTERNS.

- c. "Possibilities"; Armstrong, Inc.
- d. "Fields"; Mannington, Inc.
- e. "Images"; Tarkett, Inc.

RETAIN BELOW UNLESS COLOR AND PATTERN HAS BEEN PRE-SELECTED AND INCLUDED WITH PRODUCT DESCRIPTION ABOVE.

4. Color/Pattern: Selected from manufacturer's standard range for products indicated.

BELOW DESCRIBES HOMOGENOUS SHEET VINYL WITH HEAT WELDABLE SEAMS FOR "SEAMLESS" FLOOR. THESE FLOORS ARE MORE DURABLE THAN THE BACKED TYPE. IN ADDITION, MEDINTECH HAS PROVEN RELATIVELY STAIN AND CHEMICAL RESISTANT.

B. Vinyl Sheet Without Backing: Vinyl sheet with pattern and color extending through full thickness, complying with ASTM E 84 (75 or less), and ASTM E 662 (NBS Smoke 450 or less). Manufacturer's standard width rolls.

1. Thickness: 0.080-inch.
2. Vinyl Sheet Manufacturer/Style: Subject to compliance with requirements, provide one of the following:
 - a. "Medintech"; Armstrong, Inc.

BELOW IS CLAIMED BY MANUFACTURER TO BE EQUIVALENT TO MEDINTECH FOR CHEMICAL RESISTANCE. SAMPLES HAVE NOT BEEN CHECKED BY UM. SELECT WITH CAUTION.

- b. "Biospec"; Mannington Inc.
- c. "Expressions" "Eminent/Optima/Collage Optima"; Tarkett, Inc.

RETAIN BELOW UNLESS COLOR AND PATTERN HAS BEEN PRE-SELECTED AND INCLUDED WITH PRODUCT DESCRIPTION ABOVE.

3. Color/Pattern: Selected from manufacturer's standard range for products indicated.

2.3 RUBBER STAIR TREAD

BELOW DESCRIBES STANDARD RUBBER STAIR TREAD UNITS.

A. Preformed Rubber Stair Treads: Homogenous vulcanized rubber composition units complying with Fed. Spec. RR-T-650D, Composition A, Type 2; with raised, slip-resistant pattern on tread surface, reinforced nose, of manufacturer's standard thickness for indicated pattern, and as follows:

SELECT ONE OF THE FOLLOWING.

1. Pattern: Raised disk.
2. Pattern: Straight ribs.
3. Pattern: Diagonal grid (diamond).

BELOW ARE EXAMPLES ONLY. CHECK SAMPLES FOR WIDER SELECTION. AVOID BLACK STAIR TREAD (LIGHTING PROBLEMS UNDER EMERGENCY FIXTURE OPERATION). IT IS ALSO BEST TO AVOID WHITE AND BLACK TREAD DUE TO CLEANING PROBLEMS.

4. Color: Gray.
5. Color: Tan.
6. Color: Selected from manufacturer's standard range.

DELETE BELOW IF NOT DESIRED. ADDITIONAL COST MAY NOT BE JUSTIFIED IN TYPICAL SERVICE STAIRS.

7. Provide 1/8-inch gage coved rubber risers matching tread composition and color.
8. Manufacturers: Subject to compliance with requirements, one of the following:
 - Armstrong.
 - Flexco.
 - Musson.
 - Johnsonite.
 - Nora
 - RCA.

Roppe.

2.4 RESILIENT WALL BASE

BELOW DESCRIBES 100% VULCANIZED RUBBER COVE BASE - STANDARD FOR MOST UNIVERSITY PROJECTS AND ALL MED SCHOOL PROJECTS. COLOR IS HOMOGENOUS

- A. Rubber Base: ASTM F 1861, Type TS (rubber, vulcanized thermoset), Group I (solid, homogeneous).

SELECT STYLE FROM OPTIONS BELOW. TYPICALLY SELECT "COVE (BASE WITH TOE)"

1. Style: Cove (base with toe).
2. Style: Straight (flat or toeless).
3. Style: Butt to (fit-to-floor).
4. Minimum Thickness: 0.125 inch.

SELECT HEIGHT FROM OPTIONS BELOW. 4 INCHES IS TYPICAL. OTHER OPTIONS ARE AVAILABLE.

5. Height: 2-1/2 inches.
6. Height: 4 inches.
7. Height: 6 inches.

BELOW ARE EXAMPLES ONLY. CHECK SAMPLES FOR WIDER SELECTION.

8. Color: Black.
9. Color: Dark brown.
10. Color: Selected from manufacturer's standard range.
11. Furnish cove base in continuous length rolls.

USUALLY RETAIN ABOVE AND DELETE BELOW, UNLESS COST AND DELIVERY TIME IS PARAMOUNT.

12. Furnish cove base in standard 6-foot lengths.

DELETE BELOW IF NOT DESIRED.

13. Provide matching end stops and preformed corner units.
14. Manufacturers: Subject to compliance with requirements, one of the following:
Burke Mercer.
Flexco.
Roppe.

BELOW DESCRIBES THERMOPLASTIC RUBBER COVE BASE (RUBBER / VINYL BLEND). DISADVANTAGES INCLUDE DECREASED DURABILITY AND VISIBILITY OF SCRATCHES. ADVANTAGES INCLUDE MORE MRFS, SLIGHTLY LOWER COST AND WIDER COLOR SELECTION.

TYPICALLY CHOOSE GROUP II, GROUP I IS NOT AVAILABLE IN ALL LISTED MRFS.

- B. Rubber Base: ASTM F 1861, Type TP (rubber, thermoplastic), Group I (solid, homogeneous) or Group II (layered).

SELECT STYLE FROM OPTIONS BELOW. TYPICALLY SELECT "COVE (BASE WITH TOE)"

1. Style: Cove (base with toe).

2. Style: Straight (flat or toeless).
3. Style: Butt to (fit-to-floor).
4. Minimum Thickness: 0.125 inch.

SELECT HEIGHT FROM OPTIONS BELOW. 4 INCHES IS TYPICAL. OTHER OPTIONS ARE AVAILABLE.

5. Height: 2-1/2 inches.
6. Height: 4 inches.
7. Height: 6 inches.

BELOW ARE EXAMPLES ONLY. CHECK SAMPLES FOR WIDER SELECTION.

8. Color: Black.
9. Color: Dark brown.
10. Color: Selected from manufacturer's standard range.
11. Furnish cove base in continuous length rolls.

USUALLY RETAIN ABOVE AND DELETE BELOW, UNLESS COST AND DELIVERY TIME IS PARAMOUNT.

12. Furnish cove base in standard 6-foot lengths.

DELETE BELOW IF NOT DESIRED.

13. Provide matching end stops and preformed corner units.
14. Manufacturers: Subject to compliance with requirements, one of the following:
 - Armstrong.
 - Burke Mercer.
 - Flexco.
 - Johnsonine.
 - Nafco by Tarkett.
 - Roppe.
 - VPI.

BELOW DESCRIBES STANDARD VINYL BASE. DRAWBACKS INCLUDE REDUCED DURABILITY. COLOR IS NOT HOMOGENOUS. DISADVANTAGES INCLUDE DECREASED DURABILITY AND VISIBILITY OF SCRATCHES. ADVANTAGES INCLUDE MORE MRFS, LOWER COST AND WIDER COLOR SELECTION.

- C. Vinyl Wall Base: ASTM F 1861, Type TV (vinyl, thermosplastic), Group II (layered).

SELECT STYLE FROM OPTIONS BELOW. TYPICALLY SELECT "COVE (BASE WITH TOE)"

1. Style: Cove (base with toe).
2. Style: Straight (flat or toeless).
3. Style: Butt to (fit-to-floor).
4. Minimum Thickness: 0.125 inch.

SELECT HEIGHT FROM OPTIONS BELOW. 4 INCHES IS TYPICAL. OTHER OPTIONS ARE AVAILABLE.

5. Height: 2-1/2 inches.
6. Height: 4 inches.
7. Height: 6 inches.

BELOW ARE EXAMPLES ONLY. CHECK SAMPLES FOR WIDER SELECTION.

8. Color: Black.
9. Color: Dark brown.

10. Color: Selected from manufacturer's standard range.
11. Furnish cove base in continuous length rolls.

USUALLY RETAIN ABOVE AND DELETE BELOW, UNLESS COST AND DELIVERY TIME IS PARAMOUNT.

12. Furnish cove base in standard 6-foot lengths.

DELETE BELOW IF NOT DESIRED.

13. Provide matching end stops and preformed corner units.
14. Manufacturers: Subject to compliance with requirements, one of the following:
 - Armstrong.
 - Burke Mercer.
 - Flexco.
 - Johnsonine.
 - Nafco by Tarkett.
 - Roppe.
 - VPI.

INCLUDE BELOW FOR INTEGRAL COVE BASE ON WELDABLE SHEET VINYL FLOORS.

- D. Integral Cove Base Accessories: Provide the following accessory items for integral sheet vinyl cove base installations.
 1. Cap Trim: Provide aluminum or stainless steel flash-cove capping trim at top edge of integral base.

BELOW OPTIONAL - USUALLY DELETE. CORNERS COMMONLY FORMED FROM FLOORING MATERIALS.

2. Corner Trim: Provide aluminum or stainless steel corner trim at inside and outside corners of flash-coving.

USUALLY RETAIN BELOW FOR INTEGRAL COVERED BASE APPLICATIONS.

3. Cove Stick: At each wall/floor intersection, provide wood or plastic cove stick materials manufactured specifically for use as back-up for flash-coving.

2.5 ACCESSORIES

- A. Transition (Reducer) Strips: Provide units fabricated of solid rubber or vinyl as required to match specified topset cove base materials.
- B. Adhesives: Provide Manufacturer's recommended non-asbestos-containing adhesive for each type of flooring, wall base and substrate indicated.

DELETE THE FOLLOWING IF NO HEAT WELDED SEAMS.

- C. Welding Rods: Provide manufacturer's welding rods for heat-welded seam installations.
 1. Color: Selected from manufacturer's standard range to coordinate with flooring.

BELOW AVAILABLE FROM ARMSTRONG FOR MEDINTECH PRODUCTS.

2. Color: Selected from manufacturer's patterned, premium grade rods designed to blend with color and pattern of flooring for a near-invisible joint.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. In presence of Installer, inspect substrate conditions for compliance with resilient flooring manufacturer's installation recommendations. Report, in writing, deleterious conditions to Owner's Representative.

USUALLY INCLUDE BELOW.

1. Obtain Architect's written approval before beginning installation.

3.2 PREPARATION

- A. In general: Prepare substrates as required to receive new materials. Remove dirt and debris from substrate. Adhesive removal is included in Division 2 Section "Selective Demolition."
- B. Where uneven floor levels or holes occur, fill, patch, and provide underlayment as required to level surface prior to installation of finished floor material. Underlayment may be latex cement as applicable.

REQUIREMENT BELOW IS INTENDED TO LIMIT CLAIMS FOR EXTRAS. INCREASE OR DECREASE AREA PERCENT BASED ON YOUR JUDGMENT, OR DELETE ENTIRELY FOR NEW CONCRETE FLOORS.

1. Patching is required for approximately [not less than] 20 percent of the gross floor area of the Project.

INCLUDE BELOW FOR LARGE AREAS OF PATCHING OR LEVELING. COORDINATE WITH "CONCRETE FLOOR UNDERLAYMENT" SECTION.

2. Floor patching and leveling is included in Division 3 Section "Hydraulic Cement Underlayment."

- C. Clean floors and apply substrate primer (if recommended by flooring manufacturer) in accordance with flooring manufacturer's instructions.

3.3 INSTALLATION, GENERAL

- A. Comply with flooring manufacturer's recommendations for type(s) of materials, project conditions, and intended use.
- B. Place resilient flooring continuously under locations of the following:

MODIFY THE FOLLOWING TO SUIT PROJECT.

1. Movable partition systems.
2. Laboratory casework.

INCLUDE BELOW FOR ALL MEDICAL SCHOOL PROJECTS.

- C. Apply continuous bead of sealant along perimeter edge of installation and around all floor penetrations prior to installing wall base.

3.4 SHEET VINYL INSTALLATION

INCLUDE BELOW FOR STANDARD SHEET VINYL PRODUCTS - CHEMICAL WELDING IS NOT IMPLY SEAMLESS FLOORING.

- A. Chemically Welded Vinyl Sheet: Manufacturer's standard chemical joint adhesive system.

DELETE ABOVE AND INCLUDE BELOW FOR HEAT-WELDED "SEAMLESS" FLOORING ONLY.

- B. Vinyl Sheet with Heat Welded Seams: Manufacturer's standard seam sealing system with seam edges heated and fused with specifically compounded vinyl welding rods, resulting in a seamless installation.

3.5 TILE INSTALLATION

- A. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half of a tile at perimeter.

- 1. Lay tiles square with room axis, unless otherwise indicated.

DELETE SUBPARA ABOVE OR BELOW, OR REVISE IF FLOOR GEOMETRY OR PATTERN DICTATES ANOTHER RELATIONSHIP OF TILES WITH ROOM AXIS.

- 2. Lay tiles at a 45-degree angle with room axis, unless otherwise indicated.

- B. Match tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Cut tiles neatly around all fixtures. Discard broken, cracked, chipped, or deformed tiles.

RETAIN ONE SUBPARA BELOW OR INSERT REQUIREMENTS TO SUIT PROJECT.

- 1. Lay tiles with grain running in one direction.
 - 2. Lay tiles in basket-weave pattern with grain direction alternating in adjacent tiles.
 - 3. Lay tiles in pattern of colors and sizes indicated on Drawings.

IF ANY BUILT-IN ITEMS ARE REQUIRED TO BE SET ON TOP OF TILE, INDICATE ON DRAWINGS AND REVISE PARA BELOW ACCORDINGLY.

- C. Scribe, cut, and fit tiles to butt neatly and tightly to vertical surfaces and permanent fixtures, including built-in furniture, cabinets, pipes, outlets, edgings, door frames, thresholds, and nosings.

- D. Extend tiles into toe spaces, door reveals, closets, and similar openings.

- E. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use chalk or other nonpermanent, nonstaining marking device.

DELETE PARA BELOW IF NO COVERS.

- F. Install tiles on covers for telephone and electrical ducts, and similar items in finished floor areas. Maintain overall continuity of color and pattern with pieces of flooring installed on covers. Tightly adhere edges to perimeter of floor around covers and to covers.

REVISE PARA BELOW IF OTHER THAN FULL-SPREAD ADHESIVE METHOD IS RECOMMENDED BY TILE MFR FOR SUBSTRATE AND TILE PRODUCTS SELECTED.

- G. Adhere tiles to flooring substrates using a full spread of adhesive applied to substrate to comply with tile manufacturer's written instructions, including those for trowel notching, adhesive mixing, and adhesive open and working times.
1. Provide completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

DELETE BELOW IF ROLLING IS NOT REQUIRED FOR PRODUCTS SELECTED.

- H. Hand roll tiles according to tile manufacturer's written instructions.

3.6 WALL BASE INSTALLATION

COORDINATE THE FOLLOWING WITH LABORATORY CASEWORK SPECIFICATIONS, CONCERNING PROVISION OF BASE ON CASEWORK.

- A. Apply wall base in lengths as long as practicable to walls, columns, and all permanent fixtures and where indicated. Mitered outside corners not acceptable.

RETAIN BELOW WITH CASEWORK.

- B. Apply base to fixed cabinetry as follows:
1. Base cabinet toe spaces.
 2. Exposed sides of base cabinets.
 3. Filler and closure panels extending to floor.

DELETE ABOVE AND INCLUDE BELOW FOR SHEET VINYL FLOORS WITH INTEGRAL COVE BASE.

- C. Form flooring material into continuous cove base at walls, columns, and permanent fixtures (including fixed casework) and where indicated. Heat weld all seams.
1. Provide metal cap trim at exposed edges of base, and where base is formed into outside corners. Mitered and welded outside corners without metal trim are not acceptable.
 2. Apply base to fixed laboratory cabinetry as follows:
 - a. Base cabinet toe spaces.

- b. Exposed sides of base cabinets.
 - c. Filler and closure panels extending to floor.
- D. On masonry or other irregular surfaces, fill voids behind base and along top edge with manufacturer's recommended adhesive filler.

3.7 CLEANING

- A. Clean floors and accessories after installation in accordance with flooring manufacturer's instructions.
 - 1. Do not polish floors.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 096723 - RESINOUS FLOORING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 096723 - RESINOUS FLOORING

THIS SECTION IS LIMITED TO COMMERCIAL-TYPE HIGH-TEMPERATURE AND CHEMICALLY-RESISTANT SYSTEM. CONSIDER USING AIA MASTERSPEC SECTION OF THE SAME NAME AND NUMBER FOR DECORATIVE FLOORS, FACTORY FLOORS AND OTHER SIMILAR APPLICATIONS.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of seamless, resinous flooring is shown and scheduled on Drawings.
- B. Type of seamless resinous flooring is high-build, temperature-resistant, chemically resistant, trowel-down epoxy mortar type with compatible finish coat.

1.2 SUBMITTALS

- A. Manufacturer's product literature indicating compliance with requirements.
- B. Installation instructions for each primary product and accessory.
- C. Samples for Initial Selection: Submit 4-inch square sample of actual flooring material in color proposed to match indicated color.
- D. Samples for Verification: Submit 4-inch square sample of actual flooring material with final approved color adjustments.
- E. Qualification Data for Individuals and Firms listed in Quality Assurance Article.

INCLUDE BELOW FOR ALL PROJECTS.

- F. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

1.3 QUALITY ASSURANCE

- A. Installer Qualifications: Installer having not less than 5 years of experience installing comparable flooring systems; and approved by resinous flooring manufacturer for application indicated.
- B. Design Criteria: The Project has been designed using Stonclad HT/Stonkote HT4 by Stonhard, Inc. Fully equivalent products of other listed, approved manufacturers will be considered, provided deviations in product qualities are minor and do not change the performance of the flooring system as judged by the Architect.

PART 2 - PRODUCTS

2.1 MANUFACTURER

- A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:

Dex-O-Tex; Crossfield Products Co.
Epoxy-Tech, Inc.
Mastertop; Master Builders Technologies Ltd.
Stonclad; Stonhard Inc. USA

2.2 SEAMLESS RESINOUS FLOORING

- A. Mortar: Seamless, built-up, troweled-down, thermally- and chemically-resistant three-component epoxy resin-based flooring system. Provide mortar materials with performance equal or better than the following values for each indicated test method:

1. Compressive Strength: 11,500 psi at 7 days; ASTM C 579.
2. Tensile Strength: 2,200 psi; ASTM C 307.
3. Flexural Strength: 5,000 psi; ASTM D 580.
4. Flexural Modulus of Elasticity: 17,000,000 psi; ASTM D 790..
5. Hardness: 87-90; ASTM D2240/Shore D Durometer.
6. Bond Strength: Greater than 400 psi (100 percent concrete failure); ACI Committee 503/PP.1139-1141.
7. Indentation: None; MIL-D-3134F.
8. Abrasion Resistance: 0.18 gm max. weight loss; ASTM D 4060, CS-17 wheel.
9. Flammability: Self-extinguishing, extent of burning not more than 0.25 inches; ASTM D 635,
10. Thermal Coefficient of Linear Expansion: 0.00002-in/in deg C; ASTM E 831.
11. Water Absorption: 0.2 percent; ASTM C 413.
12. Heat Resistance Limitation: 200 deg F for continuous exposure; 250 deg F for intermittent exposures.

- B. Finish Coating: Thermally- and chemically-resistant 100 percent solids, two-component epoxy resin coating compounded to compliment the performance of the mortar material.

1. Temperature Limitations: Not less than that specified for mortar material.
2. Chemical-resistance: Not less than that specified for mortar material.
3. Color: Equivalent to Stonhard, Inc. "Brick Red."

2.3 ACCESSORIES

- A. Primer: Two-component epoxy resin primer compounded for the application indicated.
- B. Cove Cap: Manufacturer's standard cove top cap to provide a neat, level, and durable finished cove installation.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Prepare substrates to condition recommended by seamless resinous flooring manufacturer for application indicated. Remove adhesives, sealer, wax, and dirt; and scarify substrate as follows:
 - 1. At minimum, shot-blast all existing floor surfaces using power-driven, metal-shot-recycling equipment. Shot-blast or otherwise etch or scarify new concrete floor surfaces if required to bring surface into compliance with manufacturer's recommendations.
 - 2. Sand-blasting is not permitted. Rotating-blade type scarifiers are not permitted.
- B. Upon completion of floor preparation work, obtain and submit to the Architect, written approval of existing substrate conditions by an authorized representative of the resinous flooring manufacturer.
- C. Obtain Architect's written approval prior to beginning subsequent application work.

3.2 APPLICATION

- A. Application, General: Provide final installation with no seams, joints, or cracks. Provide seamless transition between adjoining rooms. Extend base up walls and up base of walls to provide an uninterrupted cove base around room perimeter. Apply resinous flooring in pit, covering sides and bottom.
- B. Prime surfaces using manufacturer's recommended penetrating primer for indicated application. Apply primer in strict adherence to manufacturer's printed instructions.
- C. Mortar Installation: Blend materials in accordance with manufacturer's recommendations. Screed-apply 5/16-inch layer of mortar and trowel finish with steel-blade power trowels. Routinely clean and dry trowel blades in accordance with manufacturer's instructions. Trowel mortar a dense, hard surface with minimal porosity.
 - 1. Install surface as level as practicable using laser lines or other method acceptable to Architect.
 - 2. Cove Bases: Install cove bases at each wall. Use manufacturer's cove material compounded for the purpose. Cap cove base with manufacturer's standard cove cap strip.
 - a. Cove Height: 6-inches.
 - 3. Pitch 1/8-inch to drains within a 24-inch radius of each floor drain, except where concrete substrate is sloped to drain.
- D. Mortar Leveling: Allow mortar to cure thoroughly. Flood surface lightly to reveal local low points ("birdbaths") and similar imperfections. Mark low points and dry and prepare surface to receive additional mortar in accordance with manufacturer's directions. Apply additional mortar materials as required to level surface.

E. Coating Application: Apply coating material with a rubber squeegee. Immediately after application, use a short-nap roller to remove squeegee lines and smooth out the coat. Apply in 4- to 6-mil thick layers and allow to thoroughly dry before subsequent applications.

1. Apply material to a total built-up thickness of not less than 12-mils.
2. Finish flooring surface with non-slip roughened texture.

3.3 CLEANING AND PROTECTION

A. Clean floors after installation in accordance with flooring manufacturer's written instructions. Do not polish floors.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 096813 - TILE CARPETING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 096813 - TILE CARPETING

*SECTION WRITTEN FOR PROJECTS WITH SELECTED CARPET PRODUCTS /
COMPETITIVELY BID INSTALLATION.*

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 035416 - Hydraulic Cement Underlayment
 - 2. Section 096500 - Resilient Flooring
 - 3. Section 096816 - Sheet Carpeting

1.2 SUMMARY

- A. Section Includes:
 - 1. Modular carpet tile.
 - 2. Resilient base.
- B. Work Provided under this section but specified under other sections:
 - 1. Resilient wall base.
 - 2. Resilient transitions strips.

1.3 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include manufacturer's written data on physical characteristics, durability, and fade resistance.
 - 2. Include installation recommendations for each type of substrate.
 - 3. For installation adhesive, documentation including printed statement of VOC content.

*INCLUDE BELOW FOR LEED PROJECTS. NOTE THAT REQUIREMENTS ARE
BASED ON LEED 2009*

- B. LEED Submittals:
 - 1. Product Data for Credit EQ 4.3:
 - a. For carpet tile, documentation indicating compliance with testing and product requirements of CRI's "Green Label Plus" program.
 - b. For installation adhesive, documentation including printed statement of VOC content.
- C. Shop Drawings: Show the following:

1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet tiles.
 2. Carpet tile type, color, and dye lot.
 3. Type of subfloor.
 4. Type of installation.
 5. Pattern of installation.
 6. Pattern type, location, and direction.
 7. Pile direction.
 8. Type, color, and location of insets and borders.
 9. Type, color, and location of edge, transition, and other accessory strips.
 10. Transition details to other flooring materials.
- D. Samples: For each of the following products and for each color and texture required.
1. Carpet Tile: Full-size Sample.
 2. Exposed Edge, Transition, and Other Accessory Stripping: 12-inch-long Samples.

INCLUDE BELOW FOR ALL PROJECTS

- E. Affidavits of Compliance to be included in final inspection manual:
1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 2. Letter shall include project number, project name, and building name.

1.4 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For carpet tiles to include in maintenance manuals. Include the following:
1. Methods for maintaining carpet tile, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
 2. Precautions for cleaning materials and methods that could be detrimental to carpet tile.

COORDINATE WITH OCCUPANT PRIOR TO INCLUDING BELOW.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Carpet Tile: Full-size units equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd.

1.6 QUALITY ASSURANCE

- A. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.

1. Reference Standards:

REFER TO MICHIGAN BUILDING CODE FOR FURTHER REQUIREMENTS CONCERNING CLASS, FLAME SPREAD AND SMOKE DEVELOPED RATINGS.

- a. Carpet Flammability: Pass pill test, ASTM D 2859 (DOC FF-1-70).

MODIFY TO CLASS II IF ALLOWABLE BY CODE AND REQUIRED BY CARPET SELECTION

- b. Radiant Panel Test: Meet NFPA 253 Class I.

EDIT AND INCLUDE IF REQUIRED BY PROJECT

- c. Static Electricity: 3.0 KV max. at 70 deg. F and 20% RH, AATCC 134.

1.7 FIELD CONDITIONS

- A. Comply with CRI 104 for temperature, humidity, and ventilation limitations.

DELETE BELOW FOR TYPICAL INTERIOR RENOVATION WORK.

- B. Environmental Limitations: Do not deliver or install carpet tiles until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at occupancy levels during the remainder of the construction period.

RETAIN BELOW FOR PROJECTS WITH NEW CONCRETE.

- C. Do not install carpet tiles over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive and concrete slabs have pH range recommended by carpet tile manufacturer.

RETAIN BELOW FOR PROJECTS WITH DEMOUNTABLE PARTITIONS.

- D. Where demountable partitions or other items are indicated for installation on top of carpet tiles, install carpet tiles before installing these items.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

EDIT AFTER CARPET IS SELECTED. MATERIALS AND CONSTRUCTION NOT INCLUDED. ASSUMES A SINGLE SELECTION IS MADE FOR EACH TYPE BASED ON MANUFACTURER AND PATTERN AND THAT ALTERNATIVE CARPETS ARE NOT BID.

- A. Acceptable Manufacturers:
 - 1. Carpet type no. 1: [Manufacturer Name]
 - a. Style:
 - b. Color:

INCLUDE MATERIALS, CONTRUCTIONS IF COMPEDITIVELY BIDDING MATERIALS AND INSTALLATION. NOT REUIQRED IF ONLY BIDDING INSTALLATION.

2.2 INSTALLATION ACCESSORIES

DELETE BELOW IF SECTION 035416 - HYDRAULIC CEMENT UNDERLAYMENT IS INCLUDED.

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet tile manufacturer.

BELOW IS TYPICAL. COORDINATE WITH INTERIOR DESIGN.

- B. Adhesives: Water-resistant, mildew-resistant, nonstaining, pressure-sensitive type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet tile and is recommended by carpet tile manufacturer for releasable installation.

RETAIN FOR ALL PROJECTS

1. Adhesives shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

RETAIN "METAL EDGE/TRANSITION STRIPS" PARAGRAPH BELOW UNLESS RESILIENT EDGE STRIPS FOR CARPET TILE ARE SPECIFIED IN SECTION 096513 "RESILIENT BASE AND ACCESSORIES." IF RETAINING, REVISE FINISH OR DESCRIPTION TO SUIT PROJECT AND SHOW WIDTH REQUIREMENTS ON DRAWINGS.

- C. Metal Edge/Transition Strips: Extruded aluminum with mill finish of profile and width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.

2.3 WALL BASE

- A. Provide wall base for each area scheduled to receive carpet. Comply with the requirements for wall base specified in Division 9 Section "Resilient Flooring".

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, adhesive and floor coating removal, installation tolerances, and other conditions affecting carpet tile performance. Examine carpet tile for type, color, pattern, and potential defects.

RETAIN "CONCRETE SUBFLOORS" PARAGRAPH BELOW IF PRODUCTS ARE ADHESIVELY ATTACHED TO CONCRETE SUBFLOORS.

- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:

REVISE FIRST SUBPARAGRAPH BELOW TO INCLUDE SPECIFIC TESTS IF APPLICABLE TO PROJECT.

1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet tile manufacturer.

INCLUDE BELOW NEW SLABS

2. Subfloor finishes comply with requirements specified in Section 033000 "Cast-in-Place Concrete" for slabs receiving carpet tile.
3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.

COORDINATE REQUIREMENTS BELOW WITH ACCESS FLOORING.

- C. Raised access flooring systems: Verify the following:

1. Access floor substrate is compatible with carpet tile and adhesive if any.
2. Underlayment surface is flat, smooth, evenly planed, tightly jointed, and free of irregularities, gaps greater than 1/8 inch, protrusions more than 1/32 inch, and substances that may interfere with adhesive bond or show through surface.

- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Comply with CRI 104, Section 6.2, "Site Conditions; Floor Preparation," and with carpet tile manufacturer's written installation instructions for preparing substrates indicated to receive carpet tile installation.

RETAIN OR REVISE FIRST PARAGRAPH BELOW TO SUIT PRODUCT AND PROJECT; DIMENSIONS ARE RECOMMENDED BY CRI.

- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch wide or wider and protrusions more than 1/32 inch unless more stringent requirements are required by manufacturer's written instructions.

REQUIREMENT BELOW IS INTENDED TO LIMIT CLAIMS FOR EXTRAS. INCREASE OR DECREASE AREA PERCENT BASED ON YOUR JUDGMENT, OR DELETE ENTIRELY FOR NEW CONCRETE FLOORS.

1. Patching is required for approximately [not less than] 20 percent of the gross floor area of the Project.

INCLUDE BELOW FOR LARGE AREAS OF PATCHING OR LEVELING. COORDINATE WITH "HYDRAULIC CEMENT UNDERLAYMENT" SECTION.

2. Floor patching and leveling is included in Division 03 Section "Hydraulic Cement Underlayment."

RETAIN BELOW FOR NEW CONCRETE SURFACES

- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet tile manufacturer.

RETAIN BELOW FOR EXISTING CONCRETE SURFACES

- D. Remove existing adhesives per Division 02 Section "Selective Demolition." Remove other coatings as recommended in writing by carpet tile manufacturer.
- E. Broom and vacuum clean substrates to be covered immediately before installing carpet tile.

3.3 INSTALLATION

- A. General: Comply with CRI 104, Section 14, "Carpet Modules," and with carpet tile manufacturer's written installation instructions.

SELECT ITEM B OR C BELOW.

- B. Installation Method: As recommended in writing by carpet tile manufacturer.

COORDINATE SPECIFIC "INSTALLATION METHOD" REQUIREMENTS WITH INTERIOR DESIGN AND EDIT BELOW. NOTE THE FOLLOWING GENERAL GUIDELINES

FULL-SPREAD, GLUE-DOWN INSTALLATION IS APPROPRIATE FOR WHEEL TRAFFIC.

PARTIAL GLUE-DOWN INSTALLATION IS APPROPRIATE FOR CARPET TILES OF MODERATE DIMENSIONAL STABILITY, WEIGHT, AND MASS.

FREE-LAY INSTALLATION IS APPROPRIATE FOR DIMENSIONALLY STABLE CARPET TILES WITH HEAVY BACKINGS. REVISE SECOND OPTION BELOW IF SPOT-GLUED INSTALLATION IS RECOMMENDED BY MANUFACTURER AND SUITS PRODUCT AND PROJECT.

- C. Installation Method: [Glue down; install every tile with full-spread, releasable, pressure-sensitive adhesive] [Partial glue down; install periodic tiles with releasable, pressure-sensitive adhesive] [Free lay; install carpet tiles without adhesive].
- D. Maintain dye lot integrity. Do not mix dye lots in same area.
- E. Cut and fit carpet tile to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet tile manufacturer.
- F. Extend carpet tile into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.

G. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.

H. Pattern:

1. General: Install pattern parallel to walls and borders.

SELECT OPTION FROM BELOW OR CONSIDERING SHOWING ON DRAWING FOR COMPLICATED PATTERNS OR MULTIPLE CARPETS WITH DIFFERENT REQUIREMENTS.

2. Monolithic.
3. Quarter-turn.
4. Ashlar.

DELETE BELOW IF NO RAISED ACCESS FLOORING SYSTEMS. ADHESIVE IN SEAMS MAY IMPEDE PANEL REMOVAL AND REPLACEMENT.

I. Stagger joints of carpet tiles so carpet tile grid is offset from access flooring panel grid. Do not fill seams of access flooring panels with carpet adhesive; keep seams free of adhesive.

DELETE ARTICLE BELOW IF NO WALL BASE INCLUDED OR IF SPECIFIED IN OTHER SECTION.

3.4 WALL BASE INSTALLATION

A. Apply wall base in lengths as long as practicable to walls, columns, and all permanent fixtures and where indicated. Mitered outside corners not acceptable. Apply base to fixed laboratory cabinetry as follows:

1. Base cabinet toe spaces.
2. Exposed sides of base cabinets.
3. Filler and closure panels extending to floor.

3.5 CLEANING AND PROTECTION

A. Perform the following operations immediately after installing carpet tile:

1. Remove excess adhesive and other surface blemishes using cleaner recommended by carpet tile manufacturer.
2. Remove yarns that protrude from carpet tile surface.
3. Vacuum carpet tile using commercial machine with face-beater element.

B. Protect installed carpet to comply with CRI 104, Section 16, "Protecting Indoor Installations."

C. Protect carpet tile against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet tile manufacturer.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 096816 - SHEET CARPETING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 096816 - SHEET CARPETING

*SECTION WRITTEN FOR PROJECTS WITH SELECTED CARPET PRODUCTS /
COMPETTIVELY BID INSTALLATION.*

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 035416 - Hydraulic Cement Underlayment
 - 2. Section 096500 - Resilient Flooring
 - 3. Section 096813 - Tile Carpeting

1.2 SUMMARY

MODIFY TO SUIT PRODUCT SELECTIONS.

- A. Section Includes:
 - 1. Tufted carpet.
 - 2. Woven carpet.
 - 3. Carpet cushion.
- B. Work Provided under this section but specified under other Sections:
 - 1. Resilient wall base.
 - 2. Resilient transition strips.

1.3 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include manufacturer's written data on physical characteristics, durability, and fade resistance.
 - 2. Include installation recommendations for each type of substrate.
 - 3. For installation adhesive, documentation including printed statement of VOC content.

*INCLUDE BELOW FOR LEED PROJECTS. NOTE THAT REQUIREMENTS ARE
BASED ON LEED 2009*

- B. LEED Submittals:
 - 1. Product Data for Credit EQ 4.3:
 - a. For carpet, documentation indicating compliance with testing and product requirements of CRI's "Green Label Plus" program.

b. For installation adhesive, documentation including printed statement of VOC content.

C. Shop Drawings: Show the following:

1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet.
2. Carpet type, color, and dye lot.
3. Layout and seaming diagrams.
4. Type of subfloor.
5. Type of installation.
6. Pattern of installation.
7. Pattern type, location, and direction.
8. Pile direction.
9. Type, color, and location of insets and borders.
10. Type, color, and location of edge, transition, and other accessory strips.
11. Transition details to other flooring materials.

D. Samples: For each of the following products and for each color and texture required.

1. Submit 18 inch by 27 inch samples of each type, color, pattern and texture of carpet.
2. Exposed Edge, Transition, and Other Accessory Stripping: 12-inch long samples.

INCLUDE BELOW FOR ALL PROJECTS.

E. Affidavits of Compliance to be included in final inspection manual:

1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
2. Letter shall include project number, project name, and building name.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For each type of carpet to include in maintenance manuals. Include the following:

1. Methods for maintaining carpet, including cleaning and stain-removal products and procedures and manufacturer's recommended maintenance schedule.
2. Precautions for cleaning materials and methods that could be detrimental to carpet.

COORDINATE WITH OCCUPANT PRIOR TO INCLUDING BELOW.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Carpet: Full-width rolls equal to 5 percent of amount installed for each type indicated, but not less than 10 sq. yd.

1.6 QUALITY ASSURANCE

- A. Reference Standards: Products in this Section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.

1. Reference Standards:

REFER TO MICHIGAN BUILDING CODE FOR FURTHER REQUIREMENTS CONCERNING CLASS, FLAME SPREAD AND SMOKE DEVELOPED RATINGS.

- a. Carpet Flammability: Pass pill test, ASTM D 2859 (DOC FF-1-70).

MODIFY TO CLASS II IF ALLOWABLE BY CODE AND REQUIRED BY CARPET SELECTION

2. Radiant Panel Test: Meet NFPA Class I.

EDIT AND INCLUDE IF REQUIRED BY PROJECT

3. Static Electricity: 3.0 KV max. at 70 deg. F and 20% RH, AATCC 134.

1.7 FIELD CONDITIONS

- A. Comply with CRI 104 for temperature, humidity, and ventilation limitations.

DELETE BELOW FOR TYPICAL INTERIOR RENOVATION WORK.

- B. Environmental Limitations: Do not deliver or install carpet until spaces are enclosed and weathertight, wet work in spaces is complete and dry, and ambient temperature and humidity conditions are maintained at occupancy levels during the remainder of the construction period.

RETAIN BELOW FOR PROJECTS WITH NEW CONCRETE.

- C. Do not install carpet over concrete slabs until slabs have cured and are sufficiently dry to bond with adhesive, and concrete slabs have pH range recommended by carpet manufacturer.

RETAIN BELOW FOR PROJECTS WITH DEMOUNTABLE PARTITIONS.

- D. Where demountable partitions or other items are indicated for installation on top of carpet, install carpet before installing these items.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

EDIT AFTER CARPET IS SELECTED. MATERIALS AND CONSTRUCTION NOT INCLUDED. ASSUMES A SINGLE SELECTION IS MADE FOR EACH TYPE OF

CARPET BASED ON MANUFACTURER AND PATTERN AND THAT ALTERNATIVE CARPETS ARE NOT BID.

A. Acceptable Manufacturers:

1. Carpet type no. 1: [Manufacturer Name]
 - a. Style:
 - b. Color:

2.2 INSTALLATION ACCESSORIES

DELETE BELOW IF SECTION 035416 - HYDRAULIC CEMENT UNDERLAYMENT IS INCLUDED.

- A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet manufacturer.

BELOW IS TYPICAL. COORDINATE WITH INTERIOR DESIGN.

- B. Adhesives: Water-resistant, mildew-resistant, nonstaining, pressure-sensitive type to suit products and subfloor conditions indicated, that complies with flammability requirements for installed carpet and is recommended by carpet manufacturer for installation.

RETAIN FOR ALL PROJECTS

1. Adhesives shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

RETAIN "METAL EDGE/TRANSITION STRIPS" PARAGRAPH BELOW UNLESS RESILIENT EDGE STRIPS FOR CARPET ARE SPECIFIED IN SECTION 096513 "RESILIENT BASE AND ACCESSORIES." IF RETAINING, REVISE FINISH OR DESCRIPTION TO SUIT PROJECT AND SHOW WIDTH REQUIREMENTS ON DRAWINGS.

- C. Metal Edge/Transition Strips: Extruded aluminum with mill finish of profile and width shown, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.
- D. Seam Adhesive: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for sealing and taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.

2.3 WALL BASE

- A. Provide wall base for each area scheduled to receive carpet. Comply with the requirements for wall base specified in Division 9 Section "Resilient Flooring".

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, adhesive and floor coating removal, installation tolerances, and other conditions affecting carpet performance. Examine carpet for type, color, pattern, and potential defects.

RETAIN "CONCRETE SUBFLOORS" PARAGRAPH BELOW IF PRODUCTS ARE ADHESIVELY ATTACHED TO CONCRETE SUBFLOORS.

- B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710 and the following:

REVISE FIRST SUBPARAGRAPH BELOW TO INCLUDE SPECIFIC TESTS IF APPLICABLE TO PROJECT.

1. Slab substrates are dry and free of curing compounds, sealers, hardeners, and other materials that may interfere with adhesive bond. Determine adhesion and dryness characteristics by performing bond and moisture tests recommended by carpet manufacturer.

INCLUDE BELOW FOR NEW SLABS

2. Subfloor finishes comply with requirements specified in Section 033000 "Cast-in-Place Concrete" for slabs receiving carpet.
3. Subfloors are free of cracks, ridges, depressions, scale, and foreign deposits.

- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. General: Comply with CRI 104, Section 7.3, "Site Conditions; Floor Preparation," and with carpet manufacturer's written installation instructions for preparing substrates.

RETAIN OR REVISE FIRST PARAGRAPH BELOW TO SUIT PRODUCT AND PROJECT; DIMENSIONS ARE RECOMMENDED BY CRI.

- B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch wide or wider and protrusions more than 1/32 inch unless more stringent requirements are required by manufacturer's written instructions.

REQUIREMENT BELOW IS INTENDED TO LIMIT CLAIMS FOR EXTRAS. INCREASE OR DECREASE AREA PERCENT BASED ON YOUR JUDGMENT, OR DELETE ENTIRELY FOR NEW CONCRETE FLOORS.

1. Patching is required for approximately [not less than] 20 percent of the gross floor area of the Project.

INCLUDE BELOW FOR LARGE AREAS OF PATCHING OR LEVELING. COORDINATE WITH "HYDRAULIC CEMENT UNDERLAYMENT" SECTION.

2. Floor patching and leveling is included in Division 03 Section "Hydraulic Cement Underlayment."

RETAIN BELOW FOR NEW CONCRETE SURFACES

- C. Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by carpet manufacturer.

RETAIN BELOW FOR EXISTING CONCRETE SURFACES

- D. Remove existing adhesives per Division 02 Section "Selective Demolition." Remove other coatings as recommended in writing by carpet manufacturer.
- E. Broom and vacuum clean substrates to be covered immediately before installing carpet.

3.3 CARPET INSTALLATION

- A. General: Comply with CRI 104 and with carpet manufacturer's written installation instructions for the following:

COORDINATE SPECIFIC "INSTALLATION METHOD" REQUIREMENTS WITH INTERIOR DESIGN AND EDIT BELOW. BELOW ARE COMMONLY USED EXAMPLES. OTHER EXAMPLES ARE LISTED IN AIA MASTERSPEC 096816.

1. Carpet Seam Edge Preparation: Comply with CRI 104, Section 8, "Carpet Seam Edge Preparation."
 2. Direct-Glue-Down Installation: Comply with CRI 104, Section 9, "Direct Glue-Down Installation."
 3. Stair Installation: Comply with CRI 104, Section 13, "Carpet on Stairs" for [~~stretch-in~~] [~~glue-down~~] installation.
- B. Comply with carpet manufacturer's written recommendations and Shop Drawings for seam locations and direction of carpet; maintain uniformity of carpet direction and lay of pile. At doorways, center seams under the door in closed position.
 - C. Pre-plan installation for proper sequencing with other work.
 - D. Do not bridge building expansion joints with carpet.
 - E. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.
 - F. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
 - G. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, nonstaining marking device.

RETAIN FIRST PARAGRAPH BELOW IF CARPET HAS A PATTERN OR MODIFY TO SUIT PROJECT.

- H. Install pattern parallel to walls and borders to comply with CRI 104, Section 15, "Patterned Carpet Installations" and with carpet manufacturer's written recommendations.

**RETAIN BELOW FOR HIGH TRAFFIC SEAMS. NOTE THAT SEALED SEAMS
MAY NOT BE TOTALLY INVISIBLE.**

- I. Sealing Edges - Prior to seaming, both trimmed edges of the carpet sections to be joined must be sealed with an manufacturer's recommended seam adhesive. Apply seam adhesive in a manner that encapsulates both primary and secondary backings without contaminating face yarns
- J. Save carpet scraps, defined as mill ends less than 9 feet long and pieces larger than 3 sq. ft. in area and wider than 8 inches, and deliver to Owner's storage space as directed. Dispose of smaller pieces.

**DELETE ARTICLE BELOW IF NO WALL BASE INCLUDED OR IF SPECIFIED
IN ANOTHER SECTION.**

3.4 WALL BASE INSTALLATION

- A. Apply wall base in lengths as long as practicable to walls, columns, and all permanent fixtures and where indicated. Mitered outside corners not acceptable. Apply base to fixed laboratory cabinetry as follows:
 - 1. Base cabinet toe spaces.
 - 2. Exposed sides of base cabinets.
 - 3. Filler and closure panels extending to floor.

3.5 CLEANING AND PROTECTING

- A. Perform the following operations immediately after installing carpet:
 - 1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
 - 2. Remove yarns that protrude from carpet surface.
 - 3. Vacuum carpet using commercial machine with face-beater element.
- B. Protect installed carpet to comply with CRI 104, Section 16, "Protecting Indoor Installations."
- C. Protect carpet against damage from construction operations and placement of equipment and fixtures during the remainder of construction period. Use protection methods indicated or recommended in writing by carpet manufacturer and carpet adhesive manufacturer.

END OF CONTENTS TABLE

DIVISION 09 FINISHES

SECTION 098433 - SOUND ABSORBING WALL UNITS

JUNE 2005 - UPDATED TO CHANGE TO 1997 NFPA "LIFE SAFETY CODE".

THIS SECTION SPECIFIES STANDARD WALL MOUNTED ACOUSTIC TILE AND AUDIOCUSTIC "SONEX" UNITS.

OTHER OPTIONS ARE AVAILABLE. CONSULT MANUFACTURER'S LITERATURE

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of acoustic wall panels is indicated on Drawings.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's product literature, color samples and installation instructions.

INCLUDE BELOW FOR ALL PROJECTS.

- B. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

PART 2 - PRODUCTS

2.1 ACOUSTIC BAFFLE PANELS

- A. Open cell polyester urethane, wall mounted acoustical panels.
 - 1. Manufacturer: "Sonex Co."
 - a. Model: "Sonex Classic".
 - b. Size: 24 inches by 48 inches by 2 inches thick.

2.2 ACOUSTIC TILE

- A. Acoustic tile, water felted units.
 - 1. Manufacturer: "Armstrong World Industries"
 - a. Model: "Optima" textured scrim wall panels.
 - b. Size: 48 inches by 96 inches by 1 inch thick.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation: Comply with mfr's recommended procedures for indicated application. Use mfr's recommended adhesives for each substrate.

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 099100 - PAINTING

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 099100 - PAINTING

JULY 2011 - UPDATED TO ADD LOW VOC PRODUCTS TO INTERIOR PAINT SCHEDULE AND TO REMOVE MOST NON-COMPLIANT VOC PRODUCTS AS OPTIONS FOR INTERIOR PAINTS. REFER TO DESIGN GUIDELINE 099110 FOR INFORMATION ON PERMISSIBLE EXCEPTIONS TO LOW VOC PRODUCTS.

SECTION ALSO REFORMATTED TO MEET CURRENT UM STANDARDS.

12/1/2017 - ADDED PROHIBITION OF PRODUCTS INCLUDING ISOCYANATE COMPOUNDS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:

LIST BELOW CONTAINS ITEMS THAT ARE USUALLY SHOP PRIMED AND MATERIALS THAT MIGHT BE SPECIFIED IN THIS SECTION. REVISE TO SUIT THE PROJECT. VERIFY THAT SECTION TITLES LISTED BELOW ARE CORRECT FOR THIS PROJECT'S SPECIFICATIONS. IF ROOM FINISH SCHEDULE IS TO BE INCLUDED AS A SEPARATE SPECIFICATION SECTION ADD THAT SECTION TO THE LIST BELOW. INCLUDE SECTION BELOW FOR ALL TYPES OF EPOXY PAINT.

- 1. Division 01 Section "Work Restrictions" for special protections for epoxy painting work.
- 2. Division 05 "Structural Steel Framing" for shop priming structural steel.
- 3. Division 05 Section "Metal Fabrications" for shop priming ferrous metal.
- 4. Division 06 Section "Interior Architectural Woodwork" for shop finishing interior architectural woodwork.
- 5. Division 08 "Hollow Metal Doors and Frames" for shop priming steel doors and frames.
- 6. Division 08 Section "Flush Wood Doors" for pre-finished wood doors.
- 7. Division 09 Section "Gypsum Board Assemblies" for surface preparation for gypsum board.
- 8. Division 09 Section "Electrostatically Applied Coating" for electrically charged, spray-applied coatings.
- 9. Divisions 21, 22 and 23: Mechanical.
- 10. Division 26: Electrical.
- 11. Division 27: Communications.
- 12. Division 28: Electronic Safety and Security.

1.2 SUMMARY

- A. Section Includes:

1. Surface preparation and field painting of the following:

ADJUST LIST BELOW TO SUIT THE PROJECT.

- a. Exposed exterior items and surfaces.
- b. Exposed interior items and surfaces.
- c. Surface preparation, priming, and finish coats specified in this Section are in addition to shop priming and surface treatment specified in other Sections.

1.3 DEFINITIONS

STANDARD TERMS USED BY THE COATINGS INDUSTRY ARE DEFINED IN ASTM D 16.

- A. General: Standard coating terms defined in ASTM D 16 apply to this Section.

DELETE GLOSS RANGES BELOW NOT REQUIRED FOR THE PROJECT. STANDARD GLOSS RANGES WERE DEVELOPED BY THE NATIONAL PAINT AND COATINGS ASSOCIATION (NPCA).

1. Flat refers to a lusterless or matte finish with a gloss range below 15 when measured at an 85-degree meter.
 2. Eggshell refers to low-sheen finish with a gloss range between 5 and 20 when measured at a 60-degree meter.
 3. Satin refers to low-sheen finish with a gloss range between 15 and 35 when measured at a 60-degree meter.
 4. Semigloss refers to medium-sheen finish with a gloss range between 30 and 65 when measured at a 60-degree meter.
 5. Full gloss refers to high-sheen finish with a gloss range more than 65 when measured at a 60-degree meter.
- B. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, convector covers, covers for finned-tube radiation, grilles, and similar components are in place. Extend coatings in these areas, as required, to maintain the system integrity and provide desired protection.

1.4 SUBMITTALS

EXPAND PARA AND SUBPARAS BELOW TO SUIT THE PROJECT AND PRODUCTS REQUIRED.

- A. Product Data: For each paint system specified. Include block fillers and primers.
 1. Material List: Provide an inclusive list of required coating materials. Indicate each material and cross-reference specific coating, finish system, and application. Identify each material by manufacturer's catalog number and general classification.
 2. Manufacturer's Information: Provide manufacturer's technical information, including label analysis, statement of VOC content and instructions for handling, storing, and applying each coating material proposed for use.

RETAIN PARAGRAPH BELOW FOR LEED PROJECTS.

- B. LEED Submittals:

1. Product Data for Credit EQ 4.2: For paints and coatings, including printed statement of VOC content.

REVISE PARA BELOW IF COLORS ARE PRESELECTED AND SPECIFIED OR SCHEDULED.

- C. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for each type of finish-coat material indicated.

RETAIN BELOW WITH OR WITHOUT ABOVE.

- D. Samples for Verification: Of each color and material to be applied, with texture to simulate actual conditions.

1.5 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials, **from the same product run**, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

REVISE BELOW TO SUIT PROJECT.

1. Paint: **5** percent, but not less than **1 gallon** of each material and color applied.

1.6 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. ASTM D16 Standard Terminology for Paint, Related Coatings, Materials, and Applications.
- C. Source Limitations: Obtain block fillers, primers, and undercoat materials for each coating system from the same manufacturer as the finish coats.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to the Project Site in manufacturer's original, unopened packages and containers bearing manufacturer's name and label.
- B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 deg F. Maintain containers used in storage in a clean condition, free of foreign materials and residue.
 1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily. Take necessary measures to ensure that workers and work areas are protected from fire and health hazards resulting from handling, mixing, and application.

ADD SPECIAL REQUIREMENTS FOR FIRE PROTECTION, HEATING, VENTILATION, AND OTHER SPECIAL CONDITIONS FOR STORAGE AREAS ON-SITE, IF NECESSARY.

1.8 SITE CONDITIONS

REVISE 2 PARAGRAPHS BELOW TO SUIT THE PROJECT REQUIREMENTS AND MATERIALS TO BE USED.

- A. Apply water-based paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 50 and 90 deg F.
- B. Apply solvent-thinned paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 45 and 95 deg F.

DELETE BELOW IF NO EXTERIOR PAINTING WORK INCLUDED.

- C. Do not apply paint in snow, rain, fog, or mist; or when the relative humidity exceeds 85 percent; or at temperatures less than 5 deg F above the dew point; or to damp or wet surfaces.
 - 1. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature limits specified by manufacturer during application and drying periods.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide one of the products in the paint schedules.
- B. Manufacturers:
 - 1. Benjamin Moore & Co.
 - 2. International Protective Coatings.
 - 3. O'Leary Paint Co.
 - 4. PPG Industries, Inc.
 - 5. Pratt & Lambert Paints.
 - 6. Sherwin-Williams Co.
 - 7. Tnemec.

2.2 PAINT MATERIALS, GENERAL

ALWAYS RETAIN PARA BELOW. SYSTEMS COULD FAIL IF COATINGS ARE INCOMPATIBLE.

- A. Material Compatibility:
 - 1. Provide materials for use that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.

RETAIN VALUES BELOW UNLESS AREA BEING PAINTED MEETS EXCEPTIONS LISTED IN DESIGN GUIDELINE 099110. VALUES LISTED COMPLY WITH LEED-NC, LEED-CI, OR LEED-CS CREDIT EQ 4.2 (AS OF 7/2011); COORDINATE WITH PRODUCTS.

- B. VOC Content for Interior Paints: For interior paints and coatings applied at Project site, the following VOC limits, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24)].
 - 1. Flat Paints and Coatings: 50 g/L.
 - 2. Nonflat Paints and Coatings: 150 g/L.
 - 3. Dry-Fog Coatings: 400 g/L.
 - 4. Primers, Sealers, and Undercoaters: 200 g/L.
 - 5. Anticorrosive and Antirust Paints Applied to Ferrous Metals: 250 g/L.
 - 6. Zinc-Rich Industrial Maintenance Primers: 340 g/L.
 - 7. Pretreatment Wash Primers: 420 g/L.
 - 8. Floor Coatings: 100 g/L.
 - 9. Shellacs, Clear: 730 g/L.
 - 10. Shellacs, Pigmented: 550 g/L.
- C. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified. Paint-material containers not displaying manufacturer's product identification will not be acceptable.

ISOCYANATE COMPOUNDS ARE OFTEN IN DRY ERASE PRODUCTS AS A HARDENER. SYMPTOMS OF EXPOSURE INCLUDE RESPIRATORY IRRITATION, ASTHMA AND THE POTENTIAL FOR INDIVIDUALS TO BECOME SENSITIZED. IF PRODUCT IS NEEDED, REMOVE THE FOLLOWING PROHIBITION AND SPECIFY REQUIREMENTS FOR MECHANICAL LOCAL EXHAUST VENTILATION, AIR MONITORING, RESPIRATORY PROTECTION, AND ADEQUATE CURE TIME BEFORE RE-OCCUPANCY. COORDINATE WITH EHS

- D. Do not use products containing isocyanate compounds.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine substrates, areas, and conditions, with the Applicator present, under which painting will be performed for compliance with paint application requirements.
 - 1. Do not begin to apply paint until unsatisfactory conditions have been corrected and surfaces receiving paint are thoroughly dry.
 - 2. Start of painting will be construed as the Applicator's acceptance of surfaces and conditions within a particular area.

IF EPOXY PAINTING WORK IS PART OF THE PROJECT INCLUDE THE FOLLOWING PARAGRAPH.

- B. Provide seven days' notice to the Owner's Representative prior to the application of epoxy paints.

COORDINATE PRIMERS SPECIFIED IN OTHER SECTIONS WITH UNDERCOATS AND FINISH MATERIALS SPECIFIED IN THIS SECTION TO ENSURE COMPATIBILITY OF MATERIALS. SOME FINISH-COAT MATERIALS, SUCH AS LACQUERS AND EPOXIES, LIPT OIL AND OLEORESINOUS AIR-DRY PRIMERS. A LONG-OIL FINISH COAT MAY CRAWL AND HAVE POOR ADHESION WHEN USED OVER ZINC-DUST PHENOLIC OR BAKED PRIMERS.

- C. Coordination of Work: Review other Sections in which primers are provided to ensure compatibility of the total system for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.
1. Notify the Architect about anticipated problems using the materials specified over substrates primed by others.

EXPAND PARA AND SUBPARA BELOW IF ADDITIONAL REQUIREMENTS ARE NECESSARY TO SATISFY UNUSUAL PROJECT CIRCUMSTANCES.

- D. General: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items already installed that are not to be painted. If removal is impractical or impossible because of the size or weight of the item, provide surface-applied protection before surface preparation and painting.
1. After completing painting operations in each space or area, reinstall items removed using workers skilled in the trades involved.

USUALLY DELETE BELOW AND NOTE PATCHING WORK ON THE DRAWING. IF BELOW IS RETAINED, USE ONLY FOR EXISTING SURFACES WHEN PLASTER/DRYWALL TRADES ARE NOT ENGAGED ON THE PROJECT. THE INTENT OF THE REQUIREMENT BELOW IS TO REPAIR A FEW ANCHOR HOLES, DIMPLES AND SIMILAR PROBLEMS. DO NOT EXPECT PAINTERS TO BE RESPONSIBLE FOR LARGE AREA REPAIR, DRYWALL BOARD INSTALLATION, OR TAPING.

- E. Repair Of Existing Plaster And Drywall Surfaces: Spackle and sand smooth minor surface imperfections in existing drywall and plaster surfaces. Repair is limited to imperfections of not more than 2 sq. inches in area and 3/8 inch in depth.
- F. Cleaning, General: Before applying paint or other surface treatments, clean the substrates of substances that could impair the bond of the various coatings. Remove oil and grease before cleaning.
1. Schedule cleaning and painting so dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.

DELETE BELOW IF EXISTING PAINT WILL NOT BE COVERED BY NEW PAINT.

2. Clean previously painted surfaces to remove dirt, masking tape, labels, adhesives, and other materials that would either be deleterious to adhesion of, or show through, new paint.

ALWAYS RETAIN PARA AND SUBPARAS BELOW THAT SPECIFY SURFACE PREPARATION. PROPER SURFACE PREPARATION IS ESSENTIAL FOR SATISFACTORY COATING PERFORMANCE. EXPAND REQUIREMENTS, IF NECESSARY, TO INCLUDE SPECIAL PROCEDURES REQUESTED BY MFRS OR TO SATISFY SPECIAL PROJECT CONDITIONS.

- G. Surface Preparation: Clean and prepare surfaces to be painted according to manufacturer's written instructions for each particular substrate condition and as specified.

COORDINATION OF SHOP-APPLIED PRIMERS WITH FINISH COATS IS CRITICAL. SEE THE "COORDINATION OF WORK" PARA IN THE "EXAMINATION" ARTICLE. IF COMPATIBILITY PROBLEMS DEVELOP, IT MAY BE NECESSARY TO PROVIDE BARRIER COATS OVER SHOP-APPLIED PRIMERS OR REMOVE THE PRIMER AND REPRIME THE SUBSTRATE.

1. Provide barrier coats over incompatible primers or remove and reprime.
2. For coatings applied over previously painted surfaces, test application to check for lifting and other adhesion problems. Perform test in an isolated area where practicable.

DELETE SUBPARAS BELOW IF CEMENTITIOUS SURFACES ARE NOT TO BE PAINTED, OR REVISE TO SUIT THE PROJECT.

3. Cementitious Materials: Prepare concrete, concrete masonry block, cement plaster, and mineral-fiber-reinforced cement panel surfaces to be painted. Remove efflorescence, chalk, dust, dirt, grease, oils, and release agents. Roughen as required to remove glaze. If hardeners or sealers have been used to improve curing, use mechanical methods of surface preparation.
 - a. Use abrasive blast-cleaning methods if recommended by paint manufacturer.
 - b. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause the finish paint to blister and burn, correct this condition before application. Do not paint surfaces where moisture content exceeds that permitted in manufacturer's written instructions.

DELETE SUBPARA BELOW IF PROCEDURE IS NOT REQUIRED.

- c. Clean concrete floors to be painted with a 5 percent solution of muriatic acid or other etching cleaner. Flush the floor with clean water to remove acid, neutralize with ammonia, rinse, allow to dry, and vacuum before painting.

DELETE SUBPARAS BELOW IF WOOD SURFACES ARE NOT TO BE PAINTED, OR REVISE TO SUIT THE PROJECT.

4. Wood: Clean surfaces of dirt, oil, and other foreign substances with scrapers, mineral spirits, and sandpaper, as required. Sand smooth and dust off surfaces exposed to view.
 - a. Scrape and clean small, dry, seasoned knots, and apply a thin coat of white shellac or other recommended knot sealer before applying primer. After priming, fill holes and imperfections in finish surfaces with putty or plastic wood filler. Sand smooth when dried.

DELETE SUBPARAS BELOW IF THESE REQUIREMENTS ARE SPECIFIED IN OTHER SECTIONS.

- b. Prime, stain, or seal wood to be painted immediately on delivery. Prime edges, ends, faces, undersides, and backsides of wood, including cabinets, counters, cases, and paneling.

- c. When transparent finish is required, backprime with finish product.
- d. Backprime paneling on interior partitions where masonry, plaster, or other wet wall construction occurs on backside.
- e. Seal tops, bottoms, and cutouts of unprimed wood doors with a heavy coat of varnish or sealer immediately on delivery.

REVISE SUBPARAS BELOW TO SUIT THE PROJECT.

- 5. Ferrous Metals: Clean ungalvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale, and other foreign substances. Use solvent or mechanical cleaning methods that comply with the Steel Structures Painting Council's (SSPC) recommendations.

DELETE SUBPARA BELOW IF TREATMENT IS NOT REQUIRED.

- a. Treat bare and sandblasted or pickled clean metal with a metal treatment wash coat before priming.

DELETE SUBPARA BELOW IF TOUCHUP PAINTING OF SHOP-APPLIED PRIMERS WILL BE DONE BY THE MATERIAL ERECTOR OR INSTALLER.

- b. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by paint manufacturer, and touch up with the same primer as the shop coat.
- 6. Galvanized Surfaces: Clean galvanized surfaces with nonpetroleum-based solvents so surface is free of oil and surface contaminants. Remove pretreatment from galvanized sheet metal fabricated from coil stock by mechanical methods.

- H. Materials Preparation: Mix and prepare paint materials according to manufacturer's written instructions.

- 1. Maintain containers used in mixing and applying paint in a clean condition, free of foreign materials and residue.
- 2. Stir material before application to produce a mixture of uniform density. Stir as required during application. Do not stir surface film into material. If necessary, remove surface film and strain material before using.
- 3. Use only thinners approved by paint manufacturer and only within recommended limits.

THE FOLLOWING PARA CAN STAND ALONE FOR NEW CONSTRUCTION, BUT NEEDS EXPANSION FOR RENOVATION WORK. INCLUDE APPROPRIATE SUBPARAGRAPHS BELOW FOR REVOVATION.

3.2 APPLICATION, GENERAL

THE FOLLOWING PARA CAN STAND ALONE FOR NEW CONSTRUCTION, BUT NEEDS EXPANSION FOR RENOVATION WORK. INCLUDE APPROPRIATE SUBPARAS BELOW FOR RENOVATION.

A. Paint exposed surfaces of all new work, except where the paint schedules or provisions of this Section indicate that a surface or material is not to be painted or is to remain natural. If the schedules do not indicate color or finish, the Architect will select from standard colors and finishes available.

1. Walls: Where walls are scheduled, include the following surfaces in addition, unless otherwise indicated:

EDIT THE LIST BELOW TO SUIT THE PROJECT. REMINDER: SCHEDULE WALLS OF NEW MECHANICAL ROOMS AND ELEVATOR SHAFTS FOR PAINTING (ON DRAWING).

- a. Surfaces of wall mounted items previously painted in existing construction.
- b. Exposed portions of pipes, ducts, conduit, outlet and junction boxes and convactor covers (regardless of factory finish).
- c. Columns, both engaged and free-standing within the scheduled area.
- d. Access panels.
- e. Doors and door frames.

DELETE FASCIA/SOFFIT BELOW IF INCLUDED WITH CEILING PAINT.

- f. Gypsum fascia and soffits.
- g. Woodwork and trim.
- h. Handrails, including brackets and escutcheons.

DELETE BELOW IF NO CEILINGS SCHEDULED TO RECEIVE PAINT. NOTE: IF NEW CLGS ARE ACOUSTIC PANELS (NOT SCHEDULED TO BE PAINTED), AND SOFFITS ARE TO BE PAINTED, INCLUDE UNDER "WALLS" ABOVE OR PROVIDE SPECIAL NOTE BELOW.

2. Ceilings: Where ceilings are scheduled, include the following in addition to ceilings, unless otherwise indicated:

EDIT THE LIST BELOW TO SUIT THE PROJECT.

- a. Surfaces of ceiling mounted items previously painted in existing construction.
- b. Access panels.
- c. Gypsum ceilings, soffits, fascia and trim.
- d. Exposed portions of structural slabs.
- e. Exposed interior steel and iron work.
- f. Exposed portions of pipes, ducts, conduit, junction boxes.

USUALLY RETAIN BELOW.

3. Where floors are scheduled, include the following in addition to floors, unless otherwise indicated:

EDIT LIST BELOW TO SUIT PROJECT.

- Base band 4-inches above finished floor.
- a. Base band 6-inches above finished floor.

DELETE BELOW IF NO STAIRS.

4. Where stairwell walls are scheduled, include the following in addition to walls, unless otherwise indicated:

- a. Exposed portions of stringers, risers, support brackets, tread and landing pan edges.
- b. Underside of stairs, including tread and landing pans.

- c. Handrails, guards and infill panels.
- d. Exposed anchors and fasteners.

PARAS BELOW ARE TYPICAL PAINTING REQUIREMENTS FOR MECHANICAL. REVISE IN CONSULTATION WITH MECHANICAL ENGINEER.

B. Mechanical Work: Painting of mechanical work is limited to the following:

DELETE PARA BELOW IF NO EXTERIOR MECHANICAL ITEMS TO BE PAINTED.

- 1. Exterior: Unless otherwise indicated, paint the following:

LIST BELOW CONTAINS MECHANICAL ITEMS THAT MAY BE FIELD PAINTED. ADD OR DELETE ITEMS TO SUIT THE PROJECT.

- a. Structural supports for mechanical equipment.
- b. Mechanical equipment (except pre-finished equipment).
- c. Piping (except insulated piping), pipe hangers, and supports.
- d. Ductwork.
- e. Accessory items.

DELETE PARA BELOW IF NO INTERIOR MECHANICAL ITEMS TO BE PAINTED.

- 2. Interior Occupied Areas and Stairways: Unless otherwise indicated, paint the following when exposed to view in finished construction:

LIST BELOW CONTAINS MECHANICAL ITEMS THAT MAY BE FIELD PAINTED. ADD OR DELETE ITEMS TO SUIT THE PROJECT.

- a. Structural supports for mechanical equipment.
- b. Mechanical equipment (except pre-finished equipment).
- c. Piping (except insulated piping), pipe hangers, and supports.
- d. Convactor covers.
- e. Ductwork.

TYPICALLY DELETE BELOW. INSULATION IS RARELY PAINTED.

- f. Insulation on pipe and ductwork.
- g. Accessory items.
- h. Fire suppression system piping.
- 3. Interior Service Areas (Equipment Rooms, Mechanical Rooms, and Utility Spaces): Unless otherwise indicated, paint the following items when exposed to view in finished construction:

LIST BELOW CONTAINS MECHANICAL ITEMS THAT MAY BE FIELD PAINTED. ADD OR DELETE ITEMS TO SUIT THE PROJECT.

- a. Structural supports for mechanical equipment.
- b. Mechanical equipment (except pre-finished equipment).
- c. Piping (except insulated piping), pipe hangers, and supports.
- d. Accessory items.
- e. Fire suppression system piping.

RETAIN BELOW IF FIRE SUPPRESSION (SPRINKLERS) ARE INCLUDED IN THE PROJECT.

- 4. Interior Spaces, Concealed Above Acoustic Ceilings: Unless otherwise indicated, paint the following:
 - a. Fire suppression piping, 3-inch diameter and larger.

PARA BELOW IS AN EXAMPLE OF PAINTING REQUIREMENTS FOR ELECTRICAL. DELETE IF NO PAINTING OF ELECTRICAL WORK IS INCLUDED IN PROJECT, OR REVISE TO SUIT THE PROJECT.

C. Electrical Work: Painting of electrical work is limited to the following:

1. Exterior: Unless otherwise indicated, paint the following:

REVISE THREE PARAGRAPHS BELOW AFTER CONSULTATION WITH ELECTRICAL ENGINEER. NOTE THAT INSTRUCTIONS FOR PAINTING JUNCTION BOXES FOR IDENTIFICATION PURPOSES ARE COVERED IN 16050.

- a. Structural supports for electrical equipment, including unpainted cut ends of Unistrut.
2. Interior Occupied Areas: Unless otherwise indicated, paint the following when items exposed to view in finished construction:

LIST BELOW CONTAINS ELECTRICAL ITEMS THAT ARE USUALLY FIELD PAINTED. ADD OTHER ITEMS TO SUIT THE PROJECT.

- a. Structural supports for electrical equipment.
3. Interior Service Areas (Equipment Rooms, Stairs and Utility Spaces): Unless otherwise indicated, paint the following items exposed to when view in finished construction:

LIST BELOW CONTAINS ELECTRICAL ITEMS THAT ARE USUALLY FIELD PAINTED. ADD OTHER ITEMS TO SUIT THE PROJECT.

- a. Structural supports for electrical equipment.

3.3 APPLICATION

REVISE THIS ARTICLE TO SUIT THE PROJECT. ADD SPECIAL RESTRICTIONS ON APPLICATION METHODS, IF REQUIRED.

A. General: Apply paint according to manufacturer's written instructions. Use applicators and techniques best suited for substrate and type of material being applied.

1. Paint colors, surface treatments, and finishes are indicated in the schedules.
2. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, or conditions detrimental to formation of a durable paint film.
3. Provide finish coats that are compatible with primers used.
4. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, convactor covers, covers for finned-tube radiation, grilles, and similar components are in place. Extend coatings in these areas, as required, to maintain the system integrity and provide desired protection.
5. Paint surfaces behind movable equipment and furniture the same as similar exposed surfaces. Before the final installation of equipment, paint surfaces behind permanently fixed equipment or furniture with prime coat only.

BELOW IS OPTIONAL. CONSIDER DELETING.

6. Paint interior surfaces of ducts with a flat, nonspecular black paint where visible through registers or grilles.
7. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.

8. Finish exterior doors on tops, bottoms, and side edges the same as exterior faces.

DELETE SUBPARAGRAPH BELOW IF CASEWORK IS PREFINISHED.

9. Finish interior of wall and base cabinets and similar field-finished casework to match exterior.
10. Brackets and Standards: Paint standards before installation of brackets, and allow to dry thoroughly. Paint brackets before installation on standards.
11. Sand lightly between each succeeding enamel or varnish coat.

- B. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pretreated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.

INSERT RESTRICTIONS OR LIMITS ON USE OF SPRAY EQUIPMENT IF NECESSARY TO SUIT SPECIAL PROJECT CONDITIONS.

1. The number of coats and the film thickness required are the same regardless of application method. Do not apply succeeding coats until the previous coat has cured as recommended by the manufacturer. If sanding is required to produce a smooth, even surface according to manufacturer's written instructions, sand between applications.
2. Omit primer on metal surfaces that have been shop primed and touchup painted.
3. If undercoats, stains, or other conditions show through final coat of paint, apply additional coats until paint film is of uniform finish, color, and appearance. Give special attention to ensure edges, corners, crevices, welds, and exposed fasteners receive a dry film thickness equivalent to that of flat surfaces.
4. Allow sufficient time between successive coats to permit proper drying. Do not recoat surfaces until paint has dried to where it feels firm, does not deform or feel sticky under moderate thumb pressure, and where application of another coat of paint does not cause the undercoat to lift or lose adhesion.

REVISE PARA BELOW IF THE OWNER'S REQUIREMENTS OR OTHER SPECIAL PROJECT CONDITIONS RESTRICT OR LIMIT USE OF SPRAY EQUIPMENT FOR PAINT APPLICATION. SOME OWNERS PROHIBIT OR RESTRICT THE USE OF SPRAY ON THEIR PROJECTS. SPRAY APPLICATION OF PAINTS CAN DAMAGE SENSITIVE ELECTRONIC OPERATING EQUIPMENT AND MIGHT CAUSE PROBLEMS FOR PERSONNEL IN OCCUPIED BUILDINGS.

- C. Application Procedures: Apply paints and coatings by brush, roller, spray, or other applicators according to manufacturer's written instructions.

1. Brushes: Use brushes best suited for the type of material applied. Use brush of appropriate size for the surface or item being painted.
2. Rollers: Use rollers of carpet, velvet back, or high-pile sheep's wool as recommended by the manufacturer for the material and texture required.
3. Spray Equipment: Use airless spray equipment with orifice size as recommended by the manufacturer for the material and texture required. Spray apply coating to the following items:

- a. Shelf standards and brackets.
 - b. Laboratory bench reagent shelving supports and brackets.
- D. Minimum Coating Thickness: Apply paint materials no thinner than manufacturer's recommended spreading rate. Provide the total dry film thickness of the entire system as recommended by the manufacturer.
- E. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.

**USUALLY DELETE BELOW - THIS IS INTENDED FOR ANIMAL ROOMS, BIO-
HAZARD ROOMS, OR FOOD-PREPARATION AREAS WHERE PINHOLES IN
CONCRETE BLOCK MUST BE ELIMINATED. INDICATE LOCATIONS ON
DRAWINGS.**

- F. Block Filler for Special High-Build, Tile-Like Application: In indicated rooms and areas, apply block filler in accordance with manufacturer's written instructions, and the following special requirements:
- 1. Below-Ceiling Application: Apply multiple coats of block filler, sufficient in number to fill all voids in concrete masonry walls, in preparation for specified topcoat applications resulting in a finished surface coating that is without voids and tile-like. Apply coating using airless spray followed by back-rolling to force material into voids. Remove excess material by squeegeeing the surface. Remove excess material from masonry joints with a paint brush.
- G. Prime Coats: Before applying finish coats, apply a prime coat of material, as recommended by the manufacturer, to material that is required to be painted or finished and that has not been prime coated by others. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears, to ensure a finish coat with no burn through or other defects due to insufficient sealing.
- H. Pigmented (Opaque) Finishes: Completely cover surfaces as necessary to provide a smooth, opaque surface of uniform finish, color, appearance, and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections will not be acceptable.

**DELETE FINISHES BELOW IF NONE IS IN THE PROJECT. INDICATE
LOCATIONS IN THE FINISH SCHEDULES.**

- I. Transparent (Clear) Finishes: Use multiple coats to produce a glass-smooth surface film of even luster. Provide a finish free of laps, runs, cloudiness, color irregularity, brush marks, orange peel, nail holes, or other surface imperfections.
- 1. Provide satin finish for final coats.
- J. Stipple Enamel Finish: Roll and redistribute paint to an even and fine texture. Leave no evidence of rolling, such as laps, irregularity in texture, skid marks, or other surface imperfections.
- K. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.4 ADJUSTING, CLEANING, PROTECTION

- A. Cleanup: At the end of each workday, remove empty cans, rags, rubbish, and other discarded paint materials from the site.

DELETE SUBPARA BELOW IF FINAL CLEANING IS NOT DONE BY THE PAINTER.

- 1. After completing painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping. Be careful not to scratch or damage adjacent finished surfaces.
 - 2. Dispose wash water from latex paint to the sanitary sewer. Excess latex paint shall be salvaged for reuse or solidified for disposal with other construction materials. Dry empty latex paint cans and dispose with other construction materials. Contact UM OSEH Hazardous Materials (734-763-4568) to arrange for disposal of alkyd paints and solvents.
- B. Protect work of other trades, whether being painted or not, against damage by painting. Correct damage by cleaning, repairing or replacing, and repainting, as approved by Architect.
 - C. Provide "Wet Paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others to protect their work after completing painting operations.
 - 1. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces. Comply with procedures specified in PDCA P1.

USE THE SCHEDULES BELOW AS A GUIDE ONLY. SEE MANUFACTURER'S CATALOGS OR AIABAS SECTIONS 099113 "EXTERIOR PAINTING" AND 099123 "INTERIOR PAINTING" FOR ADDITIONAL INFORMATION AND SELECTIONS, INCLUDING ODOR-FREE AND "GREEN" COATINGS.

3.5 INTERIOR PAINT SCHEDULE

- A. Interior Paint Systems, General: Products of Benjamin Moore are listed below, unless otherwise indicated. Provide indicated products or, subject to compliance with requirements, equivalent products of other approved manufacturers. Apply coatings at manufacturer's recommended spreading rate to achieve indicated dry film thicknesses.
 - 1. Where "Industrial" coating is indicated, provide Moore's "Industrial and Maintenance Coatings" products; or equivalent of other, listed approved manufacturers.
 - 2. Where "Professional" coating is indicated, provide Moore's "Professional Coatings" products; or equivalent of other, listed approved manufacturers.

ADD COLOR INFORMATION TO EACH PRODUCT IF SCHEDULED HERE.

RETAIN ONE OF THE FOLLOWING 3 OPTIONS

- B. Colors: Match colors indicated in "Schedule" articles of this Section, and as follows:
- C. Colors: Match colors indicated in "Finish Schedule" on Drawings, and as follows:

IF COLORS ARE INCLUDED IN A SEPARATE DIVISION 09 ROOM FINISH SCHEDULE SECTION USE OPTION BELOW.

D. Colors: Match colors indicated in Finish Schedule Section and as follow:.

ALWAYS RETAIN BELOW

1. Fire suppression system piping: High-gloss "OSHA" red.

GENERALLY INCLUDE BELOW. NOTE THAT COLOR CODING OF PLUMBING PIPE IS NOT REQUIRED.

2. Paint uninsulated piping, ductwork and conduit to match wall or ceiling color to which it is mounted.

E. Concrete (non-wear surfaces): Provide indicated "Professional" or "Industrial" coating systems over interior concrete and brick masonry surfaces:

BELOW IS A LOW-LUSTER (EGGSHELL OR SATIN), ACRYLIC-ENAMEL FINISH OVER INTERIOR CONCRETE AND OTHER CEMENTITIOUS SURFACES.

1. Low-Luster, Acrylic Blended Latex Finish: Two finish coats over a primer.

a. Primer Coat: Acrylic; total dry thickness 7 mils.

1) Insl-X AquaPruf Masonry Waterproofer XA12-01.

SELECT PRIMER ABOVE OR ONE OF TWO LISTED BELOW. ABOVE FOR SEVERE MOISTURE CONDITIONS (WALLS ONLY); IT IS FROM A COMPANY OWNED BY BENJAMIN MOORE AND IS COMPATIBLE WITH BENJAMIN MOORE PRODUCTS.

b. Primer Coat: 100% acrylic, interior primer; total dry film thickness of not less than 0.95 mils.

1) Super Spec Masonry Sealer N066.

USE PRIMER ABOVE ON UNPAINTED CONCRETE. CONSIDER USE OF PRIMER BELOW ON PREVIOUSLY PAINTED SURFACES.

c. Primer: Latex-based, interior primer; total dry film thickness of not less than 1.2 mils.

1) Super Spec Latex Enamel Undercoater & Primer Sealer 253.

d. Finish Coats: Eggshell, acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.

1) Super Spec Latex Eggshell Enamel 274.

2) Color: SELECT.

BELOW IS A SEMI-GLOSS, ACRYLIC-ENAMEL FINISH OVER INTERIOR CONCRETE AND OTHER CEMENTITIOUS SURFACES.

2. Semi-Gloss, Vinyl Acrylic Latex Finish: Two finish coats over a primer.

a. Primer Coat: Acrylic; total dry thickness 7 mils.

1) Insl-X AquaPruf Masonry Waterproofer XA12-01.

SELECT PRIMER ABOVE OR ONE OF TWO LISTED BELOW. ABOVE FOR SEVERE MOSITURE CONDITIONS; IT IS FROM A COMPANY OWNED BY BENJAMIN MOORE AND IS COMPATIBLE WITH BENJAMIN MOORE PRODUCTS.

b. Primer Coat: 100% acrylic, interior primer; total dry film thickness of not less than 0.95 mils.

1) Super Spec Masonry Sealer N066.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 099100 - - 15

USE PRIMER ABOVE ON UNPAINTED CONCRETE. CONSIDER USE OF PRIMER BELOW ON PREVIOUSLY PAINTED SURFACES

- c. Primer: Latex-based, interior primer; total dry film thickness of not less than 1.2 mils.
 - 1) Super Spec Latex Enamel Undercoater & Primer Sealer 253.
- d. Finish Coats: Semi-gloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.2 mils.
 - 1) Super Hide Latex Semi-Gloss Enamel 283.
 - 2) Color: SELECT.

BELOW IS A VOC-COMPLIANT SEMI-GLOSS WATERBORNE EPOXY FINISH FOR CONCRETE AND OTHER CEMENTITIOUS SURFACES. IT PROVIDES GOOD CHEMICAL AND ABRASION RESISTANCE, GOOD CLEANABILITY AND WIDE COLOR RANGE.

- 3. Semi-Gloss, Acrylic Epoxy Finish: Two finish coats over a primer.
 - a. Primer Coat: Acrylic; total dry thickness 7 mils.
 - 1) Insl-X AquaPruf Masonry Waterproofer XA12-01.

SELECT PRIMER ABOVE OR BELOW. ABOVE FOR SEVERE MOISTURE CONDITIONS; IT IS FROM A COMPANY OWNED BY BENJAMIN MOORE AND IS COMPATIBLE WITH BENJAMIN MOORE PRODUCTS.

- b. Primer Coat: 100% acrylic, interior primer; total dry film thickness of not less than 0.95 mils.
 - 1) Super Spec Masonry Sealer N066.
- c. Finish Coats: Semi-gloss, two-component lacrylic epoxy coating; total dry film thickness of not less than 3.0 mils.
 - 1) Super Spec HP Acrylic Epoxy Coating P43-86.
 - 2) Color: SELECT.

BELOW IS A NON-VOC-COMPLIANT TILE-LIKE EPOXY FINISH OVER INTERIOR CONCRETE. COLOR CHOICES MAY BE LIMITED. DO NOT USE FOR MOST APPLICATIONS (SEE DESIGN GUIDELINE 099110 FOR PERMISSIBLE EXCEPTIONS). IF USING IN OCCUPIED BUILDINGS REVIEW CAREFULLY THE IMPACT ON BUILDING OCCUPANTS AND SPECIAL WORK RESTRICTIONS, DUE TO THE PRODUCTION OF TOXIC FUMES. CONSIDER OFF-HOUR APPLICATION.

- 4. Polyamide Epoxy High Gloss Coating: Two finish coats; no primer required
 - 1) Finish Coats: High gloss two-component polyamide epoxy; total dry thickness 4.0 mils.
 - 2) Super Spec HP Polyamide Epoxy Coating P36.
 - 3) Color: SELECT.

- F. Concrete (wear surfaces): Provide the indicated "Industrial" coating systems over interior concrete floor surfaces:

BELOW IS A 100% SOLIDS LOW-VOC FULL-GLOSS TWO-COMPONENT WATERBORNE AMINE CURED EPOXY ENAMEL FINISH OVER INTERIOR CONCRETE FLOORS SUBJECT TO MODERATE WEAR AND CHEMICAL ATTACK. IF USING IN OCCUPIED BUILDINGS REVIEW CAREFULLY THE IMPACT ON BUILDING OCCUPANTS AND SPECIAL WORK RESTRICTIONS, DUE TO THE PRODUCTION OF TOXIC FUMES. CONSIDER OFF-HOUR APPLICATION. DELETE SAND IN TOP COAT IF SMOOTH FINISH IS DESIRED.

1. High Gloss 100% Solids Epoxy Finish: Two finish coats over an undercoat.

SELECT PRIMER BELOW FOR NEW OR UNCOATED CONCRETE AND MODIFY SENTENCE ABOVE TO DELETE REFERENCE TO AN UNDERCOAT. PREVIOUSLY PAINTED CONCRETE DOES NOT NEED A PRIMER.

- a. Undercoat: Semi gloss, moisture-tolerant, waterborne polyamide epoxy sealer; total dry thickness 1.5 mils.
 - 1) Super Spec HP Fast Dry Epoxy Floor Sealer/Finish P41.
 - b. Finish Coats: Semi-gloss polyamide epoxy with sand admixture to produce light non-slip texture; total dry thickness 2.5 mils.
 - 1) Super Spec HP Anti-Slip Aggregate P67.
 - 2) Super Spec HP 100% Solids Floor Epoxy P40.
 - 3) Color: SELECT.
- G. Concrete Masonry Units: Provide the indicated "Professional" or "Industrial" coating systems over interior concrete masonry block units:

BELOW IS A LOW-LUSTER (EGGSHELL OR SATIN), ACRYLIC-ENAMEL FINISH OVER INTERIOR CONCRETE MASONRY BLOCK UNITS.

1. Low-Luster, Acrylic-Enamel Finish: Two finish coats over a block filler for new work.

A SECOND COAT OF BLOCK FILLER MAY BE NEEDED OVER VERY COARSE CONCRETE MASONRY SUBSTRATES. MOST MFRS RECOMMEND TEST PAINTING AN INCONSPICUOUS AREA BEFORE APPLYING PAINT.

- a. Block Filler (new work only): High build latex block filler; dry film thickness of not less than 8.5 mils.
 - 1) Super Spec Masonry Hi-Build Block Filler 206.
- ABOVE PRODUCT FOR NEW OR UNCOATED MASONRY, BELOW PRIMER FOR PREVIOUSLY PAINTED SURFACES.*
- b. Primer (over existing painted surfaces): Acrylic-latex primer; dry film thickness of not less than 1.2 mils.
 - 1) Fresh Start Interior/Exterior Latex Primer 023-00.
 - c. Finish Coats: Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) Super Spec Latex Eggshell Enamel 274.
 - 2) Color: SELECT.
2. Semi-Gloss, Vinyl Acrylic Latex Finish: Two finish coats (over a block filler for new work).

A SECOND COAT OF BLOCK FILLER MAY BE NEEDED OVER VERY COARSE CONCRETE MASONRY SUBSTRATES. MOST MFRS RECOMMEND TEST PAINTING AN INCONSPICUOUS AREA BEFORE APPLYING PAINT.

- a. Block Filler (new work only): High build latex block filler; total dry film thickness of not less than 8.5 mil.
 - 1) SuperSpec Masonry Hi-Build Block Filler 206.
- ABOVE PRODUCT FOR NEW OR UNCOATED MASONRY, BELOW PRIMER FOR PREVIOUSLY PAINTED SURFACES.*
- b. Primer (over existing painted surfaces): Acrylic-latex primer; dry film thickness of not less than 1.2 mils.
 - 1) Fresh Start Interior/Exterior Latex Primer 023-00.

- c. Finish Coats: Semi-gloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.0 mils.
 - 1) Super Hide Latex Semi-Gloss Enamel 283.
 - 2) Color: SELECT.

BELOW IS A VOC-COMPLIANT WATERBORNE EPOXY FINISH OVER INTERIOR CONCRETE.

- 3. Semi-Gloss, Acrylic Epoxy Finish: Two finish coats over a primer.

TWO FINISH COATS OVER A BLOCK FILLER FOR NEW WORK.

- a. Block Filler (new work only): Waterborne high solids epoxy block filler; dry film thickness of not less than 9.8 mils.
 - 1) Waterborne Epoxy Block filler P31.

ABOVE PRODUCT FOR NEW OR UNCOATED MASONRY, BELOW PRIMER FOR PREVIOUSLY PAINTED SURFACES.

- b. Primer (over existing painted surfaces): Acrylic-latex primer; dry film thickness of not less than 1.2 mils.
 - 1) Fresh Start Interior/Exterior Latex Primer 023-00.
- c. Finish Coats: Semi-gloss, two-component acrylic epoxy coating; total dry film thickness of not less than 3.0 mils.
 - 1) Super Spec HP Acrylic Epoxy Coating P43-86.

BELOW IS A HIGH-BUILD NON-VOC COMPLIANT SYSTEM FOR ELIMINATING CMU PINHOLES AND CREATING A TILE-LIKE SURFACE. THIS SYSTEM IS ONLY APPROPRIATE FOR ANIMAL ROOMS AND BIO-HAZARD ROOMS WHERE PINHOLES ARE NOT ACCEPTABLE. IF USING IN OCCUPIED BUILDINGS REVIEW CAREFULLY THE IMPACT ON BUILDING OCCUPANTS AND SPECIAL WORK RESTRICTIONS, DUE TO THE PRODUCTION OF TOXIC FUMES. CONSIDER OFF-HOUR APPLICATION.

- 4. High Gloss, High-Build, Polyamide Epoxy Enamel Finish: Two finish coats over multiple coats of block filler.

CONSIDER ADDING THE "FRESH START" PRIMER IN 3B ABOVE AS A BARRIER COAT BETWEEN NEW FILLER AND PREVIOUSLY PAINTED SURFACES WHERE APPLICABLE.

- a. Block Filler: Waterborne high solids epoxy block filler; dry film thickness of not less than 9.8 mils per coat.
 - 1) Waterborne Epoxy Block Filler P31.
- b. Second and Third Coats: High gloss two component polyamide epoxy enamel; total dry film thickness of not less than 4 mils.
 - 1) Super Spec HP Polyamide Epoxy P36.
 - 2) Color: SELECT.

- H. Gypsum Board and Plaster: Provide the indicated "Professional" or "Industrial" coating systems over interior gypsum board and plaster surfaces:

BELOW IS A LOW-LUSTER (EGGSHELL OR SATIN), ACRYLIC-ENAMEL FINISH OVER INTERIOR GYPSUM BOARD WALL AND CEILING SURFACES.

- 1. Low-Luster, Acrylic-Enamel Finish: Two finish coats over a primer.
 - a. Primer: Latex-based, interior primer; total dry film thickness of not less than 1.2 mils.

- 1) Super Spec Latex Enamel Undercoater & Primer Sealer 253.
- b. Finish Coats: Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) Super Spec Latex Eggshell Enamel 274.
 - 2) Color: SELECT.

BELOW IS A SEMIGLOSS, ACRYLIC-ENAMEL FINISH OVER INTERIOR GYPSUM BOARD WALL AND CEILING SURFACES.

- 2. Semigloss, Acrylic-Enamel Finish: Two finish coats over a primer.
 - a. Primer: Latex-based, interior primer; total dry film thickness of not less than 1.2 mils.
 - 1) Super Spec Latex Enamel Undercoater & Primer Sealer 253.
 - b. Finish Coats: Semigloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.4 mils.
 - 1) Super Spec Latex Semigloss Enamel 276.
 - 2) Color: SELECT.

BELOW IS A VOC-COMPLIANT WATERBORNE EPOXY FINISH WITH GOOD WATER RESISTANCE FOR APPLICATION ON INTERIOR GYPSUM BOARD WALL AND CEILING SURFACES. DO NOT USE FOR MOST APPLICATIONS (SEE DESIGN GUIDELINE 099110 FOR PERMISSIBLE EXCEPTIONS).

- 3. Waterborne Acrylic Epoxy Finish: Two finish coats over a primer.
 - a. Primer: Acrylic-latex primer; dry film thickness of not less than 1.2 mils.
 - 1) Fresh Start Interior/Exterior Latex Primer 023-00.
 - b. Finish Coats: Semi-gloss, two-component acrylic epoxy coating; total dry film thickness of not less than 3.0 mils.
 - 1) Super Spec HP Acrylic Epoxy Coating P43-86.

BELOW IS A HIGH-BUILD SYSTEM FOR ELIMINATING CMU PINHOLES AND CREATING A TILE-LIKE SURFACE. THIS SYSTEM IS ONLY APPROPRIATE FOR ANIMAL ROOMS AND BIO-HAZARD ROOMS WHERE PINHOLES ARE NOT ACCEPTABLE. IF USING IN OCCUPIED BUILDINGS REVIEW CAREFULLY THE IMPACT ON BUILDING OCCUPANTS AND SPECIAL WORK RESTRICTIONS, DUE TO THE PRODUCTION OF TOXIC FUMES. CONSIDER OFF-HOUR APPLICATION.

- 4. High Gloss, High-Build, Polyamide Epoxy Enamel Finish: Two finish coats over primer.
 - a. Finish Coats: Full-gloss polyamide epoxy enamel; total dry film thickness of not less than 4 mils.
 - 1) Super Spec HP Polyamide Epoxy P36.
 - 2) Color: SELECT.

- I. Woodwork - Opaque Finish: Provide the indicated "Professional" paint coating systems over interior wood surfaces:

BELOW IS A LOW-LUSTER (EGGSHELL), ACRYLIC-ENAMEL FINISH OVER INTERIOR GYPSUM BOARD WALL AND CEILING SURFACES.

- 1. Low-Luster (Eggshell), Acrylic-Enamel Finish: Two finish coats over a wood undercoater.

- a. Undercoat: Acrylic blended latex interior wood undercoater; total dry film thickness of not less than 0.8 mils.
 - 1) Super Hide Interior Latex Primer/Undercoater 284.
- b. Finish Coats: Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.0 mils.
 - 1) Super Hide Latex Eggshell Enamel C286.
 - 2) Color: SELECT.

BELOW IS A SEMIGLOSS, ACRYLIC-ENAMEL FINISH OVER INTERIOR GYPSUM BOARD WALL AND CEILING SURFACES.

- 2. Semigloss, Acrylic-Enamel Finish: Two finish coats over a wood undercoater.
 - a. Undercoat: Acrylic blended latex interior wood undercoater; total dry film thickness of not less than 0.8 mils.
 - 1) Super Hide Interior latex Primer/Undercoater 284.
 - b. Finish Coats: Semi-gloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.0 mils.
 - 1) Super Hide Latex Semi-Gloss Enamel 283.
 - 2) Color: SELECT.

TYPICALLY, DELETE BELOW AND SPECIFY SHOP FINISHES IN WOODWORK OR WOOD DOOR SECTION. USE BELOW ONLY IF THERE ARE NO OTHER OPTIONS.

- J. Stained Woodwork: Provide the indicated stained finishes over new, interior woodwork:

PRODUCTS BELOW ARE WATERBORNE VOC COMPLIANT FINISHES.

- 1. Waterborne, Low-Luster, Polyurethane: Two finish coats of solvent based, clear polyurethane over an alkyd, interior wood stain. Wipe wood filler before applying stain.

DELETE PASTE-WOOD FILLER COAT BELOW ON TIGHT-GRAINED WOOD SUCH AS BIRCH. RETAIN FILLER COAT ON OAK AND WALNUT AND SIMILAR OPEN-GRAIN WOODS.

- a. Filler Coat: Paste-wood filler.
 - 1) Benwood Interior Wood Finishes Wood Grain Filler 238.
- b. Stain Coat: Waterborne, interior wood stain.
 - 1) Benwood Interior Wood Finishes Waterborne Stain 205.
 - 2) Color: SELECT.
- c. First and Second Finish Coats: Waterborne, acrylic polyurethane finish.
 - 1) Benwood Stays Clear Low Luster N423.

BELOW IS A WATERBORNE CLEAR HIGH-GLOSS POLYURETHANE FINISH OVER INTERIOR WOODWORK STAINED WITH A WATERBORNE STAIN.

- 2. Waterborne, High Gloss, Polyurethane: Two finish coats of solvent based, clear polyurethane over an alkyd, interior wood stain. Wipe wood filler before applying stain.

DELETE PASTE-WOOD FILLER COAT BELOW ON TIGHT-GRAINED WOOD SUCH AS BIRCH. RETAIN FILLER COAT ON OAK AND WALNUT AND SIMILAR OPEN-GRAIN WOODS.

- a. Filler Coat: Paste-wood filler.
 - 1) Benwood Interior Wood Finishes Wood Grain Filler 238.

- b. Stain Coat: Water base interior wood stain.
 - 1) Benwood Interior Wood Finishes Waterborne Stain 205.
 - 2) Color: SELECT.
- c. First and Second Finish Coats: Waterborne, acrylic polyurethane finish.
 - 1) Benwood Stays Clear Gloss N422.

TYPICALLY, DELETE BELOW AND SPECIFY SHOP FINISHES IN WOODWORK OR WOOD DOOR SECTION. USE BELOW ONLY IF THERE ARE NO OTHER OPTIONS.

- K. Natural-Finish Woodwork: Provide the indicated clear finishes over new, interior woodwork:

BELOW IS A WATERBORNE CLEAR LOW-LUSTER POLYURETHANE FINISH OVER INTERIOR WOODWORK.

- 1. Waterborne, Low-Luster Polyurethane Finish: 2 finish coats of solvent based, clear-satin polyurethane.

DELETE PASTE-WOOD FILLER COAT BELOW ON TIGHT-GRAINED WOOD SUCH AS BIRCH. RETAIN FILLER COAT ON OAK AND WALNUT AND SIMILAR OPEN-GRAIN WOODS.

- a. Filler Coat: Paste-wood filler.
 - 1) Benwood Interior Wood Finishes Wood Grain Filler 238.
- b. First and Second Finish Coats: Waterborne, acrylic polyurethane finish.
 - 1) Benwood Stays Clear Low Luster N423.

BELOW IS A WATERBORNE CLEAR HIGH-GLOSS POLYURETHANE FINISH OVER INTERIOR WOODWORK.

- 2. Waterborne, High-Gloss Polyurethane Finish: 2 finish coats of waterborne, clear, high-gloss polyurethane.

DELETE PASTE-WOOD FILLER COAT BELOW ON TIGHT-GRAINED WOOD SUCH AS BIRCH. RETAIN FILLER COAT ON OAK AND WALNUT AND SIMILAR OPEN-GRAIN WOODS.

- a. Filler Coat: Paste-wood filler.
 - 1) Benwood Interior Wood Finishes Wood Grain Filler 238.
- b. First and Second Finish Coats: Waterborne, acrylic polyurethane finish.
 - 1) Benwood Stays Clear Gloss N422.

- L. Ferrous Metal: Provide the indicated "Professional" or "Industrial" coating systems over factory-primed ferrous metal:

BELOW FOR A LOW-LUSTER (EGGSHELL OR SATIN), ACRYLIC-ENAMEL FINISH OVER INTERIOR FERROUS METAL.

- 1. Low-Luster, Acrylic-Enamel Finish: Two finish coats over a factory-applied primer, or indicated primer as applicable.
 - a. Primer (for factory-unprimed work): Waterborne, rust-inhibitive, acrylic primer; total dry film thickness of not less than 2.0 mils.
 - 1) SuperSpec HP Acrylic Metal Primer P04.
 - b. Finish Coats: Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) Super Spec Latex Eggshell Enamel 274.
 - 2) Color: SELECT.

BELOW IS AN ACRYLIC-LATEX-BASED, SEMIGLOSS ENAMEL FINISH OVER INTERIOR FERROUS METAL. THIS FINISH IS AN ALTERNATIVE TO SOLVENT-BASED, SEMIGLOSS ENAMELS.

2. Semigloss, Acrylic-Enamel Finish: Two finish coats over a factory-applied primer, or indicated primer as applicable.
 - a. Primer (for factory-unprimed work): Waterborne, rust-inhibitive, acrylic primer; total dry film thickness of not less than 2.0 mils.
 - 1) SuperSpec HP Acrylic Metal Primer P04.
 - b. Finish Coats: Semi-gloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.0 mils.
 - 1) Super Hide Latex Semi-Gloss Enamel 283.
 - 2) Color: SELECT.

BELOW IS A VOC COMPLIANT HIGH GLOSS WATERBORNE EPOXY FINISH OVER INTERIOR FERROUS METAL.

3. Epoxy Finish: Two finish coats over a factory-applied primer coat, or indicated primer as applicable.
 - a. Primer for Factory-Unprimed Metals: Waterborne acrylic epoxy primer; total dry film thickness of not less than 2 mils.
 - 1) Waterborne Polyamide Epoxy Primer P42-70.
 - b. Finish Coats: Full-gloss acrylic epoxy; total dry film thickness of not less than 2.0 mils.
 - 1) Super Spec HP Waterborne Polyamide Epoxy High Gloss Enamel P42.
 - 2) Color: SELECT.

- M. Zinc-Coated Metal: Provide the indicated "Professional" or "Industrial" coating systems over zinc-coated metal:

WATER-BASED PRODUCTS ARE LISTED BELOW. BELOW IS A LOW-LUSTER (EGGSHELL OR SATIN), ACRYLIC-ENAMEL FINISH OVER INTERIOR GALVANIZED METAL.

1. Low-Luster, Acrylic-Enamel Finish: Two finish coats over a factory-applied primer, or indicated primer as applicable.
 - a. Primer (for factory-unprimed work): Quick-drying, rust-inhibitive, acrylic-enamel primer; total dry film thickness of not less than 1.8 mils.
 - 1) IronClad Alkyd Low Lustre Metal and Wood Enamel 363.
 - b. Second and Third Coats: Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) Super Spec Latex Eggshell Enamel 274.
 - 2) Color: SELECT.

BELOW IS AN ACRYLIC-LATEX-BASED, SEMIGLOSS ENAMEL FINISH OVER INTERIOR GALVANIZED METAL. THIS FINISH IS AN ALTERNATE TO SOLVENT-BASED, SEMIGLOSS ENAMELS.

2. Semigloss, Acrylic-Enamel Finish: Two finish coats over a factory-applied primer, or indicated primer as applicable.
 - a. Primer (for factory-unprimed work): Quick-drying, rust-inhibitive, alkyd-based primer; total dry film thickness of not less than 1.8 mils.
 - 1) IronClad Alkyd Low Lustre Metal and Wood Enamel 363.

- b. Second and Third Coats: Semi-gloss, acrylic-latex, interior enamel; total dry film thickness of not less than 2.0 mils.
 - 1) Super Hide Latex Semi-Gloss Enamel 283.
 - 2) Color: SELECT.

BELOW IS A HIGH GLOSS WATERBORNE EPOXY FINISH OVER INTERIOR GLAVANIZED METAL.

- 3. Epoxy Finish: Two finish coats over a factory-applied primer coat, or indicated primer as applicable.
 - a. Primer (for factory-unprimed zinc-coated metal): Waterborne acrylic epoxy primer; total dry film thickness of not less than 4 mils.
 - 1) Waterborne Polyamide Epoxy Primer P42-70.
 - b. Finish Coats: Full-gloss acrylic epoxy; total dry film thickness of not less than 3.0 mils.
 - 1) Super Spec HP Waterborne Polyamide Epoxy High Gloss Enamel P42.
 - 2) Color: SELECT.

3.6 EXTERIOR PAINT SCHEDULE

- A. Exterior Paint Systems, General: Products of Benjamin Moore are listed below, unless otherwise indicated. Provide indicated products or, subject to compliance with requirements, equivalent products of other approved manufacturers. Apply coatings at manufacturer's recommended spreading rate to achieve indicated dry film thicknesses.
 - 1. Where "Industrial" coating is indicated, provide Moore's "Industrial and Maintenance Coatings" products; or equivalent of other, listed approved manufacturers.
 - 2. Where "Professional" coating is indicated, provide Moore's "Professional Coatings" products; or equivalent of other, listed approved manufacturers.

ADD COLOR INFORMATION TO EACH PRODUCT IF SCHEDULED HERE.

BELOW IS A FLAT VINYL ACRYLIC FINISH OVER EXTERIOR CONCRETE AND STUCCO. NOT ALL MFRS REQUIRE USE OF A PRIMER OVER THIS SUBSTRATE.

- B. Concrete and Cement Plaster (for Non-Wear Surfaces): Provide the indicated "Professional" coating systems over exterior concrete, cement plaster surfaces:
 - 1. Flat Alkyd-Modified Vinyl Acrylic Latex Finish: Two finish coats over a primer.
 - a. Primer: Alkali-resistant, exterior, acrylic-latex sealer; total dry film thickness of not less than 0.7 mils.
 - 1) Acrylic Masonry Sealer 066.
 - b. Finish Coats: Flat, exterior, alkyd modified vinyl acrylic latex paint; total dry film thickness of not less than 2.4 mils.
 - 1) Super Spec Flat Latex House Paint 171.
 - 2) Color: SELECT.

- C. Concrete Masonry Units: Provide the indicated "Professional" coating systems over exterior concrete masonry units:

BELOW IS A FLAT ACRYLIC FINISH OVER EXTERIOR CONCRETE MASONRY BLOCK.

1. Flat Latex Based Finish: Two finish coats over a block filler.
 - a. Block Filler: High-performance, latex block filler; total dry mill thickness of not less than 8.1 mils.
 - 1) Super Craft Latex Block Filler 285.
 - b. Finish Coats: Flat, exterior, acrylic-latex paint; total dry film thickness of not less than 2.4 mils.
 - 1) Super Spec Flat Latex House Paint 171.
 - 2) Color: SELECT.

- D. Exterior Gypsum Soffit Board: Provide the indicated "Professional" coating systems over exterior gypsum soffit board:

BELOW IS A FLAT ACRYLIC FINISH OVER EXTERIOR GYPSUM SOFFIT BOARDS.

1. Flat Alkyd Modified Vinyl Acrylic Latex Finish: Two system finish coats over a primer.
 - a. Primer: Exterior, alkyd primer; total dry film thickness of not less than 1.8 mils.
 - 1) Super Spec Alkyd Exterior Primer 176.
 - b. Finish Coats: Flat, exterior, alkyd modified vinyl acrylic latex paint; total dry film thickness of not less than 2.4 mils.
 - 1) Super Spec Flat Latex House Paint 171.
 - 2) Color: SELECT.

BELOW IS A LOW-LUSTER (EGGSHELL OR SATIN) ACRYLIC FINISH OVER EXTERIOR GYPSUM SOFFIT BOARDS.

2. Low Luster Acrylic Blended Latex Finish: Two system finish coats over a primer.
 - a. Primer: Exterior, alkyd primer; total dry film thickness of not less than 1.8 mils.
 - 1) Super Spec Alkyd Exterior Primer 176.
 - b. Finish Coats: Flat, exterior, alkyd modified vinyl acrylic latex paint; total dry film thickness of not less than 2.0 mils.
 - 1) Super Spec Low Luster Latex House Paint 185.
 - 2) Color: SELECT.

- E. Wood Trim: Provide the indicated "Professional" coating systems over exterior wood trim:

BELOW IS A WATER-BASED, FLAT, ACRYLIC-ENAMEL FINISH OVER EXTERIOR WOOD TRIM, INCLUDING BLEEDING WOODS SUCH AS CEDAR AND REDWOOD.

1. Flat Alkyd Modified Vinyl Acrylic Latex Finish: Two finish coats over a solvent-thinned primer.
 - a. Primer: Exterior, solvent-thinned latex primer; total dry film thickness of not less than 1.4 mils.
 - 1) Moorwhite Primer 100.
 - b. Finish Coats: Flat, exterior, alkyd modified vinyl acrylic latex paint; total dry film thickness of not less than 2.4 mils.

- 1) Super Spec Flat Latex House Paint 171.
- 2) Color: SELECT.

F. Ferrous Metal: Provide the indicated "Professional" or "Industrial" coating systems over exterior ferrous metal.

BELOW IS A LOW LUSTER, ALKYD-ENAMEL FINISH OVER EXTERIOR NON-RUSTED FERROUS METAL.

1. Low Luster, Alkyd-Enamel Finish: Two finish coats over a factory-applied primer, or an alkyd primer as applicable.
 - a. Primer (unprimed work only) : Quick-drying, rust-inhibitive, alkyd-based primer, as recommended by the manufacturer for this substrate; total dry film thickness of not less than 1.3 mils.
 - 1) IronClad Alkyd Low Luster Metal and Wood Enamel 163.
 - b. Finish Coats: Semigloss, alkyd, exterior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) IronClad Alkyd Low Luster Metal and Wood Enamel 163.
 - 2) Color: SELECT.

BELOW IS A HIGH GLOSS, ALKYD-ENAMEL FINISH OVER EXTERIOR NON-RUSTED FERROUS METAL.

2. High Gloss, Alkyd-Enamel Finish: Two finish coats over a factory-applied primer, or an alkyd primer as applicable.
 - a. Primer (unprimed work only) : Quick-drying, rust-inhibitive, alkyd-based primer, as recommended by the manufacturer for this substrate; total dry film thickness of not less than 1.3 mils.
 - 1) IronClad Alkyd Low Luster Metal and Wood Enamel 163.
 - b. Finish Coats: High gloss, alkyd, exterior enamel; total dry film thickness of not less than 3.4 mils.
 - 1) Impervo High Gloss Enamel 133.
 - 2) Color: SELECT.

BELOW IS A POLYURETHANE BASED, FULL GLOSS FINISH OVER EXTERIOR FERROUS METAL. THIS IS A DURABLE, FADE-PROOF EXTERIOR COATING SYSTEM SUITABLE FOR HANDRAILS AND OTHER EXPOSED-TO-ABUSE WORK.

3. Polyurethane Finish: Two finish coats over an alkyd primer.
 - a. Primer: Alkyd primer formulated with a rust-inhibiting agent; total dry film thickness of not less than 2.0 mils.
 - 1) Alkyd Metal Primer M06.
 - b. First and Second Coats: High gloss urethane alkyd enamel; total dry film thickness of not less than 4.0 mils.
 - 1) Urethane Alkyd Enamel M22.
 - 2) Color: SELECT.

G. Zinc-Coated Metal: Provide the indicated "Professional" or "Industrial" coating systems over exterior zinc-coated (galvanized) metal surfaces:

BELOW IS A LOW-LUSTER, ALKYD-ENAMEL FINISH OVER EXTERIOR GALVANIZED METAL.

1. Low Luster, Alkyd-Enamel Finish: Two finish coats over a factory-applied primer, or a galvanized metal primer as applicable.

- a. Primer (unprimed work only) : Quick-drying, rust-inhibitive, alkyd-based primer, as recommended by the manufacturer for this substrate; total dry film thickness of not less than 1.3 mils.
 - 1) IronClad Alkyd Low Luster Metal and Wood Enamel 163.
- b. Finish Coats: Low luster, alkyd, exterior enamel; total dry film thickness of not less than 2.6 mils.
 - 1) IronClad Alkyd Low Luster Metal and Wood Enamel 163.
 - 2) Color: SELECT.

BELOW IS A HIGH GLOSS, ALKYD-ENAMEL FINISH OVER EXTERIOR GALVANIZED METAL.

- 2. High Gloss, Alkyd-Enamel Finish: Two finish coats over a factory-applied primer, or a galvanized metal primer as applicable.
 - a. Primer (for factory-unprimed work): Quick-drying, rust-inhibitive, alkyd-based primer; total dry film thickness of not less than 1.6 mils.
 - 1) IronClad Alkyd Low Lustre Metal and Wood Enamel 163.
 - b. Second and Third Coats: High gloss, exterior, alkyd enamel; total dry film thickness of not less than 3.4 mils.
 - 1) Impervo Alkyd High Gloss Metal & Wood Enamel 133.

BELOW IS A POLYURETHANE BASED, HIGH GLOSS FINISH OVER EXTERIOR FERROUS METAL. THIS IS A DURABLE, FADE-PROOF EXTERIOR COATING SYSTEM SUITABLE FOR HANDRAILS AND OTHER EXPOSED-TO-ABUSE WORK.

- 3. Polyurethane Finish: Two finish coats over a acrylate primer.
 - a. Primer: Elastomeric acrylate primer formulated with a rust-inhibiting agent; total dry film thickness of not less than 0.1 mils.
 - 1) Bonding Primer M15.
 - b. First and Second Finish Coats: High gloss urethane alkyd enamel; total dry film thickness of not less than 4.0 mils.
 - 1) Urethane Alkyd Enamel M22.
 - 2) Color: SELECT.

- H. Aluminum: Provide the indicated "Industrial" coating system over exterior aluminum surfaces:

BELOW IS A POLYURETHANE BASED, HIGH GLOSS FINISH OVER EXTERIOR FERROUS METAL. THIS IS A DURABLE, FADE-PROOF EXTERIOR COATING SYSTEM SUITABLE FOR HANDRAILS AND OTHER EXPOSED-TO-ABUSE WORK.

- 1. Polyurethane Finish: Two finish coats over a acrylate primer.
 - a. Primer: Elastomeric acrylate primer formulated with a rust-inhibiting agent; total dry film thickness of not less than 0.1 mils.
 - 1) Bonding Primer M15.
 - b. Finish Coats: High gloss urethane alkyd enamel; total dry film thickness of not less than 4.0 mils.
 - 1) Urethane Alkyd Enamel M22.
 - 2) Color: SELECT.

BELOW IS A DIRECT TO METAL DUAL PURPOSE PAINT FOR EXTERIOR EQUIPMENT.

- 2. Acrylic Finish: Two direct to metal coats over appropriately prepared surface.

- a. Surface preparation: Cleaned with Super Spec HP Oil & Grease Emulsifier (P83) to remove contaminants.
- b. Direct to metal primer and finish Coats: Low luster direct to metal acrylic; total dry film thickness of not less than 4.0 mils.
 - 1) Super Spec HP D.T.M. Acrylic Low Lustre P25.
 - 2) Color: As indicated on drawings.

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 099110 - ELECTROSTATICALLY APPLIED COATING

END OF CONTENTS TABLE

DIVISION 09 FINISHES

SECTION 099110 - ELECTROSTATICALLY APPLIED COATING

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of electrostatically applied coating is indicated on Drawings, schedules and by provisions of this Section.
- B. Type of electrostatically applied coating includes field application of electrostatically charged, sprayed paint coating, over existing metal casework.
- C. Colors: Color selection process is as follows:
 - 1. Colors will be selected by Architect from manufacturer's standard range of colors.

DELETE EITHER ABOVE OR BELOW.

- 2. Color selections are included in "Schedule" article of this Section.

1.2 SUBMITTALS

- A. Product Data: Submit manufacturer's literature including descriptive data and recommendations for mixing, application, and curing.

INCLUDE BELOW IF SELECTION WILL BE MADE AFTER BIDDING.

- B. Samples for Initial Selection: Manufacturer's color sample booklet showing full range of standard colors, with not less than 25 colors.

CONSIDER INCLUDING BELOW IF EXACT COLOR MATCHING IS REQUIRED.

- C. Samples for Verification: Two cards, not less than 3-inches by 5-inches, of actual paint sample of selected color. Provide additional card sets for each separate color.

1.3 QUALITY ASSURANCE

- A. Provide written certification attesting that applicators have been factory trained, and that application equipment used complies with manufacturer's requirements.

1.4 DELIVERY AND STORAGE

- A. Deliver materials to job site in new, original, and unopened containers bearing mfr's name, trade name, and label analysis. Store materials in protected area at a temperature not less than 50 F and in accordance with other mfr's instructions.

1.5 JOB CONDITIONS

- A. Apply coatings only when environmental temperature can be maintained above 50 deg. F. during application and drying period.
- B. Provide work areas free of excessive dust. and with illumination adequate to apply special coatings.

PART 2 - PRODUCTS

2.1 MANUFACTURER

- A. Manufacturer: Provide products of Cascoat Electrostatic, Inc. (Telephone 313/771-9040) or, subject to compliance with requirements, equivalent products of other manufacturers.

2.2 MATERIALS

- A. General: Provide coatings specifically compounded by manufacturer for electrostatic spray application. Where primers are indicated or required, provide only primers that are approved by manufacturer for use with finish coating materials.
- B. Material Quality: Materials which do not display Manufacturer's identification will not be acceptable.
- C. Mix, prepare, and store materials according to Manufacturer's latest printed instructions. Manually mix coating materials; power mixing devices are not permitted. Do not add thinner or other agents to coating materials.

IF COLOR WILL BE SPECIFIED IN SCHEDULE AT END OF SECTION, DELETE PARAGRAPHS BELOW.

- D. Color: Provide color as follows:
 - 1. Selected by Architect from manufacturer's standard range of colors.

RETAIN ABOVE FOR ARCHITECT SELECTION. RETAIN BELOW FOR ARCHITECT-SELECTED CUSTOM COLOR

- 2. Custom color to match Architect's sample.

RETAIN BELOW FOR COLOR SELECTED DURING DESIGN.

- 3. Match selection.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Examine surfaces to be coated and report any conditions that would adversely affect the appearance or performance of the coating systems and which cannot be put into an acceptable condition by specified preparation.

- B. Do not proceed with surface preparation and application until the surface is acceptable or authorization to proceed is given by the Owner.

3.2 PREPARATION

- A. Protect work of other trades and adjacent surfaces not scheduled to be coated. Prepare and clean in strict accordance with coating mfr's instructions.
- B. Sand, or chemically clean as appropriate, all abraded surfaces, corroded areas and other imperfections in surfaces to be coated. Fill or feather edges of sanded areas to produce for a smooth transition to bare metal.

3.3 APPLICATION

- A. Apply prime and finish materials in accordance with mfr's directions. Apply each material at not less than the mfr's recommended spreading rate. Use special equipment, applicators, and techniques recommended by mfr as best suited for the particular applications.
- B. Apply additional coats beyond scheduled requirements when undercoating, stains or other conditions show through final paint coat until the special coating is of uniform finish, color and appearance.

3.4 CLEANING

- A. Remove paint spatters from any adjoining surfaces. Repair any damage to coatings or surfaces caused by cleaning operations. Remove debris from job site and leave area clean.

3.5 SCHEDULE OF SURFACES TO BE COATED

- A. Base Cabinets: Prepare and coat each of the following surfaces:
 - 1. Surfaces exposed to view in existing construction, including all edges of doors and drawer fronts, regardless of exposure condition.

SELECT ONE OF THE FOLLOWING OR DELETE ALL.

- a. Color: selection.
- b. Match existing color.
- c. Match color of new laboratory casework.

INCLUDE BELOW IF PAINTED INTERIORS ARE DESIRED.

- 2. Interior surfaces of cabinet drawers and doors, and sides, back and bottom of cabinet shell.

SELECT ONE OF THE FOLLOWING OR DELETE ALL.

- a. Color: selection.
- b. Match existing color.
- c. Match color of new laboratory casework.

- B. Wall Mounted Cabinets: Prepare and coat each of the following surfaces:

1. Surfaces exposed to view in existing construction, including all edges of doors, regardless of exposure condition.

SELECT ONE OF THE FOLLOWING OR DELETE ALL.

- a. Color: selection.
- b. Match existing color.
- c. Match color of new laboratory casework.

MODIFY BELOW TO SUIT DESIRED LIMIT OF PAINTING. USUALLY RETAIN BELOW IF NO CABINET DOORS OR IF DOORS HAVE WINDOWS.

2. Shelves, including edges and underside.
 - a. Color: Match cabinet interior surfaces.
3. Interior surfaces of cabinet doors, and sides, back and bottom of cabinet shell.

SELECT ONE OF THE FOLLOWING OR DELETE ALL.

- a. Color: selection.
- b. Match existing color.
- c. Match color of new laboratory casework.

C. File Cabinets: Prepare and coat each of the following surfaces:

1. Surfaces exposed to view in existing location, including all edges of drawer fronts, regardless of exposure condition.

SELECT EITHER ABOVE OR BELOW.

MODIFY REQUIREMENT BELOW TO COVER ONLY THOSE SURFACES DESIRED.

2. Move file cabinets as required to expose sides and back. Coat exterior surfaces of front, sides and back of units, including all edges of drawer fronts, regardless of exposure condition.
3. Color: Provide coatings of the following color:

SELECT ONE OF THE FOLLOWING OR DELETE ALL.

- a. Color: selection.
- b. Match existing color.

SPECIFICATION DIVISION 9

NUMBER SECTION DESCRIPTION

DIVISION 09 FINISHES

SECTION 099310 - WOOD FLOOR FINISH

END OF CONTENTS TABLE

DIVISION 09 FINISHES
SECTION 099310 - WOOD FLOOR FINISH

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section specifies latex polyurethane coating system for sanded wood floors, including surface preparation, prime coats and topcoats.
- B. Other field painting is specified in Division 09 Section "Painting".

1.2 SUBMITTALS

- A. Product data for proprietary materials including basic materials analysis and application instructions for each material specified.
- B. Samples for Initial Selection: Submit three 24-inch square samples for each type of finish and color on material matching actual substrate to be coated. Carefully select substrate materials to provide samples representative of results expected to be achieved in field.
 - 1. Match Architect's sample for color, texture, and sheen.
 - 2. Resubmit samples as requested until desired color and sheen are achieved.

INCLUDE BELOW FOR ALL PROJECTS.

- C. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

1.3 QUALITY ASSURANCE

- A. Single Source Responsibility: Provide primers and undercoat materials produced by the same manufacturer as the finish coats. Use only thinners recommended by the manufacturer, and only within recommended limits.
- B. Coordination of Work: Review sections in which other coatings are provided to ensure compatibility of the total systems for various substrates. Upon request, furnish information on characteristics of specified finish materials, to ensure that compatible prime coats are used.

- C. Field Samples: On actual floor surface to be coated, duplicate coating finishes of approved samples. Provide full-coat finish samples on at least 100 square feet of surface, until required sheen and color are obtained; simulate finished lighting conditions for review of in-place work.
 - 1. Final acceptance will be from job-applied samples.
 - 2. Architect will select one room, area or surface to represent surfaces and conditions for each type of coating and substrate to be coated. Apply coatings in this room, area or surface in accordance with schedule, or as specified. After finishes are accepted, this room, area or surface will be used for evaluation of coating systems of a similar nature.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Packaged Materials: Deliver packaged materials in manufacturer's original, new, unopened, containers showing weight, analysis, and name of manufacturer. Protect materials from deterioration during delivery, and while stored at site.
- B. Store materials not in actual use in tightly covered containers at a minimum ambient temperature of 45 deg F (7 deg C) in a well-ventilated area. Maintain containers used in storage of coatings in clean condition, free of foreign materials and residue.
 - 1. Protect from freezing. Keep storage neat and orderly. Remove oily rags and waste daily. Take necessary precautionary measures to ensure that workmen and work areas are adequately protected from fire hazards and health hazards resulting from handling, mixing, and application of coatings.

1.5 PROJECT CONDITIONS

- A. Environmental Requirements: Apply special coating materials in enclosed, conditioned spaces. Comply with manufacturer's recommendations for application temperature and humidity conditions.

PART 2 - PRODUCTS

2.1 LATEX POLYURETHANE COATING

- A. Manufacturer/Product: Subject to compliance with requirements, provide the following product:
 - 1. Pacific Plus Strong; Bunakeim.
- B. Provide manufacturer's recommended catalyst hardener and stain products.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine the substrates upon which, and conditions under which, coating will be applied for compliance with requirements of this Section. Do not proceed until unsatisfactory conditions are corrected.
 - 1. Start of application will be construed as the Applicator's acceptance of surfaces within each area.

3.2 PREPARATION

- A. General: Remove items that are not to be coated, or provide surface-applied protection prior to surface preparation and coating. Remove these items if necessary for complete coating of the items and adjacent surfaces.
 - 1. Clean surfaces before applying coatings or surface treatments. Schedule cleaning and coating application so dust and other contaminates will not fall on wet, newly coated surfaces.
- B. Surface Preparation: Perform surface preparation and cleaning in compliance with the manufacturer's instructions for the particular substrate conditions, and as specified.
 - 1. Wood Surfaces: Clean wood surfaces of dirt, oil, or other foreign substances. Sand surfaces smooth, and dust off.
 - 2. Sand floors 3 time using power equipment and course medium and fine grit abrasive material. Butt-end sand edges by hand to match the field and to ensure even application of finish and stain. Abrade or burnish with steel wool between coats.
- C. Material Preparation: Carefully mix and prepare materials in compliance with the coating manufacturer's directions.

3.3 APPLICATION

- A. Apply special coating by applicators in accordance with manufacturer's directions.
- B. Apply stain in three finish coats. Do not apply succeeding coats until the previous coat has cured as recommended by manufacturer. Sand or rub with steel wool between applications where required to produce an even, smooth surface in accordance with the manufacturer's directions.
- C. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish or recoat work not in compliance with specified requirements.

3.4 CLEANING

- A. Clean-Up: At the end of each work day, remove rubbish, empty cans, rags and other discarded materials from the site.

- B. Upon completion of work, clean spattered surfaces. Remove spattered coatings by washing, scraping, or other proper methods, using care not to scratch or damage adjacent finished surfaces. Remove temporary protective wrappings provided for protection of adjacent items not to be coated.
 - 1. Dispose wash water from latex coatings to the sanitary sewer. Excess latex material shall be salvaged for reuse or solidified for disposal with other construction materials. Dry empty latex coating cans and dispose with other construction materials. Contact UM OSEH Hazardous Materials (734-763-4568) to arrange for disposal of alkyd paints and solvents.

3.5 PROTECTION

- A. Provide "WET PAINT" signs and temporary warning tape barriers to protect newly coated finishes. Provide heavy craft paper covering to protect fully cured finishes.

3.6 TOUCH-UP AND REPAIR

- A. Correct damage to caused to adjacent surfaces not to be coated by cleaning, repairing, or replacing items as acceptable to Owner.
- B. Upon completion of construction activities of other trades, return to the job site and restore damaged or defaced coated surfaces.

DIVISION 10 SPECIALTIES

SECTION 101100 - VISUAL DISPLAY UNITS

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 101100 - VISUAL DISPLAY UNITS

JUNE, 2005 - UPDATED TO CHANGE TO 1997 NFPA "LIFE SAFETY CODE".

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of visual display boards is indicated on drawings.

EDIT THE FOLLOWING TO SUIT PROJECT.

- B. Types of visual display boards include the following:
1. Chalkboards.
 2. Markerboards.
 3. Multi-purpose visual display units.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's product literature, indicating compliance with requirements.
- B. Shop Drawings: Indicate elevation, sections of trim members, and installation details.
- C. Samples for Initial Selection: Manufacturer's sample booklet of not less than 7 colors for porcelain enamel surfaces, and not less than 10 fabrics.

INCLUDE BELOW FOR ALL PROJECTS.

- D. Affidavits of Compliance to be included in final inspection manual:
1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 2. Letter shall include project number, project name, and building name.

PART 2 - PRODUCTS

THE FOLLOWING IS MULTI-PURPOSE DISPLAY UNIT.

2.1 GRAPHIC PRESENTATION BOARD

- A. Plastic laminate board and screen housing, and board cover doors. Self-edged plastic laminate construction, with concealed hinges, and as follows:
1. Size: 4 feet by 4 feet.
 2. Accessories:
 - a. Glass-beaded projection screen.

- b. Markerboard and marker tray.
 - c. Door mounted drawing paper pads with min. 50 sheets each.
3. Manufacturer: Subject to compliance with requirements, products of one of the following:
 Cig-Jan Products, Ltd.
 Da-Lite.
 Egan Visual.
 Marsh Chalkboard Co.; Div. Marsh Lumber Co.
 Polyvision Corp.

BELOW IS STANDARD MARKERBOARD UNIT FOR SPECIAL FELT TIP MARKERS.

2.2 MARKERBOARDS, PORCELAIN ENAMEL

- A. Markerboards: Provide markerboard units with concealed mechanical fastening devices for wall mounting to indicated substrates, and complete with the following:

SELECT ONE OF THE FOLLOWING - "C" CHANNEL TYPE (MOST COMMON) IS USED WITH PARTICLEBOARD BACKING (MOUNTING CLIPS ATTACH TO PARTICLEBOARD). MOUNTING CLIPS WITH SNAP-ON TRIM ARE USED WITH GYPSUM BOARD BACKING.

- 1. Frames: Aluminum "C" channel type with concealed fasteners.
- 2. Frames: Mounting clip type with extruded aluminum snap-on trim.

SELECT SOLID EXTRUSION BELOW WITH "C" CHANNEL TRIM - HOLLOW TYPE IS MORE SUBSTANTIAL AND MORE EXPENSIVE.

- 3. Markertray: Solid aluminum extrusion type.
- 4. Markertray: Hollow extruded aluminum box type.

INCLUDE BELOW IF DESIRED.

- 5. Map Rail: Aluminum extrusion with tackable cork insert.

- B. Balanced, high pressure laminated porcelain enamel markerboards of 3 ply construction consisting of facing sheet, core material, and backing.

- 1. Facing Sheet: Enameling steel or iron sheet with low metaloid and copper content, able to withstand temperature of over 1,400 degrees as used in coating porcelain on steel for architectural purposes, and as follows:
 - a. Minimum Thickness: 0.299-inch (22 gage).
 - b. Chemically bathe steel sheets in potassium hydroxide and sodium metal silicate solution and rinse prior to enameling.
 - c. Apply minimum 0.0025-inch thick spray coat of nickel cobalt primer and silica to face opposite writing surface for adhesion of laminate.
 - d. Aluminum and aluminized cold-rolled steel are not acceptable.
- 2. Markerboard Cover Coat: Mfr's special writing surface with gloss finish intended for use with erasable liquid felt tipped markers, and as follows:

- a. Apply minimum 0.0025-inch thick spray coat of nickel cobalt primer to facing sheet. Writing surface to be minimum 0.003-inch thick fired porcelain frits. Panel edges at butt joints to be porcelain same as fronts. Low fired organic (paint) coated writing surfaces are not acceptable.
- b. Provide final writing surface with uniform texture, with reflectance factor between 15 and 20 percent, and with not less than 6.0 hardness on Moh's Scale. Writing surface shall not become slick and shiny through normal use.

CONSULT CATALOG FOR ADDITIONAL AVAILABLE COLORS - USUAL SELECTION IS WHITE.

- c. Color: White.
 - d. Color: Silver.
 - e. Color: Selected by Architect from Manufacturer's standard range.
- 3. Core: 1/2-inch thick gypsum board.
 - 4. Backing Sheet: Mfr's standard aluminum foil.
 - 5. Laminating Adhesive: Moisture-resistant, thermoplastic type.

- C. Manufacturers: Subject to compliance with requirements, provide products of one of the following:

Cig-Jan Products, Ltd.
 Claridge Products and Equipment, Inc.
 Marsh Chalkboard Co.; Div. Marsh Lumber Co.
 Polyvision Corp.

BELOW IS STANDARD CHALKBOARD.

2.3 PORCELAIN ENAMEL CHALKBOARDS

- A. Chalkboards: Provide chalkboard units with concealed mechanical fastening devices for wall mounting to indicated substrates, and complete with the following:

SELECT ONE OF THE FOLLOWING - "C" CHANNEL TYPE (MOST COMMON) IS USED WITH PARTICLEBOARD BACKING (MOUNTING CLIPS ATTACH TO PARTICLEBOARD). MOUNTING CLIPS WITH SNAP-ON TRIM ARE USED WITH GYPSUM BOARD BACKING.

- 1. Frames: Aluminum "C" channel type with concealed fasteners.
- 2. Frames: Mounting clip type with extruded aluminum snap-on trim.

SELECT SOLID EXTRUSION BELOW WITH "C" CHANNEL TRIM - HOLLOW TYPE IS MORE SUBSTANTIAL AND MORE EXPENSIVE.

- 3. Chalktray: Solid aluminum extrusion type.
- 4. Chalktray: Hollow extruded aluminum box type.

INCLUDE BELOW IF DESIRED.

- 5. Map Rail: Aluminum extrusion with tackable cork insert.
- B. Balanced, high pressure laminated porcelain enamel chalkboards of 3 ply construction consisting of facing sheet, core material, and backing.

1. Facing Sheet: 24 gage enameling steel sheet especially processed for temperatures used in coating porcelain on steel Fuse cover and ground coats to the steel at the manufacturer's standard firing temperature.
2. Exposed Face: 3 coat process (primer, ground coat and color cover coat).
3. Concealed Face: 2 coat process (primer and ground coat).
4. Proprietary Facing Sheet: At the Contractor's option, provide 24 gage, "Vitracite" porcelain enamel clad aluminized steel facing sheet, as manufactured by Claridge Products and Equipment, Inc.
5. Chalkboard Cover Coat: Mfr's standard matte finish cover coat.

SELECT FROM CHOICES BELOW OR CONSULT MANUFACTURER'S CATALOG.

- a. Color: Dark Green.
 - b. Color: Black.
 - c. Color: Dark Brown.
 - d. Color: Selected by Architect from Manufacturer's standard range.
6. Core: Mfr's standard 3/8 inch thick particleboard core material complying with ANSI A208.1, Grade 1-M-1.
 7. Backing Sheet: Mfr's standard 0.015 inch thick aluminum backing sheet.
 8. Laminating Adhesive: Mfr's standard moisture-resistant, thermoplastic type adhesive.
- C. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
- Cig-Jan Products, Ltd.
 Claridge Products and Equipment, Inc.
 Marsh Chalkboard Co.; Div. Marsh Lumber Co.
 Polyvision Corp.

2.4 BULLETIN BOARDS

- A. Bulletin Boards: Provide bulletin board units with concealed mechanical fastening devices for wall mounting to indicated substrates, and complete with the following:

SELECT ONE OF FOLLOWING.

1. Frames: Aluminum "C" channel type with concealed fasteners.
2. Frames: Incorporate bulletin boards in chalk/markerboard frames.

SELECT ONE OF THE BOARD TYPES BELOW.

- B. Tackable, nominal 1/4-inch thick, resilient linoleum homogenous with integral color through board.
1. Product: Bulletin Board Cork; Forbo North America.
 - a. Color: SELECT COLOR .
- C. Vinyl fabric on fire retardant resilient tackable backing board; ASTM E-84, Class A.
1. Fabric: Tackboard manufacturer's standard.
 - a. Fabric Pattern: Burlap.

- b. Color: insert selection .
- D. Polyester cloth fabric, plain weave with edges wrapped on fire retardant resilient tackable backing board; ASTM E-84, Class A.
 - 1. Fabric Manufacturer: Guilford of Maine Div. Interface Co.
 - a. Color: insert selection .
- E. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
 - Cig-Jan Products, Ltd.
 - Claridge Products and Equipment, Inc.
 - Marsh Chalkboard Co.; Div. Marsh Lumber Co.
 - Polyvision Corp.

*INCLUDE BELOW WITH EITHER CHALKBOARD OR MARKERBOARD SURFACES -
MODIFY OR DELETE ALL FOR PROJECTS WITH BULLETIN BOARDS ONLY*

2.5 ACCESSORIES

- A. Metal Trim: 0.062 inch thick aluminum, manufacturer's standard channel size and shape; minimize number of joints. Miter corners to a neat, hairline closure.

DELETE PARAGRAPH ABOVE OR BELOW

- B. Field-Applied Trim: Mfr's standard snap-on trim, with no visible screws or exposed joints.
- C. Clear Anodized Finish: Mfr's standard color anodized satin finish with hardcoat anodic coating AA Class I integral Color Coating (AA-442), color as selected.
- D. Chalk/Markertray: Mfr's standard continuous, box type aluminum with slanted front and cast aluminum end closures.

INCLUDE THE FOLLOWING IF MARKERBOARDS HAVE BEEN SELECTED

- E. Erasable Liquid Markers: Provide a carton containing not less than 5 markers, each a different color, of type recommended by markerboard manufacturer.

2.6 FABRICATION

- A. Factory assemble units with a minimum number of joints balanced about the center of units, as acceptable to the Architect.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with mfr's print instructions. Include grounds, clips, backing materials, brackets and anchors, trim and accessories required for a complete installation.
- B. Clean units and repair or replace defective and damaged components to the satisfaction of the Architect.

NUMBER SECTION DESCRIPTION

DIVISION 10 SPECIALTIES

SECTION 101400 - SIGNAGE

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 101400 - SIGNAGE

PART 1 - GENERAL

AN ALTERNATIVE TO THIS SECTION IS TO INCLUDE A LINE ITEM IN THE BUDGET FOR PLANT TO PROVIDE SIGNAGE FOR THE PROJECT. USING PLANT MAY RESULT IN FEWER PROBLEMS AND COST-OVERRUNS.

MAY 2007 "STANDARD" MEDICAL SCHOOL SIGN SECTION REMOVED. FOR MEDICAL SCHOOL PROJECTS, CONSULT WITH MEDICAL SCHOOL FACILITIES OFFICE. FOR RENOVATION PROJECTS, SIGNAGE IS TYPICALLY PROVIDED BY OWNER.

COORDINATE EVACUATION PLAN REQUIREMENTS WITH USER AND AEC UPO GUIDELINES (CONTACT JULIE TRUETTNER.

1.1 SUMMARY

SELECT ONE OF THE FOLLOWING.

- A. Extent of signage is indicated on drawings and in schedule.
- B. Extent of signage is indicated by provisions of this Section.
- C. Types of signage include the following:

EDIT BELOW TO SUIT PROJECT.

- 1. Room number signs.
- 2. Room identification signs.
- 3. General identification signs.

1.2 SUBMITTALS

- A. Shop Drawings: Indicate unit dimensions and configuration. Include schedule indicating proposed room numbers and labels.

1.3 QUALITY ASSURANCE

- A. Standards: Unless otherwise indicated, comply with current edition of State of Michigan Department of Labor Building Code Rules pertaining to barrier-free signage.

PART 2 - PRODUCTS

SELECT FROM TWO TYPES INDICATED BELOW.

2.1 STAMPED METAL SIGNAGE

- A. Stamped Metal Signs: Manufacturer's standard aluminum units with smooth, polished raised areas and textured black background areas and with design matching existing adjacent units.
 - 1. Size: Match existing adjacent units.

2. Lettering: Match existing adjacent units.

SELECT ONE MOUNTING TYPE BELOW.

3. Mounting Type: Mechanically fastened.

4. Mounting Type: Adhered to substrate.

B. Manufacturer: The Supersine Company.

BELOW IS STANDARD U OF M PLASTIC SIGN.

2.2 ACRYLIC-PLASTIC SIGNAGE

A. Acrylic-Plastic Signs with Raised Copy: Supersine style "SS", as modified for University of Michigan use and as follows:

1. Faceplate: Acrylic plastic, as follows:

SELECT SIZE - USE 7-1/2 INCH SIGNS TO COORDINATE WITH 8 BY 8 SCORED CONCRETE MASONRY UNITS.

a. Size: 6 inch by 6 inch by 1/8 inch thick.

b. Size: 7-1/2 inch by 7-1/2 inch by 1/8 inch thick.

SELECT CORNER TYPE.

c. Corners: Radiused, 3/4 inch.

d. Corners: Square cut, without radius.

2. Card Slot: 2 inch by 4-3/4 inch. Omit card slot on toilet room and stair signs.

3. Back-up Plate: Clear acrylic plastic; 1/16 inch thick.

4. Letters and Numerals: 1-1/2 inch raised Helvetica face.

5. Colors: Provide units of the following colors:

REFER TO SAMPLES FOR FULL SELECTION OF COLORS AND GLOSS.

a. Faceplate: "Plexiglas P-95" or equivalent, opaque and as follows:

SELECT GLOSS BELOW.

1) Gloss: X-Gloss (flat).

2) Gloss: Gloss (polished).

SELECT COLOR BELOW.

3) Color: Black No. 2025.

4) Color: Dark Brown No. 2518.

5) Color: Blue No. 2114.

b. Letters and numerals: Opaque white.

EDIT THE FOLLOWING TO SUIT PROJECT.

2.3 FABRICATION

A. Numerals and Letters: Fabricate signs to indicate room number and suffix letter, if any, in raised numerals and letters on signs.

1. At toilet rooms indicate "MEN" or "WOMEN" and at stairway doors indicate "STAIR", all without room numbers.

2. Braille: Provide each sign with a braille message strip indicating room number or "Toilet" or "Stair" message.

PART 3 - EXECUTION

3.1 INSTALLATION

SELECT ONE OF THE FOLLOWING.

- A. Mechanically mount signs with manufacturer's standard anchoring system for indicated substrate.
- B. Mount with adhesive tape system adequate to hold signs of indicated size on indicated substrate material.

INCLUDE ADHESIVE BELOW IF DESIRED.

- 1. Apply silicone adhesive to sign back for permanent mounting.
- 2. Unless otherwise indicated, mount signs in corridors on latch side of doors, 5 feet above finished floor height.

3.2 SIGNAGE SCHEDULE

- A. Provide one room sign at the following locations:

EDIT LIST BELOW TO BE PROJECT SPECIFIC (ROOM SIGNS, AREA OF REFUGE SIGNS, EMERGENCY EVACUATION PLANS, ETC). NOTE THAT FOR ALL NEW CONSTRUCTION AND MAJOR RENOVATION PROJECTS, EMERGENCY EVACUATION PLANS SHOULD BE INCLUDED AS PART OF INTERIOR SIGNAGE PACKAGE.

COORDINATE EVACUATION PLAN REQUIREMENTS WITH USER AND AEC UPO GUIDELINES.

- 1. Each new door.
- 2. As shown on drawings.

DIVISION 10 SPECIALTIES

SECTION 102113 - TOILET COMPARTMENTS

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 102113 - TOILET COMPARTMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of toilet compartments is indicated on drawings.
- B. Types of toilet compartments include the following:
 - EDIT THE FOLLOWING TO SUIT PROJECT.*
 - 1. Floor supported.
 - 2. Wall supported.
 - 3. Ceiling-hung.
- C. Support steel for ceiling-hung units is specified in Division 05 Section "Metal Fabrications".

1.2 SUBMITTALS

- A. Product Data: Mfr's product literature indicating compliance with requirements, and installation instructions.
 - INCLUDE BELOW IF STATE FIRE MARSHAL WILL REVIEW PROJECT.*
- B. Affidavits of Compliance to be included in final inspection manual:
 - 1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 - 2. Letter shall include project number, project name, and building name.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide metal toilet partitions manufactured by one of the following:
 - All American Metal Corp.
 - Bradley Corporation
 - Flush-Metal Partition Corp.
 - Global Partitions
 - Hadrian Manufacturing Inc.

2.2 MATERIALS

- A. Sheet Steel: ASTM A 591, Class C, galvanized-bonderized, of following minimum thicknesses:
 - EDIT BELOW TO SUIT PROJECT.*
 - 1. Pilasters: 18 gage.

2. Panels and Screens: 22 gage.
 3. Doors: 22 gage.
 4. Concealed Reinforcement for Anchorages: 12 gage.
 5. Concealed Reinforcement for Tapping: 14 gage.
- B. Core Materials: Mfr's standard sound-deadening, honeycomb, impregnated Kraft paper core.
- C. Stirrup Brackets: Mfr's standard, non-ferrous alloy with satin chrome finish.

2.3 HARDWARE AND ACCESSORIES

- A. Provide Mfr's standard, ADA compliant, heavy-duty operating hardware and accessories, non-ferrous cast alloy with satin chrome finish.
- B. Anchorages and Fasteners: Mfr's standard theft-proof exposed fasteners, finish to match hardware.

2.4 FABRICATION

- A. Pressure laminate face sheets to core, edges sealed with continuous locking strip or lapped and formed edges. Miter and weld corners with welds ground smooth.
1. Furnish units with cut-outs, drilled holes, and internal reinforcement to receive partition mounted hardware, accessories, and grab bars, as indicated.
- B. Doors and Panels: Not less than 1 inch thick units, size shown.
1. For wall-supported units, fabricate panels of two sheets of steel with internal reinforcing to form a "V" shaped unit approximately 6 inch wide at wall edge and tapered to approximately 1 inch wide at pilaster edge.
- C. Ceiling-Hung Pilasters: 1-1/4 inch thick units with galvanized steel anchorage devices for securing to overhead support. Provide 3 inch stainless steel top trim piece, finished to match hardware.

SELECT ABOVE OR BELOW.

- D. Floor Mounted Pilasters: 1-1/4 inch thick units with stainless steel anchorage devices for securing to floor. Provide 3 inch stainless steel bottom trim piece, finished to match hardware.
- E. Hardware and Accessories: Chromium-plated finish, unless otherwise indicated. Apply the following accessories to panels and doors, one each compartment unless otherwise indicated:
1. Hinges: Either surface-mounted or cutout inset type, Adjustable to hold door open at any angle up to 90 degrees.
 2. Latch and Keeper: Recessed latch unit, with combination rubber-faced door strike and keeper.
 3. Barrier-Free Latch and Keeper: At each outswinging partition door, in addition to standard hinges, coat hook and other specified hardware, provide manufacturer's standard ADA-compliant latch and keeper. In addition, provide the following:

- a. Handles: Provide manufacturer's standard ADA-compliant pull handles on both the interior and exterior sides of partition doors.
 - 4. Coat Hook and Bumper: Mfr's standard unit, rubber tipped.
 - 5. Door Pulls: Mfr's standard, exterior of standard stall doors; and both sides of barrier-free stall doors.
- F. Baked Enamel Finish: As selected from mfr's standard colors.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install partitions rigid, straight, plumb and level in accordance with mfr's printed instructions. Set units with not more than 1/2 inch between pilasters and panels, and not more than 1 inch clearances between panels and walls.
- B. Hardware Adjustments: Adjust and lubricate hardware for proper operation after installation.
 - 1. Set hinges on in-swing doors to hold doors open approximately 30 degrees from the closed position when unlatched.
 - 2. Set hinges on out-swing doors to return to fully closed position.
- C. Cleaning and Final Adjustments: Perform final adjustments to leveling devices, door hardware, and other operating parts. Clean exposed surfaces and touch up minor finish imperfections using materials and methods recommended by partition mfr.
 - 1. Replace damaged units which cannot be satisfactorily field repaired, as directed by Architect.

DIVISION 10 SPECIALTIES

SECTION 102213 - WIRE MESH PARTITIONS

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 102213 - WIRE MESH PARTITIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of wire mesh partitions is shown on drawings.

*DELETE BELOW AND SPECIFY CYLINDERS IN THIS SECTION IF NO
HARDWARE SECTION IS INCLUDED IN SPECIFICATION.*

- B. Lock Cylinders are included in Division 08 Section "Door Hardware".

1.2 QUALITY ASSURANCE

- A. Manufacturer: Provide wire mesh partitions as complete units produced by a single manufacturer, including necessary mounting accessories and fasteners.
- B. Field Measurements: Where possible, field measure prior to preparation of shop drawings. Where field measurements cannot be obtained without delay of the work, fabricate units to allow for field adjustments and fitting.

1.3 SUBMITTALS

- A. Product Data: Submit manufacturer's technical data indicating compliance with requirements and manufacturer's installation instructions.
- B. Shop Drawings: Submit shop drawings for fabrication and erection of wire mesh partitions. Include plans, elevations, and large scale details showing anchorage and accessory items.

PART 2 - PRODUCTS

*SYSTEM SPECIFIED BELOW IS FOR STANDARD MESH PARTITIONS - TO
SPECIFY SPECIAL TYPES, OR ECONOMY OR HEAVY DUTY GRADES,
CONSULT MFR'S LITERATURE.*

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, products of one of the following:
- Acme.
 - Kentucky Metal Products Co.
 - Logan, Div. Spaceguard Co.
 - Phoenix Co.
 - Miller Wire Works.
 - Wipco, Div. Jesco Industries, Inc.
 - Wirecrafters Co.

2.2 MATERIALS AND FABRICATION

- A. General: do not use components less than sizes indicated; use larger size components as recommended by partition manufacturer for indicated application.

SELECT COMPONENTS TO SUIT PROJECT REQUIREMENTS.

- B. Mesh: 10-gage (0.135 inch) crimped steel wire woven into 1-1/2 inch mesh securely clinched to frame members.
- C. Frames: Provide cutouts for pipes, ducts, beams, and other items shown or necessary for partition installation. Finish edges of cutouts to provide a neat, protective edge.
 - 1. Vertical Members: 1-1/4 inch by 5/8 inch cold-rolled steel C-section channels with 1/4 inch bolt holes approximately 15 inches o.c.
 - 2. Horizontal Members: 1 inch by 1/2 inch by 1/8 inch cold-rolled steel channels, mortised and tenoned to vertical members.
 - 3. Horizontal Reinforcing Members: 1 inch by 1/2 inch by 1/8 inch cold-rolled steel channel with wire woven through, or two 1 inch by 3/8 inch channels bolted or riveted to each side of mesh, and secured to vertical members. Provide number of horizontal reinforcing members to suit panel height as recommended by partition manufacturer.

DELETE BELOW IF PARTITION HEIGHT DOES NOT EXCEED 8 FEET.

- D. Stiffening Bars: For free-standing partitions over 8 feet in height, provide flat bar stiffener posts between abutting panel frames. Size as recommended by partition manufacturer for partition height required. Increase size of stiffening bars if required to maintain partition rigidity.

DELETE BELOW IF TOP TIED TO OVERHEAD CONSTRUCTION.

- E. Top Capping Bars: 2-1/4 inch by 1 inch cold-rolled steel channels, secured to top framing channel with 1/4 inch U-bolts spaced not more than 28 inches o.c.
- F. Corner Posts: 1-1/4 inch by 1-1/4 inch by 1/8 inch angles with 1/4 inch bolt holes to align with bolt holes in vertical frame members, and floor plate.

DELETE BELOW IF ALL CORNERS 90 DEG.

- 1. For other than 90 deg. intersections use manufacturer's recommended tubular corner posts and installation accessories.
- G. Floor Shoes: Cast iron, sized to suit vertical framing and to provide approximately 3 inches clear space between finished floor and bottom horizontal frame members. Furnish units with set screw for leveling adjustment.
- H. Sheet Metal Base: Panels formed of 16-gage steel sheet, welded or bolted to frames.

- I. Hinged Door: Door frame of 1-1/2 inches by 1/2 inches by 1/8 inch channel with 1-1/4 inch by 1/8 inch flat bar cover plate on 3 sides, and matching 1/8 inch angle strike bar and cover on lock side. Provide 1-1/2 pair butt hinges welded to door and frame, and bronze mortise type cylinder lock operated by key outside and recessed knob inside. Align bottom of door with bottom of adjacent panels.

DELETE BELOW IF CYLINDERS ARE SPECIFIED IN SECTION 087100 "DOOR HARDWARE".

1. Manufacturer/Model of Cylinders: Best Co., only. Contact University of Michigan Key Office for cylinder information.
- J. Sliding Door: Door frame of 1-1/2 inches by 3/4 inches by 1/8 inch channel with 1-1/2 inch by 1/8 inch flat bar cover plate on all 4 sides. Provide door with two 4-wheel roller bearing carriers, box track, bottom guide channel and bronze mortise type cylinder lock operated by key outside and recessed knob inside. Align bottom of door with bottom of adjacent panels.

DELETE BELOW IF CYLINDERS ARE SPECIFIED IN SECTION 087100 "DOOR HARDWARE".

1. Manufacturer/Model of Cylinders: Best Co., only. Contact University of Michigan Key Office for cylinder information.
- K. Service Window: size as shown or, if not shown, 24 inches wide by manufacturer's standard height. Fabricate of same mesh and frames as panel units, arranged to lock in open and closed positions with spring catches.
- L. Service Window Shelf: Size as shown or, if not shown, approximately 12 inches deep and 24 inches wide. Fabricate of 12-gage steel, flanged front and back, edges finished smooth, with side brackets for support.

DELETE BELOW IF NOT REQUIRED.

- M. Line Posts: Where partition run exceeds 20 feet without intersection or connection to overhead framing, furnish manufacturer's standard line posts and base plates located at recommended intervals to ensure partition rigidity and stability.

MOST MANUFACTURERS LIMITED TO GRAY - SOME HAVE GREEN AND BLACK AVAILABLE. CHECK WITH MANUFACTURERS.

- N. Finish: Provide manufacturer's standard shop-applied enamel finish.
1. Provide finish colors of materials for wire mesh partitions and accessories as indicated or, if not indicated, as selected by Architect from manufacturer's standard color range.
- O. Provide bolts, hardware, and accessories recommended by manufacturer's printed installation instructions and as required for a complete, secure installation.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Erect partitions plumb, rigid, properly aligned, and securely fastened in place, complying with drawings and manufacturer's recommendations.
- B. Provide additional field bracing as shown or necessary for rigid, secure installation.

3.2 ADJUST AND CLEAN

- A. Adjust moving components for smooth operation without binding.
- B. Touch-up damaged finish after completion of installation using field-applied paint to match color of shop applied finish.

SPECIFICATION DIVISION 10

NUMBER SECTION DESCRIPTION

DIVISION 10 SPECIALTIES

SECTION 102239 - FOLDING PANEL PARTITIONS

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 102239 - FOLDING PANEL PARTITIONS

1.1 SUMMARY

- A. This Section includes manually operated, acoustically rated assemblies, consisting of the following:

SELECT APPROPRIATE TYPE BELOW, USUALLY CONTINUOUS SEQUENCE.

1. Individual, unlinked panels.
 2. Panels hinged in pairs.
 3. Panels hinged in continuous sequence.
- B. Related Sections: The following sections contain requirements that relate to this Section:
1. Division 05 Section "Metal Fabrications" for miscellaneous framing and supports.
 2. Plenum barriers are specified in Division 09 Section "Gypsum Board Assemblies"

1.2 SUBMITTALS

- A. Product data on physical characteristics, durability, resistance to fading, and flame spread characteristics for each type of folding fabric partition and accessory specified.
- B. Shop drawings showing location and extent of folding panel partitions. Include plans, elevations, large-scale details of anchorages, and accessory items. Indicate unit conditions at openings, typical and special details, and location and installation requirements for hardware. Indicate direction of travel and static and dynamic loading on the building structure.
- C. Template drawings prepared by manufacturer showing location of items supported or anchored by permanent construction.
- D. Samples for verification purposes of each type of material exposed to view. Include samples of each panel facing material selected.
- E. Acoustical Certification from an independent testing agency stating that product and materials furnished comply with specified requirements. Include certified laboratory testing data indicating that panels and materials meet specified test requirements. Include STC and NRC ratings and square foot weight of panel.
- F. Affidavits of Compliance to be included in final inspection manual:
1. Provide manufacturer's letter of certification showing compliance with finish testing and classification requirements referenced by current adopted NFPA 101 "Life Safety Code".
 2. Letter shall include project number, project name, and building name.

1.3 SYSTEM PERFORMANCE REQUIREMENTS

A. Acoustical Performance: Provide folding panel partitions tested by independent testing laboratory acceptable to Owner, for the following acoustical properties, according to the test methods indicated:

1. Sound Transmission Requirements: Folding panel partition assembly tested in a full-scale opening (14 feet by 9 feet) for laboratory sound transmission loss performance in accordance with ASTM E 90, determined by ASTM E 413 and rated for a STC plus or minus 1 as indicated:

INSERT APPLICABLE RATING.

2. Sound Transmission Class (STC): 49.

3. Noise Reduction Requirements: Folding panel partition assembly tested by a qualified independent laboratory for compliance with ASTM C 423 and rated for a NRC as indicated:

INSERT APPLICABLE RATING.

a. Noise Reduction Coefficient (NRC): INSERT .

1.4 QUALITY ASSURANCE

A. Single-Source Responsibility: Provide units and accessories of a single manufacturer.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver materials to project site in original factory wrappings and containers, clearly labeled with identification of manufacturer, brand name, quality or grade, and lot number.

B. Store panels only on edge, blocked off ground to prevent sagging and warping in original undamaged packages and containers, inside well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.

C. Comply with instructions and recommendations of manufacturer for special delivery, storage, and handling requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:

- Folddoor/Holcomb and Hoke Mfg. Co.
- Hufcor, Inc. (Hough Mfg. Corp.)
- Modernfold, Inc.
- Panelfold, Inc.

2.2 PANEL CONSTRUCTION

- A. Face Sheets: Top reinforcing as required to support suspension components. Internal insulation as required to achieve specified acoustical rating.

THE FOLLOWING VARY WITH MANUFACTURER - CONSULT AIA MASTERSPEC FOR GENERIC MINIMUM VALUES.

1. Face Sheets for Steel Frames: Minimum 0.838 inch (21 gage) cold-rolled steel welded to minimum 1.390 inch (16 gage) steel channel frame, factory-fabricated panels, free of joints in faces.
2. Panel Thicknesses: 3 inches.
3. Panel Weight: 12 psf maximum as determined by panel construction, surface covering, and accessories.
4. Hardware: Manufacturers standard, finished to match exposed hardware on partition.

2.3 SUSPENSION SYSTEMS

- A. Carriers: Four wheel at lead post and two wheel at intermediate spacing as required for size and weight of partition for ease of operation.
- B. Suspension Tracks: Heavy-duty steel or aluminum, with overhead supports of adjustable steel hanger rods; heavy-duty, ball-bearing, trolley system supports specifically designed for use with size and type folding panel partition assembly indicated. Track deflection independent of structural support system no more than 1/360th of opening width.

2.4 FINISH SURFACE

- A. Finish Face: Manufacturer's standard primed steel.
- B. Materials: Manufacturer's standard mildew resistant vinyl, complying with FS CCC-W-408A for Type 1 material.

2.5 POSTS AND SEALS

- A. Lead posts and jamb posts formed to provide rigidity for partition and light seal at adjacent construction.
1. Post Type: Floating or attached multiple meeting post with 2-way meeting arrangements.
- B. Sound Seals: Perimeter sweep strips for each side, top, and bottom; providing continuous contact with head and sill surfaces for positive light and sound seal. Include manufacturer's standard male and female sound and light seal at lead posts and jambs.
- C. Vertical Seals: Deep nesting, interlocking astragals with continuous vinyl acoustical seal.
- D. Horizontal Top Seals: continuous contact extruded vinyl or mechanical retractable vinyl-faced seal exerting positive pressure on track when extended.

- E. Horizontal Bottom Seals: Retractable seal exerting positive pressure downward assuring horizontal and vertical sealing and resisting panel movement. Minimum clearance between retractable seal and floor finish shall be 1 inch.
 - 1. Extension/retraction of bottom seal by operating handle or built-in operating mechanism. Holes in panel faces not permitted. Include 2 handles per partition.
- F. Final Closure: Positive mechanical closure expanding from panel edge to create positive acoustical seal.
 - 1. Type: Jamb hinged closure.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine flooring for compliance with requirements for installation tolerances and other conditions affecting performance of folding partitions. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install folding panel partitions and accessories in compliance with ASTM E 557 after other finishing operations including painting, have been completed.
- B. Install folding panel partitions in conformance with drawings and approved shop drawings and in strict compliance with manufacturer's written installation instructions.
- C. Match folding panel partitions for color and pattern by installing partitions from cartons in same sequence as manufactured and packaged, if so numbered. Broken, cracked, chipped or deformed partitions are not acceptable.
- D. Repair or replace folding panel partitions within areas where test results indicate partitions do not comply with requirements and retest partitions.

3.3 ADJUSTING

- A. Lubricate bearings and sliding parts; adjust to ensure smooth, easy operation.

3.4 CLEANING

- A. Clean all folding partition surfaces and clean adjacent surfaces soiled by work of this section. Avoid use of abrasive cleaners or solutions containing corrosive solvents. Use cleaning materials recommended by manufacturer.

SECTION 102800 - TOILET AND BATH ACCESSORIES

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 102800 - TOILET AND BATH ACCESSORIES

REVISION HISTORY:

SEPT. 04 - UPDATED MANUFACTURERS AND CHANGED TOILET PAPER AND PAPER TOWEL DISPENSERS PRODUCT INFO. TO REFLECT THAT THESE ARE PROVIDED BY OWNER.

APRIL 05 - ADDED DIAPER CHANGING STATIONS.

MAY 07 - CHANGED SOAP DISPENSER PRODUCT INFO. TO REFLECT THAT THESE ARE PROVIDED BY OWNER.

PART 1 - GENERAL

GENERAL EDITING / COORDINATION NOTES:

TOILET PAPER, PAPER TOWEL, AND SOAP DISPENSERS ARE TYPICALLY PROVIDED BY BUILDING SERVICES FOR CONTRACTOR INSTALLATION. THIS ASSURES THAT UNIT SUPPLIED IS COMPADIBLE WITH PAPER / SOAP PRODUCTS PURCHASED FOR MAINTENANCE. IF OTHER UNITS ARE SELECTED, COORDINATE WITH DESIGN MANAGER TO COMMUNICATE MAINTENANCE REQUIREMENTS TO USER.

USING OWNER SUPPLIED UNITS DOES NOT ALLEVIATE ARCHITECT OF THE RESPONSIBILITY TO COORDINATE WALL MOUNTED ITEMS WITH ALL ADA REQUIREMENTS AND COMMUNICATING THOSE INSTALLATION REQUIREMENTS TO THE CONTRACTOR.

CATALOG NUMBERS USED IN THIS SECTION DO NOT REPRESENT AN EXHAUSTIVE LISTING OF ALL POSSIBLE UNITS. CONSULT MANUFACTURERS CATALOG WHEN EDITING THIS SECTION.

1.1 SUMMARY

- A. Extent of toilet accessories is shown on drawings.
- B. Types of toilet accessories include the following:

EDIT BELOW TO SUIT PROJECT.

Grab bars.
Soap dispensers.
Toilet paper dispenser.
Paper roll towel dispenser.
Electric hand dryers
Fold-down shower seats.
Shower curtain rods.
Sanitary napkin/tampon dispensers.
Folding purse shelf.
Sanitary napkin/tampon disposal units.
Stainless steel shelves.
Janitorial utility shelves.
Mirror units.

- C. Waste paper baskets are included in Division 12 Section "Furnishing Accessories."
- D. For accessories noted in Products section as provided by Owner, coordinate with Owner's Representative to obtain from UM Plant Building Services.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's literature indicating compliance with requirements, and installation instructions.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:
 - 1. Toilet Accessories:
 - American Specialties, Inc.
 - Bobrick Washroom Equip., Inc.
 - Bradley Corp.
 - Elcoma Metal Fabricating (grab bars and shower seats only).
 - Gamco (except for shower seats and counter soap dispensers)
 - Koala Kare Products, a division of Bobrick

2.2 TOILET ACCESSORIES

- A. General: Provide toilet accessories as indicated or scheduled. Install units at locations and heights as indicated, plumb and level, firmly anchored, in accordance with mfr's instructions.

2.3 MATERIALS

- A. Stainless Steel: AISI Type 3-2/304, with polished No. 4 finish, 22 gage minimum, unless otherwise indicated.
- B. Fasteners: Screws, bolts, and other devices of same material as accessory unit or of galvanized steel where concealed.

2.4 FABRICATION

- A. General: Stamped names or labels on exposed faces of toilet accessory units are not permitted. Wherever locks are required for particular type of accessory, provide same keying throughout project. Furnish two keys for each lock, properly identified.
- B. Surface-Mounted Accessories: Fabricate units with tight seams and joints, exposed edges rolled. Hang doors or access panels with continuous piano hinge or minimum of two 1-1/2 inch long pin hinges of same metal as unit cabinet.

DELETE ABOVE OR BELOW OR RETAIN BOTH TO SUIT PROJECT.

- C. Recessed Accessories: Fabricate units of all welded construction, without mitered corners. Hang doors or access panels with full-length stainless steel piano hinge. Provide anchorage which is fully concealed when unit is closed.

2.5 GRAB BARS

NOTE: ICC/ANSI A117.1 2003 REQUIRES BOTH VERTICAL AND HORIZONTAL BARS.

PART NUMBER LISTED BELOW IS A SERIES NUMBER AND IS AVAILABLE IN MULTIPLE CONFIGURATIONS AND LENGTHS. PROVIDE ELEVATIONS ON DRAWINGS SHOWING CONFIGURATION, TYPES OF BARS, LOCATIONS, AND MOUNTING HEIGHTS. COORDINATE WITH TOILET PAPER DISPENSER AND OTHER WALL MOUNTED ITEMS IN ROOM / STALL.

- A. Provide stainless steel grab bars with wall thickness not less than 18 gage and as follows:
1. Mounting: Concealed.
 2. Gripping Surface: Manufacturer's standard non-slip texture.
 3. Size: Outside diameter 1-1/2 inch by dimensions indicated.
 4. Product: Bobrick B-6806 series of configuration and dimensions shown; or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.6 WALL MOUNTED SOAP DISPENSERS

WALL MOUNTED SOAP DISPENSERS ARE PROVIDED BY BLDG. SERVICES FOR INSTALLATION BY THE CONTRACTOR. ARCHITECT IS RESPONSIBLE TO VERIFY COMPLIANCE WITH PROJECT REQUIREMENTS AND PROVIDE INSTALLATION INFORMATION, INCLUDING MOUNTING HEIGHTS AND LOCATIONS. PM ORDERS DURING CONSTRUCTION. THE FOLLOWING IS STANDARD MODEL FROM SPARTAN:

FOAM DISPENSER (ADA COMPLIANT IF PROPERLY LOCATED): 9756

- A. Wall mounted liquid soap dispensers are provided by Owner for installation by Contractor.

2.7 COUNTER-MOUNTED SOAP DISPENSERS

OPTIONS FOR UNIT BELOW INCLUDE POLISHED BRASS COVER AND SPOUT, 4-INCH LONG SPOUT, AND 20-OZ. RESEVOIR. SEE CATALOG FOR APPROPRIATE MODEL NUMBER.

NOTE THAT BUILDING SERVICES DOES NOT FILL UNITS THAT THEY DO NOT SUPPLY.

- A. Liquid soap dispenser for counter mounting, complete with 4-inch long shank, and optional 6-inch spout. Capable of filling from top. Stainless steel spout/cover and 34 oz. capacity polyethylene reservoir. Provide units with matching stainless above-counter shank extension if required to suit application.
1. Product: Bobrick B-8226; or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.8 TOILET PAPER DISPENSERS

TOILET PAPER DISPENSERS ARE PROVIDED BY BLDG. SERVICES FOR INSTALLATION BY THE CONTRACTOR. ARCHITECT IS RESPONSIBLE FOR SELECTING UNITS FROM BELOW THAT MEET PROJECT AND ADA REQUIREMENTS AND COMMUNICATING SELECTIONS TO DM / PM. ARCHITECT IS ALSO RESPONSIBLE FOR PROVIDING INSTALLATION INFORMATION, INCLUDING MOUNTING HEIGHTS AND LOCATIONS. PM ORDERS DURING CONSTRUCTION. THE FOLLOWING ARE STANDARD MODELS FROM KIMBERLY-CLARK:

JUMBO JRT CORED DISPENSER (TYPICAL PREFERRED TYPE, 2 ROLLS SIDE BY SIDE): 09551 -- 1 OF THE 2 ROLLS CAN BE ADA COMPLIANT IF PROPERLY LOCATED

CORELESS JRT (2 ROLLS SIDE BY SIDE - USE ONLY IF STANDARD PAPER IN BUILDING IS CORELESS, NOT TYPICAL): 09608 -- 1 OF THE 2 ROLLS CAN BE ADA COMPLIANT IF PROPERLY LOCATED

STACKED DOUBLE ROLL DISPENSER (NOT RECOMMENDED IN PUBLIC RESTROOMS, ADA COMPLIANT IF PROPERLY LOCATED): 09021

- A. Toilet paper roll dispensers are provided by Owner for installation by Contractor.

2.9 PAPER ROLL TOWEL DISPENSER

PAPER TOWEL DISPENSERS ARE PROVIDED BY BLDG. SERVICES FOR INSTALLATION BY THE CONTRACTOR. ARCHITECT IS RESPONSIBLE FOR SELECTING UNITS FROM BELOW THAT MEET PROJECT AND ADA REQUIREMENTS AND COMMUNICATING SELECTIONS TO DM / PM. ARCHITECT IS ALSO RESPONSIBLE FOR PROVIDING INSTALLATION INFORMATION, INCLUDING MOUNTING HEIGHTS AND LOCATIONS. PM ORDERS DURING CONSTRUCTION. THE FOLLOWING ARE STANDARD MODELS FROM KIMBERLY-CLARK:

ROLL TOWEL DISPENSER (LEVER HANDLE OPERATED, ADA COMPLIANT IF PROPERLY LOCATED): 09736

TOUCH FREE DISPENSER (MECHANICAL UNIT, NOT ADA COMPLIANT): 09990

NOTE 10-1/2" DEPTH AND COORDINATE WITH ADA REQUIREMENTS.

- A. Paper roll towel dispensers are provided by Owner for installation by Contractor.

2.10 ELECTRIC HAND DRYERS

REMOVED DISCONTINUED PRODUCT PREVIOUSLY LISTED. A&E IS REVIEWING POTENTIAL MODELS FOR INCLUSION IN THIS SECTION. CONSIDER ADA COMPLIANCE, NOISE, DRY TIME, AND AIR DISTRIBUTION PATTERN WHEN SELECTING DEVICES. USER EXPERIENCE IN OTHER BUILDINGS HAVE INDICATED THAT DRIERS IN THE 80-90 DBA RANGE ARE TOO LOUD AND SOME AIR DISTRIBUTION PATTERNS CAUSE MAINTENANCE PROBLEMS ON THE ADJACENT WALLS.

NOTE THAT BUILDING SERVICES DOES NOT PROVIDE ELECTRIC HAND DRIERS.

2.11 SHOWER SEAT

- A. Padded, fold-down seat constructed with Type 304 stainless steel framing and with self-locking mechanism. For units on wood stud framing, provide concealed backing at screw points.
 - 1. Product: Bobrick B-517 (right hand) or B-518 (left hand) as indicated; or subject to compliance with requirements, equivalent products of other approved mfrs.

2.12 SHOWER CURTAIN ROD

- A. Extra-heavy-duty; 18-gauge type 302 stainless steel tubing with satin finish; 1-1/4 inch outside diameter; 1/8 inch thick die-cast, single piece flange; length as shown on drawings, or if not shown, 36 inches.
 - 1. Product: Bobrick B-6047; or subject to compliance with requirements, equivalent products of other approved mfrs.

INCLUDE BELOW IF DESIRED BY CLIENT. NOTE THAT THEY ARE NOT MAINTAINED BY PLANT BUILDING SERVICES.

2.13 SANITARY NAPKIN/TAMPON DISPENSERS

- A. General: Type 304 stainless steel construction; minimum 22 gage cabinet and 18 gage door. Return door edges and equip with tumbler lockset. Provide graphic identification indicating "Napkins" and "Tampons" at coin slots; brand name advertising is not allowed. Capacity not less than 30 napkins and 20 tampons.
 - 1. Coin mechanism: 25-cent coin operation, with locked coin box keyed separately. Wrong coins by-pass mechanisms and drop into product tray. Provide graphic showing indicated coin denomination.
 - a. Cost: 25-cents
 - 2. Operation: ADA compliant push button dispensing. All operations shall be mechanical.

BELOW FOR RECESSED UNITS (REQUIRES FULL 4 TO 5-1/2 INCH DEEP CAVITY). UNIT BELOW IS ADA COMPLIANT IF LOCATED PROPERLY.

- 3. Product: Bobrick B-3706 series (recessed or semi-recessed); or, subject to compliance with requirements, equivalent products of other approved mfrs.

BELOW FOR SURFACE MOUNTED UNITS. UNIT BELOW PROTRUDES FROM WALL 8" AND IS NOT ADA COMPLIANT IF LOCATED ALONG A PATH OF TRAVEL.

- 4. Product: Bobrick B-2706 (surface mounted); or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.14 FOLDING PURSE SHELF

- A. Shelf and bracket fabricated of heavy cast Zamak with bright chrome plated finish, for partition mounting.
 - 1. Product: Bobrick B-287; or, subject to compliance with requirements, equivalent products of other approved manufacturers.

2.15 SANITARY NAPKIN/TAMPON DISPOSAL UNITS

COORDINATE WITH OTHER WALL MOUNTED ITEMS, PARTICULARLY IN ACCESSIBLE STALLS / ROOMS.

- A. Type 304 stainless steel construction, with piano-hinged door.
 - BELOW FOR PARTITION MOUNTED UNITS*
 - 1. Product: Bobrick B-354 (double sided, for through-partition mounting); or, subject to compliance with requirements, equivalent products of other approved mfrs.
 - BELOW FOR WALL MOUNTED UNITS. SELECT RECESSED OR SURFACE MOUNTED UNITS AS APPLICABLE. MAINTENANCE PREFERS RECESSED WHENEVER POSSIBLE.*
 - 2. Product: Bobrick B-353 (recessed); or, subject to compliance with requirements, equivalent products of other approved mfrs.
 - 3. Bobrick B-254 (surface mounted); or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.16 STAINLESS STEEL SHELVES

- A. Type 304 stainless steel construction, 18 gauge thickness with polished satin finish. Pan type construction with edges turned down not less than 3/4 inches on all sides; and complete with integrally welded stainless steel brackets at manufacturer's standard spacing.
 - 1. Depth: 6 inches.
 - LENGTHS FROM 16 INCHES TO 96 INCHES AVAILABLE IN 2-INCH INCREMENTS - CONSULT CATALOG.*
 - 2. Length: 24 [SPECIFY OTHER] inches.
 - 3. Product: Bobrick B-296 series; or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.17 JANITORIAL UTILITY SHELVES

- A. Type 304 stainless steel construction, 18 gauge thickness with polished satin finish; 8-inch depth. Pan type construction with edges turned down not less than 1-1/2 inches on all sides, and complete with rag bar, rag hooks, mop hooks, and integrally welded stainless steel brackets.
 - 1. Length: 30 inches; not less than 3 mop holders and 2 rag hooks.
 - 2. Length: 36 inches; not less than 4 mop holders and 3 rag hooks.
 - 3. Length: 48 inches; not less than 6 mop holders and 5 rag hooks.
 - 4. Product: Bobrick B-224 series; or, subject to compliance with requirements, equivalent products of other approved mfrs.

2.18 MIRRORS

A. Provide framed glass mirror units of standard or custom sizes as indicated, and as follows:

1. Frames: Provide glass mirror units with UNS 30302/30304 stainless steel channel frames, 1/2-inch by 1/2-inch, no. 4 finish, and with mitered corners.

BELOW IS TEMPERED GLASS. ANNEALED AND LAMINATED ARE ALSO AVAILABLE. CONSIDER LESS EXPENSIVE ANNEALED GLASS ALTERNATIVE FOR NON-STUDENT, NON-PUBLIC AREAS.

2. Mirror: Provide units with 1/4 inch thick tempered glass, Type I, Class 1, Quality q2, conforming to FS DD-G-451, with silvering, copper coating, and protective organic coating complying with FS DD-M-411.

DELETE BELOW IF NO STAINLESS STEEL MIRRORS. USE WHERE SECURITY OR IMPACT DAMAGE ARE CONSIDERATIONS.

3. Mirror: Bright polished, 22 gage, UNS 51430 stainless steel sheet.

DELETE BELOW IF NO SHELF. SHELF TYPICALLY CONFLICTS WITH FAUCETS WHEN MIRRORS ARE SET AT ADA HEIGHT.

4. Mirror Shelf: Where indicated on drawings, provide 4 inch deep, satin finished stainless steel units, full length of mirror.

B. Product: Provide the following product, or equivalent products of other approved manufacturers:

1. Bobrick B-165 series.

DELETE BELOW IF NO SHELF.

2. Bobrick B-166 series (with shelf.)

VERTICAL WALL MOUNTED BABY CHANGING STATION ALSO AVAILABLE FOR TIGHT SPACES. SEE MANUFACTURER'S CATALOG. HORIZONTAL MODEL PREFERRED.

2.19 DIAPER-CHANGING STATION:

A. Description: Horizontal unit that opens by folding down from stored position and with replaceable child-protection strap.

1. Engineered to support a minimum of 250-lb static load when opened.
2. Comply with ASTM F2285 Standard Consumer Safety Performance Specification for Commercial Use.

B. Mounting: Surface mounted, with unit projecting not more than 4 inches from wall when closed.

C. Operation: By pneumatic shock-absorbing mechanism.

SELECT ONE OF THE FOLLOWING MATERIALS. STAINLESS IS MORE EXPENSIVE BUT MORE DURABLE - CONSIDER IN HIGH USE AREAS.

- D. Material and Finish: Stainless steel, No. 4 finish (satin), with replaceable insulated polystyrene tray liner and rounded plastic corners.
- E. Material and Finish: Blow-molded high-density polyethylene, cream color, with antimicrobial additive, with reinforce full length steel-on-steel hinge and 11 gauge steel mounting plates.
- F. Liner Dispenser: Built in.
- G. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Brocar Products, Inc.
 - 2. Koala Care Products, a division of Bobrick.
 - 3. Synergy Management.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install toilet accessory units in accordance with mfr's instructions, using fasteners appropriate to substrate and recommended by mfr of unit. Install units plumb and level, firmly anchored in locations indicated. Secure mirrors to walls in tamperproof manner with special hangers, toggle bolts, or screws.
- B. Adjust toilet accessories for proper operation and verify that mechanisms function smoothly.
- C. Clean and polish all exposed surfaces after removing protective coatings. Clean exposed surfaces of mirror units in compliance with mfr's recommendations.

CONSIDER INCLUDING THE SCHEDULE BELOW IF HELPFUL.

3.2 SCHEDULE

- A. In each toilet room marked "Men's Toilet" on plans, provide the following toilet accessory units:
 - 1. Grab Bars: Configuration as shown in toilet marked "Handicap".
 - 2. Soap Dispenser: 1 at each sink.
 - 3. Toilet Paper Dispenser: 1 in each toilet stall.
 - 4. Paper Roll Towel Dispenser: 1 within room.
 - 5. Stainless Steel Shelf: 1 within room.
 - 6. Mirror Units: 1 over each sink.

IF DESIRED BY CLIENT, ADD DIAPER CHANGING STATION.

 - 7. Diaper Changing Station: 1 within room.
- B. In each toilet room marked "Women's Toilet" on plans, provide the following toilet accessory units:
 - 1. Grab Bars: Configuration as shown in toilet marked "Handicap".
 - 2. Soap Dispenser: 1 at each sink.
 - 3. Toilet Paper Dispenser: 1 in each toilet stall.
 - 4. Paper Roll Towel Dispenser: 1 within room.
 - 5. Sanitary Napkin/Tampon Dispenser: 1 within room.

6. Folding Purse Shelf: 1 in each toilet stall.
7. Sanitary Napkin Receptacles: As indicated on drawings, but with access to one in each toilet stall.
8. Stainless Steel Shelf: 1 within room.
9. Mirror Units: 1 over each sink.

IF DESIRED BY CLIENT, ADD DIAPER CHANGING STATION.

10. Diaper Changing Station: 1 within room.
- C. In each room marked "Janitor's Closet" on plans, provide the following toilet accessory units:
1. Janitorial utility shelves: 1 unit within room.

NUMBER SECTION DESCRIPTION

DIVISION 10 SPECIALTIES

SECTION 104400 - FIRE PROTECTION SPECIALTIES

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 104400 - FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.1 SUMMARY

- A. Types of fire extinguishers include the following:
 - 1. ABC multipurpose dry chemical.
 - 2. BC carbon dioxide.
 - 3. Water under pressure.
- B. Locations of fire extinguishers are shown on drawings.

1.2 SUBMITTALS

- A. Product Data: Manufacturers literature indicating compliance with requirements, and installation instructions.

1.3 QUALITY ASSURANCE

- A. Provide new UL-listed fire extinguishers bearing UL "Listing Mark" for type, rating, and classification of extinguishers indicated.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
Badger Fire Protection.
Buckeye Fire Equipment Co.
General Fire Extinguisher Corp.
Kidde Co.
Larsen's Manufacturing Co.
Potter-Roemer Inc.

SELECT APPROPRIATE TYPES OF FIRE EXTINGUISHER UNITS. NOTE THAT THERE ARE OTHER TYPES THAN LISTED BELOW.

SELECT BELOW FOR STANDARD LABORATORY AND OTHER TYPICAL APPLICATIONS, INCLUDING ELEVATOR MACHINE ROOMS.

2.2 MULTI-PURPOSE DRY CHEMICAL TYPE

- A. Provide UL-rated 4-A; 60-BC, 10-lb. nominal capacity, in enameled steel container.

SELECT BELOW ONLY AFTER VERIFYING THAT IT MEETS CODE FOR CONTEMPLATED USAGE.

2.3 CARBON DIOXIDE TYPE

- A. Provide UL-rated 10-BC, 10-lb. nominal capacity, enameled metal container.

2.4 MATERIALS

- A. Provide units with metal valve assemblies, discharge levers and carrying handles and with rubber hoses. Plastic is not permitted. Provide metal brackets for wall mounting units where cabinets are not indicated.

INCLUDE THE FOLLOWING WHERE DESIRED - USUALLY NOT IN LABS OR EQUIPMENT ROOMS.

2.5 FIRE EXTINGUISHER CABINETS

- A. Provide fire extinguisher cabinets at locations indicated on drawings.

BELOW IS EXAMPLE ONLY - SEMI-RECESSED AND SURFACE MOUNTED TYPES ARE AVAILABLE. CONSULT CATALOGS FOR MFR AND MODEL DESIRED. FULLY RECESSED REQUIRED 6" STUD DEPTH

1. Type: Fully recessed with trim.
2. Size: To suit type of unit being housed.
3. Door and Frame Finish: Satin stainless steel.
4. Window: Approx. 2 inches by 24 inches, 1/4 inch clear acrylic.
5. Manufacturer/Model: Potter-Roemer Inc.; No. 1704, or equivalent products of Samson Metal Products, Larsen's Mfg Co.
6. Signage: Identify extinguisher cabinets with manufacturer's standard red lettering applied to cabinet door, spelling "FIRE EXTINGUISHER". Letter size, style and location selected by Architect.

DELETE BELOW IF NO BRACKET-MOUNTED EXTINGUISHERS.

2.6 ACCESSORIES FOR BRACKET MOUNTED EXTINGUISHERS

- A. Mounting Brackets: Provide units designed to hold specified extinguishers. Mount brackets with expansion anchors to withstand a 200 pound load applied in any direction.
- B. Signage: Identify bracket-mounted extinguishers with red letter decals with clear backgrounds, spelling "FIRE EXTINGUISHER" applied to wall surface. Letter size, style and location selected by Architect and indicating "FIRE EXTINGUISHER".

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install in accordance with manufacturer's directions for type of mounting required at height and locations indicated, or if not indicated, to comply with applicable regulations of governing authorities.
 - 1. Coordinate installation of fire extinguisher cabinets with wall system installers.

SECTION 105113 - METAL LOCKERS

END OF CONTENTS TABLE

DIVISION 10 SPECIALTIES
SECTION 105113 - METAL LOCKERS

UPDATED 4-22-04 TO REMOVE LYON FROM MFRS. LIST DUE TO POOR PERFORMANCE

PART 1 - GENERAL

1.1 SUMMARY

- A. Work of this Section: Extent of steel lockers as shown on drawings.

1.2 SUBMITTALS

- A. Shop Drawings: Indicate overall dimensions for installation, details for installation, trim and vertical sections.
- B. Samples for Initial Selection: Provide manufacturer's standard card containing samples of paint in full range of standard colors. Photographic reproductions of colors are not acceptable.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products of one of the following:
 - Interior Steel Products Co.
 - List Industries Inc.
 - Penco
 - Republic Storage System Co.

BELOW DESCRIBES ONE TYPE OF LOCKER UNIT. EDIT WITH MANUFACTURER'S CATALOGS FOR SIZES, MATERIALS AND CONFIGURATIONS TO SUIT PROJECT.

2.2 METAL LOCKER UNITS

- A. Single tier lockers with expanded metal mesh (or punched steel) doors, sides and tops, and solid backs. Provide units within 1 inch of following dimensions, subject to manufacturer's standards:
- B. Size: 18 inches wide by 72 inches high by 18 inches deep.

2.3 ACCESSORIES

- A. Hat Shelf: Mfr's standard shelf 12 inches down from top of unit.
- B. Latch: Chrome plated or stainless steel door latch to accept standard padlock.
- C. Clothes Hook: Both sides of interior.
- D. Metal Base: 4 inches high.

2.4 MATERIALS

A. Fabricate parts of mild, cold-rolled, furniture grade steel, minimum gages as follows:

- 1. Door Frames: 16 ga.

SELECT DOOR TYPE BELOW.

- 2. Doors: 14 ga. expanded metal mesh.
- 3. Doors: 14 ga. perforated metal.

DELETE SIDE/END AND BACK TYPES BELOW IF SOLID PANEL TYPE LOCKERS SELECTED.

- 4. Sides and Ends: 16 ga. expanded metal mesh.
- 5. Backs: 18 ga.

DELETE BELOW IF EXP. MESH TYPE LOCKERS SELECTED.

- 6. Body: 24 ga. min.
- 7. Row Ends: 16 ga. min.

BELOW FOR BOTH EXP. MESH AND PANEL TYPES.

- 8. Tops and Bottoms and Shelves: 16 ga. steel.

2.5 FABRICATION

A. Fabricate units with mfr's standard diamond pattern expanded metal mesh, or square punched steel panels. Fabricate units with mfr's standard methods; both knock-down and welded construction are permitted. Provide lockers as separate, independent units, [except adjoining locker units are permitted to share common partition (s).

- 1. Deliver knock-down type units to site fully assembled and ready for installation in field.
- 2. Provide mfr's standard hold-down clips, fasteners, and accessories required to secure units to base and wall.
- 3. Where necessary, provide finished end covers at row ends exposed to view in finished construction. Units that are perforated to receive standard accessories are not acceptable; knock-out plugs are not acceptable.
- 4. Finish: Mfr's standard baked enamel finish over prime coat.
 - a. Colors: Selected by Architect from mfr's standard color range.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Assemble and install units in strict accordance with mfr's recommendation and published installation literature. Fasten units to floor and wall with recommended attachment methods.

DIVISION 11 EQUIPMENT

SECTION 115213 - PROJECTION SCREENS

END OF CONTENTS TABLE

DIVISION 11 EQUIPMENT
SECTION 115213 - PROJECTION SCREENS

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of projection screens is shown on drawings.
- B. Type of projection screen required:

SELECT ONE OF THE FOLLOWING]

- 1. Front projection screen, electrically operated, surface mounted unit.
- 2. Front projection screen, manually operated.

1.2 RELATED SECTIONS

OMIT BELOW IF NO WOOD BACKING REQUIRED. MANUFACTURERS GENERALLY PROVIDE A BRACKET THAT POSITIONS THE SCREEN AWAY FROM THE WALL TO AVOID CONFLICT WITH CHALK TROUGH OF CHALKBOARDS.

- A. Wood backing is included in Division 06 Section "Rough Carpentry".

DELETE BELOW IF NO ELECTRICALLY OPERATED UNITS.

- B. Electrical wiring, connections, and installation of remote control switches for electrically operated projection screens are specified in Division 26 sections.

1.3 SUBMITTALS

- A. Product Data: Submit copies of Manufacturer's specifications and installation instructions for projection screen unit.

DELETE BELOW IF NO ELECTRICALLY OPERATED UNITS.

- B. Wiring Diagrams: Submit manufacturer's wiring diagram for electrically operated units.

1.4 QUALITY ASSURANCE

- A. Quality Assurance: Obtain projection screen from a single manufacturer as a complete unit, including mounting hardware and accessories.

- B. Fire Performance Characteristics: Provide projection screen fabrics identical to those materials which have undergone testing and passed requirements for flame resistance of one of the following:

- 1. NFPA 701 per small scale test.
- 2. Federal Standard 191A/5903 for test method. FS GG-S-00172D(1) for flame resistance.

PART 2 - PRODUCTS

DELETE BELOW UP TO "MANUALLY OPERATED FRONT PROJECTION SCREENS" IF NO ELECTRICALLY OPERATED UNITS

2.1 FRONT PROJECTION, ELECTRICALLY OPERATED SCREENS

- A. General: Provide mfr's standard UL-listed and -marked units consisting of case, screen motor, controls, mounting accessories and other components as required for a complete installation and complying with requirements indicated.
- B. Viewing Surface of Screen: Comply with the following requirements for type of viewing surface:
 - 1. Matte white viewing surface with minimum gain characteristics complying with FS GG-S-00172D(1) for Type A screen surface; without black masking borders.
 - a. Edge Treatment: Without black masking borders.
 - b. Edge Treatment: With black masking borders.

RETAIN EITHER ABOVE OR BELOW

- 2. Glass beaded viewing surface with minimum gain characteristics complying with FS GG-S-00172D(1) for Type C screen surface.
 - a. Edge Treatment: Without black masking borders.
 - b. Edge Treatment: With black masking borders.
- C. Screen Controls: Remotely control operation of each screen as follows:

MODIFY BELOW FOR MULTI-STATION UNITS

- 1. Single station Control: Three-position, UL-listed control switch for each screen with metal device box and cover plate for flush mounting and for connection to 120VAC electric power supply.

OTHER POSSIBILITIES FOR BELOW INCLUDE ROLLER-MOUNTED MOTORS (NOT USUALLY SELECTED FOR UNIVERSITY WORK) AND AUTOMATIC CEILING CLOSURES

- D. End-Mounted-Motor-Operated Screens Without Ceiling Closure: Units designed and fabricated for recessed, surface, or suspended installation, with bottom of case entirely or partially open under screen compartment, as standard with manufacturer, under screen compartment to allow raising and lowering of screen, closed with access door under motor compartment; and complying with the following requirements:
 - 1. Screen Case: Wood sides and top, with metal-lined motor compartment, factory primed and constructed as follows:
 - a. Provide single or double top as standard with manufacturer.

2. Motor: Instant reversing, gear drive motor of size and capacity recommended by screen manufacturer, with permanently lubricated ball bearings, automatic thermal overload protection, preset limit switches to automatically stop screen in "up" and "down" position, and positive stop action to prevent coating: mounted in motor compartment on right end of screen, unless otherwise indicated, and remotely controlled as indicated.
3. Screen: Mildew- and flame-resistant glass fiber fabric with vinyl-coated viewing surface complying with requirements indicated, with top edge mounted on, and securely fastened to, rigid metal roller supported by self-aligning bearings in brackets.

INCLUDE DIMENSIONS BELOW IF NOT SHOWN ON DRAWING

- a. Size of Viewing Surface: As indicated.

MODIFY BELOW TO SUIT APPLICATION

- E. Acceptable Manufacturers: Subject to compliance with requirements, provide products of one of the following:

"Series 800"; Bretford/Knox Mfg. Co.
 "Series 900"; Bretford/Knox Mfg. Co.
 "Senior Electrol"; Da-Lite Screen Co.
 "Rollermatic"; Draper Shade & Screen Co.

DELETE BELOW IF NO MANUALLY OPERATED UNITS

2.2 MANUALLY-OPERATED FRONT PROJECTION SCREENS

- A. General: Provide manufacturer's standard units consisting of case, screen, mounting accessories and other components as required for a complete installation and complying with descriptive requirements indicated below:
- B. Spring-Roller-Operated Projection Screens: Units designed and fabricated for wall or ceiling installation and complying with the following requirements:
 1. Screen Case: Fabricated in one piece from not less than 22 gage steel with flat back design, vinyl-covered or baked-enamel finish, and end caps with integral roller brackets and furnished with universal mounting brackets in finish matching end caps to enable attachment to wall or ceiling.
 2. Screen: Mildew- and flame-resistant glass fiber fabric with vinyl coated viewing surface complying with requirements indicated below, with top edge mounted on, and securely anchored to, a 3 inch diameter rigid steel spring roller and bottom edge formed into a pocket holding a tubular metal slat, with ends of rod protected by plastic caps containing a screw-attachment saddle and pull.

INCLUDE DIMENSIONS BELOW IF NOT SHOWN ON DRAWING

3. Size of Viewing Surface: As indicated.
4. Type of Viewing Surface: Matte white with minimum gain characteristics complying with FS GG-S-00172D(1) for Type A screen surface; without black masking borders.

- a. Edge Treatment: Without black masking borders.
- b. Edge Treatment: With black masking borders.

DELETE ABOVE OR BELOW TO SUIT PROJECT

- 5. Type of Viewing Surface: Glass beaded viewing surface with minimum gain characteristics complying with FS GG-S-00172D(1) for Type C screen surface.
 - a. Edge Treatment: Without black masking borders.
 - b. Edge Treatment: With black masking borders.
- 6. Products: Subject to compliance with requirements, select one of the following:
 - a. "Series 500 Auditorium"; Bretford/Knox Manufacturing Co.
 - b. "Model C"; Da-Lite Screen co., Inc.
 - c. "Luma 2"; Draper Shade and Screen Co.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install projection screen units and accessories at locations shown in accordance with Manufacturer's instructions. Install level, plumb, secure, and at proper height. Cooperate with other trades for securing projection screen units to finished surfaces. Repair or replace damaged units as directed.

3.2 CLEANING, ADJUSTMENT AND PROTECTION

DELETE PARAGRAPH BELOW IF NO ELECTRICALLY OPERATED UNITS

- A. Adjust electrically operated projection screens for proper operation. Adjust screen speed to comply with manufacturer's recommendations. Adjust screen extension for maximum exposure in unrolled condition.
- B. Protect installed units so that they will be in satisfactory operating condition, without damage, at completion of project.

SPECIFICATION DIVISION 11

NUMBER SECTION DESCRIPTION

DIVISION 11 EQUIPMENT

SECTION 115300 - LABORATORY EQUIPMENT

END OF CONTENTS TABLE

DIVISION 11 EQUIPMENT
SECTION 115300 - LABORATORY EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

USE THIS SECTION TO SPECIFY EQUIPMENT RELATED TO LABORATORIES

- A. Extent of laboratory equipment is indicated on drawings and in schedules.
- B. Type of laboratory equipment includes:
 - 1. Undercounter dishwashers.
 - 2. Undercounter freezers.
 - 3. Undercounter refrigerators.
 - 4. Undercounter icemakers.

1.2 SUBMITTALS

- A. Product Literature: Submit manufacturer's product literature indicating compliance with requirements for each specific type of laboratory equipment.
 - 1. Submit manufacturer's printed installation instructions, maintenance manual and warranty certificate.

1.3 QUALITY ASSURANCE

- A. Provide only UL listed and labeled equipment and components.
- B. Provide the following equipment with NSF (National Sanitation Foundation) approval:

EDIT THE FOLLOWING TO SUIT PROJECT. USUALLY REQUIRE NSF SEAL FOR DISHWASHER, ICEMAKER, AND REFRIGERATORS

- 1. Dishwasher.
- 2. Ice maker.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Coordinate delivery with supplier of laboratory casework specified in Division 12 Section "Laboratory Casework". Time equipment delivery to prevent delay in laboratory casework installation.

PART 2 - PRODUCTS

2.1 UNDERCOUNTER DISHWASHERS

- A. Glassware Washer: Provide front loading glassware washer for undercounter installation, with not less than 4 independent wash/dry cycles, automatic safety switch to interrupt operation when door is open, low water cut-off device, and as follows:

1. Exterior Dimensions: 24-inches wide by 34-3/4-inches high by 25-1/2-inches deep.
 2. Interior Dimensions: 22-inches wide by 24-inches high by 21-inches deep.
 3. Cabinet Construction: AISI Type 308 18-8 stainless steel interior and exterior.
 4. Controls: Solid state electronic timers and push button controls for individual programming and automatic operation of cycles. Wash water temperature selectable to 99 deg. C. and displayed by manufacturer's standard LED indicator or gage.
 5. Available Power: 110V, 20A, 1 phase.
- B. Accessories: Provide units with roll-out baskets sized and arranged to accommodate both beakers, test tubes and other small items, and larger items with minimum 10-inch clearance height.
- C. Manufacturer/Model: Hotpack Corp.; Model UC2B, or equivalent products of Labconco, or Forma Scientific.

2.2 UNDERCOUNTER FREEZER

NOT PREPARED

2.3 UNDERCOUNTER FREEZER (EXPLOSION PROOF)

NOT PREPARED

2.4 UNDERCOUNTER REFRIGERATOR

NOT PREPARED

2.5 UNDERCOUNTER REFRIGERATOR (EXPLOSION PROOF)

NOT PREPARED

2.6 UNDERCOUNTER FLAKE ICE MAKER

THE FOLLOWING UNIT HAS THE ADVANTAGE OF BEING AN UNDERCOUNTER TYPE UNIT - NO CURRENTLY KNOWN EQUIVALENTS EXIST

- A. Undercounter Icemaker: Provide ice maker unit for undercounter installation complete with built-in 40-lb. capacity storage bin.
1. Exterior Dimensions: 24-inches wide by 24-inches deep by 34-inches high.
 2. Cabinet Construction: Provide units with face panels constructed of manufacturer's standard grade of satin finish stainless steel. Coat concealed portions of units with thermosetting epoxy.
- B. Accessories: Include four, 6-inch adjustable legs.
- C. Manufacturer/Model: Crystal Tips Ice Systems, model as follows:

SELECT ONE OF THE FOLLOWING. IN GENERAL PROVIDE UNITS WITH AIR COOLED CONDENSER AND 115 V. POWER REQUIREMENT - COORDINATE WITH MECHANICAL AND ELECTRICAL

1. 350-FAV-161 (air cooled condenser).
 - a. Power requirement: 115 V., 8.8 A., 1 P.
2. 350-FAV-251 (air cooled condenser).
 - a. Power Requirement: 220 V., 5.3 A., 1 P.
3. 350-FWVS-251 (water cooled condenser).
 - a. Power Requirement: 220V., 4.4 A., 1 P.

PART 3 - EXECUTION

3.1 INSTALLATION

INCLUDE PARAGRAPH BELOW WHERE APPLICABLE

- A. Coordinate installation activities with installer of laboratory casework specified in Division 12 Section "Laboratory Casework".
- B. Install units in accordance with manufacturer's recommendations and printed instructions.

3.2 TESTING AND ADJUSTMENT

- A. Test installed equipment for proper operation. Demonstrate operation and features to Owner's Representative and Owner's personnel.
- B. Repair malfunctioning equipment to comply with manufacturer's specifications.

3.3 CLEANING AND PROTECTION

- A. Protect installed units from dirt, dust, and damage caused by subsequent construction operations.
- B. Clean units within 7 calendar days prior to Owner's inspection for Substantial Completion.

DIVISION 11 EQUIPMENT

SECTION 115313 - LABORATORY FUME HOODS

END OF CONTENTS TABLE

SUBSTANTIAL REVISIONS INCORPORATED INTO THIS SECTION - MAY 9, 2011, BY LAB SUSTAINABILITY TEAM AND A&E ARCHITECTURAL DEPARTMENT.

REVISED NOV. 8, 2013 TO REFLECT NEW ANSI Z9.5 2012 VERSION AND TO SPECIFY THE MINIMUM HOOD AIR FLOW RATE TO BE 375 ACH. D. KARLE, PER LAB SUSTAINABILITY TEAM.

DIVISION 11 EQUIPMENT
SECTION 115313 - LABORATORY FUME HOODS

CONSULT WITH MECHANICAL ENGINEER TO DETERMINE APPROPRIATE TYPE OF FUME HOOD AND VENTILATION REQUIREMENTS. SECTION 115313 "LABORATORY FUME HOODS" AND SECTION 230920 LABORATORY TERMINAL AIRFLOW UNITS AND CONTROLS MUST BE COORDINATED WITH EACH OTHER. SEE U-M DESIGN GUIDELINE 230920 FOR ADDITIONAL INFORMATION REGARDING HOODS AND LAB DESIGN. INVOLVE OSEH EARLY IN THE PLANNING OF PROJECTS WHICH WILL UTILIZE FUME HOODS.

THIS SPECIFICATION COVERS BENCH TOP STYLE HOODS. FLOOR MOUNTED (SOMETIMES REFERRED TO AS "WALK-IN" HOODS) REQUIRE SPECIAL CONSIDERATIONS AND ARE NOT SPECIFIED BELOW. SEE THE U-M LAB VENTILATION DESIGN GUIDELINE FOR REQUIREMENTS FOR FLOOR MOUNTED WALK IN HOODS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:
 - 1. Division 01 Sections "Project Commissioning for Small Projects" and "Full Project Commissioning".
 - 2. Division 12 Section: "Laboratory Casework".
 - 3. Division 22 Section: Basic Piping Materials and Methods
 - 4. Division 22 Section: Mechanical Identification
 - 5. Division 23 Section: Laboratory Terminal Airflow Units and Controls
 - 6. Division 23 Section: Laboratory Airflow Controls-DDC
 - 7. Division 26 Section: Electrical

1.2 SUMMARY

- A. Section Includes

ADD FULL BYPASS CONSTANT VOLUME TYPE IF INCLUDED ON YOUR PROJECT. FULL BYPASS CONSTANT VOLUME HOODS ARE NOT TYPICALLY USED AT U-M AND ARE THUS NOT SPECIFIED IN THIS SPECIFICATION (ALTHOUGH THEY ARE DEFINED IN THE "DEFINITIONS" SECTION, FURTHER BELOW).

- 1. Chemical Fume Hoods of the following types:
 - a. Partial Bypass Constant Volume
 - b. Restricted Bypass Variable Volume
 - c. Reduced Face Velocity (RFV)
- 2. Fume Hood Understructures (base units, flammable and acid storage cabinets)
- 3. Fume Hood Plumbing Accessories
- 4. Fume Hood Electrical Accessories

1.3 SUBMITTALS

- A. Samples: Submit samples of exterior finish colors and interior liner material for Architect's initial selection.
- B. Shop Drawings: Submit shop drawings for fume hoods showing plans, elevations, ends, cross-sections, service run spaces, location and type of service fixtures; details and location of anchorages and fitting to floors, walls, and base; layout of units with relation to surrounding walls, doors, windows, and other building components; connection to hood exhaust system; location of access doors.
 - 1. Coordinate shop drawings with other work involved.
 - 2. Provide roughing-in drawings for mechanical and electrical services, including location of cut-off valves and junction boxes, where pre-plumbed or pre-wired units are required.
 - 3. Quantify net free area of fume hood opening with Sash Height in fully open position and at sash stop height.
 - 4. Provide static pressure drop at 100 fpm face velocity with fume hood sash in full open position.
- C. Certification of Performance As Manufactured: Provide for each hood type and size indicating hood meets or exceeds the ASHRAE 110 As Manufactured (AM) requirements specified in Part 2.
- D. Certification of Performance, Field: Provide certification of performance signed by Installer, verifying that each unit has been field tested in accordance with the provisions of Part 3 "Field Quality Control" article, and is operating in compliance with specified requirements.
- E. Shipping, handling, and storage instructions.
- F. Installation and start-up instructions.
- G. Project specific maintenance and operating data, and recommended spare parts list.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

USUALLY RETAIN BELOW - DELETE/REVISE ONLY IF FUME HOOD BASE CABINETS DO NOT NEED TO MATCH ADJACENT LAB BENCH BASE CABINETS, OR FOR OTHER CIRCUMSTANCES.

- B. Laboratory fume hoods, casework, tops, sinks, service fixtures, and related furniture shall be provided by the same distributor who shall be fully responsible for coordinating all such components. All fume hoods shall be supplied from the same hood manufacturer.
 - 1. For projects using both RFV and standard fume hoods, fume hoods from a maximum of two manufacturers may be provided.
- C. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise:

1. Comply with provisions of Michigan Building Code .
2. Scientific Equipment and Furniture Association, SEFA 1 Laboratory Fume Hoods.
3. Scientific Equipment and Furniture Association, SEFA 8 Laboratory Furniture, Casework, Shelving and Tables.
4. Scientific Equipment and Furniture Association, SEFA 2.3 Installation of Scientific Laboratory Furniture and Equipment.
5. Underwriters Laboratories, UL 1805 Laboratory Hoods and Cabinets.
6. American Society of Heating, Refrigeration and Air-conditioning Engineers, ANSI/ASHRAE 110-1995 Method of Testing Performance of Laboratory Fume Hoods.
7. ANSI/AIHA Z9.5-2012 Laboratory Ventilation.
8. National Fire Protection Association NFPA 45 Flammable and Combustible Liquids Code 2004.

1.5 DEFINITIONS

A. Hood- Full Bypass Constant Volume Type

1. With the sash at sash stop height, the air flowing through the bypass and the air flowing through the Working Area are essentially equal in volume (the free area of the bypass and the free area of the Working Area are essentially the same).
2. With the sash at any other position, including fully opened or fully closed, the total air volume (bypass + Working Area) entering the hood remains essentially unchanged. The face velocity through the Working Area remains constant, regardless of sash position.

B. Hood-Partial Bypass Constant Volume Hood

1. With the sash at sash stop height, the air flowing through the bypass is essentially zero.
2. With the sash at any position between sash stop height and fully closed, the bypass opens in proportion to the sash closing, such that the face velocity through the Working Area remains essentially constant.
3. With the sash at any position between sash stop height and fully open, the air volume exiting the hood remains unchanged, therefore as the sash is opened the face velocity through the Working Area decreases proportionally with the sash position. When the sash is fully open, the face velocity through the Working Area is approximately half what it was when the sash was at sash stop height (assuming a typical maximum Sash Height of approximately 28").

C. Hood- Restricted Bypass Variable Volume Hood

1. Regardless of sash position, the face velocity through the Working Area remains constant. The air flowing through the bypass is only enough such that the hood maintains the minimum air change rate when the sash is fully closed. Thus "restricted bypass" means there is nearly zero bypass.

- D. **Sash Height:** The distance from the bottom of the sash to the working surface of the hood. Not from the bottom of the sash to the top of the airfoil vane(unless the top of the air foil vane and the top of the working surface are at the same height).
- E. **Working Area:** The area bounded by the Sash Height and the net width of the hood opening.

1.6 DELIVERY, STORAGE, AND HANDLING

ADD BELOW IF LABORATORY CASEWORK SECTION INCLUDED

- A. Coordinate delivery of fume hood with delivery of other laboratory casework components.
- B. Protect finished surfaces from soiling and damage during handling and installation. Keep covered with polyethylene film or other protective covering.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 1 year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Chemical fume hoods, all types except Reduced Face Velocity type:
 - 1. Air Master; Air mmaster Systems Corp.
 - 2. BMC

BELOW MFR. FORMERLY NAMED FISHER HAMILTON

- 3. Hamilton Scientific
 - 4. Kewaunee Scientific Corp.
 - 5. Mott Manufacturing, Ltd.
 - 6. Labconco Corp.
 - 7. Lab Crafters, Inc
- B. Reduced Face Velocity type chemical fume hoods (bench top models only):
 - 1. Lab Crafters Air Sentry
 - 2. Labconco Protector Xstream
 - 3. Kewaunee Supreme Air LV

2.2 FUME HOODS, GENERAL

- A. Provide UL 1805 labeled fume hoods that provide proper exhaust volume and operate in a safe, efficient manner, within the tolerances for face velocities specified. Dead air pockets and reverse air currents shall not occur along the surface of hood interiors.
- B. Static Pressure Drop: Maximum of 0.35" (WG) at 100 FPM face velocity with fume hood sash in full open position.

THE MINIMUM 375 AIR CHANGE RATE PER HOUR SPECIFIED BELOW MAY NOT BE ADEQUATE TO PREVENT A HAZARD IF FLAMMABLE LIQUIDS, VAPORS, OR GASES WILL EXIST ALONG WITH AN IGNITION SOURCE, OR BECAUSE OF OTHER CONCERNS OUTLINED IN Z9.5. WHEN IN DOUBT EVALUATE THE HAZARD WITH U-M OSEH, AND ADJUST ACCORDINGLY.

- C. Hood minimum air flow rate (any sash position): Sufficient to prevent hazardous concentrations of contaminants within the hood and in compliance with ANSI Z9.5-2012, no less than 375 hood air changes per hour.
- D. Splay or radius the top and sides of the face opening with configuration proven to provide an aerodynamic section to ensure smooth, even flow of air into hood.
- E. Provide air foil vane at work surface. Air foil vane shall not be mounted more than 3" above the hood working surface. Air foil vane shall prevent backflow of air and shall direct positive flow of air across work surface.
- F. Control System Components: Coordinate with Related Section "Laboratory Terminal Airflow Units and Controls" and "Laboratory Airflow Controls-DDC". Provide cutout in side of sash opening for the fume hood monitor to allow it to be flush or surface mounted, as required for the project. Also make provisions to allow mounting of sash sensors, sash alarm, and other devices provided by Related Section.

ALWAYS INCLUDE THE REQUIRED HOOD PERFORMANCE CRITERIA. THE PERFORMANCE CRITERIA BELOW IS TYPICALLY ADEQUATE FOR U-M LABS. HOODS INVOLVING HIGHLY TOXIC CHEMICALS, HIGH PRODUCTION VOLUMES, HIGH-HAZARD RADIOACTIVE MATERIALS, OR OTHER UNIQUE CIRCUMSTANCES MAY REQUIRE MORE STRINGENT CRITERIA. U-M OSEH SHOULD BE CONSULTED IN SUCH CASES.

FIELD "AS INSTALLED" (AI) TESTING MAY BE APPROPRIATE IN SOME CASES. IF REQUIRED, REVISE BELOW IF NECESSARY AND CORRESPONDING PART 3 PARAGRAPH.

2.3 HOOD PERFORMANCE CRITERIA

- A. Chemical fume hoods shall meet or exceed the following ASHRAE 110 As Manufactured (AM) performance criteria. Performance criteria shall be met with the sash raised to the height of the sash stop (unless noted otherwise), and at any face velocity within +/- 10 FPM of the average face velocity indicated.
 - 1. All Hood Types shall pass the Local Flow Visualization and Large Volume Visualization challenges.
 - 2. Chemical fume hoods except Reduced Face Velocity (RFV) type shall be tested at 100 FPM average face velocity. Tracer gas concentrations, including Sash Movement Effect, shall not exceed 0.01 PPM at 4 LPM tracer gas release rate (4AM0.01 and 4SME-AM0.01). VAV Hoods shall also achieve this performance at the full open sash position.

3. Chemical fume hoods RFV type shall be tested at 60 FPM average face velocity. Tracer gas concentrations, including Sash Movement Effect, shall not exceed 0.01 PPM at 6 LPM tracer gas release rate (6AM0.01 and 6SME-AM0.01). The vertical position of the detector port shall be located 12" above the hood working surface during testing. All other detector positions (horizontal positions, distance from sash) shall match ASHRAE 110 requirements.
- B. The above performance criteria shall also be met when field ASHRAE 110 testing is specified.

SELECT ONE OR MORE OF THE FOLLOWING STANDARD HOOD TYPES, OR REVISE TO SUIT PROJECT. IF YOU HAVE A VARIETY OF LINING OR TOP TYPES IN YOUR PROJECT, BE SURE TO CAREFULLY INDICATE ON DRAWINGS WHAT MATERIALS BELONG IN WHICH HOODS

ALWAYS CONSULT WITH THE MECHANICAL ENGINEER AND U-M OSEH REGARDING THE APPROPRIATE HOOD TYPE TO SPECIFY. CLEARLY DELINEATE THE HOOD TYPES REQUIRED FOR THE PROJECT EITHER IN THIS SPECIFICATION OR ON THE DRAWINGS (PREFERRED).

CONSTANT VOLUME HOODS OF ANY TYPE ARE NOT SAFE WITH COMBINATION SASH ARRANGEMENTS BECAUSE CORRECT FACE VELOCITY CAN'T BE ASSURED AS THE HORIZONTAL SASH IS ADJUSTED. IF COMBINATION SASHES ARE REQUIRED, SPECIFY RESTRICTED BYPASS VAV HOODS, AND ASSURE THE MECHANICAL ENGINEER SPECIFIES A CORRESPONDING VAV TYPE LAB TERMINAL AIR FLOW UNIT.

FULL BYPASS CONSTANT VOLUME HOODS ARE NOT SPECIFIED BELOW AS THEY ARE NOT TYPICALLY USED AT U-M. IF YOUR PROJECT REQUIRES A HOOD OF THIS TYPE, ADD BELOW.

2.4 PARTIAL BY-PASS CONSTANT VOLUME CHEMICAL FUME HOOD

- A. Equip units with compensating by-pass above the sash which functions automatically as the vertical sash is operated, to provide air flow control as described in the Definitions article.
1. Provide vertical rising sashes only.

DEPENDING ON ROOM MINIMUM AIR CHANGE RATES, VAV HOODS MAY SAVE ENERGY. THEY SHOULD NOT BE INDISCRIMINATELY SPECIFIED UNLESS THE MECHANICAL ENGINEER HAS DONE AN ANALYSIS DETERMINING ENERGY SAVINGS WILL ACTUALLY OCCUR. AN EXCEPTION IS COMBINATION SASHES; IF THESE ARE REQUIRED, ALWAYS SPECIFY A VAV HOOD AND ASSURE THE MECHANICAL ENGINEER SPECIFIES A CORRESPONDING VAV TYPE LAB TERMINAL AIR FLOW UNIT.

IF YOUR PROJECT REQUIRES VAV HOODS, EDIT BELOW OR INDICATE ON A DRAWING SCHEDULE (PREFERRED) WHICH TYPE SASH IS REQUIRED: VERTICAL RISING OR COMBINATION.

2.5 RESTRICTED BYPASS, VARIABLE AIR VOLUME (VAV) CHEMICAL FUME HOOD

- A. Provide hoods specifically designed for VAV application which provide air flow control as described in the Definitions article.
 - 1. Provide vertical rising or combination sashes, as indicated.

RFV HOODS ARE RESTRICTED TO ONLY THE MODEL AND MFR. LISTED UNDER THE ARTICLE "APPROVED MANUFACTURERS". BY U-M OSEH RULING, RFV HOODS:

ARE LIMITED TO 6' MAXIMUM WIDTH.

ARE TO BE BALANCED TO PROVIDE 70 +/- 5 FPM AVERAGE FACE VELOCITY AND SHALL ALARM AT 60 FPM FACE VELOCITY. THIS AIR BALANCE INFORMATION MUST APPEAR IN THE MECHANICAL DOCUMENTS-COORDINATE WITH MECHANICAL ENGINEER.

IF YOUR PROJECT REQUIRES RFV HOODS, EDIT BELOW OR INDICATE ON A DRAWING SCHEDULE (PREFERRED):

WHICH TYPE SASH IS REQUIRED: VERTICAL RISING OR COMBINATION.

IF THE RFV HOODS ARE PARTIAL BYPASS CONSTANT VOLUME OR VAV TYPE.

2.6 REDUCED FACE VELOCITY CHEMICAL FUME HOOD

- A. Provide bench top type hoods specifically designed for reduced face velocity (RFV) operation of model and manufacturer listed under Acceptable Manufacturers, and which provide air flow control as described in the Definitions article.
 - 1. RFV hoods shall be partial bypass constant volume or VAV type, as indicated.
 - a. Provide vertical rising sash on constant volume type.
 - b. Provide vertical rising or combination sashes, as indicated, on VAV type.
 - 2. Maximum over-all hood depth: 36".

2.7 HOOD SUPERSTRUCTURE CONSTRUCTION

USUALLY RETAIN ALL FOLLOWING REQUIREMENTS

- A. General: Design hoods to be chemical and flame resistant, for collection, retention and disposal of hazardous fumes with complete safety, minimum expenditure of purging air from room supply, and minimum turbulence within chamber.
- B. Framework: Heavy-gage steel members, reinforced, braced and assembled to insure strength and rigidity.

- C. Body Construction: Superstructure shall have double wall construction. Exterior shall be of minimum 18 gage cold-rolled steel with component parts screwed together to allow removal of end panels, front end fascia pieces, top fascia and air foil strips, and to allow access to plumbing lines and service fixtures. Apply manufacturer's standard acid and alkali resistant baked-on or powder-coated finish to interior and exterior surface of component parts prior to final assembly.

SELECT COLOR

1. Color: Selected by Architect from manufacturer's standard range.
- D. Ends: Double-wall end panels (enclosing sash counter-balance weights and all utilities) without projecting corner posts or other obstructions to interfere with smooth, even flow of air.
- E. Rear Baffle: Provide non-adjustable baffle at rear of hood with openings located to purge the upper and lower area of the hood. Baffle is to be fabricated of the same material as the hood liner.

USUALLY SELECT ABOVE AND DELETE BELOW FOR TEACHING LABS (WHERE USERS ARE LESS LIKELY TO BE KNOWLEDGEABLE ABOUT FUME HOODS AND TO HAVE NEED FOR THE FLEXIBILITY OF ADJUSTABLE BAFFLES). FOR RESEARCH LABS AND LABS USED FOR CHEMICAL DISPENSING, SELECT BELOW AND DELETE ABOVE IN CONSULTATION WITH MECHANICAL ENGINEER AND OSEH.

- F. Rear Baffle: Provide baffle at rear of hood with manually adjustable openings at top and bottom to allow adjusted flow of air through hood to compensate for type of gas, apparatus, or heat source used. Fabricate unit to be easily removable for cleaning behind baffle, and of same material as hood lining.
- G. Plenum Chamber: Adequate volume for hood dimensions, extending full width of hoods to equalize incoming air flow, of same material as hood lining. Provide corrosion resistant duct stub of proper dimension for connection to exhaust duct assembly.
- H. By-Pass Grilles: When air is required to be taken from room other than through hood sash opening, provide suitable by-pass grilles having required free opening but concealing plenum behind.
- I. Sash: Provide an operable sash fabricated with minimum 18 gage steel four-sided frame with corners welded and ground smooth. Glaze with laminated safety glass set into chemical resistant rubber glazing channels, held in place with removable stops. Sash lifting system (cable or chain) shall hold sash at any position without creep and prevent sash drop in the event of a cable failure. Sash and counter balance mechanism design shall be life cycle tested to withstand a minimum of 100,000 full travel cycles without signs of fatigue.

14" IS THE STANDARD SASH HEIGHT AT U-M AND RARELY IF EVER SHOULD BE CHANGED. SEE U-M DESIGN GUIDELINE 230920 FOR ADDITIONAL INFORMATION. THE DESCRIPTION BELOW FOR SASH STOP LOCATION WHEN VANES ARE LOCATED MORE THAN 2" ABOVE THE HOOD WORKING SURFACE IS NECESSARY TO ACCOMMODATE CERTAIN HOOD MFR.S.

1. Sash Stops: Install integral sash stops on fume hoods 14 inches above the hood working surface. For hoods with air foil vanes located more than 2" above the hood working surface, locate sash stop 12" above top of vane.
 - a. Example- The vane is located 3" above the working surface: sash stop to be 12" above vane, 15" above working surface.
 - b. The stops shall be of the type that can be temporarily bypassed to allow the sash to be raised to the full open position for equipment/experiment set-up and removal.
2. Vertical Rising Sash: Provide sliding single-hung, full-view sash.

SELECT ABOVE OR BELOW OR BOTH IF BOTH TYPES OF SASH ARE REQUIRED. IF BOTH, INDICATE THE SASH TYPE REQUIRED AT EACH SPECIFIC HOOD LOCATION. CAREFULLY REVIEW ADDITIONAL SPEC EDITORS NOTES AT ARTICLES 2.3, 2.4 AND 2.5 BEFORE SELECTING SASH TYPES. VERTICAL SASH HAS LESS EXPENSIVE FIRST COST AND ARE PREFERRED BY U-M OSEH AND PLANT. COMBINATION SASH PROVIDES ADDITIONAL FLEXIBILITY FOR USERS BUT REQUIRES THAT MORE EXPENSIVE VAV FUME HOODS AND VAV CONTROLS BE SPECIFIED AS WELL.

3. Combination Sash: Provide sliding single-hung sash with dual-track system at top and bottom of glazing opening for individual, horizontally sliding safety glass panes.

MODIFY PARAGRAPH BELOW IF DIFFERENT CONFIGURATION IS DESIRED.

- a. Panel Arrangement: Provide sash with 4 individual sliding glass panes.
4. Counterbalance vertical sliding sash with sash weight and cable/chain system. Provide stainless steel or monel metal cable/chain, ball-bearing sheaves/sprockets, plastic glides in stainless steel guides, and stainless steel lift handles. Provide rubber bumpers at top and bottom of each sash unit.
5. Safety Glazing: Two sheets of double strength "B" quality, clear sheet glass permanently laminated with a sheet of clear, plasticized polyvinyl butyl.

- J. Closure Strips: Wood or metal, as required to matching adjoining materials and finishes. Provide where required to close openings between fume hood base cabinet and superstructure and adjacent building wall construction.

INCLUDE BELOW FOR IMPROVED APPEARANCE WITH SUSPENDED CEILINGS. USUALLY NOT APPROPRIATE FOR USE IN ROOMS WITHOUT SUSPENDED CEILINGS

- K. Enclosure Panels: Provide removable metal panels matching hood superstructure. Enclose area from top of hood to underside of suspended ceiling unless indicated otherwise.
- L. Holes: Provide holes for passage of piping and conduit and for fixtures furnished in this Section or under Related Sections.
- M. Fasteners: Provide stainless steel fasteners wherever exposed to fumes in hood.

2.8 INTERIOR LINER PANELS AND WORKING SURFACE

USUALLY RETAIN BELOW LINER PANEL PARAGRAPH; MODIFY IN THE RARE CASE WHERE ONLY STAINLESS STEEL INTERIORS ARE REQUIRED, OR IF EPOXY RESIN LINER IS REQUIRED. AT THIS TIME ONLY KEWAUNEE AND MOTT OFFER EPOXY RESIN LINER AS AN OPTION.

- A. Liner Panels: Interior lining shall be flush, cut to fit size of hood interior and securely held in place with fasteners. Provide back baffles of the same material as liner panels. Fabricate liner panels with cut-outs in hood side panels to provide access to plumbing lines and to receive service fixtures at side of hood, as indicated. Furnish removable plug buttons for holes not used for indicated fixtures. Liner material shall be as follows:

EPOXY RESIN ALSO AVAILABLE FROM SOME MANUFACTURERS. PROVIDES INCREASED HEAT AND CHEMICAL RESISTANCE. USE CAUTION WHEN SPECIFYING. TYPICAL THICKNESS IS 1/4" - EPOXY RESIN AT THIS THICKNESS IS SUSCEPTIBLE TO DAMAGE DURING SHIPPING.

GLASS FIBER REINFORCED EPOXY RESIN AND CELLULOSE FIBER REINFORCED PHENOLIC RESIN IS ALSO AVAILABLE FROM SOME MANUFACTURERS WHICH ALSO PROVIDES INCREASED CHEMICAL RESISTANCE WITHOUT THE ISSUES OF BREAKAGE FOR EPOXY RESIN. VERIFY AVAILABILITY PRIOR TO SPECIFYING.

- 1. Glass Reinforced Polyester: 1/4-inch thick, press-molded, heat-converted, catalyzed glass reinforced polyester sheet. Color: Manufacturer's standard white.

ALWAYS INCLUDE BELOW.

- 2. Liner shall have a flame spread rating of 25 or less when tested in accordance with ASTM E-84.

INCLUDE BELOW FOR STANDARD BLACK EPOXY RESIN WORKING SURFACE IN HOOD.

- B. Epoxy Resin Working Surface: 1-1/4-inch thick, dished to retain spillage.

- 1. Conform to specifications for epoxy resin top material properties outlined in Division 12 Section "Laboratory Casework".

IF RESIN TOPS ARE NOT SPECIFIED IN LAB CASEWORK SECTION: DELETE PARAGRAPH ABOVE AND RETAIN TWO PARAGRAPHS BELOW

- 2. Color: Black.

IF RESIN TOPS ARE SPECIFIED IN LAB CASEWORK SECTION: RETAIN TWO PARAGRAPHS ABOVE AND DELETE PARAGRAPH BELOW.

- 3. Physical Properties: Flexural strength - 4000 psi; compressive strength - 14,000 psi; hardness, Rockwell M-197; water absorption in 24 hours - 0.05%; heat distortion point - 400 deg. F; resistant to thermal shock.
a. Workmanship: Cast surfaces very smooth, with factory cut-outs for sinks, drip grooves, and service fixtures. Plain butt type joints assembled with epoxy adhesive.

RETAIN BELOW FOR ISOTOPE-TYPE STAINLESS STEEL INTERIORS AND PERCHLORIC ACID HOODS. NOTE THAT MOST LOW-LEVEL RADIOISOTOPE WORK CAN BE CARRIED OUT IN REGULAR FUME HOODS. THEREFORE, IF RADIOISOTOPES ARE TO BE USED, CONSULT WITH OSEH TO DETERMINE WHICH TYPE OF HOOD TO SPECIFY.

PERCHLORIC ACID HOODS ALSO REQUIRE A WASH-DOWN SYSTEM FOR THE HOOD, EXHAUST DUCTWORK, AND EXHAUST FAN.

MODIFY LANGUAGE IN PARAGRAPH BELOW (I.E., CHANGE "RADIOISOTOPE" TO "PERCHLORIC" OR DELETE REFERENCE TO RADIOISOTOPE FOR NON-ISOTOPE HOODS).

- C. Radioisotope (RI) Type Stainless Steel Liner and Work Surface: For applications where highly radioactive materials will be used with lead brick shielding, furnish seamless welded construction of the work surface with intersecting rear and interior end panels, and as follows:
1. Stainless Steel Lining: Radius corners, weld, grind smooth and polish to eliminate cracks and crevices.
 - a. Punch hood side panels to receive remote controls and service fixtures at side of hood, as indicated. Furnish removable plug buttons for holes not used for indicated fixtures.
 - b. Interior corners: 1/2 inch radius, seamless, coved.
 - c. Stainless steel: 16 gage, AISI Type 302/304, with no. 4 finish.
 2. Stainless Steel Working Surface: 14 gage, AISI Type 302/304, with no. 4 finish and 1/2 inch high raised "marine edge" around perimeter to retain spillage.

RETAIN THE FOLLOWING IF CUPSINK WILL BE INCLUDED IN STAINLESS STEEL TOP.

- a. Integrally weld stainless steel cupsinks to stainless steel work surfaces. Also see Plumbing Accessories article, below.

FOLLOWING REQUIREMENT PROVIDES SUFFICIENT LOAD CAPACITY FOR MOST LEAD BRICK SHIELDING ARRANGEMENTS - USUALLY RETAIN

- b. Reinforce to provide min. 200 lbs. per sq. ft. load capacity.

SELECT EITHER METAL OR WOOD UNDERSTRUCTURES FROM BELOW

2.9 FUME HOOD UNDERSTRUCTURES

- A. Products: Subject to compliance with indicated requirements, provide products manufactured by one of the following:
1. Metal Units:
 - a. Airmaster; Airmaster Systems Corp.
 - b. BMC
 - c. Kewaunee Scientific Equipment Corp.
 - d. Mott Manufacturing
 - e. Thermo Scientific: Hamilton Laboratory Furniture and Fume Hoods
 2. Wood Units:

- a. Kewaunee Scientific Equipment Corp.
- b. Mott Manufacturing
- c. Thermo Scientific Hamilton Laboratory

B. In general, provide metal base units complying with the following:

1. Toe Space: Approximately 4 inches high by 3 inches deep, closed metal with no open pockets. Open channel formations are not permitted.

DELETE BELOW IF NO METAL CABINETS

2. Exterior Metal: Mfr's standard with acid and alkali resistant baked-on finish. Match fume hood color.

DELETE BELOW IF NO WOOD CABINETS

C. In general, provide wood base units complying with the following:

1. Finish: Mfr's standard with acid and alkali resistant finish. Color to be selected by Architect from mfr's standard range of finishes.

DELETE THE FOLLOWING TWO REQUIREMENTS FOR FLAMMABLE STORAGE UNITS

2. Provide base cabinets with removable backs in cupboard areas to provide openings for access to plumbing lines and shut-off valves.
3. Provide space, cut-outs, and holes for pipes, conduits and fittings and cabinet bodies to accommodate services and their support-strut assemblies.

TYPICALLY PROVIDE BOTH FLAMMABLE STORAGE CABINET AND ACID STORAGE CABINET BELOW FUME HOOD.

NOTE THAT FLAMMABLE STORAGE CABINETS ARE NOT REQUIRED TO BE VENTED. IF THEY ARE VENTED, DO NOT VENT THROUGH HOOD, BUT USE A SEPARATE NON-FLAMMABLE VENT PIPE FROM THE CABINET DIRECTLY CONNECTED TO THE EXHAUST DUCT. INCLUDE A DETAIL ON THE DRAWINGS TO SHOW THE VENTING.

D. Flammable Liquid Storage Cabinets: Provide flammable liquid storage type constructed in compliance with NFPA 30 and UL or FM labeled. Requirements of NFPA 30 supersede other indicated requirements.

1. Label door exterior: "FLAMMABLE - KEEP FIRE AWAY".

ACID STORAGE CABINETS ARE REQUIRED TO BE VENTED. COORDINATE WITH MECHANICAL ENGINEER TO ENSURE THAT VENTING DETAIL IS INCLUDED ON DRAWINGS. DELETE REFERENCE TO METAL OR WOOD AS APPROPRIATE.

E. Vented Metal and Wood Acid Storage Cabinets: Provide vented acid storage cabinets as indicated. Do not vent acid storage cabinets through hood. Provide all required vent piping and connections for direct connection to fume hood exhaust duct.

1. Minimum cabinet ventilation: 10 air changes per hour.

2. Line interior of acid storage cabinets with manufacturer's standard chemical-resistant polyethylene lining.
3. Label door exterior: "ACIDS"

2.10 PLUMBING ACCESSORIES

EDIT THIS ARTICLE BASED ON WHETHER RELATED SECTION "LABORATORY CASEWORK AND ACCESSORIES" IS INCLUDED.

ALWAYS RETAIN PARAGRAPH BELOW. IN THE UNUSUAL CIRCUMSTANCE THAT THERE IS MEDICAL GAS PIPING IN THE HOOD IT WILL REQUIRE A SPECIAL PIPING SPECIFICATION.

A. Plumbing, General: Refer to Related Sections and as follows:

1. Provide complete factory plumbing for hoods. Use materials as specified in Related Section. All natural gas piping shall be threaded black steel, Schedule 40.
2. Plumbing Fixtures: Remote controlled from face of hood.

IF CUPSINKS ARE REQUIRED, SELECT EPOXY RESIN TYPE UNLESS A RADIOISOTOPE HOOD WITH WELDED STAINLESS STEEL INTERIOR IS REQUIRED.

3. Cup Sinks: Cast epoxy resin, 3 inch by 6 inch with raised rim. Rim height to match the fume hood's working surface indented (dished edge) height. Coordinate cup sink location to avoid interference with dished edge of work surface.
4. Cup Sinks: Integrally welded 3 inch by 9 inch, Type 304 stainless steel, raised rim. Rim height to match the fume hood's working surface indented (dished edge) height. Coordinate cup sink location to avoid interference with dished edge of work surface.

INFORMATION BELOW MAY BE REDUNDANT WITH INFORMATION IN THE U-M LAB CASEWORK SECTION. EDIT PARAGRAPHS BELOW UP TO "ELECTRICAL ACCESSORIES" IF A LAB CASEWORK SECTION WILL BE INCLUDED IN THE PROJECT'S SPECIFICATIONS AND THAT SECTION COVERS HOOD PLUMBING FIXTURES.

B. Plumbing Service Fixtures: Provide pre-piped units complete with washers, locknuts, unions, nipples and other accessories for positive mounting to hood superstructures. Include wall flanges, escutcheons, handle extension rods, remote valves, and similar items required. Fabricate units to withstand test pressure of 100 psig.

1. Service fixtures are indicated on drawings by symbols, with design type of each fixture indicated by letter and number reference marks.
2. Material and Finish: Cast or forged red brass containing a minimum of 81 percent copper.
3. Exposed surfaces (including fittings and escutcheons): Acid and solvent resistant baked-on plastic coating of mfr's standard color. Fixtures fabricated of plastic are not acceptable except for use as high purity water faucets.

4. Service Outlets Identification: Provide colored plastic index disks with embossed identification letters at each service fixture handle or knob. Secure disks to fixture handles to be tamperproof.
5. Handles: Provide 3 arm or 4 arm forged brass handles for remote controls.
6. Valves and Faucets: Provide indicated fixtures with renewable barrel locked in valve body. Barrel shall contain all wearing parts, with renewable disks.
 - a. Remote Control Valves: Provide valves controlled from face of hood. Use angle valves where required.

SELECT ONE OF THE OPTIONS BELOW

- b. Faucets: Wall-mounted, gooseneck style faucets.
- c. Faucets: Wall-mounted, hose cock water outlets.

ALWAYS INCLUDE BELOW

- d. Vacuum breaker: Provide in-line vacuum breaker complying with codes, installed on front face of hood.

2.11 ELECTRICAL ACCESSORIES

COORDINATE THIS ARTICLE WITH RELATED SECTION "LABORATORY CASEWORK AND ACCESSORIES". INFORMATION BELOW MAY BE REDUNDANT WITH INFORMATION IN THE U-M LAB CASEWORK SECTION. EDIT PARAGRAPHS BELOW IF A LAB CASEWORK SECTION WILL BE INCLUDED IN THE PROJECT'S SPECIFICATIONS AND THAT SECTION COVERS HOOD ELECTRICAL FIXTURES.

- A. Electrical Fixtures, General: Refer to Related Sections and as follows:
 1. Electrical Receptacles: Provide each hood with two duplex receptacles.
 2. Lights: Provide each hood with a two-lamp light fixture of longest practicable length. Equip each fixture with two T-8, 32 watt, straight tube, rapid-start, multi-phosphor fluorescent lamps with a medium bi-pin base, color temperature of 3500 deg K, and a CRI of not less than 82.
 - a. Shield light from hood interior by 1/4 inch thick safety glass or 1/8 inch thick tempered glass panel, sealed air tight into hood body with chemical resistant rubber channels. Set units so that lamps are easily replaceable from outside hood.
 - b. Provide switch marked "Fume Hood Light" on face of hood.
 - c. Provide only fixtures which carry the Underwriter's Laboratory (UL) label.
- B. Internal Electrical Wiring: Provide complete factory wiring for hoods. Comply with requirements of the National Electrical Code.
 1. Wire duplex receptacles and light to a single gang junction box for connection to Owner's 120V, single phase, 20 amp, AC supply.
 2. Where fume hood is supplied with an air flow monitor or similar controls, wire monitor components together and to a second single gang junction box for connection to Owner's second 120V, single phase, 20 amp AC supply.

3. Provide wiring with a green ground conductor. Conduit shall not be used for ground.
4. Install all wiring in metallic conduit.

INFORMATION BELOW MAY BE REDUNDANT WITH INFORMATION IN THE U-M LAB CASEWORK SECTION. EDIT PARAGRAPHS BELOW IF A LAB CASEWORK SECTION WILL BE INCLUDED IN THE PROJECT'S SPECIFICATIONS AND THAT SECTION COVERS HOOD ELECTRICAL FIXTURES.

C. Electrical Service Fixtures: Provide units complete with box; necessary receptacles, terminals, switches, device plates, and fittings and gaskets required for mounting on casework. Provide only fixtures with UL label.

1. Service fixtures are indicated on drawings by symbols, with design type of each fixture indicated by letter and number reference marks.
2. Cover Plates: Provide stainless steel cover plates for AC receptacles and devices.
 - a. Cover Plate Material: Stainless steel, Type 302, satin finish, with formed beveled edges.
3. Mark the following devices whether shown on drawings or not.
 - a. AC receptacles, other than standard 120 volt duplex, grounding type. Indicate voltage and phase.
 - b. Switches: Indicate equipment being controlled (e.g., "Fume Hood Light").
4. Finishes for Service Fixture Components: Furnish boxes with mfr's standard finish. Provide galvanized finish on ferrous fittings.

MODIFY BELOW IF USER REQUIRES 208 V. RECEPTACLES OR SPECIAL TYPE OF OUTLETS.

5. Receptacles: 125 volt, 20 amp, 2 pole, 3 wire, NEMA Type 5-20R, ground fault circuit interrupter type (at all locations), UL extra heavy duty grounding type with nylon or Lexan bodies.
 - a. Ground fault circuit interrupter receptacles shall be rated for 2000 amps interrupting capacity and trip in 25 milliseconds or less when ground currents exceed 5 milliamps.

SELECT ONE OF THE FOLLOWING

- b. Color: Dark brown.
- c. Color: Ivory.
- d. Products: Subject to compliance with requirements, provide products of one of the following:
Arrow Hart.
Bryant.
Hubbell.
Leviton.
Pass and Seymour.

USUALLY RETAIN BELOW FOR LIGHT SWITCH

6. Switches: Rated 120-277 volts AC and 20 amps, unless otherwise indicated, UL extra heavy duty.
 - a. Furnish pilot light adjacent to toggle switch, where noted as "PL" adjacent to switch identification.

SELECT ONE OF THE FOLLOWING

- b. Color: Dark brown.
- c. Color: Ivory.
- d. Products: Subject to compliance with requirements, provide products of one of the following:
 - Arrow Hart.
 - Bryant.
 - Hubbell.
 - Leviton.
 - Pass and Seymour.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install fume hoods plumb level, rigid, securely anchored to building and adjacent furniture in proper location, in accordance with manufacturer's instructions. Install closures neatly. Securely attach access panels, but provide for easy removal and secure re-attachment.
 - 1. Coordinate sequence of work with Mechanical and Electrical trades and with laboratory casework and fixtures specified in Related Sections.

ALWAYS INCLUDE THE COMMISSIONING ARTICLE BELOW.

3.2 COMMISSIONING

- A. Perform the commissioning activities as outlined in Division 01 Section "Full Project Commissioning" or "Project Commissioning for Small Projects" and other requirements of the Contract Documents.

3.3 FIELD QUALITY CONTROL

- A. Field test each fume hood after completion of installation to verify proper operation of hoods in accordance with SEFA 1 Guidelines

USUALLY DELETE BELOW. CONSIDER AS INSTALLED TESTING ONLY FOR LARGE PROJECTS, AND AFTER CONSULTATION WITH U-M OSEH AND MECHANICAL ENGINEER. ADJUST PERCENTAGE OF FUME HOODS TO BE TESTED IF APPROPRIATE, AND INDICATE TYPES TO BE TESTED IF MULTIPLE TYPES ARE USED ON THE PROJECT.

- B. Perform As Installed Containment Testing per ASHRAE 110 on 10% of installed fume hoods. Hoods shall be selected by the Commissioning Agent in consultation with U-M OSEH.
 - 1. Demonstrate that hoods meet the performance criteria specified in Part 2. Remedy failing hoods and retest until hoods meet the performance criteria.
 - 2. Provide a complete test report to the Commissioner immediately after each test.

3.4 ADJUST AND CLEAN

- A. Moving Parts: Carefully check to insure: smooth, near-silent, and accurate operation; sash operation with one hand with uniform contact of rubber bumpers; counterbalance operation without interference.
- B. Clean surfaces, including both sides of glass.
- C. Damaged Work: Repair equal to new undamaged work, or replace with new units, as directed by Architect.

END OF CONTENTS TABLE

DIVISION 11 EQUIPMENT
SECTION 115314 - FUME HOOD REFURBISHMENT

USE THIS SECTION FOR ROUTINE CHECK AND REPAIR OF EXISTING FUME HOODS

PART 1 - GENERAL

1.1 SUMMARY

- A. Work includes cleaning, painting, and routine maintenance as follows:

NOTE: OSEH REQUIRES REFURBISHED AND UPGRADED HOODS TO BE PROVIDED WITH FLOW ALARMS (ALARMS ARE WORK OF DIV. 23 AND 26). REMEMBER TO TELL ENGINEERS OF ALARM REQUIREMENT.

1. Provide electrostatic painting of Owner's existing fume hood superstructure exterior and existing fume hood base cabinet interior and exterior.
 2. Remove existing hood work surface materials. Install new 1-1/4-inch thick epoxy resin work surface with raised "marine" edge. Color: Black.
 3. Coat hood lining with epoxy paint.
 4. Provide routine maintenance as follows:
 - a. Lubricate moving parts.
 - b. Check and adjust sash alignment; replace pulleys and cable.
 - c. Check and adjust baffle operation.
- B. Mechanical and Electrical work are specified in Division 22, 23 and 26 sections respectively.
- C. Fume hood vent connections (from hood collar to hood exhaust system) is the work of Division 23 Sections.
- D. Clean Surfaces, including both sides of glass.

SECTION 122000 - WINDOW TREATMENT

END OF CONTENTS TABLE

DIVISION 12 FURNISHINGS
SECTION 122000 - WINDOW TREATMENT

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of window treatment is indicated on drawings.

EDIT THE FOLLOWING TO INCLUDE VERTICAL BLINDS OR OTHER WINDOW TREATMENT REQUIRED

- B. Types of window treatment include:

1. Venetian blinds.
2. Room darkening roller shades.

MODIFY THE FOLLOWING FOR BLIND POCKETS FABRICATED OF WOOD, OR DELETE IF NO BLIND POCKETS

- C. Sheet metal blind pockets are included in Division 05 Section "Metal Fabrications".

1.2 SUBMITTALS

- A. Product Data: Manufacturer's literature indicating compliance with requirements.
- B. Samples: Submit samples of materials and finishes.
- C. Shop Drawings: Submit shop drawings for installations not fully detailed in product data.

1.3 QUALITY ASSURANCE

- A. Provide complete assemblies produced by one mfr for each type required including hardware, accessory items, mounting brackets, and fastenings.
- B. Provide units which comply with NFPA 701 flammability test requirements.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:
1. Venetian Blinds:
Levolor Window Fashions
Hunter Douglas
Springs Window Fashions; Bali
 1. Roller Shades:
Springs Window Fashions; Bali
Draper Inc.; Flexshade
OpenLight

MechoShade Systems, Inc.
Roll Ease, Skyline Series
SRF Enterprises, Inc.

2.2 HORIZONTAL BLINDS

BELOW DESCRIBES "RIVIERA" QUALITY BLINDS. BOTH LOWER AND HIGHER QUALITY BLINDS ARE AVAILABLE - REFER TO MANUFACTURER'S CATALOGS

- A. Mfr's standard vertical lifting and horizontal tilting units complete with headrail, bottom rail, slats, and accessories as follows:
1. Headrail formed from sheet steel, min. 0.025 inch thick, into channel shaped section housing tilting mechanism; with top and end braces, top cradles, cord lock and required accessories; finished to match slats.
 2. Bottom rail formed from sheet steel into tubular shape, with end caps, finished to match slats.
 3. Aluminum slats formed from 0.0075-inch thick, spring-tempered aluminum; coated with manufacturer's standard baked enamel finish, resulting in nominal 0.0085-inch finished thickness; and as follows:
 - a. Slat Width: 1 inch narrow slats.
 - b. Ladders: Braided polyester cord with braided ladder rungs.
 - c. Coverage: Not less than 15.7 slats per vertical foot.
 - d. Color: As shown or as selected by Architect from mfr's standards.
- B. Provide lifting mechanism consisting of crash-proof cord locks with cord separators, braided polyester or nylon lift cords, and cord equalizers.
- C. Provide installation brackets including mounting hardware as recommended by mfr for installation indicated. In general, provide required fasteners, tracks, accessories required for a complete installation.
- D. Operation: Provide full-tilting slats rotating approximately 180 degrees with operating controls on the left side; full height raising with lifting cord locks and cords on right hand side of units unless otherwise indicated.

2.3 ROOM DARKENING ROLLER SHADES

- A. Fabric: Close-woven fiberglass; completely opaque. Provide horizontally seamless shades.
1. Color: White.
- B. Support Hardware and Trim: Painted steel or aluminum fascia panel and end caps. Provide units with side and sill channels.
1. Color: White.
- C. Roller Tube: Manufacturer's standard steel or aluminum units.
- D. Operation: Manual, spring roller operation.

- E. Bottom Weight: Manufacturer's standard aluminum unit.
- F. Provide installation brackets including mounting hardware as recommended by manufacturer for installation indicated. In general, provide required fasteners tracks, accessories required for a complete installation.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with manufacturer's recommended installation procedures for indicated installation conditions.
- B. Provide adequate clearance between sash and blinds to permit unencumbered operation of sash hardware.
- C. Isolate metal parts from concrete and mortar to prevent galvanic action. Use tape or thick coating or other means recommended by manufacturer to effect separation.

SECTION 122200 - CURTAINS AND DRAPES

END OF CONTENTS TABLE

DIVISION 12 FURNISHINGS
SECTION 122200 - CURTAINS AND DRAPES

PART 1 - GENERAL

1.1 SUMMARY

- A. Types of curtains include:
 - 1. Manually operated, room dividing, lightproof curtains.
 - 2. Manually operated, lightproof curtains over wall openings.

1.2 RELATED WORK OF OTHER SECTIONS

- A. Division 05 Section "Metal Fabrications" for sheet metal valences and trim.
- B. Division 06 Section "Interior Architectural Woodwork" for wood trim.

1.3 SUBMITTALS

- A. Product Data: Manufacturer's literature indicating compliance with requirements.
- B. Samples: Submit samples of materials and finishes.
- C. Shop Drawings: Submit shop drawings for installations not fully detailed in product data.

1.4 QUALITY ASSURANCE

- A. Provide complete assemblies produced by one mfr for each type required including hardware, accessory items, mounting brackets, and fastenings.
- B. Provide units that are fire retardant treated to comply with NFPA 701 flammability test requirements.

PART 2 - PRODUCTS

2.1 CURTAIN FABRIC

- A. Fabric, General: Fire-retardant treated rayon-acetate blend with vinyl backing. For all applications, provide double faced curtains with fabric material on both sides.
- B. Room Dividing Curtains: Provide 2 curtains, both fabricated to cover half the room width plus 1-1/2 feet, resulting in 3-foot total overlap. Fabricate curtains without pleats.
 - 1. Accessories: Provide Velcro male and female fastening strips for wall ends of curtain units, Apply continuous Velcro fasteners to wall ends of curtain units and on walls as shown, to provide positive, lightproof seal.

- C. Curtains at Wall Openings: Fabricate curtains to cover opening widths plus 4 feet, resulting in 2-foot overlap at both sides of opening. Fabricate curtains without pleats.

BELOW EXAMPLE DESCRIBES A LIGHTPROOF CURTAIN FABRIC. MODIFY TO SUIT PROJECT.

- D. Manufacturer/Product: Coral Co; "Stoplight II".
 - 1. Color: "Flax".

2.2 TRACKS AND CARRIERS

- A. Provide Manufacturer's standard anodized aluminum or painted steel units without splices.
 - 1. Provide ball bearinged carrier and hook assemblies.

BELOW EXAMPLE DESCRIBES A CURTAIN TRACK. MODIFY TO SUIT PROJECT.

- B. Manufacturer/Model: Provide products as follows:
 - 1. Tracks: Graber; model 9-8191.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Examine support work for tracks in presence of Installer. Correct conditions that would result in improper operation of curtain units.
- B. Comply with manufacturer's recommended installation procedures for indicated installation conditions, and as indicated on drawings.

END OF CONTENTS TABLE

DIVISION 12 FURNISHINGS
SECTION 123553 - LABORATORY CASEWORK

11/03 CHANGED SPECIFICATIONS FOR EYE WASHES.

9/11: ADDED SOLID PHENOLIC (TRESPA) SHELVES, TACK STRIPS AND CUSTOM DRYING RACK ASSEMBLY.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of laboratory casework and fixtures is shown on drawings and schedules, and indicated by the provisions of this Section.

EDIT BELOW TO SUIT PROJECT.

- B. Types of laboratory casework include:

Base cabinets.
Wall cabinets.
Storage cabinets.
Tables.
Shelf units.
Tops and curbs.
Sinks.
Mechanical and electrical service fixtures shown on drawings.
Other units as indicated.

DELETE BELOW IF NO P.LAM. CASEWORK.

- C. Plastic laminate casework is included in Division 06 Section "Interior Architectural Woodwork".

DELETE BELOW IF NO FUME HOODS.

- D. Fume hoods are included in Division 11 Section "Laboratory Fume Hoods".

DELETE BELOW IF NO ENVIRONMENTAL ROOMS.

- E. Shelving in environmental room is specified in Division 13, "Controlled Environmental Rooms".

DELETE ONE OR BOTH BELOW IF NO MECHANICAL OR ELECTRICAL FITTINGS ARE INCLUDED.

- F. Installation of plumbing fixtures supplied under this Section are included in Division 22 sections.

- G. Installation of electrical fixtures supplied under this Section are included in Division 26 sections.

1.2 SUBMITTALS

- A. Product Data: Submit mfr's product data indicating compliance with requirements.

B. Samples for Initial Selection: Submit sample cards of actual finishes to be used showing manufacturer's standard range of colors/finishes for the following:

1. Paint coating for metal furniture.

DELETE ABOVE IF NO METAL CASEWORK. DELETE BELOW IF NO WOOD CASEWORK.

2. Stains for wood furniture.

DELETE BELOW IF NO P.LAM TOPS, SHELVES, PRIVACY SCREENS, ETC.

3. Plastic laminate for accessory items.

USUALLY DELETE BELOW EXCEPT FOR CUSTOM FINISHES TO MATCH ARCHITECT'S SAMPLE.

C. Samples for Verification: Samples of each specified color/finish applied to each applicable type of substrate material. Provide samples sized not less than 4-inches by 4-inches and consisting of the actual materials specified for the final product.

D. Shop Drawings: Submit shop drawings for laboratory furniture showing plans, elevations, ends, cross-sections, service run spaces, location and type of service fixtures and as follows:

1. Layout of units with relation to surrounding walls, doors, windows, and other building components.

2. Details and location of anchorages and fitting to floors, walls, and base.

3. Details of shelf standard and bracket attachments, fittings, and fasteners, including relationship to laboratory tops, walls, ceilings, and other attachment points.

4. Coordinate shop drawings with other work involved.

E. Material Certificate: Provide manufacturer's certificate indicating compliance with specified requirements for stainless steel Type and Grade.

F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating compliance of laboratory casework finishes and countertops with requirements specified for chemical and physical resistance.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain laboratory casework, including countertops, sinks, service fittings, and accessories, through one source from a single manufacturer.

B. Product Standard: Comply with SEFA 8, "Laboratory Furniture--Casework, Shelving and Tables--Recommended Practices."

C. Catalog Standards: Mfr's catalog numbers are shown on drawings for convenience in identifying certain equipment. Unless modified by notation on drawings or otherwise specified, mfr's current catalog description for indicated number constitutes requirements for each such unit.

1. Provide cabinet door swings as indicated on drawings.

2. Use of catalog numbers and specific requirements set forth in drawings and specifications, does not preclude the use of equivalent products by other listed approved mfrs, but are given for the purpose of establishing a standard of design, quality of materials, product content, construction, and workmanship.
3. Numbers on drawings refer to products of the following:

SELECT ONE OF THE FOLLOWING, OR EDIT TO SUIT SELECTED PRODUCT CATALOG.

Thermo Scientific: Hamilton Laboratory Furniture
Kewaunee Scientific Equipment Corporation.

- D. Flammable Liquid Storage Cabinets: Provide flammable liquid storage type constructed in compliance with NFPA 30 and UL or FM labeled.
- E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.4 DELIVERY, STORAGE AND HANDLING

DELETE TWO REQUIREMENTS BELOW FOR MOST RENOVATION WORK.

- A. Deliver wood laboratory furniture only after wet operations in building are completed.
- B. Store completed wood laboratory furniture in a ventilated place, protected from the weather, with relative humidity therein of 50% or less, at 70 degrees F (22 degrees C).
- C. Protect finished surfaces from soiling and damage during handling and installation. Keep covered with polyethylene film or other protective covering.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Check actual space available by accurate field measurement before fabrication. In addition to dimensions for clearance, check for obstructions, including columns, piping, ducts and conduits. Show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.
 1. Where construction of new structures and systems is not complete, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit of laboratory casework items without field modification.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide the products of one of the following:

DELETE BELOW IF NO METAL CASEWORK. USUALLY RETAIN ALL MANUFACTURERS/SUPPLIERS LISTED BELOW

B. Metal Casework; associated suppliers:

1. Air Master Systems Cor., Millenia Series.
2. BMC Laboratory Cabinets; R.D. Landstra Associates.
3. Kewaunee Scientific Equipment Corp.; Farnell Equipment Co.
4. Laboratory Design & Supply; mfr. direct.
5. Mott Manufacturing Ltd.; Sigma Systems; Detroit Technical Equipment Company.

DELETE BELOW IF NO WOOD CASEWORK. USUALLY RETAIN ALL SUPPLIERS LISTED BELOW.

C. Wood Casework; associated suppliers:

1. Kewaunee Scientific Equipment Corp.; Farnell Equipment Co.
2. Mid Canada Millwork.
3. Mott Manufacturing Ltd.; Detroit Technical Equipment Company.

MANUFACTURER BELOW HAS ONLY FLUSH OVERLAY TYPE PRODUCTS. DO NOT INCLUDE IF PROJECT MUST INCLUDE ONLY LIPPED OVERLAY CASEWORK.

4. Laboratory Design & Supply; mfr. direct.

BELOW ARE NEW TO PML. INCLUDE FOR PROJECTS WITH ESTIMATED CASEWORK VALUE LESS THAN \$100,000

5. CIFLab L-Line (lipped overlay) and E-line (full overlay); Stonecreek Interior Systems, LLC
6. Diversified Casework; R.D. Landstra Associates.
7. Wood-Metal Industries; Division of Wood-Mode, Inc.; Farnell Contracting.

USUALLY RETAIN ALL BELOW.

D. Resin Tops and Sinks:

Kewaunee Scientific; "Kemresin"
Durcon Co.; Durcon-IIA"
Epoxy Products "Epoxy"

E. Stainless Steel Sinks and Tops:

Elkay Co.
Just Manufacturing

F. Fiberglass Sinks:

Kreolab, Inc.

G. Solid Phenolic Shelves:

Kewaunee Scientific
Resistop

Trespa Athelon

H. Shelf Standards and Brackets:

Cooper B-Line, Inc.

Flex-Strut, Inc.

Kewaunee Scientific Equipment Corporation

Nu-Strut framing channel system, Kumar Industries, Inc.

Unistrut Corp.

I. Service Fittings:

Chicago Faucet

SPS (distilled water faucets)

T & S Brass

Watersaver

Wolverine Brass

DELETE THE ARTICLE BELOW IF NO METAL LABORATORY CASEWORK IN PROJECT.

2.2 METAL LABORATORY CASEWORK

A. Metal: Prime furniture steel, stretcher or roller leveled, free of scales, buckles, or other defects; ASTM A 366, Class 1 (matte) finish. Provide steel laboratory furniture components of following minimum U.S. Standard gages:

1. Back panels, inner door panels, drawer outer pan, inner pan and body, and shelves: 20 gage. Add reinforcement or use 18 gage material for shelves over 36" long.
2. Sides, ends, fixed backs, bottoms, tops, soffits, outer door pans, and other items not otherwise specifically noted: 18 gage. Bottoms may be 20 gage if reinforced.
3. Intermediate horizontal rails, table frame aprons and cross rails, center posts, top gussets: 16 gage.
4. Drawer runners, sink supports: 14 gage.
5. Leveling and corner gussets: 12 gage.

B. Casework Fabrication: Provide units which are square, fully reinforced with angles, gussets, and channels, integrally framed and welded to form a dirt and vermin retardant enclosure; and as follows:

1. Flange metal upward on three sides of cabinet bottoms.
2. Where applicable, reinforce base cabinets for heavy sink support.
3. Maintain uniform clearance around door and drawer fronts, not exceeding 3/32-inch.
4. Fabricate laboratory furniture to dimensions, profiles, and details shown.
5. Assemble units in shop in as large components as practicable to minimize field jointing.
6. Provide base cabinets with removable backs in cupboard areas to provide openings for access to plumbing lines and shut-off valves.
7. Fabricate units on precision dies to provide field interchangeability of drawers, hinged doors, and similar pieces.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 123553 - - 5

C. Cabinet Components: Provide cabinets with the following, as applicable to selected units:

1. Flush Doors: Outer pan and inner pan formed and telescoped into box formation, with channel reinforcements full height on center of each pan. Fill doors solid with fire-resistant, sound-deadening material.
2. Glazed Doors: Hollow metal stiles and rails of similar construction as flush doors, with glass held in resilient channel or gasket material.
3. Hinged Doors: Mortise at flanges for hinges and reinforce with minimum 16 gage angle, welded inside inner pan at hinge edge. Provide nylon roller catches and stainless steel strike welded to door assembly.
4. Drawers: Assemble fronts from telescoping inner and outer pans, designed to eliminate raw edge of steel at top. Fabricate sides, back, and bottom of one piece, with rolled or formed top of sides for stiffening and comfortable grasp or drawer removal. Weld drawer front to sides, back, and bottom to form a single, integral unit. Provide drawers and rubber bumpers, runners and positive stops to prevent metal-to-metal contact or accidental removal.
5. Adjustable Shelves: Sides and ends formed down, and returned to front and back.
6. Glass for Glazed Doors: Double strength "B" quality.
7. Drawer Guides: Provide nylon rollers with metal guide channels, with integral stops to eliminate accidental removal of drawer. Include provisions to prevent rebounding action when doors are closed.
8. Filler Strips: Provide where required for closing space between cabinets and walls and ceilings, of same material and finish as cabinets. Hem exposed edges. Job fabricated fillers not acceptable.
9. Utility Space: Provide space, cut-outs, and holes for pipes, conduits and fittings and cabinet bodies to accommodate services and their support-strut assemblies.
10. Toe Space: Approximately 4" high by 3" deep, closed metal with no open pockets. Open channel formations are not permitted.
 - a. Provide base cabinets with individual, integral toe kick bases. Separate toe kick bases independent of base cabinets are not permitted.

D. Steel Cabinet Finish: Coat metal casework as follows:

1. Pretreatment: After assembly, thoroughly clean surfaces of grease, dirt, oil, flux and other foreign matter by physical and chemical means. Treat entire unit with metallic phosphate process leaving surfaces with uniform, fine-grained, crystalline phosphate coating providing bond for subsequent finish.
2. Prime and Finish Coats: One coat high-bake primer followed by one or more coats of high-bake chemical-resistant enamel, to provide a hard and smooth, satin luster finish, applied to treated surfaces.

- a. In concealed areas, including inside of doors and drawers, behind cross rails and mullions, inside of sub-base members, inside front and rear posts, and behind adjustable shelf front and back edges, provide rust inhibiting coating.

MODIFY BELOW FOR CUSTOM COLOR TO MATCH ARCHITECT'S SAMPLE, IF REQUIRED.

- 3. Colors: Unless otherwise indicated, color to be selected by Architect from mfr's standard palette of at least 5 colors.

DELETE THE ARTICLE BELOW IF NO WOOD CASEWORK IN PROJECT.

2.3 WOOD LABORATORY CASEWORK

- A. Definitions: The following definitions apply to wood laboratory casework units:

- 1. Exposed portions of casework include surfaces visible when doors and drawers are closed. Bottoms of cases more than 4 feet above floor shall be considered as exposed. Visible members in open cases or behind glass doors shall be considered as exposed portions.

COORDINATE THE FOLLOWING REQUIREMENT WITH OWNER.

- a. Sides to be concealed in final installation shall be considered exposed for purpose of determining material and finish requirements.
- 2. Semi-exposed portions of casework include those members behind opaque doors, such as shelves, divisions, interior faces and ends, case back, drawer sides, backs and bottoms, and back face of doors.
 - a. Tops of cases 6 feet, 6-inches or more above floor, and drawer sides and back, shall be considered semi-exposed for purpose of material selection; concealed for purpose of finish selection.
- 3. Concealed portions of casework include sleepers, web frames, dust panels, interior faces and ends of cabinets with drawers only, and other surfaces not usually visible after installation, except as otherwise indicated.

- B. Materials: Provide units fabricated of the following:

- 1. Exposed Materials: Do not use exposed faces of lighter-than-average color joined with exposed faces of darker-than-average color. Do not use two adjacent faces which are noticeably dissimilar in grain, figure and natural character markings.
 - a. Solid Lumber: Clear, dry, sound, selected from compatible grain and color, no defects, and of same species as plywood panel exposed face veneer.

- b. Plywood: Provide panels of 7-ply construction, with face veneer clear, selected for grain and color compatible with exposed solid lumber, and with no defects. Provide solid crossbandings without voids. Except for doors and drawer faces, edgeband exposed edges with solid wood of same species as face veneer. Provide panels with the following veneer for exposed faces:

SELECT RED OAK BELOW UNLESS MATCHING EXISTING CABINETS.

- 1) Species: Plain sliced red oak.
 - 2) Species: Plain sliced white oak.
 - 3) Species: Rotary cut birch.
- 2. Semi-Exposed Materials:
 - a. Solid Lumber: Dry, sound, selected to eliminate appearance defects. Any species of hardwood, or softwood of similar color and grain to exposed portions.
 - b. Plywood: Hardwood, PS-51, Good Grade (1), or softwood PS-1/ANSI A199.1, Group 1, A-A, INT, of species to resemble color and grain of exposed members.
 - 3. Concealed Members:
 - a. Solid Lumber or Plywood: Any species, with no defects affecting strength or utility.
 - b. Hardboard: ANSI A135.4, Class 1, tempered; for use as drawer bottom, base cabinet interior bottom, and cabinet backs.
 - 4. Unacceptable Materials: The following veneered materials are not permitted in cabinetry construction, regardless of exposure condition:
 - a. Particleboard (pressboard or flakeboard).
 - b. Oriented strand board (OSB).
 - c. Laminated solid lumber panels.
 - d. Tempered hardboard, except as otherwise indicated.
- C. Wood Casework Fabrication: Fabricate laboratory furniture with manufacturer's standard dimensions, profiles, and details shown, unless otherwise indicated. Assemble units in the shop in as large components as practicable to minimize field jointing.
- 1. Provide units with manufacturer's standard door and drawer configuration, and as follows:

USUALLY SELECT LIPPED OVERLAY TYPE BELOW. NOT ALL MANUFACTURERS HAVE FLUSH OVERLAY OPTION.

- a. Lipped overlay type with rounded edges.
- b. Flush overlay type with square edges.

USUALLY SELECT GRAINING BELOW.

- c. Grain Pattern: Horizontal on drawers, vertical on doors.

BELOW IS OFFERED BY FISHER HAMILTON - USUALLY DELETE.

- d. Grain Pattern: Vertical, unmatched doors and drawer fronts.

FISHER-HAMILTON OFFERS ALL-VERTICAL OPTIONS ABOVE AND BELOW. BELOW REQUIRES FLUSH OVERLAY DOORS/DRAWERS.

- e. Grain Pattern: Vertical, matched doors and drawer fronts.
- 2. Cabinet Bodies: Fabricate units with full (4-sided) top frame, and with horizontal intermediate rails between each door and drawer. Fabricate wood-framed glass doors (if included) with solid lumber frames.
- 3. Shelves Within Cabinets: Fabricate units of 3/4-inch thick plywood, with the following configurations for the indicated cabinet types included in Project:
 - a. Full depth in wall and counter-mounted units; half depth in base units.

COMMON PRACTICE IS TO SELECT ABOVE AND DELETE TWO OPTIONS BELOW. IF SPLIT-DEPTH SHELF OPTION IS SELECTED, SHOW ON DRAWINGS OR REVISE PARAGRAPH TO DESCRIBE DESIRED COMBINATION.

- b. Full depth in base, wall and counter-mounted units.
- c. Full depth in wall and counter-mounted units; split depth in base units as indicated on drawings.

D. Clear Wood Finish:

- 1. General: Apply laboratory casework manufacturer's standard two or three-coat, chemical-resistant, transparent finish consisting of sealer and catalyzed topcoat(s). After installation, touch up to refinish damaged portions equal to original factory finish.
- 2. Chemical and Physical Resistance of Finish System: Finish complies with acceptance levels of cabinet surface finish tests in SEFA 8 for Laboratory Grade Casework. Acceptance level for chemical spot test shall be no more than four Level 3 conditions.
- 3. Preparation: Sand exposed and semi-exposed components, using machine and hand methods. Machine marks, cross sanding, tool marks or other surface blemishes are not acceptable.
- 4. Exposed Portions: Carefully sand finishes after each surface treatment. Apply finishes as follows:
 - a. Sealer coat, if required.

SELECT 1 OF THE 3 STAINS FOLLOWING

- b. Stain: None.
- c. Stain: Selected from mfr's standard range of tones.
- d. Stain: Non-standard, custom tone selected by Architect.
- e. Mineral filler: for open grained wood, if required.
- f. Multiple coats of highly chemical resistant finish, heat dried and sanded between each coat to produce a smooth, satin luster free of imperfections.
- 5. Semi-Exposed Portions: Apply sealer coat, stained to resemble exposed portions, and follow with heavy application of clear, water repellent finish coat to provide a smooth, washable surface.
- 6. Concealed Portions: One heavy coat of water repellent finish.

REMAINING PORTION OF THIS SECTION IS APPLICABLE TO BOTH WOOD AND METAL CASEWORK.

2.4 CASEWORK ACCESSORIES

- A. Leg Shoes: Extruded vinyl or rubber, black, open bottom type.

DELETE BELOW IF BASE INCLUDED IN FLOORING SECTION.

- B. Base Cabinet Molding: Extruded vinyl or rubber, black, 4-inches high. Provide as indicated on drawings, on casework items in contact with floor, and in the following locations:

1. Base and floor standing cabinet toe spaces.
2. Exposed sides of base and floor standing cabinets.
3. Filler and closure panels extending to floor.

- C. Grilles: Provide clear anodized aluminum grilles and frames in sizes and at locations shown on drawings, and as follows:

1. CT-16; Titus, or equivalent.

- D. Glass: ASTM C 1036 Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select); double strength.

USUALLY RETAIN ABOVE AND DELETE BELOW.

- E. Tempered Glass: ASTM C 1048 Condition A (uncoated surfaces), Type I (transparent glass, flat), Class I (clear), Quality q3 (glazing select), Kind FT (fully tempered); 1/8-inch thick.

2.5 CASEWORK HARDWARE

- A. Install hardware uniformly and precisely after final finishing is complete. Set hinges snug and flat in mortises unless otherwise indicated. Turn screws to flat seat. Adjust and align hardware so that moving parts operate freely and contact points meet accurately. Allow for final field adjustment after installation.

USUALLY SELECT BELOW AND DELETE OTHER HINGE OPTIONS.

1. Hinges: Manufacturer's standard 5-knuckle hinge with US26D satin chrome finish.
2. Hinges: Manufacturer's standard 5-knuckle, US32D stainless steel hinge with satin finish.

HINGE BELOW IS AVAILABLE WITH FLUSH OVERLAY STYLE ONLY.

3. Hinges: Manufacturer's standard concealed hinge for 170 deg. minimum swing.

USUALLY SELECT BELOW AND DELETE OTHER PULL OPTIONS.

4. Pulls: Manufacturer's standard surface mounted units of brushed aluminum.
5. Pulls: Manufacturer's standard surface mounted units of wire stock satin stainless steel.
6. Pulls: Manufacturer's standard flush recessed units of brushed aluminum.

BELOW NOT AVAILABLE FROM ALL MANUFACTURERS AND IN ALL STYLES - VERIFY BEFORE SELECTION.

7. Pulls: Manufacturer's standard flush recessed units of hardwood matching door/drawer face veneer species.
8. Catches: Manufacturer's standard mechanical roller type units. Magnetic catches are not acceptable.

9. Adjustable Shelf Supports (within cabinets): BHMA B84072, wrought steel, mortise mounted; or drilled holes with metal or plastic plug-type shelf supports.
10. Drawer Slides: Manufacturer's standard wood keel or metal ball bearing drawer slides. Where metal drawer metal slides are provided, comply with the following requirements:

INCLUDE ALL BELOW. ADJUST CAPACITY AS DESIRED. VOLUMES ROUGHLY CORRESPOND TO 18"W. BY 4"H. FOR 2100 CU. IN. AND 36"W. BY 8"H. FOR 4,600 CU. IN. INTENT IS TO ESTABLISH 100 LBF CAPACITY FOR ALL BUT VERY SMALL OR VERY LARGE AS DRAWERS.

- a. Minimum Rated Capacity: 75 lbs. for drawers with interior volumes of 2,100 cu. inches or less.
- b. Minimum Rated Capacity: 100 lbs. for drawers with a volume of more than 2,100 cu. inches, but less than or equal to 4,600 cu. inches.
- c. Minimum Rated Capacity: 150 lbs. for drawers with a volume of more than 4,600 cu. inches.

DELETE BELOW IF NO LOCKS REQUIRED. MEDICAL SCHOOL REQUIRES ONE LOCKED DRAWER OR CUPBOARD PER BENCH RUN AND 1 EACH SIDE OF ISLAND UNITS. MODIFY BELOW TO ADD "BEST" UNITS FOR RE-KEYABLE CORE, GREATER SECURITY, OR KEYING WITH BUILDING. MODIFY KEYING REQUIREMENT TO SUIT PROJECT.

11. Drawer/Door Locks: Manufacturer's standard factory keyed, 5-pin lock. Provide 2 keys for each lock. Key each drawer separately, unless otherwise indicated.

DELETE BELOW IF NO LABEL HOLDERS.

12. Label Holders: Manufacturer's standard, surface applied [brass] [chrome] units, approximately 2-1/2-inches by 1-inch with exposed fasteners in matching finish.

2.6 TOPS

- A. Tops, and Curbs: Provide smooth, clean, exposed tops and edges, in uniform plane, free of defects. Make exposed edges and corners uniformly rounded.

1. Top Sizes: Furnish tops in maximum practicable lengths.
2. Top Thicknesses: As indicated, with tolerance not exceeding plus or minus 1/32". Provide front and end overhang of 1" over base cabinets, formed with continuous drip groove on under surface 1/2" from edge.

- B. Top Materials:

SELECT THE FOLLOWING TOP MATERIAL TYPES APPLICABLE TO PROJECT.

1. Cast Epoxy Resin: Factory molded tops of modified epoxy resin formulation, uniform mixture throughout full thickness. Provide indented, "Marine" edge tops as indicated.
 - a. Finish: Non-glare black.
 - b. Thickness: 1-inch.
 - c. Physical Properties:
 - 1) Flexural strength - 4000 psi
 - 2) Compressive strength - 14,000 psi
 - 3) Hardness, Rockwell M-197

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 123553 - - 11

- 4) Water absorption in 24 hours - 0.05%
- 5) Heat distortion point - 400 deg. F (204 deg, C)
- 6) Resistant to thermal shock.
- d. Workmanship: Cast surfaces very smooth, with factory cut-outs for sinks, drip grooves, and service fixtures.
- 2. Resin Impregnated Sandstone: Natural quarried hard sandstone with uniform grain and texture, free of seams and veins. Using manufacturer's standard vacuum process, impregnate stone throughout with multiple coats of thermo-setting resin. Bake coating at high temperature to ensure complete polymerization of resin and permanent bond with substrate. Apply additional coats to tops and edges to ensure required chemical resistance. Configure units with top and corner edges rounded to a 1/4 inch radius, and with bottom and abutting side edges broken.
 - a. Finish: Non-specular smooth jet-black.

SELECT ONE BELOW

- b. Thickness: 1-1/4 inch.
- c. Thickness: 1 inch.
- d. Physical Properties: Density - 140 pcf; modulus of rupture - 3,200 psi; compressive strength - 15,900 psi; Brinnel hardness - 84.
- e. Workmanship: Complete machining, cutouts, drilling, grooving, sizing, and similar operations before impregnation.
- 3. Stainless Steel: 16 gage, ANSI type 304 with No. 4 satin finish, unless otherwise indicated.
 - a. Weld shop joints, grind smooth and polish to become practically invisible. Provide hair-line butt jointed field joints, mechanically bolted through continuous channels welded to underside at edges. Keep field jointing to a minimum. Apply reinforcing channels to underside of top where necessary to insure rigidity without deflection.
 - b. Extend top down to provide 1-1/4 inch thickness and 1/2 inch return flange under frame. Sound deaden entire under-surface with heavy build mastic coating.
 - c. Form backsplash with 1/4 inch cove, integral with top surface.
 - d. Provide 1/4 inch indented "marine edge" around perimeter of countertops throughout, except provide 1 inch high raised tops where indicated. In tops with sinks, pitch top surface two ways to bowl to provide adequate drainage without channeling or grooving.
- 4. Plastic Laminate (P. Lam.): Provide plastic laminate sheet, black color through entire thickness with satin finish, complying with NEMA LD-3, and as follows:
 - a. Flat Tops: General purpose grade; 0.050 inches thick.
 - b. Formed Tops: Post-forming grade; 0.042 inches thick.
 - c. Sub-top: 3/4 inch thick sub-top of hardwood faced plywood, medium density overlaid plywood, or 45 pound phenolic resin bonded particleboard.
 - d. Shop-bond laminate to sub-top with fully waterproof bond glue. Smooth sand surfaces to which plastic laminate is to be bonded. Apply standard phenolic backing sheet to back of panels.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 123553 - - 12

- e. Build up exposed edges of tops to 1-1/2 inch thickness. Self-edge exposed edges of top, splash, and openings with same plastic laminate used for tops.
- f. Unless otherwise indicated, construct top and back splash of one piece with intersection coved. Intersections of end splash with top and back splash need not be coved.

2.7 SHELVES, STANDARDS AND BRACKETS

A. Acid Resistant Plastic Laminate Shelves:

CHANGE TO 1-1/4 IF DESIRED. 1" IS STANDARD FROM KEWAUNEE.

- 1. Core material: 1 inch thick particleboard, 40-50 pound density particleboard according to ANSI A208.1-2009, grade M-2 specifications.
- 2. Finish: Chemical Resistant high-pressure decorative laminate on both faces and all edges.
 - a. Manufacturers:
 - 1) Wilsonart; Chemsurf
 - 2) Formica Group; Chemtop2
- 3. Color: Black.

B. Solid phenolic shelves:

- 1. Material: Solid phenolic core chemical and stain resistant panels. Material shall be a natural kraft paper based, saturated / impregnated with phenolic resin and processed under high heat and pressure to form a composite panel, to provide a work surface with high chemical resistant and abrasion resistant properties. Finished material shall be extremely hard and resistant to scratches and abrasion.
 - a. Finish: Non-glare black.
 - b. Thickness 1-inch.
 - c. Edge: Standard edge with 3/16" Radius or Bevel Finish
 - d. Physical Properties:
 - 1) Flexural strength: MD 23,000 psi / CD 15,000 psi
 - 2) Compressive strength: MD 31,000 psi / CD 25,000 psi
 - 3) Hardness, Rockwell M-95 to 115
 - 4) Water absorption in 24 hours - 0.35%

C. Cast Epoxy Resin Shelves: Provide epoxy resin shelving units conforming to epoxy resin top and curb specifications.

- 1. Thickness: 1 inch.

D. Shelf Support Structures: Fabricate wall-mounted, bench top mounted, ceiling-suspended, and other shelf support structures, including standards, brackets and other elements as shown on drawings. Provide manufacturer's standard pre-fabricated steel structural system, complete with connections, braces, fasteners, and anchorage devices as shown, or if not shown, as required to construct complete fabricated units that are tight, secure and capable of resisting expected loads without damage or permanent deformation.

BELOW IS EXAMPLE ONLY. MODIFY FOR VERY LIGHT OR HEAVY LOADING.

1. Expected Shelf Loads: Self-weight of shelf section plus live-loads as follows for size indicated:
 - a. Less than 10-inches deep: 25 lbf per lineal foot.
 - b. 10-inches deep to 14-inches deep: 50 lbf per lineal foot.
 - c. Over 14-inches deep to 18-inches deep: 75 lbf per lineal foot.
 - d. Over 18-inches deep: 100 lbf per lineal foot.

BELOW IS UNISTRUT'S PERMAGREEN FINISH. DELETE IF ANOTHER FINISH IS REQUIRED.

2. Finish: Factory applied standard paint coating.

DELETE BELOW IF PRIMED-ONLY FINISH ABOVE IS RETAINED.

3. Finish: Factory applied primer and alkyd paint finish coats.
 - a. Finish Color: Match casework finish.
 - b. Finish Color: Match fume hood exterior finish.
 - c. Finish Color: Custom color selected by Architect.
 - d. Finish Color: Selected by Architect from mfr's standard casework colors.

2.8 MISCELLANEOUS FABRICATIONS

DELETE BELOW IF NO WOOD PIPE CHASE COVER. REVISE TO SUIT PROJECT DETAILS. MODIFY FOR P.LAM. UNITS

- A. Wood Pipe Enclosure Covers: Fabricate units of red oak veneer plywood matching casework. Construct with chrome plated screw fasteners and grommets to allow removal of a single panel, providing access to pipes and conduit concealed by the enclosure.
 1. Provide indicated base trim as follows:
 - a. "Fry Reglet"; Shape No. 1680; 6063-T5, .050" thick aluminum with black, "Duranar" finish. Install with mitered joints, neatly cut and butted tight.

DELETE BELOW IF NO METAL PIPE CHASE COVER. REVISE TO SUIT PROJECT DETAILS.

- B. Metal Pipe Enclosure Covers: Fabricate units of metal materials matching casework. Provide chrome plated screw fasteners and grommets to allow removal of a single panel, providing access to pipes and conduit concealed by enclosure.

DELETE BELOW IF NO WOOD PRIVACY PANELS AT DESKS. MODIFY FOR P.LAM. UNITS

- C. Wood Privacy Panels: Fabricate units of red oak veneer plywood matching casework; and of dimensions and configuration shown. Use concealed fasteners where practicable.

THE FOLLOWING IS A UNISTRUT-AND-NYLON BELT SYSTEM SIMILAR TO UNITS IN DOW CHEMISTRY BUILDING

- D. Tank Restraints: Provide units as shown on drawings, complete with necessary fasteners and anchors, as required for a complete installation:

1. Nylon Strap: Provide 1 inch wide by 54 inch long nylon strap with brass buckle; equal to AGM Container Controls, Inc., Tuscon, Arizona <http://www.agmcontainer.com> (1-800-995-5590).

USUALLY MODIFY THE FOLLOWING TO ELIMINATE SPECIFIC MODEL NUMBERS. NUMBERS SHOULD BE INDICATED ON DRAWINGS.

2. Restraint Bracket: Provide continuous cold-rolled steel channel section equal to Unistrut P-3300. Provide P-1713 attachment brackets at both ends of nylon strap.
- E. Tack strips: Provide 2" aluminum rail with tackable tan cork insert and flat end stops. Mount per manufacturer's recommendation using concealed fasteners.
1. Manufacturers:
 - a. Cig-Jan Products, Ltd.
 - b. Claridge Products and Equipment, Inc.
 - c. Marsh Chalkboard Co.; Div. Marsh Lumber Co.
 - d. Polyvision Corp.
- F. Custom drying rack assembly: Refer to details on Drawings.

ADD DESCRIPTION HERE OF SPECIAL UNISTRUT FABRICATIONS.

2.9 SINKS

- A. Tub Sinks, General: Fabricate tub sinks of monolithic construction without seams, with bottoms pitched to drain outlets, and as follows:

THE FOLLOWING REQUIREMENTS ARE APPLICABLE TO MOST TUB SINKS. SELECT MATERIAL TYPES APPLICABLE TO PROJECT.

1. Sizes: as indicated or mfr's closest stock size of equal or greater volume, as acceptable to Architect.
2. Outlets: 1-1/2 inch diameter, 2 3/4" inch minimum length, fabricated of cast epoxy resin, or stainless steel; of same material as sink.

DELETE BELOW IF NO RESIN TUB SINKS.

- B. Cast Epoxy Resin Tub Sinks: Nonglare black, molded in one piece with surfaces smooth, corners coved and bottom sloped to outlet. Minimum physical properties and chemical resistance as specified for cast epoxy resin tops; 1/2-inch minimum thickness.

DELETE BELOW IF NO STAINLESS STEEL TUB SINKS.

- C. Stainless Steel Tub Sinks: 18 gage, Type 316, with No. 4 satin finish.
1. Fabricate with horizontal and vertical corners rounded to at least 5/8 inch radius. Slope sink bottoms to pitch to outlet.
 2. Provide double wall construction for sink partitions with top edge rounded to at least 1/2 inch diameter.
 3. Continuous butt weld joints and provide factory punching for fixtures.

BuildingName

The Description of the Project

P0000000 0000 Issued for: BID 123553 - - 15

4. Apply approximately 1/8 inch thick heat resistant underseal to undersink surfaces for condensation prevention and sound deadening.
5. Where stainless steel sinks occur in stainless steel tops, factory assemble sinks and tops into one integral unit with welds ground smooth and polished to near invisibility.

DELETE BELOW IF NO CUP SINKS.

- D. Cup Sinks: Fabricate cup sinks of cast epoxy resin or stainless steel as indicated on drawings. Conform to requirements specified for materials as specified for tops or sinks.

DELETE BELOW IF NO STAINLESS STEEL SCULLERY SINKS.

- E. Stainless Steel Scullery Sinks: 18 gage, Type 316, with No. 4 satin finish.
1. Fabricate with horizontal and vertical corners rounded to at least 5/8 inch radius. Slope sink bottoms to pitch to outlet.
 2. Provide double wall construction for sink partitions with top edge rounded to at least 1/2 inch diameter.
 3. Continuous butt weld joints and provide factory punching for fixtures.
 4. Apply approximately 1/8 inch thick heat resistant underseal to undersink surfaces for condensation prevention and sound deadening.
 5. Where stainless steel sinks occur in stainless steel tops, factory assemble sinks and tops into one integral unit with welds ground smooth and polished to near invisibility.

REVIEW WITH MECHANICAL ENGINEER TO ENSURE THAT ALL LABORATORY SERVICE ITEMS ARE SPECIFIED AND COORDINATED. SPECIFICALLY, EMERGENCY SHOWERS AND EYEWASHES ARE SOMETIMES MISSED ON PROJECTS.

2.10 MECHANICAL SERVICE FIXTURES

- A. Service Fixtures, General: Provide units complete with washers, locknuts, unions, nipples and other accessories for positive mounting to supporting laboratory units. Include wall and deck flanges, escutcheons, handle extension rods, remote valves, and similar items required. Fabricate units to withstand test pressure of 100 psig, unless otherwise indicated.
1. Service fixtures are indicated on drawings by symbols, with design type of each fixture indicated by letter and number reference marks.
 2. Handles: Provide 3-arm or 4-arm forged brass handles for valves, stops, faucets, remote controls, and cocks, except for ground key cocks, and micro-adjustable needle cocks.
 3. Hand of Fixtures: Provide right hand fixtures.
 4. Service Outlets Identification: Provide colored plastic index disks with embossed identification letters at each service fixture handle or knob. Secure disks to fixture handles to be tamperproof.

- B. Material and Finish: Fabricate service fixtures from cast or forged red brass containing a minimum of 81 percent copper. Exposed surfaces including fittings and escutcheons: polished chrome plated finish. Fixtures fabricated of plastic are not acceptable in any application, except as follows:
1. Distilled Water Fixtures: As indicated.
 2. Fixtures Inside Fume Hoods: Solvent resistant plastic coated brass as indicated.

EDIT THE FOLLOWING TO SUIT PROJECT.

USE BELOW FOR ECONOMY GRADE UNITS. THESE CANNOT BE FINELY CONTROLLED AND ARE INTENDED FOR "ALL-ON" OR "ALL-OFF" USE.

- C. Ground Key Type Hose Cocks: Tapered core and handle of one piece forged brass, ground and lapped, held in place under constant spring pressure.

USE BELOW WHERE RESEARCHERS REQUIRE UNITS THAT CAN BE FINELY CONTROLLED.

- D. Needle Valve Type Hose Cocks: Provide units with renewable, self-centering floating cones and renewable seats of stainless steel or monel metal. Provide units designed for 100 psig operating pressure.

- E. Water Valves and Faucets: Provide units with renewable barrel locked in valve body. Barrel shall contain all wearing parts, with renewable disks.

1. Furnish all water faucets with integral vacuum breakers in goose neck, regardless of model number indicated on drawings.

INCLUDE ABOVE EXCEPT IN CHEMISTRY BUILDING.

2. Provide bench-top mounted gooseneck water faucets with fittings required to allow gooseneck to swivel 360 degrees.
3. Provide each fixture with an integral vacuum breaker, regardless of model number indicated on drawings or in schedules.

BELOW IS STANDARD DI UNIT. NOTE THAT THIS PARAGRAPH SPECIFIES MODEL NUMBERS, WHICH IS ATYPICAL. USUALLY DELETE MODEL NUMBERS HERE AND INCLUDE THEM ON DRAWINGS.

- F. Brass Distilled (Purified) Water Fixtures: Provide units fabricated of forged brass, with polypropylene internal construction, and with no metal parts in contact with water. Provide each fixture with self-closing valves (unless otherwise indicated), and with a polypropylene vacuum breaker:

1. Deck Mounted Fixtures: Model 7833SC-7110; Watersaver.

DELETE ABOVE OR BELOW, OR RETAIN BOTH TO SUIT PROJECT.

2. Panel Mounted Fixtures: Model 7834SC-7110; Watersaver.

DELETE TWO FIXTURES LISTED ABOVE AND SUBSTITUTE NON-SELF-CLOSING MODELS BELOW IF CLIENT WILL NOT ACCEPT THE SELF-CLOSING MODEL. FIRST FIXTURE LISTED IS DECK-MOUNTED AND SECOND FIXTURE IS PANEL-MOUNTED.

3. Deck Mounted Fixtures: Model 7833-7110; Watersaver.
4. Panel Mounted Fixtures: Model 7834-7110; Watersaver.

DELETE DI UNITS ABOVE AND INCLUDE ALL-PLASTIC CONSTRUCTION UNIT BELOW FOR ECONOMY AT REQUEST OR CLIENT.

- G. PVC Distilled (Purified) Water Fixtures: Provide units fabricated of PVC, with no metal parts in contact with water. Provide each fixture with self-closing lever valve (unless otherwise indicated), and with a PVC vacuum breaker:
1. Product: Subject to compliance with requirements, provide Filterchem SVG-50"; Special Plastics Systems, Alhambra, Ca.

DELETE BELOW IF NONE.

- H. Fixtures in Fume Hoods: Provide valves controlled from face of hood. Use angle valves where required.

SELECT ONE OF THE FOLLOWING FAUCET TYPES

1. Faucets: Provide wall-mounted gooseneck style faucets in hoods.
2. Faucets: Provide wall-mounted, hose cock water outlets in hoods.
 - a. Backflow Preventer: Provide manufacturer's standard in-line backflow preventer (vacuum breaker) installed outside hood interior between valve body and outlet for each water faucet.
3. Hose Cocks: Provide units with acid and solvent resistant baked-on plastic coating in mfr's standard color.

DELETE BELOW IF NONE. NOTE THAT THIS PARAGRAPH SPECIFIES MODEL NUMBERS, WHICH IS ATYPICAL. USUALLY DELETE MODEL NUMBERS HERE AND INCLUDE THEM ON DRAWINGS.

- I. Deck Mounted Emergency Eyewash: Provide swinging dual-head units activated by pulling the arm into position for use. Unit to have plastic heads and polished chrome arm:
1. Deck Mounted Unit: Model 7610; Haws.

SELECT ABOVE OR BELOW OR BOTH TO SUIT PROJECT. ABOVE IS MOUNTED AT THE REAR OF THE SINK ADJACENT TO THE FAUCET AND PULLS DOWN AND FORWARD FOR USE. BELOW IS MOUNTED ON THE SIDE OF THE SINK AND PULLS FORWARD HORIZONTALLY FOR USE. IF HANDICAP ACCESSIBILITY IS REQUIRED, A DIFFERENT TYPE OF FIXTURE MAY BE REQUIRED.

2. Deck Mounted Unit: Model 7611; Haws.

2.11 ELECTRICAL SERVICE FIXTURES

- A. Service Fixtures: Provide units complete with metal housing or box; necessary receptacles, terminals, switches, pilot lights, device plates, and fittings and gaskets required for mounting on casework. Provide only fixtures with Underwriter's Laboratories label.

1. Service fixtures are indicated on drawings by symbols, with design type of each fixture indicated by letter and number reference marks.
- B. Pedestal Type Fixtures: Cast aluminum housing complete with cover plates, neoprene gasket under base, and with specification grade receptacles or other devices indicated. Fabricate units with sloped single face or double face, as indicated, and concealed mounting holes in base for attaching to casework. Provide holes tapped for conduits.
- C. Recessed Type Fixtures: Galvanized steel outlet box, size as required complete with cover plate and receptacles or other devices as indicated.
- D. Cover Plates: Provide stainless steel cover plates for AC outlets and devices.
 1. Stainless Steel, Type 302, satin finish, with formed beveled edges.
- E. Mark the following devices whether shown on drawings or not.
 1. AC receptacles, other than standard 120 volt duplex, grounding type. Indicate voltage and phase.

BELOW USUALLY NOT REQUIRED FUME HOOD LIGHT SWITCHES ARE INCLUDED IN FUME HOOD SECTION.

2. Switches: Indicate equipment being controlled (e.g., "PUMP OUTLET"). Provide units with pilot lights when located remotely from associated equipment or switch, where function is not obvious. Indicate equipment or circuit being energized.
- F. Finishes for Electric Service Fixture Components: Mfr's standard finish. Provide galvanized finish on ferrous fittings.
- G. Receptacles: Furnish AC receptacles for AC circuits, 125 volt, 20 amp, 2 pole, 3 wire, NEMA Type 5-20R, specification grade, extra heavy duty grounding type with nylon or Lexan bodies.
 1. Provide GFCI (ground fault circuit interrupter) receptacles within fume hoods and within 6 feet of sink units. GFCI receptacles shall be rated for 2000 amps interrupting capacity and trip in 25 milliseconds or less when ground currents exceed 5 milliamps.

SELECT ONE OF THE FOLLOWING.

2. Color: Dark brown.
3. Color: Ivory.
4. Products: Subject to compliance with requirements, provide products of one of the following:
 - Arrow Hart.
 - Bryant.
 - Hubbell.
 - Leviton.
 - Pass and Seymour.

RETAIN BELOW FOR FUME HOOD SWITCHES, AND OTHER AUXILLIARY EQUIPMENT SWITCHES (SUCH AS OUTLETS ON THE FACE OF, OR INSIDE, CABINETS).

H. Switches: Furnish single pole, double pole, or 3-way switches, as required, rated 120-277 volts AC and 20 amps, unless otherwise indicated.

1. Furnish pilot light adjacent to toggle switch, where noted as "PL" adjacent to switch identification.

SELECT ONE OF THE FOLLOWING.

2. Color: Dark brown.
3. Color: Ivory.
4. Products: Subject to compliance with requirements, provide products of one of the following:
Arrow Hart.
Bryant.
Hubbell.
Leviton.
Pass and Seymour.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. General: Install plumb, level, true, and straight with no distortions. Shim as required, using concealed shims. Where laboratory furniture abuts other finished work, scribe and apply filler strips for accurate fit with fasteners concealed where practicable.
- B. Base Cabinets: Set cabinets straight, plumb, and level. Adjust sub-tops within 1/16" of a single plane. Bolt continuous cabinets together. Unless otherwise noted, secure individual cabinets with not less than 2 fasteners into floor, where they do not adjoin other cabinets.
 1. Where required, assemble units into one integral unit with joints flush, tight, and uniform. Align similar adjoining doors and drawers to a tolerance of 1/16.
- C. Legs and Aprons: Install with exposed surfaces of legs approximately 1/8 in front of apron faces. Legs set flush or behind apron faces at conditions exposed-to-view are not permitted.
- D. Fillers and Closure Panels: Provide matching filler panels at openings between cabinets and adjacent walls, whether or not indicated on drawings. Provide closure panels at openings into service chases below aprons, whether or not indicated on drawings. Fasten fillers at ends of island benches and all closure panels with Phillips-head screws set in matching grommets, for easy removal.
- E. Wall Cabinets: Securely fasten to solid supporting material. Anchor, adjust, and align wall cabinets as specified for base cabinets.

RETAIN OR DELETE BELOW AS APPLICABLE TO PROJECT.

1. Where reinforcing of metal stud wall system is required, reinforcement is the work of other trades, but responsibility for accurate location and sizing of reinforcement is part of this work.
2. Adjust casework and hardware so that doors and drawers operate smoothly without warp and bind. Lubricate operating hardware as recommended by mfr.

3.2 INSTALLATION OF TOPS

- A. Field Jointing: Where practicable, make in same manner as factory jointing using dowels, splines, adhesives, and fasteners recommended by mfr. Locate field joints as shown, factory prepared so there is no job site processing of top and edge surfaces.
- B. Solid Hardwood, Stainless Steel and Plastic Laminate Tops: Use concealed clamping devices for field joints, locate within 6 inches of front, at back edges and at intervals not exceeding 24 inches. Tighten in accordance with mfr's instructions to exert a constant, heavy clamping pressure at joints.
- C. Natural Stone and Epoxy Tops: Secure to cabinets with epoxy cement applied at each corner and along perimeter edges at not more than 48 inches on center.
- D. Workmanship: Abut top and edge surfaces in one true plane, with internal supports placed to prevent deflection, and as follows:
 1. Solid Hardwood, Stainless Steel and Plastic Laminate: Provide flush hairline joints in top units using clamping devices.
 2. Natural Stone and Epoxy Resin: Use mfr's recommended adhesives and holding devices to provide joint widths not more than 1/16 inch wide at any location, completely filled and flush with abutting edges.
- E. Where necessary to penetrate tops with fasteners, countersink heads approximately 1/8 inch and plug hole flush with material equal in chemical resistance, color, hardness, and texture to top surface.
- F. After installation, carefully dress joints smooth, remove any surface scratches, clean and polish entire surface.
- G. Provide holes and cutouts as required for mechanical and electrical service fixtures.
- H. Provide scribe moldings for closures at junctures of top, curb and splash with walls as recommended by mfr for materials involved. Use chemical resistant, permanently elastic sealing compound where recommended by mfr.

3.3 INSTALLATION OF SHELVING UNITS

- A. Erect steel channel support system using manufacturer-recommended connectors, fasteners and anchors. Where not otherwise indicated, anchor into concrete structure using expansion bolts designed for the condition encountered. Lay shelves into support structure and fasten each shelf from underside with wood screws.

3.4 INSTALLATION OF SINKS

- A. Coordinate installation of sinks with work of Division 22.
 - 1. Underside Installation: Use mfr's recommended adjustable support system for table-type and cabinet-type installations. Set top edge of sink unit firmly pressed to counter top, set in mfr's recommended chemical resistant sealing compound to produce a tight and fully leakproof joint. Adjust sink and securely support to prevent movement.
 - 2. Semi-flush Installation: Use stainless steel sink frame, complete with clamping lugs and pads. Before setting, apply a full coat of mfr's recommended sealant under rim lip and along top. Omit sink frame in sinks fabricated with integral rim seal.

3.5 INSTALLATION OF ACCESSORIES

- A. Install in a precise manner in accordance with manufacturer's directions. Turn screws to a flat seat; do not drive into place. Adjust moving parts to operate freely without excessive bind.

3.6 CLEANING, ADJUSTING AND REPAIR

- A. Cleaning: Perform the following cleaning operations not more than 7 days prior to substantial completion:
 - 1. Clean shop-finished surfaces, and touch-up as required by Architect, and remove or refinish damaged or soiled areas.
 - 2. Clean glass surfaces installed under this section.
 - 3. Remove construction debris from drawers and cabinet interiors. Clean drawer and cabinet interiors as required to remove dirt, grease, dust and film.
 - 4. Dust exposed surfaces of casework and equipment; polish tops and curbs.
- B. Adjust drawer and door operation of each unit to provide smooth operation, positive latching, and close fit within specified tolerances.
- C. Repair, or remove and replace defective work as directed upon completion of installation.

NUMBER SECTION DESCRIPTION

DIVISION 12 FURNISHINGS

SECTION 124600 - FURNISHING ACCESSORIES

END OF CONTENTS TABLE

DIVISION 12 FURNISHINGS
SECTION 124600 - FURNISHING ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following furniture accessories:
 - 1. Waste receptacles.
 - 2. Wall mounted nylon plastic coat hooks.
- B. Extent of furniture accessories is indicated by provisions of this Section.

1.2 SUBMITTALS

- A. Product data indicating compliance with requirements.
- B. Installation instructions for installation on indicated surfaces.
- C. Schedule showing locations by room number, and number of units required.

PART 2 - PRODUCTS

2.1 WASTE RECEPTACLES

- A. Provide painted steel waste receptacle with vinyl bumper edge, and as follows:
 - SELECT ONE OF THE FOLLOWING COLORS**
 - 1. Color: Black.
 - 2. Color: Beige.
 - 3. Color: Grey.
 - 4. Color: Putty.
 - 5. Size: Approximately 21-inches by 11-inches by 30 inches.
- B. Product: Model 96R; United Receptacle Co., or equivalent products of Steelcase Corp.

2.2 COAT HOOKS

- A. Nylon Coat Hooks: Cast plastic two-piece units with L-shaped hook and round mounting rose. Provide units with concealed fasteners, designed for wall mounting, and as follows:
 - 1. Size: 3-15/16-inch overall length; 2-3/4-inch rose.
 - 2. Color: Selected by Architect from manufacturer's standard colors.
- B. Manufacturer/Model: Subject to compliance with requirements, provide the following:
 - 1. HEWI.

PART 3 - EXECUTION

DELETE ARTICLE BELOW IF NO COAT HOOKS INCLUDED.

3.1 INSTALLATION

- A. Install coat hooks in compliance with manufacturer's printed instructions. Fasten units indicated to be mounted on drywall walls through reinforcing materials, or if no reinforcing exists, fasten through drywall with cadmium plated steel expansion type anchors.

3.2 WASTE RECEPTACLE SCHEDULE

- A. Provide 1 waste receptacle in each toilet room.

SECTION 124813 - ENTRANCE FLOOR MATS AND FRAMES

END OF CONTENTS TABLE

DIVISION 12 FURNISHINGS
SECTION 124813 - ENTRANCE FLOOR MATS AND FRAMES

*THE FOLLOWING UNIT HAS BEEN USED SUCCESSFULLY BY DOUG - OTHER
TYPES AVAILABLE, REFER TO MANUFACTURER'S CATALOGS*

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of floor mats and frames is indicated on drawings.
- B. Type of floor mat and frame includes:
 - 1. Recessed units for retrofit application.

1.2 SUBMITTALS

- A. Submit manufacturer's product literature indicating compliance with requirements.
- B. Samples: Submit samples of carpet tread colors for initial selection.

PART 2 - PRODUCTS

2.1 RECESSED MAT

- A. Fabrication: Fabricate tread rails of black co-extruded vinyl and acrylic with soft support legs to accommodate moderate imperfections in floor finish. Continuously connect tread rails in ball and socket arrangement. Fabricate assembly so that mat can be rolled up and removed for cleaning.
 - 1. Spacing Between Rails: Less than 3/16".
 - 2. Tread Surfaces: Colorfast, nylon carpet.
 - a. Tread Color: Selected by Architect from manufacturer's full range of standard colors, of not less than 15 colors.
 - 3. Mat Frame: Block-out design aluminum (for retrofit application) in clear anodized finish. Match frame fillers to treads. Furnish with corner locks and necessary anchors.
- B. Manufacturer/Model: Provide products of Construction Specialties Inc.; "Treadline" model T1HCLB, or subject to compliance with requirements, equivalent products of Arden Architectural Specialties Inc., Balco Inc., J.L. Industries., MM Systems Corp., Pawling Corp., or Reese Enterprises Inc.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Examine condition of floor prior to installing mat frame. If unacceptable for proper mat installation, correct deficiencies before installing frame.
- B. Securely anchor frame to floor, in accordance with manufacturer instructions. Isolate metal parts from concrete and grout to prevent galvanic action. Use tape, thick coating or other means recommended by manufacturer to effect separation.
- C. Install mat in frame. Ensure maximum 3/16-inch clearance between mat and frame. Repair or replace improperly fitting mat.

NUMBER SECTION DESCRIPTION

DIVISION 13 SPECIAL CONSTRUCTION

SECTION 132100 - CONTROLLED ENVIRONMENT ROOMS

END OF CONTENTS TABLE

DIVISION 13 SPECIAL CONSTRUCTION
SECTION 132100 - CONTROLLED ENVIRONMENT ROOMS

SPECIAL ATTENTION SHOULD BE GIVEN TO COORDINATING WORK OF THIS SECTION WITH SECTION 123553 LABORATORY CASEWORK AND MECHANICAL AND ELECTRICAL WORK. SECTION 055000 "METAL FABRICATIONS" MAY BE REQUIRED TO SUPPORT EXTERIOR MOUNTED CONDENSER UNITS.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent and type of controlled environment room are indicated on Drawings and by provisions of this Section.
- B. Work included in this Section:
 - 1. Plumbing and wiring related to lighting, alarm, control and refrigeration systems, ready for hook-up to building services are included in this Section.

DELETE BELOW IF HUMIDITY CONTROL SYSTEM NOT INCLUDED.

- 2. Plumbing and wiring related to humidity control system, complete and ready for hook-up to building services, are included in this Section.

USUALLY RETAIN BELOW. REVISE IN COORDINATION WITH ELECTRICAL ENGINEER IF THIS WORK WILL BE PERFORMED UNDER DIVISION 26.

- 3. An electrical panel, receptacles and related conduit, surface raceways, wiring, boxes, and connections are included in this Section.
 - 4. Cutting and patching of penetrations in insulated sandwich panels for connection of plumbing and electrical services work of Divisions 22 and 26, is included in this Section.

DELETE BELOW IF SHELVING NOT INCLUDED IN THIS SECTION

- 5. Floor and wall mounted wire shelving are included in this Section.

- C. Related Sections: The following Sections contain requirements that relate to this Section:

INCLUDE BELOW IF ROOM WILL BE INCLUDED AS AN ALTERNATE.

- 1. Division 01 Section "Alternates" for additional requirements related to this Section.

DELETE BELOW IF NONE. IF PARA RETAINED, MODIFY TO SUIT PROJECT.

- 2. Division 12 Section "Laboratory Casework" for laboratory furniture, tops, sinks, faucets and service fittings.

COORD. BELOW WITH ARTICLE "MECHANICAL AND ELECTRICAL SYSTEMS AND ACCESSORIES."

- 3. Division 22 for plumbing services and connections to sink and service fittings within controlled environment room.

COORDINATE BELOW WITH ELECTRICAL ENGINEER. REVISE BELOW AND COORDINATE WITH PLUMBING AND WIRING ARTICLE ABOVE IF OUTLETS ARE REQUIRED TO BE RECESSED IN WALLS.

4. Division 26 for connection of equipment to building electrical service.

1.2 QUALITY ASSURANCE

- A. Fire-Rating: Panel construction shall meet UL flame spread rating of 25.
- B. Sanitary Construction: Provide unit with National Sanitation Foundation (NSF) seal on door.
- C. Personnel Safety: Comply with Occupational safety and Health Administration regulations regarding personnel alarms and equipment location.
- D. Plumbing Systems: Comply with the requirements of the "Michigan Plumbing Code 20033.
- E. Ventilation Systems: Comply with the requirements of the Michigan Building Code 2003 and Michigan Mechanical Code 2003 with respect to minimum ventilation requirements.
- F. Electrical Equipment and Wiring:
 1. Comply with requirements of the "National Electrical Code" of the National Fire Protection Association (NFPA).
 2. Provide electrical components, including, but not limited to refrigeration equipment, lighting, receptacles, and heated door section listed and labeled by Underwriter's Laboratories, Inc. (UL) for electrical safety.
 3. Provide control panels and electrical panels listed and labeled by UL, ETL, MET, or CSA.

1.3 SUBMITTALS

- A. Product Data: Submit Manufacturer's literature indicating compliance with requirements, and the following:
 1. Installation instructions.
 2. Operating and maintenance instructions for each item of equipment.
- B. Shop Drawings: Showing construction of box and ancillary equipment, including component data sheets, control diagrams, and operating sequence information.
 1. Provide a detailed power riser diagram specific to the controlled environmental room to be supplied.
- C. Pre-Training Submittals: Submit start-up, functional test, and performance test reports not less than 2 weeks prior to conducting training session.
- D. Product Warranties: Submit manufacturer's standard written warranty for each environmental room covering, at minimum, one year, parts and labor.

1.4 DESIGN REQUIREMENTS

*DELETE BELOW IF UNIT WILL NOT BE USED FOR CRYSTALLIZATION
(WHICH REQUIRE VIBRATION RESTRICTIONS).*

- A. Crystallization Room: In environmental rooms designated "crystallization room", provide units with the following special features:
1. Provide quiet switches in lieu of standard mechanical relays and solenoids.
 2. Provide self-closing, self-sealing doors.
 3. Provide remote mounted compressor and condenser units.
 4. Provide refrigeration system piping mounted on vibration isolators and not mounted along walls.

*DELETE BELOW IF UNIT WILL NOT BE USED FOR ANIMAL HOLDING
(WHICH REQUIRE NOISE RESTICTIONS).*

- B. Animal Room: In environmental rooms designated "animal room", provide the following special feature:
1. Provide quiet switches and relays in lieu of standard mechanical relays and solenoids.

1.5 PROJECT CONDITIONS

- A. Existing Clearances: Clear headroom above the unit is restricted by piping and ductwork. Maximum clear dimension from the finished floor to underside of the lowest obstruction is as follows:

MODIFY EXMPLE BELOW TO SUIT ACTUAL PROJECT CONDITIONS.

1. feet, 9 inches.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Subject to compliance with requirements, provide products of one of the following:

Bahnson Environmental Specialties
Environmental Growth Chambers
Harris Environmental Systems, Inc.
Insulated-Structure, Ltd.
Nor-Lake, Inc.

2.2 ENVIRONMENTAL ROOM ENCLOSURE

- A. Size: Environmental room dimensions are indicated on Drawings. Provide rooms of manufacturer's standard sizes, but within 12-inches of dimensions indicated on drawings.

*IF HEIGHT NOT INDICATED ON DRAWINGS, INCLUDE ONE OF THE
FOLLOWING. NOTE THAT IT WILL BE DIFFICULT OR IMPOSSIBLE TO
INSTALL A GRID CEILING IN ROOMS LOWER THAN 8'-7".*

1. Room Height: 7 feet, 7 inches outside dimension.

2. Room Height: 8 feet, 1 inch outside dimension.
3. Room Height: 8 feet, 7 inches outside dimension.
4. Room Height: 9 feet, 7 inches outside dimension.

B. Wall and Ceiling Panels: Manufacturer's standard rigid, foamed-in-place urethane insulation core with metal panel skins adhered to exterior and interior sides. Provide all mechanical latching devices, gasketing and trim required for positive seal between panels and neat finished appearance.

1. Panel Thickness: 4-inches
2. Thermal Performance: U-value of assembled panels not less than 0.29.
3. Panel Skins: Provide metal panel skins of indicated materials. Paint metal panels in areas exposed to view in finished construction.
 - a. Exterior Floor and Ceiling: 14 gage galvanized steel.

BELOW IS TYPICAL, BUT OPTIONS INCLUDE STAINLESS STEEL AND GALVANIZED STEEL - CONSULT MFR'S LITERATURE.

- b. Exterior Wall Panels: 0.040-inch thick, stucco embossed, aluminum.
- c. Interior Wall Panels: 0.040-inch thick, stucco embossed, aluminum.
- d. Colors: Provide white interior and white exterior.

DELETE BELOW IF WALL-MOUNTED SHELVING, OR IF FLOOR-TO-CEILING UNISTRUT SUPPORTS WILL BE PROVIDED. COORDINATE BELOW WITH DRAWINGS.

4. Reinforcing: Provide reinforcing in the form of wood blocking or heavy-gage steel stripping, concealed within walls at locations indicated to receive wall mounted casework, shelving or equipment.

DELETE BELOW IF NO ELEVATED CO2 ROOMS

5. Panel Sealants for Elevated CO2 Room: In addition to requirement of mechanical latching device (cam-lock panels), provide silicone sealant at all panel joints for redundantly sealed, air-tight construction.

C. Doors: Provide units with the following characteristics:

1. Size: 36-inches by 78-inches.

USUALLY SELECT SWINGING TYPE BELOW.

2. Type: Flush mounted, swinging type.
3. Type: Sliding type.

SELECT SELF-SEALING FOR CRYSTALLIZATION ROOMS.

4. Operation: Self-closing hinges.
5. Operation: Self-closing, self-sealing.

MODIFY BELOW TO SUIT PROJECT REQUIREMENTS.

6. Observation Window: 12-inches by 12-inches (approximate dimension) triple pane observation window.

MODIFY BELOW TO SUIT PROJECT REQUIREMENTS.

- a. Electrically heat windows in freezer doors.

MODIFY BELOW TO SUIT PROJECT REQUIREMENTS.

7. Latching Hardware: Positive latching hardware with door handle and inside safety release. Provide cylinder locks in door handles, except in freezer unit (if applicable).

LIMIT KEYING INFORMATION TO BELOW. DO NOT INCLUDE SPECIFIC DEPARTMENTAL KEYING INFORMATION IN THIS SECTION.

- a. Manufacturer/Model of Cylinders: Best Co., only. Contact University of Michigan Key Office at (734) 764-3481 for cylinder and keying requirements.

RETAIN ALL BELOW.

8. Gaskets and Seals: Replaceable magnetic gaskets on sides and top, and adjustable sweep seals on bottom. Provide openings with stainless steel threshold.
9. Heat opening perimeter as required to prevent condensation.

INSULATED FLOORS BELOW MAY BE OMITTED IN WARM ROOMS AND COLD ROOMS WHERE NECESSARY FOR BARRIER-FREE APPLICATION OR HEIGHT RESTRICTIONS. IN COLD ROOMS, THIS CAN RESULT IN CONDENSATION ON UNDERSIDE OF THE SLAB, SO IT IS BEST TO CONSIDER ELIMINATING INSULATED FLOORS ONLY IN SLAB-ON-GRADE CONSTRUCTION.

- D. Floors: Insulated panels of construction similar to wall panels, except able to withstand floor loads of 600 psf.

1. Panel Thickness: 3-1/2 inches, minimum.
2. Floor Finish: 14 gage galvanized steel.
3. Floor Covering: 1/8-inch thick diamond tread PVC mat in manufacturer's standard color.

INSULATED FLOORS REQUIRE RAMPS (UNLESS A DEPRESSED SLAB CAN BE PROVIDED). RAMPS CREATE BARRIERS TO ACCESS THAT MUST BE DEALT WITH - SEE NOTES BELOW.

- E. Ramps: Provide ramp of type indicated, fabricated of minimum 1/8-inch thick Type 6061-T6 aluminum tread plate with diamond-check pattern, or flat aluminum plate with durable, non-skid coating. Provide fire-retardant-treated wood substructure designed to support structural loads equal to, or greater than, those specified for the insulated floor structure. Provide ramp of width indicated on Drawings, or if not indicated, 48 inches wide; and of indicated length or slope.

1. Fixed Exterior Ramp: Provide where indicated on Drawings, or if not indicated, one unit at each door where a transition from insulated floor to building floor occurs.

SELECT ABOVE OR BELOW.

2. Portable Exterior Ramp: Provide where indicated on Drawings, or if not indicated, one unit at each door where a transition from insulated floor to building floor occurs.

INCLUDE ONE LENGTH OPTION BELOW FOR EITHER OF THE ABOVE TYPES. ALL DISCUSSIONS ASSUME A 4-INCH TOTAL RISE.

OPTION BELOW WILL NOT COMPLY WITH STATE ACCESSIBIITY CODES OR ADA. 36 INCHES IS MFR STANDARD, BUT UM HAS HAD SUCCESS OBTIANING VARIANCES WITH THE 42-INCH EXTERIOR RAMP OPTION BELOW. THE STATE PREFERS THE 42-INCH LENGTH, WHICH GIVES THE CODE-REQUIRED 1:10 SLOPE FOR MAX. 6-INCH RISE (EXCEPTION MUST BE REQUESTED FOR THE MISSING LANDING AT DOOR).

- a. Length: 42 inches.

OPTION BELOW DOES NOT NEED LANDING, ACCORDING TO MICHIGAN BUILDING CODE (LESS THAN 1:12), AND DOES NOT REQUIRE VARIANCE. USE THIS IF SPACE IS AVAILABLE.

- b. Length: 50 inches.

USUALLY DELETE BELOW AND RETAIN ABOVE - MOST USERS DO NOT WANT AN INTERIOR RAMP SINCE IT CREATES A TRIPPING HAZARD. USE ONLY WHERE EXTERIOR RAMP CANNOT BE PROVIDED BECAUSE OF SPACE CONSIDERATIONS. AN EXCEPTION FOR RAMP LENGTH AND MISSING LANDING IS REQUIRED.

- 3. Fixed Interior Ramp: Maximum 20-inches long, provided at door. Include non-skid PVC mat.
- F. Trim Strips and Closure Panels: Provide closure and trim pieces as indicated. Use materials and finishes matching exterior panel skins.
- G. Ceiling Plenum: No plenum within room.

SELECT EITHER ABOVE OR BELOW. NOTE THAT GRID CEILING MATERIAL WILL REDUCE AVAILABLE HEADROOM TO BELOW THE BOTTOM OF THE LOWEST MECHANICAL ELEMENT (USUALLY THE CONDENSATE DRAIN LINE OUT OF THE FAN COIL UNIT IN ROOM). DO NOT SELECT PLENUM OPTION WITH ROOMS SHORTER THAN 8'-7" UNDER ANY CIRCUMSTANCES.

GRID IS PREFERRED BY MED. SCHOOL WHICH MAY REQUIRE VERY HIGH AIR VELOCITIES DUE TO ELECTRICAL LOAD REQUIREMENTS. BE SURE TO INVESTIGATE AND RESOLVE POTENTIAL CONFLICTS BETWEEN AVAILABLE HEADROOM AND GRID.

- H. Ceiling Plenum: Provide white acrylic plastic, 1/2-inch square, "open cell" grid type ceiling supported by medium duty, painted steel suspension system to form plenum for distribution of air and light. Secure grid to T-bar supports to prevent rattling.

FOR PROJECTS WITH MULTIPLE ENVIRONMENTAL ROOMS, CREATE SEPARATE "OPERATING REQUIREMENT" ARTICLES FOR EACH TYPE OF ROOM AND RE-TITLE ACCORDINGLY. EXAMPLE: "COLD ROOM OPERATING REQUIREMENTS" AND "WARM ROOM OPERATING REQUIREMENTS"; OR "ROOM TYPE NO. 1"/"ROOM TYPE NO. 2". ENSURE CONSISTANT NOMENCLATURE ON DRAWINGS.

2.3 ENVIRONMENTAL ROOM OPERATING REQUIREMENTS

- A. System Operation, General: Provide units that are capable of maintaining selected set point(s), within indicated temperature and humidity control and uniformity ranges, when operated under the indicated maximum and minimum thermal loading conditions. Provide units with compressor running continuously, and with evaporator unit fan operating on demand. Size compressor and related components to operate under both minimum and maximum loading conditions without "short cycling," excessive wear on the compressor, or throttling of the hot gas bypass valve. Design units to operate without excessive compressor noise, and without high air velocities within the occupiable space of the room.

REVIEW THE FOLLOWING VALUE WITH ELECTRICAL ENGINEER.

1. Available Building Power Supply: 208V, 3 phase, 4 wire plus ground.

- B. Environmental Control: Provide environmental rooms complying with the following temperature and humidity control requirements:

TEMPERATURE SET POINT OR RANGE MUST BE DETERMINED BY CLIENT.

BELOW DESCRIBES STANDARD COLDROOM WITH A FIXED SET POINT.

1. Temperature Set Point: 4 degrees C., constant.

BELOW DESCRIBES A ROOM CAPABLE OF A RANGE OF TEMPERATURES FROM WARM TO COLD.

2. Temperature Range: 0 to 60 degrees C., constant.

BELOW IS NOT RECOMMENDED PRACTICE. ELEVATED CO2 POSES HEALTH RISK.

3. to 60 degree C., elevated CO2 environment.
4. Temperature Control Range: Provide units capable of maintaining temperature within the following range, when measured at a single point within the room over time:

RETAIN ONE OF THE FOLLOWING VALUES IN CONSULTATION WITH CLIENT - USUALLY +/- 0.5 DEG C. IS ACCEPTABLE. NOISE ASSOCIATED WITH THE OPERATION OF THE VALVE TYPE REQUIRED FOR +/- 0.2 DEG. C. ABOVE HAS PROVED ANNOYING TO OCCUPANTS.

- a. +/- 0.2 deg. C.
 - b. +/- 0.5 deg. C.
5. Uniformity Range: +/- 0.5 degree C, or better, when measured between a variety of points anywhere within the room, excluding areas of the room within 12 inches of walls, floor, and ceiling.
 6. Humidity Range: As follows:

BELOW IS MOST COMMON. HUMIDITY CONTROL SYSTEMS ADD CONSIDERABLE COST AND COMPLICATIONS TO UNITS.

- a. Uncontrolled, except that room supplier is responsible for providing system which ensures that condensation will not form on horizontal or vertical surfaces within the room.

BELOW WILL KEEP CONDENSATION FROM FORMING ON COLD SURFACES OF TYPICAL 4 DEG. C. ROOM.

- b. Less than 20 grains/lb.

RETAIN BELOW OR MODIFY FOR SPECIFIC REQUIREMENT OF RESEARCH BEING CONDUCTED.

- c. Ambient to 90 percent RH.

USUALLY DELETE BELOW - ELEVATED CO2 ROOMS ARE RARE.

- 7. CO2 Range: 0 to 10 percent.

- C. Thermal Loads: Provide environmental rooms capable of maintaining indicated controlled temperature and humidity conditions when operating under the following thermal loads:

CLIENT MUST DETERMINE DOOR OPENINGS BELOW. 8 PER HOUR IS A FAIRLY HIGH FREQUENCY OF USE.

- 1. Door Openings: Maximum of 8 per hour, for 8 working hours per day.
 - a. Temperature and humidity range recovery time for a 5-second door open condition: Not more than 5 minutes.

CLIENT MUST DETERMINE OCCUPANTS BELOW. 2 IS USUALLY THE MAXIMUM.

- 2. Number of Occupants: Maximum of 2, for 8 working hours per day.
- 3. Lighting: As indicated in "Electrical Systems and Accessories" Article of this Section.

CONSULT WITH CLIENT TO DETERMINE APPROPRIATE HEAT LOAD FROM EQUIPMENT EXPECTED TO OPERATE WITHIN THE ROOM, AND DURATION.

- 4. Owner's Equipment: Minimum thermal load from Owner's movable equipment within the room is a continuous zero-load condition. Maximum thermal load from Owner's movable equipment within the room is as follows:

SELECT VALUES BELOW IN COORDINATION WITH OWNER. NOTE THAT 1 KW IS FREQUENTLY ACCEPTABLE. NOTE THAT POSSIBLE THERMAL LOAD CANNOT EXCEED AVAILABLE ELECTRICAL POWER, AND IS FREQUENTLY MUCH LESS THAN THAT VALUE. CONSULT WITH MECHANICAL ENGINEER IF IN DOUBT.

- a. kilowatts, operating for 24 hours per day.
- b. kilowatts, operating for 8 hours per day.
- c. kilowatts, operating for 8 hours per day.

IF HUMIDITY CONTROL IS REQUIRED, ADD HUMIDITY-AFFECTING EQUIPMENT SUCH AS WATER BATHS HERE.

- 5. Ambient Conditions Exterior to Room: 60 to 80 deg. F.

DELETE BELOW IF NO FREEZER UNIT

2.4 FREEZER ROOM OPERATING REQUIREMENTS

- A. System Operation, General: Provide units that are capable of maintaining selected set point, within the indicated temperature control and uniformity ranges, when operated under the indicated maximum and minimum thermal loading conditions.

- B. Environmental Control: Provide freezer rooms complying with the following temperature control requirements:
 - 1. Temperature Set Point: Minus 20 degrees C., constant.
 - 2. Temperature Control Range: +/- 0.5 deg. C., when measured at a single point within the room over time.
 - a. +/- 0.5 deg. C.
 - 3. Uniformity Range: +/- 0.5 deg. C, or better, when measured between a variety of points anywhere within the room, excluding areas of the room within 12 inches of walls, floor, and ceiling.
 - 4. Humidity: Uncontrolled.
- C. Thermal Loads: Provide freezer rooms capable of maintaining indicated controlled temperature when operating under the following thermal loads:
 - 1. Door Openings: 4 per hour, during 8 working hours per day.
 - 2. Number of People: Maximum of 1, for a duration of 5 minutes or less.
 - 3. Lighting: As indicated in "Electrical Systems and Accessories" Article of this Section.

BELOW IS AN EXAMPLE ONLY. VERIFY WITH CLIENT AND EDIT TO SUIT ACTUAL CONDITIONS.

- 4. Product Load: Approximately 1 gallon of room temperature liquid introduced at 24 hour intervals.
- 5. Ambient Conditions Exterior to Room: 60 to 80 deg. F.

2.5 PLUMBING AND REFRIGERATION SYSTEMS AND ACCESSORIES

- A. Refrigeration, General: Provide units with factory installed refrigeration systems, complying with indicated requirements of "Operating Requirements" Article of this Section, and as follows:
 - 1. Plumbing: Provide factory-and-field installed equipment, including piping, fittings and connections required to provide a complete, ready-to-operate refrigeration system.
 - a. Use pre-charged coolant lines where possible.
 - 2. Electrical: Provide factory-and-field installed conduit, wiring, fittings and connections (including compressor disconnect switch) required to provide a complete, ready-to-operate refrigeration system. Terminate wiring in power panel as indicated in "Electrical Systems and Accessories" Article of this Section.
- B. Condensing Unit: Factory assemble compressor/condenser units using UL listed or recognized components. Compressor shall be of semi-hermetic type. Use manufacturer's standard non-CFC refrigerant for condition of use. Pre-wire and factory pipe units.

CONSULT WITH MECHANICAL ENGINEER WHEN SELECTING SYSTEM TYPE. CURRENT PREFERENCE IS FOR WATER-COOLED SYSTEMS.

RETAIN BELOW FOR WATER-COOLED SYSTEMS. THESE SYSTEMS REQUIRE EITHER A BUILDING DOMESTIC WATER OR CHILLED WATER SUPPLY. BELOW IS FOR CHILLED WATER SUPPLY WITH DOMESTIC WATER BACK-UP.

1. System Type: Provide controlled environment room with water-cooled refrigeration system, for connection to building chilled water supply with domestic water back-up system. Include a control valve to throttle chilled water based on demand, and designed for a 10 deg. F. temperature rise.

MODIFY BELOW IN CONSULTATION WITH MECHANICAL ENGINEER.

- a. Chilled Water Temperature: Approximately 45 deg. F.
- b. Domestic Water Temperature: Approximately 65 deg. F.

SELECT ONE MOUNTING LOCATION FROM THREE CHOICES BELOW - CRYSTALLIZATION ROOMS MUST HAVE REMOTE MOUNTED EQUIPMENT. INSTALLATIONS ON COLDROOM ROOF MAY BE NOISY. A CLEAR, WRITTEN DESCRIPTION OF THE LOCATION MAY BE SUBSTITUTED HERE FOR A LOCATION DRAWING.

- c. Mounting Location: Mount unit on roof of cold room.
- d. Mounting Location: Building interior, as indicated on Drawings.
- e. Mounting Location: Building exterior, as indicated on Drawings.

USUALLY INCLUDE BELOW, EXCEPT FOR REMOTE INSTALLATIONS WHERE NOISE AND VIBRATION TRANSMISSION ARE NOT CRITICAL.

- f. Mounting Type: Mount system components on a single steel frame. Mount compressor on spring isolators sized for specific equipment provided.

RETAIN BELOW FOR AIR-COOLED SYSTEMS. THESE SYSTEMS REQUIRE MOUNTING THE CONDENSER UNIT OUTSIDE THE BUILDING AND SHOULD NOT BE RUN MORE THAN 50-75 FEET FROM THE ROOM.

2. System Type: Provide controlled environment room with an air-cooled refrigeration system.

SELECT ABOVE OR BELOW MOUNTING LOCATION - NOTE THAT CRYSTALLIZATION ROOMS SHOULD HAVE REMOTE MOUNTED REFRIGERATION EQUIPMENT

- a. Mount refrigeration system on building exterior as shown. Provide exterior mounted refrigeration units with all-weather hood and low-ambient controls, suitable for local climate.

USUALLY DELETE BELOW FOR EXTERIOR INSTALLATIONS, UNLESS NOISE AND VIBRATION CONTROL ARE IMPORTANT.

- b. Mounting Type: Mount system components on a single steel frame. Mount compressor on spring isolators sized for specific equipment provided.

BELOW MAKES DRAIN PIPE FROM CONDENSATION PAN A RESPONSIBILITY OF THE ROOM MANUFACTURER. SHOW OR NOTE ROUTE OF DRAIN PIPE (USUALLY TO A SINK OR OTHER WASTE WITHIN THE ROOM) ON DRAWINGS. IF NO SINKS ARE INCLUDED IN THE ROOM, CONSULT WITH MECHANICAL ENGINEER AND POSSIBLY INCLUDE SUBPARA BELOW TO LIMIT ROOM MANUFACTURER'S RESPONSIBILITY TO STUB-OUT ONLY.

C. Evaporator Unit: Provide forced-air type, designed for ceiling installation, complete with condensation collection pan, drain pipe, and, where necessary, condensate pump; and terminated with an air gap at location shown on Drawings, unless otherwise indicated. Provide evaporator units which are UL listed or recognized.

1. Provide units with defroster with automatic, programmable, timed operation.

USUALLY DELETE BELOW, UNLESS COORD. WITH MECHANICAL ENGINEER RESULTS IN DIVISION 15 BEING RESPONSIBLE FOR THE PLUMBING.

2. Stub out drain pipe from condensation collection pan for connection under Division 22.

PRIOR TO EDITING THE PARAGRAPH BELOW, DETERMINE WHETHER ROOM WILL BE OCCUPIED (DEFINED AS ONE OR MORE PERSONS SPENDING ONE HOUR OR MORE CONTINUOUSLY IN THE ROOM AT ANY GIVEN TIME). IF ROOM IS OCCUPIED, INCLUDE THE STANDARD BELOW. IF THE ROOM IS DETERMINED TO BE UNOCCUPIED, ELIMINATE PARAGRAPH BELOW.

D. Ventilation: Built-in fresh-air ventilation system. Comply with the standards below:

BELOW DESCRIBES A SYSTEM IN WHICH VENTILATION AIR IS SUPPLIED FROM THE ROOM IN WHICH THE ENVIRONMENTAL ROOM IS LOCATED. IT ASSUMES THAT THE AIR HANDLING UNIT IS PROVIDING 100% OUTSIDE AIR. IF THE AHU IS PROVIDING LESS THAN 100% O.A., THE MECHANICAL ENGINEER SHOULD MODIFY THE SPECIFICATIONS ACCORDINGLY.

1. Ventilation air supplied from the room within which the package environmental room is located and routed directly to the evaporator inlet. Return air shall be vented through a relief damper in the roof. System shall have an electrically driven centrifugal type ceiling fan. Blade type fans are not acceptable: Minimum 20 cfm per person.

SELECT OPTION BELOW IF ROOM WILL BE UNOCCUPIED OR WILL BE A FREEZER ROOM. IF THIS OPTION IS RETAINED BE SURE TO DESIGNATE ON DRAWINGS WHICH ROOMS MEET THE CRITERIA BELOW. IF NO VENTILATION IS TO BE PROVIDED, BE SURE TO NOTIFY THE CLIENTS THAT THE FOLLOWING SIGN MUST BE POSTED ON THE OUTSIDE OF THE ENVIRONMENTAL ROOM: "NOT FOR USE WITH FLAMMABLE SOLVENTS IN QUANTITIES GREATER THAN 1 L."

E. Omit ventilation in freezer rooms and in unoccupied storage rooms which are designated thus on the Drawings.

F. Humidification System: Manufacturer's standard, electrically powered steam generator, for direct injection of steam into room supply air stream ahead of cooling coils. Provide unit ready for connection to building purified water system, and capable of meeting humidity set point and control range indicated under "Operating Requirements" Article of this Section, and as follows:

A CLEAR, WRITTEN DESCRIPTION COULD BE SUBSTITUTED HERE FOR A LOCATION DRAWING.

1. Location: As shown on Drawing.

2. Duct the humidifier output through the evaporator unit mounted to the environmental room ceiling.
3. Interlock humidifier and cooling controls as required to provide stable interior temperature and humidity ranges.

DELETE BELOW IF NO DEHUMIDIFICATION SYSTEM REQUIRED. MODIFY TO INDICATE TITLE OF DIVISION 15 SECTION REFERENCED IN PARA.

- G. Dehumidification System: Manufacturer's standard desiccant-type air dryer system complete with required sheet metal ductwork between controlled environment room and dehumidifier unit. Connect unit to exhaust duct, specified in Division 23 Section ". Provide unit capable of meeting humidity range control indicated under "Operating Requirements" Article of this Section, and the following:

A CLEAR, WRITTEN DESCRIPTION COULD BE SUBSTITUTED HERE FOR A LOCATION DRAWING.

1. Location: As shown on Drawing.
2. Duct the dehumidifier output through evaporator unit mounted to the environmental room ceiling.
3. Interlock dehumidifier and cooling controls as required to provide stable interior temperature and humidity ranges.
4. Acceptable Models: Subject to compliance with requirements, provide units manufactured by one of the following:
 - a. Munters Cargocaire.
 - b. Brye-Aire.
 - c. Low-Humidity Systems.

USUALLY DELETE BELOW - MAY BE INCLUDED FOR FREEZER ROOMS TO PERMIT DEFROSTING.

- H. Floor Drain: Provide indicated floor drain and cover in environmental room.

DELETE BELOW IF NO ELEVATED CO2 ROOM.

- I. CO2 Sensor and Injection System: Provide CO2 Injection System with digital CO2 Controller with Thermistor Thermal Conductivity Cell and as follows:

1. Operation: Device measuring electrical conductivity of CO2, with factory installed sensors located for optimum performance. Interlock with control mechanism for release of CO2 into air supply of room. Release of CO2 shall be intermittent and only as required to maintain desired CO2 levels. Continuous flow devices are not permitted.
2. Controller Range: 0 to 20 percent.
3. Controller Sensitivity: +/- 0.1 percent.
4. Display: Digital readout of CO2 concentration in environmental room control panel.
5. Fabrication: Factory pre-assemble and test unit in presence of Owner's representative. Notify Owner at least 15 days before test.

2.6 ELECTRICAL SYSTEMS AND ACCESSORIES

- A. General: Provide factory installed conduit, wiring, switches, fittings and connections for each electrically powered accessory and item of equipment required by provisions of this Section. Terminate wiring in an electrical panel as indicated in this Article.

CONTROLLER BELOW IS ALWAYS REQUIRED.

- B. Controllers: Manufacturer's standard digital electronic control unit with lighted digital display and controls and as follows:

DELETE BELOW IF NO ANIMAL OR CRYSTALLIZATION ROOMS.

1. Mechanical relays are not permitted.

SELECT ONE OF THE FOLLOWING TO SUIT PROJECT.

2. Type: Temperature controller.
3. Type: Temperature and humidity controller.

RECORDER BELOW MAY BE OMITTED FOR SMALL SAVINGS IF APPROVED BY THE CLIENT.

- C. Recorders: Manufacturer's standard chart recorder with seven day movement and 10-inch diameter chart for recording conditions within the environmental room. Provide 100 additional papers for future use.

1. Type: Temperature recorder with single pen.

ABOVE IS FOR ENVIRONMENTAL ROOM WITHOUT HUMIDITY CONTROL. BELOW IS FOR HUMIDITY-CONTROLLED ROOMS.

2. Type: Temperature and humidity recorder with dry and wet bulb sensing for recording temperature and humidity, respectively. Provide a dual-pen unit for independent record of temperature and relative humidity conditions.

- D. Lighting: Fluorescent lighting with vapor proof fixtures and electrical components and cold weather ballasts capable of operation for indicated room condition without perceivable light flickering.

USUALLY RETAIN BELOW.

1. Cold Rooms and Combination Warm-and-Cold Rooms: Design lighting to provide light level of 70 foot-candles at 40 inches above finished floor at 4 deg. C.

DELETE BELOW IF NO FREEZER ROOMS.

2. Freezer: Design lighting to provide light level of 40 foot-candles at 40 inches above finished floor at minus 20 deg. C.

DELETE BELOW IF NO WARM-ONLY ROOMS.

3. Warm Rooms: Design lighting to provide light level of 70 foot-candles at 40 inches above finished floor at 30 deg. C.

- E. Switches for Light Fixtures and Outlets: Furnish single pole, double pole, or 3-way switches, as required, rated 120-277 volts AC and 20 amps, unless otherwise indicated. Locate light fixture switches as indicated on Drawings, or if not otherwise indicated, within room next to the latch side of the door.

DELETE BELOW IF NO SWITCHED OUTLETS. COORD. "PL" DESIGNATION ON DRAWINGS.

1. Furnish pilot light adjacent to toggle switch, where noted as "PL" adjacent to switch identification.

SELECT ONE OF THE FOLLOWING.

2. Color:
 - a. Brown.
 - b. Ivory.
 - c. White.
3. Products: Subject to compliance with requirements, provide products of one of the following:
 - Arrow Hart.
 - Bryant.
 - Eagle (industrial spec grade only).
 - Hubbell.
 - Leviton.
 - Pass and Seymour.

RETAIN OR DELETE BELOW IN CONJUNCTION WITH ELECTRICAL ENGINEER. THIS MASTER SPECIFICATION SECTION HAS BEEN PREPARED ASSUMING THAT BELOW WILL BE RETAINED.

- F. Electrical Power Wiring and Accessories: Factory install conduit, wiring, fittings, and connections for electrical receptacles indicated on Drawings and by provisions of this Section. Provide a sufficient number of 20 amp circuits to accommodate the maximum power requirements of Owner's movable equipment within the room indicated in the "Operating Requirements" Article of this Section. Recess conduit and wiring devices within environmental room walls. Provide a junction box to serve each surface-mounted raceway indicated on Drawings.

RETAIN OR DELETE BELOW IN CONJUNCTION WITH ELECTRICAL ENGINEER. THIS MASTER SPECIFICATION SECTION HAS BEEN PREPARED ASSUMING THAT BELOW WILL BE RETAINED.

- G. Surface Raceways: Provide 2-7/8-inch wide, 1-7/8-inch deep, single-channel, surface mounted, wire raceways complete with base, cover, and duplex receptacle covers.
1. Products: Provide 0.60-inch thick, 6063-T5 alloy aluminum extrusions with a clear satin anodized finish, and including base, cover, fittings, duplex receptacle cover, and other fittings as required for a complete installation.
 - a. ALA 3800 Series; The Wiremold Company.
 - b. SWA3200 Series ; Mono-Systems.

RETAIN OR DELETE BELOW IN CONJUNCTION WITH ELECTRICAL ENGINEER. THIS MASTER SPECIFICATION SECTION HAS BEEN PREPARED ASSUMING THAT BELOW WILL BE RETAINED.

H. Power Receptacles: Duplex receptacles shall be rated 125 volt, 20 amp, 2-pole, 3-wire, NEMA Type 5-20R, specification grade, extra-heavy duty, grounding type, with nylon or Lexan bodies and faces of indicated color.

1. Receptacle Spacing: 24-inches on center, unless otherwise indicated.
2. Circuiting: Feed receptacles from 2 dedicated 20 amp circuits, with adjacent receptacles wired to alternate circuits, unless otherwise indicated.
3. Provide GFCI (ground fault circuit interrupter) receptacles within 6 feet of sink units. GFCI receptacles shall be rated for 2000 amps interrupting capacity and trip in 25 milliseconds or less when ground currents exceed 5 milliamps.
4. Receptacle Face Color:

SELECT DESIRED COLOR BELOW.

- a. Brown.
 - b. Ivory.
 - c. White.
5. Products: Subject to compliance with requirements, provide products of one of the following:
Arrow Hart
Bryant.
Eagle (industrial spec grade only).
Hubbell.
Leviton.
Pass and Seymour.

I. Data Outlets: Where data outlets are indicated on the Drawings furnish and install "standard faceplate bracket" (similar to Panduit #T70DB-X) only. Jacks and final faceplate shall be provided by Owner (ITcom). "Hanging Boxes" are not acceptable.

1. Furnish and install one 1" conduit for data wiring from the surface raceway to a 4"x4" box outside the cold room. Furnish and install nylon pull cord. Box shall be accessible so the Owner (ITcom) so the 1" conduit can be extended to the existing cable tray. All conduits shall have plastic bushings.

PANEL BELOW IS ALWAYS REQUIRED

J. Control Panel: Provide a factory-installed control panel housing temperature and humidity controllers and recorders, as applicable; alarm controls; and other devices requiring periodic adjustment or access by the user. Multiple control panels may be provided where a single control panel is not large enough to accommodate all required devices. Control panel may be standard unit of the Manufacturer of the environmental room, but shall be provided with the following characteristics:

1. Panel Door: Secure, metal-framed unit, with clear, laminated safety-glass window permitting an unobstructed view of all displays, settings, charts, and condition lights when the door is in the closed position.

BELOW IS STANDARD WITH MEDICAL SCHOOL, BUT MAY NOT BE REQUIRED IN ALL CASES. DISCUSS WITH CLIENT.

2. Door Lock: The same keyable, 7-pin tumbler, Best Co. cylinder lock specified for the environmental room door in "Environmental Room Enclosure" Article of this Section.

DISCUSS BELOW WITH ELECTRICAL ENGINEER. THIS APPROACH WILL RESULT IN A CLEAN ELECTRICAL INSTALLATION.

- K. Electrical Panel: Provide a factory-installed electrical panel of single power drop design, rated 208/120V, 3-phase, 4-wire. The ampere ratings shall be suitably sized to meet the power requirements of the controlled environment room, but not less than 60A. Panel shall be of "load center" construction with main lugs only (MLO) and shall include all necessary circuit breakers of the appropriate size and pole number. Branch circuit breakers shall feed all loads including, but not necessarily limited to, receptacles, lighting, evaporator unit, compressor unit, and control panels.

1. Locate the electrical panel as indicated on the Drawings, or if not otherwise indicated, next to the control panel. Roof- or remote-mounted panels are not acceptable. The electrical panel may be incorporated into the control panel, as standard with the Manufacturer.
2. Products: Subject to compliance with requirements, provide products of one of the following:
Cutler-Hammer/Westinghouse.
General Electric.
Siemens.
Square D.

- L. Alarm Systems: Provide the following alarm systems:

BELOW IS STANDARD ALARM APPLICABLE TO BOTH WARM AND COLD ROOMS.

1. Temperature Set point Deviation Alarm: Audible and visible warning device mounted on exterior of environmental room indicating temperature rise or fall outside of design parameters.

DELETE BELOW IF NO COMBINATION COLD ROOM/FREEZER ROOMS.

- a. Provide a separate, distinctly marked alarm for the freezer.

BELOW IS ALARM APPLICABLE COLD ROOMS ONLY. SO FAR, IT HAS BEEN REQUESTED BY MED. SCHOOL ONLY. REVIEW WITH CLIENT FOR INCLUSION IN PROJECT.

2. High-Pressure Refrigeration System Failure Alarm: Audible and visible warning device mounted on exterior of environmental room, and actuating upon failure of the high-pressure refrigeration system. System failure is defined as a 25 percent or greater increase in refrigerant pressure beyond normal operating parameters.

BELOW IS ALARM APPLICABLE COLD ROOMS ONLY. REVIEW WITH CLIENT FOR INCLUSION IN PROJECT. BELOW COULD ALSO BE RE-WRITTEN FOR ELECTRICAL RESISTANCE HEAT IN WARM ROOMS.

3. Compressor Power Failure Alarm: Audible and visible warning device mounted on exterior of environmental room, and actuating upon failure of power supply to the compressor.

DELETE BELOW IF NO FREEZER ROOMS.

4. Manually Activated Personnel Alarm: Provide personnel alarm system in freezer, activated by "mushroom" type emergency push button on interior door jamb (latch side of door). Provide separate audible alarm with distinct tone mounted on exterior of environmental room.

DELETE 2 PARAGRAPHS BELOW IF NO ELEVATED CO2 ROOMS.

5. CO2 Set point Deviation Alarm: Provide audible and visible warning device mounted on exterior of environmental room indicating CO2 set point deviation outside of selected parameters.
6. Automatic CO2 Safety Alarm: Provide personnel safety alarm system in environmental room with time-delay feature. Alarm shall be activated by delay switch connected to pre-set timer. Include both audible and visual alarm indications on exterior of environmental room.

THE FOLLOWING IS AN OPTION. DISCUSS WITH THE OWNER BEFORE INCLUDING IN PROJECT.

7. Trouble Alarm Contact: Provide a general trouble alarm SPDT dry relay contact rated 125 VAC, 5 amps minimum, that actuates upon any of the above alarms for use with Owner's remote alarm system.

DELETE BELOW IF NO FURNISHINGS, OR MODIFY TO SUIT PROJECT.

2.7 FURNISHINGS AND EQUIPMENT

- A. Wall Mounted Shelving: Provide min. 18 gage, AISI Type 302/304 stainless steel wire shelves mounted on manufacturer's standard-and-bracket system with height adjustable in 1-inch increments. Manufacturer's standard units in configurations indicated on drawings.
 1. Size: 14 inches wide by lengths shown on drawings.
 2. Load Capacity: Not less than 50 pounds per lineal foot.
 3. Product: Super Erecta; Metro.
- B. Free-Standing Shelving: Provide free-standing, adjustable-height, wire post-and-shelf system of dimensions and in configuration indicated Drawings. Provide units with components fabricated of AISI Type 302/304 stainless steel. Include necessary fasteners and foot plates for each unit.
 1. Shelves: 14 inches wide by lengths shown on Drawings; position adjustable in 1-inch increments.
 2. Posts: 74-5/8 inches tall.
 3. Product: Super Erecta; Metro.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Field assemble environmental room components following manufacturer's printed instructions.
- B. Provide all required cutting and patching of openings required for mechanical and electrical penetrations of room.
- C. Field plumb and wire the various system components that cannot be factory plumbed and wired. Comply with referenced building codes and requirements of authorities having jurisdiction.

3.2 FIELD TESTING

- A. Perform start-up, functional test, and performance tests not less than 2 weeks prior to conducting training session. Perform tests in the presence, and to the satisfaction, of the Project Representative.
- B. Prepare a written report documenting satisfactory completion of start-up activities, and not less than 2 weeks of recorded data indicating compliance with requirements for maintaining temperature range, including tests of temperature recovery time.

3.3 TRAINING

- A. Provide not less than 8 hours of training, by a qualified manufacturer's technician, for Owner's personnel in the proper operation and maintenance of the controlled environmental room. Training shall include a general operation and maintenance course for the end users, and a detailed operation and maintenance course for the Owner's Plant Department Maintenance and Services group.

SPECIFICATION DIVISION 14

NUMBER SECTION DESCRIPTION

DIVISION 14 CONVEYING SYSTEMS

SECTION 142123 - ELECTRIC TRACTION ELEVATOR

END OF CONTENTS TABLE

EDITOR NOTE:

*THIS ELEVATOR SPECIFICATION IS WRITTEN BASED ON PERMANENT
MAGNET AC MACHINE, WHICH REPLACED PREVIOUS GEAR STYLE MACHINES.
THIS SPECIFICATION CAN BE USED FOR MRL OR MACHINE ROOM
(OVERHEAD OR BASEMENT) TYPE TRACTION ELEVATORS, AND FOR
PASSENGER OR SERVICE ELEVATORS. USE REQUIRES CAREFUL EDITTING
TO MEET PROJECT REQUIREMENTS.*

1-9-15: SUBSTANTIALLY REVISED NEW MASTER SPECIFICATION

DIVISION 14 CONVEYING SYSTEMS
SECTION 142123 - ELECTRIC TRACTION ELEVATOR

PART 1 - GENERAL

1.1 GENERAL CONDITIONS

- A. The Contractor under this Division of Work (elevator contractor) is referred to the Contract Forms and General Conditions of these specifications, all of which apply to this Division of the Work.

1.2 SCOPE OF WORK

EDITOR:
EDIT THE FOLLOWING TO SUIT THE PROJECT.

- A. The work of this division shall consist of the complete removal and replacement (except items specifically noted to be reused) of --- traction passenger elevator(s) in the **BUILDING NAME** building. Bidders shall include all labor, materials, permits, and services required for the complete installation of the elevator and hoistway equipment as herein specified.
1. In all cases where a device or part of the equipment is herein referred to in the singular, it is intended that such reference shall apply to as many of such devices or parts as are required to make a complete installation.
 2. Elevator installer to obtain all approvals for any required code variances to accommodate this renovation/installation from Michigan Elevator Safety Division at no additional cost to Owner prior to starting construction.
 3. Refer to architectural, mechanical and electrical drawings, and coordinate accordingly
- B. Two weeks prior to removal of any equipment, elevator contractor must notify U-M elevator department at 734-647-2059. U-M elevator department will tag any parts to be salvaged. Contractor to remove tagged parts, transport parts to building's loading dock, and notify U-M elevator department which in turn shall remove salvaged parts from site. All other equipment will become property of contractor who will remove from site in accordance with all codes and regulations.
- C. Related sections and work of other divisions:
1. The elevator contractor shall include all work and materials, except that listed under "Related work by other contractors", for a complete and operational system.
 2. Following is a brief description of work by other divisions included in this contract. This work must be done in accordance with the codes having jurisdiction and the approved drawings of the elevator contractor.
 - a. Architectural work: See architectural drawings and specifications.
 - b. Mechanical Work: See mechanical drawings and specifications.
 - c. Electrical work: See electrical drawings and specifications.

3. Elevator Contractor shall coordinate with all other trades working in hoistway, machine rooms and be available to operate the elevator in a running "Platform" manner to allow other trades to complete their work.
4. All telephone cable and conduit between machine room terminals, controller and car shall be provided by elevator contractor.
5. Final Cleaning: Refer to architectural specifications, division 1, and also refer to Part 3, item 3.8 of this division.

1.3 CODE AND STANDARD OF REGULATORY AGENCIES

- A. Applicable elevator codes that are in effect based on the time the permit is drawn shall govern the installation process.
- B. Provide a copy of testing documents to the elevator shop at the time of testing.
- C. Perform work in accordance with applicable codes, the State of Michigan Elevator Code, the National Electrical Code, and the American Society Mechanical Engineering Safety Code for Elevators, and Escalators ASME A17.1 as adopted by the State of Michigan as referenced therein and all of the provisions in the University of Michigan's Standard General Conditions.
- D. Give all necessary notices, obtain State and Municipal permits, pay fees in connection with the installation, including sales and use taxes as applicable, and make tests as are called for by the regulations of such authorities. These test(s) or inspection(s) shall be made in the presence of the authorized representative of such authorities and the owner's representative. It is the responsibility of the elevator contractor to provide any variances from the Governing Authority that could be necessary for a complete acceptable elevator installation. Also refer to Part 3, Item 3.7 of division 14.
- E. Elevator Guidelines to Ensure Accessibility by People with Disabilities.
 1. Elevators shall meet the guidelines of the Americans with Disabilities Act using the Uniform Federal Accessibility Standards (UFAS) relevant to elevator (section 4.10 Elevators) as the technical requirements.
 2. Elevators shall meet the requirements of the State of Michigan Department of Labor Building Code relevant to barrier free design and elevators. Section 512.10.

1.4 SAFETY AND SECURITY REQUIREMENTS:

**EDITOR:
TO BE MODIFYING FROM DIVISION 1.**

- A. The building may be occupied and used by occupants throughout the construction period.
- B. Comply with the following safety and security requirements for work conducted in occupied buildings and related areas:
 1. Schedule Work with owner through construction Engineer.

2. Building Access: During regular business hours (6:30 AM through 5:30 PM; Monday through Friday, except University-recognized holidays), notify Owner's Representative for access to Project site.
- C. Individual areas can be opened as often as once each day by the Owner's building facilities manager. When more frequent daily access is required, or when access is required for more than 5 working days, obtain keys from the University Key Office. When working in more than one area, check with the building facilities manager to ensure no scheduling conflicts exist.
1. Building access outside of regular business hours and on weekends is available only with the written approval of the Owner's Representative. Coordinate access with the Owner's Representative and the Owner's Public Safety Department.
 2. Security: Purchase University-provided photographic identity badges for each person engaged in on-site work, and ensure that workers wear badges at all times on University property. Coordinate through Owner's Representative.
 - a. Badges are required in occupied buildings when the Contract Time is longer than 1 week.
 3. Work activities shall not result in excessive noise, vibration, odors, smoke fumes, etc. in occupied areas. Offending work must be stopped, and rescheduled after off-hours completion: 5:30PM to 6:30AM.
- D. Personnel Restriction:
1. Personnel Conduct Restrictions: Employees of the Contractor and subcontractors shall comply with the following restrictions regarding personal conduct while on University of Michigan property.
 2. Smoking: Smoking is strictly prohibited except in specially designated areas. In effective of July 1st, 2011 the all campus will be smoke free.
 3. Harassment: Conduct considered by the Owner as harassing is strictly prohibited, including the use of profanity; or the use of derogatory or demeaning gender or race-related comments or actions. The Owner reserves the right to require the Contractor, at no additional cost to the Owner, to remove from the Project all personnel who violate this policy.

1.5 **GUARANTEE**

- A. The elevator contractor shall guarantee that the materials and workmanship of the apparatus installed by him meet the specification, and that he will repair any defects not due to ordinary wear and tear or improper use or care, which may develop within warranty from date of final payment or extended new product service period.

1.6 SCHEDULING OF OPERATIONS

A. Contractor must note that the building may be occupied at all times. Construction scheduling is of utmost importance. Refer to bid documents for special conditions and additional information. During the progress of the work, job meetings will be subject to call between the Owner's representatives, and the Contractor's representatives. The Contractor shall provide a representative to attend meetings held from time to time for the purposes of schedule coordination and consideration of technical and construction matters. The Contractor's representative shall be the job superintendent or other person who is authorized to act as the agent of the Contractor.

B. Dates:

EDITOR:

EDIT THE FOLLOWING TO SUIT THE PROJECT IF THERE IS MORE THAN ONE ELEVATOR.

1. Start and completion on project, refer to bid documents.
2. Any elevator shall not be out of service continuously for more than 4 months.

C. Sequence of work:

1. Work on one elevator at a time.
2. Therefore one elevator system will always be working while the other one is being worked on.

D. Work restriction shall be verified with building documents.

EDITOR:

EDIT THE FOLLOWING TO SUIT THE PROJECT IF THERE IS MORE THAN ONE CAR.

E. The elevator contractor shall be responsible for all elevator equipment maintenance and repair when the elevator contractor has been on site.

1.7 NEW PRODUCT WARRANTY SERVICES

A. After completion of the installation, warranty and 24-hour callback service for the equipment furnished under this specification shall be provided for a period of twelve (12) months as part of this Contract. This service shall also include regular biweekly examination. Provide minimum of (26) inspections in the one-year period. In the event the 26 site visitation are not completed the elevator contractor will extend his warranty covering all callbacks, repairs, parts, testing, labor and any other item necessary to keep the elevator in like new condition until the twenty-six warranty site visitation have been completed. Advise U-M elevator department each time before and after completion of service (of the installation during regular working hours by trained employees of this Contractor, and shall include all necessary adjustments, greasing, oiling, cleaning, supplies and parts to keep the equipment in proper operation, except parts made necessary by misuse, accidents or neglect caused by others). Contractor shall provide written record of work performed signed by the elevator shop after each visit.

- B. All warranty service must be performed by the installers and not by any other services agency. Also, the installer must have an established maintenance and service organization available for performance in the City of Ann Arbor that can provide regular and emergency service, 24 hours a day, every day of the year.
- C. It is the responsibility of the U-M elevator department to respond to any emergency regarding elevators. In the event that someone is trapped in an elevator that is under contracted warranty, the University Elevator Department will respond to free the passengers as soon as possible to minimize the inconvenience to users. It is within the right of the University to remove covers, open doors, install monitoring equipment, etc. However, all of this work shall be performed by elevator journey person licensed by the State of Michigan.
- D. A detailed record of work performed by University Elevator Mechanics is maintained in the Elevator Shop. Contractors shall contact U-M Elevator Shop for work performed by University Elevator journey person.
- E. The elevator contractor shall be responsible to service and maintain all elevator emergency circuits (including the fire service circuit, related equipment and sensors) as part of the regular elevator warranty services contract.
- F. The warranty services start after the completion of the 2nd car.

1.8 SUBMITTALS

- A. Before beginning fabrication and work, the elevator contractor shall prepare drawings that show the arrangement of the elevator equipment. Approval of drawings and other data (submit minimum of eight sets), which are to be submitted by the elevator contractor to the owner representative, must be approved by U-M engineer/architect. Before proceeding with fabrication and installation of the equipment. Field verify existing conditions and sizes prior to preparation of drawings.
- B. Samples:
 - 1. Submit one samples of car wall construction, car floor tile and enamel colors.
 - 2. Do not proceed with the orders until samples are approved by U-M engineer/architect.
- C. Shop Drawings:
 - 1. Submit eight (8) copies of Shop Drawings as required showing the general and detailed arrangement of all elevator equipment. Show ceiling, lighting, signal fixtures, and smoke detectors including routing of exposed conduit and all material.
 - 2. Show dimensions, weights, and indicate who will perform the work of each item.
 - 3. Statements to the effects of work by other shall not be accepted; you must identify who is responsible for the work.

- D. Product Data: Submit the manufacturer's specification and data sheets, and standard details. Include pictures, catalog cuts, or other suitable illustrations of all elevator equipment that will be exposed in the finish work, including car, hoistway entrance, and signal and control apparatus. Also include these items in bound set.
- E. Certificates:
1. Furnish without cost to the Owner all certificates necessary as evidence that the elevator conforms to the applicable laws, ordinances, and requirements.
 2. Provide a copy of certificate and State permit to the elevator shop.
- F. Operation & Maintenance Manuals:
1. At completion of work provide four complete project and specification sets (bound and properly arranged) of the parts lists and operator's manuals, copies of approved shop drawings, prior to receiving final payment. Following is a brief summary of items:
 - a. Legible schematic wiring diagrams including all changes made during installation.
 - b. Description of operation of elevator system installed.
 - c. Hoisting machine: Including Motor, Brake, Geared Machine and associated devices such as Tach Motors or Monitors.
 - d. Deflector Sheaves, Governor and Governor Tail Sheaves, Safeties, Buffers.
 - e. Counterweight Assembly, Guide Rollers on Counterweight and Car, Cable Shackles. Safeties and rope brake or other approved emergency stopping device.
 - f. Controller and Selector: Including parts information on Relays, Printed Circuit Boards, Reverse Phase Relays, Switches, Lamps, Electrical Cables, Monitors, Modems, Diagnostic Hardware, Diagnostic Software, and Overload Protection Devices.
 - g. Door Assemblies: Including Hangers, Rollers, Door Motor, Door Operator, Door Clutch Assembly, Door Closers, Door Drive Arms, Related Hardware, Sheaves, Door Guides, Interlocks, Safety Door Edge.
 - h. Signal Equipment: Including Car Station, Hall Stations, Position Indicators, Direction Indicators, Fire Service Panel, Smoke Detectors, Key switches, And Pushbutton Assemblies.
 - i. SCR Drive Units, Transformers, Chokes.
 - j. Car Top Inspection Station, Limit Switches, Solid State Leveling Control Units, Leveling Switches, Cabs, Door Sling, Platform, and Alarm Bell.
 - k. Provide a Laptop computer and demonstrate the elevator system operation to owner personnel as part of training.
 2. Maintenance records shall document compliance with ASME A17.1 section 8.6 including maintenance control diagram.
 3. Additional O&M manuals will be required per each machine room.

1.9 ACCEPTABLE PRODUCTS

- A. Fixtures (Car Operating Panel, Hall Push Button): PTL Performer or Innovation Industries. All shall be Vandal Resistant.

- B. Controller: Motion Control Engineering I Format or Model VVV for flux vector and remote diagnostics or Galaxy Controls by GAL, or SmartRise controllers or Virginia control or Elevator Controller Pixel Controllers. All diagnostics shall be compatible with the laptop PC that will be provided and shall be equipped with Campus view.
- C. Door Operator & Equipment: GAL Manufacturing Corp. MOVFR Operator, car and hall door tracks, car and door hangers with roller assemblies. All interlocks, pickup rollers and operating linkage manufactured by GAL.
- D. Hoist Machine: Manufacturer's standard that complies with all duty requirements of this Section and manufactured by Hollister Whitney or Imperial Electric.
- E. Variable Speed Drives: With all applicable options, or as approved by controller manufacturer.
- F. Door Protective Device: ICU/Gatekeeper 3D from Adams Elevator Equipment Company or Janus 3D.
- G. Telephone: RATH Microtech 2100-957-CC telephone integral of cabinet with Rath 2100-Alarm as part of the phone and elevator communications failure. See Item 2.6.D.
- H. Roller Guides: ElSCO Model "A" on car and Model "B" on counterweights.
- I. Car Top Inspection Station: Adams Model A-912CG.
- J. Floor Announcement System: Shall be through chime and voice announcements, by Adams or approved elevator controller manufacturer and shall be approved by University of Michigan engineer.
- K. Cab Manufacturers:
 1. G & R Elevator Mfg.
 2. Haunstein Burmeister
 3. Tyler
 4. Columbia
 5. Eklund

PART 2 - PRODUCTS

2.1 SCHEDULE OF NEW EQUIPMENT

**EDITOR:
EDIT THE FOLLOWING TO SUIT PROJECT.**

- A. Elevator Number: Existing State Number _____
- B. Type of Service: Passenger/ Freight (Dormitory)
- C. Elevator Type: Overhead, traction, geared, machine located on _____ floor (Room number _____)

- D. Quantity: ----
- E. Capacity: ----- pounds
- F. Speed: Minimum ---- FPM
- G. Travel: ----- + or - (Field verify)
- H. Number of Stops: ----
- I. Number of Door Openings: -----
- J. Floors Served: -,-,-,-
- K. Main Floor Egress: -----; Alternate Floor Egress: -----.
- L. Hoistway Size: ----- long x ----- wide (to edge of sill) - Approx. Existing; Field Verify
- M. Pit Dimensions: ----- long x ----- wide x ----- deep (Field Verify)
- N. Platform Size: ----- long x ----- wide
- O. Car Interior Dimensions: ----- long x ----- wide x ----- high (dimensions to match existing). Field verify
- P. Car Door Size/Operation: ----- wide x ----- high
- Q. Door Opening Type: Single Speed, Center Opening (match landing size)
- R. Machine Type/Location: Gearless PMAC/Overhead

COORDINATE POWER SUPPLY WITH THE ELECTRICAL TRADE.

- S. Power Supply: --- Volts/ 3 Phase/ 60 Cycle; Motor Horsepower: ---
- T. Fire Fighter Service: Yes
- U. Independent Service Operation: Yes
- V. Load Bypass Operation: Yes
- W. Anti-nuisance Feature: Yes
- X. Special key Switches: Yes, (two key switches per floor, one for security on & off, one for momentary override).

2.2 GEARELESS HOISTING MACHINE

- A. Gearless Machine "PMAC":
 1. The machine shall be a Permanent Magnet, Synchronous Design, and AC Gearless Traction Elevator Machine.
 2. The traction driving sheave and brake drum shall be mounted to the motor shaft. Motor will be mounted to a structural bed plate of sufficient design for compliance with ASME A17.1.

3. Machine should be totally enclosed, self-cooling without the use of auxiliary fan(s) for cooling.
 4. Gearless machine demountable drive sheave shall be cast from the best grade of hard cast iron, semi steel or cast steel of approved composition and shall be machined with grooves, providing maximum traction with a minimum of cable and sheave wear. The surface of sheaves shall be tested individually for hardness and the actual hardness to be plainly stamped next to the grooves on the sheave rim. The hardness must measure between 220 and 240 Brinell.
 5. The diameters of the Gearless machine driving sheave shall be not less than forty (40) times the diameter of the hoisting rope.
- B. Motor: The motor shall be designed for elevator service. Motor shall be one hour rated, class F insulation. As specified by elevator controller manufacturer.
- C. Brake: Provide machine with a spring applied and electrically released electromechanical brake so designed as to be effective to the extent of stopping the car during emergency stop and holding the car under all conditions of loading or operation. Design brake electromagnet for quick release to provide smooth and gradual application of the brake shoes. Brake shall be individually controlled and able to hold 125% of rated capacity. The brake drum must have the wearing surface and edge of flange turned smooth, and the wearing surface must run true within a minimum variation of .005 inch. Brake shoes are to be lined with non-asbestos bonded type linings. Brake plunger rod shall be polished steel with surface free of machine marks. An emergency brake or rope brake shall be provided as per ASME A17.1.
- D. Machine Location and Foundation/Bedplate: The elevator machine shall be placed directly over the hoistway upon structural steel beams. The bedplate shall consist of structural steel members fabricated into a rigid unit designed to minimize deflection.
- E. Isolation: The machine bedplate shall rest on isolation pads of proper density to effectively isolate the machine from the building structure.
- F. All exposed surfaces of machine, motors and governor shall be painted with rust-resisting gloss, gray color enamel after installation.
- G. Machine shall not have any name or logo printed or other than University of Michigan made a part of any device supplied under these specifications.
- H. Hoisting Machine Acceptable Manufacturers:
1. Hollister Whitney or Imperial Electric.

2.3 PROGRAMMABLE CONTROLLERS FOR AC TRACTION ELEVATORS:

- A. Controller Description:
1. The controller shall use a variable voltage variable frequency drive or flux vector for the control of three phase AC induction motors.

2. The drive shall use a three-phase, full-wave bridge rectifier and capacitor bank to provide a bus for the solid-state inverter.
3. The drive shall use power semiconductor devices and pulse width modulation, with a carrier frequency of not less than 2kHz, to synthesize the three-phase, variable voltage variable frequency output to operate the hoist motor in an essentially synchronous mode.
4. The drive shall have the capability of being adjusted or programmed to achieve the required motor voltage, current and frequency, in order to properly match the characteristics of the AC elevator hoist motor.
5. The drive shall not create excessive audible noise in the elevator machine motor.
6. The drive shall limit the total harmonic distortion (THD) reflected back into the power system to the following values at any motor speed from 50 to 100 percent.
 - a. Drive input voltage waveform: Less than 3 percent THD.
 - b. Drive input current waveform: Less than 100 percent THD.
7. The elevator contractor shall provide at no additional cost any additional devices required to meet the above THD limits.
8. The drive shall be a heavy-duty type, capable of delivering sufficient current required to accelerate the elevator to contract speed with rated load. The drive shall provide speed regulation appropriate to the motor type.
9. 9. The regenerated power from the elevator shall be of benefit to the building. The regenerative power shall not be dissipated in a resistor bank but will be returned to the building electrical system. Steps shall be taken to provide equipment so the regenerated power does not adversely affect other equipment in the facility, steps such as the use of the filter network and or isolation transformer shall be used.
10. A contactor shall be used to disconnect the hoist motor from the output of the drive each time the elevator stops. This contactor shall be monitored and the elevator shall not start again if the contactor has not returned to the de-energized position when the elevator stops.
11. All power feed lines to the brake shall be opened by an electro-mechanical switch. A single ground, short circuit or solid-state control failure shall not prevent the application of the brake.
12. The controller shall provide stepless acceleration and deceleration and provide smooth operation at all speeds.
13. The power control shall be arranged to continuously monitor the performance of the elevator in such a way that if the car speed exceeds 150fpm during access, inspection or leveling, the car shall shut down immediately, requiring a reset operation.

EDITOR NOTE: THE FOLLOWING PARAGRAPH HAS BEEN USED FOR SELECT PROJECTS WHERE PIT HEIGHT WAS LOWER THAN 48". EDIT CAREFULLY OR DELETE.

14. The controller shall be arranged to continuously monitor the performance of the elevator in such a way that the car speed shall not exceed 150fpm during travel down from the -- floor to the Basement floor for elevators ----.

15. The automatic leveling zone shall not extend more than 12" (304.8mm) above or below the landing level nor shall the doors begin to open until the car is level with the landing. In addition, the inner leveling zone shall not extend more than 3" (76.2mm) above or below the landing. The car shall not move if it stops outside the inner leveling zone unless the doors are fully closed and locked.
16. The system shall use an automatic two-way leveling device to control the leveling of the car to within 1/4" (6.35mm) or better above or below the landing sill. Overtravel or undertravel shall be compensated for and the car brought level to the landing sill.
17. The appropriate landing system shall be used with this controller and shall be of steel tape type. Or approved type from controller manufacturer.
18. Automatic Operation of the Car Lighting shall be provided meeting the requirements of ASME A17.1. The Feature shall allow the car lights to be turned off when the following conditions exist for not less than five minutes: the car is at a floor, the doors are closed, there is no demand for service and the car is on automatic operation. Momentary interruption of any of these conditions will cause the car lights to be turned on. The Automatic Operation Feature shall be able to be turned on or off as desired by the owner from the Elevator Controller.

B. Specifics For Closed Loop System:

1. Provide a closed loop tachometer feedback control. The control system shall continuously monitor the elevator speed signal from a velocity transducer and compare it with the intended speed signal to verify proper and safe operation of the elevator and to correct the actual speed to match the intended speed.

EDITOR:

DELETE THE FOLLOWING TO SUIT PROJECT IF THE SPEED 150FPM OR ABOVE.

C. Specifics For VVVF Drives (For speeds of 150fpm or below):

1. NOTE: For VVVF applications, the AC motor shall have slip specifications between 8 percent and 12 percent, or a NEMA rating of "D".
2. The VVVF drive shall be capable of providing a braking pulse to use in the stopping sequence of the elevator. The braking pulse shall take the form of an adjustable DC current pulse applied to the AC motor for an adjustable period of time (0 to .75 second).
3. The VVVF drive shall be able to be programmed with different volts per hertz patterns, which shall be used to adjust the drive control characteristics.

EDITOR:

DELETE THE FOLLOWING TO SUIT PROJECT IF THE SPEED 150FPM OR BELOW

- D. Specifics For Flux Vector Drive (For speeds over 150fpm) NOTE: For flux vector applications, the AC motor shall have slip specifications of 5 percent or less, or a NEMA rating of "A" or "B".

1. The flux vector drive shall be capable of producing full torque at zero speed.
 2. The flux vector drive shall not require DC injection braking in order to control the stopping of the car.
 3. The flux vector drive shall utilize encoder feedback to regulate hoist motor speed. The encoder shall be mounted to the motor shaft.
- E. The controller shall be UL, ETL or CSA listed, and shall meet FCC part 15 subpart J limits for radio frequency interference.
- F. Provide fluorescent lighting at the front and back inside the controller cabinet. Ventilation fans shall be part of the controller cabinet.
- G. Controller: Motion Control Engineering I Format or Model VVV for flux vector and remote diagnostics or Galaxy Controls by GAL, or SmartRise controllers or Virginia control or Elevator Controller Pixel Controllers. All diagnostics shall be compatible with the laptop PC that will be provided and shall be equipped with Campus view.
- H. Drives: Provide as recommended and approved by controller manufacture.
- I. Elevator controller is to be factory equipped with provisions for emergency power connections and be able to prevent regenerative power back into line.
- J. Phase protection: Provide 3-phase power monitor for elevator power which monitors phase loss, low and high voltage, phase reversal, phase unbalance, and has both manual and automatic reset. Leave in manual position.

EDITOR: DELETE THE FOLLOWING IF YOU DO NOT HAVE EMERGENCY POWER.

- K. Emergency Power: When emergency power is detected, cars shall sequentially return to the main lobby one elevator at a time, and remain there with doors open. While each car is being returned, all other cars shall be shut down so as not to overload the emergency power generator. Once all cars have been returned to the lobby, one car may be selected to run under emergency power. Selection of the car that runs under emergency power shall be done automatically by the group system. This automatic selection may be overridden through manual selection. Refer to Mechanical drawings and detail sheets M --.
- L. Elevator contractor shall obtain necessary variances to address the reaction toe guard and provide safety switches in the safety loop that will prevent the elevator from running should the toe guard not extend or retract as applicable when leaving or approaching the lowest landing, if contractor has the ability to provide another guaranteed method to address safety concerns with a shorter toe guard and will approved by the State of Michigan Elevator Safety Division then the university will consider this option
- M. Auxiliary Operations:

EDITOR:

FILL OUT THE EGRESS FLOOR AND THE ALTERNATE FLOOR.

1. Firefighter's Service:
 - a. The following operation is for the use of firemen and other authorized personnel per ASME A17.1.
 - b. Automatic passenger elevators shall conform to the following:
 - 1) Provide a three position (on, off, and re-set) key-operated switch at the main floor for each single elevator or each group of elevators. The key shall be removable only in the "on" and "off" positions. When the switch is in the "on" position, the elevators controlled by this switch and which are on automatic service shall return non-stop to the main floor, and the doors shall open and remain open.
 - 2) An elevator traveling away from the main floor shall reverse at the next available floor without opening its doors.
 - 3) Elevators equipped with automatic power-operated doors and standing at a floor other than the main floor, with doors open, shall close the doors without delay and proceed to the main floor.
 - 4) Door reopening devices for power-operated doors, which are sensitive to smoke, heat or flame shall be rendered inoperative.
 - 5) All car and corridor call buttons shall be rendered inoperative and all call register lights and direction lanterns shall be extinguished and remain inoperative.
 - 6) The University Elevator Shop will supply to the installing contractor a "Security Box" (key box) for installation at the egress floor.
 - 7) A car stopped at a landing shall have its "Emergency Stop Switch" rendered inoperative as soon as the doors are closed and it starts toward the main floor. A moving car, traveling to or away from the main floor, shall have its "Emergency Stop Switch" rendered inoperative immediately.
 - 8) A sensor in each elevator lobby, which when activated prevents cars from stopping at that floor, shall not be substituted for the above requirements.
 - c. Sensing Devices: In addition to the key-operated switch required in "b" above, heat and smoke or products of combustion sensing devices shall be furnished and installed by fire alarm contractor in each elevator lobby at each floor, and the main floor (Note - Egress floor is --- floor) alternate floor for the elevator is --- floor. The activation of a sensing device in any elevator lobby shall cause all cars in all groups that serve that lobby to return non-stop to the main floor. The key operated switch when moved to the "Re-set" position, shall restore normal service independent of the sensing devices. Sensors at each floor shall be connected separately from sensors at main floor. Smoke detectors shall be photoelectric type, supplied by fire alarm contractor. Submit drawings showing locations of smoke heads and exposed conduit for owner's approval prior to installation.

- d. Provide a three position (off-hold-on) key-operated switch in each car fire service compartment per ASME A17.1 and shall be effective only when the main floor key-operated switch is in the "on" position or a sensor has been activated and the car has returned to the egress floor or other approved level. The key shall be removable in all positions, and shall not change the operation until the car is at a floor with doors fully opened.
 - e. The operation of elevators on Fire service shall be as follows:
 - 1) An elevator shall be operable only by a person in the car.
 - 2) Elevators shall not respond to elevator corridor calls.
 - 3) The opening of power-operated doors shall be controlled only by continuous pressure "open" buttons or switches. If the switch or button is released prior to the doors reaching the fully open position, the doors shall automatically re-close. Open doors shall be closed by continuous pressure on "Door Close" switch or button.
 - 4) Means shall be provided to cancel registered car calls.
 - 5) When the switch is in the 'hold' position, the car shall remain at the floor with its doors open.
 - 6) Elevators can be removed from individual car fire service by moving the key-operated switch to the "off" position and the car is at the main floor or other approved level.
 - f. The switches required above shall be operated by the same key but are not a part of a building master key system. There shall be a key for the main floor switch and for each elevator in the group and these keys shall be kept on the premises by persons responsible for maintenance and operation of the elevators, in a location readily accessible to authorized persons, but not where they are available to the public. TURN OVER ALL KEYS TO PROJECT ENGINEER.
 - g. Instructions of operation shall be provided as required by code.
2. Elevators arranged for dual operation shall:
- a. Conform to the automatic operation described above when on automatic operation.
 - b. When firefighter's emergency operation is activated and the elevator is on independent or inspection operation the elevator shall be provided with a signal system consisting of both visual and audible types to alert the attendant to close the door and return non-stop to the main floor or other approved level. Provisions shall be made to alert the attendant in the same manner when a heat and smoke or products of combustion sensing device is activated.
 - 1) Floor Fire Service:
 - 2) Alternate Floor Fire Service:
 - 3) The activation of a sensing device at the lobby (item 2. above) shall cause all elevators to return non-stop to the alternate floor and the doors shall open and remain open. (The alternate fire service floor shall be defined as any building floor other than the main fire service floor) which will be ---- floor.

- 4) Operation of the elevators shall conform to "Firefighters Service". When sensing devices are activated, the elevators shall return non-stop to the designated main floor and the doors shall open and remain open. When building sensors activate at the main fire service floor, elevators shall automatically be dispatched to that building's --- floor, which has been designated "alternate" fire service floor where the elevator doors shall open and remain open.

N. Independent Service Operation:

1. Independent service operation shall permit one or more elevators to be removed from the group control and used without interfering with the normal operation of the remainder of the group.
2. Provide a two-position switch in the car-operating panel for each elevator.
3. When the switch is placed in the independent service position, the mode of operation shall be amended as follows:
 - a. The car is disconnected from the group supervisory system.
 - b. Existing car calls shall be canceled.
 - c. The cars shall bypass landing calls.
 - d. Continuous pressure on the car button of the selected floor shall close the doors and start the car toward the selected floor. Pressure shall be required on the button until the car starts. Releasing the car button before the car starts shall cause the doors to automatically reopen.
 - e. After the car has arrived at the floor and the doors have automatically opened, the cars shall remain at the floor until another car button is pressed or until the key switch is returned to the normal position.
 - f. Should all cars be put on independent service, all hall calls registered shall be canceled. Further registration of hall calls shall be inhibited.

O. Load Bypass Operation:

1. Shall automatically delete hallway call buttons when car is loaded to its limit. Load bypass operation shall be adjustable from the controller to adjust the load at which to bypass hall calls not delete them.

EDITOR:

DELETE THE FOLLOWING IF YOU DO NOT HAVE EMERGENCY POWER.

P. Emergency Power Panel For Fire Service:

1. Emergency switch and annunciation panel shall be a 24"x24" brushed stainless steel, with lockable cover, fully recessed panel to be located on the egress floor where indicated on drawings. The panel shall have indicating red lights showing locations of cars during emergency power condition.
2. A key switch shall have auto, manual, 1, 2 & **-NO. OF ELEVATORS.**
3. The panel shall be labeled as "Elevator Emergency Panel".
4. See details on sheet ---.

Q. Anti-Nuisance Feature:

1. Provide an anti-nuisance operation to prevent the elevator control system from responding to a faster than normal rate or registration of car calls. The "normal" rate of registration of car calls shall be programmable on an individual elevator basis within the group.
 2. If the anti-nuisance monitor determines that the rate of registration of car calls is excessive as compared to the pre-programmed rate of car calls, all car calls shall be canceled and shall be required to be reregistered.
- R. Automatic Two-Way Car Leveling:
1. Each elevator car shall have two-way leveling to automatically bring the car to a stop approximately level with any floor for which a stop has been initiated, regardless of load, rope stretch, or direction of travel.
 2. Automatic leveling control shall permit the synchronization of door opening with the stopping of the car at a floor.
- S. Machine Finish and Painting: All exposed surface of machines, motors and controllers shall be repainted after field installation and before acceptance by owner with rust resisting gloss enamel light gray paint.
- T. Computer For Elevator Controller Diagnostics:
1. Provide a Dell Laptop, Model "Dell Latitude E6420" with Intel vPro Advanced Systems Management loaded with Diagnostics software for the installed elevator controller.
 2. Laptop Requirements:
 1. Provide a Dell Laptop, Model "Dell Latitude E6420" with Intel vPro Advanced Systems Management loaded with Diagnostics software for the installed elevator controller.
 2. Liftnet monitoring system shall be installed and operational by elevator contractor.
 3. Laptop Requirements:
 - a. Dell Latitude E6420
 - b. Operating system Genuine Windows 7 professional, no media, 32-bit, English.
 - c. Primary Storage: 250GB 5400rpm Hard Drive
 - d. Processor Branding: Intel Core i5 vPro Label.
 - e. Processor: Intel Core i5-2520M (2.50GHz, 3M cache) with turbo Boost Technology 2.0.
 - f. LCDs: 14.0" HD Anti-Glare LED backlit.
 - g. Memory: 4.0GB, DDR3-1333MHz SDRAM, 2, DIMMS
 - h. Internal Keyboard: Inertial English keyboard Dual Pointing Keyboard
 - i. Primary Optical Device: 8X DVD+/-RW w/Roxio and Cyberlink Power DVD, no media.
 - j. Wireless LAN: Intel® Centrino® Advanced-N 6205 802.11a/b/g/n Half Mini Card
 - k. Energy Star & EPEAT: Energy star 5.0 Enabled / EPEAT Gold
 - l. USB Optical Mouse
 - m. Primary Battery: 6-cell (60WH) Primary Lithium Ion Battery
 - n. AC Adapter: 90W /C ADAPTER (3-PIN)
 - o. carrying case: Slim Nylon Case (2 Pocket)
 - p. Support Services: 4 Year Basic Hardware Service with 4 Year NBD Limited Onsite Service After Remote Diagnosis
 - q. 4 year complete care accidental damage protection.
 4. Laptop shall be compatible with all new elevator controllers.

EDITOR: DELETE THE FOLLOWING IF LCD SCREEN IS NOT REQUIRED ON CAR OPERATING PANEL.

U. Elite Computer Specs:

1. The display shall utilize a (SIZE). Active matrix TFT screen and be powered by a computer with enough memory to support customer specific text and graphics. The display must interface with the elevator controls to support position, direction and status of the car and or bank. In addition the display must be able to support customer programmable scheduled messages in text or graphic format. The system must have software that allows the customer to change the design and transfer to each display individually.
2. Specification for a computer when interfacing to C.E. Electronics, Inc. ELITE DISPLAY:
 - a. Windows XP or better.
 - b. Pentium/Celeron 2 GHZ or better.
 - c. 512 MB of ram
 - d. 100 MB free drive space
 - e. Network connection
 - f. USB ports-2
 - g. CD drive
 - h. Keyboard & Mouse
3. Monitor:
 - a. 800x600 resolution or better.
 - b. 16 bit color or better.
 - c. 15 inch or larger
4. Specs on the Elite's:
 - a. Processor: Intel Celeron M processor 800 MHz.
 - b. Ram: 256 MB Ram DDR-SO-DIMM.
 - c. Chipset: Intel 82852GM, 400MHz FSB, integrated graphics
 - d. Video Controller: Intel Extreme Graphics2 controller,
 - e. Storage: 40 GB notebooks hard drive.
 - f. OS: XP Embedded services pack 2.

V. Acceptable manufacturer:

1. Motion Controller Engineering (MCE) I Controller or Virginia Controls or Galaxy Controls by GAL or SmartRise controllers or Virginia control or Pixel Controllers.

2.4 HOISTWAY EQUIPMENT & HOISTWAY ENTRANCES

A. Provisions for Hoistway Access:

1. Elevator door safety plug-lock- Keyway - Furnish and install hoistway door unlocking devices at all landings with Tri-lock MFG. & MAINT. CORP. key NO. 6950 in accordance with requirements of the latest Edition of the American Standard Safety Code for Elevators, Dumbwaiters, and Escalators, and as permitted by the Local Code.
2. The hoistway door-unlocking device shall unlock and permit the opening of the hoistway door from any floor irrespective of the position of the car. The design of the device shall be such as to prevent unlocking the door with common tools. The means for unlocking the door shall be available and used only by inspectors, maintenance, and repair personnel.
3. Access Switches - Furnish and install hoistway access switches and associated devices (at the top and bottom landings in accordance with requirements of the latest Edition of the American Standard Safety Code for Elevators, and Escalators, and as permitted by the Local Code.

B. Top of Car Operating Device:

1. An operating device shall be provided on the top of the car located in the front between the car crosshead and hoistway door, complete with an Emergency Stop Switch, GFCI plug, fire service lamp and buzzer, lamp and guard, a Selections Switch, UP, DOWN and safety operating Buttons. This device shall comply with ASME A17.1 and local codes. Using Adams model A-912CG with Light guard.
2. Operation from the top of the car shall not be permissible unless all electric door contacts are closed.
3. Elevator(s) shall be provided with at least two electric light fixtures and a convenience outlet fixture on the car top. The two light fixtures combined shall provide an illumination level of not less than 10fc measured at the point of any elevator part or equipment, where maintenance or inspection is to be performed from the car top. The light fixtures shall be permanent and be of the fixed or portable type and shall be equipped with guards. The light switch shall be accessible from the landing when accessing the car top.

C. Pit Stop Switch:

1. A switch or switches shall be located in each elevator pit, in accordance with ASME A17.1 and local codes, which when turned to the "OFF" position will cause the electric power to be removed from the elevator motor and brake. This switch shall be lockable in the "OFF" position.

D. Emergency Alarm Bell:

1. Provide an alarm bell with it's own battery source and recharging unit for emergency power unit, mounted on the car. When the emergency alarm bell button in the car is pressed, it shall illuminate and the alarm bell shall sound. Operation shall be in accordance with ASME A17.1 and the State of Michigan Elevator Code.
2. DBA level of the alarm bell (80-85 DBA).

E. Hoisting And Governor Ropes:

1. Provide hoisting suspension means & ropes, specifically designed for elevator service, of sizes and numbers sufficient to comply with the requirements of the Code. The number and sizes of ropes proposed to be used shall be indicated on the shop drawings.
2. Governor ropes shall comply with the requirements of the Code, shall be at least 3/8 inch in diameter, and specifically designed for elevator service.
3. Use only wedge type sockets to fasten the ropes.

F. Counterweights:

1. Elevator shall be suitably counter-balanced for smooth and economical operation by adjusting the quantity of weights. Weights shall be contained in a structural steel frame properly guided with suitable roller guides. The counterweights shall be equal to the weight of the complete elevator car and approximately 40% of the rated load.
2. The counterweight frame shall be equipped with roller guides. Each roller guide shall consist of three wheels, each a minimum of 6" inches in diameter, tired with a durable resilient material. The guides shall be designed as to maintain continuous contact with the guide rails.

3. Manufacturer of roller guide: ElSCO model B.
4. If contractor desires to reuse existing counterweights and frame, he/she shall submit a certified letter by a professional structural engineer that they will meet the loads and reactions of the new elevator system and without any defect.

G. Guide Rails:

EDITOR:

REUSE ON REPLACEMENT PROJECTS WHERE POSSIBLE FOR CAR AND COUNTERWEIGHT.

1. Provide steel tee guide rails to meet ASME A17.1 requirements, including suitable brackets and clamps for attachment to the building structure. The guide rails and car frame shall be located such that the car is in balance with guides. The machined tongue and groove joints shall be fitted with machined fishplates fastened to each rail with at least 4 through bolts.
2. All joints shall be located free of interference with supporting clamps and brackets. Shims used to obtain rail alignment shall be designed to remain in position, even through the fastening bolts may be loosened.
3. The guide rails shall be installed and aligned with their machined faces plumb within one-eighth of an inch from the top to the bottom of the hoistway.
4. Minimum Rail size shall be 15 pounds per foot for both car and counterweight guides. Upgrade rails based on application.

EDITOR:

DELETE THE NEW GUIDE RAIL IF THE GUIDE RAILS ARE TO BE REUSED FOR CAR AND COUNTERWEIGHT.

5. The car and counterweight guide rails shall be realigned, refinished and cleaned so that the faces of the rails are plumb within one-sixteenth (1/16) of an inch in 100 feet of travel. Refinish rails for smooth operation and paint back plains with black paint.

H. Buffers:

EDITOR:

DELETE IF THE ELEVATOR SPEED IS LESS THAN 200FPM.

1. Provide oil type buffer for speed over 200 fpm, buffers shall be in accordance with ASME A17.1 code. The buffers shall be fastened to steel channels provided and installed by the elevator contractor.

EDITOR:

DELETE IF THE ELEVATOR SPPEED IS OVER 200 FPM.

2. Provide spring type buffer for under 200 fpm, buffers shall be in accordance with ASME A17.1 code. The buffers shall be fastened to steel channels provided and installed by the elevator contractor

I. Normal Stopping Devices:

1. Slow-down and normal stopping devices shall be furnished and installed for each car. These devices shall be so arranged that, as the car approaches either terminal landing, a series of activation devices mounted in the hoistway shall activate bi-stable magnetic reed switches mounted on the car and automatically bring the elevator to a smooth stop at the terminal floor.

J. Final Limit Switches:

1. In addition to the normal limit stops, a hoistway final limit switch shall be installed at the top and at the bottom of each hoistway. These final limit switches shall be operated by a fixed cam securely attached to the car. The switches shall be so located that they are operated should the car travel a predetermined distance above or below the upper or lower terminal floor. These limit switches shall be independent of any other stopping devices, shall be positively opened without the use of springs and shall cut off all power from the motors and brakes and prevent the operation of the car in either direction.
2. Final limit switches shall be so located that they open at or about the time the buffer is engaged by the car or counterweight.

K. Deflector Sheaves:

1. Deflector sheave: Provide new deflector sheaves to properly lead the hoisting ropes from the machine to the car and/or counterweight. Sheaves shall be cast iron, accurately machined and grooved for the diameter of ropes used and supported by steel beams furnished in place by the elevator contractor. The bearings shall be permanently lubricated type commonly referred to as (sealed) bearings (non-grease-able type).
2. Existing steel channels at top of hoistway may be reused if engineering data supplied by Elevator Contractor supports their reuse. Guards and beams if reused shall be stripped and repaint.
3. Deflector sheave guard: When deflector sheave extends below the bottom of machine beams, a substantial metal guard shall be provided below the sheave and attached to the sheave supports.

L. Landing System:

1. This landing system shall provide high speed stepping signals, one-floor-run stepping signals, leveling, and door zone signals. Each output signal shall be electrically isolated and shall be capable of reliably operating at 120 VAC.
2. Landing system shall be provided by the elevator controller manufacturer.
3. The system shall consist of a steel tape with mounting hardware to accommodate the complete travel of the elevator, a car top assembly with tape guides and sensors, and magnetic strips for stepping and leveling.
4. The leveling and stopping accuracy of the system shall be within 1/4 inch of the floor level and shall correct for over travel or under travel to within the same accuracy, regardless of load variations or direction of travel.

M. Hoistway Doors:

EDITOR:

FOR NEW HOISTWAY DOOR SERVICES

1. New doors shall be flush hollow metal panels fabricated of No. 16 U.S. gauge steel, minimum. The doors shall be 1-1/4" thick and reinforced with continuous members. Panels shall have sound deadening insulation. Doors shall have removable non-metallic gibs to run in the sill guideway with minimum clearance. Door panels shall conform to the National Elevator Code ASME A17.1 and the Underwriter's Laboratories 1-1/2 hour fire test requirement. Door unlocking devices shall be provided at all floors and as required by local codes. Sight guards shall be provided for all entrances. Provide new hoistway doors at all landings. The doors shall be equipped with nylube door guides.
2. Hoistway landing interior finish shall be painted black.
3. Hoistway landing Doors exterior finish shall be stainless steel.
4. Hoistway door unlocking devices at all landing shall be provided with TRI-Lock removable plugs with key number 6950

EDITOR:

TO BE USED WHEN BI-PARTING FREIGHT DOORS ARE REQUIRED. THIS SECTION IS INFREQUENTLY USED. EDIT CAREFULLY.

N. Hoistway Doors (Freight):

1. The doors shall bear a 1 1/2 hr. UL Label.
2. Doors shall meet ASME A17.1 code requirements.
3. Doors shall be solid panels with resilient edges.
4. Doors construction to be "316" stainless steel.
5. Doors operation shall be power type. Each door shall be electrically operated with two motorized 2-speed door operators mounted on either side of the assembly. An automatic stay-open, feature shall assure that the door stays fully open. All operating mechanisms shall be entirely within the elevator shaft. The controls shall permit immediate emergency manual operation.
6. Rails for the doors shall be steel construction and have adjustable trucking sill stops.
7. Door sections shall be connected to each other with suitable roller chain running over grooved ball bearing sheaves.
8. Door shall be interlocked with the elevator controls to prevent normal operation of the elevator unless all doors are closed and locked, and to prevent door opening when elevator is in motion.
9. Door electrical characteristic is 208v, 3phase, 60cycle, with 30AMP. Circuit
10. Manufacturer: Peelle F10S. Refer to detail on drawings **sheet M--**.
11. Observation window is to be provided per ASME-A17.1.
12. Door shall be with automatic closing feature, with horn while it is closing. Operation shall be of the sequenced type.

O. Entrances:

1. New entrances shall consist of flush hollow metal door panels, bolted unit type frames, sill's integral hanger(s), hanger covers, fascia plates, headers, struts, sight guards and hardware.

P. Frames:

EDITOR:
FOR NEW FRAMES

1. New unit frame shall be fabricated of No. 14 U.S. gage steel comprising the head and side jamb sections, which shall be securely bolted to form one piece unit construction and shall be securely fastened to the sill and hanger support. They shall be returned on the hoistway side to present a neat appearance.

EDITOR:
FOR REUSE PROJECTS

2. To be reused, sand, fill-in dents and paint matching existing color. Enamel paint to be used. Provide prime coat prior the finish coat for each floor.

Q. Sills:

EDITOR:
FOR NEW SILLS

1. Sills shall be of extruded aluminum construction with a non-slip wearing surface. They shall be supported on steel brackets and securely fastened to the floor. Grooves for the door guides shall have minimum clearance for the guides. The sills must be suitable for "class C3" loading.

EDITOR:
FOR REUSE SILLS

2. To be reused, clean and polish each sill.

R. Struts:

EDITOR:
FOR NEW STRUTS

1. A 3"x3"x ¼" steel angle struts shall extend from the sill to the building beam above and shall be securely fastened to ensure rigidity and adequate support for the header.

EDITOR:
FOR REUSE STRUTS

2. To be reused sand, prime and paint black.

S. Headers:

EDITOR:
FOR NEW HEADERS

1. Header shall be constructed of 3/16" formed steel to provide support for the frame and hangers.

EDITOR:
FOR REUSE HEADERS

2. To be reused sand, prime and paint black.

T. Fascia, covers, and Toe guards:

EDITOR:
FOR NEW FACIA COVERS AND TOE GUARDS

1. Fascia, including hanger covers, toe guards and dust covers shall be fabricated of No. 16 U.S. gauge steel. Fascia shall span the width of the opening plus 6 inches. Dust cover extends a minimum of 8 inches above the header and the toe guard shall extend a minimum 8' below the sill. Both shall return to the wall at 60 deg. Angle.
2. Finish:
 - a. Struts, headers, hanger cover, fascia, dust covers, and toe guards shall have matte black finish. New entrance frames (existing) shall be finished in stainless steel of color selected by owner. All landing doors shall be new and finished in enamel of color selected by owner.
 - b. All existing heads and jambs shall be stripped to bare metal, prepared with primer and finished with two coats of enamel paint.

EDITOR:

FOR REUSE FACIA COVERS AND TOE GUARDS

3. To be reused sand, prime and paint black or provide new.
4. finish:
 - a. All existing headers and jambs shall be stripped to bare metal, prepared with primer and finished with two coats of enamel paint.

2.5 CAR EQUIPMENT & CAR ENCLOSURES:

A. Power door operation:

1. The car and hoistway doors shall be operated quietly and smoothly by an electric operator, which shall open and close the car door and respective hoistway door simultaneously. The doors shall open automatically when the car is leveling at the respective floor and, when operating without an attendant, shall close after a predetermined time has elapsed. Momentary pressure on the "Open Door" button in the car shall cause the doors to remain open or, if closing, to reopen and reset the time interval.
2. The doors shall be opened at rated speed and the closing speed shall be per Code. Door closing force shall be as allowed by code.
3. An electric contact for the car doors shall be provided which shall prevent elevator movement away from the floor unless the door is in the closed position as defined by code.
4. Each hoistway door shall be equipped with an auxiliary door closing device and a positive electro-mechanical interlock to prevent the operation of the elevator until the interlock circuit is established and the doors are locked and closed.
5. Car doors shall be provided with zone looking.
6. Manufacturer: GAL, MOVFR operator.

B. Landing Door Hangers:

1. Each hoistway door shall be suspended by two (2) sheave type hangers. Each hanger shall consist of a polyurethane tread on a metal hub equipped with precision ball bearings mounted onto a steel bracket. The hanger sheaves shall not be less than 3-1/4 inches in diameter. The track shall be so shaped as to permit free movement of sheaves without regard to vertical adjustment of the sheave brackets. An up-thrust roller shall be provided beneath the track and each sheave wheel, capable of withstanding a vertical thrust equal to the carrying capacity of the upper sheave. The up-thrust roller shall be adjustable for fine vertical adjustment and the face of the roller shall be so shaped as to conform to the bottom face of the hanger track. Doors closers shall be sill mounted.
 2. Manufacturer: GAL MOVFR operator.
- C. Door protection and reopening device:
1. Acceptable products are limited to: ICU/Gatekeeper 2000 from Adams or Janus 3D.
- D. Adaptive door timing:
1. Door open times will be varied subject to the call situation causing the stop:
 - a. Shortest timing, when car call only causes stop.
 - b. Longer timing, when hall call only causes stop.
 - c. Longest timing, when coincident hall and car calls exist.
 - d. All timing shall meet ADA guidelines as a minimum.
 2. The door opening time, measured from the instant the doors start to open until within 1" of fully open position, shall not exceed code standard.
 3. Long door and short door "hold open" times shall be set at 4.0 and 2.5 second respectively and shall be ADA complaint.
- E. Car sling, safeties and governors:
1. Provide new car sling and safeties.
 2. The new safety, of type required by Code, shall be mounted on the bottom members of the car frame and shall be operated by a speed governor located over the hoistway. The safety shall be arranged to stop the car whenever excessive descending speed is attained and means shall be provided to cut off power from the motor and apply the brake prior to application of the safety.
 3. Acceptable Manufacturer: Hollister-Whitney or Titan.
- F. Car platforms and flooring:
1. Each passenger type car platform shall consist of a structural steel frame with a wood and metal composite floor (i.e. one layer of 3/4" marine grade plywood plus 14 gauge steel plate plus 3/4" thick marine grade plywood plus finish flooring). Top finish flooring on cars shall be furnished and installed by elevator contractor and shall be as described in Item 2.5.J.
 2. Each passenger type platform shall be equipped with an extruded aluminum threshold and a steel toe guard at the loading edge. The under side of the platform shall be fireproofed to comply with local codes.
 3. The car platform shall be capable for handling the capacity of the car being loaded in one-piece across the entrance of the car and landing.
- G. Platform isolation:

1. Each passenger type platform shall be mounted on rubber pads supported on an auxiliary steel frame fastened to the car frame. This arrangement shall form an isolating cushion between the car and the steel car frame.

H. Car and counterweight roller guides:

1. The car and counterweight system shall be provided with roller guides. The guides shall be designed so as to maintain continuous contact with the guide rails.
2. The elevator frame shall be provided with roller guides. Each roller guide wheel shall be 6" in diameter, tired with a durable resilient material. The guides shall be designed so as to maintain continuous contact with the guide rails.
3. Acceptable Manufacturer: Elasco model "A" for car and model "B" for counterweight.

I. car doors:

1. Provide car Doors flush hollow stainless steel panels. Panels shall have sound deadening insulation. Doors shall have removable non-metallic gibs to run in the sill guideway with minimum clearance. Door panels shall conform to the National Elevator Code ASME A17.1 and the Underwriter's Laboratories 1-1/2 hour fire test requirement. Door unlocking devices shall be provided as required by local codes. The doors shall be equipped with nylube door guides.
2. Car door hangers and tracks shall be provided similar to hoistway doors.
3. Doors finish shall be #4, brushed stainless steel.

J. Car Enclosures:

1. All cab material; design, lighting, ventilation and exits shall comply with "American National Standard Safety Code for Elevators, ASME A17.1 and/or local codes. Where codes conflict the more stringent shall apply.
2. Wall panels and reveals shall be of rigidized 316 stainless steel constructions and applied to a steel shell.
3. Returns shall be of stainless steel construction and have a #4 brushed finish. Cutouts shall be provided for operating elements and fixtures. Minimize thickness of return to maximize clear floor area.
4. Canopy shall be constructed from formed and reinforced 16 gauge steel finished in white enamel and shall have an overall height of 8'0" from the finished floor. An emergency exit shall be provided which is locked from the top of the car.
5. Provide LED lighting in 45 degree beveled coves at ceiling and wall corner that will apply 10 foot-candles in the cab at floor level. Total of six or eight lights, four on each side. Coves shall be made of stainless steel with #4 finish and located at ceiling level of cab. Also comply with UFAS lighting level requirements.
 - a. LED Model SB-1 Manufacturer by Man-D-Tec.
6. Entrance columns shall be #4 brushed stainless steel finish. Columns shall run from floor to canopy, be finished in a vertical grain, and shall be integral to the returns.
7. Entrance transom shall be #4 brushed stainless steel finish. Columns shall run from floor to canopy. Transom shall run the full width of the car and be finished in a horizontal grain.

8. A single speed fan shall be provided that matches the ceiling and is mounted to the canopy. Air intake to the fan shall be through the 3/8" diameter holes (adequate in number to allow free passage of required air quantity) drilled in canopy. Submit shop drawing of canopy for approval prior to fabrication. CFM as required per ASME A17.1. Sound power is to be 45 DBA max.
9. A 3/8" x 2" bar handrail with radius ends of #4 brushed stainless steel finish shall be provided to meet code requirements, on side and back walls but shall not interfere with car operating panel.
10. Car sills shall be extruded aluminum. Car sills for elevator in parking structures shall be nickel silver.
11. Finished floor covering shall be furnished and installed by the elevator contractor.
 - a. Flooring shall be "Endura" style rubber tile by Burke Flooring. Texture and color to be selected by owner.
12. Provide removable protective wall pads with padlocks inside elevator car to protect the wall panels. Pads shall meet all codes for elevator car enclosures, and be equal to Palmer "PalmTuff Vinyl Pads". Color to be selected by owner from mfg standards.
13. Acceptable Cab Manufacturers:
 - a. G&R Elevator Co.
 - b. Haunstein Burmeister
 - c. Tyler
 - d. Columbia
 - e. Eklund

2.6 OPERATING FIXTURES

A. Car operating panel:

1. The operating panel in the car shall consist of vandal resistant stainless steel control panel. (Taper all projected sides of car panel back to return panel for a neat appearance. Submit drawings for approval prior to fabrication.) The main control panel shall contain a series of push buttons with illuminated call registration devices, numbered to correspond to the various landings serviced. In Car Stop Switch, Fire Service Compartment, Alarm Button (connected to a bell located on the car) and a Door Close, Door Open button for each entrance. Alarm bell shall be operated from its own independent battery pack power supply and recharging system. The control panel shall also contain separate key operated switches for Access, independent service, car lights, car fan, emergency light and test switch. Emergency phone shall be hands free type. Panel shall also accommodate certificate frame, hands free phone and digital car position indicator. All key switch cylinders shall be standard Adams fixtures.
2. Buttons shall be made of brushed stainless steel with LED for illumination, with translucent floor designations, with Braille.
3. Provide emergency light in car-operating panel with rechargeable nickel cadmium batteries and recharging system.
4. Provide engraved fire services instruction per ASME A17.1.
5. Acceptable Manufacturers: PTL-Performer series or Innovation Industries. All shall be vandal resistant and brailled.
6. Refer to detail on drawings.

B. Hall push button:

1. ADA compliant vandal resistant illuminating LED type Hall push buttons shall be installed at each floor to permit waiting passengers to call the elevator to the floor.
2. Shall include hall position indicator, LED, Digital.
3. Fixtures shall have up and down buttons with Braille adjacent to the button on the left at intermediate floors and single buttons at top and bottom floors.
4. Buttons shall be made of vandal resistant stainless steel and shall illuminate to indicate a call has been registered. Button shall remain illuminated until the call has been answered. Provide oversized vandal resistant brushed stainless steel cover plates at all push button stations to cover all openings (including the openings that result from removal of existing hall push button stations or any other devices). The Braille signage adjacent to the directional button requires at least half inch lettering denoting the direction of the button
5. Provide engraved graphic (Appendix "O") per ASME A17.1 emergency sign and illustration on all hall push button station plates: "IN CASE OF FIRE USE STAIRWAY FOR EXIT". "DO NOT USE ELEVATOR"
6. Acceptable Manufacturers: PTL Performer Series or Innovation Industries.
7. Refer to details on drawing.
8. Hall push button panel shall accommodate the hall position indicator (HPI).
9. Hallway push button shall be flush wall mounted fixture type.

C. Floor passing chime:

1. Provide a floor-passing chime and voice annunciation to meet ADA requirements. Mount in main car operating panel.
2. Acceptable Manufacturer: Adams Voice or approved Elevator Controller Manufacturer.

D. Communication system (telephone):

1. Provide hands-free vandal resistant emergency telephone in the car, with wiring (shielded pairs) to terminals on control panel in machine room. Engraved with ASME A17.1.
2. Phone shall keep working during power failure. Coordinate work with U-M ITCOM. Phone shall be one push button to talk type and flash when call is answered. Telephone shall be an integral part of the car panel.
3. Annunciator Interface, Auxiliary Relay and 24V LED Board: The board shall be mounted behind the phone in the elevator car operating panel which contains an auxiliary relay that can be tied to DDC panel. The connection from the elevator controller to the DDC panel shall be provided by electrical contractor. When the board is programmed correctly, DDC will receive an alarm whenever the RATH phone detects the phone line has failed. Note that the car traveling cable containing the phone line must be expanded to contain a pair of wires for connection to the nearest DDC panel.

4. Provide a RATH 2100-ALARM unit. Unit shall be mounted in the designated floor elevator lobby per elevator code ASME A17.1 as part of the egress floor hallway push button and shall be wired to the RATH phone in the car operating panel. The alarm unit will contain the code required local alarm light, sounder and a momentary key switch on a label back plate. The traveling cable containing the phone line and pair of wires for the DDC circuit must be expanded to contain a pair of wires from the RATH phone RATH alarm unit.
 5. Manufacturer:
 - a. RATH Microtech 2100-957-cc telephone (call track), with hand free operation or equivalent.
 - b. RATH 2100 Alarm Unit or equivalent..
- E. Car traveling lantern:
1. Provide on both sides of car doorjamb and shall be ADA compliant.
 2. Manufacturer: PTL Performer series or Innovation Industries Vandal Resistant Series.
 3. Refer to detail on drawings.
- F. Car fire alarm horn: (omitted)
- G. Car position indicator:
1. A LED (Light Emitting Diode) vandal resistant digital type position indicator shall be provided inside car, as part of main car operating panel (COP). It shall indicate the floor at which the car is stopped or passing and the direction the car is traveling. The cover plates shall be #4, brushed Stainless Steel.
 2. Manufacturer: PTL Performer Series or Innovation Industries Vandal Resistant Series.
 3. Refer to detail on drawings.
- H. Special Key Feature:
1. Provide (2) key switches per floor. One shall be for security on & off and one shall be for momentary override. Keys shall be keyed to U of M's KEY SYSTEM and shall be coordinated with KEY OFFICE through Owner Representative.
- I. Hall position indicator:
1. Provide at each floor in elevator lobby **OR HALLWAY, ABOVE HOISTWAY DOOR**. Description shall be as in item 2.6.G as part of the hallway push buttons and shall be LED digital type in red color.

2.7 ELECTRIC WIRING:

- A. Complete insulated wiring shall be furnished and installed to connect all parts of the equipment furnished by the elevator contractor. Wiring shall conform to the requirements of the latest edition of the National Electrical Code. Include rigid conduit or EMT, at least 1/2" diameter, and short lengths of flexible conduit. Conduit or EMT shall terminate in junction boxes. Conduit, EMT, wiring duct, conduit fittings, enclosures and junction boxes shall be galvanized steel or aluminum.
- B. All wiring shall have a flame retarding moisture resisting outer cover and shall be run in metal conduit, flexible metallic tubing, or wire ducts.

- C. Traveling cables shall have flame retarding and moisture resisting outer cover. They shall be flexible and suitably suspended to relieve strains in the individual conductors. Provide the required quantity plus at least 10 percent spares. All wiring between telephone cabinet in car and a junction box in elevator machine room shall be provided by the elevator contractor. Conductors shall be numbered to correspond to numbered terminals at the car and machine room.
- D. Terminal blocks shall be coded to identify the circuits. Multi-conductor cables shall have the conductor color coded and numbered.
- E. The elevator car top shall be provided with a suitable GFCI duplex plug receptacle. Car top lighting shall comply with State of Michigan elevator code requirements.
- F. Unless otherwise specified, control wiring shall be a minimum size of #18 AWG. Wire size shall be large enough so that the voltage drop under inrush conditions will not adversely affect operation of the controls.
- G. Electrical Receptacle in Car: Provide GFCI duplex electrical receptacle in car. Locate receptacle approximately 2" above finished floor below car operating panel. Provide matching face plate on receptacle.
- H. Execution:
 - 1. Install all power wiring in raceway systems. No exposed wiring or conduit shall be run in finished areas without prior written approval of owner.
 - 2. Splice cables and wires only in outlet boxes, junction boxes or pull boxes. (Note - No wire splicing allowed in raceway or wire ducts).
 - 3. Install cable supports for all vertical feeders in accordance with the NEC. Provide Kellum GRIP type supports, which firmly clamp each individual cable and tighten due to cable weight.
 - 4. All terminal strip connections shall be identified with corresponding reference numbers from cable termination chart and electrical straight-line diagrams.

PART 3 - EXECUTION

3.1 ACCEPTABLE ELEVATOR INSTALLERS

- A. Acceptable installers: Subject to compliance with the requirements specified herein, installers offering product approved by the Owner are limited to the following listed companies. Elevator installer for project must provide the equipments as specified.
 - 1. Detroit Elevator Co.
 - 2. Kone Elevator Co.
 - 3. Otis Elevator Co.
 - 4. Schindler Elevator Inc.
 - 5. Thyssen Kruup Elevator Co.

* Note: Above is not a list of elevator manufacturers; it is a list of INSTALLERS only. Elevator installer must provide the equipment specified.

3.2 EXAMINATION

- A. Inspect all surfaces, and required embedded anchorage devices, and verify that they are in proper condition to receive the work of this Section. Verify that field measurements are as indicated on approved shop drawings.
 - 1. Prior to preparation of drawings, the contractor shall examine the hoistway and machine room areas and verify that no discrepancies or irregularities exist which would adversely effect the execution of the work.
 - 2. No exposed wiring or conduit shall be run in finished areas without prior written approval of owner.
- B. Beginning of installation means acceptance of existing conditions.

3.3 PERFORMANCE

- A. Contact speed: Actual speed shall vary no more than 5 FPM from speed specified under any loading condition or direction of travel.
- B. Leveling Accuracy: Consistently level within +/- 1/4" under loading conditions.

3.4 ACCESSORIES

- A. Provide storage cabinet for the protective pads.

3.5 PERFORMANCE GUARANTEE

- A. The elevator contractor shall assume full responsibility to furnish and provide a complete and functional elevator and to obtain and furnish the University final State Elevator Inspection approval. All costs necessary to correct code deficiencies cited by the State Elevator Inspector will be paid by the elevator contractor as part of this Contract at no additional cost to the Owner.

3.6 TECHNICAL TRAINING

- A. On site technical training shall be held for the purpose of familiarizing Elevator Support Mechanics with operations and troubleshooting procedures. The session shall accommodate up to ten personnel in each session and consist of forty hours of Training (This to include two 2-day sessions and the fifth day reserved for any additional diagnostic training). Training on equipment controller shall be provided by trained factory service engineers of controller manufacturers through the elevator installers.

3.7 ACCEPTANCE DEMONSTRATION AND PERFORMANCE TEST (COMMISSIONING):

- A. Demonstrate to Owner, or Owner's designated representative, the operation of the elevator system. Demonstration shall include:
 - 1. Installation compliance with specifications.
 - 2. Contract speed, capacity, and floor-to-floor performance compliance with specifications.
 - 3. Stopping accuracy and car ride compliance with specifications.
 - 4. Operation of signal fixtures and operation of supervisory or dispatching system.
 - 5. Promptly remove all work rejected by the Engineer for failure to meet specifications and replace the rejected work to comply with requirements, at no additional cost to the Owner. All expenses of repairing work of other Trades damaged by this replacement shall be borne by Contractor.
 - 6. Rejected work which is not made good within a reasonable time, determined by the Engineer, may be corrected by the Owner at Contractor's expense.
 - 7. Upon completion of installation and before final acceptance, conduct a running speed test with full design load to verify compliance with performance requirements. Also refer to Article 1.3 of this division
- B. Operating Instructions: Provide instructions to the Owner's personnel, including safety procedures, proper operation of the equipment, and routine maintenance procedures.
- C. The laptop computer shall be provided to commissioner prior to start of commissioning process by minimum of (2) weeks. See item 2.3.S.

3.8 CLEANUP

- A. Keep work areas orderly and free of debris on a daily basis.
- B. Remove filings and loose materials resulting from this work from hoistways.
- C. Clean all dirt, oil and grease from machine room and pit equipment and floors.
- D. Clean car, car enclosures, entrances, hoistways, operating and signal fixtures and trim of dirt, oil, grease, and finger marks.
- E. Polish and shine all stainless steel components.
- F. Clean, re-align guide rails for car and counterweight and paint the back of guide rails with black paint.

SPECIFICATION DIVISION 14

NUMBER SECTION DESCRIPTION

DIVISION 14 CONVEYING SYSTEMS

SECTION 142423 - HYDRAULIC ELEVATOR

END OF CONTENTS TABLE

EDITOR NOTE:

1-9-15: SUBSTANTIALLY REVISED NEW MASTER SPECIFICATION

DIVISION 14 CONVEYING SYSTEMS
SECTION 14240 - HYDRAULIC PASSENGER ELEVATOR

PART 1 - GENERAL

1.1 GENERAL CONDITIONS

- A. The Contractor under this Division (elevator contractor) is referred to the Contract Forms and General Conditions of these specifications, all of which apply to this Division.

1.2 SCOPE OF WORK

EDITOR:
EDIT THE FOLLOWING TO SUIT PROJECT.

- A. The work of this division shall consist of the complete replacement of --- hydraulic elevator(s) with a new hydraulic elevator in the **BUILDING NAME** Building. Bidders shall include labor, materials, permits, and services required for the complete installation of the elevator system and hoistway equipment as herein specified.
1. In all cases where a device or part of the equipment is herein referred to in the singular, it is intended that such reference shall apply to as many of such devices or parts as are required to make a complete installation.
 2. Elevator installer shall obtain all approvals for any required code variances to accommodate this renovation/installation from the Michigan Elevator Safety Division at no additional cost to owner prior to starting construction.
 3. Refer to Architectural and Electrical drawings, and coordinate accordingly.
- B. Two weeks prior to removal of any equipment, elevator contractor must notify U-M elevator shop dept. at 734-647-2059. U-M. Elevator Department will tag any parts to be salvaged. Contractor shall remove tagged parts, transport parts to building loading dock, and notify U-M elevator department which in turn shall remove salvaged parts from site. All other equipment will become property of contractor who will remove from site in accordance with all codes and regulations.
- C. Cost of drilling for hydraulic cylinders into the existing ground shall include any anticipated rocks or other obstructions in the ground, and shall not include any requests for additional cost to owner.
- D. Related sections and work of other divisions:
1. Outline of work by University of Michigan's OSEH Department:
 - a. Analysis and testing for any soil contamination.
 - b. Transportation removed contaminated soil if any, to a dumping site with MDEQ permit which shall be at contractor cost.
 - c. Contact number at OSEH is obtainable from construction manager.

2. The elevator contractor shall include all work and materials, except that listed under "Related work by other contractors", for a complete new state certified hydraulic system.
3. Following is a brief description of work by other divisions included in the contract. This must be done in accordance with the codes having Jurisdiction and approval drawings of the elevator contractor.
 - a. Architectural work, refer to architectural drawings and specifications.
 - b. Electrical work, refer to electrical drawings and specifications.
 - c. Mechanical work, refer to mechanical drawings and specifications.
4. Elevator contractor shall coordinate work of other trades in the hoistway and elevator machine room and be available to operate the elevator in a running "Platform" to allow other trades to complete their work.
5. All telephone cable and conduit between machine room controller terminals and car shall be provided by elevator contractor.
6. Final cleaning: Refer to Architectural specifications, Division 1 and Part 3, Item 3.8 of Division 14.

1.3 CODE AND STANDARD OF REGULATORY AGENCIES

- A. Applicable elevators codes shall be in effect based on the time the permit is drawn and shall govern the installation process.
- B. Perform work in accordance with applicable codes, the State of Michigan Elevator Code, the National Electrical Code, and the American Society Mechanical Engineering Safety Code for Elevators and Escalators, ASME A17.1 as adopted by the State of Michigan, as referenced therein and all of the provisions in the University of Michigan's Standard General Conditions.
- C. Give necessary notices, obtain State and Municipal permits, pay fees in connection with the installation, including sales and use taxes as applicable, and make tests as are called for by the regulations of such authorities. These test(s) or inspection(s) shall be made in the presence of the authorized representative of such authorities and the owner's representative. It is the responsibility of the elevator contractor to provide any variances from the Governing Authority that could be necessary for a complete acceptable elevator installation. Also refer to part 3, item 3.7 of division 14.
- D. "Elevator Guidelines to Ensure Accessibility by People with Disabilities".
 1. Elevators shall meet the guidelines of the Americans with Disabilities Act using the Uniform Federal Accessibility Standards (UFAS) relevant to elevators (Section 4.10 Elevators) as the technical requirements.
 2. Elevators shall meet the requirements of the State of Michigan Department of Labor Building Code relevant to barrier free design and elevators. Section 512.10.

1.4 SAFETY AND SECURITY REQUIREMENTS:

- A. The building may be occupied and used by occupants throughout the construction period.
- B. Comply with the following safety and security requirements for work conducted in occupied buildings and related areas:
 - 1. Schedule Work with owner.
 - 2. Building Access: During regular business hours (7:30 AM through 5:30 PM; Monday through Friday, except University-recognized holidays), notify Owner's Representative for access to Project site.
- C. Individual areas can be opened as often as once each day by the Owner's building facilities manager. When more frequent daily access is required, or when access is required for more than 5 working days, obtain keys from the University Key Office. When working in more than one area, check with the building facilities manager to ensure no scheduling conflicts exist.
 - 1. Building access outside of regular business hours and on weekends is available only with the written approval of the Owner's Representative. Coordinate access with the Owner's Representative and the Owner's Public Safety Department.
 - 2. Security: Purchase University-provided photographic identity badges for each person engaged in on-site work, and ensure that workers wear badges at all times on University property. Coordinate through Owner's Representative.
 - a. Badges are required in occupied buildings when the Contract Time is longer than 1 week.
 - 3. For off-hours work time, see general notes on sheet M1.1
 - a. Work activities shall not result in excessive noise, vibration, odors, smoke, fumes, etc. in occupied areas. Offending work must be stopped, and rescheduled for off-hours completion: 5:30PM to 6:30AM.
- D. Personal Restrictions:
 - 1. Personal Conduct Restrictions: Employees of the Contractor and subcontractors shall comply with the following restrictions regarding personal conduct while on University of Michigan property:
 - 2. Smoking: Smoking is strictly prohibited except in specially designated areas.
 - 3. Harassment: Conduct considered by the Owner as harassing is strictly prohibited, including the use of profanity; or the use of derogatory or demeaning gender or race-related comments or actions. The Owner reserves the right to require the Contractor, at no additional cost to the Owner, to remove from the Project all personnel who violate this policy.

1.5 GUARANTEE

- A. The elevator contractor shall guarantee the materials and workmanship of the apparatus installed by him under this specification, and that he will make good any defects not due to ordinary wear and tear or improper use or care, which may develop within warranty from date of final payment or extended new product warranty service period.

1.6 SCHEDULING OF OPERATIONS

A. Contractor must note that building may be occupied at all times. Construction scheduling is of utmost importance. Refer to bid documents for special conditions for additional information. During the progress of the work, job meetings will be subject to call between the Owner's representatives, and the Contractor's representatives. The Contractor shall provide a representative to attend meetings held from time to time for the purposes of schedule coordination and consideration of technical and construction matters. The Contractor's representative shall be the job superintendent or other person who is authorized to act as the agent of the Contractor.

B. Dates:

EDITOR: EDIT RHE FOLLOWING TO SUIT THE PROJECT IF THERE IS MORE THAN ONE ELEVATOR

- 1. Start and completion of constructions, Refer to bid documents.
- 2. Any elevator shall not be continuously out of services for more than 4 months.

C. Sequence of work:

- 1. Work on one elevator at a time.
- 2. When the project involve more than one elevator in the group. All cars shall be in operation expect the one being worked on.
- 3. When performing elevator group tie-ins work shall be scheduled to be preformed during off hours through construction manager.

D. Work restriction shall be verified with building manager.

*EDITOR:
EDIT THE FOLLOWING TO SUIT THE PROJECT IF THERE IS MORE THAN ONE CAR*

E. The elevator contractor shall be responsible to service and to maintain in service car(s) while working on any car in the group.

1.7 NEW PRODUCT WARRANTY SERVICES

- A. After completion of the installation, warranty and 24-hour callback service for the equipment furnished under this specification shall be provided for a period of twelve (12) months as part of this Contract. This service shall also include regular biweekly examination. Provide minimum of (26) inspections in the one-year period. In the event the 26 site visitations are not completed the elevator contractor will extend his warranty covering all callbacks, repairs, parts, testing, labor and any other item necessary to keep the elevator in like new condition until the twenty-six warranty site visitations have been completed. Advise U-M elevator department each time before and after service call completion of service (of the installation during regular working hours by trained employees of this Contractor, and shall include all necessary adjustments, greasing, oiling, cleaning, supplies and parts to keep the equipment in proper operation, except parts made necessary by misuse, accidents or neglect caused by). Contractor shall provide written record of work preformed signed by the elevator shop after each visit.
- B. All warranty service must be performed by the installers and not by any other services agency. The installer must have an established maintenance and service organization available for performance in the City of Ann Arbor that can provide regular and emergency service, 24 hours a day, every day of the year.
- C. It is the responsibility of the U-M elevator department to respond to any emergency regarding elevators. In the event that someone is trapped in an elevator that is under contracted warranty, the University Elevator Department will respond to free the passengers as soon as possible to minimize the inconvenience to users. It is within the right of the University to remove covers, open doors, install monitoring equipment, etc. However, this work will be performed by elevator journey person licensed by the State of Michigan.
- D. A detailed record of work performed by University Elevator Mechanics is maintained in the Elevator Shop. Contractors shall contact U-M Elevator Shop to review work performed by University Elevator journey person.
- E. The elevator contractor shall be responsible to service record and maintain all elevator emergency circuits (including the fire service circuit, related equipment and sensors) as part of the regular elevator warranty service contract.
- F. Include and maintain an oil log in the elevator machine room.

1.8 SUBMITTALS

- A. Before beginning fabrications and work, the elevator contractor shall prepare drawings that show the arrangement of the elevator system. Approval of drawings and other data (submit minimum of eight sets), which are to be submitted by the elevator contractor to the owner representative, must be approved U-M before proceeding with fabrication and installation of the equipment. Field verify existing conditions and hoistway sizes prior to preparation of drawings.

- B. Submit provisions for delivery of drilling machine into building and setting it in place to provide the drilling process.
- C. Samples:
1. Submit samples of car wall, car floor tile and enamel colors.
 2. Do not proceed with orders until samples are approved by U-M Engineer/Architect.
- D. Shop drawings:
1. Submit eight (8) copies of shop drawings showing the general and detailed arrangement of all elevator equipment. Show ceiling, lighting, signal fixtures, and smoke detectors including routing of exposed conduit and all materials.
 2. Show dimensions, weights, and indicate who will perform the work of each item.
 3. Statements to the effects of work "by other" shall not be accepted; you must identify who is responsible for the work.
- E. Product Data: Submit the manufacturers' specification and data sheets, and standard details. Include pictures, catalog cuts, or other suitable illustrations of all elevator equipment that will be exposed in the finish work, including car, hoistway entrance, and signal and control apparatus. Also include these items in bound set.
- F. Certificates:
1. Furnish without cost to the Owner all certificates necessary as evidence that the elevator conforms to the applicable laws, ordinances, and requirements.
 2. Certificate shall be mounted in car operating panel.
- G. Operation & Maintenance Manuals:
1. At completion of work provide four complete project and specification sets (bound and properly arranged) of the parts lists and operators manuals, copies of approved shop drawings, prior to receiving final payment. Following is a brief summary of items:
 - a. Legible schematic wiring diagrams including all changes made during installation.
 - b. Description of operation of elevator system installed.
 - c. Pump Package: Including motor, jack unit, PVC line, shut-off valve, isolation coupling, pump and accessories.
 - d. Buffers.
 - e. Guide Rollers on Car.
 - f. Controller and Selector: Including parts information on Relays, Printed Circuit Boards, Reverse Phase Relays, Switches, Lamps, Electrical Cables, Monitors, Modems, Diagnostic Hardware, Diagnostic Software, and Overload Protection Devices.
 - g. Door Assemblies: Including Hangers, Rollers, Door Motor, Door Operator, Door Clutch Assembly, Door Closers, Door Drive Arms, Related Hardware, Sheaves, Door Guides, Interlocks, Safety Door Edge.
 - h. Signal Equipment: Including Car Station, Hall Stations, Position Indicators, Direction Indicators, Fire Service Panel, Smoke Detectors, Key switches, and Pushbutton Assemblies.
 - i. Car Top Inspection Station, Limit Switches, Solid State Leveling Control Units, Leveling Switches, Cabs, Doors Sling, Platform, and Alarm Bell.

- j. Provide a laptop computer and demonstrate the elevator system operation to owner personal as part of training.
- k. Provide a copy of certificate and State permit.
- l. Provide emergency phone number.
- 2. Additional O&M manuals will be required per each machine room.
- 3. Maintenance records shall document compliance with ASME A17.1 section 8.6.

1.9 ACCEPTABLE PRODUCTS:

- A. Fixtures (Car Operating Panel, Hall Push Button): Vandal Resistant, PTL Performer Series or Innovation Industries.
- B. MICRO-PROCESSOR BASED CONTROLLER (For Hydraulic Elevators): Motion Control Engineering Model or Elevator Control Corp or SmartRise controllers or Virginia control. with soft start features to limit inrush current and remote diagnostics. All diagnostics shall be compatible with the laptop PC that will be provided and shall be compatible with University existing IBM system.
- C. DOOR OPERATOR & EQUIPMENT: GAL Manufacturing Corp. MOVFR operator car and hall door tracks, car and door hangers with roller assemblies. All interlocks, pickup rollers and operating linkage manufactured by GAL.
- D. PUMP PACKAGE: Standard dry type pump unit that complies with all duty requirements of this Section consisting of Delaval Imo pump with Maxton Valve and all required accessories.
- E. DOOR PROTECTIVE DEVICE: ICU/Gatekeeper 2000 from Adams Elevator Equipment Company, Juans Model 3D.
- F. TELEPHONE: RATH Microtech 2100-957-CC telephone integral of cabinet with Rath 2100-Alarm as part of the phone and elevator communications failure. See Item 2.6.D.
- G. Roller Guides: ElSCO Model "B" on car.
- H. Car Top Inspection Station: Adams Model A-910A with A-910X5 guards.
- I. Floor Announcement System: Shall be through chime and voice announcement, by Adams or the controller manufacturer and shall be approved by University of Michigan engineer.
- J. Cab Manufacturers:
 - 1. G & R Elevator Mfg.
 - 2. Havenstein Burmeister
 - 3. Tyler
 - 4. Columbia
 - 5. Eklund
 - 6. Eklund
- K. DOOR GUIDES: NYLUBE
- L. Limit Switch: EECO

- M. Buffers: Shall be supplied by jack manufacturer. Meeting ASME A17.1 code requirements.

PART 2 - PRODUCTS

2.1 SCHEDULE OF NEW ELEVATOR EQUIPMENT

**EDITOR:
EDIT THE FOLLOWING TO SUIT PROJECT.**

- A. Elevator Number: Existing State Number -----
- B. Type of Service: Passenger / Freight
- C. Elevator Type: Hydraulic elevator machine room, Located on --- Floor (Room number ---)
- D. Quantity: ---
- E. Capacity: --- pounds
- F. Speed: --- FPM
- G. Travel Distance: 0'-0", + or - (Field verify)
- H. Number of Stops: ---.

VERIFY IF THERE A REAR DOOR OPENING IF NO DELETE THE REAR DOOR OPENING

- I. Number of Door Openings: front door opening ----, and rear door opening ----
- J. Floors Served: -, -, -, -
- K. Main Floor Egress: ---; Alternate Floor Egress: ---
- L. Hoistway Size: ---" Long x ---" Wide Approx.; (Field Verify)
- M. Pit Dimension: ---- long x ---- wide x ---- deep (Field Verify)
- N. Platform Size (Width x Depth): ---- long x ---- wide or size to be maximum allowable but at minimum match the existing.
- O. Car Interior Dimensions: ---- Long x ---- Wide x ---- High (dimensions to match existing). (Field Verify)
- P. Car Door Size: ---" Wide x ---" High.

EDITOR: VERIFY THE DOOR OPENING TYPE SPPED

- Q. Door opening Type: ---- speed, ---- Opening (match landing size).
- R. Machine Type: Hydraulic

COORDINATE POWER SUPPLY WITH THE ELECTRICAL TRADE.

- S. Power Supply: --- Volts/ 3 Phase/ 60 Cycle; motor horsepower --- HP.
- T. Fire Fighter Service: Yes
- U. Independent Service Operation: Yes

EDITOR: SEE IF WE NEED THIS OPTION FOR THE SPECIAL KEY SWITCHES IN THE PROJECTS

- V. Special key switches: Yes, (two key switches per floor, one for security on & off, one for momentary override).

2.2 HYDRAULIC ELEVATOR

- A. Oil Hydraulic Machine: The power unit shall be of a compact, self-contained design including pump, drive motor, oil control unit assembly, oil storage tank, removable drip pan a rigid structural steel frame with storage tank and neoprene vibration isolators. Refer to detail on drawings.
- B. Pump: The pump shall be a positive displacement screw type, for maximum smoothness and quietness and shall be belt drive by the motor. Do not use pumps mounted in the oil and shall be belt driven to the motor.
- C. Motor: The drive motor shall be of premium efficiency meeting NEMA 12.6C table and have a duty rating use with hydraulic elevator systems.
- D. Oil Control Unit: The oil control unit shall consist of electrically actuated and hydraulically operated valves with adjustments accessible without removing the assembly from the oil lines. An automatic bypass valve shall provide smooth starting and stopping in the up direction and shall give regulated up leveling speed under varying load conditions in the car. The lowering and down leveling valve shall be fully adjustable for smoothness and speed of operation and shall be designed to close automatically if the power fails. Operation of a manual valve shall permit the car to be lowered at slow speed in the event of power failure. A safety check valve shall hold the car when the pump is at rest and a relief valve shall be provided which is capable of bypassing the entire output of the pump without increasing the system pressure more than 25% above the normal working pressure. Permanently install a liquid filled pressure gage on oil control unit.
- E. Oil Storage Tank: The oil storage tank shall be of sufficient capacity for the full travel of the car with a reserve of not less than 10 gallons and shall have a drain connection, means of isolating oil in the tank for servicing of pump and valves, an effective pump suction strainer and a removable cover. The cover shall be designed for low velocity breathing with a protected vent opening to prevent entry of liquids or debris into the tank. Tanks with single small vent openings shall be guarded against accidental blockage, which may cause collapse of the tank during operation of the elevator in the up direction. Tank to be located in elevator equipment room.

- F. Oil: Sufficient specially prepared hydraulic oil with greater than 400 degrees F. flashpoint and of proper viscosity and lubricating qualities shall be provided.
- G. Sound Reduction With Isolating Panels And Muffler: In addition to selection of individual components to minimize noise generation, a blow-out proof muffler for absorption of hydraulic pulsations shall be installed in the oil line between the pump and the cylinder, and the hydraulic machine shall be provided with rubber isolation pads to prevent transmission of noise and vibration to the building structure. Sheet steel panels lined with sound-deadening material shall enclose the motor and pump location area of the hydraulic machine for reduction of air-borne noise.
- H. All Hydraulic Supply Piping: Shall be at least schedule 80 black steel pipe. Threaded pipe only. No grooved fittings are allowed. The system must be free from seepage at joints.
- I. Shut-Off Valve: Manually operated valves shall be provided and installed in the oil supply line to isolate the cylinder and plunger unit from the hydraulic machine. Provide two valves-one in pit near jack assembly and another one in the Machine Room near machine.
- J. Oil Strainer: A self-cleaning strainer shall be provided and installed in the oil line between the hydraulic machine and the cylinder plunger unit to protect the oil control valves during downward travel of the elevator. The strainer shall have a 40-mesh screen for removal of solid particles and a magnetic drain plug for removal of ferrous materials. The strainer assembly shall be constructed for at least 600 psig. working pressure.
- K. Isolation Coupling(s): Isolation coupling(s) shall be provided to abate the transmission of noise produced by the vibration of the pumping unit. Proper location of the isolation coupling(s), in the oil delivery line, shall be determined by the elevator subcontractor.
- L. Cylinder and Plunger Unit:
1. The cylinder shall be fabricated of steel pipe, closed at the bottom and provided with a removable cylinder head and packing gland at the top. The cylinder head shall have a bronze, babbitt or phenolic-lined bearing and an integral drip ring. Packing shall be of the self-adjusting type not requiring external adjustment and shall allow operation of the plunger with minimum friction. The packing gland shall be arranged to return automatically to the reservoir any oil, which may escape the packing ring. Structural steel shapes shall be provided to support the cylinder and to transmit vertical loads to the pit floor.
 2. The exterior of the cylinder shall be treated with a corrosion resistant compound and double-lap wrapped with a commercial grade wrapping, such as Scotchwrap or Tapecoat, before installation.
 3. The plunger shall be constructed of seamless steel pipe or tubing turned true and smooth and polished to a fine finish. A stop plate to prevent the plunger from leaving the cylinder shall be welded to the bottom of the plunger.

4. Grey cast iron or other brittle materials shall not be used and the cylinder and plunger unit shall be factory tested at not less than 600 psi, or as per ASME A17.1 and State of Michigan Elevator Code, for strength and freedom from leakage. Units of multiple section construction shall be securely joined by couplings. Cylinder couplings shall have all joints welded before installation to prevent leakage.
5. The well hole for the cylinder shall be provided by the Elevator Contractor, including drilling and dirt removal at no additional cost to the owner.
6. Provide outer cylinder casing and related schedule 40 PVC protective covering. Casing shall be schedule as per Michigan Elevator Code requirements, with welded joints and welded steel bottom.
7. Provide a stainless steel drip pan (at pit floor) or drip ring around cylinder with scavenger pump, oil piping between pump and oil storage tank and all related power wiring.

2.3 PROGRAMMABLE CONTROLLERS FOR HYDRAULIC ELEVATOR

A. Controller Description:

1. The elevator controller shall utilize a microprocessor based logic system and shall comply with ASME 17.1 safety code for elevators and escalator. The system shall provide comprehensive means to access the computer memory for elevator diagnostic purposes without need for any external devices, and shall have permanent indicators to indicate important elevator status as an integral part of the controller. Systems that require hookup of external devices for troubleshooting are not acceptable. The elevator control equipment shall be provided such that at least three (3) elevator service companies can maintain the equipment. Immediate availability of replacement parts shall be guaranteed and no special proprietary diagnostic devices will be utilized. An O.E.M. control, serviceable only by the O.E.M. will not be accepted. Controller shall be provided with the capability of in-the field changes for certain variables such as door time. These changes should be stored permanently using non-volatile memory. Thus if the power to the unit is disconnected, the system will maintain the programmed variables. The Car Diagnostic Display shall have the capability of selecting either the operational or programming modes and/or displaying the status of all inputs and outputs and capability of remote diagnostics to be interfaced with U-M's elevator shops existing IBM compatible computer system.
2. Failure of any single magnetically operated switch, conductors, or relay to release in the intended manner; or the occurrence of a single accidental ground or short circuit shall not permit the car to start or run if any hoistway door or gate interlock is UNLOCKED or if any hoistway door or car door or gate contact is not in the made position. Furthermore, while on car top inspection or hoistway access operation, failure of any single magnetically operated switch, conductors or relay to release in the intended manner; or the occurrence of a single accidental ground shall not permit the car to move even with the hoistway door locks and car door contacts in the closed or made position.

3. Provide a dedicated permanent status indicators on the controller to indicate when the safety string is open, when the door locks are open, when the elevator is running at high speed, when the elevator is on independent service, when the elevator is on fireman's service, when the elevator out of service timer has elapsed or when the motor limit timer or valve limit timer has elapsed. When duplex operation is provided a switch, shall select which of the two cars statuses is to be displayed on the indicators, in addition, provide means of displaying other special or error conditions that are detected by the microprocessor.
4. The elevator shall not require the functioning or presence of the microprocessor to operate normally during car top inspection operation or hoistway access operation in order to provide a reliable means to move the car if the microprocessor fails.
5. Provide a motor limit timer function which in the event of the pump motor being energized longer than a predetermined time, shall cause the car to descend to the lowest landing, open the doors automatically and then re-close them and the elevator shall then be rendered unresponsive to any automatic operation car door open pushbutton shall remain operational. Operation may be restored by cycling the power disconnect switch or putting the car on access or inspection operation.
6. Provide a valve limit timer function which in the event of the pump motor being energized longer than a predetermined time, shall cause the car to descend to the lowest landing, open the doors automatically and then re-close them and the elevator shall then be rendered unresponsive to any automatic operation car door open pushbutton shall remain operational. Operation may be restored by cycling to power disconnect switch or putting the car on access or inspection operation.
7. Low Oil Control:
 - a. A low oil control feature shall protect the hydraulic components if the elevator fails to complete its upward travel in the normal time.
 - b. Actuation of the low oil control circuit shall stop the pump and lower the car to the lowest landing. Power-operated doors shall open to permit passengers to depart and shall then close. Car door open pushbutton shall remain operational. The car shall remain parked at that landing completely removed from demands for service.
 - c. To return the car to normal service, the malfunction shall be corrected and the elevator controls reset in the machine room.
8. Provide an out of service timer (T.O.S.) which will automatically take the car out of service if the car is delayed in leaving the landing while there are calls existing in the building. The car shall not respond to hall calls while in this mode of operation.
9. Provide door protection timers for both the open and close directions which will help protect the door motor and which will help prevent the car from getting stuck at a landing. The door open protection timer shall cease attempting to open the door after a predetermined time in the event that the door is prevented from reaching the open position. The door close protection timer will reopen the doors for a short time in the event that the door-closing attempt fails to close the door locks after predetermined time.

10. Provide a minimum of three different door standing open times. A car call time value shall predominate when a car call only is cancelled. A hall call time value shall predominate whenever a hall call is cancelled. In the event of a door reopen from the safety edge, photo eye, a separate short door time value shall predominate.
11. Provide a Door Timing - Separate adjustable timing means to establish independent minimum passenger transfer time for car stops, hall stops, main lobby stops, and door reversal operations (short door time).
12. Hall call or car call registration and lamp acknowledgment shall be by means of a single wire per call besides the power busses. Systems that register the call with one wire and light the call acknowledgment lamp with a separate wire are not acceptable. Phase I emergency recall operation, and Phase II emergency in-car operation shall be provided within the controller according to ASME A17.1 and applicable local codes.
13. Independent service operation shall be provided such that actuation of a key switch in the car-operating panel will cancel any existing car calls, and hold the doors open at the landing. The car will then respond only to car calls and will ignore hall calls. Car and hoistway doors will only close by constant pressure on car call buttons or a door close button until the car starts to move. While on independent service any hall arrival lanterns or jamb mounted arrival lanterns and gongs shall be inoperative.
14. The car shall be equipped with two-way leveling to automatically bring the car within plus or minus 1/4 inch of exact level at any landing regardless of load up to maximum capacity.
15. A selector switch shall be provided on the controller to select high or low speed during access or inspection operation as long as speed does not exceed 150 feet per minute.
16. A test switch shall be provided. In the "test" position, this switch shall allow independent operation of the elevator without any door open functioning for purposes of adjustment or testing the elevator. The elevator shall not respond to hall calls and shall not interfere with the other car in a duplex installation.
17. A timer shall be provided to limit the amount of time a car is held at a floor due to a defective hall call or car call including stuck pushbuttons. Call demand at another floor shall cause the car to eventually ignore the defective call and continue to provide service in the building.
18. Door Timing: Separate adjustable timing means shall be provided to establish independent minimum passenger transfer time for car stops, hall stops, main lobby stops, and door reversal operations (short door time).
19. Automatic Operation of the Car Lighting shall be provided meeting the requirements of ASME A17.1. The Feature shall allow the car lights to be turned off when the following conditions exist for not less than five minutes: the car is at a floor, the doors are closed, there is no demand for service and the car is on automatic operation. Momentary interruption of any of these conditions will cause the car lights to be turned on. The Automatic Operation Feature shall be able to be turned on or off as desired by the owner from the Elevator Controller.

20. Simplex selective collective automatic operation shall be provided for the single car installations. Operation of one or more car call or hall call buttons shall cause the car to start and run automatically provided the hoistway door interlocks and car door contacts are closed. The car shall stop at the first car call or hall call set for the direction of travel of car. Stops shall be made in the order in which the car calls or hall calls set for the direction of operation of the elevator are reached, irrespective of the order in which they were registered. If only hall calls set for the opposite direction of travel of the elevator exist ahead of the car, the car shall proceed to the most distant hall call, reverse direction, and start collecting the calls.
21. Collective Operation:
 - a. Operation shall be automatic by means of the car and landing buttons. Stops registered by the momentary actuation of the car or landing buttons shall be made in the order in which the landings are reached in each direction of travel after the buttons have been actuated. All stops shall be subject to the respective car or landing button being actuated sufficiently in advance of the arrival of the car at that landing to enable the stop to be made.
 - b. If all calls in the system have been answered, the car shall park at the last landing served or the pre-determined home landing.
22. Home landing operation shall be provided and, if no calls are registered shall cause the car to travel to a predetermined home landing floor and stop without providing a door operation. The ability to change home landing feature shall be provided.
23. If the car is en-route to the home landing and a call appears from the direction opposite to which the car is traveling, the car shall slow down, stop, and then accelerate in the opposite direction, toward the call. The home landing function shall cease instantly upon the appearance of a normal call and the car shall proceed non-stop in response to any normal call.
24. Florescent lighting shall be at the front and back inside the controller cabinet. Ventilation fans are part of controller cabinet.
25. Elevator controller shall be Motion Control Engineering (MCE) or Elevator Controls Inc. Elevator controller shall be modified to include all features noted above including soft start features to limit inrush current and remote diagnostics and shall be compatible with the existing U-M system. All systems shall have remote diagnostics.
26. Phase Protection: Provide 3-phase power monitor for elevator power supply, which monitors phase loss, low voltage, phase reversal, phase unbalance, and has manual and automatic reset. Level in manual position.
27. Elevator controller is to be factory equipped with provisions for emergency power connections.

B. Auxiliary Operations:

EDITOR:

EDIT THE FOLLOWING TO SUIT PROJECT.

1. Firefighter's Service:

- a. The following operation is for the use of firemen and other authorized personnel. Per ASME A17.1.
- b. Automatic passenger elevators shall conform to the following:
 - 1) Provide a three position (on, off, and by-pass) key-operated switch at the main floor for each single elevator or each group of elevators. The key shall be removable only in the "on" and "off" positions. When the switch is in the "on" position, the elevators controlled by this switch and which are on automatic service shall return non-stop to the main floor, and the doors shall open and remain open.
 - 2) An elevator traveling away from the main floor shall reverse at the next available floor without opening its doors.
 - 3) Elevators equipped with automatic power-operated doors and standing at a floor other than the main floor, with doors open, shall close the doors without delay and proceed to the main floor.
 - 4) Door reopening devices for power-operated doors, which are sensitive to smoke, heat or flame shall be rendered inoperative.
 - 5) All car and corridor call buttons shall be rendered inoperative and all call registered lights and direction lanterns shall be extinguished and remain inoperative.
 - 6) A car stopped at a landing shall have its "Emergency Stop Switch" rendered inoperative as soon as the doors are closed and it starts toward the main floor. A moving car, traveling to or away from the main floor, shall have its "Emergency Stop Switch" rendered inoperative immediately.
 - 7) A sensor in each elevator lobby, which when activated prevents car from stopping at that floor, shall not be substituted for the above requirements.
 - 8) The university elevator shop will supply to the installing contractor a "Security Box" (key box) for installation at the egress floor.
- c. Sensing Devices: In addition to the key-operated switch required in "b" above, heat and smoke or products of combustion sensing devices shall be furnished and installed by fire alarm contractor in each elevator lobby at each floor and the main floor (Note - Egress floor is --- floor) alternate floor is for the elevator --- floor. The activation of a sensing device in any elevator lobby shall cause all cars in all groups that serve that lobby to return non-stop to the main floor. The key operated switch when moved to the "by-pass" position, shall restore normal service independent of the sensing devices. Sensors at each floor shall be connected separately from sensors at main floor.
- d. Provide a three position (off-hold-on) key-operated switch in each car operating panel per ASME A17.1 Fire Service Key Switch and shall be effective only when the egress floor key-operated switch is in the "on" position or a sensor has been activated and the car has returned to the egress floor or other approved level. The key shall be removable in all positions, and shall not change the operation until the car is at a floor with doors fully opened.

- e. The operation of elevators on Fire service shall be as follows:
 - 1) An elevator shall be operable only by a person in the car.
 - 2) Elevators shall not respond to elevator corridor calls.
 - 3) The opening of power-operated doors shall be controlled only by continuous pressure "open" buttons or switches. If the switch or button is released prior to the doors reaching the fully open position, the doors shall automatically re-close. Open doors shall be closed by continuous pressure on "Door Close" switch or button.
 - 4) Means shall be provided to cancel registered car calls.
 - 5) When the switch is in the 'hold' position, the car shall remain at the floor with its doors open.
 - 6) Elevators can be removed from individual car fire service by moving the key-operated switch to the "off" position and the car is at the main floor or other approved level.
 - f. The switches required above shall be operated by the same key but are not a part of a building master key system. There shall be a key for the main floor switch and for each elevator in the group and these keys shall be kept on the premises by persons responsible for maintenance and operation of the elevators, in a location readily accessible to authorized persons, but not where they are available to the public. TURN OVER ALL KEYS TO PROJECT ENGINEER. These keys shall be Adams Fire Service Keying System.
 - g. Instructions of operation shall be provided as required by code.
2. Elevators arranged for dual operation shall:
- a. Conform to the automatic operation described above when on automatic operation.
 - b. When firefighter's emergency operation is activated and the elevator is on independent or inspection operation the elevator shall be provided with a signal system consisting of both visual and audible types to alert the attendant to close the door and return non-stop to the main floor or other approved level. Provisions shall be made to alert the attendant in the same manner when a heat and smoke or products of combustion sensing device is activated.

EDITOR:

EDIT THE FOLLOWING TO SUIT PROJECT.

- 1) Floor Fire Service: ---- floor.
- 2) Alternate floor fire service: ---- floor.
- 3) The activation of a sensing device at the lobby (item 2 above) shall cause all elevators to return non-stop to the alternate floor and the doors shall open and remain open. (The alternate fire service floor shall be defined as any building floor other than the main fire service floor) which will be --- floor.

- 4) Operation to the elevator shall conform to "Firefighters' Service". When sensing devices are activated, the elevators shall return non-stop to the designated main floor and the doors shall open and remain open. When building sensors activate at the main fire service floor, elevator shall automatically be dispatched to that building's --- floor, which has been designated "Alternate" fire service floor where the elevator doors shall open and remain open.

THESE ARE OPTIONS. DELETE THEM IF THEY ARE NOT REQUIRED BY THE PROJECT.

C. Load Bypass Operation:

1. To automatically delete hallway calls when car is loaded to its limit. Load bypass operation shall be adjustable from the controller to adjust the load at which to bypass hall calls and not delete them.

D. Special Key Switches:

1. Provide (2) key switches per floor. One shall be for security on & off and one shall be for momentary override. Keys shall be keyed to U of M's KEY SYSTEM and shall be coordinated with KEY OFFICE through Owner representative.

E. Anti-nuisance Feature:

1. Provide an anti-nuisance operation to prevent the elevator control system from responding to a faster than normal rate or registration of car calls. The "normal" rate of registration of car calls shall be programmable on an individual elevator basis within the group.
2. If the anti-nuisance monitor determines that the rate of registration of car calls is excessive as compared to the pre-programmed rate of car calls, all car calls shall be canceled and shall be required to be reregistered.

F. Independent Service Operation:

1. Independent service operation shall permit one or more elevators to be removed from the group control and used without interfering with the normal operation of the remainder of the group.
2. Provide a two-position switch in the car-operating panel for each elevator.
3. When the switch is placed in the independent service position, the mode of operation shall be amended as follows:
 - a. The car is disconnected from the group supervisory system.
 - b. Existing car calls shall be canceled.
 - c. The cars shall bypass landing calls.
 - d. Continuous pressure on the car button of the selected floor shall close the doors and start the car toward the selected floor. Pressure shall be required on the button until the car starts. Releasing the car button before the car starts shall cause the doors to automatically reopen.
 - e. After the car has arrived at the floor and the doors have automatically opened, the cars shall remain until another car button is pressed or until the key switch is returned to the normal position.

- f. Should all cars be put on independent service, all hall calls registered shall be canceled. Further registration of hall calls shall be limited.

EDITOR:

DELETE THE FOLLOWING IF YOU DO NOT HAVE EMERGENCY POWER.

G. Emergency Power Panel:

1. Emergency switch and annunciation panel shall be a 12"x12" brushed stainless steel, with lockable cover, fully recessed panel to be located on the egress floor where indicated on drawings. The panel shall have indicating red lights showing locations of cars during emergency power condition.
2. A key switch shall have auto, manual ----. **NO. OF ELEVATORS**
3. The panel shall be labeled as "Elevator Emergency Panel".
4. See details on sheet ---.

H. Computer For Elevator Controller Diagnostics:

1. Provide a Dell Laptop, Model "Dell Latitude E6420" with Intel vPro Advanced Systems Management loaded with Diagnostics software for the installed elevator controller.
2. Liftnet monitoring system shall be installed and operational by elevator contractor.
3. Laptop Requirements:
 - a. Dell Latitude E6420
 - b. Operating system Genuine Windows 7 professional, no media, 32-bit, English.
 - c. Primary Storage: 250GB 5400rpm Hard Drive
 - d. Processor Branding: Intel Core i5 vPro Label.
 - e. Processor: Intel Core i5-2520M (2.50GHz, 3M cache) with turbo Boost Technology 2.0.
 - f. LCDs: 14.0" HD Anti-Glare LED backlit.
 - g. Memory: 4.0GB, DDR3-1333MHz SDRAM, 2, DIMMS
 - h. Internal Keyboard: Inertial English keyboard Dual Pointing Keyboard
 - i. Primary Optical Device: 8X DVD+/-RW w/Roxio and Cyberlink Power DVD, no media.
 - j. Wireless LAN: Intel® Centrino® Advanced-N 6205 802.11a/b/g/n Half Mini Card
 - k. Energy Star & EPEAT: Energy star 5.0 Enabled / EPEAT Gold
 - l. USB Optical Mouse
 - m. Primary Battery: 6-cell (60WH) Primary Lithium Ion Battery
 - n. AC Adapter: 90W /C ADAPTER (3-PIN)
 - o. carrying case: Slim Nylon Case (2 Pocket)
 - p. Support Services: 4 Year Basic Hardware Service with 4 Year NBD Limited Onsite Service After Remote Diagnosis
 - q. 4 year complete care accidental damage protection.
4. Laptop shall be compatible with all new elevator controllers.

I. Acceptable Manufacturers:

1. Motion Controller Engineering (MCE) model HMC-100.
2. Elevator Controls Inc.

J. Machine Finish and Painting:

1. All exposed surfaces of machines and motors, and controllers, shall be repainted after field installation and before acceptance by owner with rust resisting gloss enamel paint of light gray color.

2.4 HOISTWAY EQUIPMENT & HOISTWAY ENTRANCES

A. Provisions for Hoistway Access:

1. Elevator door safety plug-lock- Keyway - Furnish and install hoistway door unlocking devices at all landings with Tri-lock MFG. & MAINT. CORP. key NO. 6950 in accordance with requirements of the latest Edition of the American Standard Safety Code for Elevators, Dumbwaiters, and Escalators, and as permitted by the Local Code.
2. The hoistway door-unlocking device shall unlock and permit the opening of the hoistway door from any floor irrespective of the position of the car. The design of the device shall be such as to prevent unlocking the door with common tools. The means for unlocking the door shall be available and used only by inspectors, maintenance, and repair personnel.
3. Access Switches - Furnish and install hoistway access switches and associated devices (at the top and bottom landings in accordance with requirements of the latest Edition of the American Standard Safety Code for Elevators, and Escalators, and as permitted by the Local Code.

B. Hoistway Doors:

1. New doors shall be flush hollow metal panels fabricated of No. 16 U.S. gauge steel, minimum. The doors shall be 1-1/4" thick and reinforced with continuous members. Panels shall have sound deadening insulation. Doors shall have removable non-metallic gibs to run in the sill guideway with minimum clearance. Door panels shall conform to the National Elevator Code ASME A17.1 and the Underwriter's Laboratories 1-1/2 hour fire test requirement. Door unlocking devices shall be provided at all floors and as required by local codes. Sight guards shall be provided for all entrances. Provide new hoistway doors at all landing. The doors shall be equipped with nylube door guides.
2. Hoistway landing interior finish shall be painted black.
3. Hoistway landing Doors exterior finish shall be stainless steel.
4. Hoistway door unlocking devices at all landing shall be provided with TRI-LOCK removable plugs with key number 6950.

C. Top of Car Operating Device:

1. An operating device shall be provided on the top of the car located in the front between the car crosshead and hoistway door, complete with an Emergency Stop Switch, GFCI plug, fire service lamp and buzzer, lamp and guard, a Selections Switch, UP, DOWN and safety operating Buttons. This device shall comply with ASME A17.1 and local codes. Using Adams model A-912CG with Light guard.
2. Operation from the top of the car shall not be permissible unless all electric door contacts are closed.
3. Elevator shall be provided with at least two electric light fixtures and convenience outlet fixture on the car top. The two light fixtures combined shall provide an illumination level of not less than 10fc at the car top. The light fixture shall be permanent and be of the fixed or portable type and shall be equipped with guards. The light switch shall be accessible from the landing when accessing the car top.

D. Pit Stop Switch:

1. A switch or switches shall be located in each elevator pit, in accordance with ASME A17.1 and local codes, which when turned to the "off" position will cause the electric power to remove from the elevator pump motor. This switch shall be lockable in the "off" position.

E. Emergency Alarm Bell:

1. Provide an alarm bell with its own battery source and recharging unit for emergency power unit, mounted on the car. When the emergency alarm bell button in the car is pressed, it shall illuminate and the alarm bell shall sound. Operation shall be in accordance with ASME A17.1 and the State of Michigan Elevator Code.
2. Indicate DBA level of the alarm bell (80-85 DBA).

F. Guide Rails

1. Provide steel tee guide rails to meet ASME A17.1 requirements, including suitable brackets and clamps for attachment to the building structure. The guide rails and car frame shall be so located that the car is in balance with the guides. The machined tongue and groove joints shall be fitted with machined fishplates fastened to each rail with at least 4 through bolts. Rails are to be cleaned of any shipping or protective coatings at time of installation.
2. All joints shall be located free of interference with supporting clamps and brackets. Shims used to obtain rail alignment shall be designed to remain in position, even though the fastening bolts may be loosened.
3. The guide rails shall be installed and aligned with their machined faces plumb within one-eighth of an inch from top to bottom of the hoistway.
4. Minimum Rail Size shall be 16 pounds per foot. Upgrade rails based on application.

EDITOR:

DELETE THE NEW GUIDE RAIL IF THE GUIDE RAILS ARE TO BE REUSED FOR CAR AND COUNTERWEIGHT.

5. The car and counterweight guide rails shall be realigned, refinished and cleaned so that the faces of the rails are plumb within one-sixteenth (1/16) of an inch in 100 feet of travel. Refinish rails for smooth operation and paint back plains with black paint.

G. Buffers:

1. Buffers shall be installed in the pit to meet ASME A17.1 requirements. These buffers shall be fastened to steel channels furnished and installed by the Elevator Contractor.

H. Normal Stopping Devices:

1. Slow-down and normal stopping devices shall be furnished and installed for each car. These devices shall be so arranged that, as the car approaches either terminal landing, a roller with noiseless tread, mounted on a movable arm, shall come into contact with cams located in the car. Through the operation of the stopping device, bring the car automatically to a smooth stop at the terminal landing. The full width of the roller tread shall engage the cam surface. The emergency car stopping system shall comply with the ASME A17.1 requirements.

I. Landing System:

1. This landing system shall provide high speed stepping signals, one-floor-run stepping signals, leveling, and door zone signals. Each output signal shall be electrically isolated and shall be capable of reliably operating at 120 VAC.
2. The system shall consist of a steel tape with mounting hardware to accommodate the complete travel of the elevator, a car top assembly with tape guides and sensors, and magnetic strips for stepping and leveling.
3. The leveling and stopping accuracy of the system shall be within 1/4 inch of the floor level and shall correct for over travel or under travel to within the same accuracy, regardless of load variations or direction of travel.
4. Landing system shall be as provided by the elevator controller manufacturer.

J. Entrance:

1. New entrance shall consist of flush hollow metal door panels, bolted unit type frames, sill's hanger(s), hanger covers, fascia plates, headers, struts, site guards and hardware.

K. Frames:

1. New unit frame shall be fabricated of No. 14 U.S. gage steel comprising the head and side jamb sections, which shall be securely bolted to form one piece unit construction and shall be securely fastened to the sills and hanger supports. They shall be returned on the hoistway side to present a neat appearance.

EDITOR:

REUSE ON REPLACEMENT PROJECTS WHERE POSSIBLE FOR CAR AND COUNTERWEIGHT

2. To be reused, sand, fill in dents and paint matching existing color. Enamel paint to be used. Provide coat prior to the finish for each floor.

L. Sills:

1. Sills shall be extruded aluminum construction with a non slip wearing surface. They shall be supported on steel brackets and securely fastened to the floor. Grooves for the door guides shall have minimum clearance for the guides. The sills must suitable for "class C3" loading.

EDITOR:

REUSE ON REPLACEMENT PROJECTS WHERE POSSIBLE FOR CAR AND COUNTERWEIGHT

2. To be reused, clean and polish sills.

M. Struts:

1. A 3"x 3" x 1/4" steel angle struts shall extend from the sill to the building beam above and shall be securely fastened to ensure rigidity and adequate support for the header.

EDITOR:

FOR REUSE STRUTS

2. To be reused sand, prime and paint black.

N. Headers:

1. Headers shall be constructed of 3/16" formed steel to provide support for the frame and hangers.

EDITOR:

REUSE ON REPLACEMENT PROJECTS WHERE POSSIBLE FOR CAR AND COUNTERWEIGHT

2. To be reused, sand, prime and paint black, or provide new.

O. Hanger Covers:

1. Hanger covers shall be fabricated of No. 14 gauge steel extending the full width of the hanger pocket. A section shall be easily removable from inside the car for servicing the hanger.

EDITOR:

REUSE ON REPLACEMENT PROJECTS WHERE POSSIBLE FOR CAR AND COUNTERWEIGHT

2. To be reused, sand, prime and paint black, or provide new.

P. Fascia, Covers, and Toe Guards:

EDITOR:

FOR NEW FACIA COVERS AND TOE GUARDS

1. Fascia, including hanger covers, toe guards and dust covers shall be fabricated of No. 16 U.S. gauge steel. Fascia shall span the width of the opening plus 6 inches. Dust cover extends a minimum of 8 inches above the header and the toe guard shall extend a minimum 8' below the sill. Both shall return to the wall at 60 deg. Angle.
2. Finish:
 - a. Struts, headers, hanger cover, fascia, dust covers, and toe guards shall have matte black finish. New entrance frames (existing) shall be finished in stainless steel of color selected by owner. All landing doors shall be new and finished in enamel of color selected by owner.
 - b. All existing heads and jambs shall be stripped to bare metal, prepared with primer and finished with two coats of enamel paint.

EDITOR:

FOR REUSE FACIA COVERS AND TOE GUARDS

3. To be reused sand, prime and paint black or provide new.
4. Finish:
 - a. All existing heads and jambs shall be stripped to bare metal, prepared with primer and finished with two coats of enamel paint.

2.5 CAR EQUIPMENT & CAR ENCLOSURE

A. Power Door Operation:

1. The car and hoistway doors shall be operated quietly and smoothly by an electric operator, which shall open and close the car door and respective hoistway door simultaneously. The doors shall open automatically when the car is leveling at the respective floor and, when operating without an attendant, shall close after a predetermined time has elapsed. Momentary pressure on the "Open Door" button in the car shall cause the doors to remain open or, if closing, to reopen and reset the time interval.
2. The doors shall be opened at rated speed and the closing speed shall be per Code. Door closing force shall be as allowed by code.
3. An electric contact for the car doors shall be provided which shall prevent elevator movement away from the floor unless the door is in the closed position as defined by code.
4. Each hoistway door shall be equipped with a sill mounted auxiliary door closing device and a positive electro-mechanical interlock to prevent the operation of the elevator until the interlock circuit is established and the doors are locked and closed.
5. Car doors shall be provided with zone locking.
6. Acceptable Manufacturer: Gal, MOVFR operator.

B. Landing Door Hangers

1. Each hoistway door shall be suspended by two (2) sheave type hangers. Each hanger shall consist of a polyurethane tread on a metal hub equipped with precision ball bearings mounted onto a steel bracket. The hanger sheaves shall not be less than 3-1/4 inches in diameter. The track shall be so shaped as to permit free movement of sheaves without regard to vertical adjustment of the sheave brackets. An up-thrust roller shall be provided beneath the track and each sheave wheel, capable of withstanding a vertical thrust equal to the carrying capacity of the upper sheave. The up-thrust roller shall be adjustable for fine vertical adjustment and the face of the roller shall be so shaped as to conform to the bottom face of the hanger track. Doors closers shall be sill mounted.
2. Manufacturer: GAL.

C. Door Protection and Reopening Device:

1. ICU/Gatekeeper 2000 from Adams or Janus 3D.

D. Adaptive Door Timing:

1. Door open times will be varied subject to the call situation causing the stop:
 - a. Shortest timing, when car call only causes stop.
 - b. Longer timing, when hall call only causes stop.
 - c. Longest timing, when coincident hall and car calls exist.
 - d. All timing shall meet ADA guidelines as a minimum.
2. The door opening time, measured from the instant the doors start to open until within 1" of fully open position, shall not exceed code standard.
3. Long door and short door "hold open" times shall be set at 4.0 and 2.5 second respectively and shall be ADA complainant.

E. Car Frames:

1. Car frame shall consist of structural steel members that are securely welded or bolted together and the frame shall be so reinforced and braced as to relieve the car enclosure of undue strains. Steel bumper plates shall be provided to engage the buffers.

F. Car Platforms and Flooring:

1. Each passenger type car platform shall consist of a structural steel frame with a wood and metal composite floor (i.e. one layer of 3/4" marine grade plywood plus 14 gauge steel plate plus 3/4" thick marine grade plywood plus finish flooring). Top finish flooring on car shall be furnished and installed by Elevator Contractor, shall be as described in item 2.4.J.
2. Each passenger type platform shall be equipped with an extruded aluminum threshold and a steel toe guard at the loading edge. The under side of the platform shall be fireproofed to comply with local codes.
3. The platform shall be capable of the capacity of the car being loaded in one-piece across the entrance of the car and loading.

G. Car Isolation:

1. The steel platen plate used to secure the car frame to the plunger shall be provided with rubber pads to effectively prevent transmission of vibration from the plunger to the complete car frame, platform and car enclosure.

H. Roller Guides for Car:

1. Each roller guide shall consist of three wheels (minimum roller diameter - 6") tired with a durable resilient material; each rotating on ball bearings having sealed-in lubrication; all assembled on a substantial metal base and so mounted as to provide continuous contact of all wheels with the corresponding rail surface under all conditions of loading and operations. The wheels shall run on three finished rail surfaces. The roller guides shall be properly secured at top and bottom on each side of car frame. Provide roller guides at top and bottom of car.
2. The roller guides shall run on dry guide rails.
3. Manufacturer: ELSCO Type B.

I. Car Doors:

1. Provide car doors with flush hollow stainless steel panels. Panels shall have sound deadening insulation. Doors shall have removable non-metallic gibs to run in the sill guide way with minimum clearance. Door panels shall conform to the National Elevator Code ASME A17.1 and the Underwriter's Laboratories 1-1/2 hour fire test requirements. Door unlocking devices shall be provided as required by local codes. The door shall be equipped with nylube door guides.
2. Car door hangers and tracks shall be provided similar to hoistway doors.
3. Door finish shall be #4, brushed stainless steel.

J. Car Enclosures:

1. All cab material, design, lighting, ventilation and exits shall comply with "American National Standard Safety Code for Elevators, ASME A17.1 and/or local codes. Where codes conflict the more stringent shall apply.

2. Wall panels and reveals shall be of rigidized 316 stainless steel construction and applied to a steel shell.
3. Returns shall be of stainless steel construction and have a #4 brushed finish. Cutouts shall be provided for operating elements and fixtures. Minimize thickness of return to maximize clear floor area.
4. Canopy shall be constructed from formed and reinforced 16 gauge steel finished in white enamel and shall have an overall height of 8'0" from the finished floor. An emergency exit shall be provided which is locked from the top of the car.
5. Provide in vertical beveled through lighting per LED that will apply 10 foot-candles in cab at floor level. Coves shall be made of stainless steel with #4 finishes and located at ceiling level with to meet the requirements LED lights on both sides of cab. Also comply with UFAS lighting level requirements. Provide stainless steel protective guards consisting of two mesh, 14 gauge, wire cloth encased in a U-channel frame and of adequate size for maintenance. These guards shall be secured in place with tamper proof screws. Submit shop drawings prior to fabrication for Owner's approval.
 - a. LED Model SB-1 Manufacturer by Man-D-Tec.
6. Entrance columns shall be #4 brushed stainless steel finish. Columns shall run from floor to canopy, be finished in a vertical grain, and shall be integral to the returns.
7. Entrance transom shall be #4 brushed stainless steel finish. Columns shall run from floor to canopy. Transom shall run the full width of the car and be finished in a horizontal grain.
8. Doors shall be of hollow stainless steel construction with #4 brushed finish, suitably reinforced and sound deadened. Equipped with NYLUBE door guides.
9. A single speed fan shall be provided that matches the ceiling and is mounted to the canopy. Air intake to the fan shall be through the 3/8" diameter holes (adequate in number to allow free passage of required air quantity) drilled in canopy. Submit shop drawing of canopy for approval prior to fabrication. CFM as required per ASME A17.1. Sound power is to be 45 DBA max.
10. A 3/8" x 2" bar handrail with radiused ends of #4 brushed stainless steel finish shall be provided to meet code requirements on side and back walls but shall not interfere with car operating panel.

EDITOR: IN CASE THE ELEVATOR REPLACEMENT IN PARKING STRUCTIOR USE NICKEL SILVER

11. Car sills shall be extruded aluminum. Car sills for elevator in parking structures shall be nickel silver.
12. Finished floor covering shall be furnished and installed by the elevator contractor.
 - a. Flooring shall be "Endura" style rubber tile by Burke Flooring. Texture and color to be selected by owner.
13. Provide removable protective wall pads with padlocks inside elevator car to protect the wall panels. Pads shall meet all codes for elevator car enclosures, and be equal to Palmer "PalmTuff Vinyl Pads". Color to be selected by owner from mfg standards.
14. Acceptable Cab Manufacturers:
 - a. G&R Elevator Co.
 - b. Haunstein Burmeister
 - c. Tyler

- d. Columbia
- e. Eklund

2.6 OPERATING FIXTURES

A. Car Operating Panel:

1. The operating panel in the car shall consist of a vandal resistant stainless steel control panel. (Taper all projected sides of car panel back to return panel for a neat appearance. Submit drawings for approval prior to fabrication.) The main control panel shall contain a series of push buttons with illuminated call registration devices, numbered to correspond to the various landings serviced. In Car Stop Switch, Fire Service Compartment, Alarm Button (connected to a bell located on the car) and a Door Close, Door Open button for each entrance. Alarm bell shall be operated from its own independent battery pack power supply and recharging system. The control panel shall also contain separate key operated switches for Access, Independent Service, Car Lights, Car Fan, Emergency Light and Test Switch. Emergency phone shall be hand free type. Panel shall also accommodate certificate frame, hand free phone and digital car position indicator. All key switch cylinders shall be standard Adams keying system.
2. Buttons shall be made of brushed stainless steel with LED for illumination, with translucent floor designations, with Braille.
3. Provide emergency light in car-operating panel with rechargeable nickel cadmium batteries and recharging system.
4. Provide engraved fire services instruction and security keys per ASME A17.1.
5. Acceptable Manufacturers: PTL-Performer series or Innovation Industries. All shall be vandal resistant and brailled
6. Floor Passing Chime:
 - a. Provide a floor-passing chime and voice annunciation to meet ADA requirements. Mount in main car operating panel.
 - b. Acceptable Manufacturer: Adams Voice or approved Elevator Controller Manufacturer
7. Refer to detail on drawings.

B. Hall push button:

1. ADA compliant vandal resistant illuminating LED type Hall push buttons shall be installed at each floor to permit waiting passengers to call the elevator to the floor.
2. Fixtures shall have up and down buttons with Braille adjacent to the button on the left at intermediate floors and single buttons at top and bottom floors.
3. Buttons shall be made of vandal resistant stainless steel and shall illuminate to indicate a call has been registered. Button shall remain illuminated until the call has been answered. Provide oversized vandal resistant brushed stainless steel cover plates at all push button stations to cover all openings (including the openings that result from removal of existing hall push button stations or any other devices). The Braille signage adjacent to the directional button requires at least half inch lettering denoting the direction of the button
4. Provide engraved graphic per

5. ASME A17.1 emergency sign and illustration on all hall push button station plates: "IN CASE OF FIRE USE STAIRWAY FOR EXIT". "DO NOT USE ELEVATOR"
6. Acceptable Manufacturers: PTL Performer Series or Innovation Industries.
7. Refer to details on drawing.
8. Hall push button panel may accommodate the hall position indicator (HPI).

C. Communication System (Telephone):

1. Provide hands-free vandal resistant emergency telephone in the car, with wiring (shielded pairs) to terminals on control panel in machine room. Engraved with ASME A17.1.
2. Phone shall keep working during power failure. Coordinate work with U-M ITCOM. Phone shall be one push button to talk type and flash when call is answered. Telephone shall be an integral part of the car panel.
3. Annunciator Interface, Auxiliary Relay and 24V LED Board: The board shall be mounted behind the phone in the elevator car operating panel which contains an auxiliary relay that can be tied to DDC panel. The connection from the elevator controller to the DDC panel shall be provided by electrical contractor. When the board is programmed correctly, DDC will receive an alarm whenever the RATH phone detects the phone line has failed. Note that the car traveling cable containing the phone line must be expanded to contain a pair of wires for connection to the nearest DDC panel.
4. Provide a RATH 2100-ALARM unit. Unit shall be mounted in the designated floor elevator lobby per elevator code ASME A17.1 as part of the egress floor hallway push button and shall be wired to the RATH phone in the car operating panel. The alarm unit will contain the code required local alarm light, sounder and a momentary key switch on a label back plate. The traveling cable containing the phone line and pair of wires for the DDC circuit must be expanded to contain a pair of wires from the RATH phone RATH alarm unit.
5. Manufacturer:
 - a. RATH Microtech 2100-957-cc telephone (call track), with hand free operation or equivalent.
 - b. RATH 2100 Alarm Unit or equivalent.

D. Car Traveling Lantern:

1. Provide on both sides of car doorjams and shall be ADA compliant.
2. Manufacturer: PTL Performer series or Innovation Industries Vandal Resistant Series.
3. Refer to detail on drawings.

E. Car Fire Alarm Horn: (omitted)

F. Car Position Indicator:

1. A LED (Light Emitting Diode) vandal resistant digital type position indicator shall be provided inside car, as part of main car operating panel (COP). It shall indicate the floor at which the car is stopped or passing and the direction the car is traveling. The cover plates shall be #4, brushed Stainless Steel.
2. Manufacturer: PTL Performer Series or Innovation Industries Vandal Resistant Series.
3. Refer to detail on drawings.

USE SPECIAL KEY AS AN OPTION

- G. Special Key Feature:
 - 1. Provide (2) key switches per floor. One shall be for security on & off and one shall be for momentary override. Keys shall be keyed to U of M's KEY SYSTEM and shall be coordinated with KEY OFFICE through Owner Representative.
- H. Hall Position Indicator:
 - 1. Provide at each floor in elevator lobby or hallway, above hoistway door. Description shall be as in item 2.6.G or as part of the hallway push buttons and shall be LED digital type in red color.

2.7 ELECTRIC WIRING

- A. Complete insulated wiring shall be furnished and installed to connect all parts of the equipment furnished by the elevator contractor. Wiring shall conform to the requirements of the latest edition of the National Electrical Code. Include rigid conduit or EMT, at least 1/2" diameter, and short lengths of flexible conduit. Conduit or EMT shall terminate in junction boxes. Conduit, EMT, wiring duct, conduit fittings, enclosures and junction boxes shall be galvanized steel or aluminum.
- B. All wiring shall have a flame retarding moisture resisting outer cover and shall be run in metal conduit, flexible metallic tubing, or wire ducts.
- C. Traveling cables shall have flame retarding and moisture resisting outer cover. They shall be flexible and suitably suspended to relieve strains in the individual conductors. Provide the required quantity plus at least 10 percent spares. All wiring between telephone in car and a junction box in elevator machine room shall be provided by the elevator contractor. Conductors shall be numbered to correspond to numbered terminals at the car and machine room.
- D. Terminal blocks shall be coded to identify the circuits. Multi-conductor cables shall have the conductor color coded and numbered.
- E. The elevator car shall be provided with a suitable GFCI duplex receptacle fitted with a wire lamp guard on top of the car and a suitable duplex plug receptacle.
- F. Unless otherwise specified, control wiring shall be minimum size #18 AWG. Wire size shall be large enough so that the voltage drop under inrush conditions will not adversely affect operation of the controls.
- G. Electrical Receptacle in Car: Provide GFCI duplex electrical receptacle in car. Locate receptacle approximately 2" above finished floor below car station. Provide matching face plate on receptacle
- H. Execution:

1. Install all power wiring in raceway systems. No exposed wiring or conduit shall be run in finished areas without prior written approval of owner.
 2. Splice cables and wires only in outlet boxes, junction boxes or pull boxes. (Note - No wire splicing allowed in raceway or wire ducts).
 3. Install cable supports for all vertical feeders in accordance with the NEC. Provide Kellum GRIP type supports, which firmly clamp each individual cable and tighten due to cable weight.
- I. All terminal strip connections shall be identified with corresponding reference numbers from cable termination chart and electrical straight-line diagrams.

PART 3 - EXECUTION

3.1 ACCEPTABLE ELEVATOR INSTALLERS

- A. Acceptable installers: Subject to compliance with the requirements specified herein, installers offering product approved by the owner are limited to the following listed companies. Elevator installer for project must provide the equipments as specified.
1. Detroit Elevator Co.
 2. Kone Elevator Co.
 3. Otis Elevator Co.
 4. Schindler Elevator Inc.
 5. Thyssen Krupp Elevator.

3.2 EXAMINATION

- A. Inspect all surfaces, and required embedded anchorage devices, and verify that they are in proper condition to receive the work of this section. Verify that field measurements are as indicated on approved shop drawings.
1. Prior to preparation of drawings, the contractor shall examine the hoistway and machine room areas and verify that nothing will adversely effect the execution of the work.
 2. No exposed wiring or conduit shall be run in finished areas without prior written approval of owner.
- B. Beginning of installation means acceptance of existing conditions.

3.3 PERFORMANCE

- A. Contract speed: Actual speed shall vary no more than +/- 5% from speed specified under any loading condition or direction of travel.
- B. Leveling accuracy: Consistently level within +/- 1/4" under all loading conditions.

3.4 PERFORMANCE GUARANTEE

- A. The elevator contractor shall assume full responsibility to furnish and provide a complete and functional elevator and to obtain and furnish the University final State Elevator Inspection approval. All costs necessary to correct code deficiencies cited by the State Elevator Inspector will be paid by the elevator contractor as part of this Contract at no additional cost to the Owner.

AS AN OPTION

3.5 ACCESSORIES

- A. Car and/or hall operating key switches: Provide ground fault circuit-interrupter protection for car-top inspection station and in car electrical receptacle.

3.6 TECHNICAL TRAINING

- A. On site technical training shall be held for the purpose of familiarizing Elevator Support Mechanics with operations and troubleshooting procedures. The session shall accommodate up to ten personnel in each session and consist of forty hours of Training (This to include two 2-day sessions and the fifth day reserved for any additional diagnostic training). Training on equipment controller shall be provided by trained factory service engineers of controller manufacturer through the elevator installers.

3.7 ELEVATOR ACCEPTANCE DEMONSTRATION AND PERFORMANCE TEST (COMMISSIONING BY U OF M ELEVATOR SHOP)

- A. Demonstrate to Owner, or Owner's designated representative, the operation of the elevator system. Demonstration shall include:
 - 1. Installation compliance with specifications.
 - 2. Contract speed, capacity, and floor-to-floor performance compliance with specifications.
 - 3. Stopping accuracy and car ride compliance with specifications.
 - 4. Operation of signal fixtures and operation of supervisory or dispatching system.
 - 5. Promptly remove all work rejected by the Engineer for failure to meet specifications and replace to comply with requirements, at no additional cost to the Owner. All expenses of repairing work of other Trades damaged by this replacement shall be borne by Contractor.
 - 6. Rejected work which is not made good within a reasonable time, determined by the Engineer, may be corrected by the Owner at Contractor's expense.
 - 7. Upon completion of installation and before final acceptance, conduct a running speed test with full design load to verify compliance with performance requirements. Also refer to Article 1.3 of this division
- B. Operating Instructions: Provide instructions to the Owner's personnel, including safety procedures, proper operation of the equipment, and routine maintenance procedures.

- C. The lap top computer shall be provided to commissioner prior to start of commissioning process by minimum of (2) weeks. See item 2.3.J.

3.8 CLEANUP

- A. Keep work areas orderly and free of debris on a daily basis.
- B. Remove filings and loose materials resulting from this work from hoistways.
- C. Clean all dirt, oil and grease from machine room and pit equipment and floors.
- D. Clean car, car enclosures, entrances, hoistways, operating and signal fixtures and trim of dirt, oil, grease, and finger marks.
- E. Polish shine all stainless steel components.
- F. Clean, re-align guide rails for car and paint the back guide rails.

SPECIFICATION DIVISION 14

NUMBER SECTION DESCRIPTION

DIVISION 14 CONVEYING SYSTEMS

SECTION 144200 - WHEELCHAIR LIFT

END OF CONTENTS TABLE

DIVISION 14 CONVEYING SYSTEMS
SECTION 144200 - WHEELCHAIR LIFT

SPEC EDITOR: THIS SECTION INCLUDES WHEELCHAIR LIFTS, WHICH ARE DISTINGUISHED FROM BFLD'S, IN PART, BY RESTRICTED LIFT HEIGHT AND MINIMAL SHAFT ENCLOSURE REQUIREMENTS. CONSULT UNIVERSITY OF MICHIGAN DESIGN GUIDELINES FOR SELECTION ASSISTANCE TO DETERMINE WHETHER A WHEELCHAIR LIFT IS AN APPROPRIATE DESIGN SOLUTION, OR WHETHER ANOTHER LIFT TYPE SPECIFIED IN SECTION 14 ("BARRIER-FREE LIFTING DEVICE") IS REQUIRED.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. This Section specifies a vertical-travel wheelchair lift.
1. Include manufactured hoistway and platform doors.
- SPEC EDITOR: SELECT PARAGRAPH ABOVE OR BELOW.*
2. Install lift within site-built custom enclosure.
- B. Electrical service and final electrical connections are specified in Division 26 sections.

SPEC EDITOR: INCLUDE THE FOLLOWING WHERE APPROPRIATE.

- C. Alternates: The work of this Section affected by an alternate. Refer to Division 01 Section "Alternates" for additional information.

1.3 SUBMITTALS

- A. Submit each indicated item in compliance with Division 1 Section "Submittals."
- B. Product manufacturer's literature indicating compliance with applicable requirements.
- C. Shop Drawings: Provide shop drawings showing layout, including critical dimensions for installation, details, and anchorages for wheelchair lift. Include internal wiring diagram and requirements for connection to building electrical service.
- D. Samples: Submit finish paint color samples of manufacturer's full standard range of surface coating colors and textures in the form of actual coating material samples applied to metal sample cards of approximately 3 inches wide by 5 inches long.

- E. Permits and Certificates: Submit four copies of each of the following:
 - 1. Installation permit required under Quality Assurance Article.
 - 2. Inspection and acceptance certificates required under Quality Assurance Article.
- F. Manufacturer's Instructions: Submit operation and maintenance manuals and parts list.

1.4 QUALITY ASSURANCE

SPEC EDITOR: SPEC SHOULD USUALLY RETAIN ALL BELOW.

- A. Installer Qualifications: Engage an experienced Installer who has completed installation of products similar in design and extent to those required for the project and whose work has resulted in construction with a record of successful in-service performance.
 - 1. Installer shall hold a valid Class C license issued by the State of Michigan.
- B. Single-Source Responsibility: Provide products and units from one source and produced by a single manufacturer.
- C. Regulatory Requirements: As follows:
 - 1. Comply with applicable provisions of the most recent edition (unless otherwise indicated) of each of following codes and standards:
 - a. Americans with Disabilities Act, Uniform Federal Accessibility Standards (ADA/UFAS).
 - b. ANSI 17.1 - 1993; with ANSI 17.1a - 1994 Addenda.
 - c. Michigan Department of Labor Building Code Rules, Chapter 11 - Accessibility.
 - d. Michigan Department of Labor "Elevator Laws and Rules" (Public Acts 227 of 1967 & 333 of 1976).
 - 2. Factory-installed wiring shall comply with applicable requirements of the National Electrical Code.
 - 3. Obtain installation permit from the State of Michigan Elevator Safety Board.
 - 4. Obtain necessary inspection and acceptance certificates from authorities having jurisdiction.

1.5 PROJECT CONDITIONS

- A. Field Measurements: Check actual space available by accurate field measurement before fabrication. Show recorded measurements on final shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.
 - 1. Where necessary, proceed with fabrication without field measurements, and coordinate fabrication tolerances to ensure proper fit of window units.

PART 2 - PRODUCTS

2.1 WHEELCHAIR LIFT

SPEC EDITOR: THE PARAGRAPH BELOW INCLUDES PROVISION OF A MAUNUFACTURED HOISTWAY ENCLOSURE. OMIT THE REFERENCES TO A "MANUFACTURED HOISTWAY ENCLOSURE" IN PARAGRAPHS A AND C IF THE UNIT WILL BE INSTALLED IN A SITE-BUILT CUSTOM ENCLOSURE.

- A. Wheelchair Lift, General: Provide vertical-travel wheelchair lift with roped- (cable-) hydraulic-type lift mechanism, with single-chair capacity, and with manufactured hoistway enclosure. Wheelchair lift, hoistway, components, hardware, and operational features shall comply with requirements of this Section and requirements of authorities having jurisdiction.
- B. Provide wheelchair lifts with the following characteristics:
 - 1. Capacity: 750 lbs.
 - 2. Rated Speed: 15 feet per minute max.
 - 3. Vertical travel distance: As indicated on Drawing.
 - 4. Platform size: 13 sq. ft. minimum area; meet minimum length and width requirements of authorities having jurisdiction.
 - 5. Power Supply: 115V, single phase, or as required by manufacturer.
 - 6. Emergency Operation: Rechargeable battery operated system, capable of completing a full up and down cycle.
- C. Product: Subject to compliance with requirements, provide the following product:

SPEC EDITOR: SELECT ONE OF THE FOLLOWING PARAGRAPHS BASED ON THE SPECIFIC PROJECT.

- 1. Wheelchair lift with manufactured enclosure:
P.A.L-SE; Concord, Div. Ricon Corporation.
- 2. Wheelchair lift for use with architectural enclosure:
Concord, Div. Ricon Corporation.

2.2 COMPONENTS

- A. Doors: In addition to complying with regulatory requirements, provide doors that are self-closing, swinging type fabricated with internal noise deadening materials and with rubber bumper stops to prevent metal-to-metal contact with jambs. Provide doors with hydraulic door closers (spring hinges not permitted).
 - 1. Provide doors with manufacturer's standard safety glazed lights (windows). Provide lights of not less than 625 sq. inches in each door.
- B. Seat: Side-mounted, spring loaded seat that in retracted position does not impinge on the required clear width of the platform.
- C. Controls: Constant pressure paddle type.
- D. Platform entrance safety device: Photo-electric eye.
- E. Handrails: Provide guards on both sides of platform with handrails.

- F. Fused Safety-Disconnect: Provide unit in accordance with requirements of authorities having jurisdiction. Locate unit as indicated in Installation article of this Section.

2.3 FINISH

- A. Paint Coating: Manufacturer's standard powder-coated enamel finish. Color to be selected by Architect from manufacture's standard range.

PART 3 - EXECUTION

3.1 INSPECTION

- A. Inspect surrounding wall and floor surfaces before beginning installation. Verify that rough opening tolerances are correct and the landing construction is level. Do not proceed with installation until deficiencies have been corrected.

SPEC EDITOR: DELETE BELOW IF NO DEPRESSED SLABS.

1. Verify that depressed slab area dimensions are correct.

3.2 INSTALLATION

- A. Comply with manufacturer's printed installation instructions for products and applications indicated, except where more stringent requirements apply. Comply with applicable requirements of authorities having jurisdiction, and the following:
 1. Securely fasten lifting structures to the structural floor using expansion anchors or similar devices.
 2. Field alteration of factory-fabricated structural elements, including platform and doors is not permitted.
 3. Locate fused safety-disconnect as indicated on Drawings, or if not indicated, in a location near the lift mechanism, but not in the hoistway and not in location accessible to the public.

3.3 ADJUSTING

- A. Test and adjust operation of wheelchair lift. Verify, and adjust as required, indicated dimensional tolerances related to enclosure and platform, and landing and platform. Ensure smooth, non-binding operation of platform, doors and other moving parts and assemblies. Ensure proper operation of safety devices and related interlocks. Adjust limit switches to ensure proper alignment with landings.

3.4 CLEANING

- A. Clean surface finishes promptly after installation of unit. Lubricate hardware and other moving parts.

3.5 TRAINING

- A. Training: Demonstrate proper operation to Owner's personnel. Provide not less than 4 hours of training, by a qualified manufacturer's technician, for Owner's personnel in the proper operation and maintenance of the wheelchair lift.

DIVISION 14 CONVEYING SYSTEMS

SECTION 146000 - HOISTS AND CRANES

END OF CONTENTS TABLE

DIVISION 14 CONVEYING SYSTEMS
SECTION 146000 - HOISTS AND CRANES

SPEC EDITOR: THIS MASTER SPECIFICATION IS OLD. RECHECK AND VERIFY MANUFACTURERS, PRODUCTS & MODEL NUMBERS BEFORE USE.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. Extent of hoist and crane equipment is indicated on drawings.
- B. Types of hoist and crane equipment includes the following:
 - 1. Trolley hoist.
 - 2. Bridge crane end trucks.
- C. Hoist rails and bridge crane end tracks are included in Division 5 Section "Structural Steel".

1.3 SUBMITTALS

- A. Product Literature: Submit manufacturer's product literature indicating compliance with specified requirements for each unit.
- B. Shop Drawings: Submit shop drawings indicating assembly requirements and dimensions for coordination.

1.4 QUALITY ASSURANCE

- A. Standards: Comply with ANSI B30.16 fabrication requirements.

1.5 DELIVERY STORAGE AND HANDLING

- A. Coordinate delivery and installation of bridge crane end trucks and hoists with supporting steel to prevent delays.

PART 2 - PRODUCTS

2.1 TROLLEY HOISTS

- A. Provide army-type trolley hoists, manually operated with hand hoist and geared trolley. Equip units with chain and hook, cushioned stop fittings for end of travel at both ends of rail, and as follows:

1. Capacity: 1000 pounds.

B. Manufacturer/Model: Acco Industries, model no. 1510090, or equivalent products of Chester Hoist, Inc.; Duff-Norton (Coffing); or Columbus Mckinnon Corp.

2.2 BRIDGE CRANE END TRUCKS

A. Provide kits for underhung girder bridge crane, including manually operated (push-pull) end trucks and accessories. Equip units with cushioned stop fittings for end of travel at both ends of runway beams, and as follows:

1. Capacity: 1000 pounds.

B. Manufacturer/Model: Acco Industries, model no. 521, or equivalent products of Chester Hoist, Inc.; Duff-Norton (Coffing); or Columbus Mckinnon Corp.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine structural steel supports in presence of Installer before installation of end truck and hoist units. Correct conditions deleterious to operation of units prior to installation.

3.2 INSTALLATION

A. Install end trucks and hoists in accordance with manufacturer's recommendations.

3.3 CLEANING AND ADJUSTMENT

- A. Test units for proper operation. Repair malfunctioning equipment.
- B. Clean and protect units from dust, dirt, and damage caused by subsequent construction operations. Replace damaged units that cannot be repaired to original condition.
- C. Use of hoisting equipment of this Section for construction operations is not permitted.

NUMBER SECTION DESCRIPTION

DIVISION 21 FIRE SUPPRESSION

SECTION 211313 - WET AND DRY PIPE SPRINKLER SYSTEMS

END OF CONTENTS TABLE

DIVISION 21 FIRE SUPPRESSION
SECTION 211313 - WET AND DRY PIPE SPRINKLER SYSTEMS

REVISIONS:

AUGUST 2018: INCORPORATED MICH MEDICINE SPECIFIC REQUIREMENTS (ANTI-LIGATURE HEADS, NO SCH. 10 SPRINKLER PIPE ALLOWED IN INPATIENT AREAS). REVISED B-FLY VALVE MODEL NUMBER TO 705 (708 NO LONGER AVAILABLE), ADD GIACOMINI AS APPROVED FOR FIRE PUMP TEST HEADERS. D. KARLE PER FP/PLMG MTT AND HOSPITAL FP&D.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK.

AUGUST 2016: REVISED TO ELIMINATE GALVANIZED PIPE AND FITTINGS FOR DRY PIPE SYSTEMS. D. KARLE PER FP/PLMG MTT.

AUGUST 2015: REVISE SPRINKLER HEAD MFR. FROM ANVIL TO TYCO TO REFLECT CORRECT MFR., PER B. BEGG/D. KING. D. KARLE.

APRIL 2015: REVISED TO SPECIFY FOR DRY PIPE SYSTEMS: MATERIAL TO BE SCH. 40 GALV. STEEL PIPE AND FITTINGS, INSTALL PIPE WITH WELD SEAM ABOVE HORIZONTAL CENTERLINE OF PIPE, DRAIN VALVES TO BE INSTALLED AT ALL LOW POINTS, ALL DRY PIPE PIPING TO BE PITCHED. ADDED SPEC FOR DRY PIPE VALVE. KARLE FOR FP/PLMG MTT.

SPEC EDITOR: IN ORDER FOR THE CONTRACTOR TO HYDRAULICALLY DESIGN SPRINKLER PIPING, BID DOCUMENTS MUST INCLUDE TEST DATA INCORPORATING THE LATEST FLOW TEST CONDUCTED BY FACTORY MUTUAL, FIRE PUMP LOCATION, LATEST FIRE PUMP TEST DATA, HYDRAULIC CALCULATIONS (IF AVAILABLE), AND AS-BUILT INFORMATION.

SPEC EDITOR: PRIOR TO ISSUING FIRE PROTECTION DRAWINGS FOR BID, THEY SHOULD BE SENT TO, REVIEWED AND APPROVED BY FACTORY MUTUAL.

SPEC EDITOR: FOR CLASSROOM BUILDINGS, PROJECT LEAD SHOULD SEND DRAWINGS TO STATE FIRE MARSHAL DURING SR. REVIEW, VIA DOUG KOEPEL.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Section 220500 - Common Work Results for Mechanical
 - 2. Section 221113 - Piping Materials and Methods

1.2 SCOPE OF WORK:

- A. Provide piping, fittings, valves and specialties for automatic wet and dry sprinkler systems.

SPEC EDITOR: STANDPIPE SYSTEMS ARE TYPICALLY ONLY INCLUDED FOR BUILDINGS OF FIVE OR MORE STORIES.

- B. Provide piping, fittings, valves and specialties for standpipe systems.
- C. All wiring related to 211313 is covered under Division 26.

1.3 DRAWINGS:

- A. Deviations from the drawings, with the exception of minor changes in routing and other such incidental changes that do not affect the functioning or serviceability of the system, shall not be made without the written approval of the architect-engineer, and re-submitted to FM and the authority having jurisdiction for approval.

1.4 QUALITY ASSURANCE:

- A. Materials, installation and testing shall comply with the following:
 - 1. NFPA 13 - Installation of Sprinkler Systems.
 - 2. FM - Factory Mutual Approval Guide.
 - 3. NFPA 14 - Installation of Standpipe and Hose Systems.
 - 4. UL - Fire protection Equipment Directory.
 - 5. FM - Data Sheets.
 - 6. City of Ann Arbor requirements.
- B. Equipment and Components shall bear UL and FM label or marking and shall be FM approved for fire service.

1.5 SUBMITTALS:

- A. Submit data, drawings, and hydraulic calculations, as specified in Division 01.

SPEC EDITOR: SELECT ONE OF THE FOLLOWING:

- B. For Inpatient healthcare buildings, Ambulatory Surgery Centers or buildings containing classrooms: Submit shop drawings to Factory Mutual for approval first. Then, submit FM approved shop drawings to State of Michigan Bureau of Fire Services (BFS) for approval. Submit shop drawings bearing stamp of FM and OFS form 12A from State Office Of Fire Safety to the architect/ engineer for approval.
- C. For Non Bureau of Fire Services (BFS) Buildings: Submit shop drawings to Factory Mutual for approval prior to submitting to the architect/ engineer. Submit shop drawings bearing stamp of FM to the architect/ engineer for approval.

1.6 HYDRAULIC DESIGN CRITERIA:

- A. Locate mains and risers as indicated. Size piping per drawings, where indicated.
- B. Hydraulic calculations shall be per NFPA and FM requirements.

- C. Use latest FM water test to ascertain water supply parameters.
 - D. Density shall be as indicated (gallons/minute /square foot, gpm/sf). Size all piping to suit densities indicated below:
 - 1. Offices: Density of 0.15 gpm/sf over the most remote 2000 sq. ft. area, 168 sq. ft. per head maximum.
 - 2. Laboratories: Density of 0.18 gpm/sf over the most remote 2500 sq. ft., 130 sq. ft. per head maximum.
 - 3. Mechanical rooms: Density of 0.18 gpm/sf over the most remote 2500 sq. ft., 130 sq. ft. per head maximum.
- SPEC EDITOR: REVIEW STORAGE ROOMS WITH FM, AND CUSTOMIZE CRITERIA ACCORDINGLY. GENERALLY CRITERIA IS THE SAME AS FOR MECHANICAL ROOMS.**
- 4. Storage Rooms:
 - 5. Other rooms: Same as offices.
 - E. Include 250 gpm hose stream allowance at the floor of calculation.
 - F. Provide inspector's test connections per NFPA 13 and FM Data Sheets. Locate as indicated on the drawings.
 - G. Provide fire protection for soffit areas, void spaces, obstructions, top and bottom of ductwork above 4' wide, closets, and other spaces required by authority having jurisdiction, and at no additional cost to owner.

1.7 EXTRA MATERIALS:

- A. For projects requiring more than 30 sprinkler heads, provide extra sprinkler heads with metal cabinet and head wrench, per NFPA 13 and FM Data Sheets.

1.8 IMPAIRING FIRE PROTECTION SYSTEM:

- A. The University of Michigan Fire Alarm Shop shall impair existing fire protection system. Notify Fire Alarm Shop a minimum of 48 hours prior to required shutdown.
- B. Plan and coordinate work to minimize period of time which the system is impaired.
- C. In general, reactivate system at the end of each workday, under the supervision of the Fire Alarm Shop. System may be left impaired overnight only if explicitly authorized by the University and if contractor provides continuous fire watch in impaired areas.

PART 2 - PRODUCTS

2.1 GENERAL:

SPEC EDITOR: TOM TO CHECK ON FOLLOWING:

- A. All hose threads shall be National Standard.
- B. Pressure gauges: Liquid filled 6" dial, 0 to 150 psig range, 5 psig division, with gauge cock.
Manufacturers: Trerice Series 600, Weiss or Marsh

- C. All piping materials of a given type shall be manufactured by a single source, and supplied by a single supplier.

2.2 ABOVE GROUND PIPING MATERIAL:

SPEC EDITOR: THIS SPEC IS FOR SYSTEMS WITH MAXIMUM REQUIRED OPERATING PRESSURE OF 175 PSIG. REVISE TO SUIT NEEDS FOR HIGH-RISE BUILDINGS.

SPEC EDITOR: SELECT 2.2.A (DELETE 2.2.B) FOR INPATIENT FACILITIES. SCH 10 SPRINKLER PIPING IS NOT ALLOWED IN INPATIENT FACILITIES. SELECT 2.2.B (DELETE 2.2.A) FOR ALL OTHER LOCATIONS.

- A. Wet Pipe Systems in Inpatient Facilities: Schedule 40, ASTM A53, black steel pipe with screwed cast iron or malleable iron fittings (or match existing fittings in building) for sizes through 2", and grooved couplings for sizes 2-1/2" and larger.
- B. Wet Pipe Systems in non-Inpatient Facilities: Schedule 40, ASTM A53, black steel pipe with screwed cast iron or malleable iron fittings (or match existing fittings in building) for sizes through 2", and schedule 10, ASTM A135, black steel pipe with grooved couplings for sizes 2-1/2" and larger.
- C. Dry Pipe Systems: Schedule 40, ASTM A53, black steel pipe for all pipe sizes, with screwed cast or malleable iron fittings for sizes through 2", and grooved couplings for sizes 2- 1/2" and larger.
- D. All piping, fittings and accessories shall be rated for a minimum working pressure of 175 psig.
- E. Manufacturers: Victaulic Style 005 Rigid Firelock couplings with type "E" EPDM gasket, Tyco Grinnell.
- F. Pipe Hangers: Pipe hangers shall comply with requirements of related sections, be FM approved, and be spaced in accordance with NFPA 13 and FM.

SPEC EDITOR: FOR SYSTEMS OVER 175 PSIG, RESOLVE SYSTEM APPROACH WITH FM AND CUSTOMIZE SPECIFICATION ACCORDINGLY.

- G. For systems rated over 175 psig:

2.3 ABOVEGROUND ISOLATION VALVES:

- A. General: Provide where shown on drawings, and as required, with valve monitor switch, and means of padlocking open.
- B. Isolation valves 2-1/2" and larger: butterfly valve.
Manufacturers: Victaulic Series 705 (rated 300 PSI), Tyco Grinnell.
- C. Isolation valves 2" and smaller: gate or ball valve, brass body.
Manufacturers: Victaulic Series 727, Tyco Grinnell
- D. OS&Y type: Where specifically indicated on drawings, provide OS&Y type valves.
Manufacturers: Kennedy Figure 4068 (AWWA) or any other approved by the City of Ann Arbor Utilities Department Requirements, pages WM-1 & 2.

- E. Valve monitor switch: Isolation valves shall be supervised open. Provide 115 volt, single pole, double throw roller type monitor switch to signal valve closing.
Manufacturers: Tyco Grinnell, Anvil, Notifier

2.4 SPRINKLER HEADS:

SPEC EDITOR: INDICATE TYPE OF HEAD ON PLANS. 286F LINKAGE MAY BE REQUIRED IN CERTAIN AREAS.

NOTE THAT FULLY CONCEALED HEADS SHOULD BE SPECIFIED FOR ALL CLINICAL CARE AREAS WITH DROPPED CEILINGS.

- A. General: Provide brass sprinkler heads with wide angle spray, thermosensitive glass bulb with temperature rating of 155F to 165F, rated for 175 psig, standard response and orifice, except as otherwise specified, FM and UL approved. Install sprinkler head type as indicated on drawings.
- B. Sprinkler head guards: Provide red, wire mesh guards where damage to sprinkler heads may occur, such as stairways, loading docks or aisles. Manufacturers: same as sprinkler manufacturer.
- C. Semi-recessed pendant type: chrome plated brass, with chrome plated brass semi-recessed escutcheon.
Manufacturers: Reliable model G, Tyco, Viking model M., Victaulic
- D. Concealed pendant type: brass finish with cover to match ceiling.
Manufacturers: Reliable model G4FR, Tyco, Viking, Victaulic
- E. Upright type: brass finish.
Manufacturers: Reliable model G, Tyco, Viking, Victaulic
- F. Sidewall type: chrome plated brass, with deflector and chrome plated brass escutcheon.
Manufacturers: Reliable HSW1, Tyco, Viking, Victaulic
- G. Dry type (freezeproof): recessed with center strut, lever and solder capsule, unobstructed waterway.
Manufacturers: Tyco, Reliable Model G3, Viking, Victaulic
- H. Behavioral Health (anti-ligature) type: concealed pendant or sidewall, tamper-resistant. Manufacturers: Tyco Raven 5.6K (quick response style), Tyco TFP PH2 (standard response style).

2.5 TEST CONNECTIONS:

- A. Inspector's Test Connection: Provide per NFPA 13 4-7.4.2, and where indicated on drawings: minimum 1 inch piping and test valve, orifice equivalent to one sprinkler head, with chain and cap. Drain to sanitary waste or as indicated on drawings.
Manufacturers: Elkhart, Victaulic, Test Master

DESIGNER: DRAIN MUST BE ABLE TO HANDLE FULL FLOW OF INSPECTOR'S TEST. USE A 3" DRAIN OR EQUAL FOR 1" LINE. ROUTE TO A JANITORS CLOSET IF POSSIBLE.

- B. Zone Test and Drain Connection: Provide per detail on drawings and NFPA 13 4-7.4.2. Integrated test and drain valve assembly is acceptable.
Manufacturer: AGF Model 1000

2.6 FIRE PUMP TEST CONNECTIONS (HEADER):

SPEC EDITOR: CUSTOMIZE DETAIL TO HAVE APPROPRIATE NUMBER OF CONNECTIONS SHOWN, DEPENDING ON FIRE PUMP CAPACITY.

- A. Provide test connection per detail and NFPA 13 4-7.4.2. Cast brass body with end inlet, brass plate lettered PUMP TEST CONNECTION, with loose bonnets, 3-inch female NPT inlet x 2-1/2 inch male hose thread outlets to match local fire department connections. Provide cap and chain for each bonnet. Nipple connection between flush inlet body connection and snoot (exterior connections) shall be chrome-plated steel.
Manufacturers: Potter-Roemer Inc. 5800 series, Elkhart Brass Mfg. Co., W.D. Allen Mfg. Co, Giacomini.

2.7 FIRE DEPARTMENT CONNECTION (SIAMESE):

- A. Cast brass or bronze, flush wall mounted escutcheon plate type with polished brass finish, two 2-1/2 inch fire department inlets to match local fire department connections, double clapper check valves, lug caps and chains and cast-in function lettering.
Manufacturers: Elkhart Brass Mfg. Co., No. 166, Potter-Roemer Inc., No. 5020 Series, Seco Mfg. Inc., No. 261, W.D. Allen Mfg. Co., No. 276

2.8 ROOF FIRE DEPARTMENT CONNECTION:

SPEC EDITOR: DELETE IN SHORT SPEC; TOM WILL RESEARCH FURTHER

- A. Cast brass body with 4 inch NPT inlet and two (2), 2-1/2 inch NPT outlets to match local fire department connections. Provide 2-1/2 inch cast brass straight globe valve with red hand wheel. Valve shall have female NPT inlet x male hose thread outlet, rated for 300 psig. Provide cast-in function lettering.
Manufacturers: Elkhart Brass Mfg. Co., Potter-Roemer Inc., Model No. 5875 outlet with model 4115 valve, W.D. Allen Mfg. Co.

2.9 DETECTOR CHECK VALVE:

INCLUDE U-M STANDARD DETAIL "15300 001 - Fire Service System Detail", REVISED AS REQUIRED TO MAKE PROJECT SPECIFIC.

THIS IS USED TO MECHANICALLY DETECT SMALL VOLUMES OF WATER THAT PASS THROUGH THE FIRE PROTECTION MAIN. IT DOES NOT PROVIDE PROTECTION OF THE POTABLE WATER FROM POSSIBLE CONTAMINANTS IN THE FIRE PROTECTION SYSTEM. ASSEMBLY DOES NOT CONNECT TO THE FIRE ALARM SYSTEM.

- A. Provide valve assembly, including flanged detector check valve and bypass line. Detector check valve shall have galvanized or epoxy coated cast iron body, bronze clapper with resilient seal. Bypass line shall include City of Ann Arbor meter, isolation valves and check valve.
- B. Manufacturer: Ames 1000DCV or model 3000, Victaulic, Reliable, Viking, Hershey-Anvil

2.10 FIRE PROTECTION ZONE CONTROL VALVE

- A. Manufacturers: Victaulic, Milwaukee, Nibco, Stockham

2.11 FIRE DEPARTMENT HYDRANT VALVE:

SPEC EDITOR: DELETE IN SHORT SPEC

- A. Cast brass back outlet body with 4 inch NPT inlet and two (2) 2-1/2 inch male NPT outlets to match local fire department connection. Provide caps and chains and cast brass round wall plate lettered HYDRANT.
- B. Provide NRS gate valve with polished brass 7 inch plate lettered HYDRANT VALVE CONTROL with threaded 1-1/2 inch NPT lock nut, 30 inch long x 7/8 inch square steel extension rod with coupling for attachment to stem of gate valve.
- C. Manufacturers: Potter-Roemer Inc., Model No. 5840, Elkhart Brass Mfg. Co., W.D. Allen Mfg. Co.

2.12 DRAIN VALVE:

- A. Provide a brass ball valve, with hose thread outlet, and cap. Riser drains shall be 3/4" ball valve with hose thread outlet, and cap, unless otherwise noted on drawings.
Manufacturers: Victaulic Series 727, Tyco Grinnell, Anvil

DESIGNER: PIPE TO DRAIN CAPABLE OF TAKING FULL FLOW.

2.13 FIRE DEPARTMENT VALVE:

SPEC EDITOR: TYPICALLY USED IN STANDPIPE SYSTEMS

- A. Provide 2-1/2" cast brass straight globe valve with red hand wheel, female NPT inlet and 2 1/2" male hose thread outlet with cap, rated for 300 psig. Fire department valve shall meet local fire department standards. Provide with pressure restricting valve as required. Identify with words "FIRE DEPARTMENT VALVE" per NFPA requirements and the authorities having jurisdiction.
Manufacturers: Potter-Roemer Inc., Model 4115, Elkhart Brass Mfg. Co., W.D. Allen Mfg. Co.

2.14 ISOLATION, DRAIN AND TEST VALVES SIGNS:

- A. Provide permanent plastic or metal 6" x 6" signs for all isolation, drain and test valves describing purpose and location.
Manufacturer: Seton, Bramer

2.15 FLOW ALARM SWITCH:

- A. Provide flow alarm switches where indicated and as detailed on the drawings.

SPEC EDITOR: CHECK CATALOG ON PSI RATING 300?

- B. Each water flow switch shall be equipped with an adjustable recycling type retarding device designed to prevent false alarms due to pressure surges within the piping. The flow switch piping shall be suitable for 175 psig working pressures.
- C. Each flow alarm shall be provided with a set of contacts rated for 115V for connection by Electrical Trades.
- D. Manufacturer: Viking VSR-D, Reliable, Notifier, Victaulic, Anvil,

2.16 JOCKEY PUMP AND CONTROLLER:

- A. Provide jockey pump and controller package as detailed on drawings, including 1/3 HP, 115V motor, 1.6 gpm, 100 psig pump.

SPEC TEAM: NEED TO CHECK FOR MANUFACTURER

- B. Manufacturer/Supplier: Grundfos/Underwood Fire Equipment

2.17 PRESSURE RESTRICTING VALVE:

SPEC EDITOR: FIRE HOSES ARE NOT GENERALLY USED. BUT IF HOSES ARE USED, PRESSURE MUST BE LESS THAN 100 PSIG.

- A. Provide pressure-restricting valve on bottom of rack nipple or on male side of fire department valve to restrict water pressure at hose line. Valve shall be 1 1/2" swivel inlet with pin lugs X male outlet, cast brass. A removable breakable link shall permit adjustment of restriction.
Manufacturer: Crocker Model 5370-5375, Powhattan 16-255.

2.18 FIRE PUMP PRESSURE RELIEF VALVE:

SPEC EDITOR: THIS PRESSURE RELIEF VALVE IS REQUIRED WHEN FIRE PUMP CAN DEVELOP SHUT-OFF HEAD MORE THAN SYSTEM IS RATED FOR - TYPICALLY 175 PSIG.

DESIGNER: PIPE TO DRAIN.

- A. Provide UL and FM approved fire pump pressure relief valve: cast iron globe or angle valve body, bronze seat, Teflon coated stainless steel trim, hydraulically operated, cast bronze direct acting pilot control with stainless steel trim, adjustable spring loaded diaphragm. Relief pressure range factory set at 175 psig, adjustable 20 to 200 psig. Manufacturer: Claval 50B-4KG-1, size 6"

CAUTION: THE BELOW DRY PIPE SPECIFICATION WAS EXTRACTED FROM AIA MASTER SPEC, REQUIRES REVIEW AND EDIT AS REQUIRED TO MAKE PROJECT SPECIFIC. MAY NOT BE COMPLETE.

2.19 DRY PIPE VALVE AND ACCESSORIES:

- A. Provide dry pipe valve and all required trim and accessories including air maintenance device, air compressor, and accelerator device. Provide all UL listed and FM approved components with a rated minimum pressure of 175 or 300 PSIG to match system pressure rating.
- B. Valve: UL 260 differential-pressure type, cast or ductile iron, with flanged or grooved end connections. Include UL 1486, quick-opening device/accelerator, galvanized trim sets for air supply, drain, priming level, alarm connections, ball drip valves, pressure gages, priming chamber attachment, and fill-line attachment.
- C. Automatic device to maintain minimum air pressure in piping: shall include shutoff valves to permit servicing without shutting down sprinkler piping, bypass valve for quick filling, pressure regulator or switch to maintain pressure, strainer, with adjustable range.
- D. Air compressor: 120-V ac, 60 Hz, single phase.
- E. Approved Manufacturers: Viking, Reliable, Tyco, Victaulic

PART 3 - EXECUTION

3.1 GENERAL PIPING INSTALLATION REQUIREMENTS:

- A. Install piping in compliance with Section 221113, Article 3.1, with hanger spacing as dictated by NFPA and FM.
- B. Flush per NFPA 13 and FM requirements.
- C. Sleeve all piping passing through walls, floors and partitions per details and Section 220500.

3.2 DRY PIPE SYSTEMS

- A. Install all piping with the longitudinal weld seam located above the horizontal centerline of the pipe.
- B. Provide auxiliary drain valves terminated with a nipple and cap in all trapped sections of pipe, regardless of volume trapped. Drain valve size shall be per NFPA 13. Provide signage required by NFPA 13 at dry pipe or preaction valve indicating the number of low point drains and the location of each individual drain.
- C. Mains and branch lines shall be pitched to drain at least 1/2 in. per 10 ft in all locations, including non-refrigerated areas and areas not subject to freezing.

3.3 VALVE AND SPECIALTY INSTALLATION REQUIREMENTS:

- A. Inspector's Test Connections: Install where indicated, and if not indicated, at end of most hydraulically remote point for each zone.
- B. Isolation/ Control valves: Locate where readily accessible in emergency situations - in stairwells max 7' a.f.f.

- C. Drain Valves: Provide downstream of each flow alarm to facilitate testing, at low points trapping more than 5 gallons of water, at base of each riser. Provide metal air gap fittings for connection to the underground drainage system. Drain must be capable of taking full flow.
- D. Fire Department Connections: Locate with sufficient clearance from obstructions to allow full swing of fire department wrench handle.
- E. Pressure Gauges: Provide, with petcock valve, at the top of each standpipe, in readily visible location.

3.4 SPRINKLER HEAD INSTALLATION REQUIRMENTS:

- A. Locate heads per drawings, FM and NFPA 13, coordinated with lighting, building equipment layout, and other interferences. Aesthetically locate heads with respect to ceiling patterns, tile patterns, masonry bonds and similar constructions lines. Center heads in two directions in ceiling tile, with piping offsets as required.
- B. Protect heads, covers and escutcheons prior to painting. Remove protection after painting.

3.5 FIELD QUALITY CONTROL AND TESTING:

- A. Test equipment per the manufacturer's instructions, NFPA, and FM.
- B. Test piping systems per NFPA 13 and the requirements of Factory Mutual.

SECTION 213113 - FIRE PUMPS

END OF CONTENTS TABLE

DIVISION 21 FIRE SUPPRESSION
SECTION 213113 - FIRE PUMPS

REVISIONS:
07-30-07: ELCTRICAL CHANGES PER KEN BIRRINGER.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide a complete UL listed, FM approved, fire pump, jockey pump, and pump controllers as specified, detailed, and scheduled, meeting all of the applicable NFPA requirements.

1.3 QUALITY ASSURANCE:

- A. Provide listing/approval stamp, label, or other marking on equipment made to specified standards.
- B. Comply with local fire department/marshal standards pertaining to material, hose threads, and installation.
- C. Comply with the requirements of NFPA 20 "Centrifugal Fire Pumps" for fire pumps, drivers, controllers, accessories, materials, and installation.
- D. Comply with the requirements of NFPA 70-2005 "National Electrical Code" for electrical materials and installation.
- E. Fire pumps and controllers shall be UL listed.
- F. Comply with the requirements of FM "Approval Guide" as applicable to fire pumps, drivers, controllers, and accessories, and provide system capable of FM acceptance.
- G. Manufacturer's Factory Tests: Perform factory test of each fire pump.

1.4 MANUFACTURERS:

- A. The following fire pump manufacturers are acceptable:
 - 1. Allis-Chalmers
 - 2. Aurora
 - 3. Peerless
- B. The following controller manufacturers are acceptable:
 - 1. Joslyn Clark

2. Metron
 3. Hubbell
 4. Firetrol
- C. The drawings show the layout of equipment based on XXXXXXXXX units. Equipment by other approved manufacturers is acceptable provided it fits within the space allocated with adequate maintenance access space and meets all other requirements in the specifications and plans.

PART 2 - PRODUCTS

2.1 FIRE PUMP SYSTEMS - GENERAL REQUIREMENTS

- A. Horizontal fire pumps, except in line type, and drivers shall be factory assembled, mounted on same base, and connected with a flexible coupling having a guard.
- B. Fire Pumps: UL 448, base-mounted, factory-assembled, and factory-tested, of types, capacities, and characteristics indicated.
- C. Preparation for Shipping: After assembly and testing, clean flanges and exposed machined metal surfaces and treat with an anticorrosion compound. Protect flanges, pipe openings, and nozzles.
- D. Nameplates
 1. Fire Pump and Motor, Pressure Maintenance (Jockey) Pump and Motor: Provide nameplates, complete with motor horsepower, capacity, characteristics, and other pertinent data.
 2. Fire Pump and Pressure Maintenance (Jockey) Pump Controllers: Provide nameplate complete with capacity, electrical characteristics, approvals and listings, and other pertinent data, on enclosure door
- E. Factory Finish
 1. Fire Pump, Motor and Controllers: Red, enamel paint applied to assembled, tested units prior to shipping.
 2. Jockey Pump, Motor and Controllers: Manufacturer's standard color enamel paint applied to assembled, tested units prior to shipping.

2.2 AXIALLY-SPLIT-CASE FIRE PUMPS

- A. Fire pumps shall furnish not less than 150 percent of rated capacity at not less than 65 percent of total rated head. The shutoff head shall not exceed 120 percent of total rated head.
- B. Fire pumps shall be base-mounted, centrifugal, separately coupled, bronze-fitted, axially-split-case design, specifically labeled for fire service.
 1. Type: Horizontally mounted, single stage - double suction.

SPEC EDITOR: THE TYPE ABOVE COVERS MOST SITUATIONS. IF NECESSARY, CHOOSE ONE OF THE OTHER TYPES LISTED BELOW. DELETE OPTIONS NOT REQUIRED.

2. Type: Horizontally mounted, multistage - single suction.

3. Type: Vertically mounted, single stage - double suction.

- C. Casing: Axially-split-case centrifugal design; cast-iron pump casing with suction and discharge flanges machined to ANSI B16.1 dimensions, and 125-psi pressure rating, except where 250-psi rated flanges are indicated.
- D. Impeller: Statically and dynamically balanced, of construction to match type fire pump, fabricated from cast bronze, keyed to shaft.
- E. Wear Rings: Replaceable, bronze.
- F. Pump Shaft and Sleeve: Steel shaft, with bronze sleeve.
- G. Pump Shaft Bearings: Grease-lubricated double row ball thrust bearings contained in a cast-iron housing.
- H. Seals: Stuffing box consisting of a minimum of 4 rings of graphite-impregnated braided yarn with a bronze lantern ring between center 2 graphite rings, and a bronze packing gland.
- I. Pump Couplings: Flexible, capable of absorbing torsional vibration; complete with metal coupling guard.
- J. Fire Pump Electric Motor: NEMA MG 1, open drip proof, squirrel cage, induction motor, complying with NFPA 20 and NFPA 70, and wiring compatible with type controller used. Motor shall meet requirements of Section 220513 - Motors.

2.3 FIRE PUMP CONTROLLERS AND ALARM PANELS

- A. Combined automatic and non-automatic operation, UL listed and FM approved, factory-assembled and wired, and factory-tested, of types, capacities, electrical characteristics, and with features indicated.
- B. Enclosure: NEMA Type 12 (IEC IP55), drip proof, indoor, except where special-purpose enclosure is indicated.
- C. Provide controls, devices, alarms, functions, and operations listed in NFPA 20, as required for the type driver and controller used, and the specific items listed for each type controller.
- D. Provide mounting for enclosures as indicated:
 - 1. Full-Service Fire Pump Controller Mounting: Wall or floor stand type, as indicated, for field electrical connections.
 - 2. Alarm Panel Mounting: Wall type.
- E. Controller Sensing Pipes: Provide nonferrous metal sensing piping, 1/2-inch size, with 1/2-inch globe valves for testing mechanism of controller, from system to pump controller, as indicated. Provide bronze check valve with 3/32-inch orifice in clapper or ground-face union with non-corrosive diaphragm having 3/32-inch orifice.
 - 1. Fabricate pipe and fittings in accordance with NFPA 20.
- F. The controllers shall not require rear access for installation or maintenance. For ease of installation in tight corners and basement equipment rooms, the controllers shall be capable of being hand trucked through a standard three-foot door opening without being disassembled.

- G. All controllers' components, including circuit breakers and contactors, shall be front mounted, front wired and front accessible for maintenance. The circuit breaker interrupting capacity shall in no case be less than 18,000 AIC SYM. at 480 volts.
- H. The controller manufacturer, prior to shipment, shall hook up and test the entire controller as a complete assembly. This test shall include, but not be restricted to, each function the controller may be required to perform including remote alarms, remote start, auto start with manual shut down, remote deluge valve start, pressure drop, manual start-stop, etc. Additionally, the controller manufacturer shall set the instantaneous and longtime trips in the circuit breaker at these settings to see that the breaker trips within the current time requirements stated above. Advise Owner to enable witness of testing at Owner's option

2.4 ELECTRIC-MOTOR-DRIVE FIRE PUMP CONTROLLERS

- A. Motor Controllers: Controller specifically listed for electric motor drive fire pump service and service entrance.

SPEC EDITOR: SELECT CONTROLLERS FROM 6 OPTIONS BELOW. SEE EVALUATIONS FOR INFORMATION ON TYPES, APPLICATIONS, AND COSTS OF CONTROLLERS. EDIT TO SUIT PROJECT REQUIREMENTS WHERE MORE THAN ONE TYPE OF CONTROLLER IS REQUIRED. DELETE OPTIONS NOT REQUIRED.

SPEC EDITOR: ITEMS BELOW USUALLY USED FOR SMALL HP MOTORS AND WHERE HIGH INRUSH CURRENT IS ACCEPTABLE.

- 1. Type: Across the line.
 - 2. Type: Primary resistance.
 - 3. Type: Part winding.
 - 4. Type: Wye-delta (closed transition).
 - 5. Type: Autotransformer.
- B. Size controller for scheduled horsepower. Provide controller with short circuit withstand rating at least equal to short circuit current available at controller location, taking into account cable size and distance from substation or supply transformers.
 - 1. Standard: UL218, Standard for Fire Pump Controllers.
 - C. Provide controller capable of performing or containing the following features:
 - 1. Isolating means and circuit breaker.
 - 2. "Power On" pilot lamp.
 - 3. Fire alarm system connections for indicating motor running condition, loss of line power, and line power phase reversal.
 - 4. Automatic and manual operation, and minimum run time relay to prevent short cycling.
 - 5. Water pressure actuated switch having independent high and low calibrated adjustments responsive to water pressure in fire protection system.
 - 6. Manual and automatic shutdown.

SPEC EDITOR: CHOOSE ONE FOR THE FOLLOWING PARAGRAPHS (POWER TRANSFER SWITCH FOR GENERATOR SET EMERGENCY POWER SOURCE OR

POWER TRANSFER SWITCH FOR SECOND UTILITY EMERGENCY POWER SOURCE) DEPENDING ON TYPE OF EMERGENCY POWER SOURCE.

2.5 POWER TRANSFER SWITCH FOR GENERATOR SET EMERGENCY POWER SOURCE:

- A. The power transfer switch shall be housed within the fire pump controller enclosure or in a NEMA Type 12 (IEC IP55) drip-proof enclosure attached directly to the fire pump controller. Where the power transfer switch is provided in an attached enclosure, the enclosures shall be fitted so that the assembly constitutes a single unit. The fire pump controller/power transfer switch shall be factory assembled, wired and tested as a unit prior to shipment.
- B. The power transfer switch shall include a motor rated disconnect/isolating switch capable of interrupting the motor locked rotor current. The disconnect/isolating switch shall be mechanically interlocked so that the enclosure door cannot be opened with the handle in the ON position except by a hidden tool operated defeater mechanism. The disconnect/isolating switch shall be capable of being padlocked in the OFF position with up to three padlocks for installation and maintenance safety, and shall also be capable of being locked in the ON position. The enclosure door shall have a locking type handle and three-point cam and roller type vault hardware.
- C. Provide an auxiliary contact on the transfer switch to prevent starting of the emergency generator set when the transfer switch or the main fire pump controller are being serviced.
- D. The transfer switch circuitry shall be capable of sensing both the normal power source and the emergency power source. The normal power source pickup shall be set at 95 nominal voltage. The emergency power source shall be set to pick up at 90 nominal voltage and 95 nominal frequency. All voltage sensing, frequency sensing, and time delays shall be field adjustable to accommodate individual installation requirements. The transfer signal shall be delayed for one second, delaying the transfer and engine start signals so as to compensate for momentary, normal power outages. An automatic delay of three seconds shall be provided upon transfer to or from the emergency power source to allow the motor to slow sufficiently, preventing line disturbances that could trip either the generator set or fire pump circuit breakers.
- E. The transfer switch shall have TRANSFER SWITCH NORMAL, TRANSFER SWITCH EMERGENCY and EMERGENCY ISOLATING SWITCH OFF LED's, TEST and TRANSFER BYPASS switches, an audible alarm device and SILENCE ALARM pushbutton mounted on the flange of the enclosure. The power transfer switch shall be furnished with both normally open and normally closed auxiliary contacts for an engine start signal when normal power failure occurs. Auxiliary contacts shall also be provided and wired to terminals to indicate the transfer switch position. The transfer switch shall be electrically operated and mechanically held, and shall be capable of being operated by a manual transfer mechanism located on the switch.

2.6 POWER TRANSFER SWITCH FOR SECOND UTILITY EMERGENCY POWER SOURCE:

- A. The power transfer switch shall be housed within the fire pump controller enclosure or in a NEMA Type 12 (IEC IP55) drip-proof enclosure attached directly to the fire pump controller. Where the power transfer switch is provided in an attached enclosure, the enclosures shall be fitted so that the assembly constitutes a single unit. The fire pump controller/power transfer switch shall be factory assembled, wired and tested as a unit prior to shipment.
- B. The power transfer switch shall include a motor rated combination isolating disconnect switch/circuit breaker, mechanically interlocked and operated with a single, externally mounted handle. When moving the handle from OFF to ON, the interlocking mechanism shall sequence the isolating disconnect switch closed first, and then the circuit breaker. When the handle is moved from ON to OFF, the interlocking mechanism shall sequence the circuit breaker open first, and then the isolating disconnect switch.
- C. The isolating disconnect switch/circuit breaker shall be mechanically interlocked so that the enclosure door cannot be opened with the handle in the ON position except by a hidden tool operated defeater mechanism. The isolating disconnect switch/circuit breaker shall be capable of being padlocked in the OFF position for installation and maintenance safety, and shall also be capable of being locked in the ON position without affecting the tripping characteristics of the circuit breaker. The enclosure door shall have a locking type handle and three-point cam and roller type vault hardware.
- D. The circuit breaker trip curve adjustment shall be factory set, tested and sealed for the connected full load amps of the motor.
- E. The fire pump controller/power transfer switch shall have data logging capability for historical operation recording and to aid in annual test, service and trouble shooting. The data logging shall be accessible by front mounted interface panel and also by saving to file. The file shall be in text (.txt) format and easily readable by most common text editing or word processing software. The circuit breaker shall be capable of being field tested to verify actual pick up, locked rotor, and instantaneous trip points after field installation without disturbing incoming line and load conductors.
- F. The transfer switch circuitry shall be capable of sensing both the normal power source and the emergency power source. The normal power source pickup shall be set at 95 nominal voltage. The emergency power source shall be set to pick up at 90 nominal voltage and 95 nominal frequency. All voltage sensing, frequency sensing, and time delays shall be field adjustable to accommodate individual installation requirements. The transfer signal shall be delayed for one second, delaying the transfer signal so as to compensate for momentary, normal power outages. An automatic delay of three seconds shall be provided upon transfer to or from the emergency power source to allow the motor to slow sufficiently, preventing line disturbances that could trip either the transfer switch or fire pump circuit breakers.

- G. The transfer switch shall have TRANSFER SWITCH NORMAL, TRANSFER SWITCH EMERGENCY and EMERGENCY ISOLATING SWITCH OFF LED's, TEST and TRANSFER BYPASS switches, an audible alarm device and SILENCE ALARM pushbutton mounted on the flange of the enclosure. To aid servicing, no indicating lights or switch devices shall be mounted on the enclosure door. Auxiliary contacts shall be provided and wired to terminals to indicate the transfer switch position. The transfer switch shall be electrically operated and mechanically held, and shall be capable of being operated by a manual transfer mechanism located on the switch.

2.7 ALARM PANEL:

SPEC EDITOR: RETAIN THIS PARAGRAPH ONLY WHEN A REMOTE ALARM PANEL IS REQUIRED.

- A. NEMA ICS 6, Type 1 wall-mounting-type panel (or integral with main controller) with audible and visible alarms matching type controller used. Provide following features and manufacturer's standard features:
 - 1. Motor operating condition.
 - 2. Loss of line power.
 - 3. Phase reversal.
 - 4. Low water pressure alarm.

2.8 HORIZONTAL FIRE PUMP ACCESSORY FITTINGS

- A. Provide the following accessory fittings, matching fire pump suction and discharge ratings, as required for fire pump capacity rating:
 - 1. Automatic air release valve.
 - 2. Casing relief valve.
 - 3. Suction and discharge pressure gages.
 - 4. Eccentric tapered reducer at suction inlet.
 - 5. Concentric tapered reducer (increaser) at discharge outlet.

2.9 PRESSURE MAINTENANCE (JOCKEY) PUMPS

- A. Base-mounted, factory-assembled, and factory-tested, of pump types, capacities, and electrical characteristics indicated. Close-coupled pressure maintenance pumps are exempt from base-mounted requirement.
- B. Pressure maintenance pumps shall furnish not less than rated capacity at not less than total rated head indicated.
- C. Cast-iron pump casing with suction and discharge connections of size indicated, threaded, or flanged and machined to ANSI B16.1 dimensions, and 125-psi minimum pressure rating, except where 250-psi rated flanges are indicated.
 - 1. Impeller: Bronze or stainless steel.
 - 2. Shaft: Stainless steel.
 - 3. Seals: Mechanical.
- D. Multi-Stage Pressure Maintenance Pumps:

1. Multi-stage, centrifugal, vertical construction, base mounting.
- E. Electric Motor: NEMA MG 1, open drip proof, squirrel cage, induction motor, complying with NFPA 20 fire pump motor requirements and NFPA 70, and wiring compatible with controller. Motor shall meet requirements of Section 220513 - Motors.

2.10 PRESSURE MAINTENANCE (JOCKEY) PUMP CONTROLLERS

- A. Combined automatic and non-automatic operation, UL listed, factory-assembled and wired, and factory-tested, of types, capacities, electrical characteristics, and with features indicated, for electric motor drive pressure maintenance pump service.

1. Type: Across the line.

SPEC EDITOR: MODIFY PARAGRAPH BELOW AS REQUIRED. DELETE IF SYSTEM IS NOT UL.

2. Standard: UL 508.

SPEC EDITOR: MODIFY PARAGRAPH BELOW WHERE NEMA TYPE 1 ENCLOSURE TO BE ALLOWED.

- B. Enclosure: NEMA ICS 6, Type 2, wall mounted, for field electrical wiring.
- C. Provide controls, devices, alarms, functions, and operations listed in NFPA 20, and the specific items listed.
- D. Size controller for scheduled horsepower and provide the following items:

SPEC EDITOR: DELETE FEATURES BELOW NOT WANTED AND ADD OTHER OPTIONS WANTED. SEE MANUFACTURERS' CATALOG LITERATURE FOR VARIOUS OPTIONS.

1. Fusible disconnect switch.
2. Pressure switch.
3. "HAND-OFF-AUTO" selector switch.
4. Pilot light.
5. Running period timer.

- E. Mounting: Wall type for field electrical connections.
- F. Controller Sensing Pipes: Provide nonferrous metal sensing piping, 1/2-inch size, with 1/2-inch globe valves for testing mechanism of controller, from system to pump controller, as indicated. Provide bronze check valve with 3/32-inch orifice in clapper or ground-face union with non-corrosive diaphragm having 3/32-inch orifice.
1. Fabricate pipe and fittings in accordance with NFPA 20.

2.11 PRESSURE MAINTENANCE PUMP ACCESSORIES

- A. Provide following accessory fittings, matching pressure maintenance pump suction and discharge ratings, as required for pump capacity rating:
1. Casing relief valve.
 2. Suction and discharge pressure gages.

SPEC EDITOR: COORDINATE CONCRETE WORK WITH DIVISION 3. DELETE ARTICLE BELOW IF EQUIPMENT PADS ARE INCLUDED IN DIVISION 3. COORDINATE SIZE AND LOCATION OF CONCRETE PADS ON THE DRAWINGS. VERIFY STRUCTURAL REQUIREMENTS WITH A STRUCTURAL ENGINEER. VERIFY STRENGTH REQUIREMENTS FOR CONCRETE AND REINFORCING MATERIALS, SPACING, AND PLACEMENT.

2.12 EQUIPMENT BASES

- A. Construct concrete equipment pads of dimensions per manufacturers requirements, minimum 6" on all sides. Form concrete pads by using framing lumber with form release compounds. Chamfer top edge and corners of pad.
- B. Concrete: Portland cement mix, 4,000 psi:
 - 1. Cement: ASTM C 150, Type I.
 - 2. Fine Aggregate: ASTM C 33, sand.
 - 3. Course Aggregate: ASTM C 33, crushed gravel.
 - 4. Allow concrete to cure before installation of equipment.
- C. Reinforcement: Steel conforming to the following:
 - 1. Fabric: ASTM A 185, welded wire fabric, plain.
 - 2. Reinforcement Bars: ASTM A 615, Grade 60, deformed.
 - 3. Install reinforcing, tied to frame, and place anchor bolts and sleeves using manufacturer's installation template.

2.13 FLOW MEASURING SYSTEMS

SPEC EDITOR: DELETE BELOW WHERE FLOW MEASURING SYSTEMS ARE NOT ACCEPTABLE TO LOCAL AUTHORITIES FOR FLOW TESTS. U OF M PREFERENCE IS FOR 'ANNUAL' PITOT TESTS. USE IN APPROPRIATE AREAS.

- A. Fire pump flow measuring systems shall be FM approved, indicate flow in gpm to not less than 175 percent of fire pump rated capacity, and consist of a sensing element of size to match pipe, tubing, flow meter, and fittings.
- B. Pressure Rating: 175 psi minimum.
- C. Sensing Element: Venturi, annular probe, or orifice plate flow sensor.
- D. Flow Meter: Compatible with flow sensing element and direct reading in gpm; dial not less than 4-1/2 inches in diameter or equivalent.

SPEC EDITOR: SELECT FROM 2 OPTIONS BELOW.

- 1. Permanently Mounted: Flow meter suitable for wall mounting with copper tubing for connecting to flow sensing element.
 - 2. Portable: Flow meter, with two 12-foot hoses, in carrying case with handle.
- E. Provide flow-measuring systems complete with operating instructions.

2.14 SOURCE QUALITY CONTROL

- A. Factory Shop Tests: Hydrostatically test and test run each pump prior to shipment. Test at 150 percent of shut-off head plus suction head, but not less than 250 psig. Produce certified test curves showing head capacity and brake horsepower of each pump. Advise Owner to enable witnessing of the shop tests at Owner's option.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas, equipment foundations, and conditions with Installer present, for compliance with requirements for installation and other conditions affecting performance of fire pumps. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Examine fire protection piping systems to verify actual locations of piping connections prior to installation.

3.2 INSTALLATION OF FIRE PUMPS

- A. Comply with the manufacturer's written installation and alignment instructions and with NFPA 20 and FM standards.
- B. Install pumps in locations indicated and arrange to provide access for periodic maintenance, including removal of motors, impellers, couplings, and accessories.
- C. Support pumps and piping independently so that the weight of the piping system does not rest on pumps.
- D. Set base-mounted pumps on concrete foundations. Disconnect coupling halves before setting. Do not reconnect couplings until alignment operations have been completed.
 - 1. Support pump base plate on rectangular metal blocks and shims, or on metal wedges having a small taper, at points near the foundation bolts to provide a gap of 3/4 to 1-1/2 inches between the pump base and the foundation for grouting.
 - 2. Adjust the metal supports or wedges until the shafts of the pump and driver are level. Check the coupling faces and suction and discharge flanges of the pump to verify that they are level and plumb.
- E. Provide piping accessories, hangers, supports and anchors, valves, meters and gages, and equipment supports as required for complete installation.
- F. Provide housekeeping pad for all floor mounted controllers.
- G. Electrical Wiring: Install electrical devices furnished by manufacturer but not specified to be factory-mounted. Furnish copy of manufacturer's wiring diagram submittal to Electrical Installer.

1. Verify that electrical wiring installation is in accordance with manufacturer's submittal and installation requirements of Division 26 sections. Do not proceed with equipment start-up until wiring installation is acceptable.

3.3 ALIGNMENT

- A. Align pump and driver shafts after complete unit has been leveled on foundation and after grout has set and foundation bolts have been tightened.
- B. After alignment is correct, tighten the foundation bolts evenly but not too firmly. Fill the base plate completely with non-shrink, nonmetallic grout, with metal blocks and shims or wedges in place. After grout has hardened, fully tighten foundation bolts. Check alignment and take corrective measures required.
- C. Make piping connections, check alignment, and take corrective measures required.
 1. Adjust alignment of pump and driver shafts for angular and parallel alignment by one of the two methods specified in the Hydraulic Institute "Centrifugal Pumps - Instructions for Installation, Operation and Maintenance."
 2. Alignment tolerances shall meet manufacturer's recommendations.

3.4 CONNECTIONS

- A. General: Install valves of types and at locations indicated, that are same size as the piping connecting the fire pump, bypass, test header, and other piping systems.
- B. Install suction and discharge pipe sizes equal to or greater than the diameter of fire pump nozzles.
- C. Install pressure gages on the suction and discharge of each pump at the integral pressure gage tappings provided.

SPEC EDITOR: OMIT PARAGRAPH BELOW IF FLOW MEASURING SYSTEMS ARE NOT USED.

- D. Install flow meters and sensing elements where indicated. Install connections, tubing, and fittings between flow sensing elements and meters as prescribed by manufacturer's installation instructions.
- E. Electrical wiring and connections are specified in Division 26 sections.

3.5 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Provide the services of a factory-authorized service representative to supervise field assembly of components, installation of fire pump units and pressure maintenance pump units, including piping and electrical connections, field acceptance tests, and to report test results in writing.
- B. Check suction lines connections for tightness to avoid drawing air into the pump.

SPEC EDITOR: MODIFY PARAGRAPH BELOW TO SUIT PROJECT REQUIREMENTS. HOWEVER; RETAIN COMPLIANCE WITH NFPA 20. NORMALLY FIELD ACCPTANCE TESTS ARE PERFORMED FOR OWNER, INSURANCE UNDERWRITER, LOCAL FIRE OFFICALS, AND REPRESENTATIVES OF THE AUTHORITY HAVING JURISDICTION, AND PUMP AND CONTROLLER REPRESENTATIVES.

- C. Perform field acceptance tests of each fire pump unit (fire pump, driver, and controller) and system piping, when installation of fire pump units is complete. Comply with operating instructions and procedures of NFPA 20 to demonstrate compliance with requirements. Where possible, field correct malfunctioning equipment, then retest to demonstrate compliance. Replace equipment that cannot be satisfactorily corrected or that does not perform as specified and as indicated, then retest to demonstrate compliance. Verify that each fire pump unit performs as specified and as indicated.

3.6 COMMISSIONING

- A. Start-Up Services, General: Provide the services of a factory-authorized service representative to provide start-up service and to demonstrate and train Owner's maintenance personnel as specified below. Training will not occur at time of start-up.

- 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.
- 2. Train Owner's maintenance personnel on procedures and schedules related to start-up and shutdown, troubleshooting, servicing, and preventative maintenance.
- 3. Review data in Operating and Maintenance Manuals. Refer to Division 01 Section "Project Closeout."
- 4. Schedule training with at least 7 days' advance notice after factory-authorized service representative has performed start-up and forwarded a copy of the start-up report to the Owner.

SPEC EDITOR: WHERE FIRE PUMPS MUST BE TESTED AND WATER WASTED, A PLACE FOR DISPOSAL OF LARGE QUANTITIES OF TEST WATER MUST BE ARRANGED. IF SPECIFIED FLOW MEASURING SYSTEM WILL BE ADEQUATE FOR TESTS, THEN DELETE PARAGRAPH BELOW. DELETE TEST HEADER, MANIFOLD, AND FIRE HOSE VALVES IN PART 2 OF THIS SECTION, ONLY IF APPROVED BY LOCAL FIRE AUTHORITY. MODIFY BELOW TO SUIT PROJECT CONDITIONS. OWNER MAY WANT TO RETAIN FIRE HOSES. THEN FIRE HOSES SHOULD BE NEW, PARAGRAPH BELOW MUST BE EDITED, AND FIRE HOSES ADDED TO PART 2 OF THIS SECTION.

- 5. Provide fire hoses in number, size, and of length as required to reach a storm drain or other acceptable locations for the disposal of fire pump test water. These fire hoses are for use during field acceptance tests only and are not to become property of the Owner.
- B. Final Checks Before Start-Up: Perform the following preventative maintenance operations and checks before start-up:
 - 1. Lubricate oil-lubricated bearings.

2. Remove grease-lubricated bearing covers and flush the bearings with kerosene and thoroughly clean. Fill with new lubricant in accordance with the manufacturer's recommendations.
3. Disconnect coupling and check electric motor for proper rotation. Rotation shall match direction of rotation marked on pump casing.
4. Check that pump is free to rotate by hand. If the pump is bound or even drags slightly, do not operate the pump until the cause of the trouble is determined and corrected.

C. Starting procedure for pumps:

1. Prime the pump, opening the suction valve, closing the drains, and prepare the pump for operation.
2. Open the sealing liquid supply valve if the pump is so fitted.
3. Start motor.
4. Open the discharge valve slowly.
5. Observe the leakage from the stuffing boxes and adjust the sealing liquid valve for proper flow to ensure the lubrication of the packing. Do not tighten the gland immediately, but let the packing run in before reducing the leakage through the stuffing boxes.
6. Check the general mechanical operation of the pump and motor.

SECTION 220500 - COMMON WORK RESULTS FOR MECHANICAL

END OF CONTENTS TABLE

DIVISION 22 PLUMBING

SECTION 220500 - COMMON WORK RESULTS FOR MECHANICAL

REVISIONS:

2012-07-24: UPDATED CODE REFERENCES AND ADDED REFERENCES TO SID-F AND DG SECTION 220500. ADDED REFERENCE TO SECTION 078413 UNDER FIRESTOPPING. REVISED 'GRINNELL' TO 'ANVIL' IN PARA'S 2.3.A.3, 2.3.B.1.AAND 2.3.C.1, REMOVED POWDER ACTUATED FASTENERS, MOVED BELT DRIVES TO SECTION 233400 FANS. B. BEGG FOR PLMG MTT.

2017-08-02: REVISED TO DELETE REFERENCES TO 2009 MECH AND PLMG CODES, AND TO PROVIDE CORRECT LINK TO U-M DG CODE PAGE. D. KARLE FOR PLMG MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 078413 - Penetration Firestopping

1.2 INTERPRETATION OF DRAWINGS:

- A. The Drawings show the location and general arrangement of equipment, piping, ductwork and related items. They shall be followed as closely as elements of the construction will permit. Examine the drawings of other trades and verify the conditions governing the work on the job site. Drawings are schematic in nature, and installation may require additional offsets and modifications, including fittings, traps, valves and accessories.
- B. The architectural and structural drawings take precedence in all matters pertaining to the building structure, mechanical drawings in all matters pertaining to mechanical trades and electrical drawings in all matters pertaining to electrical trades. Report conflicts or differences to the architect/ engineer for resolution.

1.3 PROJECT RECORD DOCUMENTS:

- A. For underground piping, record dimensions and invert elevations of all piping, including all offsets, fittings, cathodic protection and accessories. Locate dimensions from benchmarks that will be preserved after construction is complete.
- B. For fire protection systems, record actual locations of sprinkler heads, and valves and deviations of piping from drawings. Indicate drain and test locations.

1.4 DELIVERY, STORAGE AND HANDLING:

- A. Deliver, store and handle all materials to keep clean and protected from damage.
- B. Store products in shipping containers and maintain in place until installation. Provide temporary inlet and outlet caps. Maintain caps in place until installation.
- C. Protect equipment and other materials from damage after installed from construction debris and other damage.

1.5 QUALITY ASSURANCE:

- A. Regulatory Requirements: Comply with the following:
 - 1. Michigan Mechanical Code.
 - 2. Michigan Plumbing Code.
 - 3. Applicable City of Ann Arbor rules and regulations.
- B. Labeling requirement for packaged equipment:
 - 1. Electrical panels on packaged mechanical equipment shall bear UL label or label of other approved testing agency (ETL, CSA).
- C. Other referenced standards:
 - 1. Comply with codes and regulatory agency requirements as detailed in University of Michigan Design Guideline 1.0 Codes and Regulatory Agencies (<http://www.umaec.umich.edu/for-vendors/design-guidelines/1-0-codes-and-regulatory-agencies/>)

PART 2 - PRODUCTS

2.1 FIRE STOPPING:

- A. Provide UL classified firestopping system for mechanical penetrations through fire rated construction to maintain the fire rating. See Related Section for additional firestopping requirements, including approved manufacturers.

2.2 ACCESS PANELS:

SPEC EDITOR: COORDINATE USE OF ACCESS DOORS WITH ARCHITECT

- A. Furnish access panels to access valves, traps, control valves or devices, dampers, damper motors, etc. Access panels shall be sized as necessary for ample access, or as indicated on drawings, but no smaller than 12" x 12" where devices are within easy reach of operator, and at least 24"x24" when operator must pass through opening in order to reach the devices. Architectural Trades shall install access panels coordinated with Mechanical Trades.

- B. Access panels in fire rated walls or ceiling must be U.L. labeled for intended use. Unless otherwise indicated on plans, access doors shall be hinged flush type steel framed panel, 14 gauge minimum for frame, and with anchor straps. Only narrow border shall be exposed. Hinges shall be concealed type. Locking device shall be flush type and screw driver operated. Metal surfaces shall be prime coated with rust-inhibitive paint. Panels shall be compatible with architectural adjacent materials Manufacturer: Milcor, Bilco

2.3 BUILDING ATTACHMENTS FOR MECHANICAL WORK SUPPORTS:

SPEC EDITOR: PROJECT SPECIFIC DETAILS MUST ACCOMPANY SPECIFICATIONS.

SPEC EDITOR: SPEC TEAM IS CONTINUING TO RESEARCH BUILDING ATTACHMENTS. EDIT CAREFULLY

- A. General Requirements:
 - 1. Provide building attachments required for supporting mechanical work, suitably selected and installed for the loads applied with a minimum additional safety factor of 3.
 - 2. Where specified attachments are not suitable for conditions, submit to Engineer for approval, proposal for alternate building attachments.
 - 3. Approved Manufacturers: Anvil, or equivalent products by Michigan Hanger and B-Line.
 - 4. Provide supplemental trapeze supports where necessary. Design trapeze to support all trades. Coordinate loads, and supports with all trades. Size trapeze for maximum deflection of 1/64 of the span.
- B. Attachments to Structural Steel:
 - 1. Support mechanical work from building structural steel where possible and approved. No welding or bolting to structural steel is permitted unless authorized by Architect. C-clamps are not permitted.
 - a. Center beam clamp - for loads over 120 lb.: Malleable center hung Anvil Fig. 228.
 - b. Side beam clamp with retaining clips - for loads up to 120 lb.
- C. Cast in Place Concrete Inserts:

SPEC EDITOR: APPLICABLE FOR SUPPORTING FROM NEW CONCRETE ONLY.

 - 1. Provide inserts selected for applied load of present load plus 100% for future, and coordinated with concrete work. Except as detailed on drawings, inserts shall be Unistrut or Grinnell. Plan, lay out and coordinate setting of inserts prior to concrete pour. Use Anvil Fig. 285 lightweight concrete insert for loads up to 400# or Anvil Fig. 281 Wedge Type concrete insert for loads up to 1200#
- D. Drilled Insert Anchors:

SPEC EDITOR: APPLICABLE FOR SUPPORTING FROM NEW AND EXISTING CONCRETE. COORDINATE LOADING WITH STRUCTURAL ENGINEER. DEVELOP AND EDIT CRITERIA FOR PROJECT SPECIFIC REQUIREMENTS

1. Where mechanical work cannot be supported from structural steel, or cast in place concrete inserts, provide drilled concrete insert anchors. Submit for approval, project specific installation drawings for all loads over 100 lbs. Install inserts in web of beam if possible and approved. Insert depth shall not exceed two thirds the thickness of the concrete. Where existing concrete appears to be deteriorating, or where applied load at insert exceeds 1000 lbs., conduct test of concrete to determine derated capacity of insert. Anchors may be adhesive or expansion type up to 1000 lbs., and shall be adhesive type for loads over 1000 lbs.

Manufacturers: Hilti, Powers Fasteners

SPEC EDITOR: POWDER ACTUATED FASTENERS HAVE BEEN REMOVED FROM THIS SPECIFICATION. IF A DESIGN REQUIRES POWDER ACTUATED FASTENERS, DESIGNER TO DEVELOP AND ADD SPECIFICATION.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

- A. Install equipment and materials in accordance with manufacturer's written and illustrated instructions, as detailed on drawings and as described in these specifications. Bring discrepancies in installation methods to the attention of the owner and A/E.
- B. Install hanger rod straight, without bending.

3.2 REFRIGERANT HANDLING

- A. Refrigerant Installation and Disposal: Perform all work related to refrigerant contained in chillers, cooling coils, air conditioners, and similar equipment, including related piping, in strict accordance with the following requirements:
 1. ASHRAE Standard 15 and Related Revisions: Safety Code for Mechanical Refrigeration.
 2. ASHRAE Standard 34 and Related Revisions: Number Designation and Safety Classification of Refrigerants.
 3. United States Environmental Protection Agency (US EPA) requirements of Section 808 (Prohibition of Venting and Regulation of CFC) and applicable State and local regulations of authorities having jurisdiction.
- B. To assure the proper handling of refrigerant materials, the Owner has implemented a tracking procedure for all CFC and HCFC refrigerants. When new refrigeration equipment is installed, or when refrigerant is disposed of, the "Refrigerant Disposal Form" must be completed. A copy of the form has been included with the Project Bidding Requirements and General Conditions package. Alternatively, copies may be obtained from Owner's Plant Operations Air Conditioning Shop. Contact Air Conditioning Shop Foreman at (734) 647-2041. Submit completed forms to the Owner's Representative and Air Conditioning Shop Foreman.

- C. Recovered refrigerant is the property of the Contractor. Dispose of refrigerant legally, in accordance with applicable rules and regulations of authorities

NUMBER SECTION DESCRIPTION

DIVISION 22

SECTION 220513 - MOTORS

END OF CONTENTS TABLE

DIVISION 22
SECTION 220513 - MOTORS

REVISIONS:

3-1-09: REVISED BEARING REQUIREMENTS AND MOTOR FRAME REQUIREMENTS BY D. KARLE PER MECH TECH TEAM.

10-21-10: REVISED TO ADD GROUNDING RINGS FOR HOSPITAL MOTORS OPERATED ON VFDS BY L. RICHARDSON FOR MECH TECH TEAM.

12-09-2010 - REVISED PERFORMANCE REQUIREMENTS AND REVISED FORMAT.

08-30-2012: REVISED TO DROP REQUIREMENT FOR MOTORS TO COMPLY WITH ALL PARTS MG-1 PART 31 AND TO DROP REQUIREMENT THAT MOTOR LABELS STATE "INVERTER DUTY". UPDATED MG-1 REFERENCES FROM MG-1 2009 TO MG-1 2011. D. KARLE FOR HVAC MTT.

07-29-13: REVISED TO DELETE "CLASS B TEMPERATURE RISE" REQUIREMENT FOR A MOTOR USED WITH A VFD PER K. BIRINGER. D. KARLE.

OCT. 2016: REVISED 2.4.K. TO REQUIRE SHAFT GROUNDING RINGS FOR ALL MOTORS, AND CERAMIC BEARINGS ON THE NON-DRIVE END OF MOTORS 100 HP AND ABOVE, IN ALL CASES AS OPPOSED TO JUST FOR HOSPITAL FUNDED PROJECTS. CHANGE DUE TO NEW EVIDENCE OF BEARING FAILURES FROM ELECTRICAL DISCHARGE, PER DECISION OF AD-HOC COMMITTEE ON MOTOR FAILURES CONVENED 10-13-16. PER THAT COMMITTEE, USE OF CERAMIC BEARINGS MAY BE DROPPED AT LATER DATE AFTER ADDITIONAL RESEARCH, SINCE CERAMIC BEARINGS MAY NOT BE EFFECTIVE. ADDITIONALLY IMPROVED SPECIFICATION LANGUAGE FOR MOTORS ON VFDS, INCLUDING DROPPING REQUIREMENT FOR "RATED INVERTER DUTY" SINCE THAT TERM IS UNDEFINED BY NEMA. D. KARLE

PART 1 - GENERAL3

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Division 26: Electrical.

1.2 SUMMARY

- A. Section includes:

1. Motors and requirements for factory or field installed motors, including but not limited to, air handling units, fans, pumps, and air compressors.

SPEC EDITOR: A/E MUST PROVIDE THE MOTOR SPECIFICATIONS FOR THE SPECIALIZED EQUIPMENT INDICATED BELOW. VERIFY IF THESE MOTORS ARE AVAILABLE IN EFFICIENCIES THAT COMPLY WITH NEMA MG-1 (2011) TABLE 12-12 AND SPECIFY AS SUCH, WHENEVER POSSIBLE.

- B. This section does not include motors for fire pumps, elevators, centrifugal chillers, sealed refrigeration equipment and vertical hollow or vertical solid shaft motors used with vertical turbine pumps.

1.3 SUBMITTALS

- A. Submit the following product data for approval:
 1. Manufacturer information.
 2. Dimensions and elevations.
 3. Complete NEMA nameplate electrical data including design type, insulation, service factor, and efficiency.
 4. Materials of construction.
 5. Bearing type, L10 life, and seal construction (open, single, or double shielded).
 6. Certification that VFD driven motors comply with NEMA MG-1 Part 31.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
- C. NFPA 70: National Electrical Code.
- D. NEMA Standards Publication MG 1 (2011): Motors and Generators.
- E. ABMA 9: American Bearings Manufacturers Association, Load Ratings and Fatigue Life for Ball Bearings.
- F. UL 1004: Motors, Electric.

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable manufacturers of motors 1/2 HP and larger.

1. Reliance Electric.
2. Baldor Electric Company.
3. Dayton.
4. General Electric.
5. Toshiba Corporation.
6. U. S. Electrical Motors.
7. Leeson Electric.
8. Marathon Electric.

2.2 MOTORS - GENERAL REQUIREMENTS

SPEC EDITOR: THE FOLLOWING IS GENERALLY APPLICABLE. REVIEW AND EDIT TO SUIT PROJECT.

- A. Motors 1/2 HP and larger shall be three-phase, squirrel cage, induction type.
- B. Motors smaller than 1/2 HP shall be single-phase, permanent split capacitor type, with built-in overload protection.
- C. Frequency Rating: 60 Hz, alternating current.
- D. Voltage rating of motor shall be determined by voltage of circuit to which motor is connected.
 1. 120 V Circuit: 115 V motor rating.
 2. 208 V Circuit: 200 V motor rating.
 3. 240 V Circuit: 230 V motor rating.
 4. 480 V Circuit: 460 V motor rating.
- E. Motors shall be NEMA Design B.
- F. Provide Class B insulation, unless noted otherwise.
- G. Service Factor: 1.15, unless noted otherwise.
- H. Motors shall be nominal 1,800 rpm, unless noted otherwise.
- I. All disconnects and other electrical accessories shall comply with Division 26 requirements.

2.3 SINGLE PHASE MOTORS

- A. Use shaded pole motors only for motors smaller than 1/20 HP.
- B. Provide automatic reset type thermal over-load protection.
- C. Bearings: Sealed or regreasable ball or sleeve bearings, suitable for the radial and thrust loading of the application.
- D. Furnish with sliding base/slotted mounting holes adequate for proper belt tensioning and alignment of motor or motor/load.
- E. Nameplates may be printed-type glued to the motor.

2.4 THREE PHASE MOTORS

- A. Enclosure: Open Drip Proof (ODP) unless noted otherwise in equipment specifications or schedules, and as suitable for service and application.

SPEC EDITOR: ODP IS THE U-M STANDARD FOR MOST APPLICATIONS. TOTALLY ENCLOSED FAN COOLED (TEFC) MOTORS ARE SPECIFIED FOR COOLING TOWERS AND SOME OTHER APPLICATIONS. WHERE TEFC OR OTHER NON-ODP ENCLOSURES ARE REQUIRED, INCLUDE SPECIFIC REQUIREMENT IN EQUIPMENT SPECIFICATION SECTION AND/OR ON EQUIPMENT SCHEDULE.

- B. Motor Efficiency: Nominal (nameplate) full load efficiency and corresponding minimum efficiency shall be equal to or greater than that stated in NEMA MG-1 (2011) Table 12-12 - Full Load Efficiencies of 60hz NEMA Premium Efficient Electric Motors - 600 volts or Less
- C. Motors less than 3 HP: Steel or cast iron motor frames, cast aluminum, cast iron, or steel end plates, steel or cast iron terminal box, copper windings. Motor nameplates shall be steel, engraved-type, riveted to motor.
 - 1. Bearings: Regreasable with relief plugs, pre-lubricated ball bearings suitable for radial and thrust loading of the application, with grease fittings, selected for a minimum L-10 bearing life of 26,280 hours, for belted and direct drive.
- D. Motors 3 HP and above: cast iron motor frame and mounting feet, cast iron end plates (bells), steel or cast iron terminal box, copper windings. Motor nameplates shall be stainless steel engraved type, riveted to the motor.
 - 1. Bearings shall be regreasable with relief plugs, pre-lubricated ball bearings suitable for radial and thrust loading of the application, with grease fittings. Rated for an L-10 life of 40,000 hours (belted) or 130,000 hours (direct connected).
- E. Bearing life calculations shall be per ABMA 9, and for belted applications shall be based on the maximum external side load limits for belted applications per NEMA MG-1 Table 14-1A. L-10 life calculations for vertical motors and horizontal motors mounted in the vertical position shall consider the application's thrust loading.
- F. TEFC motors shall also include an external shaft slinger on drive end.
- G. Motors shall not exceed dBA levels listed in NEMA MG-1 54 PART 9 Tables 9-1 and 9-3, at all speeds.
- H. Motors shall be suitable for continuous duty at rated horsepower, with a maximum hot spot temperature that does not exceed the temperature limit of the insulation, when operated in an ambient temperature of 40 degrees C, except as otherwise indicated.
- I. Direct connected motors shall be furnished with adjustable base. Motors connected to driven equipment by belt or shaft shall be furnished with adjustable NEMA foundation sliding bases.
- J. Multi-Speed Motors: Separate windings shall be provided for each speed.
- K. For motors used with variable frequency drives, provide General Purpose NEMA Premium Efficiency Class motors complying with NEMA MG-1 Part 30 with windings that meet the requirements of NEMA MG-1 Part 31.4.4.2 and with minimum insulation of Class F.
 - 1. For all PWM VFD driven motors up to 100 HP:

- a. Provide a maintenance free, circumferential conductive micro fiber grounding ring installed on the AC motor to discharge shaft currents to ground. Grounding ring shall be AEGIS SGR (Shaft Grounding Ring).
 - b. Motors protected by the AEGIS SGR shall be warranted for the term of the manufacturer's motor warranty from induced bearing current damage.
- 2. For all PWM VFD driven motors 100 HP & greater:
 - a. Provide a maintenance free, circumferential conductive micro fiber grounding ring installed on the drive end of the AC motor to discharge shaft currents to ground. Grounding ring shall be AEGIS SGR (Shaft Grounding Ring). In addition, all VFD driven motors 100 HP and larger shall utilize an insulated ceramic bearing assembly on the non-drive end of the motor, in conformance with the Aegis installation requirements.
- L. Explosion Proof motors:
 - 1. UL listed for application or duty.
 - 2. Motors shall conform to requirements defined in Article 500, 501, 502, and 503 of the National Electric Code.
 - 3. Motor nameplate shall be specifically marked "explosion proof."
 - 4. Sound power levels shall not exceed recommendations of NEMA MG-1 PART 9 Tables 9-1 and 9-3, at all speeds.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install and align motors in accordance with equipment manufacturer's recommendations.
- B. For VFD driven motors using a shaft grounding ring: Install grounding ring in accordance with the manufacturer's recommendations, including the application of a colloidal silver shaft coating on the motor shaft.

3.2 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.3 ADJUSTING, CLEANING, PROTECTION

- A. Assure motor nameplate is legible and properly affixed.
- B. Verify that bearings are factory lubricated before starting motors. Lubricate per manufacturer's instructions. Do not over-lubricate bearings.
- C. Check motors for unusual heating, noise, or excess vibration during operation. Correct any such deficiencies.

1. Any motors with vibration exceeding specified limits, as noted in the Testing, Adjusting and Balancing Section, or manufacturer's recommendations, whichever is more stringent, shall be corrected, at no cost to Owner, until reduced below those limits.
- D. Clean the motor prior to start-up and immediately prior to final turn over to the Owner.

END OF CONTENTS TABLE

DIVISION 22 PLUMBING
SECTION 220514 - VARIABLE FREQUENCY DRIVES

REVISIONS:

OCTOBER 2008: REVISED TO ADD TOTAL HARMONIC DISTORTION LIMITS, SUBMITTAL REQUIREMENTS, PID CONTROLLER, TIME CLOCK, AND MISC. OTHER CORRECTIONS AND CLARIFICATIONS BY D. KARLE FOR HVAC MECH TECH TEAM.

3-11-09: DELETE REQUIREMENT FOR MOTOR-ON-VFD PILOT LIGHT, DRIVE FAILURE PILOT LIGHT; CLARIFY REQUIREMENT FOR RUN PERMISSIVE, POWERED RUN MODE, AND POWERED RUN REQUEST CIRCUITS. BY D. KARLE FOR HVAC MECH TECH TEAM.

6-8-09: ADDED: RELAYS TO BE PLUG-IN STYLE, MAIN AND INVERTER DISCONNECT TO BE ACCESSIBLE W/O OPENING CABINET, FUSES TO BE IN FUSE BLOCKS. D. KARLE FOR HVAC MECH TECH TEAM.

10-15-09: ADDED: REQUIREMENT THAT WIRES ON THE SUBMITTAL DIAGRAMS SHALL BE LABELED WITH AN IDENTIFIER AND THAT WIRES BE CORRESPONDINGLY TAGGED IN THE DRIVE CABINET. D. KARLE FOR HVAC MECH TECH TEAM.

5-9-11: ABB ADDED AS APPROVED MFR. PER HVAC MTT (D.KARLE).

9-10-12: ADDED REQUIREMENT THAT DRIVE BE IN A NEMA 1 OR NEMA 3R ENCLOSURE. D. KARLE FOR HVAC MTT.

01-24-13: ADDED REQUIREMENT AND EDITOR NOTE FOR SHORT CIRCUIT CURRENT RATING.

PROVIDE A COPY OF THIS SECTION TO THE ELECTRICAL ENGINEER FOR COORDINATION. INDICATE LOCATION OF VFD IN MECHANICAL PLANS AND ENSURE IT IS SHOWN IN ELECTRICAL PLANS. INCLUDE VFD SCHEDULE. SPECIFY 480V IN LIEU OF 208V WHERE EVER POSSIBLE, ESPECIALLY WHEN POWER SOURCE ALSO FEEDS COMPUTERS. ON RETROFIT PROJECTS, BE SURE THAT EXISTING MOTOR IS COMPATIBLE WITH THE NEW VFD.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide variable frequency drives (VFD) meeting the requirements contained herein and as indicated in the VFD schedule.

1.3 QUALITY ASSURANCE:

- A. VFD shall comply with NFPA 70 (National Electrical Code), IEEE 519, UL 508, NFPA 70, and FCC compliance for Radio Frequency Interference (RFI) and Electro- Mechanical Interference (EMI).

1.4 WARRANTY:

- A. Provide a minimum of 3 years parts and labor warranty from the date of final acceptance by the University.

1.5 ACCEPTABLE MANUFACTURERS:

- A. Variable speed drives shall be manufactured by one of the following: Danfoss, Toshiba, ABB. VFDs manufactured by parent companies or their subsidiaries are not acceptable.

1.6 SUBMITTAL DATA

- A. Submit for approval, the following product data:
 - 1. Dimensions and elevations.
 - 2. Complete product data listing all included features.
 - 3. The electrical rating for each VFD, matched to each piece of driven equipment.
 - 4. Short circuit current (withstand) rating.
 - 5. Project specific wiring diagrams indicating:
 - a. Line/load connection points
 - b. Main input and inverter input disconnect switches
 - c. VFD/bypass switch circuit
 - d. Fusing/circuit breakers
 - e. Auxiliary control transformer
 - f. Local/remote circuit
 - g. Hand-off-auto circuit
 - h. Safety interlock, run permissive, and drive initiated external circuits
 - i. Analog inputs and outputs
 - j. Pilot lights
 - k. Each wire on the wiring diagram shall be labeled with a distinct wire identifier.
 - 6. VFD panel face diagram indicating the location of the main and inverter disconnect switches, local/remote and H-O-A switches, VFD/bypass switch, pilot lights, digital display, keypad, and any other face mounted device, along with the panel face labeling.

PART 2 - PRODUCTS

2.1 GENERAL:

- A. VFDs designated for installation indoors shall have enclosures rated NEMA 1. VFDs designated for installation outdoors shall have enclosures rated NEMA 3R minimum. The same NEMA requirements shall be provided for enclosures housing a bypass or any other accessory.
- B. Unit shall be dead front construction.
- C. All relays shall be plug-in style base.
- D. All fuses shall be mounted in fuse blocks with insulated covers. Covers shall shield fuse ends and wire terminations.

COORDINATE WITH THE ELECTRICAL ENGINEER AND INSERT THE REQUIRED MINIMUM SHORT CIRCUIT CURRENT RATING.

- E. The VFD (including bypass and other accessories) shall have an overall short circuit current (withstand) rating of _____ amps symmetrical minimum, and shall be marked with its short circuit current rating in compliance with UL.
- F. The unit, including all specified accessories, shall have a minimum efficiency of 85 percent at any speed from 50 to 100 %. The unit shall have a power factor of 0.9 or higher when operating at any speed from 50 to 100%.
- G. The VFD shall be variable torque type and shall provide full motor torque at any operating speed from 40% to 100%.
- H. The VFD shall provide variable torque V/Hz control when operating at speeds less than 100%.
- I. Provide the drive with a main input disconnect switch, accessible without opening the drive cabinet, equipped with current limiting fuses and fuse rejection clips, or with circuit breakers. All other fuse blocks with current limiting fuses installed shall be equipped with fuse rejection clips. It shall be possible to padlock the disconnect switch in the off position.

HOSPITAL PROJECTS MAY REQUIRE 18 PULSE DRIVES. REVIEW THE HOSPITAL DESIGN GUIDELINES AND CONSULT WITH HOSPITAL FACILITIES AND ADJUST THE BELOW PARAGRAPH IF REQUIRED.

- J. Provide minimum 6 pulse PWM type drives.
- K. Provide the necessary electronics to avoid audible noise generated from motor due to frequency change. The unit shall not increase the motor audible noise by more than 3 dB above the motor's across the line noise at any motor speed from 50 to 100 %.
- L. The unit shall include self diagnostics with a digital display that identifies fault conditions and simplifies trouble shooting. Fault indication shall be retained even after a power outage or an input over-current protective device trip.
- M. Unit shall be provided with RFI/EMI filters.
- N. Unit shall be UL, CSA or ETL labeled.

- O. VFD shall include current sensors on all three output phases to accurately measure motor current.

SPEC EDITOR: THE ENGINEER MUST SPECIFY AS PART OF THE DIVISION 26 ELECTRICAL TESTING SECTION THAT THE CURRENT AND VOLTAGE THD BE MEASURED AT EACH DRIVE.

- P. Provide minimum 3 percent AC input line reactors and/or minimum 5 percent DC link reactors to limit the maximum current total harmonic distortion (THD) to not more than 100% of the VSD input current waveform at any VSD operating speed from 20% to 100%. Reactors shall be integral to the VSD. The reactor(s) shall not be active when the drive is in bypass mode. If testing reveals the maximum THD is exceeded, the manufacturer shall provide and install additional reactors at no cost to reduce the THD to within these specified limits.
- Q. The unit shall have a dedicated terminal block for all external inputs and outputs.
- R. Provide factory mounted and wired 115V, 1 phase, 60 Hz control power transformer sized for handling an additional 30 VA inductive load. Limit fuse size for the control transformer to 3 amps maximum.

SPEC EDITOR: 480V IS OUR STANDARD VOLTAGE FOR VFDS, EVEN IF POWER AVAILABLE IS 208V/3P. IN THOSE CASES, WORK WITH THE ELECTRICAL ENGINEER AND PROVIDE A STEP-UP TRANSFORMER. IF MOTOR MUST USE 208V FOR A SPECIFIC APPLICATION, COORDINATE WITH ELECTRICAL ENGINEER AND PROVIDE A DESIGN THAT SEGREGATES VFD FROM ANY FEEDER CIRCUIT OR PANEL THAT ALSO FEEDS COMPUTERS OR ELECTRONIC EQUIPMENT.

- S. The VFD input and output shall be rated at 480 V, 3 phase.

SPEC EDITOR: BYPASS MAY BE OMITTED FOR FULLY REDUNDANT EQUIPMENT. SEE U-M DESIGN GUIDELINES FOR FURTHER INFORMATION. DO NOT INDISCRIMINATELY REQUIRE BYPASSES. INSTALL A BYPASS FOR ALL LABORATORY FANS.

- T. Provide a factory mounted and wired manual bypass device as scheduled. The bypass device shall allow the load to run across-the-line while electrically isolating the VFD so that maintenance can be performed on the drive components.

2.2 CONTROL FEATURES:

- A. The VFD shall be provided with the following control features:
 - 1. Factory mounted and wired Hand-Off-Auto selector switch that allows local or remote starting or stopping of the drive. Separate start and stop buttons, electronic circuits that "virtually" provide this capability, or other alternative devices are not acceptable.
 - 2. Factory mounted and wired VFD-Bypass switch, if bypass device is provided.

3. Factory mounted and wired Local-Remote speed control switch, that allows either local or remote control of the drive speed. Key pad buttons are also acceptable provided that permanently labeled, dedicated buttons are provided for the local and the remote speed control functions.
4. Main input disconnect switch.
5. Inverter input disconnect switch, accessible without opening the drive cabinet, if bypass device is provided.
6. Manual speed potentiometer or keypad control, for local speed control with the Local-Remote speed control switch in the Local position.
7. VFD shall accept an input reference (feedback) signal, 0-10 Vdc analog input, or 4-20 mA analog input, as indicated in VFD schedule, for remote speed control with the Local-Remote speed control switch in the Remote position. Provide input signal isolation to isolate input signal ground from VFD internal control ground.

SPEC EDITOR: NORMALLY DELETE THE FOLLOWING PARAGRAPH. PNEUMATIC VFD CONTROL IS RARELY USED.

8. Pneumatic, 3-15 psig analog input (with pressure gauge) for remote speed control, when indicated.
9. A remote start/stop contact input that functions in the automatic mode only.
10. A safety interlock circuit that functions in drive and bypass modes.
11. A run permissive circuit, separate from the safety interlock circuit, which prevents motor operation whether in drive or bypass mode. This circuit, via the customer's external contact device, signals the motor may run, provided the safety interlock contact(s) is made. A typical application would be for a time delay before motor start to allow some external event to occur. The run permissive circuit shall be jumpered from the factory.
12. Provide the following drive initiated external circuits:
 - a. Powered run mode: A circuit that is powered after the motor is started in drive or by-pass modes.
 - b. Powered run request: A circuit that is powered whenever the drive safety interlock contact(s) are closed, and the drive H-O-A is in hand, or the drive H-O-A is in auto and the remote start/stop contact is closed.
13. A standard USB port for direct connection of a Personal Computer (PC) to the VFD. The manufacturer shall provide PC software to allow complete setup and access to the VFD through the USB port. It shall be possible to communicate to the VFD through this USB port without interrupting VFD communications to the building management system
14. An integral PID controller that, when activated, controls drive speed to maintain a programmed setpoint based on a remote analog input feed-back signal.
 - a. The VFD shall be able to apply a scaling factor to the feedback signal
 - b. The VFD shall be able to calculate the square root of the feedback signal so that a pressure sensor can be used to measure flow.
15. A real-time clock shall be an integral part of the VFD.

- a. It shall be possible to use this to display the current date and time on the VFD's display.
 - b. The clock shall include a time clock function with 7 day programmability and a minimum of four programmable time periods per day, with individually selectable ON and OFF functions. The time clock function shall be programmable to control start/stop functions, constant speeds, PID parameter setpoints and output relays. The time clock function shall be programmable through the controller display and keypad, or by included software that allows programming via a PC and a USB connection.
16. VFD shall be capable of starting a coasting load.
 17. VFD shall automatically attempt to restart a minimum of three (3) times during an adjustable time period of no less than 30 seconds after shutting off for any reason, except for short circuit or motor overload.
 18. The VFD shall have adjustable motor acceleration and deceleration rates.
 19. The VFD shall have the ability to lock-out a minimum of four critical frequency ranges to prevent the VFD from operating the load at a speed that causes vibration in the driven equipment.
 20. The VFD shall be configured as required to meet system operational requirements including:
 - a. Provide an additional set of N.O. contacts on the VFD-Bypass switch that close when the switch is set to Bypass.
 - b. Provide one normally open and one normally closed auxiliary contacts to actuate when the motor is started in any mode.
 - c. Provide a minimum of one 4-20 ma analog output signal selectable to proportionally indicate drive output frequency, current, or power, or to indicate the VFD input reference/feedback signal, for monitoring by DDC

2.3 INDICATORS:

- A. Indicating lamp for "POWER AVAILABLE" and for "MOTOR ON BYPASS". Lights shall be LED type.
- B. Motor RPM and AMP display factory mounted on the face of the unit, either as a separate indicator or via the controller display..

2.4 SAFETIES:

- A. Provide status lights or digital display indication of the cause of any shutdown.
- B. The VFD shall be provided with the following safety features:
 1. VFD over voltage and under voltage protection and protection against temporary power outages.
 2. VFD over temperature protection.
 3. Motor over temperature protection per NEC 430.126(A)(2).
 4. Short circuit and ground fault protection.
 5. Separate motor overload protection functional in by-pass and normal operation. For VFD's controlling multiple motors, provide overload protection for each motor.

6. Adjustable current limiter.

2.5 LABELING:

- A. Provide engraved plastic labels permanently attached to the VFD panel face indicating the function of all switches and indicators, and the equipment served.
- B. Tag all wiring in the drive. Tag nomenclature shall match the corresponding wire identification nomenclature indicated on the approved drive submittal.
- C. For VFDs serving smoke purge, stair pressurization, or other smoke control systems, include an engraved permanently attached red faced label, minimum 6" x 6", with the following nomenclature: CAUTION: THIS VFD IS PART OF A LIFE SAFETY SMOKE CONTROL SYSTEM. NOTIFY U-M DEPARTMENT OF PUBLIC SAFETY PRIOR TO ANY CHANGE OR MAINTENANCE ACTIVITY TO THIS DRIVE.

PART 3 - EXECUTION

3.1 INSTALLATION:

- A. Unit installation, including mounting and supports, and wiring to motor shall be by the Electrical Contractor, in compliance with Division 26. Coordinate with the Electrical Trades and Control Trades as required.
- B. Install the VFD as close as possible to the motor. The load side power cables to the motor shall be kept as short as possible and shall not be run in the same conduit as the line side power cables. Control wiring shall be in separate conduit from power wiring. Where applicable, control wires from the motor disconnect early break contacts may be installed with the motor power wiring.
- C. Protect the unit from dirt, dust, water and physical damage prior to and during construction. If the inside of the unit becomes dirty or dusty before acceptance by the University, it shall be thoroughly cleaned by the unit manufacturer at the contractor's expense.

3.2 CHECK, TEST AND START:

- A. Provide the services of a factory trained and certified technician to supervise check, test and start. The contractor shall notify U of M representative 5 days in advance of the start-up.

3.3 TRAINING:

SPEC EDITOR: TRAINING IS NOT GENERALLY REQUIRED FOR VFDS WITH WHICH PLANT IS ALREADY FAMILIAR, BUT MAY BE REQUIRED FOR NEW MODELS. CONSULT THE U-M DESIGN MANAGER REGARDING IF TRAINING IS REQUIRED.

- A. Conduct a minimum of 4 hours training for maintenance staff on operation, programming and service of VFDs. Training shall be conducted by a factory trained service technician.

- B. Training shall not be performed until system is operational and functional and two (2) weeks after receiving approved job specific technical manuals.

DIVISION 22 PLUMBING
SECTION 220516 - PIPE EXPANSION JOINTS

REVISIONS:

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide expansion joints per plans and specifications in the following systems.
1. Steam and Condensate Pipe
 2. Heating Hot Water Piping
 3. Domestic Hot Water and Recirculation Piping

1.3 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
1. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F. Applies to any item in contact with domestic (potable) water.
 2. U.S Safe Drinking Water Act (any item in contact with domestic (potable) water).

1.4 PRICE BASIS

- A. Base bid shall be based on "ADSCO" model RJ Rampack joints. Under Alternate x provide price, name and model for one other acceptable manufacturer.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS:

- A. For Slip Joints: ADSCO Manufacturing, Advanced Thermal Systems, Flexonics
- B. For Bellows Joints: ADSCO Manufacturing Corruflex, Metraflex, Flexonics, Microflex, Twin City Hose
- C. For slip type (packed) expansion joints only "ADSCO" model RJ Rampack is the acceptable manufacturer and model.

2.2 GENERAL

- A. Conform to the standards of the Expansion Joint Manufacturers Association and shall be pressure rated for 60 PSI for low-pressure (9 lbs.) systems and for 175 PSI for high-pressure (60 lbs.) systems.
- B. Expansion joints located in heating fin tube enclosures in the copper serpentine piping shall have bronze elements and external self-guide shell, bronze sweat ends and designed for 100 pounds of working pressure unless indicated otherwise.
- C. Expansion joints sizes 2" and smaller shall have screw threads, welding or sweat ends. Joints 2-1/2 " and larger shall have 150 pound ASA standard flange ends unless indicated otherwise.
- D. All bellows joints shall be pre-set at the factory and "held" with removable metal clips or strips tack welded across the flanges.
- E. Provide guides of the type indicated at locations indicated in the plans.
- F. All slip type expansion joints to be installed in the tunnels or main utility incoming lines shall be precompressed 1", to compensate for pipe contraction.

2.3 SLIP TYPE (PACKED) EXPANSION JOINTS

(USE FOR STEAM LINES IN TUNNELS AND UTILITY WORK.)

- A. Expansion joints shall be packed slip type permitting the addition of new packing while joint is in service under full line pressure, externally/internally guided, single or double as scheduled, 150 or 300 lb. with weld or flanged end with base, drain and service connections as required suitable, 600 F. maximum operating temperature, and traverse as scheduled. Single expansion joints with base shall be suitable for main anchor. The inner end of each ring shall have a limit stop to prevent slip disengagement should an anchor fail.

- B. Each expansion joint shall have a minimum of four (except 6" dia. or smaller) angle type extended packing gun or other special manufacturer recommended fittings to facilitate access to difficult to reach packing locations. These special packing fittings/extenders shall match existing in tunnels. Vendors are to visit the site or obtain a copy of previous shop drawing submittal from Owner. Provide "Van Stone" floating flanges at the slip end of joints.
- C. Packing shall be semi plastic injectable asbestos free Teflon based or graphite based as recommended by manufacturer of the joints for this application.
- D. Provide a shut off valve in the packing manifold in addition to the check valve.
- E. Where the new expansion joints replace existing joints or are being installed in an existing line, the successful Bidder's representative (before submitting shop drawings for approval) shall visit the job site and obtain necessary field data to verify pipe sizes, to match existing flange to flange dimensions and make sure the joints will physically fit and operate without relocating existing pipes. Joint base heights may have to be custom measured to suit existing pipe location. If this cannot be done the supplier shall advise the mechanical contractor, who shall include necessary funds in his bids to relocate existing pipes, adjust or replace existing supports, guides and anchors. Flanges shall be "floating flanges" type construction to eliminate bolt hole misalignment with existing matching flanges.
- F. Provide a drip connection and base for expansion joint as indicated in the plans.

2.4 EXPANSION COMPENSATORS: (BELLOWS TYPE JOINTS)

SPEC EDITOR: USE THESE IN SMALL SIZE BUILDING WORK: ECONOMICAL DESIGN

- A. Bellows type expansion joints for iron and steel piping for condensate system shall be constructed with two ply stainless steel bellows and carbon steel shrouds, and end fittings. ADSCO model FASSI or equal by other acceptable manufacturers.
- B. Bellows type expansion joints for hot water systems with copper piping shall be constructed from 2 ply phosphor bronze bellows, brass shrouds and end fittings. All internal parts shall be of non-ferrous metal. ADSCO model FASCBB or equal by other acceptable manufacturer

2.5 BELLOWS EXPANSION JOINTS (CONTROLLED FLEXING TYPE):

(USE THIS FOR CONDENSATE, DHW, AND DHWR LINES IN TUNNELS AND UTILITY WORK)

- A. Expansion joints shall be multiply stainless steel bellows (high convolute design, low convoute design is not acceptable), with mated neck rings. Bellows shall be welded with minimum number of longitudinal seams and no circumferential seams. The joints shall be single or double with center anchor base where indicated and scheduled, with Van Stone flanges and with internal sleeves(joints are to be insulated). The joints shall be rated for 125 lbs. operating pressure and 500 degree F maximum operating temperature.

PART 3 - EXECUTION

3.1 GENERAL

- A. The installations shall be in strict accordance with manufacturer's instructions.
- B. During the commissioning period record the initial and final position and record actual movement of the joint.

SECTION 220519 - THERMOMETERS, PRESSURE GAUGES, AND ACCESSORIES

REVISIONS:

2013-12-01: ADD MILJOCO, LEAD FREE FOR DOMESTIC, AND OTHER MINOR IMPROVEMENTS. D. KARLE FOR HYDRONICS/STM MTT.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Thermometers, pressure gauges, and accessories.

1.3 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
1. UL Compliance: Comply with applicable UL standards pertaining to meters and gauges.
 2. ASME and ISA Compliance: Comply with applicable portions of ASME and Instrument Society of America (ISA) standards pertaining to construction and installation of meters and gauges.
 3. ASME/ANSI B40.1, Pressure Gauge Standard.
 4. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content)(and/or NSF/ANSI-372)and Annex F. Applies to any item in contact with domestic (potable) water.
 5. U.S Safe Drinking Water Act (any item in contact with domestic (potable) water).

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 220519 - - 1

PART 2 - PRODUCTS

2.1 THERMOMETERS:

SPEC EDITOR: "INDUSTRIAL" MERCURY TYPE THERMOMETERS HAVE BEEN REMOVED FROM THE MASTER SPECIFICATIONS BASED ON OSEH REQUIREMENT TO ELIMINATE UNNECESSARY USE OF MERCURY IN CONSTRUCTION.

BI-METAL THERMOMETER DELETED PER HYDRONIC TEAM MEETING 10-19-01

SPEC EDITOR: CHOOSE BETWEEN THE TWO THERMOMETERS LISTED.

- A. Digital Thermometer: electronic, with LCD display and solar cell, clear plastic window, adjustable angle, separable socket.
 - 1. Range and accuracy: -40 to 300 deg.F, accuracy greater of (+/-) 1 deg.F or 1% of reading.
 - 2. Manufacturers: Weiss Model DVBM25 (vari-angle), Tech Controls, Miljoco Corp.
- B. Industrial Glass Thermometer: adjustable angle, scale to be 9" long with white aluminum back and black graduation, aluminum casing, blue appearing liquid tube, glass window. Stem for air duct shall be 6" long with protective aluminum slotted bulb guard and mounting flange. Stem for piping shall be 3-1/2" long aluminum, brass or stainless steel, stem to match specified thermometer well. Adjust stem length for insulation extension.
 - 1. Range and accuracy: (+/-) 1 scale div. Except where otherwise noted, select range for maximum precision for system served:
 - 2. Manufacturers: Ashcroft, H. O. Trerice, Marsh, Weksler, Weiss, Miljoco Corp.

SPEC EDITOR: VERIFY SPECIFIED RANGE FOR EACH PROJECT

Service	Range (deg. F)
Domestic Cold Water	30-130 or 0-120
Domestic Hot Water	30-180
Chilled Water / Condenser water	30-130 or 0-120
Heating Water	30-240
All other locations	shown on drawings

- C. Thermometer Wells: Brass or stainless steel, with neck extension for insulated piping, with cap and chain fastened to well. 3/4"NPT, 2 1/2" insertion length, and extension length as required to extend well to outside of insulation. Lead free when used for domestic water applications.
- D. Outdoor thermometers shall be ultraviolet proof and specifically manufactured for outdoor use.

2.2 PRESSURE GAUGES

SPEC EDITOR: THIS SPEC IS GEARED TOWARD MAINSTREAM HVAC APPLICATIONS. EDIT FOR CRITICAL APPLICATION. SOME DISCUSSION ON OPTIONS FOLLOW: STAINLESS MOVEMENT IS A BIT MORE EXPENSIVE

THAN BRASS, BUT PROBABLY WORTHWHILE FOR ALL APPLICATIONS.
BRASS SOCKET IS SUITABLE FOR ALL BUT VERY AGGRESSIVE SYSTEMS.
STAINLESS STEEL IS ALSO AVAILABLE.
1/2" SOCKET WORKS WELL WITH 1/2" ISOLATION AND MANIFOLD WE
TYPICALLY USE - ALSO LESS PRONE TO PLUGGING THAN 1/4".
2 1/2" AND 4 1/2" ARE MOST COMMONLY USED IN THE INDUSTRY, AND
SUITABLE FOR MOST LOCATIONS, EXCEPT WHERE GAUGES ARE
DIFFICULT TO GET TO AND READ.
ACCURACY (OF FULL RANGE) OF 2%, 1% AND 1/2% ARE AVAILABLE.
COST INCREASES SIGNIFICANTLY WITH IMPROVED ACCURACY. 1% IS
REASONABLE FOR MOST APPLICATIONS. SPECIFY 1/2% FOR CRITICAL
APPLICATIONS ONLY.
GLYCERIN FILL HELPS REDUCE VIBRATION AT PUMP, BUT TURNS CLOUDY
ABOVE 150 DEG. F, NECESSITATING THE USE OF NEEDLE VALVES TO
DAMPEN ABOVE THAT TEMP. DAMPENERS ARE NOT TYPICALLY REQUIRED.
THEY PREVENT PRESSURE SURGES WITH A SMALL ORIFICE. DAMPENERS
ARE PRONE TO PLUGGING UP AND ARE THEREFORE NOT TYPICALLY
SPECIFIED.

- A. Unless otherwise noted, provide all pressure gauges with clear glass window, cast aluminum, stainless steel or polypropylene case, black on white face, stainless steel wetted parts, brass 1/2" MPT socket, 1% full scale accuracy complying with ASME/ANSI B40-1 Grade 1A. Lead free when used for domestic water applications.
- B. Water and Compressed Air Services through 2" piping (Utility/Economy): 2 1/2" diameter face, stainless steel case, brass or stainless steel 1/4" MPT socket, 2% full scale accuracy.
- C. Water and Compressed Air Services over 2" piping: 4 1/2" diameter face, 6" diameter face for location more than 8 feet above floor, sealed glass window, glycerin filled for connections within 10 feet of pumps. For applications exceeding 145 deg. F, provide 316 stainless steel needle valves rated minimum 500 psi, in lieu of glycerin filled.
- D. Steam Service: 4 1/2" diameter face, 6" diameter face for location more than 8 feet above floor, sealed glass window, brass or stainless steel coil siphon tube with a minimum pressure rating of 1000 psi.

SPEC EDITOR: EDIT OR DELETE THE FOLLOWING

- E. Critical System Pressure Gauges: Stainless steel socket, 1/2% of full range accuracy, 6" diameter face, in accordance with AMSE/ANSI B40-1 Grade 2A. Applicable for the following locations:

SPEC EDITOR: LIST APPLICATIONS

SPEC EDITOR: EDIT OR DELETE THE FOLLOWING

- F. Differential Pressure Gauges: 4 1/2" diameter face, 6" diameter face for location more than 8 feet above floor, sealed glass window, glycerin filled for connections within 10 feet of pumps. For applications exceeding 145 deg. F, provide 316 stainless steel needle valves rated minimum 500 psi, in lieu of glycerin filled. Applicable for the following locations:

SPEC EDITOR: LIST APPLICATIONS

G. Except where noted otherwise, select range for twice normal operating pressure:

Service	Range
Water (CW and HW)	0-100 psig
Steam(15#)	30" Hg vac. - 30 psig
Steam(60#)	30" Hg vac. - 100 psig
Comp. Air	0-100 psig

H. Outdoor gauges shall be ultraviolet proof and specifically manufactured for outdoor use.

I. Manufacturers: Ashcroft, H. O. Trerice, Marsh, Weksler, Weiss, Miljoco Corp.

2.3 PRESSURE/TEMPERATURE TEST PLUGS AND KITS:

A. Provide 1/4" brass pressure and temperature test plugs where shown on drawings, with two core Nordel rated for 275 degrees and 300 psig.

SPEC EDITOR: THE FOLLOWING IS NOT TYPICALLY REQUIRED, BUT CAN BE INCLUDED ON LARGE PROJECTS.

B. Provide one readout meter kit including required hoses with a minimum 3-1/2" dial differential pressure gauge. Gauge shall read 0 to 60 psig and have end connections to match both the flow valves and plugs. Included in the case shall be two pocket thermometers (25 to 125 and 0 to 220 degrees), one gauge adapter, and one pocket pressure gauge (0 to 160 psig). Meter shall become property of U of M (hand over to project engineer) after completion of work.

C. Manufacturers:

1. Plugs: Petes, Sisco, Schrader, Miljoco Corp.
2. Meter: Auto Flow, Griswold

PART 3 - EXECUTION

3.1 THERMOMETERS INSTALLATION

A. Install and orient wells and thermometers so thermometer can be read from the floor. Digital thermometers shall be located in areas with adequate light, where possible.

B. Thermometer Wells: For piping 2" and below, install in piping tee where thermometers are indicated, in vertical position. For piping below 2 1/2" and above, "weldolets" may be used. Fill well with oil or graphite and secure cap.

C. Install in the following locations and elsewhere as indicated:

SPEC EDITOR: EDIT LIST BELOW TO SUIT PROJECT REQUIREMENTS.

1. At inlet and outlet of each hydronic zone.
2. At inlet and outlet of each hydronic boiler and chiller.

3. At inlet and outlet of each hydronic coil in air-handling units over 5000 cfm.
4. At inlet and outlet of each hydronic heat exchanger.
5. At inlet and outlet of each hydronic heat recovery unit.
6. At inlet and outlet of each thermal storage tank.
7. At outside air intake ductwork.
8. At mixed air plenums.
9. At hot/cold deck plenums.
10. At each zone supply duct of multi-zone systems.
11. At supply duct of single zone systems.

3.2 INSTALLATION OF PRESSURE GAUGES

- A. Install pressure gauges with 1/2" isolation ball valve. Where needle valves are specified as a substitute for glycerin filled in Part 2, install the needle valve between the ball valve and the gauge. Locate gauges to be readable from the floor preferably at eye level. Mount gauges securely to prevent excessive vibration, adjust needle valve to dampen pulsations. Install syphon tubes for steam pressure gauges, connected after the isolation ball valve. Do not install pressure gauges on bottom of piping.

SPEC EDITOR: EDIT LIST BELOW TO SUIT PROJECT REQUIREMENTS.

- B. Install in the following locations, and elsewhere as indicated on drawings:
 1. At suction and discharge of each pump.
 2. At inlet and outlet of each pressure-reducing valve.
 3. At building water service entrance.
 4. At inlet and outlet of hydronic equipment (HW boilers, chillers, heat exchangers, filters).

3.3 INSTALLATION OF TEST PLUGS

- A. Test Plugs: Install in piping tee where indicated, located on pipe at most readable position. Secure cap.

3.4 ADJUSTING AND CLEANING

- A. Adjusting: Adjust faces of meters and gauges to proper angle for best visibility.
- B. Cleaning: Clean meters and gauges. Replace cracked and broken windows. Touch up scratches.

SECTION 220523 - VALVES

REVISIONS:

07-17-08 REVISED TO INDICATE DOM. H.P. B.F. TO BE STAINLESS, ALL LOCATIONS (NOT JUST TUNNELS) AND TO ELIMINATE "STANDARD" B.F. VALVE SPEC.

09-16-08: REVISED PREFERRED MANUFACTURERS FOR HP BUTTERFLY VALVES, ADDITIONAL UTILITY TUNNEL REQUIREMENTS AND P/FP MECH TECH TEAM EDITS.

1-09: RECONCILED EDITS BETWEEN 7/08 AND 9/08 REVISIONS, AND ADDRESSED OTHER MINOR ISSUES.

7-19-12: ADDED (2.2.B) THAT SEALS ARE TO BE IMMUNE FROM CHLORAMINES AND THAT ALL EPDM IS TO BE PEROXIDE CURED. D. KARLE FOR PLMG MTT.

07-30-13: REVISED TO UPDATE TUNNEL REQUIREMENTS. D. KARLE PER WAYNE GROTH AND HYDRONICS MTT.

2013-12-17: REMOVED KEYSTONE AS APPROVED FOR HP BF VALVES DUE TO ON-GOING SHUT-OFF PROBLEMS REPORTED BY PLANT, D. KARLE FOR MTT.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

2014-2-28: REVISED TO STRIKE BALL VALVE MODEL NUMBERS, WHICH WERE OUTDATED. JOMAR REMOVED PENDING REVIEW OF THEIR BRASS BALL VALVE OFFERING (JOMAR DOES NOT OFFER BRONZE BALL VALVES). JAMESBURY REMOVED, DON'T OFFER BALL VALVES OF TYPE SPECIFIED. D. KARLE FOR MTT.

2014-12-15: REVISED TO STRIKE BALL VALVE MFR.S NO LONGER APPROVED OR AVAILABLE, ADD SPECIFIC JOMAR MODEL NUMBER BALL VALVE AS APPROVED, STRIKE GRINNELL GHP SINCE IS THE SAME VALVE AS THE KEYSTONE THAT HAS PROVEN UNRELIABLE, AND RESTRICTED USE OF LEAD FREE VALVES TO POTABLE WATER SYSTEMS ONLY DUE TO SOLDERING CHALLENGES. D. KARLE FOR MTT.

2015-06-30: CLARIFIED THAT GROOVED BUTTERFLY VALVES ARE ONLY PERMITTED WHEN SPECIFICALLY INDICATED, H.P. BUTTERFLY VALVES ARE REQUIRED OTHERWISE, INCLUDING IN GROOVED PIPING. D. KARLE FOR PLMG. MTT.

2017-02-08: ADDED APPROVED MFRS - ABZ FOR HP B'FLY, VANESSA FOR METAL SEATED B'FLY AND APOLLO FOR GATE/GLOBE/CHECK. B. BEGG FOR PLMG. MTT.

2018-01-31: REVISED JOMAR BALL VALVE MODEL NUMBER, EXACT SAME VALVE PER JOMAR INCLUDING MATERIALS, THE MODEL NUMBER WAS ONLY UPDATED TO REFLECT ADDITIONAL LISTINGS. D. KARLE AS APPROVED BY PLMG. MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide valves as scheduled and specified for the following systems:
 - 1. Cold Water, Hot Water, Hot Water Return
 - 2. High Purity Water
 - 3. Compressed Air
 - 4. Lab Vacuum
 - 5. Natural Gas
 - 6. Hot Water Heating, Chilled Water, Condenser Water
 - 7. Steam and Condensate
 - 8. Others as indicated

1.3 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. National Sanitation Foundation NSF/ANSI-61, including Annex G (listed as $\leq 0.25\%$ weighted average lead content)(and/or NSF/ANSI-372)and Annex F. Applies to any item in contact with domestic (potable) water.
 - 2. U.S Safe Drinking Water Act (any item in contact with domestic (potable) water).

PART 2 - PRODUCTS

2.1 VALVE APPLICATION SCHEDULE:

SPEC EDITOR: EDIT 2.1 CAREFULLY TO SUIT PROJECT. CONSIDER USE OF LESS EXPENSIVE STANDARD BUTTERFLY VALVES FOR CW, HW, CHW AND HWH. COORDINATE VALVE SELECTION WITH PLANT. ADD SOLENOID VALVES UNDER SPECIALTY VALVES IF APPLICABLE, CONSIDER USE OF GROOVED BUTTERFLY VALVES. EDIT BALANCING VALVES TO SUIT PROJECT.

- A. Cold Water, Hot Water and Hot Water Return System:
Isolation through 2": Ball Valve

Isolation 2 1/2" and larger: High Performance Butterfly Valve, All stainless steel.
Check: Swing Check through 2", Silent Check for 2 1/2" and up.
Balancing: Automatic Balancing Valve, Manual Balancing Valve

SPEC EDITOR: SWING CHECK ARE NOT ACCEPTABLE IN UTILITY TUNNELS. ONLY SILENT CHECKS SHALL BE USED IN TUNNELS, FOR ALL SIZES.

SPEC EDITOR: ADD/ DELETE SPECIALTY VALVES IF APPLICABLE
Specialty Valves:

- B. High Purity Water Systems (deionized, reverse osmosis, distilled):
Isolation: High Purity Water Valve
- C. Compressed Air System,
Lab Vacuum System:
Isolation through 2": Ball Valve
Isolation 2 1/2" and larger: High Performance Butterfly Valve
Check: Swing Check Valve
- D. Natural Gas System:
Isolation through 2": Ball Valve certified by UL or CSA for natural gas.
Isolation 2 1/2" and larger: Lubricated Plug Valve (Section 231123)

SPEC EDITOR: INSERT BELOW, THE REQUIREMENT FOR UNDERGROUND CHILLED WATER VALVES. IF INCLUDED IN A SEPARATE SPECIFICATION SECTION FOR UNDERGROUND CHW PIPING, REFERENCE THAT SPEC. SECTION.

- E. Hot Water Heating System,
Chilled Water System,
Condenser Water System:
Isolation through 2": Ball Valve
Isolation 2 1/2" and larger: High Performance Butterfly Valve
Isolation - Underground chilled water:
Check: Swing Check through 2", Silent Check for 2 1/2" and up.
Balancing: Automatic Balancing Valve, Manual Balancing Valve
- F. Steam and Condensate System (through 60 psig):

SPEC EDITOR: ON STEAM SYSTEMS, A WARM-UP BYPASS VALVE SHOULD BE INSTALLED ON SIZES 3" AND LARGER IN TUNNELS AND WHERE REQUIRED IN BUILDINGS (8" OR HIGHER) DUE TO DOWNSTREAM PIPING CONFIGURATIONS. COORDINATE WITH SECTION 232216 AND AVOID DUPLICATION OF SPECIFICATIONS FOR THE SAME APPLICATION.

METAL-TO-METAL BUTTERFLY VALVES ARE SPECIFIED FOR ALL STEAM SYSTEMS 2-1/2" AND LARGER, BASED ON THE ASSUMPTION THAT MOST STEAM SYSTEMS IN BUILDINGS ARE CONNECTED TO THE CENTRAL CAMPUS UTILITY TUNNEL SYSTEM AND SHOULD BE RATED FOR 600°F. IF YOUR PROJECT DOES NOT USE STEAM FROM THE UTILITY TUNNEL SYSTEM, A HIGH PERFORMANCE BUTTERFLY VALVE (RATED 150 PSIG/450°F) ILO A METAL-TO-METAL MAY BE MORE APPROPRIATE; EDIT SPEC ACCORDINGLY.

Isolation through 2": Ball Valve

Isolation through 2" in Utility Tunnels: Gate Valve - Steel body with stainless steel trim.

Isolation 2 1/2" and larger: Metal-to-Metal Seated Butterfly Valve Check (condensate only): Swing Check through 2", Silent Check for 2 1/2" and up. In Utility Tunnels, only Silent Checks shall be provided for all sizes.

Other valves in 232216, as specified.

SPEC EDITOR: SWING CHECK VALVES ARE NOT ACCEPTABLE IN UTILITY TUNNELS. ONLY SILENT CHECKS SHALL BE USED IN TUNNELS, FOR ALL SIZES.

2.2 GENERAL VALVE REQUIREMENTS:

- A. All valves shall have seats, stem seals and disc materials compatible with intended fluid, temperature, pressure and service.
- B. All EPDM shall be peroxide cured. All wetted seals shall be made from materials that are immune from chloramine degradation.
- C. Valves in contact with domestic (potable) water shall be "lead free" NSF/ANSI-61 Annex G (and/or NSF/ANSI-372) labeled. Soldered lead free valves (all types) are restricted to use on domestic potable water systems only.
- D. Manually operated valves 4" and larger installed 10 feet A.F.F., or higher, shall have chain wheel operators. Chain shall reach to within 7'-0" of floor or operating platform, or within two feet of accessible ceiling.
- E. Gate and globe valves shall be repackable under pressure whether open or closed.
- F. Unless noted otherwise, valves shall be rated for a minimum of 125# WSP (working steam pressure)/ 250# WOG (cold water, oil, gas).
- G. Unless noted otherwise, all butterfly valves shall be full lug construction, suitable for bi-directional dead end service, and have open position memory stop. Manually operated butterfly valves 4" and larger shall have enclosed worm gear operators with position indicators.
- H. Provide extended valve stems for insulated piping.
- I. Where the valves are installed outdoors, all components including the gear operated wheel operators shall be weatherproofed.
- J. Unless noted otherwise, valves through 2" shall have screwed connections for steel piping and sweat connections for copper piping; valves 2-1/2" and larger shall be flanged. Grooved connections are permitted where specified.
- K. Unless noted otherwise, valves shall be same size as piping.

2.3 BALL VALVE:

- A. Two-piece, full port, bronze body, stainless steel ball and stem, Teflon seat, plastic coated lever handle and locking devices where noted in drawings.
 - 1. Valves for Natural Gas shall be UL or CSA approved for natural gas service.

- B. Manufacturers: Watts, Nibco, Apollo, Milwaukee, Hammond, Grinnell (Grinnell permitted only where grooved connections permitted). Also approved: Jomar Valve model T/S-100CG with CW511L brass alloy body and end connection and CW510L brass alloy ball and stem and T.E.A. coated ball.

2.4 HIGH PERFORMANCE BUTTERFLY VALVE:

SPEC EDITOR: STANDARD FOR MOST ISOLATION VALVES 2 1/2" AND LARGER. NOTE, STANDARD BUTTERFLY VALVES ARE NOT TYPICALLY ACCEPTABLE, AND HAVE BEEN REMOVED FROM THIS MASTER SPECIFICATION.

- A. Full lug, high performance type, carbon steel body, 316 stainless steel disc, stainless steel shaft and bearing, PTFE seat, Teflon stem packing. Rated for 150 psi, 450 degrees F.

SPEC EDITOR: REMOVE BRAY ON ALL CENTRAL POWER PLANT PROJECTS.

- B. Manufacturers: Bray - Braylok Series 41, Dezurik - BHP, Jamesbury - 815L, Milwaukee - HP Series, Tri-Seal Valve-Contromatics (formerly Watts/KF Contromatics), Xomox Pliaseal, ABZ ABZolute Seal Series 400.
- C. For domestic water systems, full lug, high performance type, 316 stainless steel body, 316 stainless steel disc, stainless steel shaft and bearing, (all wetted parts stainless steel) PTFE seat, Teflon stem packing. Rated for 150 psi, 250 degrees F.

2.5 BUTTERFLY VALVE - GROOVED:

SPEC EDITOR: FOR USE WITH GROOVED PIPING, NOT OUR STANDARD, USE ONLY UNDER SPECIAL CONDITIONS. NORMALLY HIGH PERFORMANCE BUTTERFLY VALVES ARE TO BE USED, EVEN IN GROOVED PIPING SYSTEMS, THEREFORE THIS SECTION SHOULD BE DELETED IN MOST CASES. SELECT APPLICABLE SECTION BELOW IF USED. GRINNELL IS NOT ON PREFERRED LIST OF MANUFACTURERS YET. NOT FOR USE IN TUNNELS

- A. Grooved ductile iron body, suitable for installation with grooved piping, EPDM coated steel disc and shaft, stainless steel hub bearing, EPDM seat, Teflon stem packing. Rated for 300 psi, 230 degrees F.

Manufacturer: Victaulic Vic-300

- B. Grooved Nylon coated ductile iron body, EPDM coated ductile iron disc, stainless steel shaft, bronze shaft bearing. MSS SP-67

Manufacturer: Grinnell Gruvlock Series 7700.

- C. Grooved butterfly valves may be used only within grooved piping systems and only when specifically noted as permitted on the project drawings. Otherwise, high performance butterfly valves shall be provided, including for grooved piping systems.

2.6 HIGH PERFORMANCE METAL-TO-METAL SEATED BUTTERFLY VALVE:

- A. Full lug or short body flanged for end-of-line dead end service, bi-directional shutoff, triple offset type, single piece carbon steel body per ANSI B16.5 flange dimensions, carbon or stainless steel hardened abrasion-resistant disc keyed to stem with self-centering feature, stainless steel stem, hardened heavy duty stainless steel bearings with line debris ingress protection feature, stainless steel or Inconel seat and seal, bolted replaceable elastically resilient seal, high-temp graphite stem packing with blow-out proof design and adjustable gland. Pressure Class 150 rated for 140 psig, 600 degrees F. per ANSI/ASME B16.34. Valve tested for minimum 5000 cycles, with initial bubble-tight, zero leakage closure classification per FCI 70-2 or equivalent testing and fabricated per ISO 9001 QA program protocols. Operator to be lockable, low operational torque fully enclosed lifetime lubricated worm gear type, keyed to shaft with local position indicator, size based on seating and break away safety factor. Valve warranty shall be 36 months from substantial completion. Mounting taps to be tapered to aid bolt threading. Body to have quantity (4) tapped holes equally spaced around the body for mounting threaded lifting lugs to aid installation.

- B. Valve Flow Capacity: The minimum Cv value for various valve sizes in the full open position shall be as follows:
 - 1. 4 inch: 230
 - 2. 6 inch: 660
 - 3. 8 inch: 1500
 - 4. 10 inch: 2400
 - 5. 12 inch: 3600
 - 6. 14 inch: 5500
 - 7. 16 inch: 7600
 - 8. 18 inch: 10300
 - 9. 20 inch: 13000
 - 10. 24 inch: 20200

- C. Manufacturers: Bray Trilok, Metso/Neles Neldisc, Adams MAK, ABZ Extreme 6000 Series, Vanessa, Weir Tricentric, Zwick Tri-Con, Crane ChemPharma & Energy.

2.7 GATE VALVE - (FOR 2" AND SMALLER ONLY):

- A. General Service: Bronze body and trim, screwed, rising stem. de-zincification resistant.
 - 1. Description:
 - a. Standard: MSS SP-80
 - b. CWP Rating: 300 psig
 - c. SWP Rating: 150 psig
 - d. Body Material: Bronze ASTM B 62
 - e. Ends: Threaded
 - f. Stem: Silicon Bronze
 - g. Disc: Solid wedge, Bronze ASTM B 62
 - h. Packing: Asbestos free
 - i. Bonnet: screw in style, Bronze ASTM B 62
 - j. Handwheel: Malleable Iron

- k. For domestic water service: Per above, accept with non-rising stems and rated 200 psig CWP at 300°F. Solder end connections to 3/4 inch size, threaded ends for 1 inch and above.
 - 2. Manufacturers: Nibco T-131 (T/S-113-LF lead free), Apollo, Crane, Grinnell, Stockham, Watts, Milwaukee, Hammond
 - B. Utility Tunnel Locations: Class 150 Steel Body Gate Valves with stainless steel trim.
 - 1. Description:
 - a. ANSI Class 150 OS&Y Bolted Bonnet ASTM A 105 steel body, 13 Chrome Trim, hard-faced seats, graphite packing.
 - b. Manufacturers:
 - 1) Crane Co.; Crane Valve Group; Crane Valves.
 - 2) Vogt.

2.8 SWING CHECK VALVE:

SPEC EDITOR: TYPICALLY USED FOR ALL SERVICES, 2" AND UNDER, SWING CHECK VALVES ARE NOT ACCEPTABLE FOR UTILITY TUNNELS

- A. Bronze body and trim.
- B. Manufacturers: Milwaukee model 509, Crane model 37, Grinnell model 3300, Nibco, Apollo

2.9 SILENT CHECK VALVE:

SPEC EDITOR: TYPICALLY USED FOR ALL SERVICES, 2 1/2" AND OVER

- A. Spring loaded type check valves, stainless steel spring, iron body, and bronze trim.
- B. Manufacturers:
 - 1. Wafer Style: Milwaukee - Series 1400, APCO - Series 300, Mueller, Metraflex
 - 2. Globe Style: Milwaukee, APCO, Mueller, Metraflex, Apollo
 - 3. Utility Tunnels:
 - a. Durabula model SCV, stainless body
 - b. Steam Trap Assemblies: "The Connector" by Check-All Mfg. Company, 316 stainless steel body and trim.
 - 4. Condensate pump and pressure powered pump discharge: Durabula model SCV, stainless body

2.10 DRAIN VALVE:

- A. General Service: Ball valve with 3/4-inch hose threaded end fitting and cap.
- B. Utility Tunnels:
 - 1. Steam and condensate: Gate valve with 3/4-inch hose end fitting and cap.
 - 2. Domestic hot water and compressed air: ball valve with 3/4-inch hose threaded end fitting and cap.

2.11 AUTOMATIC BALANCING VALVE:

SPEC EDITOR: THIS SECTION STILL NEEDS SOME WORK - EDIT CAREFULLY

- A. Automatic flow control, pressure independent type, +/- 5 percent accuracy. 304 stainless steel cartridge, two P/T ports for flow reading. Valve size shall match pipe size. Refer to drawings for flow and pressure range.
- B. Manufacturers: Griswold Ultra "Z", Autoflow, Bell and Gossett

2.12 MANUAL BALANCING VALVES:

SPEC EDITOR: THIS SECTION STILL NEEDS SOME WORK - EDIT CAREFULLY

- A. General Manual Balancing Valve Requirements: ports for measuring flow, memory stop, bubble tight shut-off, valve Cv characteristics suitable for throttling. Size valve to produce readable design flow and maximum full open pressure drop of 3 feet.
- B. Through 2": bronze body, brass ball, calibrated.
Manufacturers: Bell & Gossett Circuit Setter Plus, Armstrong, Flow Design Inc., TACO, T&A
- C. Valves 2-1/2" and larger: cast iron body, brass ball or bronze disc, TFE seat rings, bronze seat, and stainless steel stem.
Manufacturers: Bell & Gossett Circuit Setter, Armstrong, Flow Design Inc., TACO, T&A

SPEC EDITOR: VERIFY PRESSURE DROPS AT DESIGN FLOWS AND INSURE THEY ARE MEASURABLE, IF NOT USE THE FOLLOWING.

- D. Venturi Style: bronze body, brass ball, and venturi flow measuring station. Manufacturers: Preso B Plus, Accusetter
- E. Provide gauge kit for projects requiring over 20 balancing valves. Gauge kits shall be capable of directly reading GPM, or shall include conversion chart from Cv and pressure.

2.13 HIGH PURITY WATER VALVE:

- A. Union body ball valve with Teflon seat and viton stem packing. Construction, material, pipe connections and size to match piping.
- B. Manufacturers: Harvel Plastics, Hayward, Watts

2.14 SOLENOID VALVES:

- A. Full port, bronze body, malleable iron coil enclosure, stainless steel plunger, valve stem, bonnet tube, and spring, Buna-N seal, rated for 500 psi. See drawings for voltage, size and position (NC or NO).
- B. Manufacturer: Magnetrol Figure No. 200-A, ASCO, Skinner

PART 3 - EXECUTION

3.1 GENERAL VALVE INSTALLATION REQUIREMENTS:

- A. Install valves such that operator is completely operable, and the valve position indicator is discernible from the floor.

3.2 SOLENOID VALVE INSTALLATION REQUIREMENTS:

- A. Provide a strainer before each solenoid valve. Provide a water hammer arrestor upstream of solenoid valves used for water service.

3.3 NATURAL GAS VALVE INSTALLATION REQUIREMENTS:

- A. Install valves in accessible locations, protected from physical damage. Do not locate valves in plenum ceilings.
- B. Install isolation valve upstream and within 6 feet of gas appliance. Install a union or flanged connection downstream from the valve to permit removal of controls.

3.4 STEAM, CONDENSATE AND DOMESTIC HOT WATER VALVE INSTALLATION:

- A. For general service applications: steam and condensate flanged valves shall be installed with Flexitallic gaskets, 316 L stainless steel, with "Flexicarb" filler.
- B. For general service applications: domestic hot water flanged valves shall be installed with 100% PTFE gaskets, Interlex SQ-S.
- C. For Utility Tunnels: Domestic hot water flanged valves shall be installed with Garlock Blue-Gard Style 3000 ring type gaskets or comparable. Full face gaskets allowed only when BOTH flanges are full face."
- D. For Utility Tunnels: steam and condensate flanged valves shall be installed with Flexitallic gaskets, 316 L stainless steel, with "Flexicarb" filler. Steam butterfly valves with removable seat screw heads that would interfere with the metal strip winding shall be installed with Garlock Style 9800 gaskets on the seat screw head side.

NUMBER SECTION DESCRIPTION

DIVISION 22 PLUMBING

SECTION 220533 - HEAT TRACING FOR PIPING

END OF CONTENTS TABLE

DIVISION 22 PLUMBING
SECTION 220533 - HEAT TRACING FOR PIPING

REVISIONS:

2-24-00: MINOR CORECTIONS, APROVED AS NEW MASTER.

SPEC EDITOR: SCOPE OF HEAT TRACING MUST BE SHOWN ON THE DRAWINGS. CAREFULLY SELECT REQUIRED HEAT TRACE,SCHEDULE AND DETAIL ACCORDINGLY.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK

- A. Furnish and install a complete UL listed system of heaters, components, and controls to prevent pipelines from freezing. Refer to drawings for additional scope clarification.

1.3 COORDINATION

SPEC EDITOR: COORDINATE ELECTRICAL REQUIREMENTS WITH DIV. 26

- A. The heat tracing and all the necessary accessories shall be furnished and installed by the Mechanical Contractor. Electrical Contractor shall provide power supply and related wiring by the per Division 26, and as shown on electrical drawings.

1.4 MANUFACTURERS

- A. Raychem.
- B. Thermon.
- C. Delta Therm Inc.

PART 2 - PRODUCTS

2.1 MATERIAL

- A. Electric heat tracing shall be self-limiting type suitable for temperature maintenance up to 40 degrees F.

- B. The heater shall have a self-regulating factor of at least 90 percent. (the percentage reduction, without thermostatic control, of the heater output going from 40 degrees F pipe temperature operation to 150 degrees F pipe temperature operation).

SPEC EDITOR: COORDINATE ELECTRICAL REQUIREMENTS WITH DIV. 26, EDIT VOLTAGE

- C. The heater shall operate on line voltages of (select: 120, 208 or 220) volts without the use of transformers.
- D. The heater shall be sized according to this table. The required heater output rating is in watts per foot at 50 degrees F. (Heater selection based on 1" fiberglass insulation on metal piping).

Pipe Size	Min. Ambient - 10 deg.F	Temp. - 20 deg. F
3" or less	5 watt	5 watt
4"	5 watt	8 watt
6"	8 watt	8 watt
8	2 strips - 5 watt	2 strips - 8 watt
12" - 14"	2 strips - 8 watt	2 strips - 8 watt

- E. Connectors and fittings, and indicator lights, and other required installation accessories shall be manufacturers standard recommended for the freeze protection application. The heater shall include a tinned copper braided shield, electrically bonded at splice locations, and bonded to the branch circuit ground conductor at the power connection point.
- F. All the components and system shall be U. L. listed.

2.2 ELECTRICAL PROTECTION

- A. Provide ground fault circuit breakers or other ground fault protection with a 30 mA ground fault trip level. See Division 26 for more details.

2.3 CONTROLS

- A. Provide heater system controls indicated below, and as shown in the drawings:

SPEC EDITOR: EDIT LIST AND COORDINATE WITH DETAILS

1. Outdoor air thermostat control to prevent operation when outside air temperature is above 40F (adjustable).

SPEC EDITOR: PLANT A/C SHOP PREFERS TO HAVE A DDC ALARM, BUT WILL ACCEPT LOCAL ALARM IF IT IS LIKELY TO BE OBSERVED. COORDINATE WITH A/C SHOP.

2. Heater failure alarm, using outdoor piping thermostats, and voltage detectors, with audible and visual alarm and alarm contact for remote monitoring by the owner's Energy Management System.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. The entire installation shall comply with the manufacturer's instructions and all the applicable sections of NEC, latest edition.
- B. The electrical and mechanical installation details shall strictly adhere to manufacturer's recommended practices. The manufacturer's representative shall supervise and test the installation and provide a letter to the Owner that the entire installation complies with their requirements, and the installation tested out satisfactorily.

3.2 TESTS

- A. After heater installation and before and after installing the thermal insulation, subject heater to testing using a 1000 VDC megger. Minimum insulation resistance shall be 20 megohms regardless of length. Test both heating cable bus wires to verify the connection of any splices or tees.
- B. After all megger testing and insulation is complete, manufacturer shall conduct functional performance test to ensure system is fully operational, and submit report.

DIVISION 22 PLUMBING

SECTION 220548 - VIBRATION CONTROL

END OF CONTENTS TABLE

DIVISION 22 PLUMBING
SECTION 220548 - VIBRATION CONTROL

REVISIONS:

FEBRUARY 2017 REVISIONS/ SIGNIFICANT CHANGES.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A IN EVERY SPECIFICATION SECTION.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

SPEC EDITOR: THIS SECTION SHOULD BRIEFLY DESCRIBE ALL THE MECHANICAL WORK TO ENABLE POTENTIAL SUBCONTRACTORS TO DECIDE WHETHER OR NOT TO OBTAIN A FULL SET OF DOCUMENTS AND TO BID. PARTICULAR CARE SHOULD BE USED WHEN SELECTING VIBRATION ISOLATION TYPES FOR HIGHLY VIBRATION SENSITIVE BUILDINGS

- A. Provide vibration control items for isolating vibration of mechanical equipment, piping and ductwork.
- B. Provide all hangers, isolators, bases, pads, sleeves and other devices specified, required, or detailed for the project. Include all vibration isolation system elements as recommended by the equipment manufacturer's representative to make a complete, correct and safe installation. Supply and install all incidental materials needed.

1.3 QUALITY ASSURANCE

- A. Work of this section shall be performed by skilled workers who are experienced in the necessary crafts to meet the requirements of this Section.
- B. Provide field supervision and inspection to assure proper installation, adjustment and performance. Replace any isolators that are found to resonate with the supported equipment.
- C. As a minimum provide vibration control per ASHRAE - 2015 - HVAC Applications, Chapter 48 - "Sound and Vibration Control".
- D. Isolators shall be selected, installed and adjusted to prevent the transmission of objectionable vibration and noise to the building structure.

- E. The size and number of mounts and hangers shall be chosen to meet these specifications, even if not specifically shown on the plans. Brackets, rails, bases, braces, etc., shall be provided as needed for a complete and correct installation.

1.4 ACCEPTABLE MANUFACTURERS

- A. Subject to compliance with the Contract Documents, manufacturers for products specified in this Section shall be one of the following:
 1. Vibration Eliminator Co.
 2. Mason Industries, Inc.
 3. Kinetics Noise Control
 4. Vibration Mounting and Controls (VMC)
 5. Amber Both
 6. Korfund
 7. Vibration Isolation Co.

PART 2 - PRODUCTS

2.1 FLEXIBLE DUCT CONNECTIONS

- A. Flexible sleeves for duct connections shall be fabricated from flexible, airtight, coated fabric. Each sleeve shall be installed with at least 3 inches slack across a clear metal to metal gap of at least 4 inches. That is, 7 inches of this fabric is required for each sleeve.

2.2 FLEXIBLE PIPE CONNECTORS

- A. Flexible connectors for pipes shall be neoprene Mason Type MFNC, MFTNC or as approved.

2.3 FLEXIBLE METAL HOSE CONNECTORS:

USE THIS IN HOT WATER, STEAM, CONDENSATE AND REFRIGERATION SYSTEMS AS REQUIRED

- A. Length and end fittings as shown in drawings, with an inner corrugated hose made of type 304, 321, or 316 stainless steel and outer braid made of 304 stainless steel. Manufacturers: Metraflex, Flexonics, Mason, Twin City Hose.
- B. For copper piping systems, use copper construction braided hoses. Approved Manufacturers: Anaconda, Flexonics, Mason, Metraflex, Twin City Hose.

SPEC EDITOR: USE THE FOLLOWING ARTICLES FOR TUNNELS ONLY

2.4 FLEXIBLE METAL HOSE CONNECTORS FOR TUNNELS:

- A. For steel piping systems, length and end fittings as shown in drawings, with an inner corrugated hose made of type 316 stainless steel and outer braid (double braided) made of 316 stainless steel. Dual floating flanges or one fixed and one floating flange may be used. Manufacturers: Metraflex, Flexonics, Mason.

- B. For copper piping systems, (up to 2" in size) use copper construction braided hoses. Manufacturers: Anaconda, Flex Hose Co., Flexonics, Mason, Metraflex. For sizes 2½" above, all stainless steel with an inner corrugated hose made of type 316 stainless steel and outer braid made of 316 stainless steel, with stainless steel flanges. Dual floating flanges or one fixed and one floating flange may be used. All wetted parts shall be stainless steel. Approved Manufacturers: Metraflex, , Flexonics, Mason, Twin City Hose.

2.5 FLEXIBLE CONNECTORS (RUBBER) :

SPEC EDITOR: USE THIS IN LARGE PUMP SYSTEMS

- A. Flexible connectors with neoprene and nylon type elements, with carbon steel or ductile iron floating flanges. Rated for 150 psig working pressure at 200°F, with peroxide cured EPDM liner and cover, ultraviolet resistant, hand wrapped, non-molded, multiple arch body, with control rods or cables. Approved Manufacturers: Mason Industries, Inc. Type SFDEJ, Mercer Rubber Co., Metraflex Type DS, Twin City Hose.

2.6 INERTIA BASES

- A. All mounts shall have leveling bolts rigidly secured to the equipment being isolated.
- B. Provide vibration isolation bases as indicated in the table in section 3.2.
- C. Base Type A
 - 1. Floor mounted equipment that is mounted directly to the floor, no inertia base is required.
- D. Base Type B
 - 1. Inertia base Type B (Steel Inertia Base) shall be a structural steel base frame with clearance holes located to correspond to the mounting bolt holes of the equipment mounted on the base.
 - 2. Bases shall have built-in motor slide rails and shall be reinforced as necessary to withstand belt pull without drive misalignment or base distortion. The bases shall be constructed with deep angle steel sections with a minimum vertical angle leg of 4 inches for motors of 7.5 hp or less, 5 inches for motors between 7.5 hp and 20 hp and 6 inches for motors over 20 hp.
 - 3. Mason Industries Type WFSL with unhoused spring isolators SL, or approved equal.
- E. Base Type C

1. Inertia base Type C (Concrete Inertia Base) shall have an integral rectangular structural steel form into which concrete is poured. Perimeter members shall be beams of depth equal to 10% of the longest span of the base, but not more than 12 inches nor less than 6 inches deep. Forms shall include motor slide base and all reinforcing steel. Where anchor bolt locations fall in concrete, the reinforcing steel shall include drilled members with sleeves welded below the steel to accept the anchor bolts. Height saving steel brackets shall be used in all mounting locations.
2. When the concrete base in "T" shaped, isolators shall be located under the projections as well as under the main body in order to prevent cantilever distortion.
3. Mason Industries Type BMK/KSL with unhoused spring isolators SL or approved equal.

2.7 VIBRATION ISOLATORS

- A. The static deflection of isolators shall be as specified below and in ASHRAE - 2015 Chapter 48.
- B. Vibration isolator sizes and layout shall be determined by the vibration isolator supplier.
- C. Provide vibration isolator types as indicated in the table in section 3.2.
- D. Isolator Mount Type 1
 - a. Type 1(Waffle Pads) shall be 3/8 inch thick neoprene pads ribbed or waffled on both sides. The pads shall be manufactured with quality neoprene and selected for a maximum durometer of 50 and designed for 15% strain. Where required, steel load-spreading plates shall be incorporated between the equipment and the neoprene pad.
 - b. If the isolator is bolted to the structure, a neoprene mounting sleeve shall be installed under the bolt head between the steel washer and the base plate.
 - c. Mason Industries Type Mini Super W or approved equal.
- E. Isolator Mount Type 2
 1. Type 2 (Double Deflection Neoprene Mounts) shall be laterally stable, double deflecting, molded neoprene isolators. All metal surfaces shall be covered with neoprene. The top and bottom surfaces shall be ribbed and bolt holes shall be provided in the base. The mounts shall have a leveling bolts rigidly secured to the equipment.
 2. The isolator shall be manufactured with bridge bearing quality neoprene and selected for a maximum durometer of 50 and designed for 15% strain. DDNM mounts shall be selected for a static deflection of 3/8 inch unless otherwise specified.
 3. Mason Industries Type ND or approved equal.
- F. Isolator Mount Type 3

1. Type 3 (Spring and Low Dynamic Stiffness Mounts) shall have a free-standing and laterally stable steel spring without any housing. Springs shall be designed so that the ratio of the horizontal to vertical spring constant is between one and two. The spring diameter shall be not less than 80% of the compressed height of the spring at rated load. Loaded springs shall have a minimum additional travel to solid equal to 50% of the specified static deflection.
2. Unless otherwise specified, the minimum static deflection of Type 3 isolators for equipment mounted on grade slabs shall be 1 inch and for the minimum static deflection for equipment mounted above grade level shall be 2 inches.
3. Two Type 3 isolation pads sandwiching a 16 gauge stainless or galvanized steel separator plate shall be bounded to the isolator baseplate.
4. Unless otherwise specified, isolators need not be bolted to the floor for indoor installations. If the base plates are bolted to the structure, a neoprene mounting sleeve shall be installed under the bolt head between the steel washer and the base plate.
5. Mason Industries Type SLF or approved equal.

G. Isolator Mount Type 4

1. Laterally stable, restrained spring type with housings and heavy top plates for supporting the equipment and resisting seismic and wind loading. Spring isolators shall be comprised of two interfacing but independent elements; a coil spring element and a seismically rated housing. Housings and springs shall be powder coated and hardware galvanized. The spring coil element shall be comprised of one or more coil assemblies having all of the characteristics of freestanding coil spring isolators.
2. The seismically rated housing shall be sized to meet or exceed the force requirements applicable to the project and have the capability of accepting coils of various sizes, capacities, and deflections as required to meet the desired isolation criteria. All spring forces will be contained within the coil/housing assembly and under no seismic load condition shall the restraint anchoring hardware be exposed to spring generated forces. Top plate and restraining bolts shall be out of contact with the housing during normal operation.
3. The restraint element shall incorporate a steel housing with elastomeric elements at all dynamic contact points. The restraint will allow a maximum of 1/4 in. (25 mm) motion in any direction from the neutral position. All elastomeric elements shall be replaceable.
4. The leveling nut or screw shall be accessible for adjustment with the use of a pneumatic or electric impact wrench. The spring element shall be replaceable without having to lift or otherwise remove the supported equipment.

H. Isolator Hanger Type 2

1. Type 2 (Double Deflection Low Dynamic Stiffness Hangers) shall consist of a molded low dynamic stiffness (LDS) isolating element in a steel hanger box. A LDS sleeve shall be provided where the lower hanger rod passes through the steel hanger box, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch larger than the diameter of the hanger rod and permit the hanger rod to swing through a 30° arc. When installed, the hanger box shall be allowed to rotate through a full 360° without encountering any obstructions.
2. The isolator shall be manufactured with quality LDS and selected for a maximum durometer of 50 and designed for 15% strain. Unless otherwise specified, the static deflection of Type 2 hangers shall be minimum of 0.3 inches.
3. Mason Industries Type HD or approved equal.

I. Isolator Hanger Type 3

1. Type 3 (Spring and Low Dynamic Stiffness Hangers) shall consist of a steel spring in a series with a low dynamic stiffness (LDS) isolating element. The spring shall have a minimum additional travel to solid equal to 50% of the specified deflection. The neoprene element shall have a static deflection of not less than 0.3 inches with a strain not exceeding 15%.
2. Unless otherwise specified, the static deflection of SPH hangers shall be 2 inches.
3. Spring diameter and hanger box hole size shall be large enough to permit the hanger rod to swing through a 30° arc. A neoprene sleeve shall be provided where the lower hanger rod passes through the steel hanger box, such that the hanger rod cannot contact the steel hanger. The diameter of the clear hole in the hanger box shall be at least 3/4 inch larger than the diameter of the hanger rod. When installed the spring element shall not be cocked and the hanger box shall be allowed to rotate through a full 360° arc without encountering any obstructions.
4. Mason Industries Type 30N or approved equal.

PART 3 - EXECUTION

3.1 GENERAL

- A. All equipment mounted on vibration isolators shall have a minimum operating clearance of 1 inch between the bottom of the equipment or inertia base (and height saving bracket) and the concrete housekeeping pad (or bolt heads) beneath the equipment.
- B. Check the clearance to ensure that no scraps have been left to short circuit the vibration isolators.
- C. Provide a minimum of 4 inches between isolated equipment and the walls, ceiling, floors, columns and any other equipment not installed on vibration isolators.
- D. Piping, ductwork, conduit or mechanical equipment shall not be hung from or supported on other equipment, pipes, or ductwork installed on vibration isolators.

- E. Equipment connected to water or other fluid piping shall be erected on isolators or isolated foundations at correct operating heights prior to connection of piping. Equipment should be blocked-up with temporary shims to final operating height. When the system is assembled and fluid is added, the isolators shall be adjusted to allow removal of the shims.
- F. All mechanical equipment not specifically identified in this specification that contains rotating or vibrating elements shall be installed on Mount Type 2 neoprene isolators as appropriate. Provide supporting steel structure between isolators and equipment if isolator does not readily connect to equipment.
- G. All equipment and their respective isolators shall be directly mounted on primary steel. Units and isolators shall not be mounted on resiliently supported steel cabinets or plenum floors or other flexible construction.
- H. Roof mounted fans or roof top units shall be installed on a curb mounted base.
- I. All wiring connections to mechanical equipment on vibration isolators (either spring or neoprene type) shall be made with a minimum 36 inch long flexible conduit. Coordinate wiring connections with the Electrical Installer.

3.2 APPLICATION TABLES

A. Floor Mounted Equipment

<u>Equipment Type</u>	<u>Slab on Grade</u>		<u>Floor Span - Up to 30 Ft</u>		<u>Floor Span - 30 to 40 Ft</u>

< 22" Dia	Hanger 2
> 22" Dia & < 2" SP	Hanger 3
> 22" Dia & > 2" SP	Hanger 3

"Floor Span": Defined as the distance between centers of floor joists

3.3 BASE MOUNTED PUMPS

- A. Any rigid pipe elbows at the pump suction and discharge connections shall be supported from the inertia base. All pipe connections shall be with a flexible pipe connector.

3.4 FAN ISOLATION - GENERAL

- A. All fan bases and isolators shall be sized so that thrust restraints (which would act against turning moment caused by static pressure) are not required.

3.5 PIPES WITH MULTIPLE CONNECTIONS

- A. Where a pipe run connects multiple items of equipment in the Mechanical Room the pipe hanger isolators for the entire run shall be chosen to suit the connected equipment of greatest static deflection.

SPEC EDITOR NOTE: INCLUDE SUBSECTOIN 3.8 FOR VIBRATION SENSITIVE BUILDINGS.

3.6 INSPECTION

- A. Isolator manufacturer service representative shall inspect and approve the installation of the vibration isolators and shall submit a report to the Owner which verifies that all of the isolation equipment has been properly installed and that the installation is in full conformance with the specification. The report shall record the vibration isolator identification and model or type.
- B. For isolators containing steel springs the report shall also record the size and uncompressed height, design static deflection and measured static deflection of the isolators provided.

DIVISION 22 PLUMBING
SECTION 220553 - MECHANICAL IDENTIFICATION

REVISIONS:
10-12-00: SUBSTANTIALLY REVISED, APPROVED AS NEW MASTER
UPDATED BY PLMG/FP MTT October 2017

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A - IN EVERY SPECIFICATION SECTION.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Mechanical identification on piping, ductwork and equipment, identification of underground pipe, valve tags, and architectural access panels.

1.3 QUALITY ASSURANCE

- A. Comply with ANSI A13.1 for lettering, size, colors, and viewing angles of mechanical identification.

1.4 ACCEPTABLE MANUFACTURERS:

- A. Provide mechanical identification materials from one of the following:
1. Brady Co.
 2. Brimer
 3. Craftmark
 4. Seton
 5. Marking Services Incorporated

PART 2 - PRODUCTS

2.1 PIPE MARKERS:

- A. Manufacturer's standard, pre-printed, color-coded, plastic pipe markers, complying with ANSI A13.1, and requirements below. Self-adhesive markers are not acceptable.
- B. For pipe diameter (with insulation) less than 6": full-band, semi-rigid, snap-on pipe markers, extending 360 degrees around pipe.
- C. For pipe diameter (with insulation) of 6" and larger: full-band or strip-type pipe markers, but not narrower than 3 times letter height. Fasten with nylon or stainless steel bands for pipe 6" through 12". Fastened with stainless steel bands for piping over 12".

- D. Lettering: Standard nomenclature which best describes piping system, as selected by Engineer (in cases of variance from table below).
- E. Arrows: Pipe marker arrows indicating direction of flow, either integrally with piping system lettering, or as a separate marker.
- F. Identify contents of piping by both fluid contained and unique temperature and /or pressure (if necessary to distinguish between other systems with same fluid at different conditions); e.g. Potable Hot Water - 110F vs Potable Hot Water - 140F.
- G. Use the following color coding and nomenclature for pipe markers:

SPEC EDITOR: EDIT THIS LIST TO ADD ANY SPECIFIED SYSTEMS, NOT INCLUDED IN THIS LIST. COORDINATE NOMENCLATURE WITH SYMBOLS SHEET AND PLANS.

Plumbing and Waste Pipe System Labels	Drawing I.D. (For Reference Only)	Letter and Label Color
Acid Vent	AV	Black on Orange
Acid Waste	AW	Black on Orange
Brine	BR	Black on Orange
Cold Water, Potable	CW	White on Green
Compressed Air	A	White on Blue
Deionized Water	DI	White on Green
Deionized Water Return	DIR	White on Green
Fire Protection	FP	White on Red
Hazardous Waste	HAZ	Black on Yellow
Hot Water Supply, Potable	HW	Black on Yellow
Hot Water Return, Potable	HWR	Black on Yellow
Instrument Air	IA	White on Blue
Natural Gas	G	Black on Yellow
Non-Potable Water	NPW	Black on Yellow
Radiation Waste	RAD	Black on Yellow
Rainwater Conductor	RC	White on Green
Reverse Osmosis Water	RO	White on Green
Rev. Osmosis Return	ROR	White on Green
Sanitary Vent	V	White on Green
Sanitary Waste	SAN	White on Green
Silver Recovery	AG	Black on Yellow
Soft Cold Water	SCW	White on Green
Storm Sewer Water	ST	White on Green
Vacuum	VAC	White on Blue

Heating and Cooling Pipe System Labels	Drawing I.D. (For Reference Only)	Letter and Label Color
Chilled Beam Return	CBR	White on Green
Chilled Beam Supply	CBS	White on Green

Chilled Water Return	CHWR	White on Green
Chilled Water Supply	CHWS	White on Green
Condensate Vent	SCV	Black on Yellow
Condenser Water Return	CWR	White on Green
Condenser Water Supply	CWS	White on Green
Energy Recovery Wat. Ret.	ERWR	White on Green
Energy Recovery Wat. Supp.	ERWS	White on Green
Fuel Oil Return	FOR	Black on Yellow
Fuel Oil Supply	FOS	Black on Yellow
High Pressure Condensate	HPC	Black on Yellow
High Pressure Steam	HPS	Black on Yellow
Hot Water Heating Return	HWHR	Black on Yellow
Hot Water Heating Supply	HWHS	Black on Yellow
Low Pressure Condensate	LPC	Black on Yellow
Low Pressure Steam (15#)	LPS	Black on Yellow
Medium Pressure Condensate	MPC	Black on Yellow
Medium Pressure Steam (60#)	MPS	Black on Yellow
Process Water Return	PWR	White on Green
Process Chilled Water Supply	PCHWS	White on Green
Process Chilled Water Return	PCHWR	White on Green
Process Water Supply	PWS	White on Green
Pumped Steam Condensate	PC	Black on Yellow

Lab / Medical Gas Pipe Drawing I.D. Letter and
System Labels (For Reference Only) Label Color

Carbon Dioxide	CO2	White/Black on Gray
Helium	HE	White on Brown
Dental Air	DA	Black on Yellow
Dental Vacuum	DVAC	Silver on Yellow
Laboratory Compressed Air	LCA	Black on Yellow & White Checkerboard
Laboratory Vacuum	Lab Vac	Black boxed on white and black checkerboard
Medical Air	Med Air	Black on Yellow Block boxed on white and black checkerboard
Medical Vacuum	Med Vac	Black on White
Nitrous Oxide	N2O	White on Blue
Nitrogen	N2	White on Black
Oxygen	O2	White on Green
Waste Anesthetic Gas Disposal	WAGD	White on Violet

ALL labeling shall conform to NFPA 99.

2.2 DUCT MARKERS:

- A. Plastic, adhesive type color-coded duct markers, with arrow indicating direction of flow, and with fan system identified. Conform to the following color code and nomenclature:

Service/ Duct Label	Drawing I.D. (For Reference Only)	Letter and Label Color
Exhaust Air (Equip.#)	EA (Eq.#)	Black on Yellow
Fume Hood Exhaust (Equip.#)	FHEA (Eq.#)	Black on Yellow
Hazardous Exhaust (Equip.#)	HAZ EX (Eq.#)	Black on Yellow
Lab General Exhaust (Equip.#)	LGEX (Eq.#)	Black on Yellow
Outdoor Air (Equip.#)	OA (Eq.#)	White on Green
Return Air (Equip.#)	RA (Eq.#)	White on Green
Smoke Evac Exhaust (Equip.#)	SMOKE EX (Eq.#)	Black on Yellow
Smoke Evac Supply (Equip.#)	SMOKE SUP (Eq.#)	White on Green
Supply Air (Equip.#)	SA (Eq.#)	White on Green

- B. Provide plastic adhesive duct access door markers indicating item and associated equipment accessed, and appropriate safety and procedural information. (eg. Fire Damper AHU-1)

2.3 EQUIPMENT MARKERS:

- A. Engraved plastic equipment markers for all scheduled equipment, (eg., chillers, pumps, air handling units, heat exchangers, and fans). Indicate drawing I.D., and service, (eg., EF-1 serving FH No.3 in Rm. 2035, or P-7 Primary Chilled Water), nominal capacity (tons, cfm or gpm). Scale marker and lettering to equipment labeled. Typical nomenclature:

Drawing I.D. & Equip. Label	Equipment
ACC	Air Cooled Condenser
AHU	Air Handling Unit
CH	Chiller
CHWP	Chilled Water Pump
CP	Condensate Pump
CT	Cooling Tower
CUH	Cabinet Unit Heater
CWP	Condenser Water Pump
EWH	Electric Water Heater
FHEF	Fume Hood Exhaust Fan
FP	Fire Pump
GEF	General Exhaust Fan
GWH	Gas-fired Water Heater

HTX	Heat Exchanger
HWB	Hot Water Boiler
HWHP	Hot Water Heating Pump
LEF	Lab Exhaust Fan
P	Pump (other than those listed)
RF	Return Fan
SB	Steam Boiler
SF	Supply Fan
TEC	Terminal Equipment Controller
UH	Unit Heater
VAV	Variable Air Volume Box
VP	Vacuum Pump

2.4 IDENTIFICATION ACCESSORIES:

- A. Underground Pipe Markers: Manufacturer's standard, permanent, bright-colored plastic tape, intended for direct-burial service, 6" wide x 4 mils thick, continuously printed to indicate service of buried pipe. For plastic pipe, provide label with detectable nonferrous locator.

SPEC EDITOR: VALVE TAGS ARE TYPICALLY NOT REQUIRED FOR RENOVATION PROJECTS. CONSIDER VALVE TAGS ONLY FOR NEW BUILDINGS, AND GUT RENOVATION PROJECTS.

- B. Valve Tags: 1-1/2" diameter brass valve tags with 1/4" stamp-engraved designations with piping system abbreviation and sequenced valve numbers. Provide solid brass chain, or solid brass S-hooks of the size and type required for proper attachment of tags to valves.

SPEC EDITOR: COORDINATE ARCHITECTURAL ACCESS PANEL LABELING WITH ARCHITECT, ESPECIALLY IN AESTHETICALLY SENSITIVE AREAS..

- C. Architectural Access Panel Markers: 1/16" thick engraved plastic laminate, with nomenclature corresponding to items for which access door was installed (eg. VAV-7, TEC-7 and HWH control valve V-23).

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION REQUIREMENTS:

- A. Coordination: Install identification after insulation is applied. Protect identification from paint, or apply after painting is complete. Install above ceiling identification prior to acoustical ceilings.
- B. Attachment: Securely attach all mechanical identification to associated pipe, duct, panels and equipment. Locate identification to be readily visible.

3.2 PIPING SYSTEM IDENTIFICATION:

- A. Install pipe markers on all piping systems in all locations where piping, whether concealed or non-concealed, and where accessible at manholes and access panels. Installed at all access panels or doors, adjacent to valves and branch connections, both sides of floors, ceilings and walls, and all major changes in direction,
- B. Locate pipe markers near points where piping continues into shafts, underground, floor or wall; at 25' spacing along exposed runs (15' in congested areas), at valves, equipment and control devices, and where there could be question of flow pattern.
- C. Install marker over pipe insulation segment on hot non-insulated pipes.

3.3 DUCTWORK IDENTIFICATION:

- A. Install duct markers on all supply, return, exhaust, intake and relief ductwork, whether concealed or non-concealed, , and where accessible at access panels. Install at all access panels or doors, both sides of floors, ceilings and walls, and all major changes in direction.
- B. Locate duct markers near points where ductwork originates or continues into shafts, floor or wall, and at 25' spacing along exposed runs (15' in congested areas), equipment and control devises, and where there could be a question of flow pattern.
- C. Install duct access door markers on all access doors.

3.4 EQUIPMENT IDENTIFICATION:

- A. Provide equipment markers on scheduled equipment.

3.5 UNDERGROUND PIPING IDENTIFICATION:

- A. During back-filling, install continuous underground pipe markers over all buried piping, 6" to 8" below finished grade, at 24" intervals across the field. Where multiple pipes are in a trench up to 16" wide, install single line marker. For tile fields and similar installations, mark only edge pipe lines of field.

3.6 VALVE IDENTIFICATION:

- A. Install valve tags on all new valves and regulators for the following piping systems, except for valves within factory-fabricated equipment, at plumbing fixture faucets, hose bibs, and valves located directly at the equipment served. Number valves in a logical sequence relative to location installed.

SPEC EDITOR: SPECIFY SYSTEMS TO RECEIVE VALVE TAGS

- B. List each tagged valve in valve schedule for each piping system. Include a copy of the valve tag schedule in the Operation and Maintenance manuals, and mount a laminated copy on a wall as directed by the University.

- C. Where building has previously tagged valves, coordinate numbering with old schedule, and note changes made to previously tagged valves on new schedule.

3.7 ARCHITECTURAL ACCESS PANEL IDENTIFICATION:

- A. Install access panel markers on inside and/or outside of access doors, as directed by the University.

DIVISION 22

SECTION 220719 - MECHANICAL SYSTEMS INSULATION

REVISIONS:

JULY 2019 - : UPDATED BY THE PLUMBING COMMITTEE; COMPLY WITH ASHRAE 90.1 - 2013

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220553 - Mechanical Identification
 - 2. Section 221113 - Piping Materials and Methods

SPEC EDITOR: EDIT THE FOLLOWING AS REQUIRED

1.2 SUMMARY:

- A. Insulate piping, ductwork and equipment unless indicated as not to be insulated.
- B. Reinsulate items from which asbestos insulation was removed.
- C. Insulate connection points between new and existing items.
- D. Repair or replace insulation damaged during construction.
- E. ITEMS NOT TO BE INSULATED:

SPEC EDITOR: EDIT LIST BELOW TO SUIT PROJECT

- 1. Equipment: hot water pumps, steam condensate pumps, feed water pump, water softener shell, vacuum pumps, hot water shot feeders, hot water expansion tanks, factory insulated equipment.
- 2. In hot piping: Unions, flexible connectors, control valves 2" and smaller, safety valves, discharge vent piping, vacuum breakers, thermostatic vent valves, and steam traps 3/4 inch and smaller.
- 3. Other piping: waste and vent, compressed air, natural gas, lab vacuum, refrigerant liquid lines, vertical portion of rain water conductors.
- 4. Ductwork: indoor return and exhaust air ductwork in conditioned areas.

1.3 REFERENCES

- A. Definitions

1. Insulation thermal conductivity: No greater than value listed, in Btu-inch/hour-square foot-degrees F at 100 degrees F mean temperature.
2. Water Vapor Permeance (ASTM E97 or E96, Procedure A): No more than value listed, in perms. Water vapor permeability (ASTM C355): No greater than value listed, in perm-inch.
3. Puncture resistance (ASTM D781): No less than value listed.
4. Flame spread classification (ASTM E84, NFPA 255): No greater than value listed. Smoke density classification (ASTM E84, NFPA 255): No greater than value listed. Composite listing includes insulation, jacket, and adhesive.
5. Density no less than value listed, in pounds per cubic foot.
6. Condition area: Areas that are mechanically maintained between 65F and 80F and relative humidity less than 60% at all times. The following spaces are normally considered conditioned area: spaces above ceilings, heated penthouse, mechanical and electrical rooms.

INCLUDE 1.4.A IN EVERY SPEC SECTION, BUT EDIT AS APPROPRIATE FOR THAT SPEC SECTION, E.G. STRIKE "WIRING DIAGRAMS" IF NOT APPLICABLE TO THE SECTION.

1.4 SUBMITTALS

- A. Product Data: Include manufacturer, catalog number, catalog illustrations, rated capacities, performance characteristics, weights, conductor insulation and jacket dimensions, component sizes, rough-in requirements, materials of construction, accessories, operating and maintenance clearance requirements. Additionally include:
 1. Shop Drawings
 2. Installation, Operation and Maintenance Manuals
 3. Test and Evaluation Reports
 4. Source Quality Control Submittals
 5. Site Quality Control Submittals
 6. Certificates
 7. Manufacturer Reports
 8. Special Procedure Submittals
 9. Qualification Statements
 10. Warranty Documentation
 11. Record Documentation

SPEC EDITOR: REVISE 1.5 AS REQUIRED; INCLUDE ITEMS CONTAINING ASBESTOS IN DIVISION 02 OR ON PLANS.

1.5 ASBESTOS ABATEMENT:

- A. All asbestos within the contract bounds shall be removed per the requirements described in Division 02. Refer to drawings for items containing asbestos insulation. Reinsulate all piping, ductwork and equipment from which asbestos has been removed.

1.6 QUALITY ASSURANCE

- A. **Manufacturers and Products:** The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. **Installer Qualifications:** Skilled mechanics who have successfully completed an apprenticeship program or another craft-training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

WHEN FIRE-PERFORMANCE CHARACTERISTICS ARE IMPORTANT REQUIREMENTS, VERIFY SURFACE-BURNING CHARACTERISTICS OF INSULATION MATERIALS BY AN INDEPENDENT TESTING AGENCY AND REQUIRE TEST REPORT SUBMITTALS.

- C. **Surface-Burning Characteristics:** For insulation and related materials, as determined by testing identical products according to ASTM E 84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
 - 1. **Insulation Installed Indoors:** Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
 - 2. **Insulation Installed Outdoors:** Flame-spread index of 75 or less, and smoke-developed index of 150 or less.
- D. **Reference Standards:** Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. **Reference Standards:** ASHRAE 90.1-2013.

TYPICALLY 1.7.A SHOULD BE INCLUDED IN EVERY SPEC SECTION.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- B. Shipping and Handling Requirements
- C. Packaging and Protection
- D. On-site Storage & Staging
- E. Packaging Waste Management

BELOW IS U-M STANDARD WARRANTY LANGUAGE. ALL WARRANTIES ARE TO START FROM THE DATE OF SUBSTANTIAL COMPLETION. DO NOT USE TERMS LIKE "UPON OWNER ACCEPTANCE" OR "18 MONTHS FROM SHIPMENT OR 1 YEAR FROM STARTUP, WHICHEVER OCCURS FIRST", ETC.

1.8 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Insulate pipe, duct and equipment to meet the thicknesses and conductivities indicated.

2.2 PIPING INSULATION THICKNESS TABLE:

- A. Minimum insulation thickness in inches, shall comply with the table below for the associated piping system and pipe sizes.

Piping System Fluid	Temp. Range Deg. F	Conductivity BTU·in./ (h·ft ² ·°F)	Thickness in Inches For Pipe Sizes Through Size Listed				
			1"	1.5"	4"	8"	above
MPS (60#) (above to include MPS condensate)	251-350	0.29-0.32	3.0	4.0	4.5	4.5	4.5
LPS (15#) (above to include LPS condensate)	201-250	0.27-0.30	2.5	2.5	2.5	3.0	3.0
Hot Water	141-200	0.25-0.29	1.5	1.5	2.0	2.0	2.0
Hot Water (above includes hot water potable and hot water heating)	105-140	0.22-0.28	1.0	1.0	1.5	1.5	1.5
Cold Water potable	Any	0.21-0.27	0.5	0.5	1.0	1.0	1.0
Storm	Any	0.21-0.27	0.5	0.5	1.0	1.0	1.0
Chilled Water	40-60	0.20-0.26	0.5	1.0	1.0	1.0	1.0
Chilled Water	<40	0.20-0.26	0.5	1.0	1.0	1.0	1.0
Ref. Suct.	Any		1.0	1.5	1.5	N/A	N/A
Energy Recovery	Any		1.0	1.0	1.0	1.0	1.0
Free Cooling Cond. Water	Any		1.0	1.0	1.0	1.0	1.0

- B. For heat traced piping use insulation ¼" diameter larger to allow room for installation of cable.

2.3 PIPING INSULATION:

THESE PRODUCTS ARE SUITABLE FOR TEMPERATURES OF APPROXIMATELY 0 TO 180F.

- A. Fiberglass insulation with factory-applied vapor barrier jacket with self-sealing laps. ASTM C547 Class 1 insulation. Vapor barrier jacket: laminated white kraft paper, aluminum foil, glass fiber reinforcement.

Approved Manufacturers: Johns-Manville, Knauf, Owens/Corning

- B. At fittings and flanges, insulate with wrapped fiberglass insulation of same thickness as adjacent pipe, and cover with pre-molded PVC jackets. Seal edge of jacket with self-sealing vapor barrier tape.

Approved Jacket Manufacturers: Zeston, Ceel-Co-, Proto

- C. For valves, strainers, suction diffusers and other accessories that require maintenance: In hot piping, insulate similar to fittings and flanges. In cold piping, insulate with closed cell elastomeric insulation, installed to be removable for maintenance access.

- D. Insulate piping systems outside buildings with fiberglass Insulation. Apply insulation 1/2" thicker than listed in table, and weatherproof the insulation with PVC insulation jacketing.

Approved Jacket Manufacturers: Zeston, Ceel-Co, Proto

- E. As a Contractor's Option insulate hot water, cold water, chilled water, refrigerant, piping systems with flexible closed cell elastomeric insulation, ASTM C534, conductivity of 0.254 @90F, water vapor permeability of 0.05. In thickness 1" and less, composite flame spread/ smoke density of 25/50.

Approved Manufacturers: Armacell - AP Armaflex; Rubatex - R-180-FS, IMCOA.

1. Seal all butt joints and seams by joining cut edges with adhesive as supplied by the insulation manufacturer.
2. For exterior piping, coat insulation with glass mesh and two finish coats compatible with insulation. Manufacturer: Armstrong Armacell- Armaflex WB.

2.4 PIPING INSULATION SPECIALTIES:

SPEC EDITOR: ALUMINUM JACKETS ARE NOT GENERALLY RECOMMENDED, BECAUSE OF DAMAGE AND FAILURES WE'VE EXPERIENCED LATELY.

- A. Expansion Joints Insulation: Expansion joints shall be insulated with prefabricated insulation blankets, installed in a manner to allow for the repacking of the joints without removing blanket. Hold blankets in place with permanently attached Velcro fasteners.

- B. Aluminum Jackets: Where indicated on drawings, provide 0.016" thick alloy 3003 aluminum jacketing with longitudinal lock seam and butt strap circumferential joints.

Approved Manufacturers: Childers-Lock-on and Pabco-Surfeit.

- C. Removable Insulation Jackets: Where indicated on drawings, provide removable insulation jackets with fiberglass insulation, flexible fabric jacket and velcro fasteners.

Approved Manufacturer: ESI, Insulation Technologies Inc.

2.5 TUNNEL PIPING INSULATION

- A. Additionally provide dimpled aluminum jacketing.

2.6 DUCTWORK INSULATION - INDOOR, EXPOSED:

SPEC EDITOR: RIGID INSULATION IS AVAILABLE IN DENSITIES OF 1.6, 2.25, 3.0, 4.25 AND 6.0. R VALUE AND COST INCREASE WITH DENSITY. INSULATION THICKNESS WAS INCREASED TO IMPROVE FIT OVER FLANGED CONNECTIONS, MAY BE REDUCED TO 1" FOR SLIP AND DRIVE DUCT.

- A. In mechanical equipment rooms and all other areas where visible without removing ceilings or opening access panels, insulate ductwork with 1-1/2" thick rigid, fiberglass insulation board with factory-applied vapor barrier. Insulation: ASTM C612 Class 2, conductivity of 0.26, density of 3.0. Vapor barrier: laminated white kraft paper, aluminum foil, glass fiber reinforcement, permeance of 0.02, and puncture resistance of 50 units. Composite flame spread/ smoke density of 25/50.

Approved Manufacturers: CertainTeed, Johns Mansville, Knauf, Owens/Corning

2.7 DUCTWORK INSULATION - INDOOR, CONCEALED:

- A. In ceiling spaces, building shafts, and other locations where not visible, insulate ductwork with 1-1/2" thick, blanket-type, fiberglass insulation with factory-applied vapor barrier, and 2" stapling and taping flange along one edge. Insulation: ASTM C553, density of 0.75, conductivity of 0.23 @75F. Vapor barrier: laminated white kraft paper, aluminum foil, glass fiber reinforcement, permeance of 0.02, and puncture resistance of 50 units. Composite flame spread/ smoke density of 25/50.

Approved Manufacturers: CertainTeed, Johns Mansville, Knauf, Owens/Corning.

2.8 DUCTWORK INSULATION - OUTDOOR:

SPEC EDITOR: PLANT HAS BEEN EXPERIMENTING WITH USING EPDM ROOFING AS A WRAPPING MATERIAL FOR EXTERIOR DUCTWORK. PRELIMINARY RESULTS LOOK PROMISING. CONSIDER ADDING PLANT WORK ORDER TO BUDGET TO COVER THIS.

- A. Insulate exterior ductwork with 2.0" thick flexible closed cell elastomeric insulation, ASTM C534, conductivity of 0.30, water vapor permeability of 0.20. Composite flame spread/ smoke density of 25/50.

Approved Manufacturers: Armacell, Rubatex.

1. Seal all butt joints and seams by joining cut edges with adhesive as supplied by the insulation manufacturer.
2. Wrap insulation with glass mesh and coat with two finish coats compatible with insulation.

Manufacturer: Armacell-Armaflex WB.

3. Taper insulation to prevent ponding.

2.9 SEALING MASTICS FOR PIPE AND DUCT INSULATION

- A. Provide mastics to seal insulation joints and to provide a continuous vapor barrier. The permeance of the mastic shall be equal to or less than the permeance of the vapor barrier of the insulation it is applied to. The ASTM E84 flame spread and smoke density classification shall not exceed 25/50. Mastics shall be mercury and asbestos free, selected for the temperature range of the service, and selected for uses recommended by the manufacturer. Mastics used outdoors shall be outdoor rated, waterproof, and U.V. resistant.

Approved Manufacturers: Subject to compliance with the above requirements, provide mastics manufactured by Childers, Foster, Vimasco, Mon-Eco Industries.

2.10 HOT EQUIPMENT INSULATION:

- A. Insulate all equipment with surface temperature over 100F, using rigid fiberglass insulation board. Insulation: ASTM C612 Class 2, conductivity of 0.23 @75F, density of 6.0. Vapor barrier: laminated white kraft paper, aluminum foil, glass fiber reinforcement, permeance of 0.2, and puncture resistance of 50 units. Composite flame spread/ smoke density of 25/50.

Approved Manufacturers: CertainTeed, Johns Mansville, Knauf Owens/Corning

- B. Apply insulation in thickness as follows: 1-1/2" for operating temperature up to 150F, 2" for operating temperature of 150F to 200F, 3" for operating temperature over 200F.
- C. Cut, score, or miter insulation to fit contour of equipment and secure with galvanized steel bands or wire, or weld pins. Stagger joints where possible and fill voids with insulating cement. Apply 1" galvanized wire mesh over entire exterior surface and finish with two coats of insulating cement troweled to a hard finish.

2.11 COLD EQUIPMENT INSULATION:

- A. Insulate all equipment with surface temperature below 60F with 1" thick, flexible, closed cell, elastomeric foam insulation sheet, ASTM C534, conductivity of 0.30, permeance of 0.20, composite flame spread/ smoke density of 25/50.

Manufacturers: Armacell, Rubatex.

- B. Apply elastomeric foam insulation sheet with contact adhesive.

Approved Manufacturers: Armacell, Rubatex. Seal all butt joints with adhesive.

PART 3 - EXECUTION

3.1 INSULATION INSTALLATION

- A. All systems shall be tested and approved before being insulated.
- B. The insulation shall be applied over clean, dry surface.
- C. Insulate all valves, flanges, couplings and fittings. Valve and flange insulation shall be removable and reinstallable.
- D. Full lengths of insulation shall be used except at end of straight sections and as required to accommodate fittings. Insulation shall be applied with the joints tightly fitted together. Cracks or voids shall be filled with insulation. Manufacturer's recommended installation procedures shall be strictly adhered to.
- E. The edges and seams at all visible locations shall be finished in a neat and workmanlike manner.
- F. All exposed ductwork insulation shall be applied with edges butted. Insulation shall be impaled over stick clips or pins welded to the duct, and secured with speed clips. Spacing of pins shall be as required to hold insulation firmly in place but not less than one pin per square foot. All joints and penetrations of the vapor barrier shall be sealed with a 3" wide strip of the same material, supplied with vapor barrier adhesive to both surfaces as recommended by adhesive manufacturers.
- G. Blanket insulation shall be tightly sealed at all joints and seams. Insulation shall be cut longer than ductwork perimeter to allow maximum thickness on all areas and avoid excessive compression. All joints shall be over lapped at least 2" and stapled in place. The stapled seams shall be sealed with a minimum 3" wide pressure sensitive tape designed for use with the duct insulation. All breaks in the vapor barrier facing shall also be sealed with the tape. The underside of ductwork 18" or greater in width, and vertical surfaces 48" or greater shall have the insulation additionally secured with mechanical fasteners and speed clips spaced approximately 12" on center. The protruding ends of the fasteners shall be cut off flush after the speed clips are installed, and then sealed with the same tape as specified above.
- H. Finished installation shall provide a continuous and effective vapor barrier.

SPECIFICATION DIVISION 22

NUMBER SECTION DESCRIPTION

DIVISION 22

SECTION 221113 - PIPING MATERIALS AND METHODS

END OF CONTENTS TABLE

DIVISION 22
SECTION 221113 - PIPING MATERIALS AND METHODS

REVISIONS:

7-19-12: ADDED THAT SEALS ARE TO BE IMMUNE FROM CHLORAMINES AND THAT PRESS JOINT SEALS ARE TO BE PEROXIDE CURED. D. KARLE FOR PLMG MTT.

7-26-12: MOVED GYLCOL HANDLING FROM 220500 TO THIS SECTION. B. BEGG FOR PLMG MTT.

2014-01-06: IMPROVED LEAD FREE REQUIREMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

2014-JULY: GENERAL UPDATE OF ENTIRE SPECIFICATION PER PLMG. AND HYDRONICS MTT. D. KARLE

2014-DECEMBER: ADD GEORGE FISCHER AS APPROVED FOR PP PRESSURE PIPING, ADD MATERIAL REQUIREMENTS FOR STORM AND SANITARY PUMP DISCHARGE PIPING. ADD GENERAL REQUIREMENTS FOR PLASTIC PIPE HANGERS/SUPPORTS. D. KARLE FOR P & FP MTT.

2015-APRIL: REVISE STAINLESS PIPE DESCRIPTION TO ALLOW 316L ONLY FOR COLD DOMESTIC AND CONDENSER WATER DUE TO CONCERN WITH CHLORIDES IN CITY WATER CORRODING 304L. D. KARLE FOR P & FP MTT.

2015-AUGUST: REMOVED STANDARD DUTY NO-HUB COUPLING ASTM NUMBER C1277, ADDED SPEC FOR DIS-SIMILAR PIPE CONNECTION TO C.I. NO-HUB, IMPROVED BRACING AND HANGING REQUIREMENTS FOR NO-HUB AND STM/SAN. PIPING IN PART 3. D. KARLE FOR P & FP MTT.

2017-FEBRUARY: ADDED APOLLO XPRESS (PRESS TO CONNECT) FITTINGS, REVISED PRESS SPEC TO ALLOW FOR PRESS VALVES, STRAINERS, CHECK VALVES FROM ANY MFR APPROVED FOR THAT COMPONENT FOR PIPING 2" AND BELOW. ADDED IPEX ENFIELD PIPING TO DEIONIZED WATER - ABOVE GROUND, ADDED GEORG FISHER FUSEAL TO LAB WASTE & VENT PIPING - ABOVE/BELOW GROUND. DELETED FLEXIBLE CONNECTORS WHICH ARE COVERED IN 220548 VIBRATION CONTROL. CHANGED OSEH TO EHS. B. BEGG AND D. KARLE FOR P & FP MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

JUNE 2018: REVISED STRAINER MESH SIZES FOR WATER SERVICE PER HYDRONIC AND PLMB. MTT'S. D. KARLE

NOV. 2018: REMOVED SPEC FOR U.G. DUCTILE IRON PIPING FOR CHW AND REFERRED TO 3336100 FOR THAT SPEC. D. KARLE FOR HYDRONIC AND PLMB. MTT.

MARCH 2019: REVISED RO WATER CPVC PIPE ASTM NUMBERS TO CORRECTLY REFLECT SCHEDULE 80 PIPE. THE ORIGINAL ASTM NUMBER (D2846) WAS FOR COPPER TUBE SIZES WHICH ARE MADE IN SDR 11 ONLY. D. KARLE/A. WEIR FOR HYDRONIC AND PLMB. MTT.

GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Section 220500 - Common Work Results for Mechanical
 - 2. Section 220548 - Vibration Control
 - 3. Section 231123 - Facility Natural-Gas Piping
 - 4. Section 232300 - Refrigerant Piping
 - 5. Section 336100 - Hydronic Utilities

1.2 SUMMARY

- A. This Section specifies piping materials and installation methods for the piping systems listed in Part 2 and includes joining materials, piping specialties, and basic piping installation instructions.

1.3 SUBMITTALS

- A. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, rough-in requirements, materials of construction, and operating and maintenance clearance requirements. Additionally include:
 - 1. Provide a piping material schedule that indicates, by service, pipe material, pipe manufacturer, fitting type and manufacturer, joint type and manufacturer.
 - 2. Solder and brazing material data sheets.
 - 3. Grooved fittings, couplings, and accessories data sheets.
 - 4. Data sheets for all products listed in this section including flanges, gaskets, unions, hangers, di-electric protection method, thermal hanger shield inserts, di-electric fittings, flexible metal hose, flexible connectors, and seal sleeve systems.
 - 5. For underground pressurized and steam condensate piping systems, provide a simplified drawing of the piping system identifying pipe depth and slope, location and type of each joint and restraint, valve, and similar accessories, and dimensions of any expansion loops.

*QUALITY ASSURANCE: CENTRAL POWER PLANT AND TUNNEL PROJECTS:
REVIEW WITH U-M DESIGN MANAGER IF PIPE, FITTINGS AND FLANGES
SHOULD BE CERTIFIED AS SOURCED FROM DOMESTIC SUPPLIERS, GERMANY,
ITALY, FRANCE, OR GREAT BRITAIN.*

1.4 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. All piping, (including vacuum piping), unless noted otherwise, shall comply with ANSI Standard B31.9 - Building Service Piping.
 - 2. All steam piping above 15 psig, and all steam condensate piping shall comply with ANSI Standard B31.1 - Power Piping.
 - 3. National Sanitation Foundation NSF/ANSI-61, including Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F. Applies to any item in contact with domestic (potable) water.
 - 4. U.S Safe Drinking Water Act (any item in contact with domestic (potable) water)
 - 5. NFPA 54 - National Fuel Gas Code
 - 6. AWWA C600 Standard for Installation of Ductile-Iron Water Mains and their Appurtances
 - 7. AWWA C606 Grooved and Shouldered Joints.
 - 8. Mill certifications indicating country of origin and compliance to ASTM/ANSI/NSF and other required compliance standards verified by independent third party based in the United States, shall be promptly provided whenever requested.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store piping materials and accessories raised off the floor or ground on pallets and protected with coverings to prevent damage or contamination due to weather and construction activities. Provide temporary protective caps on pipe ends. Maintain caps installed at all times until just prior to assembly, and recap open pipe ends at the conclusion of each work day. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL PIPING REQUIREMENTS:

- A. All piping materials shall be compatible for temperature, pressure and service.
- B. All wetted seals shall be made from materials that are immune from chloramine degradation.

- C. Provide long radius elbows and returns on welded steel pipe.

GROOVED JOINTS ARE ONLY PERMITTED IN ACCESSIBLE LOCATIONS. TYPICALLY, MECHANICAL ROOMS AND ABOVE LAY-IN ACOUSTIC CEILING ARE CONSIDERED ACCESSIBLE. SHAFTS AND AREAS ABOVE DRYWALL CEILINGS ARE EXAMPLES OF INACCESSIBLE LOCATIONS. REVISE THE PARAGRAPH BELOW TO INDICATE THE INACCESSIBLE LOCATIONS ON YOUR PROJECT.

- D. Grooved Joints:

1. Where grooved joints are indicated as permitted, such joints are only permitted in accessible locations. The following locations are considered inaccessible: shafts, above dry wall ceilings.

2.2 PLUMBING PIPING SYSTEMS:

PROJECTS CONSIDERING THE USE GROOVED JOINTS OR COPPER PRESS FITTINGS (E.G. "PROGRESS") SHALL OBTAIN APPROVAL FIRST FROM THE U-M DESIGN MANAGER AND THE PLUMBING/FIRE PROTECTION MECH TECH TEAM. IF GROOVED JOINTS OR COPPER PRESS FITTINGS ARE NOT BEING USED, REMOVE ALL ASSOCIATED REFERENCES TO THESE ITEMS, BELOW. GROOVED AND PRESS JOINTS ARE PROHIBITED ON DOMESTIC HOT WATER/HOT WATER RETURN IN BUILDINGS (OK FOR TUNNELS) DUE TO U-M'S PAST EXPERIENCE WITH LEAKAGE PROBLEMS.

PVC PIPING MAY NOT BE USED IN RETURN PLENUMS OR SUPPLY DUCTS, OR IN BUILDING OVER 3 FLOORS HIGH.

- A. Domestic Cold Water, Hot Water and Hot Water Return - Above Ground (including non-potable):

1. For piping through 6":
a. Pipe: Type L Copper, hard drawn, ASTM B88
b. Fittings: Wrought Copper, ANSI B16.22
c. Joints: Soldered through 2"; Brazed for 2-1/2" through 6"

ONLY USE THE CONTRACTORS OPTIONS BELOW WITH APPROVAL. SEE ARTICLE 2.2 SPEC EDITORS NOTE, ABOVE.

Contractor Options:

- d. For piping 2-1/2" through 6", excluding inaccessible locations, Grooved Joints - for cold water may be used (not allowed on hot or hot return).
e. For piping through 4", copper press to connect fittings for cold water may be used (not allowed on hot or hot return).

U-M'S EXPERIENCE WITH GALVANIZED PIPE HAS NOT BEEN GOOD, THEREFORE COPPER OR STAINLESS STEEL IS PREFERRED AND SPECIFIED FOR 8"-12" PIPE. IF LARGER DIAMETER IS REQUIRED, DESIGNER MUST REVISE SPECIFICATION (BELOW, AND THE FITTINGS SECTION, MUCH FARTHER BELOW) ANOTHER ALTERNATIVE IS POLYPROPYLENE ("AQUATHERM").

2. For cold water piping 8" through 12":
a. Pipe:
1) Type L Copper, hard drawn, ASTM B88 or
2) Sch. 10S Type 316L ASTM A312 seamless stainless steel.

- b. Fittings:
 - 1) For Copper Pipe: Wrought Copper, ANSI B16.22.
 - 2) For Stainless Steel Pipe:
 - a) 316L ASTM A312 stainless steel.
 - b) ASTM A403 Grade WP Class S or W, ANSI B16.9.
 - c) Flanges: ASTM A182, weld neck, with ASTM A193/ASTM A194 bolts/nuts.
 - c. Joints:
 - 1) Copper Pipe: Brazed. May be grooved where accessible, up to 8" maximum.
 - 2) Stainless Steel Pipe: Welded, or grooved where accessible. Weld per ASTM A312.
 - 3. For tunnel applications:
 - a. Piping: Type L copper, hard drawn, ASTM B88.
 - b. Fittings: Wrought Copper, ANSI B16.22
 - c. Joints: Soldered through 2"; Brazed for 2-1/2" through 6". Piping 2-1/2" through 6" may be grooved joints.
- B. Domestic Cold Water - Under Ground (including non-potable):
- 1. For piping through 4"
 - Pipe: Type K Copper, hard drawn, ASTM B88
 - Fittings: Wrought Copper, ANSI B16.22
 - Joints: Brazed.
 - 2. For piping 5" and larger:
 - Pipe: Ductile Iron, AWWA C115 or AWWA C151 with C104 cement mortar lining, polyethylene encased per ANSI/AWWA C105/A21.5.
 - Fittings: AWWA C110 or AWWA C153, 150 psi rating with C104 cement mortar lining.
 - Joints: AWWA C111 rubber gaskets.

SPEC EDITOR: INVESTIGATE SPECIFIC R.O. AND DEIONIZED WATER REQUIREMENTS WITH CLIENT AND EDIT THE BELOW TWO PARAGRAPHS ACCORDINGLY. CONFIRM NEED FOR HEAT FUSION JOINTS, AND SUITABILITY FOR SCREWED JOINTS. FOR D.I. WATER AT U-M, RESEARCH LABS NORMALLY SHOULD USE POLYPROPYLENE PIPE WITH FUSION JOINTS. ULTRA PURE SYSTEMS SUCH AS FOR SEMI-CONDUCTOR FABRICATION ARE TYPICALLY RECOMMENDED TO BE PVDF PIPE WITH FUSION JOINTS.

- C. Reverse Osmosis Water - Above Ground:
 - 1. Pipe: CPVC, Schedule 80, ASTM F441
 - Fittings: ASTM F439
 - Joints: Screwed or Solvent Welded
- D. Deionized Water - Above Ground:
 - 1. Pipe: Unpigmented polypropylene, Schedule 80, ASTM D4101, PP Resin.
 - Manufacturer: Georg Fischer PPro-Seal, IPEX Enfield, NIBCO, Orion.
 - Fittings: ASTM D4101
 - Joints: Heat Fusion Welded. "Riontite" mechanical Joints.

SPEC EDITOR NOTE: THE FOLLOWING PIPING CAN BE USED AS AN ALTERNATIVE TO THE POLYPROPYLENE PIPE. USE ONLY WHERE APPROVED BY U-M PROJECT MANAGER.

2. Alternate Pipe: Low extractable, polyvinyl chloride (PVC) compound, Type II pressure rating, Schedule 80, ASTM D1784.
Manufacturer: Spears LXT.
Fittings: Schedule 80, ASTM 2467
Joints: Specialty solvent cement, that meets or exceed the requirements of ASTM D2564 - Spears One-Step.

E. Lab Vacuum - Above Ground:

1. For piping through 4":
Pipe: Type L Copper, hard drawn, ASTM B88
Fittings: Wrought Copper, ANSI B16.22
Joints: Soldered through 2"; Brazed for 2-1/2" through 4"

FOR COMPRESSED AIR PIPING ABOVE 6", PRESENT MATERIAL ALTERNATIVES TO THE U-M DESIGN MANAGER FOR APPROVAL.

F. Compressed Air - Above Ground:

1. For piping through 6":
Pipe: Type L Copper, hard drawn, ASTM B88
Fittings: Wrought Copper, ANSI B16.22
Joints: Soldered through 2"; Brazed for 2-1/2" through 6"

THE FOLLOWING IS AN ACCEPTABLE ALTERNATE SPECIFICATION FOR COMPRESSED AIR IN HIGH HAZARD AREAS, WHERE PIPING MAY BE SUBJECTED TO PHYSICAL ABUSE. IF USED, UNHIDE TEXT AND INDICATE THE SPECIFIC LOCATION WHERE STEEL PIPE MAY BE USED.

2. For piping through 2" in areas subjected to physical abuse:
Pipe: Black Steel, Schedule 40, ASTM A 53, ERW or seamless, grade B
Fittings: Cast Iron, 125 lb. ASTM A 126 or malleable iron 150 lb. ASTM A 197; unions, 250 lb. ASTM A 197
Joints: Screwed.

G. Natural Gas - Above Ground:

SPEC EDITOR: UNDERGROUND NATURAL GAS PIPING IS TYPICALLY PROVIDED ONLY BY THE GAS COMPANY AND IS THEREFORE NOT ADDRESSED HEREIN. IF REQUIRED, CONSULT CODES.

1. For piping through 2":
Pipe: Black Steel, Schedule 40, ASTM A 53, ERW or seamless, grade B
Fittings: Malleable iron, 150 lb. ASTM A 197; unions, 250 lb. ASTM A 197
Joints: Screwed Terminal connections 1/2" and less: Type L Copper, annealed, ASTM B 88, 24" maximum length, flared connections
2. For piping 2-1/2" and larger
Pipe: Black Steel, Schedule 40, ASTM A 53, ERW or seamless, grade B, standard weight for 12" and above
Fittings: Standard weight, butt welded, black steel, ASTM A 234
Joints: Welded. Flanged ASTM A 181, 150#, forged steel at valves, and equipment.

H. Sanitary Waste and Vent - Above and Under Ground:

SPEC EDITOR: CHOOSE ONE OF THE FOLLOWING. CI IS STANDARD, PVC IS ECONOMICAL ALTERNATIVE ACCEPTABLE IN SOME BUILDINGS.

1. Pipe: Cast Iron, Service Weight, CISPI Standard 301, ASTM A74, ASTM A888
Fittings: Cast Iron, drainage pattern, ASTM A74, ASTM C564
Joints: Hubless - Heavy duty, ASTM C1540 shielded couplings
2. Pipe: PVC Schedule 40, ASTM D 2665, NSF approved, type DWV
Fittings: PVC, ASTM D 3311
Joints: Screwed or solvent weld, ASTM D2564

LAB WASTE AND VENT: DEPENDING ON THE APPLICATION, A LOWER COST ALTERNATIVE TO CONSIDER VERSUS THE PP/FUSED JOINT PIPING LISTED BELOW IS A SOLVENT JOINT SYSTEM MADE ESPECIALLY FOR LAB WASTE, SUCH AS SPEARS LABWASTE™ CPVC PIPING.

- I. Laboratory Waste and Vent - Above Ground:
 1. Pipe: Polypropylene, Schedule 40, ASTM- D 4101, Type 1
Fittings: ASTM D-4101
Joints: Mechanical joints with manufacturer's recommended seals by Orion, or fuse seal joints.
Manufacturer: Orion, Enfield, Georg Fisher Fuseal, Zurn
- J. Laboratory Waste and Vent - Under Ground:
 1. Pipe: Polypropylene, Schedule 80, ASTM- D 4101, Type 1
Fittings: ASTM D-4101
Joints: Mechanical joints with manufacturer's recommended seals by Orion, or fuse seal joints.
Manufacturer: Orion, Enfield, Georg Fisher Fuseal, Zurn
- K. Equipment Condensate Drains, including coils and energy recovery devices - Above Ground:
 1. Pipe: Type DWV Copper, hard drawn, ASTM B306
Fittings: Wrought Copper, ANSI B16.22
Joints: Soldered.

CHOOSE ONE OF THE FOLLOWING. CI IS STANDARD, PVC IS ECONOMICAL ALTERNATIVE ACCEPTABLE IN SOME BUILDINGS.

- L. Storm - Above and Under Ground:
 1. Pipe: Cast Iron, Service Weight, CISPI Standard 301, ASTM A74, ASTM A888
Fittings: Cast Iron, drainage pattern, ASTM-A74, ASTM C564
Joints: Hubless - Heavy duty, ASTM C1540 shielded couplings
 2. Pipe: PVC Schedule 40, ASTM D-2665, NSF approved, type DWV
Fittings: PVC, ASTM D-3311
Joints: Solvent welded, ASTM D-2564
- M. Sanitary and Storm Pump Pressure Piping- from pump discharge to connection to gravity main:
 - a. Pipe:
 - 1) Type L Copper, hard drawn, ASTM B88; or
 - 2) Sch. 10S Type 304L ASTM A312 seamless stainless steel.
 - b. Fittings:
 - 1) For Copper Pipe: Wrought Copper, ANSI B16.22.
 - 2) For Stainless Steel Pipe:
 - a) Type 304L or 316L ASTM A312 stainless steel.

- b) ASTM A403 Grade WP Class S or W, ANSI B16.9.
- c. Joints:
 - 1) Copper Pipe: Soldered. May be grooved where accessible, up to 8" maximum.
 - 2) Stainless Steel Pipe: Welded, or grooved where accessible. Weld per ASTM A312.
- d. Elevator sump pumps, in plenum return locations:
 - 1) Galvanized steel ASTM A53 pipe, standard weight, with galvanized, Gray-Iron threaded fittings: ASME B16.4, Class 125; or
 - 2) excluding inaccessible locations, Grooved Joints - for Steel Piping may be used, with hot dip galvanized pipe and fittings (couplings may be un-galvanized).
- e. Elevator sump pumps, in non-plenum return locations:
 - 1) Schedule 40 PVC ASTM D 1785 pipe, ASTM D 2466 socket fittings, ASTM D 2464 Schedule 80 threaded fittings.

2.3 HYDRONIC, STEAM AND CONDENSATE PIPING SYSTEMS:

PROJECTS CONSIDERING THE USE GROOVED JOINTS OR COPPER PRESS FITTINGS (E.G. "PROGRESS") SHALL FIRST OBTAIN APPROVAL FROM THE U-M DESIGN MANAGER AND THE PLUMBING/FIRE PROTECTION MECH TECH TEAM. IF GROOVED JOINTS OR COPPER PRESS FITTINGS ARE NOT BEING USED, REMOVE ALL ASSOCIATED REFERENCES TO THESE ITEMS, BELOW.

A. Chilled Water - Above Ground:

- 1. For piping through 4":
 - Pipe: Type L Copper, hard drawn, ASTM B88
 - Fittings: Wrought Copper, ANSI B16.22
 - Joints: Soldered through 2"; Brazed for 2-1/2" through 4"

ONLY USE THE CONTRACTORS OPTIONS BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Options:

- a. For piping 2-1/2" through 4", excluding inaccessible locations, Grooved Joints - for Copper Piping may be used.
- b. For piping through 4", Copper press to connect fittings may be used
- 2. For piping 5" and larger:
 - Pipe: Black Steel, Schedule 40, ASTM A53, ERW or seamless, grade B, standard weight for 12" and above
 - Fittings: Standard weight, butt welded, black steel, ASTM A234
 - Joints: Welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.

ONLY USE THE CONTRACTOR OPTION BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Option: excluding inaccessible locations, Grooved Joints - for Steel Piping may be used for piping 5" through 12".

IF PROJECT HAS BELOW GROUND CHW PIPING BE SURE TO INCLUDE 336100 IN THE SPECIFICATION

B. Chilled Water - Below Ground

- 1. Refer to Related Section 336100 Hydronic Utilities

C. Hot Water Heating - Above Ground:

1. For piping through 4":
Pipe: Type L Copper, hard drawn, ASTM B88
Fittings: Wrought Copper, ANSI B16.22
Joints: Soldered through 2"; Brazed for 2-1/2" through 4"

ONLY USE THE CONTRACTORS OPTIONS BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Options:

- a. For piping 2-1/2" through 4", excluding inaccessible locations, Grooved Joints - for Copper Piping may be used.
 - b. For piping through 4", Copper press to connect fittings may be used.
2. For piping 5" and larger:
Pipe: Black Steel, Schedule 40, ASTM A53, ERW or seamless, grade B, standard weight for 12" and above
Fittings: Standard weight, butt welded, black steel, ASTM A234
Joints: Welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.

ONLY USE THE CONTRACTOR OPTION BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Option: excluding inaccessible locations, Grooved Joints - for Steel Piping may be used for piping 5" through 12":

FOR LENGTHS OF CONDENSER WATER PIPING EXPOSED TO SEASONAL DRAIN DOWN OR WHERE EXTERIOR CORROSION OF UNINSULATED CONDENSER WATER PIPING COULD PRESENT PROBLEMS, CONSIDER SPECIFYING A NONFERROUS PIPING MATERIAL, E.G. SCHEDULE 10 STAINLESS STEEL. A SAMPLE SPEC FOR STAINLESS STEEL PIPE CAN BE FOUND IN HIDDEN TEXT, BELOW.

D. Condenser Water/ Cooling Tower Water - Above Ground:

1. For piping through 4":
Pipe: Type L Copper, hard drawn, ASTM B88
Fittings: Wrought Copper, ANSI B16.22
Joints: Soldered through 2"; Brazed for 2-1/2" through 4"

SPEC EDITOR: ONLY USE THE CONTRACTORS OPTIONS BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Options:

- a. For piping 2-1/2" through 4", excluding inaccessible locations, Grooved Joints - for Copper Piping may be used:.
 - b. For piping through 4", Copper press to connect fittings may be used
2. For piping 5" and larger:
Pipe: Black Steel, Schedule 40, ASTM A53, ERW or seamless, grade B, standard weight for 12" and above
Fittings: Standard weight, butt welded, black steel, ASTM A234
Joints: Welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.

ONLY USE THE CONTRACTOR OPTION BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Option: excluding inaccessible locations, Grooved Joints - for Steel Piping may be used for piping 5" through 12".

BELOW IS SAMPLE SPEC FOR SS PIPE, IN HIDDEN TEXT.

3. For piping 5" and larger, stainless steel pipe:
 - a. Pipe: Sch. 10S Type 316L ASTM A312 seamless stainless steel.
 - b. Fittings: Type 316L ASTM A312 stainless steel. ASTM A403 Grade WP Class S or W.
 - c. Flanges: ASTM A182, forged, weld neck. Bolts/nuts ASTM A193/ASTM A194.
 - d. Joints: welded per ASTM A312.

ONLY USE THE CONTRACTOR OPTION BELOW WITH APPROVAL AS DETAILED IN PARAGRAPH 2.3 EDITOR'S NOTE ABOVE.

Contractor Option: excluding inaccessible locations, Grooved Joints - for Stainless Steel Piping may be used for piping 5" through 12".

- E. Steam - to 60 psig - Above Ground:
 1. For piping through 2":

Pipe: Black Steel, Schedule 40, ASTM A53, ERW or seamless, grade B.
Fittings: Forged steel, ASTM A181, ANSI B16.11.
Joints: Screwed.
 2. For piping 2-1/2" and larger
Pipe: Black Steel, Schedule 40, ASTM A53, ERW or seamless, grade B, standard weight for 12" and above
Fittings: Standard weight, butt welded, black steel, ASTM A234
Joints: Welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.
- F. Steam Condensate (gravity or pumped) - to 60 psig - Above Ground:
 1. For piping through 2":

Pipe: Black Steel, Schedule 80, ASTM A53, ERW or seamless, grade B.
Fittings: Forged steel, ASTM A181, ANSI B16.11.
Joints: Screwed.
 2. For piping 2-1/2" and larger
Pipe: Black Steel, Schedule 80, ASTM A53, ERW or seamless, grade B.
Fittings: Standard weight, butt welded, black steel, ASTM A234.
For utility tunnels use only extra heavy weight, butt welded, black steel, ASTM A234
Joints: Welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.
- G. Humidifier Piping (for steam humidifier using deionized or RO water):
 1. Steam piping from steam generator to humidifier manifold:

Pipe: Stainless steel for minimum 12" length at generator and at humidifier manifold.
Hose: Supplied by humidifier manufacturer, continuously pitched back to humidifier and continuously supported.
Fittings: Stainless steel.

- Joints: Screwed.
2. Condensate piping from manifold drip to generator or drain.
Pipe: Stainless steel.
Fittings: Stainless steel.
Joints: Screwed.
 3. Pipe and fittings: Sch. 40S Type 304L ASTM A312 seamless stainless steel pipe with ASTM A403 Grade WP Class S or W fittings.

2.4 SPECIAL PIPING SYSTEMS:

- A. Refrigeration Piping - Above Ground and Under Ground:
1. Pipe: Type L or K Seamless Copper, Nitrogenized ACR, ASTM B 88 or ASTM B 280, annealed for 3/8" and smaller, hard drawn for 1/2" and larger. For underground piping 2" and smaller: Type K, annealed, with no fittings.
 2. Fittings: ANSI B16.26 cast copper alloy refrigeration type with 45 degree flare or wrought copper ANSI B16.22 socket fittings
Joints: brazed, flared (above ground only).

2.5 PIPE JOINTS:

- A. Soldered Joints: ASTM B32; Alloy Sb5, (95% Tin, 5% Antimony, maximum 0.20% Lead). When recommended by the component manufacturer, use manufacturer's recommended flux. Unless noted otherwise, joints may be screwed or flanged to suit valves and equipment. Manufacturers: Engelehard "Silverbrite 100", Harris "Bridgit"
- B. Brazed Joints: ASTM B32, silver brazed joints with 1000F minimum melting point, conforming to AWS - A5.8, "Specification for brazing filler metal". Classification BAg-1. For domestic potable water applications, maintain a nitrogen purge during brazing to prevent deposit formation inside the pipe. Unless noted otherwise, joints may be screwed or flanged to suit valves and equipment. Manufacturers: Lucas-Milhaupt Inc. "Sil-Fos", J.W. Harris "Stay-Silv 15" and "Safety Silv"
- C. Screwed Joints: Tapered thread, ASME B1.20.1, joined with compatible compound or sealant tape applied to male thread only.
- D. Welded Joints: Comply with Section II, Part C, ASME Boiler and Pressure Vessel Code for welding materials appropriate for the wall thickness and chemical analysis of the pipe being welded. Pipe and fittings shall be beveled and butt welded.

GROOVED PIPING JOINTS FOR COOPER PIPE ARE LIMITED TO 8", WHICH IS THE MAXIMUM SIZE THAT ALL THREE APPROVED MFR.S HAVE AVAILABLE.

- E. Grooved Joints - for Copper Piping, maximum pipe size 8": Rolled grooves, peroxide cured EPDM gaskets, ductile iron housing (ASTM A 532 or A 536), wrought copper (ASTM B 75, ANSI B16.22) or cast bronze fittings, rated for minimum 300 psi working pressure at 250°F, when used with grooves that comply with AWWA C606. Grooved system/components shall provide rigid installation. UL and UPC approved. Utilize manufacturer's recommended gasket lubricant. Brazed Class 150 ANSI B16.24 cast bronze flanges (or copper companion flange by CTS Fabrication USA) must be used at any component requiring a flanged connection. Clamp-on branch outlets are prohibited. Exact gasket material and style shall be as recommended by the coupling manufacturer for the service, and NSF/ANSI-61 Annex G and NSF/ANSI-372 listed when used for potable water. On potable water service, provide non-standard gasket styles that close off and isolate gasket cavities from the water in the pipe. The manufacturer of the couplings and the fittings shall be the same. The same grooved component manufacturer shall be provided for the entire scope of the work, for each system.
1. The following manufacturers and coupling model numbers are permitted, provided they comply with all the above: Victaulic Style 607; Tyco Grinnell 672 or 640.
 2. For copper piping in tunnels: Victaulic Style 607 only.

GROOVED JOINTS FOR STEEL PIPE ARE LIMITED TO 12". THE PRESSURE RATING OF GROOVED COUPLINGS DECREASE ABOVE 12" PIPE SIZE, AND VARIES BY COUPLING MFR. REVISE BELOW CAREFULLY IF USING GROOVED JOINTS ABOVE 12" PIPE SIZE.

- F. Grooved Joints - for Steel Piping, for maximum pipe size of 12": Rolled or cut grooves, peroxide cured EPDM gaskets, ductile iron coupling and fittings (ASTM A532 or A536), rated for minimum 400 psi working pressure at 250°F, when used with grooves that comply with AWWA C606. Grooved system/components shall provide rigid installation. UL and FM approved. Utilize manufacturer's recommended gasket lubricant. Welded flanges must be used at any component requiring a flanged connection. Clamp-on branch outlets are prohibited. Exact gasket material and style shall be as recommended by the coupling manufacturer for the service. The manufacturer of the couplings and the fittings shall be the same. The same grooved component manufacturer shall be provided for the entire scope of the work, for each system.
1. The following manufacturers and coupling model numbers are permitted, provided they comply with all the above: Victaulic Style 07 or 107; Tyco Grinnell Fig. 740 or 772.

ALTHOUGH THE BELOW ARTICLE CALLS FOR 300 PSI WORKING PRESSURE FOR STAINLESS STEEL FITTINGS UP TO 12", THE PRESSURE RATING OF GROOVED COUPLINGS IS OFTEN LESS ABOVE 8" PIPE SIZE, AND VARIES BY COUPLING MFR. REVISE BELOW CAREFULLY IF USING S.S. GROOVED JOINTS ABOVE 8" PIPE SIZE.

- G. Grooved Joints - for Stainless Steel Piping, for maximum pipe size of 12": Rolled grooves, peroxide cured EPDM gaskets, galvanized ductile iron (indoor piping only) or stainless steel couplings, minimum sch. 10 stainless steel fittings. Provide stainless steel nuts and bolts when couplings are stainless steel. Couplings and fittings rated for a minimum 300 psi working pressure at 250°F. Grooved system/components shall provide rigid installation. NSF/ANSI-61 Annex G and NSF/ANSI-372 listed when used for potable water. On potable water service, provide non-standard gasket styles that close off and isolate gasket cavities from the water in the pipe. Welded flanges must be used at any component requiring a flanged connection. Clamp-on branch outlets are prohibited. Exact gasket material and style shall be as recommended by the coupling manufacturer for the service. Utilize manufacturer's recommended gasket lubricant. The manufacturer of the couplings and the fittings shall be the same. The same grooved component manufacturer shall be provided for the entire scope of the work, for each system. Use the manufacturer's required roll sets for stainless steel pipe.
1. The following manufacturers and coupling model numbers are permitted, provided they comply with all the above: Victaulic Style 89 (indoor), Style 489 (outdoor); Tyco Grinnell Fig. 770 (indoor), Fig. 772 (indoor), Fig. 472 (outdoor).

THE FOLLOWING JOINING METHOD IS UNDER CONSIDERATION: USE PRESS JOINTS ONLY WHERE APPROVED BY U-M PROJECT MANAGER AND THE PLUMBING/FIRE PROTECTION MECH TECH TEAM.

H. Press Joints:

1. Limited to a maximum pipe size of 4".
2. Rated for a minimum 200 PSI working pressure from -4°F to 250°F.
3. Compatible with seamless type K, L, and M copper tube conforming to ASTM B88.
4. Fittings shall be a minimum 78% copper and a maximum of 15% zinc, alloyed to prevent dezincification.
5. Fittings shall conform to the material and sizing requirements of ASME B16.18 or ASME B16.12.
6. Seals/O-rings shall be peroxide cured EPDM.
7. Joints shall be pressed using the tool approved by the manufacturer.
8. Provide press fittings from the same manufacturer for the entire scope of the work, for each system.
9. For piping 2" and smaller, non-fitting components such as valves, strainers, check valves, etc. manufactured by the press fitting manufacturer may be used provided:
 - a. the press fitting manufacturer is approved for those components elsewhere in the specifications
 - b. such components fully comply to the requirements of the respective specification section for the component.
10. Approved fitting, tool, and process:
 - a. Viega ProPress
 - b. NIBCO Press System.
 - c. Apollo Xpress

I. Flanged Joints:

1. Select flange and gasket materials to suit service of piping and to comply with the respective ASME B31.1 or B31.9 piping standard.
 2. For steel pipe, provide raised face ANSI B16.5 compliant steel flanges.
 3. For copper pipe, provide Class 150 flat face ANSI B16.24 cast bronze flanges, brazed to the copper tube.
 - a. Alternative: Copper companion flange by CTS Fabrication USA rated 450 PSI minimum working pressure from -66°F to 272°F. ANSI B16.5 compliant, powder coated, with an EPDM insulator adhered to the plate steel flange protruding inside of the flange to prevent contact with the copper companion flange adapter. Flange adapter shall be manufactured to ASME B16.22, brazed to the copper tube.
 4. Gaskets shall conform to respective ANSI Standards, A21.11, B16.20, B16.21. Gaskets in steam and condensate lines shall be "FLEXTALLIC", 316 L stainless steel with "FLEXICARB" filler. Flange gaskets for domestic hot water shall be 100% PTFE. For butterfly valves on replaceable seat side with interfering set-screws, provide Garlock Style 9800.
 5. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated. Central Power Plant and Tunnels: Provide ASTM A193 B7 bolts and studs with ASTM A194 grade 2H heavy hex nuts.
- J. Hubless Joints for Cast Iron No-Hub Pipe: Heavy duty ASTM C1540 couplings with stainless steel shield with stainless steel bands and tightening devices, ASTM C564 rubber sleeve with integral center pipe stop.
1. When connecting cast iron no-hub pipe to dis-similar pipe: Provide ASTM C1460 couplings specifically designed for both pipe types, with stainless steel shield with stainless steel bands and tightening devices, with ASTM C564 rubber sleeve with integral center pipe stop. Unshielded couplings shall not be used. *Connections between dis-similar pipe materials shall be restrained.* Submit coupling and restraint methods for approval.
 2. Approved Manufacturers:
 - a. Anaco/Huskey
 - b. Clamp-All Corp.
 - c. Ideal Tridon
 - d. Mission Rubber Company (MCP Industries Inc.)
- K. Solvent Cement Joints: Select materials suitable for pipe materials joined and compatible with fluid served. Conform to respective ASTM Standards D-2235, D-2564, D-2855 and D-3138.
- L. Gasket Joint Lubricant - for use with grooved and hubless joints: Provide manufacturer's recommended gasket lubricant.

2.6 MECHANICALLY FORMED TEE CONNECTIONS IN COPPER PIPING:

THE T-DRILL TOOL HAS BEEN DEMONSTRATED AT UM A&E, AND TO PLANT, AND SEEMS TO HAVE APPROPRIATE APPLICATIONS. THE SPEC BELOW LIMITS T-DRILL'S USE. FORWARD COMMENTS AND EXPERIENCES TO THE SPEC TEAM.

- A. Contractor may use mechanically formed Tee connections in copper piping in lieu of tee fitting only where main piping is 2 1/2" or larger and where branch connection is 3/4" or smaller. Joint must be brazed. Tool manufacturer: T-Drill.

2.7 UNIONS:

- A. Unions in steel piping systems shall be malleable iron with ground joints made between two bronze inserts.
- B. Unions in copper piping systems shall be wrought copper or brass with sweat ends.

2.8 PIPE HANGERS AND SUPPORTS:

PIPE HANGER MODEL NUMBERS, SPACING, AND APPLICATION OF HANGERS AND SUPPORTS MUST BE ADDRESSED IN DRAWINGS, IT IS NO LONGER INCLUDED HEREIN. SOME DETAILS MAY BE AVAILABLE ON THE U-M AEC WEBSITE.

- A. Provide adjustable type pipe hangers, supports and accessories for the proper support of all piping. See details on drawings for requirements. Figure and model numbers specified on drawings are for Anvil International, and Pipe Shields Inc. Equivalent products by Carpenter & Paterson, Cooper B-line and PHD Manufacturing are also acceptable. Continuous threaded rod shall be used for intermediate attachments.
- B. Dielectric protection for hangers and supports: Where copper piping is supported with steel hangers and supports, dielectric protection must be provided. Use one of the following means as applicable:
 - 1. Coated hangers (copper or plastic coating)
 - 2. Insulation inserts
 - 3. Cushion clamps
 - 4. Other as approved by Engineer.

2.9 THERMAL-HANGER SHIELD INSERT ASSEMBLIES

- A. Except as noted, thermal hanger shield "insert" assemblies shall be used on all insulated pipe systems at each horizontal support, and at each clamped or guided vertical support. Manufactured units shall comply with MSS SP-58 standards and be tested per MSS SP-89 guidelines. Each assembly shall closely fit the various pipe diameters and match the outside diameter of the adjoining pipe insulation. Provide pre-grooved inserts when piping is heat traced. Compressive strength shall be adequate to prevent deformation at the project's hanger spacing requirements, with a minimum 3:1 safety factor.
- B. Thermal hanger shield insert assembly: Water-repellent treated, ASTM C 533, Type I calcium silicate, asbestos free insert. With G-90 galvanized sheet metal shield. With attached vapor barrier, where indicated. Each component shall have an ASTM E84 flame/smoke rating maximum of 25/50.
- C. Inserts for Cold Piping (piping conveying materials less than or equal to 60F), including all chilled water and domestic cold water piping: Insert with an attached vapor barrier.

1. Provide insert and sheet metal shield covering entire circumference of pipe.
- D. Inserts for Hot Piping (piping conveying materials at more than 60F): Insert only.
 1. For clevis or band hangers that support pipe from bottom: Insert and sheet metal shield shall cover lower 180 degrees of pipe, or entire circumference of pipe.
 2. For trapeze hangers or clamped pipe: Insert and sheet metal shield shall cover entire circumference of pipe.
- E. Inserts for piping less than 3/4-inch diameter: Not required except for piping conveying materials less than 45°F.
- F. Minimum Compressive Strength of Insert Material:
 1. 100 psig for sizes smaller than NPS 6.
 2. 600 psig for sizes NPS 6 and larger.
- G. Insert Length: Extend 2 inches beyond sheet metal shield.
- H. Vapor barrier: meeting ASTM C1136, with 0.02 perms maximum water vapor permeance.
- I. Adhesives shall comply with NFPA 90-A.
- J. Sheet Metal Shield Dimensions for Pipe: Not less than the following:
 1. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
 2. NPS 4: 12 inches long and 0.06 inch thick.
 3. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick
 4. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick
 5. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick
- K. Manufacturers
 1. Cooper B-Line
 2. Pipe Shields Inc.
 3. Rilco Manufacturing Company
 4. Value Engineered Products.
 5. American Mechanical Insulation Sales
 6. ERICO International Corp

2.10 PIPE SLEEVES:

NOTE THAT SLEEVE DETAILS MUST APPEAR ON DRAWINGS, INCLUDING UNDERGROUND DETAILS IF APPLICABLE.

- A. Furnish and set pipe sleeves per details on drawings.

2.11 DIELECTRIC FITTINGS:

- A. For pipe 2 inch and less: Provide brass coupling. (Dielectric unions are not acceptable).
- B. For pipe 2-1/2 inch and larger: Provide flange union with dielectric gasket and bolt sleeves. On copper pipe, copper companion flanges by CTS Fabrication USA may be used.
- C. Dielectric waterways are prohibited for all joint systems.

2.12 STRAINERS:

- A. Body shall be bronze, cast steel or cast iron, to match piping materials. Strainers shall be same size as piping, with screwed connections on piping 2" and smaller, and flanged connections on piping 2-1/2" and larger. Where grooved piping is specified, grooved joint strainers may be used. Screen free area shall be a minimum of twice the internal cross sectional area of the piping where installed. Pressure rating shall be that of piping system, minimum Class 125. Provide a ball valve on the strainer blow down port, sized to match the blow down port size, on all strainers 2" and larger.
- B. For water service, screen material stainless steel, with openings of 1/16 (0.062) inches for pipes 2" and smaller and 1/8 (0.125) inches for pipe sizes 2-1/2" and larger.
- C. For steam and condensate service, screen material stainless steel, with openings of 1/32 (0.031) inches for pipes 2" and smaller and 3/64 (0.047) inches for pipe sizes 2-1/2" and larger.
- D. For air and gas service, screen material stainless steel, with openings of 0.006 inches for pipes 2" and smaller and 0.009 inch for pipe sizes 2-1/2" and larger.
- E. Approved Manufacturers: Armstrong, Anvil International, Keckley, Metraflex, Mueller, Spirax-Sarco, Victaulic, Watts, Yarway.

2.13 FLEXIBLE PIPING CONNECTORS:

- A. Refer to Related Section 220548 - Vibration Control.

2.14 PIPE ANCHORS:

- A. Provide pipe anchors where shown and as detailed on drawings.

2.15 PIPING TRANSITIONS:

- A. For transitions between ductile iron pipe and other pipe materials, refer to the requirements for hubless joints found elsewhere in this specification.
- B. When two different pipe materials must be joined such as cast iron, clay, steel, copper or plastic, provide transition fittings specifically designed for that purpose and that are manufactured in compliance with the standards relevant for the pipes joined. Transitions shall have equal corrosion resistance to the pipes joined.
- C. For dissimilar metal connections, see "Dielectric Fittings".

2.16 SLEEVE-SEAL SYSTEMS

- A. Approved Manufacturers:
 - 1. EnPro Industries "Link Seal"
 - 2. Advance Products & Systems, Inc.
 - 3. Metraflex Company (The).
 - 4. Proco Products, Inc.

- B. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve. Shall provide a water-proof seal between the pipe and sleeve at up to 20 psig head pressure. Each link and pressure plate shall include permanent identification of size and manufacturer's name. Manufactured in an approved ISO-9001:2000 facility.
- C. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe.
- D. Pressure Plates: Molded of glass reinforced nylon.
- E. Connecting Bolts and Nuts: Mild steel with a 60,000 psi minimum tensile strength and 2-part Zinc Dichromate coating per ASTM B-633 and Organic Coating, tested in accordance with ASTM B-117 to pass a 1,500-hour salt spray test. Of length required to secure pressure plates to sealing elements.
- F. Sleeves:
 - 1. Galvanized steel, ASTM A53/A53M, Schedule 40, with plain ends and welded steel collar, zinc coated. Steel Sleeve sizes 12" and larger shall be 0.375" thick or standard pipe wall thickness. Sleeves through wall shall be cast in place and the pipe shall be installed centered in the sleeve. Provide 2" collar (water-stop) of steel to match sleeve, welded all around on both sides to the sleeve at the point on the sleeve that positions it at the mid-point of the structural wall when the sleeve is in place.
 - 2. Molded non-metallic high density polyethylene sleeves (HDPE) with integral hollow, molded water-stop ring four inches larger than the outside diameter of the sleeve itself. End caps and reinforcing ribs, manufactured in an approved ISO-9001:2000 facility. With nailer flange.

PART 3 - EXECUTION

3.1 GENERAL PIPING INSTALLATION REQUIREMENTS:

- A. Work shall be done in accordance with applicable ordinances and codes. Arrange for inspections.
- B. For domestic potable water applications, maintain a nitrogen purge during brazing to prevent deposit formation inside the pipe, so that the inner pipe surface remains clean. Properly ventilate the area outside the pipe to avoid unsafe levels of nitrogen.
- C. Install pipe components and joining systems in accordance with the manufacturer's installation instructions.
- D. Install piping to permit complete draining. Provide capped hose end ball type drain valves at all low points.

EXPANSION OF PIPING MUST BE CONSIDERED IN DESIGN, AND ENGINEERED ON DRAWINGS, INCLUDING DIMENSIONED EXPANSION BENDS IF APPLICABLE.

- E. If water (flushing water, closed loop system water, blow down, etc.) or hydronic system fluids have a pH between 5.0 and 10.0 and meets the requirements of City of Ann Arbor Sewer Use Ordinance, it may be discharged to the sanitary sewer. If the water does not meet the sewer discharge limits, contact U-M Environment, Health and Safety (EHS) Hazmat at 763-4568 for proper disposal. City of Ann Arbor Sewer Use Limitations (Chapter 28 Sewage and Sewage Disposal, subsection 2:43.1. Prohibited discharges.) can be found at:
1. <http://www.municode.com/resources/gateway.asp?pid=11782&sid=22>
 2. or by contacting U-M EHS - Environmental Protection & Permitting Program at 936-1920.
- F. Installed piping shall be free from sagging. Provide for expansion and contraction of piping in an approved and safe manner by means of loops or offsets, where mechanical expansion joints are not specifically called for.
- G. Branch connections from horizontal steam, steam condensate, and gaseous system mains shall be taken off the top, up at a 45-degree angle, or off the side.
- H. Branch connections from horizontal hydronic system mains shall not be taken off the main bottom, or at less than 45 degrees from horizontal.
- I. Branch piping shall be valved at the branch connection points.
- J. Provide fittings and specialties necessary to properly interconnect all items, whether or not shown in detail.
- K. Piping shall remain protected and capped until just prior to connection. Immediately after assembly, restore all protection and cap unprotected ends to prevent odors, dust, moisture, and other debris from entering the piping system.
- L. Clean and swab-out all piping before installation.
- M. Lay out pipe lines straight, plumb and in true alignment. Offset as required to avoid interference with other work, to conceal piping, to allow maximum headroom and to avoid interference with windows and doors. Lay out all pipes and establish their levels from bench marks, existing floors or finished grades.
- N. Piping shall be concealed unless indicated otherwise on drawings. Do not conceal piping until it has been inspected, tested, flushed and approved.
- O. Use eccentric reducing fittings to increase or decrease pipe sizes. Bushings are not acceptable. Orient reducers to prevent trapping of water.
- P. Lubricate flange bolts and install with hardened flat washers. Use a torque wrench to tighten flange bolts to the gasket manufacturer's recommended torque.
- Q. Locate groups of pipe parallel to each other, spaced to permit applying insulation and servicing of valves. Install hot and cold water lines at least 6 inches apart.

- R. Install piping at least 3 inches clear of electrical conduit. Do not install pipe within the National Electrical Code (NEC) working space zone of electrical equipment. Examples:
1. Above the footprint of electrical equipment in the zone extending 6' above the installed height of the equipment.
 2. Within the NEC working space in front of the electrical equipment. NEC working space varies depending on voltage and other factors, typically for equipment 600 volts or less it extends from the floor to the height of the equipment or 6'-6", whichever greater, 3'-6" in front of the equipment, and for the width of the equipment or 30", whichever is greater.
- Verify NEC clearance requirements prior to installing work. Note that variable frequency drives are considered electrical equipment.
- S. Pipe extending into finished areas shall have chrome plated escutcheons large enough to cover pipe sleeves and shall fit snugly over pipe or insulation.
- T. Pitch piping as follows, but not less than required by code:
1. Hydronic piping up in direction of flow at 1/16" per foot
 2. Steam piping down in direction of flow at 1/16" per foot
 3. Vent piping back toward waste at 1/16" per foot
 4. Waste, condensate and compressed air piping down in direction of flow at 1/8" per foot.
- U. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.
1. Support vertical pipe at no less than every floor level, at the base of each riser, and at every riser offset.
 2. Support horizontal pipe 5" diameter and greater with a minimum of two pipe hangers between couplings, except sections of pipe less than 4 feet in developed length are permitted to be supported with no less than one hanger between couplings.
 3. All horizontal piping 5" diameter and greater shall be restrained or braced to prevent movement at each joint at every direction change and at each branch connection.
 4. Provide pipe hangers to support every horizontal branch connection; provide sway bracing when pipe is suspended in excess of 18" by non-rigid hangers, and comply with all other bracing, support, and installation recommendations and suggestions in the CISPI Handbook.
 5. Provide hangers and supports to eliminate all misalignment at couplings.
 6. Tighten all clamps to coupling manufacturer's recommended torque, using a torque wrench.
 7. *Joints between dis-similar pipe materials shall be restrained.*
- V. Sanitary and storm piping shall be anchored upstream of the first coupling at the point of building exit (interior side) to prevent movement due to back surges, by permanent blocks, bracing, threaded rodding anchored to the exterior wall, or other suitable means.

3.2 NATURAL GAS PIPING INSTALLATION REQUIREMENTS:

- A. Install, inspect, test, and purge natural gas systems in accordance with NFPA 54, and local utility requirements.

SPEC EDITOR: INDICATE ON THE DRAWINGS, THE ROUTING AND TERMINATION LOCATION OF THE CONDUIT VENT PIPE.

- B. Gas piping in air plenum ceilings shall be continuously welded or installed in air-tight conduit constructed of Schedule 40 seamless black steel pipe with welded joints. Vent conduit to the outside and terminate with a screened vent cap. Valves shall not be installed in plenums.
- C. Drips and Sediment Traps: Install a drip leg at inlet to terminal equipment, points where condensate may collect, and at the outlet of the gas meter. Do not install drips where condensate is likely to freeze. Construct drips using a tee with plugged or capped bottom outlet. Drip shall be minimum of 3 pipe diameters long, same size as pipe. Locate drips to permit cleaning and emptying.

3.3 UNDERGROUND PIPING INSTALLATION REQUIREMENTS

- A. Piping below grade intersecting tunnel walls, basement walls, or penetrating floors, shall be run through a sleeve seal system.
 - 1. Size sleeves and select sleeve seal links per sleeve seal manufacturer's recommendations.
 - 2. Install sleeves and seals per manufacture's recommendations. Center sleeve water stops at midpoint of wall/floor thickness. Provide temporary support to avoid sleeve collapse during pours.
- B. Record as-built sketches and dimensions prior to backfilling.

3.4 GROOVED PIPING

- A. Install couplings from the same manufacturer as the grooved fittings. The same grooved component manufacturer shall be installed for the entire scope of the work, for each system.
- B. Groove pipe per manufacturer's requirements. Grooving tools shall be the same manufacturer as the couplings and fittings. Use special roll sets for copper and stainless steel pipe when required by the manufacturer.
- C. Lubricate gaskets with manufacturer's recommended gasket lubricant. Use NSF-61 approved lubricant for domestic water piping.
- D. Allow room for pipe expansion for couplings that allow pipe ends to separate before the joint acts in a fully restrained manner, for example, certain couplings used on stainless steel pipe.
- E. Tighten coupling as recommended by the manufacturer. Use a torque wrench and tighten bolts to required torque level when required by the manufacturer.

3.5 WELDING:

- A. All welding shall be performed by registered welders qualified to perform welding operations in accordance with the National Certified Pipe Welding Bureau's procedures and standards, ASME Code Standards and the HPACCNA Standard Manual of Welding.
- B. Submit a certified copy of "Record of Pipefitter Welder Performance Qualification Test" of any employees who will be doing welding on this project.
- C. No welding to building work shall be allowed without approval of Engineer.
- D. Except where prohibited by the Reference Standards, code, or ordinance, Black steel piping larger than 6-inch diameter may be welded with chill rings.

SPEC EDITOR: DELETE THE FOLLOWING PARAGRAPH IF NO STEAM OR CONDENSATE OVER 15 PSIG

- E. Mitered turns will not be allowed. Turns shall be made with factory-made ASME B16.9 long radius wrought steel butt welding fittings.
- F. Except where prohibited by the Reference Standards, code, or ordinance, branch take-offs with manufactured formed nipples will be permitted provided nipple size is at least two pipe sizes smaller than the main size. Formed nipples shall be Bonney Forge "Weldolets", "Threadolets", "Sokolets". In all other cases, use factory-made ASME B16.9 wrought steel butt welding tee fittings.
- G. Shop welded pipe assemblies shall have all welds plainly stamped by the welding operator for inspection by the Engineer before installation.

3.6 SPECIAL WELDING REQUIREMENTS (FOR WORK LOCATED IN TUNNELS):

THIS ARTICLE IS REQUIRED FOR ALL TUNNEL PROJECTS. EDIT NUMBER OF WELDS AS NECESSARY FOR SCOPE OF PROJECT. THIS ARTICLE IS NOT NORMALLY REQUIRED FOR MOST NON-TUNNEL PROJECTS. IT CONTAINS ADDITIONAL WELDING REQUIREMENTS FOR SPECIAL CONDITIONS.

- A. Examine all welds by physical method. Include the cost of examining 5% of welds (but a minimum of 2 welds) to be selected by the Engineer, by approved graphic method similar to gamma ray process.
- B. The radiographic examination shall be by technicians of a reputable company regularly engaged in this type of work and skilled in the use of interpretation of results of this type of examination.
- C. The process shall provide visual proof at the site and such proof on photographs with reports which shall become the property of the Owner and will be included in the final Contract Documents.
- D. The report on the interpretation of the radiographic examination shall state whether or not the quality of the welding is suitable for the service for which the piping was designed.
- E. Welds examined by the above process shall be identified by a number and service symbol and shall be stamped into pipe adjacent to weld at the time of examination

- F. Failure to pass this test shall be cause for the rejection of the weld and authority to examine an additional weld. Rejected welds shall be repaired by an approved method and proven satisfactory by radiographic examination.
- G. If a second weld proves unsatisfactory by the radiographic examination, all welds shall be X-Rayed. Any welds proved unacceptable shall be repaired and X-Rayed again at no additional expense to the Owner.

3.7 PROTECTION AGAINST FREEZING:

- A. At any time that any of the piping is full of water for testing purposes or otherwise prior to actual heated operation, the system shall be protected against freezing by the introduction of pre-mixed propylene glycol type anti-freeze which will be flushed out before acceptance. Provision for introducing anti-freeze shall be made by means of valved connections to the system in an acceptable manner.

3.8 INSTALLATION OF PIPE HANGERS AND SUPPORTS:

- A. Arrange pipe hangers and supports to permit proper pitch of piping, free to move with pipe expansion, installed at proper intervals to totally prevent sagging and attached to building construction through approved means. Hangers shall be located near or at changes in piping direction and concentrated loads. Valves, strainers, in line pumps and other heavy equipment shall be supported independent of the pipes. After systems have been installed and filled adjust hangers and supports to evenly distribute weight, and maintain proper pitch. Refer to drawings for pipe hanger and support details.

PARA. B MAY BE CONSERVATIVE, REVIEW AND EDIT, OR DETAIL ON DRAWINGS

- B. Vertical Piping: When support locations are not indicated on the drawings, support piping at every floor level.

NOTE THAT HANGER SPACING IS TO APPEAR ON THE DRAWINGS - OR "APPLICABLE CODES" WILL DICTATE

- C. Horizontal Piping Hanger Spacing: Space hangers in compliance with schedule on drawings and applicable codes, or per MSS SP-89, which ever results in shortest spacing.
- D. For cold piping, install hangers and supports to maintain an effective continuous thermal and vapor barrier between cold piping and hangers and supports.

THE BELOW REQUIREMENTS FOR PLASTIC PIPE ARE GENERAL IN NATURE. THE DESIGNER SHOULD CAREFULLY SPECIFY HANGERS AND SUPPORTS AND PROVIDE DETAILS TO ASSURE PROPER SUPPORT AND TO ACCOMMODATE THE THERMAL EXPANSION OF PLASTIC PIPE.

- E. Plastic Piping: Hang and support in compliance with manufacturer's recommendations. At hangers and supports, including "Unistrut®" style channel supports, install to prevent plastic pipe contact with metal (exception: angle iron may be used for continuous support, provided all sharp edges are removed). Anchor piping only where required for expansion loops or to protect against pressure surges, etc. Compression style clamps/supports shall not be used. Use plastic pipe sleeves or equivalent as guides at all other locations, to allow longitudinal thermal expansion and to prevent lateral pipe movement. Compression style riser clamps shall not be used, use other support methods such as supporting at fitting shoulders. Support valves and other significant weight components independent of pipe. Space hangers no farther than manufacturer's recommendations for the application temperature but in no case farther than recommended for 100 deg. F application temperature. Continuously support all piping 1.5-inch nominal diameter or less (exception: PVC pipe connected to sump pumps). Provide thrust restraints where piping is subject to cyclic pressure surges, e.g. on/off pump applications.

3.9 INSTALLATION OF PIPE SLEEVES:

- A. Install pipe sleeves where piping passes through building construction including all walls, floors and ceilings.
- B. For new wall construction, promptly and accurately locate and securely set sleeves in forms before concrete is poured. For masonry construction, set the sleeves over the piping for Masonry Contractor to build around.

3.10 INSTALLATION OF STRAINERS:

- A. Provide Y-strainers in steam, condensate, or water piping preceding control valves, traps, pumps, pressure regulating valves and elsewhere as shown on drawings.
- B. Install strainer elements prior to flushing piping. Remove, clean and reinstall during flushing.

3.11 TRENCHING AND BACKFILLING:

USE THIS ARTICLE ONLY IF NOT COVERED IN ANOTHER DIVISION.

- A. All trenching and backfilling required for the proper installation of the work shall be done as prescribed in other Divisions.
- B. Excavate trenches so that pipe can be installed at proper depth. Lay pipe on a firm bed bearing its full length except at the bell. Where sewers are installed in backfilled areas, provide machine tamping and be responsible for any settling at, or rupture to the sewer work. Keep trenches water free and as dry as possible during bedding, laying and jointing. After the joints are made, place sufficient backfill along each side of pipe to offset conditions that might tend to move the pipe off line and grade.
- C. Backfill only after pipes have been tested, inspected and approved.

- D. Piping encountered in excavating, (if shown on the drawings or not), shall be supported, and protected from damage. If utility lines are encountered, notify the Owner's Representative and do not disturb the lines unless so directed. If existing utility lines are damaged during excavations, immediately repair the lines at no cost to the Owner.
- E. Storm and sanitary piping may be installed side by side in same trench. Water piping may be installed in same trench with drainage piping, provided trench is benched so the water pipe may be laid on a shelf of firm earth not less than eighteen inches (18") above top of drain pipe.
- F. No excavation for pipe shall be made in filled or disturbed earth until it has been compacted as directed.
- G. Restore street pavements, curbs and sidewalks disturbed in the performance of this work. Restore in a manner prescribed by authorities having jurisdiction.
- H. Where mains are to pass under roadways or in any locations where open ditches are dangerous or undesirable, the work is to be installed by tunneling. In all other locations, excavations shall be done by the open trench method and to the depths and widths as may be necessary. All material excavated shall be deposited on the sides of the trenches and beyond the reach of slides.
- I. Supports:
 - 1. Where lines pass under footings for walls or columns, or lower than adjacent footings, backfill trenches with concrete up to the level of the bottom of the footings.
 - 2. Where pipes pass over column footings, or are laid in filled ground, or above the original natural grade, or in soil of insufficient bearing quality, or in other cases where necessary, they shall be supported by creosoted timbers carried by brick piers or piles or other approved supports carried down to firm bearing as approved.
- J. Provide shoring, bracing or sheet piling necessary to maintain the banks of the excavations, or tunnels. Take same out as the work is backfilled. Shoring must prevent any movement of the trench banks and strains on the piping and utility lines.

3.12 FLUSHING AND CLEANING OF PIPING:

- A. Flush and clean the following piping systems:

CUSTOMIZE FOR SPECIFIC PROJECT, IN CONJUNCTION WITH COMMISSIONER.

Domestic Cold Water (flush only)
 Domestic Hot Water (flush only)
 Steam and Condensate (flush only)
 Chilled Water Supply and Return (flush and clean)
 Heating Hot Water Supply and Return (flush and clean)
 Cooling Tower Water Supply and Return (flush and clean)

- B. Develop plan for flushing and cleaning piping. Submit plan for approval prior to completion of piping. Provide all temporary and permanent piping, equipment, materials necessary to complete flushing and cleaning.
- C. Prior to flushing, swab out underground piping to remove all particulate.
- D. Prior to flushing, temporarily remove, isolate or bypass dirt sensitive equipment and devices, including the following:

LIST BELOW TO SUIT PROJECT

- 1. Automatic flow control valves
 - 2. Heating and cooling coils
 - 3. Boilers
 - 4. Chillers
 - 5. Heat exchangers
 - 6. Flow measuring devices
- Reinstall after flushing is complete.

- E. Prior to flushing, install fine mesh construction strainers at inlet to all equipment. Install fine mesh construction element in permanent strainers. During flushing and cleaning, remove and clean strainers periodically. At completion of final flush, clean permanent strainers, remove construction strainers.

CUSTOMIZE THE FOLLOWING PARAGRAPH IN CONJUNCTION WITH U-M PROJECT MANAGER AND COMMISSIONER. IDEALLY, PIPING SHOULD BE FLUSHED A MINIMUM OF ONE HOUR AT 6' PER SECOND. IN PROJECTS WHERE THIS IS SPECIFIED AND NO WATER SOURCE IS IMMEDIATELY AVAILABLE, HAVE CONTRACTOR PROVIDE SOURCE OF WATER, PIPING, HOSES AND PUMPS AS REQUIRED TO FLUSH PIPING.

- F. Flushing for new piping: Flush all piping with cold water (or fire protection system where approved by owner) for a minimum of one hour, until water runs clear. Water supply shall be equivalent to piping to be flushed. Use (2) 2-1/2" fire hose connections for piping 3" and larger. Drain all low points.

THE FOLLOWING PARAGRAPH IS TYPICALLY USED FOR CLEANING A COMPLETE HYDRONIC SYSTEM USING SYSTEM PUMPS, CIRCULATING THROUGH THE ENTIRE SYSTEM. NOT APPLICABLE FOR MINOR PIPING MODIFICATIONS.

- G. Chemical Cleaning for new and existing hydronic piping: Where flushing could not be completed at 6 feet per second, or where chemical cleaning is required for new and existing piping, circulate flush water and clean strainers prior to installing cleaning chemicals. Provide cleaning chemicals, under the direction of the owner's chemical supplier. Following flushing, install cleaning chemicals and circulate through the entire system for a minimum of one hour, or as directed by chemical supplier. Take water sample for owner's use. Drain system, including all low points. Flush, drain and fill system, circulate for one hour, sample for owner's use. Drain, flush, fill, circulate and sample until system is free of cleaning chemicals, as indicated by owner's analysis of samples.

EDIT BELOW, ADD ESTIMATED SYSTEM VOLUME.

- 1. Estimated system volume for Hot Water Heating System:
- 2. Estimated system volume for Chilled Water System:

3. Estimated system volume for Condenser Water System:

THE FOLLOWING PARAGRAPH IS NOT TYPICALLY USED. DELETE, OR EDIT CAREFULLY FOR SPECIFIC PROJECT

H. Special Provisions for Chemical Cleaning: Provide temporary pumps and piping to chemically clean piping at a minimum velocity of 6 fps without using the system pumps. Otherwise comply with chemical cleaning requirements stated above. These special provisions are required for the following piping systems:

1. _____
2. _____
3. _____

THE FOLLOWING PARAGRAPH IS NOT TYPICALLY USED. DELETE, OR EDIT CAREFULLY FOR SPECIFIC PROJECT

I. Provide temporary bypass piping around the following equipment:

1. _____
2. _____
3. _____

3.13 PIPING SYSTEMS PRESSURE TESTING

A. General

1. Test new systems only, from point of connection to the existing systems. Perform initial tests and correct deficiencies prior to requesting acceptance test.
2. Perform acceptance pressure tests in the presence of the authorities having jurisdiction. Acceptance tests must be satisfactorily completed before piping surfaces are concealed.
3. Pneumatic tests shall be conducted using dry, oil free compressed air, carbon dioxide or nitrogen. Evacuate personnel not directly involved in testing prior to performing pneumatic testing. Perform testing in two stages, initial and acceptance. Conduct initial testing at 5 PSI or less. Swab joints with a commercial leak detector. Repair deficiencies prior to testing at higher pressures. Under no circumstances shall plastic piping of any type be pneumatically tested, including pre-acceptance tests.
4. Components shall be removed or isolated during testing if damage may occur due to test pressure and/or test media.
5. Existing steam and hot water piping connected to piping to be tested shall be shutoff, drained and cooled before testing.

B. Acceptance Pressure Testing:

NOTE THAT THIS SPEC DOES NOT INDICATE ACTUAL PRESSURE TESTING VALUES. IT IS NECESSARY TO INCLUDE A PRESSURE TEST TABLE, SUCH AS THAT AVAILABLE FROM THE U-M AEC WEBSITE, ON THE PROJECT DOCUMENTS. EDIT THE TABLE TO MAKE IT PROJECT SPECIFIC. ALSO EDIT BELOW PARAGRAPH AS APPROPRIATE.

1. Perform acceptance pressure testing per table found on the drawings, or if a table is not provided, per UM website: <http://www.umaec.umich.edu/for.archs/StandardDetails.html>.
2. Remake leaking gasket joints with new flange bolting. Where welded joints fail, submit proposed method of repair for approval by the Owner's representative and authorities having jurisdiction.
3. For each system tested, provide a certificate testifying that the system was satisfactorily tested and passed, using owner furnished forms.

3.14 FLUSHING, DISINFECTING, AND TESTING DOMESTIC WATER

- A. Flush, disinfect and test domestic water piping as follows:
 1. Prior to disinfection, flush all domestic water piping as described under Flushing and Cleaning of Piping.
 2. Purge and disinfect domestic water piping per plumbing code and City of Ann Arbor requirements. Do not use excessive amounts of disinfectant as it may damage piping seals.
 3. Submit water samples in sterile bottles to the City of Ann Arbor. Repeat the procedure if the biological examination made by the City of Ann Arbor shows evidence of contamination.
- B. Prepare reports for all purging and disinfecting activities. Furnish owner final copy of test results for acceptance.

3.15 DYE TESTING - STORM AND SANITARY WASTE

DYE TESTING IS TYPICALLY REQUIRED ON ALL UNDERGROUND STORM AND SANITARY CONNECTIONS, NEW CONNECTIONS TO CONCEALED STORM AND SANITARY PIPING, AND ON ALL PROJECTS CONTAINING MORE THAN 10 NEW PLUMBING FIXTURES. DYE TESTING LINK UPDATED IN 2 PLACES BELOW ON 10/1/13 PER REQUEST OF JODY SCHAUB OF U-M EHS ON SAME DATE.

- A. Conduct Dye Testing on storm and sanitary piping connections as specified herein and in compliance with U-M EHS "Dye Testing Guidelines for Storm Water and Sanitary Systems" (Refer to <http://www.ehs.umich.edu/environment/dye.shtml>).
1. Dye testing is not required if all of the following apply:
 - a. Minor renovation with fewer than 10 total fixtures.
 - b. All piping can be clearly, visually traced back to clearly labeled existing piping.
 - c. No new underground connections.
- B. Preconstruction Phase: Prior to beginning demolition and construction activities:
 1. Identify point of connection for all storm and sanitary connections. Provide pipe labels on existing piping if required for clear identification.
 2. Identify dye test validation points in conjunction with U-M EHS (in general, first manhole outside the building).
 3. Develop dye testing plan in conjunction with U-M EHS and U-M Project Manager or assignee.
- C. Demolition and Construction Phase:

1. Furnish dye and conduct dye testing of all new connections to new and existing storm and sanitary piping prior to making connection. Coordinate testing with U-M Project Manager, U-M EHS and U-M Code Inspector. No dye testing shall be performed without explicit consent of code inspector. (Refer to <http://www.ehs.umich.edu/environment/dye.shtml> for dye requirements.)
 2. Correct any cross-connect conditions revealed by the testing and retest to validate corrections.
- D. Post-Construction:
1. Conduct additional dye testing at plumbing fixtures when instructed by U-M EHS (where new illicit connection is suspected).

3.16 MECHANICAL SYSTEM FLUID HANDLING

- A. Glycol Handling:
1. Disposal of glycol (propylene or ethylene) into Sanitary Waste or Storm Water systems is strictly forbidden by City of Ann Arbor regulations, U-M EHS Department, and State of Michigan requirements.
 2. Where indicated, remove and properly dispose of glycol mixture from hydronics systems. Drained mixture and associated flush water (flushing must be done until the water leaving the system has allowably low levels of glycol per U-M EHS - 4 system flushes minimum) is considered Liquid Industrial Waste unless otherwise notified by U-M EHS. Mixture shall be removed and disposed of by U-M EHS approved sub-contractors only. Contact U-M EHS HazMat at (734) 763-4568 for current approved sub-contractors

DIVISION 22 PLUMBING

SECTION 221119 - DOMESTIC WATER PIPING SPECIALTIES

REVISIONS:

8-1-99: CONTENT APPROVED AS NEW MASTER

8-11-99: REVISED TO VBS.DOT TEMPLATE

7-19-12: ADDED (2.1) THAT SEALS ARE TO BE IMMUNE FROM CHLORAMINES AND THAT EPDM SEALS ARE TO BE PEROXIDE CURED. D. KARLE FOR PLMG MTT.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

2015-06-30 REVISED CITY WATER METER ARTICLE TO INDICATE PURCHASED BY OWNER, INSTALLED BY CONTRACTOR, AND TO INDICATE LOCATIONS, ALL TO MATCH STANDARD DETAILS AND DG. D.KARLE FOR PLMG MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide piping, fittings, and specialties up to point 5 feet beyond the building for the following systems:
 - 1. Domestic Cold Water System
 - 2. Domestic Hot Water System

1.3 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.

1. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
2. U.S Safe Drinking Water Act.

PART 2 - PRODUCTS

2.1 GENERAL

- A. All wetted seals shall be made from materials that are immune from chloramine degradation. EPDM seals shall be peroxide cured.

2.2 PIPING SPECIALTIES

- A. Water Hammer Arresters: Certified per PDI Standard WH-201. Bellows type, with stainless steel casing and bellows, pressure rated for 250 psi. Piston type, precharged to 60 psig, suitable for installation in any position.
Manufacturers: (Bellows) Zurn Shoktrol or by J.R. Smith, Wade; (Piston) Sioux Chief, Zurn, J.R. Smith, Wade

SPEC EDITOR: WALL FAUCETS ARE INEXPENSIVE ALTERNATIVE TO WALL HYDRANTS. CHROME PLATE AND T-KEY HANDLE ARE OPTIONS.

- B. Wall Faucet - Freezeless: Bronze body, extended stem to suit wall construction, renewable composition disc, wheel handle, 3/4 inch MPT inlet, hose outlet with integral vacuum breaker.
Manufacturers: Woodford 15, J. R. Smith, Chicago, Zurn
- C. Wall Faucet - for indoor use: Bronze body, renewable composition disc, wheel handle, 3/4 inch FPT inlet, hose outlet with integral vacuum breaker.
Manufacturers: Woodford 24, J. R. Smith, Chicago, Zurn

SPEC EDITOR: SELECT FROM 2 OPTIONS BELOW.

- D. Recessed Nonfreeze Wall Hydrants: Brass box with chrome-plated face, hinged locking cover, brass body and casing, T-Key handle, vacuum breaker, 3/4-inch FPT inlet, hose outlet, inlet stem to suit wall construction.
Manufacturers: Woodford B65, J. R. Smith, Chicago, Zurn
- E. Exposed Nonfreeze Wall Hydrants: Chrome plated brass body, T-Key handle, vacuum breaker, 3/4-inch inlet, and hose outlet, inlet stem to suit wall construction.
Manufacturers: Woodford 65, J. R. Smith, Chicago, Zurn
- F. Vacuum Breakers: Hose connection vacuum breakers shall conform to ASSE Standard 1011, with finish to match hose connection.
Manufacturers: Chicago, Watts, Kewanee

SPEC EDITOR: ITEMS G THROUGH K ARE USED FOR PROTECTING DOMESTIC WATER SYSTEMS FROM CONTAMINATION. SELECT APPLICABLE ITEMS CAREFULLY, AND COORDINATE WITH DETAILS. GENERALLY, SIZE OR CAPACITY SHOULD BE ADDED TO DRAWINGS, INCLUDING FLOW AND ALLOWABLE PRESSURE DROP.

SPEC EDITOR: ITEM G BELOW IS USED FOR LARGE HIGH HAZARD CONNECTIONS, INCLUDING BUILDING MAIN, FIRE PROTECTION BRANCH, BOILER FEED. DRAIN IS REQUIRED.

- G. Backflow Preventer - Reduced Pressure Zone: Includes dual check valves, reduced pressure relief valve and air vent, shutoff valves on inlet and outlet, strainer on inlet, test ports with test cocks, manufacturer's standard materials. ASSE Standard 1013 certified.

Manufacturer: Watts 909 Series, Conbraco, Febco, Ames, Zurn-Wilkins

SPEC EDITOR: ITEM H BELOW IS USED FOR LARGE LOW HAZARD CONNECTIONS, INCLUDING COOLING TOWER MAKE-UP WHERE OUTLET IS ABOVE TOWER OVERFLOW. NO DRAIN IS REQUIRED.

- H. Backflow Preventer - Double Check Valve Assembly: Includes double check valves, shutoff valves on inlet and outlet, strainer on inlet, test ports with test cocks, manufacturer's standard materials. ASSE Standard 1015 certified.

Manufacturer: Watts 709 Series, Conbraco, Febco, Ames, Zurn-Wilkins

SPEC EDITOR: ITEM I BELOW IS USED FOR SMALL LOW HAZARD CONNECTIONS, INCLUDING ICE MACHINE AND WATER COOLERS. NO DRAIN IS REQUIRED.

- I. Backflow Preventer - Dual Check Valve: Includes two removable check valve assemblies, manufacturer's standard materials. ASSE Standard 1024 certified.

Manufacturer: Watts 7 Series, Conbraco, Febco, Ames, Zurn-Wilkins

SPEC EDITOR: ITEM J BELOW IS USED FOR SMALL HIGH HAZARD CONNECTIONS NOT SUBJECT TO CONTINUOUS PRESSURE, INCLUDING INDIVIDUAL FUME HOODS. MUST BE LOCATED OUTSIDE OF FUME HOOD, DOWNSTREAM OF SHUT-OFF VALVE. NO DRAIN IS REQUIRED. FOR NEW FUME HOODS, THIS PARAGRAPH IS NOT REQUIRED, IT SHOULD BE INCLUDED IN HOOD SPECIFICATION

- J. Atmospheric Vacuum Breaker - Single float and disc with large atmospheric port. Angle pattern brass body, with chrome plated finish, ½" inlet and outlet unless otherwise noted. ASSE Standard 1001 certified.

Manufacturer: Watts 288A Series, Chicago Water Saver Model L-102, B & G

SPEC EDITOR: ITEM K BELOW IS USED FOR SMALL HIGH HAZARD CONNECTIONS SUBJECT TO CONTINUOUS PRESSURE, INCLUDING GANGED FUME HOODS. MUST BE LOCATED OUTSIDE OF FUME HOOD. NO DRAIN IS REQUIRED.

- K. Pressure Type Vacuum Breaker - Spring loaded single float and disc with independent first check valve, manufacturer's standard materials, with test cocks and ball type isolation valves. ASSE Standard 1020 certified. Manufacturer: Watts 800 Series, Conbraco, Febco, B & G.

SPEC EDITOR: ITEM L BELOW IS USED FOR AUTOMATIC FILL FOR HW HEATING AND CHILLED WATER SYSTEMS. EDIT BELOW FOR OTHER APPLICATIONS. INDICATE FLOW RATES AND INLET AND OUTLET PRESSURES ON THE DRAWINGS.

- L. Pressure-Regulating Valves: Single-seated, direct-operated type, having bronze body with integral strainer and complying with requirements of ASSE Standard 1003. Select proper size for maximum flow rate and inlet and outlet pressures indicated. Manufacturer: B&G Model 350, Conbraco, Watts, Hoffman, Keckley, Leslie, Spirax-Sarco.

SPEC EDITOR: ITEM M BELOW IS USED FOR DOMESTIC WATER HEATERS. IT IS USUALLY SPECIFIED WITH WATER HEATER OR OTHER EQUIPMENT. COORDINATE.

- M. Combined Pressure-Temperature Relief Valves: Bronze body, test lever, thermostat, ANSI Z21.22. Factory set at 210 degrees F, and 150 psig. Size valves in accordance with ASME Boiler and Pressure Vessel Codes. Manufacturers: Watt series 40, 140, 240, 340, Spirax-Sarco, Leslie

2.3 WATER METER

SPEC EDITOR: APPROACH SPECIFIED BELOW IS THE USUAL METHOD. SIZE SHOULD BE COORDINATED BY DESIGNER, AND INDICATED ON DRAWINGS. USE DETAIL "WATMETR"

- A. General: City water meters (domestic water at building entrance, cooling tower make-up and blow down, and irrigation meters) and associated remote read-out devices shall be obtained from the City of Ann Arbor (paid for by the owner) and installed by the contractor. Coordinate piping rough in and installation with the City of Ann Arbor.

PART 3 - EXECUTION

3.1 INSTALLATION OF PIPING SPECIALTIES

SPEC EDITOR: VERIFY LOCAL AUTHORITY REQUIREMENTS.

- A. Install backflow preventers and vacuum breakers where shown on drawings, in compliance with the plumbing code and authority having jurisdiction. Install air gap fitting and pipe relief (where applicable) to sanitary waste. Test backflow prevention for proper operation. Tests shall be by Certified Tester. Provide Owner with one (1) copy of each backflow prevention test report.
- B. Install water hammer arrestors complete with accessible isolation valve on hot and cold water supply piping to lavatories and sinks.

SPEC EDITOR: DISINFECTING IS TYPICALLY REQUIRED FOR LARGE DOMESTIC WATER SYSTEMS ONLY. DISINFECTING IS ALSO REQUIRED FOR ANY PIPING UPSTREAM OF THE BACKFLOW PREVENTER THAT PROTECTS THE CITY WATER SYSTEM. FLUSHING AND SAMPLING IS TYPICALLY ALL THAT IS DONE ON SMALL PROJECTS. SELECT FROM THE TWO APPROACHES SPECIFIED BELOW.

SPEC EDITOR: SELECT 3.2 BELOW FOR LARGE PROJECTS:

3.2 FLUSHING, DISINFECTING AND TESTING

- A. Flush, disinfect and test domestic water piping as follows:
 - 1. Flush all domestic water piping per Related Section 221113.
 - 2. Purge and disinfect domestic water piping per City of Ann Arbor requirements.
 - 3. Submit water samples in sterile bottles to the City of Ann Arbor. Repeat the procedure if the biological examination made by the City of Ann Arbor shows evidence of contamination.
- B. Prepare reports for all purging and disinfecting activities. Furnish owner final copy of test results for acceptance.

SPEC EDITOR: SELECT 3.3 BELOW FOR SMALL PROJECTS:

3.3 FLUSHING AND TESTING

- A. Flush and test domestic water piping as follows:
 - 1. Flush all domestic water piping per Related Section 221113.
 - 2. Submit water samples in sterile bottles to the City of Ann Arbor. Repeat the procedure if the biological examination made by the City of Ann Arbor shows evidence of contamination.
- B. Furnish owner final copy of test results for acceptance.

SECTION 221123 - DOMESTIC-WATER PACKAGED BOOSTER PUMPS

END OF CONTENTS TABLE

SPECIFICATION SECTION ISSUED 7-16-12.

ADDED SECTION 2.7.B, INDICATING THAT ONE VFD PER PUMP IS TO BE PROVIDED. D. KARLE FOR MTT, NOV. 6, 2012.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

DIVISION 22 PLUMBING

SECTION 221123 - DOMESTIC-WATER PACKAGED BOOSTER PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

SPEC EDITOR: IN ARTICLE BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT.

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019110/019100 - Commissioning
3. Section 221113- Piping Materials and Methods
4. Section 220523 - Valves
5. Section 220519 - Thermometers, Pressure Gauges, and Accessories
6. Section 220513 - Motors
7. Section 232123 - Pumps
8. Section 220548 - Vibration Control
9. Section 220719 - Mechanical Systems Insulation
10. Section 220514 - Variable Frequency Drives
11. Section 230900 - Mechanical Systems Controls
12. Division 26 - Electrical

1.2 SUMMARY

- A. Packaged, skid mounted, domestic water booster pump system including pumps, starters or variable frequency drives (VFDs), controls, piping, valves, hydro-pneumatic tanks, and accessories.

1.3 SUBMITTALS

- A. Product Data: Include catalog illustrations, model, rated capacities, performance, weights, dimensions, component sizes, rough-in requirements, piping and wiring diagrams and details, materials of construction, accessories, operating and maintenance clearance requirements. Wiring diagrams shall be project specific, and differentiate between factory wiring and field wiring. Include shop drawings and fabrication drawings for equipment indicating piping connections, power and utility requirements, rigging, installation and support details and instructions. Include written sequence of operations for all controls. Additionally include:

1. Overall dimensional drawing and weight of the pump package
2. Pump submittal including individual pump curves and composite curve for booster package

3. Starter submittal (non-VFD equipped packages)
4. For packages equipped with VFDs:
 - a. VFD submittal
 - b. Pressure sensor data including installation instructions and calibration procedures
5. Valve, pipe, pressure gauge, and motor submittals
6. Installation, operation, and maintenance manuals
7. Factory test reports
8. Hydro-Pneumatic Tanks:
 - a. Tank volume and tank acceptance volume
 - b. Bladder replacement instructions

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. American Water Works Association
 2. ANSI/HI 9.6.1-1998, NPSH Margin
 3. ANSI/HI 9.6.3-1997 Operating Region
 4. NEC-National Electrical Code
 5. National Electrical Manufacturers Association
 6. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 7. U.S Safe Drinking Water Act.
 8. Underwriters Laboratories Inc. listed as a manufacturer of packaged pumping systems under UL/CUL Category QCZJ.
 9. Underwriters Laboratories Inc. listed as a manufacturer of control panels under UL/CUL 508a.
- C. The pumping package shall be assembled by the acceptable manufacturers listed in Part 2. Manufacturers shall assume "Unit Responsibility" for the complete pumping package. Unit responsibility shall be defined as responsibility for interface and successful operation of all system components supplied by the pumping system manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Ship the pump package with entire skid in weather-proof wrap for storage outdoors. Protect control panels, pipe openings, and other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation. Comply with protection requirements for variable frequency drives (VFD) described in Related Section.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

SPEC EDITOR: SCHEDULE THE PUMP SKID PERFORMANCE DATA ON THE DRAWINGS, INCLUDING QUANTITY OF PUMPS, VFD.S, AND REMOTE PRESSURE SENSORS. CONSIDER CONSTANT VOLUME STAGED PUMP CONTROL WHEN FRICTION LOSSES ARE LOW RELATIVE TO FIXED HEAD (STATIC HEAD AND RESIDUAL PRESSURE) REQUIREMENTS.

2.1 ACCEPTABLE MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Armstrong
 - 2. Bell & Gossett
 - 3. Canariis
 - 4. Grundfos
 - 5. Paco

2.2 GENERAL

- A. Provide, as indicated and scheduled on the drawings, a UL labeled domestic water booster pump packaged system consisting of pumps, motors, controls, suction and discharged piping, hydro-pneumatic tanks, and all required accessories, mounted on a unitized structural steel support frame ("skid"). Hydro-pneumatic tank(s) shall be provided mounted on the skid when indicated on the drawings.
- B. Skid frame shall consist of welded A-36 structural steel support members designed to support all equipment, and rigid enough to withstand transportation to site, rigging, installation, and operation. Skid frame shall be suitable for floor mounting, and painted with two coat system consisting of oxide primer and alkyd enamel finish, minimum 3 mils dry film thickness. Provide holes in the base for the installation of anchor bolts and leveling of skid. Bolts to mount equipment components shall be stainless steel or zinc plated and shall meet ASTM Grade A193 B7.
- C. Pumps, valves and all wetted components shall be manufactured in compliance with NSF/ANSI-61 and NSF-61 Annex G.
- D. All elastomeric seals utilized in the skid including pump seals shall be immune from chloramine degradation.
- E. All components provided on the skid shall comply with Related Sections.
- F. Packaged system shall be rated for 300 PSIG working pressure at 250°F, or the system's maximum operating pressure and temperature at point where installed, whichever is greater, with a 3 to 1 pressure safety factor.

- G. Piping shall be in compliance with Related Section, either type L copper or (minimum) Schedule 10 type 304 stainless steel. Dissimilar metal piping shall not be used, ancillary piping including that associated with sensors shall be the same material as the suction and discharge manifolds. Provide welded or brazed flange connections at pumps, butterfly valves, and at suction and discharge connections (both ends of each manifold) to skid piping. Piping shall be sized to provide a maximum fluid velocity of 10 ft./sec. at the scheduled design flow rate. Header piping shall be easily removable to facilitate moving package through doorways.
- H. Provide isolation valves in compliance with Related Section. Valves 2-1/2" and larger shall be butterfly valves. Valves less than 2-1/2" shall be full-port ball valves. Provide isolation valves on the suction and discharge of each pump, and for each pressure gauge.
- I. Provide pressure gauges per related section, located on the suction and discharge of each pump.
- J. Provide a self-contained high temperature relief valve on the discharge of each pump, located between the pump and the downstream pump isolation valve. Factory set as required for project conditions.
- K. Provide a low point drain consisting of a ball valve and hose thread connection, in the suction and discharge header.

SPEC EDITOR: FOR VFD CONTROLLED PUMPS WHEN THE VFD IS EQUIPPED WITH A BYPASS, SPECIFY THE APPROPRIATE RELIEF VALVE PRESSURE SETTING IN THE PARAGRAPH BELOW. DRIVE BYPASSES ARE TYPICALLY NOT RECOMMENDED ON DOMESTIC BOOSTER PUMP APPLICATIONS.

- L. For VFD controlled pumps when the VFD is equipped with a bypass: Provide a pressure relief valve between the pump discharge and the pump downstream isolation valve, factory set at 125 PSIG.
- M. All control and power wiring shall be factory prewired on the skid. All exposed wiring shall be installed to minimize potential damage, and all power wiring, 110V and higher, shall be in a NEC compliant conduit system.
- N. Starters and variable frequency drives shall be mounted on the skid and configured to provide electrical clearances in compliance with the NEC. Examine installation area of skid and also adjust mounting locations in consideration of structures adjacent to the skid to provide NEC electrical clearances.

2.3 PUMPS

- A. Provide pumps of capacity and performance scheduled.

SPEC EDITOR: SELECT CLOSED COUPLE PUMP SPEC OR MULTISTAGE PUMP SPEC, BELOW, OR EDIT TO SPECIFY THE PUMP TYPE REQUIRED FOR YOUR PROJECT.

- B. Provide close coupled end suction pumps per Related Section with the following additional features:
 - 1. Lead free per NSF/ANSI-61 and NSF-61 Annex G.

2. Casing Construction: Bronze or stainless steel.
3. Impeller Construction: Bronze or stainless steel.
4. Replaceable casing wear rings.
5. Stainless steel shaft with replaceable bronze or stainless steel shaft sleeve completely covering the wetted area of the shaft under the seal.
6. Seals: Mechanical seals consisting of carbon rotating ring, stainless steel spring, ceramic seat, and flexible bellows and gasket.
7. Pump motors shall be secured to mounting frame, not supported by the volute alone.
8. Back pull-out design allowing servicing of pump internals without disturbing piping.

C. Provide multistage vertical mounted pumps.

1. Lead free per NSF/ANSI-61 and NSF-61 Annex G.
2. Casing Construction: Bronze or stainless steel.
3. Impeller Construction: Bronze or stainless steel.
4. Stainless steel shaft with replaceable bronze or stainless steel shaft sleeve completely covering the wetted area of the shaft under the seal.
5. Mechanical seal shall be silicon carbide/carbon with Viton or peroxide cured EPDM elastomers.
6. Pump motor coupler design shall allow seal replacement without having to remove motor.

SPEC EDITOR: TO REDUCE SPEC SIZE IT IS RECOMMENDED THAT THE CHECK VALVE TYPE (BELOW) NOT APPLICABLE TO THE PROJECT BE DELETED.

2.4 PUMP CHECK VALVES

A. For constant volume pump packages provide in-line combination pressure reducing/regulating/check valve as manufactured by Cla-Val Company.

1. Pilot operated, adjustable, spring-loaded, normally open diaphragm type valve.
2. Valve shall be sized for a maximum pressure drop of 10 PSIG at the scheduled flow rate for its respective pump.
3. Designed to permit flow when controlled pressure is less than the spring setting.
4. Suitable for working pressures up to 150 psig at 180°F.
5. Certified for potable water service and lead free, per NSF/ANSI-61 and NSF-61 Annex G. (Use of a fusion bonded epoxy barrier coating is permitted to provide conformance to NSF ANSI-61/NSF-61 Annex G.)
6. Flanged in accordance with ANSI B16.1, Class 125.
7. Valve body equal to nominal pipe diameter at all points through the valve(full port design).
8. Valve body and cover shall be constructed of ASTM A536 ductile iron.
9. Hydrostatically tested and seat tested to demonstrate zero leakage.
10. Locate check valves between the pump discharge and the pump downstream isolation valve.

- B. For variable speed pump packages provide non-slam resiliently hinged type check valves, "SWING-FLEX" as manufactured by Val Matic Valve and Manufacturing Corporation.
1. Suitable for working pressures up to 150 psig at 180°F.
 2. Full body type, with one moving part, the resiliently hinged disc.
 3. Bolted dome shaped access cover allowing replacement of resiliently hinged disk without removing valve from line.
 4. Certified for potable water service and lead free, per NSF/ANSI-61 and NSF-61 Annex G.
 5. Exterior and interior of the valve coated with an NSF/ANSI 61 approved fusion bonded epoxy coating.
 6. American Water Works Association Standard ANSI/AWWA C508 compliant.
 7. Flanged in accordance with ANSI B16.1, Class 125.
 8. Valve body equal to nominal pipe diameter at all points through the valve. The 4 in. valve shall be capable of passing a minimum 3 in. sphere.
 9. Hinged disk: One-piece construction, molded with integral o-ring type sealing surface, with alloy steel and nylon reinforcement in the flexible hinge area. Provide disc material compatible with domestic water service, unaffected by chloramines. Flex portion of disc shall be warranted for twenty-five years. The valve disc design shall have been cycle tested 1,000,000 times in accordance with ANSI/AWWA C508 and show no signs of wear, cracking, or distortion to the valve disc or seat and shall remain drip tight at all pressures.
 10. Disk seating surface on a 45 degree angle to minimize disc travel. 35 degree maximum disc stroke and memory disc return action to provide a cracking pressure of 0.25 psig.
 11. Valve body and cover shall be constructed of ASTM A536 ductile iron.
 12. Hydrostatically tested and seat tested to demonstrate zero leakage.
 13. Locate check valves between the pump discharge and the pump downstream isolation valve.

SPEC EDITOR: HYDRO-PNEUMATIC TANKS ARE RECOMMENDED FOR BOTH CONSTANT AND VARIABLE SPEED APPLICATIONS TO ALLOW NO-FLOW PUMP SHUT DOWN AND TO IMPROVE PRESSURE CONTROL. THE SPECIFICATION BELOW IS FOR LARGER STYLE TANKS WITH TANK VOLUMES OF APROX.50 GALLONS AND LARGER. SMALLER TANKS ARE TYPICALLY NOT AVAILABLE WITH THE REPLACEABLE BLADDER SPECIFIED BELOW. DESIGNER MUST PROVIDE TANK DIMENSIONS, VOLUME, ACCEPTANCE VOLUME, PRESSURE/TEMPERATURE RATING, AND PRECHARGE PRESSURE (PROJECT SPECIFIC, FIELD SET) ON THE DRAWINGS. FOR VERY LARGE TANKS IT IS RECOMMENDED THAT THE DESIGNER SPECIFY A "FULL ACCEPTANCE VOLUME" TANK (WHERE ACCEPTANCE VOLUME EQUALS TANK VOLUME), WHICH AVOIDS BLADDER DAMAGE IF THE AIR CHARGE IS LOST. IF TANK IS TO BE MOUNTED ON THE PUMP SKID, INDICATE SUCH ON THE DRAWING.

2.5 HYDRO PNEUMATIC TANKS

- A. Acceptable Manufacturers:

1. Amtrol
 2. Armstrong
 3. Wessels
- B. ASME rated, precharged, vertical style bladder tank with bottom system (water) connection.
1. NSF/ANSI-61 and NSF-61 Annex G listed for drinking water use.
 2. Replaceable (non-EPDM) butyl bladder, minimum 0.10 inch thick.
 3. Large flanged bladder service openings to allow bladder to be replaced without tipping tank on its side.
 4. Steel shell with red oxide exterior primer. FDA approved liner of polypropylene or epoxy.
 5. Rated for system pressure and temperature, but not less than 125 PSIG at 200F.
 6. Provide the following additional features: Tire valve style charging connection to permit on-site charging. Bronze or malleable iron water connection. Auxiliary gauge/pressure switch connection. Lift ring(s). Steel floor support skirt.

SPEC EDITOR: SELECT EITHER CONSTANT VOLUME OR VARIABLE VOLUME PUMP CONTROL BY DELETING ONE OF THE TWO BELOW ARTICLES.

2.6 STARTER AND CONTROLS - CONSTANT VOLUME PUMP PACKAGES

- A. Provide UL listed and labeled controller/starter assembly specifically designed for constant speed domestic water pumping applications.
- B. Pump staging shall be user-selectable based on kilowatts (kW), current (amps), or pressure (PSI).
1. kW shall be true power derived from a transducer. Amps shall be RMS obtained from the kW transducer. kW and amps shall be controller calibrated with calibration held in non-volatile memory. PSI shall be derived from a pressure transducer with a 4-20 mA analog output.
- C. The controller shall operate the pump(s) to provide the following sequence of operation:
1. Pump(s) shall be staged based on DESIGNER SELECT ONE: kilowatts/current/pressure.
 2. In the "AUTO" mode, the lead pump shall start upon initiation of the system either by activation of the "START" button or by digital input from the Owner's Building Automation System (BAS).
 3. The lead pump shall operate at the point on its curve where system demand is satisfied. If the lead pump is unable to satisfy demand, lag pumps shall be sequentially started as required to meet system demand.
 4. As demand decreases, the lag pumps shall be de-staged to minimize energy consumption.
 5. The system shall continue to operate, subject to the controller safety features and alarms, or a low/zero flow condition.

- a. The controller shall detect low/zero flow conditions. When the (user adjustable) low/zero flow condition limit is reached, the controller shall shut off the pump(s) and allow system demand to be provided by the hydro-pneumatic tank. The controller shall automatically restart the pumps as hydro pneumatic tank storage is depleted (user adjustable), to maintain the required system pressure/flow.
 6. In the event of a failure due to motor overload, the next pump in sequence shall be started.
 7. In the event of any safety/alarm condition, controller shall activate a common alarm contact hardwired back to the Owner's BAS system.
 8. The controller shall equalize pump run-times.
 9. In "MANUAL" mode, it shall be possible to manually turn individual pumps on and off. When a pump is started manually, controller safety and alarm features shall continue to operate including pump cut-out.
- D. The controller shall provide the following safety features and alarms:
1. Low suction pressure alarm and cut out(automatic reset)
 2. High suction pressure alarm and cut out(automatic reset) (suction pressure is sufficient to satisfy building demand)
 3. Low system pressure alarm
 4. High system pressure alarm and cut out (manual reset)
 5. Pump failure alarm
 6. High temperature alarm and cut out (automatic reset)
 7. Motor overload failure alarm (manual reset)
- E. The control enclosure shall conform to NEMA 1 and shall include motor starters, overloads, control power transformer and a digital microprocessor based controller with a NEMA 4 rated operator interface. Provide a single point electrical power connection that provides power to all controls.
- F. Controller shall be capable of operation in ambient conditions of 32°F to 140°F and a humidity range of 5% to 95%, non-condensing.
- G. The controller will include the following features:
1. Liquid crystal display user interface.
 2. Pump status indication.
 3. Alarms shall be displayed in plain English on the display.
 4. Fault information accessed by interrogating the controller through its HELP and log keys.
 5. Minimum one level of software password security provided for protection of field modifiable data.
 6. Data logging to provide historical information of key events with date and time stamps. Log information shall include alarms, pump run timers, system on-off times and pump cycle counters. The data log shall display the minimum, maximum and average values of temperature, pressure and flow. It shall also display kilowatt-hours.
 7. Capable of operating in automatic, manual or off-line diagnostic modes.
 8. A common alarm contact for hardwiring back to Owner's BAS system, which will activate when any alarm condition occurs.

- H. The controller shall be microcomputer based and hold its software in non-volatile memory. On-line field modified data entries, such as stage point, or method of staging, shall be stored in flash memory with capability to prevent accidental loss of data due to power loss, voltage surge or spike. In the event of a complete power outage, all field and factory settings shall remain stored and shall automatically be restored when power is restored.
- I. The controller shall be powered by 115V/1ph/60Hz AC power from a control power transformer provided within the control enclosure. The control panel shall be equipped with a regulated 24VDC power supply to power analog input signals. The controller shall be capable of receiving up to four 4-20 mA analog input signals and RTD signals.
- J. All external sensors/transmitters and switches shall be powered by the controller through its integral 24VDC power supply. Over voltage and short circuit protection shall be on-board. All analog circuits shall be protected from up to 575V with a fast-acting fuse and sacrificial input resistors. All digital outputs shall be externally isolated. The incoming power and I/O circuitry shall reject electromagnetic (EMI) and radio frequency interference.

2.7 VARIABLE FREQUENCY DRIVE (VFD) AND CONTROLS- VARIABLE VOLUME PUMP PACKAGES

- A. Provide UL listed and labeled variable speed drive(s) and controller assembly specifically designed for variable speed domestic water pumping applications. The controller shall provide multi-pump parallel operation control, duty-standby pump selection, automatic alternation and automatic transfer to the standby pump upon pump/VFD failure.
- B. Unless noted otherwise, provide a separate variable frequency drive for each pump.
- C. The controller shall operate the pump(s) to provide the following sequence of operation:
 - 1. When the controller mode is in REMOTE, the pumping system shall start and operate automatically upon the closure of Owner's BAS contact.
 - 2. When the controller mode is in LOCAL, the pumping system shall start immediately and operate automatically.
 - 3. It shall be possible to manually turn individual pumps on and off. When a pump is started manually, controller safety and alarm features shall continue to operate including pump cut-out.

SPEC EDITOR: INDICATE QUALITY AND LOCATION OF REMOTE PRESSURE SENSORS ON THE DRAWINGS. PRESSURE SENSORS LOCATED AT THE PUMP SKID DEFEAT THE PRIMARY ADVANTAGE OF VFD PUMPING SYSTEMS AND ARE NOT RECOMMENDED.

 - 4. The controller shall control pump speed based on remote mounted pressure transmitter(s), quantity as indicated on drawings.

5. The pump logic controller shall compare each remote pressure transmitter signal ("process variable") to the user adjustable set point. It shall be possible to set an individual setpoint for each process variable location.
 6. When the process variable set points at all locations are satisfied the pump speed shall remain constant at the optimum energy consumption level.
 7. The controller shall continuously scan and compare each process variable to its individual set point and control to the least satisfied zone.
 8. If the set point cannot be satisfied by the designated lead pump, the controller shall initiate a timed sequence of events to stage on a lag pump.
 9. The lag pump shall accelerate resulting in the lead pump(s) decelerating until they equalize in speed.
 10. Further changes in process variable shall cause the pumps to change speed together.
 11. As the worst case zone deviates from set point, the controller shall send the appropriate analog signal to the VFD to speed up or slow down the pump(s).
 12. When the set point can be safely satisfied with fewer pumps, the controller shall initiate a timed pump de-stage sequence and continue variable speed operation.
 13. The controller shall provide end-of-pump-curve point protection.
 14. In the event of any safety/alarm condition, controller shall activate a common alarm contact hardwired back to the Owner's BAS system.
 15. The system shall continue to operate, subject to the controller safety features and alarms, or a low/zero flow condition.
 - a. The controller shall detect low/zero flow conditions. When the (user adjustable) low/zero flow condition limit is reached, the controller shall shut off the pump(s) and allow system demand to be provided by the hydro pneumatic tank. The controller shall automatically restart the pumps as hydro pneumatic tank storage is depleted (user adjustable), to maintain the required system pressure/flow.
 16. In the event of a VFD fault, the controller shall automatically initiate a timed sequence of events to start the redundant pump/VFD set in the variable speed mode.
 17. In the event of the failure of a sensor/transmitter, its process variable signal shall be removed from the controllers scan/compare program and a plain English alarm message shall be displayed.
 18. In the event of failure to receive a pressure variable signal, a user selectable number of the VFDs shall maintain a user adjustable speed; reset shall be automatic upon correction of the sensor failure.
 19. The controller shall equalize pump run-times.
- D. The controller shall provide the following safety features and alarms:
1. Low suction pressure alarm and cut out(automatic reset)
 2. High suction pressure alarm and cut out(automatic reset).
(suction pressure is sufficient to satisfy building demand)

3. Low system pressure alarm
 4. High system pressure alarm and cut out (manual reset)
 5. Pump failure alarm
 6. High temperature alarm and cut out (automatic reset)
 7. Motor overload failure alarm (manual reset)
- E. The control enclosure shall conform to NEMA 1 and shall include a control power transformer and a digital microprocessor based controller with a NEMA 4 rated operator interface. Provide a single point electrical power connection that provides power to all controls.
- F. Controller shall be capable of operation in ambient conditions of 32°F to 140°F and a humidity range of 5% to 95%, non-condensing.
- G. The controller will include the following additional features:
1. Liquid crystal display user interface.
 2. Pump status indication.
 3. Alarms shall be displayed in plain English on the display.
 4. Fault information accessed by interrogating the controller through its HELP and log keys.
 5. Minimum one level of software password security provided for protection of field modifiable data.
 6. Hydraulic stabilization program with proportional-integral-derivative control, providing smooth pump start-up, speed control, and pump stage and de-stage; and shall prevent damaging hydraulic conditions including motor overload, pump flow surges, and hunting. PID values shall be field adjustable.
 7. Display readout shall display the following values at minimum:
 - a. Pressures at each remote pressure sensor (PSIG)
 - b. Skid discharge pressure (PSIG)
 - c. Skid total flow (GPM)
 8. Data logging to provide historical information of key events with date and time stamps. Log information shall include alarms, pump run timers, system on-off times and pump cycle counters. The data log shall display the minimum, maximum and average values of temperature, pressure and flow. It shall also display kilowatt-hours.
 9. Capable of operating in automatic, manual or off-line diagnostic modes.
 10. A common alarm contact for hardwiring back to Owner's BAS system, which will activate when any alarm condition occurs.
 11. Shall meet Part 15 of FCC regulations pertaining to class A computing devices.
 12. Upon VFD fault(s), the pump controller shall display an alarm condition through a plain English message.
 - a. VFD fault indication shall be continuously displayed on the operator interface of the controller until the fault has been corrected and the controller has been manually reset.

13. Analog input resolution from flow meters and pressure sensors shall be 12-bit minimum, and the controller shall scan each analog input a minimum of once every 100 milliseconds. All sensor/transmitter inputs shall be individually wired to the pump logic controller for continuous scan and comparison function. All analog inputs shall be provided with current limit circuitry to provide short circuit protection and safeguard against incorrect wiring of sensors
14. The controller shall be microcomputer based and hold its software in non-volatile memory. On-line field modified data entries, such as stage point, or method of staging, shall be stored in flash memory with capability to prevent accidental loss of data due to power loss, voltage surge or spike. In the event of a complete power outage, all field and factory settings shall remain stored and shall automatically be restored when power is restored.
15. The controller shall be powered by 115V/1ph/60Hz AC power from a control power transformer provided within the control enclosure. The control panel shall be equipped with a regulated 24VDC power supply to power analog input signals. The controller shall be capable of receiving up to four 4-20 mA analog input signals and RTD signals.
16. All external sensors/transmitters and switches shall be powered by the controller through its integral 24VDC power supply. Over voltage and short circuit protection shall be on-board. All analog circuits shall be protected from up to 575V with a fast-acting fuse and sacrificial input resistors. All digital outputs shall be externally isolated. The incoming power and I/O circuitry shall reject electromagnetic (EMI) and radio frequency interference (RFI)

H. Variable Speed Drive

1. Provide variable speed drives per Related Section. The following features described in the Related Section are not required, except as necessary to meet other parts of this specification.
 - a. VFD manual across-the-line electrical bypass.
 - b. Local-Remote speed control switch
 - c. A run permissive circuit, separate from the safety interlock circuit, which prevents motor operation whether in drive or bypass mode. This circuit, via the customer's external contact device, signals the motor may run, provided the safety interlock contact(s) is made.
 - d. "Powered run mode" and "powered run request" circuits.
 - e. PID controller integral to VFD.
 - f. Auxiliary contacts that actuate when the motor is started in any mode.
 - g. Indicating lamp for "POWER AVAILABLE" and for "MOTOR ON BYPASS".

I. Pressure Transmitters

1. Two wire 24 VDC system providing 4-20mA output signal to pump controller. Waterproof NEMA 4 electrical enclosure with a 0.5" NPT conduit connection. 316 stainless steel wetted parts. Adjustable span. Maximum inaccuracy 0.5% of full span including linearity, hysteresis and repeatability errors. Range 0-50 PSIG. Provide higher range transmitters when required by system design or configuration. Capable of withstanding over pressurization of no less than 300 PSIG. Immune from radio frequency interference.

SPEC EDITOR: THE ARTICLE HEADING BELOW (IN HIDDEN TEXT) IS RESERVED FOR SPECIFYING A FLOW METER IF DESIRED. A FLOW METER IS NOT REQUIRED FOR PUMP CONTROL BUT COULD ASSIST IN TROUBLE SHOOTING. FOR VERY LARGE BOOSTER PUMP INSTALLATIONS A MAGNETIC FLOW METER SHOULD BE CONSIDERED DUE TO DURABILITY, ACCURACY, AND HIGH TURN-DOWN. A MAGNETIC FLOW METER CAN EASILY BE SPECIFIED BY REVISING THIS SECTION TO REFERENCE THE MAGNETIC FLOW METER SPECIFICATION FOUND IN SECTION 230900 - MECHANICAL SYSTEMS CONTROLS.

- J. Flow Meter

2.8 FACTORY TESTING

- A. Prior to shipment, hydrostatically and electrically test each unit, including all safeties and control functions. Test system with motors connected to starters or VFD output. Operate skid from 0 to 100% of design flow requirement and validate proper pump staging and speed control. Calibrate and test all safety features. Test all inputs, outputs and program execution specific to this application.
- B. The Owner's Representative shall be allowed to witness the factory testing. A report detailing the results of the factory test shall be provided. An officer of the manufacturer's company shall certify by signature that the report accurately reflects the test results, and that the package meets all performance requirements. The report shall clearly identify any performance requirements that were not achieved.

PART 3 - EXECUTION

SPEC EDITOR: WHEN REMOTE SENSORS ARE USED, COORDINATE DOCUMENTS TO PROVIDE SENSOR LOCATION AND CONDUIT/WIRING FROM SENSOR TO PUMP CONTROLLER. DESIGNER MUST SHOW SENSOR LOCATIONS ON PLANS.

3.1 EXAMINATION AND PREPARATION

- A. Rig units off delivery trucks. Comply with Manufacturer's rigging instructions.
- B. Store units protected from weather, dirt, water, construction debris, and physical damage. Support stored units at points as required by manufacturer.

- C. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Assure that required NEC electrical clearances will be available at skid mounted components such as VFDs, starters, control panels, and similar electrical equipment. Existing and new piping cannot run over skid control panels or skid VFDs. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Install skid and hydro-pneumatic tanks on support structures or concrete bases as indicated. Install skid vibration isolation when indicated or required by Related Section. Set skid base level, using stainless steel shims and metal blocks designed for leveling machinery bases. Anchor base to floor using all mounting holes.
- C. Install separate devices furnished by skid manufacturer and not factory installed, including but not limited to pressure transmitters and flow meters. Install such devices in compliance with Related Sections.
- D. Connect suction and discharge headers to building piping using flexible piping connectors per Related Section, whether indicated or not. Cap unused ends of skid manifolds.
- E. Install flow meters and pressure transmitters when included or required. Final termination of devices (both ends) shall be accomplished by the factory service technician.
 - 1. Install flow meters per flow meter manufacturer's recommendations and with the recommended up and downstream straight lengths of pipe. Install piping as required to provide these straight lengths. When manufacturer does not indicate the required up and downstream requirements, provide a minimum of 5 pipe diameters upstream and downstream of straight pipe. Provide wiring in conduit between the flow meter and the skid controller.
 - 2. Install pressure transmitters at locations specified on the drawings.
 - a. Install pressure transmitters in locations easily accessible for calibration and replacement.
 - b. Install ball type isolation valve to isolate the pressure transmitter.
 - c. Provide a pressure gauge at the same location as each pressure transmitter, to validate pressure transmitter reading.
 - d. Provide wiring in conduit between the pressure transmitter and the skid controller.
 - 3. Install wiring in conformance with Related Section (Mechanical Systems Controls), utilizing approved contractors listed in that section.
- F. Install hydro pneumatic tanks as indicated on the drawings.

1. Install to maintain manufactures specified clearance above tanks, minimum 18 inches.
 2. Connect to system piping. Provide separate isolation valve and drain valve with hose bib for each hydro-pneumatic tank.
 3. Install pressure gauge (or switch when indicated) on hydro-pneumatic tank auxiliary air connection.
 4. Isolate each tank from the system, drain the tank, then charge to specified precharge pressure. If precharge pressure is not indicated, obtain from project engineer. Factory precharge is not to be considered the correct precharge pressure. Commissioner shall witness the setting of precharge pressure.
- G. Complete all manufacturer's pre-start checks.
- H. Prior to placing system into operation, sanitize skid piping, hydro-pneumatic tanks, and any building piping not previously sanitized. Assure sanitizing solution enters each hydro-pneumatic tank. Provide temporary piping and bypasses as required to accomplish sanitization.
- I. Insulate skid piping and hydro-pneumatic tanks; materials and installation per Related Section.

3.3 TEMPORARY SERVICE

- A. Start units for temporary use only with the express written permission of the Project Manager and in compliance with all requirements of the Contract Documents.
- B. Prior to placement into temporary service perform manufacturer's pre-start protocols.
- C. Utilize factory trained service technician to perform start-up as described under the Field Quality Control article. Commission prior to putting into temporary service to the extent required by the Commissioning Authority. Re-perform factory service technician start-up and all commissioning activities prior to Owner acceptance, even if previously completed to ready for temporary service.
- D. Perform all required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store log at unit during temporary use period and include log as part of the final O & M manual.

3.4 FIELD QUALITY CONTROL

- A. Provide a factory trained service technician to perform start-up services. The service technician shall perform the following:
 1. Verify correct installation and organize, instruct and assist the mechanical contractor's personnel in start-up procedures
 2. Terminate all control wiring connections associated with the skid.
 3. Perform manufacturer's pre-start checks.
 4. Set all safety devices.
 5. Start skid controller and VFDs. Set all controller and VFD parameters. Tune the controller.

6. Commission the pump package, including demonstrating all safeties, proper pump staging, de-staging, and speed control, zero-flow shutdown, restart after power failure, and all other skid features.
 - a. Optimize the setpoint of each pressure transmitter control variable to the minimum pressure (with reasonable safety factor) required for the plumbing fixtures actually installed. Obtain preliminary setpoints in advance from project engineer. Adjust setpoints under the direction of the Commissioning Authority.
 - b. On constant volume pump packages, adjust pump pressure regulating valves to provide adequate pressure at the most remote plumbing fixture (with reasonable safety factor). Set controller to specified staging method (kW/amps/pressure); reset to another staging method and adjust controller parameters as required to provide proper performance.
7. Provide a written service report prepared on site and submitted at the time of each service visit (with copies immediately provided to the Owner and Commissioner). Report shall indicate services provided and list all controller settings, PID settings, and set points.
8. Train Owner personnel. Training and start up services are separate functions and training shall not be combined with startup services.

3.5 COMMISSIONING

- A. Perform commissioning activities per Related Sections.

3.6 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.
 1. Provide 2 hours training minimum.

APPLICABLE PORTIONS OF 1.1 SCOPE OF WORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK

SPEC EDITOR: REVISE EDIT TO SUIT PROJECT

- A. Provide piping, fittings, and specialties up to point 5 feet beyond the building for the following systems:
1. Sanitary Waste and Vent System
 2. Storm Waste System
- B. This section specifies materials and installation for the following specialties:
1. Clean-outs
 2. Floor Drains
 3. Trench Drains
 4. Roof Drains
 5. Drainage Specialties (backwater valves, trap primers, neutralization tanks)

PART 2 - PRODUCTS

2.1 CLEAN-OUTS

SPEC EDITOR: STANDARD APPLICATION IS SPECIFIED BELOW. OTHER OPTIONS INCLUDE SQUARE COVER, RECESSED COVER, TRACTOR COVER, WATER TIGHT COVER, FLANGE AND CLAMP WITH MEMBRANE (FOR WET, ABOVE GRADE LOCATIONS). CONSULT CATALOG FOR SPECIAL APPLICATIONS.

- A. Floor Clean-Out: Cast iron body, round, adjustable, scoriated, secured, nickel-bronze top, threaded and slotted bronze closure plug, outlet connection to suit application. For carpeted floors, provide nickel bronze carpet clamping frame and cover. Manufacturer: Smith 4020 to 4031, Wade, Zurn
- B. Wall Clean-Out: Treaded bronze plug in cast iron tee or ferrule, with stainless steel cover.
- C. Exposed Clean-Out: Threaded plug, of material compatible with system piping.

2.2 FLOOR DRAINS

SPEC EDITOR: THE FLOOR DRAINS LISTED BELOW ARE STANDARD APPLICATION FLOOR DRAINS. ADD ADDITIONAL FLOOR DRAINS FOR SPECIALTY APPLICATIONS (HOSPITALS ETC.). OPTIONS INCLUDE: GRATE MATERIAL, SQUARE OR HINGED GRATES, SIDE OUTLETS, INTEGRAL BACKWATER VALVES, TRAPS, TRAP PRIMERS, 12" DIAMETER GRATES, ANIMAL ROOMS (WITH AUTO FLUSH), COATED BODY.

- A. General floor drain requirements: Unless otherwise noted, provide round strainer/ grate, cast iron body, seepage flange and clamping collar, bottom outlet same size as pipe served, with caulked, no-hub or neoprene gasket connection. Load classifications per ASME A112.21.1M. Waterproofing: 40 mils sheet membrane, chlorinated polyethylene, Chloraloy 240.
- B. Provide funnel type floor drain cover for floor drains used for cooling coil condensate drains, equipment drains and wherever shown on drawings. See details.

SPEC EDITOR: USE FD-A IN TOILET ROOMS, SHOWERS, SMALL KITCHENS, FINISHED AREAS, SMALL MECHANICAL ROOMS.

- C. Type FD-A: Light duty, adjustable, nickel bronze strainer, minimum strainer diameter equal to twice pipe diameter. Manufacturer: Smith 2005-A, Wade, Zurn.

SPEC EDITOR: USE FD-B IN LARGE KITCHENS, AND AREAS WITH HEAVIER LOADS, WHERE FINAL ADJUSTMENT IS IMPORTANT, AND SEDIMENT BUCKET IS NOT REQUIRED.

- D. Type FD-B: Medium duty, adjustable 8 1/2" diameter cast iron grate. Manufacturer: Smith 2310, Wade, Zurn.

SPEC EDITOR: USE FD-C OR FD-D IN LARGE MECHANICAL ROOMS, LOADING DOCKS AND AREAS WITH HEAVIER LOADS, WHERE FINAL ADJUSTMENT IS LESS IMPORTANT, AND SEDIMENT BUCKET IS REQUIRED.

- E. Type FD-C: Medium duty, 8 1/2" diameter cast iron grate, free standing sediment bucket. Manufacturer: Smith 2110, Wade, Zurn.
- F. Type FD-D: Heavy duty, 10" x 12" cast iron grate, free standing sediment bucket. Manufacturer: Smith 2450, Wade, Zurn.

2.3 TRENCH DRAINS

SPEC EDITOR: SEE JAY R. SMITH POLYMER CONCRETE AND FIBERGLASS DRAINAGE SYSTEMS FOR A VIABLE ALTERNATIVE TO CAST IRON. ADDITIONAL RESEARCH AND EDITTING IS REQUIRED TO MAKE TRENCH DRAINS PROJECT SPECIFIC.

- A. Trench drain type designations and sizes are indicated on Drawings.
- B. Cast Iron Trench Drains: Cast-iron shallow hub body and grate with end plates and gaskets, assembled in standard lengths for total length and width as indicated, with the following features:
 - 1. Sediment bucket.
 - 2. Flashing device.
 - 3. Heel-proof, ADA compliant grate.
 - 4. Vandal-proof grate.
 - 5. Backwater valve.
 - 6. Convex grate.
 - 7. Dome bottom strainer.
 - 8. Bottom outlet, inside caulk.
- C. Manufacturers: Smith, Wade, Zurn.

2.4 ROOF DRAINS

SPEC EDITOR: THESE ROOF DRAINS ARE STANDARD FOR MOST INSULATED ROOFS. USE RD-C WHERE PRACTICAL. OTHER CONSIDERATIONS: CAST IN PLACE DRAINS, PROMENADE DRAINS, EXPANSION JOINTS, OVERFLOW DRAINS, IRMA ROOFS. SECONDARY ROOF DRAINAGE IS REQUIRED BY CODE - COORDINATE WITH ARCHITECT.

- A. General roof drain requirements: Unless otherwise noted, provide secured round cast iron dome, cast iron body and flashing clamp/ gravel stop, sump receiver, underdeck clamp, bottom outlet same size as pipe served, with caulked, no-hub or neoprene gasket connection.

SPEC EDITOR: RD-A IS FOR SMALL AREAS, 2" - 4" OUTLET

- B. Type RD-A: 8" diameter, 40 sq. in. free area, cast iron extension and collar. Manufacturer: Smith 1330, Wade, Zurn.

SPEC EDITOR: RD-B IS FOR MEDIUM AREAS, 2" - 4" OUTLET

- C. Type RD-B: 12" diameter, 70 sq. in. free area, cast iron extension and collar. Manufacturer: Smith 1310, Wade, Zurn.

SPEC EDITOR: RD-C IS FOR LARGE AREAS, 2" - 6" OUTLET

- D. Type RD-C: 15" diameter, 100 sq. in. free area, cast iron adjustable extension and collar. Manufacturer: Smith 1015, Wade, Zurn.

SPEC EDITOR: RD-D IS FOR VERY LARGE AREAS, 8" TO 10" OUTLET

- E. Type RD-D: 20" diameter, 150 sq. in. free area, cast iron extension and collar. Manufacturer: Smith 1010, Wade, Zurn.

2.5 DRAINAGE SPECIALTIES

SPEC EDITOR: EDIT ITEMS BELOW CAREFULLY. OTHER ITEMS TO CONSIDER ADDING: GREASE INTERCEPTORS, AIR ADMITTANCE VALVE (IN LIEU OF VENT - TO BE FURTHER INVESTIGATED WITH INSPECTORS)

- A. Backwater Valve (in-line): Bronze fitted cast-iron, bolted cover. Flapper shall provide a maximum 1/4 inch clearance between flapper and seat for air circulation. Manufacturer: Smith 7022, Wade, Zurn.
- B. Trap Primers: ASSE 1018, bronze body valve with automatic vacuum breaker, with 1/2 inch connections. Manufacturers: Precision Plumbing Products Model P-1
- C. Dilution and Neutralization Tank: Plastic construction, for use with acid laboratory waste, see details. Manufacturers: Orion, Wessels, Town and Country Plastics.
- D. Acid Waste Clean-out: For lab waste piping, specified to be polypropylene, provide corrosion resistant fire retardant polypropylene cleanouts, ASTM-D 401, with nickel bronze cover. Manufacturer: Orion, Sioux Chief
- E. Acid Waste Floor Drain: For lab waste piping specified to be polypropylene, provide corrosion resistant floor drains manufactured with fire retardant polypropylene, ASTM-D-4101. Grate funnel and covers shall be fiber filled polypropylene. Manufacturer: Orion: Model FD-3, Sioux Chief

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Verify existing grades, inverts, utilities, obstacles, and topographical conditions prior to installations.
- B. Examine rough-in requirements for plumbing fixtures and other equipment having drain connections to verify actual locations of piping connections prior to installation.
- C. Examine walls, floors, roof, and plumbing chases for suitable conditions where piping and specialties are to be installed.

3.2 INSTALLATION OF PIPING

- A. Refer to Related Section 221113 for additional requirements.

SPEC EDITOR: TAL WILL ORDER A COPY OF THIS MANUAL.

- B. Install underground cast iron piping per Cast Iron Soil Pipe Institute Engineering Manual.

3.3 INSTALLATION OF CLEANOUTS

SPEC EDITOR: CLEANOUT LOCATIONS SHOULD BE INDICATED ON DRAWINGS. CLEANOUTS IN ULAM AREA SHALL BE LOCATED IN WALLS. CLEANOUTS LOCATED IN THE FLOOR WILL NOT BE PERMITTED.

- A. Provide cleanouts at each change in direction of piping greater than 45 degrees, where indicated on drawings and where required by code. Clean-outs shall be same size as pipe served through 4". Above Ground Cleanouts: Install cleanouts at minimum intervals of 50' for piping 4 inch and smaller and 100' for larger piping, at base of each vertical soil or waste stack.
- B. Encase exterior cleanouts in concrete flush with grade.
- C. Cleanouts shall be aesthetically located with respect to tile patterns, masonry bond and alignment. Coordinate installation with masonry and concrete work.
- D. Prior to acceptance of the system, demonstrate that cleanout plugs are easily removable and can be easily rodded.
- E. When cleanouts are required in above grade floors, flash and clamp cleanouts in floors provided with membrane waterproofing as specified for floor drains.

3.4 INSTALLATION OF FLOOR DRAINS

- A. Install floor drains as indicated on drawings, at low points of surface areas to be drained.
- B. Provide trap for all floor drains, minimum 3" trap and waste.
- C. Check drainage of surfaces by flooding with the hose.
- D. Provide vent for floor drain piping per code, minimum 1 1/2".

3.5 INSTALLATION OF ROOF DRAINS

SPEC EDITOR: USE DETAIL SHOWING INSTALLATION OF WATERPROOF MEMBRANE

- A. Install drain flashing collar or flange so that no leakage occurs between roof drain and adjoining roofing. Maintain integrity of waterproof membranes, where penetrated.
- B. Check drainage of surfaces by flooding with hose.

DIVISION 22 PLUMBING

SECTION 221333 - PACKAGED SUBMERSIBLE STORM AND SANITARY PUMPS

END OF CONTENTS TABLE

DIVISION 22 PLUMBING

SECTION 221333 - PACKAGED SUBMERSIBLE STORM AND SANITARY PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 018113: Sustainable Design Requirements
 - 2. Section 019110/019100: Commissioning
 - 3. Section 220500: Common Work Results for Mechanical
 - 4. Section 220513: Motors
 - 5. Section 220523: Valves
 - 6. Division 26: Electrical

EDIT SUMMARY TO MAKE PROJECT SPECIFIC. THIS SPECIFICATION PERTAINS TO PUMPS SERVING BUILDING DRAINS, I.E. PUMPS LOCATED WITHIN BUILDINGS. IT IS NOT WRITTEN TO APPLY TO PUMPS SERVING BUILDING SEWERS OR OTHER SEWERS. SUCH PUMPS HAVE ADDITIONAL REQUIREMENTS (EXPLOSION PROOF, ETC.) PER NFPA 820.

1.2 SUMMARY

- A. Pumps and accessories serving Building Drains. This specification does not apply to pumps and accessories serving sewers of any type. Products specified in this section include the following:
 - 1. Submersible pumps for elevator sumps
 - 2. Submersible storm pumps
 - 3. Submersible sewage pumps
 - 4. Submersible grinder sewage pumps
 - 5. Controls for the specified pumps
 - 6. Sump basins and covers
 - 7. Check valves and accessories for submersible pumps
 - 8. Guide rail support system

1.3 SUBMITTALS.

- A. Product Data: Include catalog illustrations, model, rated capacities, performance, weights, dimensions, component sizes, rough-in requirements, piping and wiring diagrams and details, materials of construction, accessories, operating and maintenance clearance requirements. Wiring diagrams shall be project specific, and differentiate between factory wiring and field wiring. Include written sequence of operations for all controls.
- B. Provide information for the following:

1. Individual pump curves indicating flow rate, head, horsepower, and pump efficiency.
2. Pump pipe connection size and type.
3. Maximum passable solid size.
4. Shaft seals, bearings, and cord sealing information.
5. Motor insulation data.
6. Pump starter information.
7. Float information.
8. Control panel wiring diagrams.
9. Control panel face diagrams indicating components on the panel face and sides and how the components are labeled.
10. Float rod information.
11. Basin data, including depth, diameter; size, arrangement, and elevations of all openings; and data on gaskets and bushings to seal the cover and cover penetrations gas-tight.
12. Guide rail support system data.

C. Installation, Operation and Maintenance Manuals

1.4 QUALITY ASSURANCE STANDARDS

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. American Water Works Association
 2. ANSI/HI 9.6.1-1998, NPSH Margin
 3. ANSI/HI 9.6.3-1997 Operating Region
 4. NEC-National Electrical Code
 5. National Electrical Manufacturers Association
 6. National Sanitation Foundation
 7. Underwriters Laboratories Inc. listed as a manufacturer of packaged pumping systems under UL/CUL Category QCZJ.
 8. Underwriters Laboratories Inc. listed as a manufacturer of control panels under UL/CUL 508a.
 9. UL Standard 778 Motor Operated Water Pumps.

1.5 DEFINITIONS

- A. Building Drains: Refer to the Michigan Plumbing Code.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Ship the pump and accessories in weather-proof wrap for storage outdoors. Protect control panels, pipe openings, and other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.
- B. Comply with pump manufacturer's written rigging instructions for handling and installation.

1.7 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

PROVIDE A DETAIL ON THE DRAWINGS INDICATING PIT SIZE AND DEPTH, QUANTITY AND ELEVATIONS OF FLOATS, INVERT ELEVATIONS OF CONNECTIONS TO PIT, ETC.

2.1 ACCEPTABLE MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Barnes
 - 2. Zoeller
 - 3. Hydromatic
 - 4. Goulds

ELEVATOR SUMP PUMPS MUST DISCHARGE TO SANITARY. SEE THE CONVEYING SYSTEMS DESIGN GUIDELINE FOR DETAILED REQUIREMENTS REGARDING ELEVATOR SUMP PUMPS.

2.2 SUBMERSIBLE CENTRIFUGAL PUMPS FOR ELEVATOR SUMPS

- A. Simplex design, minimum capacity of 3000 gallons per hour per hoistway.
- B. Pump Type: Completely submersible, end-suction, close-coupled, overhung-impeller, centrifugal pump with controls. Capable of operating un-submerged without damage to pump. Factory-assembled and tested.
- C. Impeller: Capable of passing spherical solids 1/2 inch in diameter or greater. Statically and dynamically balanced, cast iron, stainless steel, or engineered plastic, keyed and secured to shaft.
- D. Pump Casing: Cast iron, with open inlet, legs that elevate pump to permit flow into impeller, and vertical discharge for piping connection. Powder coated epoxy finish. Stainless steel screws, bolts, and lift handle.

EDIT MOTOR HP BELOW, OR DELETE AND INCLUDE IN PUMP SCHEDULE. MICHIGAN ELEVATOR CODE PROHIBITS PUMPS OVER 300 VOLTS. VOLTAGE RANGES INDICATED BELOW ARE THE TYPICAL DESIRED BUT MAY REQUIRE REVISION DEPENDING ON THE PROJECT. SEE THE CONVEYING SYSTEMS DESIGN GUIDELINE FOR MORE INFORMATION.

- E. Motor: Hermetically sealed, oil filled, with waterproof power cable of length required with cord cap (control panel will be wired to control a receptacle in the elevator hoistway that the pump will be plugged into) and a cable-sealing assembly for connection at pump. Class B or better insulation, 1.15 service factor minimum. Non-overloading through the length of the curve.
 - 1. Pumps 1 HP or less: 120 VAC single phase.

2. Pumps greater than 1 HP: 208 VAC three phase.
 3. Single Phase Pumps: Provide capacitor-start type motors with built-in overload protection.
- F. Pump and Motor Shaft: Stainless steel with factory-sealed, oil or grease-lubricated ball bearings. Upper bearing may be sleeve type.
- G. Shaft Seals: Mechanical seals, single or double.
- H. Controls:
1. Float Switches: Provide multiple tethered style float switches to turn the pump on and off and to detect high level, with waterproof cables of length required. High level detection shall be provided by use of a separate float switch. Float switches shall be non-mercury mechanical type. Provide stainless steel clamps to secure floats to the pump discharge pipe.
 2. Control Panel: Minimum NEMA 1 rated. Hinged, lockable, dead front cover. No electrical switches, indicator lights, or enunciators of any kind shall be located on the outside of the panel/panel cover.
 3. Controls: Provide UL listed controller/starter assembly. Provide a magnetic contactor (single phase pumps) or magnetic starter with overload protection (three phase pumps) that starts and stops the pump via float switch(es) separately wired to the control panel. Provide a non-latching dry alarm contact for monitoring by the Owner's building monitoring system. The dry alarm contact shall energize *whenever the pump runs*, and when high sump level is detected by the high level float switch. When high water level is detected by the high level float switch, the pump shall turn on (if not already running) and the dry alarm contact shall energize. Provide panel circuit breaker or fuse, numbered terminal strip(s) for all electrical connections, and a project specific wiring diagram in a plastic pouch inside the panel.

THE ARTICLE BELOW IS FOR STORM PUMP APPLICATIONS.

2.3 SUBMERSIBLE DOUBLE SEAL CENTRIFUGAL STORM WATER PUMPS

- A. Pump Type: **Duplex** design, completely submersible, end-suction, close-coupled, overhung-impeller, centrifugal pump with controls. Capable of operating un-submerged without damage to pump. Factory-assembled and tested.
- B. Impeller: Vortex style, uncoated, capable of passing spherical solids 3/4 inch in diameter or greater. Statically and dynamically balanced cast or ductile iron, bronze, or stainless steel; keyed and secured to shaft.
- C. Pump Casing: Cast iron, with open inlet, legs that elevate pump to permit flow into impeller, and vertical discharge for piping connection. Powder coated epoxy finish. All fasteners exposed to liquid shall be 300 series stainless steel. Provide stainless steel lifting handle. Provide lift ring (of stainless steel) and self-sealing discharge fittings for connection to guide-rail supports, when guide rail supports are indicated.

- D. Motor: Hermetically sealed, oil filled, with waterproof power cable of length required. Class B or better insulation, 1.15 service factor minimum. Non-overloading through the length of the curve.
 - 1. Single Phase Pumps: Provide capacitor-start type motors with built-in overload protection.
- E. Cable-sealing assembly at pump connection: shall employ compression gland and epoxy potting of individual motor leads to prevent moisture from entering the motor housing if cord is damaged.
- F. Pump and Motor Shaft: Stainless steel with factory-sealed, oil or grease-lubricated upper and lower ball bearings.
- G. Shaft Seals: Double mechanical seals. Lower and upper seals to be silicon carbide/silicon carbide. Provide seal moisture probes for leak detection.

THE ARTICLE BELOW SHOULD BE USED FOR SEWAGE PUMPS THAT PRIMARILY SERVE LIGHT DUTY SANITARY APPLICATIONS SUCH AS FLOOR DRAINS IN MECHANICAL SPACES OR WHERE A FEW LOW USE WATER CLOSETS DRAIN TO THE PUMP. FOR PUMPS THAT SERVE A SIGNIFICANT NUMBER OF WATER CLOSETS A SEWAGE GRINDER PUMP AS SPECIFIED IN THE NEXT SECTION IS TYPICALLY RECOMMENDED. BE SURE TO INDICATE WHICH TYPE PUMP IS REQUIRED ON THE PROJECT DRAWINGS, PREFERABLY IN A SCHEDULE.

2.4 SUBMERSIBLE DOUBLE SEAL CENTRIFUGAL SEWAGE PUMPS

- A. Pump Type: **Duplex** design, completely submersible, end-suction, close-coupled, overhung-impeller, centrifugal pump with controls. Capable of operating un-submerged without damage to pump. Factory-assembled and tested.
- B. Impeller: Vortex style, uncoated, capable of passing spherical solids 2 inch in diameter or greater. Statically and dynamically balanced cast or ductile iron, bronze, or stainless steel; keyed and secured to shaft.
- C. Pump Casing: Cast iron, with open inlet, legs that elevate pump to permit flow into impeller, and vertical discharge for piping connection. Powder coated epoxy finish. All fasteners exposed to liquid shall be 300 series stainless steel. Provide stainless steel lifting handle. Provide lift ring (of stainless steel) and self-sealing discharge fittings for connection to guide-rail supports, when guide rail supports are indicated.
- D. Motor: Hermetically sealed, oil filled, with waterproof power cable of length required. Class B or better insulation, 1.15 service factor minimum. Non-overloading through the length of the curve.
 - 1. Single Phase Pumps: Provide capacitor-start type motors with built-in overload protection.
- E. Cable-sealing assembly at pump connection: shall employ compression gland and epoxy potting of individual motor leads to prevent moisture from entering the motor housing if cord is damaged.

- F. Pump and Motor Shaft: Stainless steel with factory-sealed, oil or grease-lubricated upper and lower ball bearings.
- G. Shaft Seals: Double mechanical seals. Lower and upper seals to be silicon carbide/silicon carbide. Provide seal moisture probes for leak detection.

THE ARTICLE BELOW SHOULD BE USED FOR SEWAGE PUMPS RECEIVING THE DISCHARGE FROM A SIGNIFICANT QUANTITY OF WATER CLOSETS, IN PARTICULAR FOR AREAS WHERE WATER CLOSETS MAY BE SUBJECT TO ABUSE SUCH AS DORMITORYS. FOR PUMPS SUBJECT TO HEAVY USE, CONSIDER SPECIFYING A REVERSE FLOW ASSEMBLY.

2.5 SUBMERSIBLE DOUBLE SEAL CENTRIFUGAL GRINDER SEWAGE PUMPS

- A. Pump Type: **Duplex** design, completely submersible, end-suction, close-coupled, overhung-impeller, centrifugal pump with controls. Capable of operating un-submerged without damage to pump. Factory-assembled and tested. 1-1/4 inch minimum discharge opening.
- B. Impeller: Vortex style, uncoated, capable of passing solids. Statically and dynamically balanced cast or ductile iron, bronze, stainless steel, or engineered thermoplastic; keyed and secured to shaft. Provide hardened stainless-steel cutter/grinder with shredding device.
- C. Pump Casing: Cast iron, with open inlet, legs that elevate pump to permit flow into impeller, and vertical or horizontal discharge (as required for the project) for piping connection. Powder coated epoxy finish. All fasteners exposed to liquid shall be 300 series stainless steel. Provide stainless steel lifting handle. Provide lift ring (of stainless steel) and self-sealing discharge fittings for connection to guide-rail supports, when guide rail supports are indicated.
- D. Motor: Hermetically sealed, oil filled, with waterproof power cable of length required. With Class F motor insulation. Non-overloading through the length of the curve.
 - 1. Single Phase Pumps: Provide capacitor-start type motors with built-in overload protection.
- E. Cable-sealing assembly at pump connection: shall employ compression gland and epoxy potting of individual motor leads to prevent moisture from entering the motor housing if cord is damaged.
- F. Pump and Motor Shaft: Stainless steel with factory-sealed, oil or grease-lubricated upper and lower ball bearings, to provide radial and thrust support.
- G. Shaft Seals: Double mechanical seals. Lower and upper seals to be silicon carbide/silicon carbide. Provide seal moisture probes for leak detection.

THE PUMP CONTROL ARTICLE BELOW REFLECTS TYPICAL U-M REQUIREMENTS. MODIFY AS REQUIRED TO MAKE PROJECT SPECIFIC. INCLUDE A MORE DETAILED PUMP SEQUENCE OF OPERATION WITH THE PUMP DETAIL ON THE DRAWINGS OR WITH THE ARTICLE BELOW, IF NECESSARY. INFORMATION BELOW DOES NOT INDICATE QUANTITY OF FLOATS SINCE FLOAT QUANTITIES VARY WITH PUMP CONFIGURATION.

**THEREFORE, INDICATE REQUIRED QUANTITY OF FLOATS ON THE PUMP
DETAIL OR BELOW.**

2.6 PUMP CONTROLS:

- A. Unless otherwise noted, provide UL listed controller/starter assembly with the following features for each pump.
1. Float Switches: Provide multiple tethered style non-mercury mechanical style float switches to turn the pump on and off and to detect high level, with waterproof cables of length required. Provide float rod/pipe, tether clamps, and hardware, to secure the floats at the required elevations, all of stainless steel construction.
 2. Control Panel: Minimum NEMA 1 rated. Hinged, lockable.
 3. Controls: Provide UL listed controller/starter assembly. Provide a magnetic contactor (single phase pumps) or magnetic starter with adjustable overload protection (three phase pumps) that starts and stops the pump via float switch(es) separately wired to the control panel.
 - a. Automatic Alternator (duplex pump arrangements): Electrical alternator that starts pumps on successive cycles and starts multiple pumps if one cannot handle load.
 - b. High-Water Alarm: Rod-mounted mechanical-float switch.
 - c. Panel features (all mounted on panel face): control on/off switch, hand-off-auto switch and pump run light for each pump, high water alarm light, high water alarm test switch, seal failure light.
 - d. Provide an audible alarm that activates upon high water or seal failure condition.
 - e. Provide a latching dry auxiliary alarm contact for monitoring by the Owner's building monitoring system, that energizes upon either a high water or seal failure condition.
 - f. Provide an alarm silence button which deactivates the audible alarm but does not deactivate the local alarm lights or auxiliary alarm contact until the alarm condition clears.
 - g. Provide motor disconnect for each motor, control transformer, control panel circuit breaker or fuse, numbered terminal strip(s) for all electrical connections, a project specific wiring diagram in a plastic pouch inside the panel, and all required accessories.
 - h. Label all components on the exterior of the control panel with engraved plastic labels screwed to the panel face. Label all wiring, terminal strips, and electrical components inside the panels using labels made for that purpose.

2.7 SUMP BASINS AND BASIN COVERS

PROVIDE A DETAIL ON THE DRAWINGS INDICATING QUANTITY AND ELEVATIONS OF TOP AND SIDE WALL CONNECTIONS AND FLOAT ACTIVATION ELEVATIONS. DUE TO RADON CONCERNS ALL COVERS (I.E. INCLUDING STORM PUMPS) ARE SPECIFIED AS GAS TIGHT, WITH THE EXCEPTION OF THOSE USED FOR ELEVATOR SUMP PUMPS.

- A. Basins: Factory-fabricated, watertight, cylindrical, basin sump with top flanges and sidewall openings for pipe connections.
 - 1. Material: Fiberglass.
 - 2. Reinforcement: Mounting plates for pumps, fittings, guide-rail supports if used, and accessories, adequately braced. Provide integral water tight anchor flange(s) that match the guide rail base plate and side support mounting holes, when guide rails are used.

RETAIN SUBPARAGRAPH BELOW IF REQUIRED TO ANCHOR BASIN TO CONCRETE SLAB IN CASE OF GROUND-WATER PROBLEMS.
 - 3. Anchor Flange: Same material as or compatible with basin sump, cast in or attached to sump, in location and of size required to anchor basin in concrete slab.
- B. Basin Covers: Gas tight cover with gaskets, seals, and bushings to seal hatches, piping, conduit and cords gas tight. Sealants and caulks shall not be used.
 - 1. Cover Reinforcement: Reinforced to support anticipated loads in the area of use but no less than required for supporting foot traffic.
 - 2. For basins larger than 36" diameter and for any duplex pump arrangement, provide a bolted sub-hatch centered above each pump and pump discharge pipe that allows the pump to be removed through the sub-hatch without disturbing the basin cover, cover vent or drainage connections, sump float rod, or adjacent pumps and their discharge pipes and power cords. Additionally, provide an inspection hatch that can be opened without disturbing any component penetrating the basin cover.
- C. Covers for basins in elevator hoistways: Provide removable galvanized steel grating (capable of supporting foot traffic), notched around the pump discharge pipe to allow grate removal without disconnecting the discharge pipe.

2.8 ACCESSORIES

- A. Check valves for elevator sump pumps and storm pumps:
 - 1. Silent check valve per Related Section.

SILENT CHECK VALVES ARE NOT RECOMMENDED FOR WASTE WATER SERVICE, THEREFORE A RESILIENTLY HINGED TYPE CHECK VALVE HAS BEEN SPECIFIED FOR THAT SERVICE, BELOW.
- B. Check valves for sewage pumps and grinder sewage pumps:
 - 1. Non-slam resiliently hinged type check valve with peroxide cured EPDM disk, disk accelerator, and flanged connections; "SurgeBuster" as manufactured by Val Matic Valve and Manufacturing Corporation.

SPECIFY GUIDE RAIL SUPPORT SYSTEMS WHEN SUMP DEPTH EXCEEDS FOUR FEET. DELETE ARTICLE BELOW WHEN GUIDE RAILS ARE NOT REQUIRED.

2.9 GUIDE-RAIL SUPPORT SYSTEM:

- A. Provide a guide rail support system allowing automatic disconnect and removal of pump, furnished by the same manufacturer that supplied the submersible pump.
- B. Guide Rails: Vertical pipes or structural members, made of stainless steel, attached to baseplate and basin sidewall or cover.
- C. Baseplate: Stainless Steel plate, attached to basin floor, supporting guide rails and stationary elbow.
- D. Hardware: all nuts, bolts, fasteners and hardware shall be stainless steel.
- E. Pull rods and lifting cable: Stainless steel.
- F. Sliding guide rail connector: Stainless steel motor-mounted or casing-mounted yokes or other attachments for aligning pump during connection of flanges and sliding pump up and down rails.
- G. Movable Elbow: Cast iron pump discharge-elbow fitting with flange and positioning device.
- H. Stationary Elbow: Cast iron fixed discharge-elbow fitting with flange that mates to movable-elbow flange and connects to baseplate.
- I. Seal between movable and stationary elbow: Elastomeric seal retained by non-corrosive clamp ring and stainless steel fasteners.

2.10 SOURCE QUALITY CONTROL

- A. All pumps shall be factory tested. Verify all control panel functions. Verify pump grounding and integrity of winding insulation by megger testing. Run each pump submerged prior to shipment at maximum running point. Verify flow rate, head, amperage draw, and water tightness.

THE TEST REPORT BELOW IS OPTIONAL, BUT TYPICALLY RECOMMENDED FOR CRITICAL OR LARGE PUMP INSTALLATIONS.

- B. A report detailing the results of the factory test shall be provided. An officer of the manufacturer's company shall certify by signature that the report accurately reflects the test results, and that the package meets all performance requirements. The report shall clearly identify any performance requirements that were not achieved.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine roughing-in for equipment support, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Install separate devices furnished by manufacturer and not factory installed, including but not limited to float rods and floats, basins, basin covers and all related accessories, guide rail system, lift rods/cables, control panels, and any manufacturer's accessory devices necessary or recommended to meet the particular needs of the pump installation.
- C. Protect basins from trash and debris at all times including during temporary service.

SEWAGE AND GRINDER SEWAGE PUMP INSTALLATIONS SHOULD NOT BE DESIGNED WITH A DISCHARGE PIPE LESS THAN 2". INDICATE THE PIPE SIZE ON THE DRAWINGS.

- D. For all sewage and grinder sewage pump installations, regardless of pump connection size, provide minimum 2 inch diameter pipe (or larger as indicated) on the discharge side of each pump.
- E. Provide a check valve and an isolation valve on each pump discharge pipe, near and above the basin cover or sump top rim level. Locate the check valve upstream of the isolation valve. Provide check valves of the type specified in Part 2.
- F. Where discharge piping is below grade, locate the check and isolation valves outside of the basin in an access pit with access cover.
- G. Run all power, float, and control wiring in conduit between basin cover and control panel. Seal inner diameter of conduit with sealing putty and connect to basin cover.
 - 1. Power cords of elevator sump pumps shall not be run in conduit. Connect directly to the non-GFCI outlet in the elevator hoistway that is controlled by the pump control panel. Install weatherproof cover on the outlet.
- H. Verify proper pump rotation of pumps before installing in basins.
- I. Adjust level control to prevent effluent in the sump basin from rising to within 2 inches of the invert of the lowest gravity drain inlet connection to the sump.
- J. Adhere to manufacturer's start-up instructions.

3.3 TEMPORARY SERVICE

- A. Start units for temporary use only with the expressed written permission of the Project Manager and in compliance with all requirements of the Contract Documents.
- B. Prior to placement into temporary service, perform manufacturer's pre-start protocols.
- C. Commission equipment prior to putting into temporary service to the extent required by the Commissioning Authority. Re-perform all commissioning activities prior to Owner acceptance, even if previously commissioned to prepare for temporary service.

- D. Perform all required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store the log at unit during temporary use period and include log as part of the final O&M manual.

3.4 FIELD QUALITY CONTROL

- A. In the presence of the Commissioning Authority:
 - 1. Demonstrate the functionality of the slide rails by sliding the pump over the full length of the rails and out the basin cover, and reseating the pump on the stationary flange without entering the basin.
 - 2. Demonstrate the operation of the pump by filling the basin with water and verifying all functions of the pump and control panel. Provide temporary plugs in basin connections to allow filling the basin for testing. Remove plugs at completion of testing.

WHEN JUSTIFIED, REQUIRE START-UP SERVICES BY A FACTORY SERVICE TECHNICIAN, OTHERWISE DELETE THE PARAGRAPH BELOW.

- B. Provide a factory trained service technician to perform start-up services. The service technician shall perform the following:
 - 1. Verify correct installation and organize, instruct and assist the mechanical contractor's personnel in start-up procedures.
 - 2. Perform manufacturer's pre-start checks.
 - 3. Set all safety devices.
 - 4. Commission the pump package, including demonstrating all safeties, proper pump staging, alteration, and all other features.
 - 5. Provide a written service report prepared on site and submitted at the time of each service visit (with copies immediately provided to the Owner and Commissioner). Report shall indicate services provided and list all controller settings.
 - 6. Train Owner personnel. Training and start up services are separate functions and training shall not be combined with startup services.

INCLUDE THE ARTICLE BELOW IN EVERY SPECIFICATION SECTION.

3.5 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

WHEN JUSTIFIED, REQUIRE TRAINING BY A FACTORY SERVICE TECHNICIAN, OTHERWISE DELETE THE FIRST PARAGRAPH BELOW.

3.6 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures, pump access and pump removal. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.

1. Provide 2 hours training, minimum.

END OF CONTENTS TABLE

DIVISION 22 PLUMBING

SECTION 221500 - COMPRESSED AIR ACCESSORIES

REVISIONS:

8-1-99: CONTENT APPROVED AS NEW MASTER

8-11-99: REVISED TO VBS.DOT TEMPLATE

EDITOR: SEE 230900 FOR COMPRESSORS, DRYERS, AND ACCESSORIES FOR CONTROL (INSTRUMENT) AIR USE. THE ACCESSORIES SPECIFIED BELOW ARE NOT TYPICALLY SPECIFIED FOR CONTROL AIR USE; NOTE THE DESCRIPTION IN THE SCOPE OF WORK, BELOW.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide piping, fittings, and specialties for the following systems:
 - 1. Compressed air regulators, filters, drain valves, relief valves and lubricators, for compressed air systems **not** associated with control (instrument) air or medical air systems.

PART 2 - PRODUCTS:

2.1 COMPRESSED AIR SPECIALTIES:

SPEC EDITOR: BELOW FOR LARGE CAPACITY ON AIR MAINS. MODIFY DESCRIPTION AS REQUIRED. ADDITIONAL RESEARCH REQUIRED.

- A. Pressure Regulating Valve: Bronze body, direct-acting, spring-loaded, manual pressure setting adjustment, pressure gauges, and rated for 150-psig inlet pressure. Manufacturers: Landis and Staefa Series 201, Van Aire, Wilkerson, Zeks, Parker-Hannifin, Fisher, Siemens
- B. Compressed Air Filter - General Requirements: Housings shall be corrosion resistant, rated for minimum of 150psig. Capacity, accessories and configuration (simplex or duplex) as indicated on drawings. Furnish spare filter set. Manufacturers: Hankinson, Van Aire, Wilkerson, Zeks

SPEC EDITOR: THIS IS A GOOD GENERAL PURPOSE FILTER, SUITED FOR REMOVAL OF HIGH VOLUMES OF OIL AND WATER.

- C. Compressed Air Filter - Centrifugal/Coalescing and Impingement: Cleanable perforated stainless steel coalescing inner core, with automatic drain and in-depth impingement filter outer section. Designed for efficient removal of water droplets (99%) and oil aerosols (40%) via coalescence, and removal of particles to 3 microns. Manufacturer: Hankinson Centriflex

SPEC EDITOR: THE FOLLOWING IS FOR MORE EFFICIENT REMOVAL OF WATER AND OIL AND PARTICLES.

- D. Compressed Air Filter - Combination Coalescing and Impingement: Glass fiber coalescing inner core, with automatic drain and in-depth impingement filter outer section. Designed for efficient removal of water droplets (100%) and oil aerosols (70%) via coalescence, and removal of particles to 1 microns. Manufacturer: Hankinson 3100 Series

SPEC EDITOR: THE FOLLOWING IS FOR FINE FILTRATION AND WATER AND OIL REMOVAL, BUT IN LOWER QUANTITIES. GOOD FINAL FILTER FOR CONTROL AIR, BUT USE ONE OF THE FILTERS ABOVE FIRST.

- E. Compressed Air Filter - Fine Impingement: Inner foam distributing core, fine glass fiber coalescing and impingement core, foam final coalescing outer section, and with automatic drain. Designed for efficient removal of oil (99.999%) via coalescence, and removal of particles to 0.025 microns. Manufacturer: Hankinson Aerolescer

SPEC EDITOR: THE FOLLOWING IS NOT GENERALLY REQUIRED. IF USED, IT SHOULD HAVE A COALESCING FILTER FIRST.

- F. Compressed Air Filter - Adsorption: Include activated carbon capable of removing virtually 100% of oil aerosols, with color change dye to indicate when carbon is saturated, and with final filter to contain carbon dust to 0.025 microns. Manufacturer: Hankinson Hypersorb

SPEC EDITOR: THE FOLLOWING IS AN OLD CARRYOVER SPEC WITH SOME EDITS AND MANUFACTURERS ADDED. ADDITIONAL RESEARCH IS REQUIRED. CONSIDER AUTOMATIC BALL FLOAT TYPE (WRIGHT AUSTINB MODEL 90-AC OR ARMSTRONG NO.21 VS. ATOMIZING TYPE, NICHOLSON DRAIN-AIR.)

- G. Automatic Drain Valves: Corrosion-resistant metal body and internal parts, rated for 150-psig minimum working pressure, capable of automatic discharge of collected condensate. Manufacturer: Drain-all, Van Aire Draintender, Zeks, Hankinson Snap-Trap

SPEC EDITOR: RELIEF VALVE IS USUALLY SPECIFIED WITH THE AIR COMPRESSOR.

- H. Pressure Relief Valve: Brass body, spring relief, capacity and factory set relief pressure as indicated on drawings.

SPEC EDITOR: LUBRICATORS ARE INFREQUENTLY REQUIRED, ONLY WHERE PNEUMATIC TOOLS REQUIRE OIL FOR LUBRICATION. ADDITIONAL RESEARCH IS REQUIRED. CHECK FISHER TYPE 67FR.

- I. Air-Line Lubricators: Sizes and capacities indicated; equip with drip chamber and sight dome for observing oil drop entering air stream; with oil feed adjustment screw, and quick-release collar for easy bowl removal.

PART 3 - EXECUTION

3.1 PIPING INSTALLATION

- A. See Related Section 221113 for piping materials and installation requirements.

3.2 SPECIALTIES INSTALLATION AND START-UP

- A. Install drain and vent from automatic drain valves per manufacturer's instructions. Route drain to floor drain or location approved by engineer.
- B. After installation is complete test operation of regulators, and automatic drain valves.
- C. Instruct owner on location, operation, and maintenance of piping specialties.

SECTION 223116 - WATER SOFTENER

END OF CONTENTS TABLE

DIVISION 22 PLUMBING
SECTION 223116 - WATER SOFTENER

2012-09-17: NEW VERSION ISSUED.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. 220500 Common Work Results for Mechanical
 - 2. 221113 Piping Materials and Methods
 - 3. 220523 Valves
 - 4. 220519 Thermometers, Pressure Gauges, and Accessories
 - 5. 221119 Domestic Water Piping Specialties
 - 6. Division 26: Electrical.

SPEC EDITOR: WHEN EDITING THIS SPEC TO MAKE IT PROJECT SPECIFIC, REVISE THE SUMMARY SECTION BELOW ACCORDINGLY.

1.2 SUMMARY

- A. Section Includes:
 - 1. Brine Regenerated Water Softening Systems.

1.3 SUBMITTALS

- A. Product Data: For each type of fixture product.
 - 1. Water softening system and accessories including rated capacities, operating characteristics, furnished specialties, accessories, dimensions of individual components and profiles.
 - 2. Construction details and piping diagrams of water softening system and components.
 - 3. Wiring diagrams for power, signal, control wiring and monitoring points tied into the owners building monitoring system.
 - 4. Proof of NSF 61 compliance for softeners used for drinking water systems.
 - 5. Operation and maintenance manuals.

1.4 QUALITY ASSURANCE

SPEC EDITOR: RETAIN PARAGRAPHS A AND B IN EVERY PROJECT SPECIFICATION.

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

SPEC EDITOR: REVISE THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - 1. Michigan Plumbing Code
 - 2. Electrical components, devices and accessories: UL Listed and labeled as defined as in NFPA 70, Article 100.
 - 3. ASME Boiler and Pressure Vessel Code: Section VII, Division 01, where indicated.
 - 4. ASME compliance for FRP Tanks: Fabricate and label mineral tanks to comply with ASME Boiler and Pressure Vessel Code
 - 5. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 - 6. U.S Safe Drinking Water Act.

1.5 COORDINATION

- A. Coordinate size and location of concrete bases.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Siemens Water Technologies
 - 2. Crown Solutions (Veolia)
 - 3. R.A. Bruner
 - 4. Ecodyne Industrial

2.2 WATER SOFTENER

- A. Provide a factory assembled, pressure type packaged water softener, consisting of a softener tank, valve, brine tank (including first full fill of the brine tank), etc., all as required for a complete system. Constructed to handle up to 120 degree Fahrenheit water.

- B. When used for drinking water systems, water softening system shall comply with NSF 61, "Drinking Water System Components - Health Effects"

SPEC EDITOR: REVISE THE PERFORMANCE FOR PROJECT REQUIREMENTS.

2.3 PERFORMANCE

- A. Provide a water softening systems that delivers the output water quality, capacity, and performance indicated below at the specified water input characteristics indicated.
- B. Input water characteristics:
 - 1. Raw City of Ann Arbor water. City of Ann Arbor water quality base line data can be found at the following web site: http://www.a2gov.org/government/publicservices/water_treatment.
 - 2. Up to 120 degree Fahrenheit water inlet temperature.
- C. Output capacity and performance:

SPEC EDITOR: REVISE TO SIMPLEX RESIN TANK IF CONTINUOUS SOFTENER OPERATION IS NOT REQUIRED.

- 1. Duplex resin tanks to provide continuous operation.
- 2. Minimum Control valve pipe size 1".
- 3. Peak flow rate: _____ GPM @ a maximum 15 psi pressure drop.
- 4. Total water softened in 24 hours: _____ gallons.
- 5. Maximum of one regeneration per 72 hour period.
- 6. Regenerations between brine tank refills: _____.
- 7. Water quality output conditions in CaCO3 equivalents:
 - a. - ppm hardness
 - b. - ppm ferrous iron

SPEC EDITOR: REVISE THE TANK PRESSURE RATINGS GIVEN BELOW, IF NECESSARY FOR THE APPLICATION.

2.4 RESIN TANK

- A. Resin tank shall have no less than 50% free-board, be designed for 100 psig, and be tested at 150 psig. Tanks shall be steel with phenolic lining or fiberglass wound type. Steel tanks shall be internally lined with a phenolic epoxy to a 4-6 mil thickness and then baked at 400 degrees F. The exterior shall be sand blasted, painted with a rust-inhibiting primer and then finished with a gloss epoxy top coat. Tank shall have a 15 year non-prorated guarantee.
- B. Tank shall be equipped with an opening in the top head for mineral filling and periodic inspection.

2.5 BRINE SYSTEM:

- A. Brine system shall consist of combination salt storage and brine tank. Tank shall be molded of corrosion-proof, high density polyethylene.

- B. Brine tank shall be equipped with an elevated salt plate for brine collection, and a chamber to house a brine valve assembly. The brine valve shall automatically open to admit brine to the resin tank during eduction and close automatically to prevent introduction of air into the resin tank. During refill, the brine valve shall regulate the flow of treated water into the brine tank, working with the timed refill feature of the control valve. Together these components shall admit the correct volume of water to the brine tank in accordance with the salt dosage settings on the control valve. The brine valve shall include a float operated safety shut-off valve as a backup to the timed refill valve on the controller to prevent brine tank overflow

2.6 DISTRIBUTOR SYSTEM:

- A. Resin tank shall have a stainless steel upper distributor which shall disperse water laterally to avoid channeling within the resin bed. The lower distributor shall be of all plastic construction in a hub-radial design. It shall incorporate fine slot distributors to avoid passing of resin to service in the event of plumbing system upset. No slots shall face upward to minimize the opportunity of channeling. One layer of gravel shall be provided to aid in the even collection of water and make efficient use of the softening capacity of the resin.

2.7 SOFTENING MEDIA:

- A. High-capacity sulfonated polystyrene ion-exchange resin that is stable over the entire pH range of the water being treated with good resistance to bead fracture from attrition or shock. Minimum exchange capacity of 30,000 grains/cu. ft. when regenerated with 15 pounds of salt. The media shall be solid, of the proper particle size and shall contain no agglomerates, shells, plates or other shapes that might interfere with the normal function of the water softener. The resins shall be manufactured to comply with the food additive regulations, 21 CFR 173.25 as set forth by the US FDA.

2.8 AUTOMATIC CONTROLS:

- A. Automatic controls shall be of top mount design. Provide corrosion proof valve head construction, with no dissimilar metals, utilizing a bolt-down flange connection to permit proper positioning between the valve and the conditioner tank openings. Valve head shall have provisions for either left-hand or right-hand raw water plumbing connections to simplify installation while maintaining a forward facing controller for easy servicing. Provide readily accessible service connections. Provide a fully automatic multi-port control valve operated by a rotary pilot that hydraulically or pneumatically activates cartridge style diaphragm valves to accomplish regeneration. The multi-port valve shall incorporate self-adjusting flow regulators to control the rate of flow and prevent resin loss during back-wash, brine rinse, and brine refill positions, regardless of pressure fluctuations between 30 and 100 psig. The control shall open and close slowly to prevent noise and hydraulic shock. It shall have provisions for manual by-pass of hard water. The electrical control mechanism shall be enclosed in a gasketed, moisture-and corrosion resistant case. The enclosure shall conform to NEMA 3 enclosure standards.
- B. On duplex resin tank systems, the controller shall automatically switched back and forth between charged and expended resin tanks to provide a continuous supply of soft water.
- C. Provide a digital demand control system installed on the unit. It shall include a turbine meter and a solid state control device to permit regeneration on a metered volume basis. The totalizing turbine water meter shall be installed in the outlet pipe of the unit. This meter shall continuously measure and record the amount of treated water that has flowed to the service. Regeneration shall not be activated until a user adjustable time of day. The controller shall also indicate the current flow rate and the estimated days' remaining before a brine tank refill is required.
- D. Controls shall have an adjustable duration of the various steps in regeneration and allow for pushbutton manual operation. Control system shall have 10 year non prorated guarantee. Regeneration shall be initiated based on total gallons softened (programmable) and average daily use, compensated for extra-high or low use, with time of regeneration preset to a user selectable time.

2.9 AUXILIARY EQUIPMENT

- A. Provide pressure gauge on inlet and outlet of softener.
- B. Provide test cock to sample water in and soft water out.

2.10 BRINE

- A. High-purity sodium chloride, free of dirt and foreign material. Processed, food grade salt pellets, 99% pure. Rock and granulated forms are not acceptable.

2.11 INSTRUCTIONS:

- A. Provide 4 complete sets of installation, operation and maintenance manuals covering the equipment.

PART 3 - EXECUTION

3.1 INSTALLATION:

- A. Complete installation shall be in accordance with manufacturer's instruction and recommendations. Contractor shall be responsible for receiving all equipment, placing and assembling of all components for a complete and operational system.
- B. Install the equipment level on a concrete base sloped so that water will not stand under or around the equipment.
- C. Make all connections required. Provide rigid connections to softener input and output water connections, using approved joining methods. Hoses shall not be used.
- D. Install service valves to isolate the softener system input and output, and to provide a bypass path around the softener to allow softener servicing.
- E. Install brine tank overflow drain line, routed to a floor drain, terminated with an approved air gap. Use approved materials and secure drain line using approved hangers.
- F. For softeners used in drinking water systems, flush, clean, and disinfect per Related Section and manufacturer's instructions.

3.2 CHECK, TEST & START-UP:

- A. Check, test and start-up services shall be provided by a factory trained representative as follows:
 - 1. Inspect the equipment to verify proper installation.
 - 2. Set-up the controller and place the equipment into operation.
 - 3. Test to verify all performance.
- B. The manufacturer representative's shall provide a written report within 3 days of the Check, Test, Start-up. Report shall include information on services provided, document all controller settings, and indicate the results of the water quality performance tests.

3.3 TRAINING

- A. Factory trained representative shall provide training to owner maintenance staff on the control and operation of the softening equipment and accessories. This shall include adjusting controller settings, cleaning of eductor and filters, other general maintenance procedures, and rebuilding the control valve head. Provide a spare control valve head to demonstrate rebuilding.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

AUGUST 2019: REVISED TO INCLUDE MICHIGAN MEDICINE HEALTHCARE SPECIFIC FIXTURE REQUIREMENTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 123553 Laboratory Casework
 - 2. Section 115313 Laboratory Fume Hoods
 - 3. Section 220500 Common Work Results for Mechanical
 - 4. Section 221113 Piping Materials and Methods
 - 5. Section 220523 Valves
 - 6. Division 26: Electrical.

SPEC EDITOR: WHEN EDITING THIS SPEC TO MAKE IT PROJECT SPECIFIC, REVISE THE SUMMARY SECTION BELOW ACCORDINGLY.

1.2 SUMMARY

- A. Section Includes:
 - 1. Water Closets
 - 2. Water Closet Seats.
 - 3. W.C. and Urinal Wall Carriers.
 - 4. Urinals.

5. W.C. and Urinal Flush Valves.
6. Lavatories, Sinks, Service Sinks, and related Faucets and Trim.
7. Lavatory Support Systems.
8. Under-Sink Waste and Supply Pipe Guards.
9. Thermostatic Mixing Valves (for hand-wash facilities).
10. Scrub Sinks
11. Shower Heads and Shower Control Valves.
12. Electric Water Coolers.
13. Emergency Fixtures, Tempering Valve, Alarm System.
14. Garbage Disposer.
15. Washing Machine Valve Box.
16. Supply Tubes and Stops.
17. Installation of fixtures including fixtures supplied by others for casework and fume hoods.

1.3 SUBMITTALS

- A. Product Data: For each type of fixture product.
 1. Construction details, material descriptions, rated capacities, operating characteristics dimensions of individual components and profiles, and finishes for fixtures.
 2. Water consumption data.
 3. Wiring diagrams for power, signal, and control wiring
 4. Proof of compliance to NSF/ANSI 61.

1.4 QUALITY ASSURANCE

SPEC EDITOR: RETAIN PARAGRAPHS A AND B IN EVERY PROJECT SPECIFICATION.

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. The Contractor shall verify and resolve compatibility between separate components (e.g. that lavatory hole quantity and centering match that of the specified faucet, supports are compatible with respective urinals and water closets, etc.). **Model numbers, when provided, are partial model numbers for identifying style. Provide fixtures that meet all the specified requirements.**

SPEC EDITOR: REVISE THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS. INCLUDE CURRENT APPLICABLE CODES WITH YEAR/VERSION ON TITLE SHEET IN DRAWING SET OR IN SPECIFICATION BOOK FRONT END.

- C. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the Michigan Plumbing Code and the following quality assurance standards; latest editions, unless noted otherwise.
 1. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 2. U.S Safe Drinking Water Act.
 3. ANSI Z358.1 Standard for Emergency Eyewash and Shower Equipment

4. ADA Standard for Accessible Design
5. ICC A117.1 Accessible and usable Building and Facilities

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 WATER CLOSETS - GENERAL

- A. Vitreous china; color white unless noted otherwise. Elongated bowl, direct-fed siphon jet action. 1-1/2 inch top spud for external flush valve. China bolt covers. For 10 in. or 12 in. rough-in (floor mounted models). Dimensions within ASME Standard A112.19.2 tolerances.
- B. Shall meet ASME A112.19.2 flush requirements at 1.1 gpf (liquids disposal) and 1.6 gpf (solids disposal) when equipped with a dual flush style valve.

2.2 WATER CLOSETS - STANDARD AND BARRIER FREE

- A. WC-A - Wall mounted.
 1. ADA compliant when installed so top of seat is 17 in. to 19 in. from the finished floor.
 2. Acceptable Manufacturers:
 - a. American Standard "Afwall".
 - b. Kohler
 - c. Crane
 - d. Sloan

SPEC EDITOR: ITEM WC-B BOWL IS 15 IN. HIGH FOR STANDARD INSTALLATION. NOT ADA COMPLIANT.

- B. WC-B: Floor mounted 15" nominal height, non-ADA compliant.
 1. Acceptable Manufacturers:
 - a. American Standard "Madera"
 - b. Kohler "Wellcomme".
 - c. Crane "Whirlton".

SPEC EDITOR: ITEM WC-C BOWL IS NOMINAL 17 IN. HIGH FOR ELDERLY, SPECIAL NEEDS, AND ADA INSTALLATIONS

- C. WC-C-Floor mounted ADA compliant.
 1. Acceptable Manufacturers:
 - a. American Standard "Madera Right Height".
 - b. Kohler "Highcliff".
 - c. Crane "Hymont".

WC-C (NEW CONSTRUCTION) AND WC-D (RENOVATION) ARE UM'S STANDARD FOR HOSPITAL PATIENT TOILET ROOMS

- D. WC-D: Floor mounted, back outlet, ADA compliant.

1. Acceptable Manufacturers:
 - a. American Standard "Huron"
 - b. Kohler "Anglesey"
 - c. Sloan

2.3 WATER CLOSET FLUSH VALVES

SPEC EDITOR: THE BELOW DUAL FLUSH VALVE IS U-M'S STANDARD FOR WATER CLOSET APPLICATIONS.

- A. WC-FLV-A: Manual, dual flush valve. Chrome plated, exposed, diaphragm type, water closet flushometer. ASTM classified as semi-red brass alloy. Chloramine resistant synthetic rubber diaphragms/seals. With 1-1/2 inch top spud, escutcheons, seat bumper, integral screwdriver stop and vacuum breaker. ADA compliant.
 1. Lifting Handle up initiates reduced flush 1.1 gpf eliminating liquid waste. Pushing handle down initiates full flush of 1.6 gpf eliminating all waste.
 2. Provide metal wall plate etched with flushing instructions.

SPEC EDITOR: PIPE SUPPORT RING, BELOW, IS RECOMMENDED FOR HIGH USE AREAS, FOR EXAMPLE, RESIDENCE HALLS. BLOCKING SHOULD BE SPECIFIED FOR NON-MASONRY WALLS IF THIS PIPE SUPPORT IS SPECIFIED.

3. With flush valve manufacturers chrome plated split ring wall pipe support accessory.
4. Acceptable Manufacturers and Models:
 - a. Sloan "Uppercut".
 - b. Zurn "AquaVantage".

SPEC EDITOR: THE BELOW FLUSH VALVE IS TYPICALLY USED FOR HOSPITAL PATIENT TOILET ROOMS.

- B. WC-FLV-B: Manual, dual flush valve with bedpan washer. Chrome plated, exposed, diaphragm type, water closet flushometer, 1.6 gpm. With bedpan washer diverter assembly. Flush valve, bedpan washer and assembly shall be ASTM classified as semi-red brass alloy. Chloramine resistant synthetic rubber diaphragms/seals. With 1-1/2 inch top spud, escutcheons, seat bumper, integral screwdriver stop and vacuum breaker. ADA compliant.
 1. Lifting handle up initiates reduced flush 1.1 gpf eliminating liquid waste. Pushing handle down initiates full flush of 1.6 gpf eliminating all waste.
 2. Provide metal wall plate etched with flushing instructions.
 3. Provide flush valve manufacturer's chrome plated split ring wall pipe support accessory.
 4. Where clearance around wall mounted grab bar is needed, provide offset configuration of same model specified below.
 5. Acceptable Manufacturers and Models:
 - a. Sloan "Uppercut" WES BPW 1000-1.6/1.1
 - b. Zurn
 - c. Kohler

2.4 WATER CLOSET ACCESSORIES

- A. WCS-A Standard Seat: 1 in. high: Solid white plastic, open front, extended back, self-sustaining stainless steel bolts and hinges, molded-in bumpers, without cover. Acceptable Manufacturers:
 - 1. Bemis.
 - 2. Church.
 - 3. Centoco
- B. WCS-B High Style ADA Seat: where required to meet ADA requirements; 2 in. high, solid white plastic, open front, extended back, self-sustaining stainless steel bolts and hinges, molded-in bumpers, without cover. Acceptable Manufacturers:
 - 1. Bemis
 - 2. Church
 - 3. Centoco.
- C. Water Closet Wall Carrier: Fully compatible with water closet installation, adjustable, high extension (barrier free), cast iron frame with integral drain hub and vent, lugs for floor and wall attachment and threaded fixture studs. Acceptable Manufacturers and Models:
 - 1. Zurn.
 - 2. Josam.
 - 3. J.R. Smith.
 - 4. Wade Drain.

2.5 URINALS - GENERAL:

- A. Vitreous china with extended sides and 14 in. elongated rim. Color white unless noted otherwise. With wall hangers.

SPEC EDITOR: CLARIFY WHICH FLUSH VALVE IS TO BE USED WITH URINAL, EITHER THROUGH DRAWING SCHEDULE OR PROJECT SPECIFIC SPECIFICATION EDIT.

2.6 URINALS AND ACCESSORIES

- A. UR-A: Shall meet ASME A112.19.2 flush requirements at 0.125 gpf. Washout action. 3/4 inch top spud, 2-inch back spud. Vandal resistant outlet strainer.
 - 1. Acceptable Manufacturers:
 - a. American Standard "Washbrook FloWise".
 - b. Kohler "Bardon".
 - c. Zurn "The Pint".
 - d. Sloan
- B. Urinal Wall Carrier: Fully compatible with urinal installation. Cast iron or steel frame, complying with load and deflection requirements of ASME Standard A112.6.1M. Tubular legs, lugs for floor and wall attachment, threaded fixture studs and hardware for hanger and bearing plate. Acceptable Manufacturers and Models:
 - 1. Zurn.
 - 2. Josam.
 - 3. J.R. Smith.
 - 4. Wade Drain.

2.7 URINAL FLUSH VALVES

SPEC EDITOR: AUTOMATIC BATTERY OPERATED URINAL FLUSH VALVE IS U-M STANDARD.

- A. U-FLV-A: 0.125 gpf Sensor Activated Urinal Flush Valve. Chrome plated, exposed, diaphragm type, urinal flushometer. ASTM classified as semi-red brass alloy. Chloramine resistant synthetic rubber diaphragms/seals. With 3/4 inch top spud, escutcheons, integral screwdriver stop and vacuum breaker. ADA compliant. Infrared sensor, controls.
1. Shall meet ASME A112.19.2 flush requirements at 0.125 gpf.
 2. Size AA size batteries, factory installed.
 3. Acceptable Manufacturers:
 - a. Sloan "ECOS".
 - b. Zurn "AquaSense".
 - c. Kohler 1/8 gpf touchless.

SPEC EDITOR: SELECT MANUAL URINAL FLUSH VALVE ONLY WHEN AUTHORIZED BY THE DESIGN MANAGER.

- B. U-FLV-B: Manual Urinal Flush Valve. Chrome plated, exposed, diaphragm type, urinal flushometer. ASTM classified as semi-red brass alloy. Chloramine resistant synthetic rubber diaphragms/seals. With 3/4 inch top spud, escutcheons, integral screwdriver stop and vacuum breaker. ADA compliant.
1. Shall meet ASME A112.19.2 flush requirements at 0.125 gpf.
 2. Acceptable Manufacturers and models:
 - a. Sloan "Royal".
 - b. Zurn "AquaVantage".

SPEC EDITOR: LAVS AND SINKS AND ASSOCIATED FAUCETS ARE TYPICALLY PROVIDED IN THIS SECTION FOR TOILET ROOMS AND KITCHENS. SINKS AND FAUCETS ARE SPECIFIED FOR LAB CASEWORK IN A DIVISION 12 SECTION AND PIPED UNDER THIS SECTION. MODEL NUMBERS INDICATED ARE PARTIAL MODEL NUMBERS FOR STYLE ONLY. DESIGNER MUST EDIT THE BELOW TO MATCH LAVS WITH LAV FAUCETS; FOR PROJECTS WITH MULTIPLE LAV AND FAUCET STYLES THIS IS BEST DONE WITH A SCHEDULE ON THE DRAWINGS.

LAVS ARE ADA COMPLIANT IF INSTALLED IN COUNTERTOP OR MOUNTED ON WALL IN COMPLIANCE WITH ADA REQUIREMENTS.

2.8 LAVATORIES - GENERAL

- A. Lavatories: Vitreous china. Color white unless noted otherwise. With faucet ledge, overflow, and polished chrome plated brass strainer grid drain. ADA compliant.

2.9 LAV-A: COUNTERTOP LAVATORY (SINGLE CENTER FAUCET HOLE)

SPEC EDITOR: THE FOLLOWING BASIN IS TYPICALLY USED WITH FAUCET LF-A SENSOR FAUCET.

- A. Lav-A: Countertop Self-rimming Lavatory: Oval, single center faucet hole.

1. Nominal overall: 20-3/8 in. wide by 17-3/8 in. front to back.
2. Bowl: depth varies 6-8".
3. Color: White
4. Acceptable manufacturers and models:
 - a. American Standard "Aqualyn" 0475.
 - b. Crane "Galaxy" 1287.
 - c. Kohler "Bryant" K-2699.
 - d. Zurn Z5110 Series.
 - e. Sloan

2.10 LAV-B: COUNTERTOP LAVATORY (8-IN. CENTER FAUCET HOLES)

SPEC EDITOR: THE FOLLOWING BASIN IS TYPICALLY USED WITH FAUCET LF-B TWO HANDLED MANUAL FAUCET.

- A. Lav-B: Countertop Self-rimming Lavatory: Oval, three hole with 8-in. center faucet holes.
1. Nominal overall: 20-3/8 in. wide by 17-3/8 in. front to back.
 2. Bowl: depth varies 6-8".
 3. Color: White
 4. Acceptable manufacturers and models:
 - a. American Standard "Aqualyn" 0475.
 - b. Crane "Galaxy" 1287.
 - c. Kohler "Bryant" K-2699.
 - d. Zurn Z5110 Series.

2.11 LAV-C: WALL MOUNTED LAVATORY (SINGLE CENTER FAUCET HOLE)

SPEC EDITOR: THE FOLLOWING BASIN IS TYPICALLY USED WITH FAUCET LF-A SENSOR FAUCET. KOHLER "KINGSTON" IS THE ONLY KOHLER SINK AVAILABLE WITH SPLASH SHIELDS, HAS A HIGH BACKSPLASH COMPARED TO COMPETITORS, AND HAS A DATED LOOK.

- A. Lav-C: Wall Mounted Lavatory D-shaped bowl: with single center faucet hole, self-draining deck area with contoured back and side splash shields.
1. Nominal overall dimensions: 20-1/2 in. wide by 18-1/4 in. front to back.
 2. Bowl: depth varies 6-7".
 3. Color: White
 4. Acceptable manufacturers and models:
 - a. American Standard "Lucerne" 0356.
 - b. Kohler "Kingston".
 - c. Zurn Z5340 Series.

2.12 LAV-D: WALL MOUNTED LAVATORY (8-IN. CENTER FAUCET HOLES)

SPEC EDITOR: THE FOLLOWING BASIN IS TYPICALLY USED WITH FAUCET LF-B TWO HANDLED MANUAL FAUCET. ORDER FOUR HOLE VARIATION IF SOAP DISPENSER TO BE USED ON LAV DECK (INTEGRAL SOAP DISPENSER NOT PREFERRED AT U-M). KOHLER "KINGSTON" IS THE ONLY KOHLER SINK AVAILABLE WITH SPLASH SHIELDS, HAS A HIGH BACKSPLASH COMPARED TO THE COMPETITORS, AND HAS A DATED LOOK.

- A. Lav-D: Wall Mounted Lavatory, D-shaped bowl: three hole with 8 in. center faucet holes, self-draining deck area with contoured back and side splash shields.
1. Nominal overall dimensions: 20-1/2 in. wide by 18-1/4 in. front to back.
 2. Bowl: depth varies 6-7".
 3. Color: White
 4. Acceptable manufacturers and models:
 - a. American Standard "Lucerne" 0356.
 - b. Kohler "Kingston".
 - c. Zurn Z5340 Series.

SPEC EDITOR: THE FOLLOWING BASIN IS TYPICALLY USED WITHIN HOSPITAL PATIENT TOILET ROOMS AND STAFF TOILET ROOMS, IN COMPLIANCE WITH INFECTION PREVENTION REQUIREMENTS. PAIR WITH MANUAL FAUCET TYPE LF-C.

2.13 LAV-E: WALL MOUNTED LAVATORY (4-IN CENTER FAUCET HOLES)

- A. Lav-E: Wall mounted vitreous china lavatory D-shaped bowl with single center faucet hole, self-draining deck area with contoured back and side splash shields, no-overflow hole.
1. Nominal overall dimensions: 21" wide by 18" front to back.
 2. Bowl: 6-1/2" deep.
 3. Color: White
 4. Acceptable manufacturers and models:
 - a. American Standard "Lucerne" 0355.912
 - b. Kohler "Greenwich" (no overflow hole)
 - c. Zurn

2.14 LF-A: LAVATORY FAUCET (SENSOR OPERATED)

SPEC EDITOR: AUTOMATIC FAUCET IS UNIVERSITY STANDARD IN PUBLIC TOILET ROOMS.

SPEC EDITOR: MODEL NUMBERS INDICATED ARE PARTIAL MODEL NUMBERS FOR STYLE ONLY. FEATURES LISTED BELOW REPRESENT THOSE FOUND IN A QUALITY COMMERCIAL FAUCET. THEREFORE, IF ALTERNATE STYLES ARE BEING CONSIDERED, THEY SHOULD PROVIDE THE SAME FEATURES. U-M PREFERS SOLID BRASS FAUCETS FOR VANDAL RESISTANCE; NOTE THAT SOME MFR.'S METAL FAUCETS ARE NOT BRASS.

- A. LF-A Lavatory Faucet: Automatic sensor activated hand washing faucet, battery powered. Polished chrome plated solid brass construction. ADA compliant. With trim.
1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as ≤ 0.25% weighted average lead content.
 2. Nominal spout height: varies 5-5/8 to 6-1/2 in.
 3. For use in single hole lavatory.

SPEC EDITOR: THE BASE PLATE REQUIREMENT FOR THE STYLES BELOW IS SO THAT ALL MFR.'S MODELS LOOK SIMILAR. NOTE THAT SLOAN EBF-85 HAS AN INTEGRAL BASE PLATE WHICH CAN'T BE OMITTED.

4. Chrome/brass trim plate base for 4 in. faucet centers.
5. Serviceable filtered solenoid valve.

6. Batteries included, factory installed.
7. 0.5 gpm vandal resistant spray head with pressure compensating flow control.
8. Trim: Rigid supplies with metal handled stops, flat grid strainer, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
9. Acceptable manufacturers and models:
 - a. Sloan Model Optima EBF-85.
 - b. American Standard "Selectronic" 6055.
 - c. Zurn AquaSense Z6913, or Aqua FIT Z6950-XL-S
 - d. Chicago Faucets

2.15 LF-B: LAVATORY FAUCET (TWO HANDLED MANUAL, 8" CENTERS)

SPEC EDITOR: MANUAL FAUCET BELOW IS FOR AREAS WHERE AUTOMATIC LAV FAUCETS ARE NOT DESIRED. SPECIFIED FAUCET IS UNDER-MOUNT (CONCEALED) "WIDESPREAD" (8" FAUCET CENTERS) TYPE SUITABLE FOR USE WITH LAVATORIES OR COUNTERTOP MOUNTED SINKS. NOTE THAT A GRID DRAIN IS SPECIFIED; MODIFY DESCRIPTION IF A POP-UP DRAIN IS REQUIRED.

SPEC EDITOR: MODEL NUMBERS INDICATED ARE PARTIAL MODEL NUMBERS FOR STYLE ONLY. FEATURES LISTED BELOW REPRESENT THOSE FOUND IN A QUALITY COMMERCIAL FAUCET. THEREFORE, IF ALTERNATE STYLES ARE BEING CONSIDERED, THEY SHOULD PROVIDE THE SAME FEATURES. U-M PREFERS SOLID BRASS FAUCETS FOR VANDAL RESISTANCE; NOTE THAT SOME MFR.S METAL FAUCETS ARE NOT BRASS.

- A. LF-B Lavatory Faucet: Polished chrome plated brass valves, spout, handles, spray head. Concealed (under-mount) body. ADA compliant. With trim.
 1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as \leq 0.25% weighted average lead content.

SPEC EDITOR: EDIT FLAT GRID STRAINER TO POP-UP DRAIN, IF POP-UP REQ'D.
 2. Chrome plated brass flat grid strainer.
 3. Center of body to center of spout: 4" minimum.
 4. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
 5. 8" rigid valve body centers (flexible tubing connections between valves and spout not allowed).
 6. 0.5 gpm vandal resistant spray head.
 7. Ceramic disc valve cartridges.
 8. Trim: Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
 9. Acceptable manufacturers and models:
 - a. American Standard "Reliant"
 - b. Moen "8413"
 - c. Chicago 404 (for grid) with curved lever handles.

SPEC EDITOR: MANUAL FAUCET BELOW IS FOR HOSPITAL PATIENT AND/ OR STAFF TOILET LAVATORY, IN COMPLIANCE WITH INFECTION PREVENTION REQUIREMENTS.

2.16 LF-C: LAVATORY FAUCET (TWO HANDLED MANUAL, 4" CENTERS)

A. LF-C Lavatory Faucet: Healthcare handwashing. Polished chrome plated brass valves, spout and handles. Deck mounted gooseneck spout with two-handle wrist blade control. ADA compliant. With trim.

1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as ≤ 0.25% weighted average lead content.
2. Faucet shall not discharge directly over fixture drain strainer.
3. Center of body to center of spout: 6" minimum.
4. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
5. 4" rigid valve body centers (flexible tubing connections between valves and spout not allowed).
6. 1.0 gpm laminar flow control in base of gooseneck spout.

SPEC EDITOR: SELECT EITHER 6" OR 4-1/2" GOOSENECK SPOUT SO THAT FAUCET DOES NOT DISCHARGE OVER GRID STRAINER. COORDINATE WITH SINK DIMENSIONS. EDIT BELOW AND MODEL NUMBER ACCORDINGLY

7. Heavy duty 6" gooseneck with smooth end (no threads or means to attach an aerator).
8. Ceramic disc valve cartridges.
9. Trim: Chrome plated brass flat grid strainer. Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
10. Acceptable manufacturers and models:
 - a. American Standard
 - b. Delta 27C4974
 - c. Moen
 - d. Chicago

2.17 LAVATORY SUPPORT SYSTEMS

SPEC EDITOR: SELECT EITHER OR BOTH SUPPORT SYSTEMS LISTED BELOW. GENERALLY, USE WALL MOUNTING BRACKET (LOWER COST) IN LIEU OF CARRIER, EXCEPT WHERE WALL FRAMING CANNOT SUPPORT THE LOAD OF THE LAVATORY (DRYWALL, ETC).

A. Wall Mounting Bracket: Steel bearing plate anchored to wall, furnished by lavatory manufacturer. Use at masonry walls only.

B. Wall Mounted Concealed Carrier Arms: cast iron and steel frame with tubular legs, lugs for floor and wall attachment, concealed arm supports, bearing plate and studs. Use at all walls except masonry type. Acceptable manufacturers:

1. Josam.
2. J.R. Smith.
3. Wade.
4. Zurn.

5. Watts

2.18 SINK-A: COUNTERTOP (SINGLE BOWL STAINLESS STEEL SELF-RIMMING)

SPEC EDITOR: SINK-A IS USED FOR KITCHENETTES/ COFFEE ROOMS WITH SINGLE BOWL SINK. USE SWING ARM FAUCET WITH SIDE SPRAY. NOTE THAT SIDE SPRAY 6" HOLE CENTER HAS BEEN SPECIFIED TO ACCOMMODATE ADA LEVER HANDLES.

- A. Sink-A: Countertop Single Bowl: Type 304 stainless steel, 18 gauge, self-rimming, chrome plated brass drain/removable strainer, sound deadening coating, with mounting clamps.
 - 1. Nominal overall dimensions 22 in. long by 25 in. wide by 8 in. deep.
 - 2. 4 faucet holes, three holes on 4-in. centers, forth on nominal 6" center to accommodate side spray.
 - 3. Acceptable manufacturers and models:
 - a. Elkay "Lustertone"
 - b. Kohler "Staccato."
 - c. Just "SL" Series.

2.19 SINK-B: COUNTERTOP (DOUBLE BOWL STAINLESS STEEL SELF-RIMMING)

SPEC EDITOR: SINK-B IS USED FOR KITCHENETTES/ COFFEE ROOMS. USE SWING ARM FAUCET WITH SIDE SPRAY. NOTE THAT SIDE SPRAY 6" HOLE CENTER HAS BEEN SPECIFIED TO ACCOMMODATE ADA LEVER HANDLES.

- A. Sink-B: Countertop Double Bowl: Type 304 stainless steel, 18 gauge, equal compartment size, self-rimming, (2) chrome plated brass drains/removable strainers (delete (1) if sink equipped with disposer), sound deadening coating, with mounting clamps.
 - 1. Nominal overall dimensions. 22 in. long by 33 in. wide by 8 in. deep.
 - 2. 4 faucet holes, three holes on 4-in. centers, forth on nominal 6" center to accommodate side spray.
 - 3. Acceptable manufacturers and models:
 - a. American Standard "Colony".
 - b. Elkay "Lustertone."
 - c. Kohler "Staccato."
 - d. Just "DL" Series

2.20 SINK-C: COUNTERTOP (SMALL SINGLE BOWL SS SELF-RIMMING)

SPEC EDITOR: SINK-C IS USED FOR SMALLER SCALE KITCHENETTES/ COFFEE ROOMS. USE SWING ARM FAUCET WITHOUT SIDE SPRAY. NOT TYPICALLY AVAILABLE IN 18 GA.

- A. Sink-C: Countertop Single Bowl: Type 304 stainless steel, self-rimming, chrome plated brass drain/removable strainer, sound deadening coating, with mounting clamps.
 - 1. Nominal overall dimensions: 15 in. long by 15 in. wide by 7-11/16 deep.
 - 2. 2 faucet holes on 4-in. centers.
 - 3. Acceptable manufacturers and models:
 - a. Kohler "Toccata."

- b. Elkay "Celebrity."
- c. American Standard "Colony".

2.21 SINK-D: COUNTERTOP (INTEGRAL)

SPEC EDITOR: THE FOLLOWING PARAGRAPH DESCRIBES ARCHITECTURALLY SPECIFIED BOWLS SUCH AS CORIAN SINK BOWL INTEGRAL WITH COUNTERTOP. COORDINATE WITH ARCHITECTURAL WORK.

SPEC EDITOR: AN INTEGRAL SOLID SURFACE SINK BOWL (WITH OFFSET STRAINER), COUNTER, BACKSPLASH AND SUPPORT IS THE STANDARD FOR ALL HOSPITAL PATIENT CARE HANDWASHING INSTALLATIONS. COORDINATE WITH ARCHITECTURAL WORK.

- A. Sink-D: Countertop Sink and countertop shall be provided by architectural (general) trades and specified in another Section.

SPEC EDITOR: SINK-E IS USED FOR HOSPITAL APPLICATIONS WHERE AN INTEGRAL SINK IS NOT UTILIZED, REVIEW APPLICATION WITH HOSPITAL ENGINEERING. MINIMUM SIZE FOR HANDWASHING SINKS SHALL BE 16" X 14" X 6-1/2". A/E TO SCHEDULE REQUIRED SINK DIMENSION BASED ON PROJECT NEEDS. COORDINATE FAUCET HOLE REQUIREMENTS BASED ON USE OF WRISTBLADES (8" CENTERS) VS FOOTPEDALS (SINGLE CENTERED HOLE FOR SPOUT).

2.22 SINK E: UNDERMOUNT (SINGLE BOWL STAINLESS STEEL)

- A. Sink-E: Undermount Single Bowl: Type 304 stainless steel, 18 gauge, undermount, coved corners, rear left or right offset strainer outlet (not centered across width of bowl), chrome plated brass drain/removable strainer, sound deadening coating, with mounting clamps.

- 1. Nominal overall dimensions: refer to drawings.
- 2. 3 faucet holes. 8-inch centers.
- 3. Faucet Type: SF-C
- 4. Acceptable manufacturers and models:
 - a. Elkay "Lustertone"
 - b. Just "US" Series

SPEC EDITOR: SERVICE SINKS ARE USED IN MECHANICAL ROOMS AND JANITOR CLOSETS. SS-A IS FOR HEAVY DUTY LOCATIONS SUCH AS CHILLER AND BOILER ROOMS. SS-C IS FOR LIGHT DUTY LOCATIONS.

2.23 SS-A: SERVICE SINK (C.I. WALL MOUNTED)

- A. SS-A: Wall mounted, concealed support, enameled cast iron, perforated grid strainer drain, with cast iron drain/trap.

- 1. Nominal 22 in. wide by 18- in. front to back by 9 in. high back by 11-1/4 in. high bowl.
- 2. Drilled back with 2 holes on 8 -in. centers.
- 3. Rim guard of stainless steel or chrome-plated brass on three sides.
- 4. Acceptable manufacturers and models:
 - a. American Standard "Lakewell" Model 7692.008.
 - b. Kohler "Bannon" Model K-6714 and 44602 rim guard.

c. Zurn Z5898.

- B. Cast iron P-trap with integral removable strainer, adjustable mounting foot, threaded brass cleanout plug. Supplied by sink manufacturer.

2.24 SS-B: SERVICE SINK (C.I. FLOOR MOUNTED CUSTODIAL)

- A. SS-B: Floor mounted, enameled cast iron, corner model, strainer/drain, and vinyl-coated removable rim guard.
1. Nominal 28 in. wide by 28 in. long by 13 in. high at walls and 8 in. high rim at room side.
 2. Acceptable manufacturers and models:
 - a. American Standard "Florwell" Model 7745.811 with removable vinyl rim guard and flat grid drain 7721.038.
 - b. Kohler K-6710 "Whitby" service sink with K-8940 Coated wire rim guard.
 - c. Zurn Z5850-RG with removable vinyl-coated rim guard.
- B. Perforated flat grid strainer drain, polished chrome solid brass.

2.25 SS-C: SERVICE SINK (MOLDED FLOOR MOUNTED UTILITY)

- A. SS-C: Floor mounted, fabricated from compression molded resin material with integral drain connection. Integral molded self-draining faucet ledge and 4 in. centered faucet holes.
1. Overall nominal outside dimensions at top of tub 23 in. by 23 in. by 13 in. tub depth. Nominal 20-gallon capacity.
 2. 4 angular steel legs with levelers.
 3. Acceptable manufacturers and models:
 - a. The Swan Corporation Model MF-1F.
 - b. E.L. Mustee and Sons Model 17F

2.26 SF-A SINK FAUCET (SWING GOOSENECK W/SIDE SPRAY)

SPEC EDITOR: MODEL NUMBERS INDICATED ARE PARTIAL MODEL NUMBERS FOR STYLE ONLY. FEATURES LISTED BELOW REPRESENT THOSE FOUND IN A QUALITY COMMERCIAL FAUCET. THEREFORE, IF ALTERNATE STYLES ARE BEING CONSIDERED, THEY SHOULD PROVIDE THE SAME FEATURES. U-M PREFERS SOLID BRASS FAUCETS FOR VANDAL RESISTANCE; NOTE THAT SOME MFR.S METAL FAUCETS ARE NOT BRASS.

SPEC EDITOR: USE FAUCET SF-A WITH COUNTERTOP SINK-A AND B. COULD ALSO BE USED WITH SINK-D.

- A. SF-A Faucet: Polished chrome plated brass valves, spout, handles, aerator. Concealed (under-mount) body. ADA compliant. With trim.
1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as \leq 0.25% weighted average lead content.
 2. Gooseneck swing spout with side spray.
 3. 8" minimum center of body to spout center. Minimum 12" high spout.
 4. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
 5. 8" rigid valve body centers (flexible tubing connections between valves and spout not allowed).

6. With aerator, maximum flow rate of 2.2 gpm.
7. Ceramic disc valve cartridges.
8. Trim: Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
9. Acceptable manufacturers and models:
 - a. American Standard "Colony" with No. 550 lever handles and side spray.
 - b. Moen "M-Dura"
 - c. Chicago Faucets 200 (base/spout) with curved lever handles.

2.27 SF-B SINK FAUCET (SWING GOOSENECK, 4" CENTERS, NO SIDE SPRAY)

SPEC EDITOR: MORE COMPACT FAUCET SF-B FOR USE WITH SINK-C.

- A. SF-B Faucet: Polished chrome plated brass valves, spout, handles, aerator. Deck mount. ADA compliant. With trim.
 1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as \leq 0.25% weighted average lead content.
 2. Gooseneck swing spout.
 3. 5" minimum center of body to spout center. Nominal 11" high spout.
 4. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
 5. 4-inch centers.
 6. With aerator, maximum flow rate of 2.2 gpm
 7. Ceramic disc valve cartridges.
 8. Trim: Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
 9. Acceptable manufacturers and models:
 - a. American Standard "Colony" with No. 550 lever handles and side spray.
 - b. Moen "M-Dura"
 - c. Chicago Faucets 895 (base/spout) with lever handles.

SPEC EDITOR: MANUAL FAUCETS SF-C & SF-D BELOW ARE FOR HOSPITAL PATIENT CARE HANDWASHING USE, IN COMPLIANCE WITH INFECTION PREVENTION REQUIREMENTS. SF-C WRISTBLADE CONTROL IS STANDARD, SF-D FOOT PEDAL CONTROL IS BASED ON USER REQUEST. FAUCET IS TYPICALLY PAIRED WITH AN INTEGRAL SOLID SURFACE SINK WITH OFFSET OUTLET PROVIDED BY ARCHTECTORAL TRADES, IE SINK-D.

2.28 SF-C: HOSPITAL HANDWASHING SINK FAUCET (GOOSENECK WITH WRISTBLADES)

- A. SF-C Faucet: Polished chrome plated brass valves, spout and handles. Concealed deck mount, gooseneck spout with two-handle wrist blade control. ADA compliant. With trim.
 1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as \leq 0.25% weighted average lead content.

2. Faucet shall not discharge directly over fixture drain strainer.
3. Center of body to center of spout: 8" minimum.
4. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.

SPEC EDITOR: SELECT EITHER 8" OR 4" VALVE BODY CENTERS, IN COORDINATION WITH SINK TYPE. EDIT BELOW AND MODEL NUMBER ACCORDINGLY.

5. 8" rigid valve body centers (flexible tubing connections between valves and spout not allowed).
6. 1.0 gpm laminar flow control in base of gooseneck spout.

SPEC EDITOR: SELECT GOOSENECK SPOUT SO THAT FAUCET DOES NOT DISCHARGE OVER GRID STRAINER AND TO LIMIT SPLASHING. COORDINATE WITH SINK DIMENSIONS. EDIT BELOW AND MODEL NUMBER ACCORDINGLY.

7. Heavy duty, fixed position 8" gooseneck with smooth end (no threads or means to attach an aerator).
8. Ceramic disc valve cartridges.
9. Trim: Chrome plated brass flat grid strainer. Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
10. Acceptable manufacturers and models:
 - a. American Standard
 - b. Delta
 - c. Moen
 - d. Chicago 786-GN2FCABCP

2.29 SF-D HOSPITAL HANDWASHING SINK FAUCET (GOOSENECK WITH FOOT PEDALS)

- A. SF-D Faucet: Polished chrome plated brass valves, spout and pedals. Concealed deck mount, gooseneck spout with dual foot pedal control. ADA compliant. With trim.

1. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as ≤ 0.25% weighted average lead content.
2. Faucet shall not discharge directly over fixture drain strainer.
3. Center of body to center of spout: 8" minimum.

SPEC EDITOR: BASED ON WALL MOUNTED EXTENDED PEDALS. IF SHORT PEDAL BOX FOR MOUNTING ON MILLWORK BELOW SINK IS DESIRED, EDIT BELOW AND MODEL # ACCORDINGLY.

4. Extended, chrome plated pedals for wall mounting, with hot and cold indicators, NAIAD metering fast cycle time closure cartridges for immediate shut-off, locking feature to keep pedals in raised position. Flexible tubing connections between valves and spout not allowed.
5. 1.0 gpm laminar flow control in base of gooseneck spout.

SPEC EDITOR: SELECT GOOSENECK SPOUT SO THAT FAUCET DOES NOT DISCHARGE OVER GRID STRAINER AND TO LIMIT SPLASHING. COORDINATE WITH SINK DIMENSIONS. EDIT BELOW AND MODEL NUMBER ACCORDINGLY.

6. Heavy duty, fixed position 8" gooseneck with smooth end (no threads or means to attach an aerator).
7. Ceramic disc valve cartridges.
8. Trim: Chrome plated brass flat grid strainer. Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
9. Acceptable manufacturers and models:
 - a. American Standard
 - b. Delta
 - c. Moen
 - d. Chicago GN2 gooseneck with 834-EPABCP extended footpedals

2.30 SSF-A SERVICE SINK-FAUCET (SINK WALL MOUNT)

SPEC EDITOR: USE SERVICE SINK-FAUCET SSF-A WITH SERVICE SINKS SS-A. SSF-A IS FOR MOUNTING ON VERTICAL SURFACE OF SINK BACK.

- A. SSF-A: Utility Faucet: For mounting on vertical surface of sink back. Rough or polished chrome plated brass body, spout, handles. ADA compliant.
 1. Metal lever handles with hot and cold indicators.
 2. Compression or ceramic disc valve cartridges.
 3. Integral vacuum breaker.
 4. 8" centers.
 5. Spout with 3/4 in. threaded hose end.
 6. 3 ft. hose with one end a 3/4 in. threaded brass conn.
 7. Minimum 5" wall-to-spout projection.
 8. Acceptable manufacturers and models:
 - a. American Standard Model 8350
 - b. Chicago Faucets 540.
 - c. Zurn AquaSpec Z842L1-RC

2.31 SSF-B SERVICE SINK-FAUCET (WALL MOUNT)

SPEC EDITOR: USE SERVICE SINK-FAUCET SSF-B WITH SERVICE SINKS SS-B.

- A. SSF-B: Wall-Mount Utility Faucet: Chrome plated brass valves, spout, handles. ADA compliant.
 1. Metal lever handles with hot and cold indicators.
 2. Ceramic disc valve cartridges.
 3. Vacuum breaker.
 4. Wall-to-spout brace.
 5. Integral check valves to prevent cross-flow.
 6. Offset adjustable shanks capable of adjustment to 8" centers.
 7. Spout with 3/4 in. threaded hose end and bucket hook.
 8. Minimum 9" wall-to-spout projection.
 9. Acceptable manufacturers and models:
 - a. American Standard Model 8354
 - b. Chicago Faucets 540.
 - c. Zurn AquaSpec Z843M1-RC

2.32 SSF-C SERVICE SINK-FAUCET (4" CENTER DECK MOUNT)

SPEC EDITOR: USE SERVICE SINK-FAUCET SSF-C WITH SERVICE SINK SS-C.

- A. SSF-C Deck-Mount Utility Faucet: Chrome plated brass valves, spout, handles. ADA compliant.
1. 4 in. centers.
 2. Metal lever handles with hot and cold indicators.
 3. Ceramic disc valve cartridges.
 4. 6" minimum center of body to spout center.
 5. Swivel spout with 3/4 in. threaded hose end and in-line or integral vacuum breaker.
 6. Acceptable manufacturers and models:
 - a. Chicago 891.
 - b. Zurn Z812N1.

2.33 SCRUB SINK

SPEC EDITOR: SCRUB SINK IS FOR USE IN HOSPITAL FACILITIES. DO NOT PROVIDE WITH INTEGRAL SOAP DISPENSERS, AS MICH MEDICINE WILL INSTALL WALL MOUNTED DISPENSERS. COORDINATE WITH SURGICAL STAFF ON USE OF SPLASH SCREEN DIVIDERS, WHICH ARE TYPICALLY NOT REQUIRED. ELECTRONIC INFRARED SENSOR FACUET IS STANDARD, DO NOT SPECIFY KNEE OPERATED OR DIGITALLY TIMED FAUCETS. EYEWASH UNITS ARE TYPICALLY NOT REQUIRED, CONSULT WITH UM SAFETY MANAGEMENT SERVICES (SMS) WHERE REQUIRED. IF REQUIRED, PROVIDE SEPARATE, DEDICATED EYEWASH UNIT COMPIANT WITH ANSI STANDARDS. DO NOT INTEGRATE EYEWASH AND HANDWASHING.

- A. SCRUB-A: 16-gauge (min) 304 stainless steel anti-splash tub with horizontal and vertical 0.25" radius coved corners, fully welded and polished to #4 finish, underside sound deadened. 18-gauge (min) 304 stainless steel outer enclosure with removable stainless steel access panels. Stainless steel shall conform to ASTM A240.
1. Factory pre-piped with thermostatic, pressure balancing, anti-scald mixing valve to allow manual adjustment of temperature up to 115°F at each station. Valve shall conform to requirements stated under THERMOSTATIC MIXING VALVE - HAND WASHING FACILITIES, "Mixing Valve Specifications". Provide with chrome plated brass adjustment handle mounted on backsplash control panel. All piping shall be concealed behind enclosure with maintenance access.

SPEC EDITOR: COORDINATE NUMBER OF STATIONS REQUIRED AND DIMENSION OF COMPLETE UNIT.

2. Stations: 2
3. Dimensions: 64" wide x 27" front to back.
4. Provide each station with an electronic infrared sensor-operated, laminar (non-rose spray) flow faucet set to flow tempered water with presence of operator within range of sensor, with time delay off. Provide with internally piped and wired solenoid valve, control module and 24VAC transformer for hard-wiring.
5. Provide with 2" drain with stainless steel flat grid strainer, one per station.

6. Provide with wall bracket(s) for installation on masonry wall. Provide chair carrier for all non-masonry wall installations.
7. Provide with integral digital timer, one per station, set to begin and stop with water flow.
8. Acceptable manufacturers and models:
 - a. Steris AMSCO Flexmatic
 - b. Continental Metal Products
 - c. LogiQuip

2.34 UNDERSINK WASTE AND SUPPLY PIPE GUARDS

SPEC EDITOR: PROVIDE UNDER SINK PROTECTIVE INSULATION FOR ADA COMPLIANT WALL MOUNTED LAVATORIES

- A. Provide ADA compliant undercounter protective covers on all supply and waste piping at barrier free lavatories. Covers shall be UV protected PVC, with reusable fastening system. Provide product type designed for the specific piping material over which it will be applied.
 1. Acceptable manufacturers and models:
 - a. Zurn.
 - b. IPS Corporation Truebro.

SPEC EDITOR: CENTRAL DOMESTIC WATER MIXING VALVES ARE NOT INCLUDED IN THIS SPECIFICATION BECAUSE THEY NEED TO BE SELECTED SPECIFICALLY FOR PROJECT CONDITIONS IF THEY ARE TO WORK PROPERLY. IF SUCH A VALVE IS REQUIRED THE DESIGNER SHOULD CAREFULLY SELECT AN APPROPRIATE MODEL AND ADD IT TO THIS SPECIFICATION.

2.35 THERMOSTATIC MIXING VALVE - HAND WASHING FACILITIES

- A. The Michigan Plumbing Code section 607.1 (2) (h) has been modified by local rule as follows:
 1. A ASSE 1070 mixing valve (water temperature limiting device) is permitted to control up to 5 accessible plumbing fixtures within the same room. The ASSE 1070 mixing valve shall be certified for a minimum flow rate of 0.5 gpm or less.
- B. Provide a thermostatic mixing valve at all public lavatories including at accessible plumbing fixtures. A maximum of 5 faucets within the same room may be served by 1 mixing valve.
 1. At other locations identified in the Michigan Plumbing Code, provide individual water temperature limiting devices (thermostatic mixing valves) to individual fixtures.
- C. Provide mixing valves based on the following selection criteria:
 1. Mixing valve serving a single fixture: Valve pressure drop shall not exceed 5 psi at 1 gpm flow rate.
 2. Mixing valve serving 2-5 fixtures: Valve pressure drop shall not exceed 5 psi at 4.0 gpm flow rate.
- D. Mixing valve specification:
 1. Manually adjustable thermostatically controlled domestic water tempering valve.
 2. ASSE 1070 listed to control down to 0.5 GPM flow rate.

3. All bronze or brass body, rough finish, chrome plated if exposed. Brass and stainless steel internal components.
4. Chloramine resistant seals.
5. Integral check valves and stainless steel strainers (screens) in hot and cold water inlet connections.
6. Tamper resistant temperature adjustment handle.
7. Union with male or female NPT connections, or compression fittings.
8. Valves shall operate properly:
 - a. At supply pressures between 20 PSIG and 125 PSIG.
 - b. With up to 20 percent pressure differential between hot and cold water supplies.
9. Outlet temperature shall be adjustable to within 10 deg. F of inlet hot water temperature.
10. Hot inlet operating range: 120-180 deg. F.
11. Lower temperature adjustment range: not more than 95 deg. F.
12. Upper temperature adjustment range: not more than 140 deg. F.

E. Acceptable manufacturers and models:

1. Powers Hydroguard.
2. Symmons Maxline.
3. Wilkins Aqua-Gard.

2.36 SHOWER HEADS, SHOWER CONTROL VALVES, AND TRIM

SPEC EDITOR: SELECT SH-A AND/OR SH-B TO SUIT PROJECT

- A. SH-A: ADA Shower System: Including chrome plated brass supply ell, wall flange, and 30-inch slide bar. Chrome plated brass hand held shower head with on/off control having non positive shut off, chrome plated brass swivel cradle with adjusting knob, (min.) 69 in. chrome plated stainless steel hose, in line vacuum breaker. Shower head flow rate 2.5 gpm. All components shall be ADA compliant. Shower head shall be compatible with shower control valve range. Acceptable manufacturers:

1. American Standard.
2. Chicago Faucet.
3. Speakman.
4. Symmons.
5. Kohler.

- B. SH-B Shower Head: Chrome plated brass shower head, shank, and ball joint. 2.0 GPM flow rate. Spray adjusting side handle. Shower head shall be compatible with shower control valve range. Acceptable manufacturers and models:

1. American Standard.
2. Chicago Faucet.
3. Speakman.
4. Symmons.
5. Kohler.

SPEC EDITOR: U-M HOUSING TYPICALLY USES A SYMMONS MODEL 4-500 "SAFETY MIX" SHOWER CONTROL VALVE IN A SYMMONS "HYDAPIPE" HOUSING. FOR HOUSING PROJECTS VERIFY IF THE AFOREMENTIONED SYMMONS SHOWER ASSEMBLY IS REQUIRED, AND REVISE BELOW ACCORDINGLY.

SPEC EDITOR: HOSPITAL PROJECTS SHALL ONLY EMPLOY COMBINATION BALANCED PRESSURE/THERMOSTATIC SHOWER VALVES, REVISE BELOW ACCORDINGLY.

- C. Shower Control Valve, for SH-A & SH-B (including tub/shower combination valves): Balanced pressure, thermostatic, or combination balanced pressure/thermostatic valve. ADA compliant.
1. Vandal resistant chrome plated brass face plate, single handle, and tub spout (provide 4-port valve, diverter, and spout for bathtub applications).
 2. Brass body mixing valve with integral check stops, for concealed piping connections, capable of back-to-back installation.
 3. Adjustable limit stop factory set to 110 deg. F (120 deg. F max adjustment).
 4. Shall provide anti-scald protection and temperature regulation at inlet pressures as low as 20 psig (flowing), at flows from 1.75-2.5 gpm, at supply temperatures from 40 deg. F to 160 deg. F.
 5. Minimum static pressure rating: 125 psig.
 6. Acceptable manufacturers and models:
 - a. American Standard.
 - b. Chicago Faucet.
 - c. Speakman.
 - d. Symmons.
 - e. Kohler.
 - f. Powers.

SPEC EDITOR: PATIENT BATHROOMS WITHIN HOSPITAL PROJECTS TYPICALLY REQUIRE BOTH A HANDHELD & FIXED SHOWER HEAD INSTALLATION. INCLUDE BELOW ACCORDINGLY.

- D. SS-H Shower System: Shower control valve, fixed shower head, handheld shower head, diverter valve & trim. ADA. Supplied as a complete matching system by a single manufacturer.
1. Chrome plated brass fixed shower head, shank and trim. Provide with matching handheld shower head, including chrome plated brass supply ell, wall flange, and 30-inch slide bar. Chrome plated brass hand held shower head with on/off control having non-positive shut-off, chrome plated brass swivel cradle with adjusting knob, (min.) 69 in. chrome plated stainless steel hose, in line vacuum breaker. Shower head flow rate 2.5 gpm. All components shall be ADA compliant. Shower head shall be compatible with shower control valve range.
 2. Shower Control Valve (including tub/shower combination valves): Combination balanced pressure/thermostatic valve. ADA compliant.
 - a. Vandal resistant chrome plated brass face plate, single handle.
 - b. Brass body mixing valve with integral check stops, for concealed piping connections, capable of back-to-back installation.
 - c. Adjustable limit stop factory set to 110 deg. F (120 deg. F max adjustment).
 - d. Shall provide anti-scald protection and temperature regulation at inlet pressures as low as 20 psig (flowing), at flows from 1.75-2.5 gpm, at supply temperatures from 40 deg. F to 160 deg. F.

- e. Minimum static pressure rating: 125 psig.
- 3. Provide a matching chrome-plated brass diverter valve meeting shower control valve requirements stated herein.
- 4. Acceptable manufacturers and models:
 - a. American Standard
 - b. Chicago Faucet
 - c. Speakman SM-5460-E-15
 - d. Symmons
 - e. Kohler
 - f. Powers "HydroGuard T/P Series e420"

2.37 ELECTRIC WATER COOLERS

SPEC EDITOR: CARBON WATER FILTERS ARE NOT TO BE PROVIDED WITH WATER COOLERS AT THE UNIVERSITY OF MICHIGAN DUE TO INCREASED MAINTENANCE.

- A. EWC-A Electric Water Cooler: Vandal-resistant, wall mounted, refrigerated water cooler. ADA compliant.
 - 1. 14 gauge satin-finish stainless steel vented cabinet and integral basin, with removable access panel.
 - 2. Self-closing button operated. Polished chrome-plated bubbler head with flow adjustment. In-line removable strainer.
 - 3. Without carbon filter.
 - 4. Cooling System: Integral to water cooler. Insulated stainless steel evaporator tank. Copper tube/aluminum fin condenser. Non-CFC/HCFC refrigerant. Adjustable thermostat. 115V/1Ph/60Hz. UL listed.
 - 5. Delivers a minimum of 8 gph of water at 50 deg. F, cooled from 80 deg. F inlet water, at 90 deg. F, ambient.
 - 6. Certified to NSF/ANSI 61-G.
 - 7. Acceptable manufacturers and models:
 - a. Halsey-Taylor "HVRHD" Series.
 - b. Haws Model "H" Series.
 - c. Oasis International "PG" Series.
- B. EWC-B Electric Water Cooler: Bi Level, vandal-resistant, wall mounted, refrigerated water cooler. ADA compliant.
 - 1. 14 gauge satin-finish stainless steel vented cabinet and integral basin, with removable access panel.
 - 2. Self-closing button operated. Polished chrome-plated bubbler head with flow adjustment. In-line removable strainer.
 - 3. Without carbon filter.
 - 4. Cooling System: Integral to water cooler. Insulated stainless steel evaporator tank. Copper tube/aluminum fin condenser. Non-CFC/HCFC refrigerant. Adjustable, accessible thermostat. 115V/1Ph/60Hz. UL listed.
 - 5. Delivers a minimum of 8 gph of water at 50 deg. F, cooled from 80 deg. F inlet water, at 90 deg. F, ambient.
 - 6. Certified to NSF/ANSI 61-G.
 - 7. Acceptable manufacturers and models:
 - a. Halsey-Taylor "HVRHD" Series.
 - b. Haws Model "H" Series.
 - c. Oasis International Model "PG" Series.

SPEC EDITOR: ELECTRIC WATER COOLER WITH BOTTLE FILLER IS ACCEPTABLE IN NUMEROUS ACCEPTABLE CONFIGURATIONS (BI-LEVEL, "ARCHITECTURAL" RECESSED, STAND-ALONE BOTTLE-FILLER, ETC. IN ALL CASES, UNITS SHALL BE ALL STAINLESS STEEL, REFRIGERATED, VANDAL RESISTANT WHERE AVAILABLE AND ADA COMPLIANT. EDIT ACCORDINGLY.

SPEC EDITOR: HOSPITAL PROJECTS REQUIRE NON-FILTERED WATER COOLERS.

- C. WC-C Electric Water Cooler with Bottle Filler: Vandal-resistant, wall mounted, refrigerated water cooler. ADA compliant.
1. 14 gauge satin-finish stainless steel vented cabinet and integral basin, with removable access panel.
 2. One piece chrome plated with integral hood.
 3. Type 300 series stainless steel cooler top with satin finish and anti-splash ridge.
 4. Self-closing button operated. Polished chrome-plated bubbler head with flow adjustment. In-line removable strainer.
 5. Provide with integral electronic bottle filler.
 6. Bottle fill station to be sensor activated with user interface graphics. Quick fill rate is 1.1 gpm.
 7. Cooling System: Integral to water cooler. Insulated stainless steel evaporator tank. Copper tube/aluminum fin condenser. Non-CFC/HCFC refrigerant. Adjustable thermostat. 115V/1Ph/60Hz. UL listed.
 8. Delivers a minimum of 8 gph of water at 50 deg. F, cooled from 80 deg. F inlet water, at 90 deg. F, ambient.
 9. Without carbon filter.
 10. Certified to NSF/ANSI 61-G.
 11. Acceptable manufacturers and models:
 - a. Halsey-Taylor "HTHBHVR" Series.
 - b. Haws
 - c. Oasis International
 - d. Elkay

SPEC EDITOR: EMERGENCY FIXTURES SPECIFICATION MUST BE MODIFIED TO BE PROJECT SPECIFIC. BELOW SPECS COVER SOME COMMONLY USED TYPES.

2.38 EMERGENCY FIXTURES

SPEC EDITOR: THE PLUMBING CODE REQUIRES THAT TEPID WATER BE DELIVERED TO EMERGENCY FIXTURES. THE BELOW ARTICLE CALLS FOR A DEDICATED TEMPERING VALVE PER EMERGENCY FIXTURE, WHICH MAY NOT BE COST EFFECTIVE FOR EVERY PROJECT. DESIGNER SHALL CAREFULLY EVALUATE TEMPERING VALVE OPTIONS AND REVISE THE BELOW ACCORDINGLY. DESIGNER IS CAUTIONED IN PARTICULAR TO EVALUATE PRESSURE DROP ACROSS THE TEMPERING VALVE.

SPEC EDITOR: PLASTIC BOWLS, EYE WASH HEADS, AND SHOWER HEADS CAN SAVE CONSIDERABLE COST BUT MAY BE MORE SUSCEPTIBLE TO BREAKAGE AND BACTERIAL GROWTH, EVEN WITH ANTIMICROBIAL PROTECTION. BELOW EYEWASH/SHOWERS ARE SPECIFIED WITH THESE PARTS IN TRADITIONAL STAINLESS STEEL OR CHROME PLATED, FOR CLEANLINESS AND DURABILITY.

SPEC EDITOR: MULTIPLE SWING ARRANGEMENTS ARE AVAILABLE FOR EYE WASH COUNTERTOP MODELS, THEREFORE MODEL NUMBERS ARE NOT PROVIDED BELOW. REVISE THE BELOW TO SPECIFY THE SPECIFIC MFR.S MODEL NUMBERS THAT WILL ACCOMMODATE YOUR PROJECT'S MOUNTING LOCATION(S) .

- A. EEWS-A Emergency Eye Wash: Countertop mounted. Swing away when not in use. ANSI Z358.1-2009 compliant. Provide swing arrangement that accommodates mounting location. Barrier Free.
1. Stainless steel or chrome plated brass eye wash head(s) with tethered dust cover(s) and auto-flow control.
 2. Chrome-plated brass pipe, fittings, deck escutcheon, and stay-open ball valve, with stainless steel ball and stem.
 3. Universal emergency sign mounted on stainless steel ball valve paddle.
 4. Test card to record weekly checks.
 5. Emergency Fixture Tempering Valve.
 6. Acceptable manufacturers and models:
 - a. Haws.
 - b. Bradley
 - c. Speakman.
- B. EEWS-B Emergency Eye/Face Wash: Pedestal mounted, self-supporting. ANSI Z358.1-2009 compliant. Barrier Free.
1. Stainless steel or chrome plated brass combination eye and face wash head(s) with tethered dust cover(s) and auto-flow control.
 2. Chrome-plated brass fittings and stay-open ball valve, with stainless steel ball and stem.
 3. Universal emergency sign mounted on stainless steel ball valve paddle.
 4. Stainless steel bowl.
 5. In-line strainer.
 6. 1-1/4 in. sch. 40 hot-dipped galvanized steel pipe stand/waste tee and cast-iron floor flange. Stand and floor flange painted/powder coated.
 7. Test card to record weekly checks.
 8. Emergency Fixture Tempering Valve.
 9. Acceptable manufacturers and models:
 - a. Haws.
 - b. Bradley.
 - c. Speakman.

SPEC EDITOR: BELOW FLUSH CEILING-MOUNTED DRENCH SHOWER IS SPECIFIED W/SS SHOWER (AS OPPOSED TO PLASTIC) AND PULL ROD BASED ON THE ASSUMPTION THAT THIS TYPE SHOWER WAS SPECIFIED FOR AESTHETIC REASONS.

- C. EEWS-C Emergency Shower: Drench shower, flush ceiling-mounted shower head with concealed horizontal supply pipe and valve. ANSI Z358.1-2009 compliant. Barrier Free.
1. Stainless steel shower head with 20 gpm flow control.
 2. Stainless steel or brass stay-open ball valve, with stainless steel ball and stem. .
 3. Stainless steel triangular pull rod; provide length required to meet ANSI Z358.1 44-48" maximum distance to floor requirement.

4. Pull rod ceiling escutcheon.
5. 1.0 in. sch. 40 galvanized steel supply pipe/fittings.
6. Universal emergency sign and weekly test card.
7. Emergency Fixture Tempering Valve.
8. Acceptable manufacturers:
 - a. Haws
 - b. Bradley.
 - c. Speakman.

D. EEWS-D Emergency Shower/Eye-Face Wash: Combination shower eye/face wash, self-supporting. ANSI Z358.1-2009 compliant. Barrier Free.

1. Stainless steel or chrome plated brass combination eye and face wash head(s) with tethered dust cover(s) and auto-flow control. Operated by stainless steel paddle with universal emergency sign.
2. Stay-open stainless steel or chrome plated brass ball valve, with stainless steel ball and stem, for eye/face wash and for shower.
3. Stainless steel bowl.
4. In-line strainer for eye/face wash.
5. 1-1/4 in. sch. 40 hot-dipped galvanized steel pipe stand/waste tee and cast floor flange. Stand and floor flange painted/powder coated.

SPEC EDITOR: COMBINATION SHOWER/EYE-FACE WASH UNITS ARE AVAILABLE WITH DRAIN AND SUPPLY CONNECTIONS LOCATED AT VARIOUS ELEVATIONS. EDIT THE BELOW TO PROVIDE CONNECTIONS SUITABLE FOR YOUR PROJECT.

6. Low waste connection, supply connection to be tee at top of pipe stand.
7. Universal shower emergency sign and weekly test card.
8. Stainless steel shower head with 20 gpm flow control.
9. Stainless steel or aluminum triangular pull rod; provide length required to meet ANSI Z358.1 69" maximum distance to floor requirement.
10. Emergency Fixture Tempering Valve.
11. Acceptable manufacturers and models:
 - a. Haws.
 - b. Bradley.
 - c. Speakman.

E. EEWS-E Emergency Eye Wash: Deck-mount drench hose, handheld eye/face wash. ANSI Z358.1-2009 compliant.

1. Stainless steel or chrome plated brass eye wash head(s) with tethered dust cover(s) and auto-flow control.
2. Chrome-plated brass pipe, fittings, deck escutcheon, and stay-open ball valve.
3. Provide with 8' thermoplastic hose with swivel fitting. Min 250 psi rating.
4. Universal emergency sign for wall mounting.
5. Test card to record weekly checks.
6. Emergency Fixture Tempering Valve.
7. Acceptable manufacturers and models:
 - a. Haws
 - b. Bradley S19-460EFW
 - c. Speakman

SPEC EDITOR: NOTE THAT COMBINATION FAUCET/ EYE WASH FIXTURE REQUIRES THAT IT BE MOUNTED IN A SINK BOWL THAT IS A MINIMUM OF 13" FRONT TO BACK (WITH STANDARD 5" SPOUT) TO CONTAIN EYEWASH PLUME WITHIN SINK.

F. EEWS-F Emergency Eye Wash: Combination eye wash / faucet. ANSI Z358.1-2009 compliant.

1. Chrome-plated brass construction faucet with integral eyewash.
2. Chrome-plated brass eye wash head(s) with tethered dust cover(s) and auto-flow control. Independent water channel for eyewash.
3. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
4. 3-hole rigid valve body centers (flexible tubing connections between valves and spout not allowed).
5. 1.5 gpm laminar flow control in base of spout.
6. Faucet, supplies, and stops shall be NSF/ANSI-61-G listed as \leq 0.25% weighted average lead content.
7. Faucet shall not discharge directly over fixture drain strainer.
8. Lever style handles, with hot and cold color indicators and vandal resistant mounting screws.
9. Ceramic disc valve cartridges.
10. Trim: Chrome plated brass flat grid strainer. Rigid supplies with metal handled stops, tailpiece, P-trap with clean-out, waste to wall, escutcheons; all chrome plated brass. Where concealed, trim under sinks may be unplated brass stops, plastic or rough brass supply tubes, PVC trap, and rough brass escutcheons.
11. Test card to record weekly checks.
12. Emergency Fixture Tempering Valve.
13. Acceptable manufacturers and models:
 - a. Speakman "SEF"

G. EEWS-G Eye Wash - Wall Mounted

SPEC EDITOR: EEWS-G IS APPROVED BY U-M EHS FOR USE AT CHEMICAL TREATMENT EQUIPMENT

1. Wall mounted eye/face wash providing laminar flow, with universal emergency sign, wall hook, 12' recoil swivel hose, chrome plated stay-open squeeze lever, with compatible manufacturer supplied, code compliant, vacuum breaker.
2. Minimum flow for plumbed and portable eyewash units is .4 gpm at 30 psi.
3. Units must be capable of delivering a minimum of 15 minutes of flushing fluid.
4. Eyewash units shall be capable of being activated in 1 second or less.
5. Stay open ball valves must be used to accommodate for hands-free rinsing.
6. Flushing fluid must be provided to both eyes simultaneously.
7. Dust caps or dust covers must be installed to protect the unit from contaminates.
8. Spray heads must be positioned between 33" and 45" from the floor.

9. Spray heads must be positioned at least 6" from the wall or nearest obstruction.
10. Eyewash stations must be located within 55' of hazard, with unobstructed travel path.
11. Eyewash must meet ANSI z358.1-2014 requirements.
12. Acceptable manufacturers and models
 - a. Haws 8905

SPEC EDITOR: TEMPERING VALVE CONSIDERATIONS: LOCATION? MOUNTING CABINET? ONE TEMPERING VALVE TO SERVE MULTIPLE FIXTURES? IS THERE ADEQUATE WATER SUPPLY PRESSURE FOR TEMPERING VALVE AND FIXTURE PRESSURE DROP?

- H. Emergency Fixture Tempering Valve: ANSI Z358.1-2009 compliant and ASSE 1071 listed emergency fixture tempering valve. Provide one tempering valve per emergency fixture. Cold water bypass when hot supply lost; shut-off of hot supply when cold supply lost; shut off hot and allow cold flow if thermal actuator fails.
1. Select valve to control accurately across the entire flow range of the emergency fixture. Tempering valve pressure drop shall not exceed 10 PSI at the emergency fixture's maximum flow rate.
 2. Tamper resistant temperature adjustment, range 65 deg. F to 95 deg. F, factory set at 85 deg. F.
 3. Rough bronze finish. Brass and stainless steel internal components.
 4. Chloramine resistant seals.
 5. Integral check valves and stainless steel strainers (screens) in hot and cold water inlet connections.
 6. Provide thermometer to measure the mixed temperature, range 0-140 deg. F. Thermometer may be integral to tempering valve or field supplied.
 7. Approved manufacturers:
 - a. Haws
 - b. Bradley
 - c. Powers Hydroguard XP
 - d. Leonard Valve Company

SPEC EDITOR: THE BELOW EMERGENCY FIXTURE ALARM SPECIFICATION (IN HIDDEN TEXT) IS A SAMPLE SPECIFICATION ONLY. TURN ON TEXT IF USED. TYPICALLY AT U-M, EMERGENCY FIXTURE ALARMS ARE ONLY USED FOR SHOWERS IN AREAS HIGHLY PRONE TO VANDALISM. HAWS, BRADLEY, AND SPEAKMAN ALL MAKE ALARM PACKAGES WITH THE FEATURES DESCRIBED BELOW. DESIGN CONSIDERATIONS: LOCATION OF THE HORN/LIGHT? IS ADEQUATE FLOW-SWITCH-TO-ALARM CABLE LENGTH AVAILABLE FROM THE MFR? HORN/LIGHT MOUNTED TO WHAT? DOME COLOR? REMOTE MONITORING? FOR EYEWASHES, SHOWERS, OR BOTH?

- I. Emergency Fixture Alarm System: Complete stand-alone alarm system with flow switch, horn, and flashing light or strobe. For non-hazardous locations.
1. 120 VAC single phase. UL listed electrical components. On-off horn silence switch. NEMA 3R rated electrical components. Factory pre-wired flow switch, silence switch, horn, and flashing light/strobe. Provide adequate cable length between flow switch and alarm devices to accommodate installation conditions.

2. Amber light dome.
3. Horn volume 85 dB at 10 feet.
4. Additional alarm contact for remote monitoring.
5. Vapor proof flow switch. Provide flow switch compatible with emergency fixture served.
6. Approved manufacturers:
 - a. Haws
 - b. Bradley
 - c. Speakman

2.39 GD-A - GARBAGE DISPOSAL

- A. GD-A Garbage Disposal:
1. Corrosion proof polymer or stainless steel hopper and grinding chamber.
 2. Compact shell, 14 in. maximum overall height. Sound insulated.
 3. Stainless steel grind ring, swivel impellers, and turntable.
 4. Motor: 3/4 HP, 120V single phase permanently lubricated. Built-in overload protection with manual reset.
 5. Stainless steel 3-bolt sink flange connection, stainless steel stopper, and dishwasher drain connection.
 6. For operation with wall switch (continuous feed).
 7. Acceptable manufacturers and models:
 - a. Insinkerator Evolution Compact Series.
 - b. Waste King Legend 9940.

2.40 WASHING MACHINE VALVE BOX

- A. ABS plastic outlet box and trim ring and with supply and drainage connections. Box shall allow piping from bottom or top. With separate quarter turn ball valve for each supply connection. Ball valves shall be brass body, 1/2 in. sweat inlet connection, stainless steel ball and stem, with 3/4 in. hose bib. Provide dual drain "Du-All" box or a separate supply and drain box "Ox Box" as convenient for installation. Provide fire rated outlet boxes when required.
1. Approved manufacturers:
 - a. IPS Corporation ("Du-All")
 - b. Sioux Chief ("Ox Box" and fire rated)

2.41 ACCESSORIES

- A. Supply Tubes, Stop Valves, and Escutcheons for Faucets: Sweat, threaded or compression connection. Rigid supplies. Metal handled valves. Valves and escutcheons chrome plated brass where exposed, may be rough brass where concealed. Supply tubes chrome plated brass where exposed, may be rough brass or plastic where concealed. Brass tubes and valves NSF/ANSI-61-G listed as $\leq 0.25\%$ weighted average lead content. Acceptable manufacturers:
1. Watts
 2. Chicago.
 3. BrassCraft.
 4. Faucet manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before fixture installation. Verify that walls and floor finishes are prepared and ready for installation of fixtures.
- B. Review millwork/casework shop drawings. Confirm location and size of fixtures and openings before rough-in and installation. Confirm that millwork/casework is constructed with adequate provision for the installation of countertop lavatories and sinks.
- C. Coordinate cutting and forming of roof and floor construction to receive drains to required invert elevations.

3.2 INSTALLATION OF PLUMBING FIXTURES AND LABORATORY SERVICE OUTLETS - GENERAL

- A. Fixtures shall not be used for construction activities. Protect fixtures from damage during construction.
- B. Install fixture supports securely to building substrate, utilizing bolts in every mounting hole provided in the fixture support. Provide additional blocking/backing when required.
- C. Install Barrier Free water closets, urinals, lavatories, and other devices at mounting heights and with clearances in conformance with the applicable Building Code and ADA requirements.
- D. Install supply, vent and drain connections to fixtures full size of fixture connection, unless larger required by code or indicated otherwise on drawings. Provide the following minimum branch piping and connection sizes:
 - 1. Lavatory and Sink Faucets: 1/2 in. branch piping to wall, 3/8 in. connection between wall and fixture, length of each 3/8 in. supply not to exceed 30 in.
 - 2. Wall Hydrants: 3/4 in. branch piping.
 - 3. Fume Hood Cup Sinks: 1/2 in. branch piping.
 - 4. Eye/Face Wash: 3/4 in. branch piping.
- E. Install fixtures and fixture carriers level and plumb.
- F. Countertop Lavs: Coordinate with architectural trades.
- G. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork. Install deep-pattern escutcheons if required to conceal protruding fittings.
- H. Install each fixture with trap, easily removable for servicing and cleaning.
- I. Provide rigid supply tubes and stops to all lavatories and sinks.
- J. Provide accessible ball type isolation valves (construction per Related Section) in the supplies to shower control valves and electric water coolers.

- K. Provide accessible ball type isolation valves and spring check valves (construction per Related Section) in the supplies to service sink faucets. These check valves are in addition to checks integral to the faucet. Locate isolation valves to isolate faucet and checks.
- L. Provide plumbing fixtures complete with supply, waste and vent piping connections; together with all fittings, supports, fastening devices, and valves.
- M. Use strap wrenches and padded tools to preclude injury to chrome plated and other decorative surfaces.
- N. Exposed to view supply and drainage trim for fixtures and equipment shall be connected to the rough piping systems at the wall, unless noted otherwise.
- O. Wall sleeves on supply and drain connections are not required at the immediate connection to plumbing fixtures. Provide escutcheons.
- P. For faucets without an included gasket, seal areas between faucet base and sink top with non-hardening plumber's putty.
- Q. Seal joints between plumbing fixtures and walls and floors using mildew-resistant 100% silicone sealant. Match sealant color to fixture color. Comply with sealant requirements specified in Division 07 section for Joint Sealants.
- R. Install emergency fixture placards at approved location.

3.3 INSTALLATION OF WATER CLOSETS AND URINALS - STANDARD AND BARRIER FREE

SPEC EDITOR: COORDINATE MOUNTING HEIGHTS WITH ARCHITECTURAL DRAWINGS

- A. Mounting Heights:
 - 1. Water closets - standard: 15 in. to 17 in. from top of toilet seat to finished floor.
 - 2. Water closets - barrier free: 17 in. from top of toilet seat to finished floor.
 - 3. Urinals- standard: 24 in. from rim to finished floor.
 - 4. Urinals - barrier free: 17 in. from rim to finished floor, 44 in. maximum from hand operated flush valve to finished floor.
 - 5. Flush Valve: Mount flush valve handle on wide side of stall or room.
- B. Apply dual flush instruction plates to wall centered above flushometer.
- C. Install toilet seats on water closets.

3.4 INSTALLATION OF FIXTURES IN CASEWORK AND FUME HOODS

SPEC EDITOR: BACKFLOW PREVENTER MAY BE REQUIRED - SPECIFY IN 221119 DOMESTIC WATER SPECIALTIES

- A. Fixtures (including tailpiece) and outlets to be installed in casework and fume hoods shall be furnished by others and installed by this contractor as part of the work under this section. Contractor shall install fixtures and outlets complete including all piping, supports, stops, etc. Contractor shall provide rough-in and shall make all final connections. Contractor shall coordinate his work with fume hood and casework manufacturers and with all other trades. Refer to Related Sections Laboratory Casework and Laboratory Fume Hoods. Refer to Architectural drawings for location and quantities of outlets and fixtures and for piping details within fume hoods.

3.5 INSTALLATION OF THERMOSTATIC MIXING VALVES (NON-EMERGENCY FIXTURES)

- A. Install in a location readily accessible for cleaning, adjustment, and valve/cartridge replacement.
- B. Install mixing valve after checks and stops are installed. Thoroughly flush all piping immediately prior to mixing valve installation.
- C. Install isolation valves on the hot and cold water inlet pipe connections, near the mixing valve.
- D. Install check valves between the mixing valve and the mixing valve isolation valves. These check valves are in addition to the mixing valve's integral check valves.
- E. Adjust valve temperature set point to 110 deg. F, following manufacturer's adjustment instructions.

3.6 INSTALLATION OF EMERGENCY FIXTURE TEMPERING VALVES

- A. Install in a location readily accessible for cleaning, adjustment, and valve/cartridge replacement.
- B. Install tempering valve after checks and stops are installed. Thoroughly flush all piping immediately prior to tempering valve installation.
- C. Install isolation valves on the hot and cold water inlet pipe connections, near the mixing valve.
- D. Install check valves between the mixing valve and the mixing valve isolation valves. These check valves are in addition to the tempering valve's integral check valves.
- E. Install individual fixture tempering valves a maximum of 10 feet from the emergency fixture served, closer if recommended by the manufacturer.
- F. Install a downstream thermometer with a range of 0-140 deg. F, to measure the mixed temperature. Not required if tempering valve is supplied with an integral thermometer.
- G. Remove isolation valve handles.
- H. Adjust valve temperature set point to 85 deg. F +/- 3 deg. F, or as indicated on drawings. Follow manufacturer's adjustment instructions.

3.7 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section for Commissioning and other requirements of the Contract Documents.

3.8 ADJUSTING AND CLEANING

- A. Flush all water closets and urinals and verify performance. Adjust or clean flush valves to produce proper flow.
- B. Back-flush shower heads, faucet aerators/spray heads, and in-line strainers at electric water coolers, emergency fixtures, and wherever installed, and reinstall.
- C. Adjust pop-up drains for proper operation.
- D. Adjust eyewashes to provide proper flow.
- E. Adjust shower control valve limit stops to deliver maximum 120 deg. water.
- F. Adjust stops or valves for intended water flow rate to fixtures without splashing, noise or overflow.
- G. Replace dead batteries in sensor operated flush valves and faucets. Adjust sensor operation to satisfaction of commissioner.
- H. At completion of project, remove excess caulk and sealants and clean plumbing fixtures and equipment.

SECTION 226313 - MEDICAL GAS CERTIFICATION (FOR HOSPITAL FUNDED PROJECTS)

END OF CONTENTS TABLE

DIVISION 22 PLUMBING

SECTION 226313 - MEDICAL GAS CERTIFICATION (FOR HOSPITAL FUNDED PROJECTS)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 018113: Sustainable Design Requirements.
 - 2. Section 019110/019100: Commissioning
 - 3. Section 220500 Common Work Results for Mechanical
 - 4. Section 221113 Piping Materials and Methods
 - 5. Section ~~XXXXXX~~ Medical Gas Systems

1.2 SUMMARY

- A. Perform certification of all medical gas/ vacuum installations in conformance with NFPA 99C.
- B. Certification services will be a direct contract between UM and the certification contractor and should not be included in the contractor's bid. Contractor shall be responsible for coordination of and with the certification contractor's services. The information expressed in this specification is for contractor information purposes only.
- C. Section Includes:
 - 1. Owner approved medical gas certification companies
 - 2. Certifiers scope of services

1.3 REFERENCES

- A. Definitions
 - 1. Portable Document Format (PDF): An open standard file format licensed by Adobe Systems used for representing documents in a device-independent and display resolution-independent fixed-layout document format.

1.4 SUBMITTALS

- A. Documentation:
 - 1. Certification reports in conformance with NFPA 99C
 - a. Submit to the State of Michigan Health Facilities Evaluation Section at the completion of each project phase. All submittals shall be conducted thru the UM Project Manager.
 - b. Final, approved reports shall be delivered in hard copy and electronic Adobe Acrobat pdf form to the UMH Plumbing Shop Foreman at the completion of each project phase.

2. Medical gas as-built drawings
 - a. Medical gas as-builts shall be uploaded in electronic Adobe Acrobat pdf form to the UMH Facilities Planning & Development website:
 - b. <http://www.med.umich.edu/facilities/plan/vn/>
- B. All Submittals: Identify and incorporate information in each submittal as follows:
 1. Assemble complete submittal package per project into a single indexed file. Report hard copies shall be bound and compiled in an orderly fashion. Report electronic copies shall be saved and compiled as a single pdf file.
 2. Submitted documents shall be FINAL, APPROVED reports and as-builts. Partial, preliminary reports or reports identifying outstanding issues of non-compliance should not be submitted to UMHHC. Prior to submitting FINAL reports, all outstanding issues and/or code deficiencies shall be resolved and re-certified.
- C. Electronic Submittals: File name shall use project identifier (UMH project RTN number) and project name followed by a description of the file contents. An example of a file name:
 1. RTN 1234567 Emergency Dept Expansion- FINAL Med Gas Certification Report.pdf
 2. RTN 1234567 Emergency Dept Expansion- FINAL Med Gas As-Built.pdf

1.5 **QUALITY ASSURANCE**

- A. Reference Standards: Services described in this section shall be in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 1. NFPA 99C, "Standard for Health Care Facilities", 2005 edition
- B. All medical gas certification services shall be conducted under the direct supervision of an ASSE 6020 certified inspector and ASSE 6030 certified verifier.
- C. All medical gas certifications required under a given project shall be conducted by a single certification company.
- D. Coordinate testing and inspections with the University of Michigan mechanical inspector, UM project manager and UMH plumbing shop.

1.6 **ACCEPTABLE CERTIFICATION CONTRACTORS**

- A. Acceptable Medical Gas Certification Service Providers:
 1. Diamond Medical Services (Rob Rawlings)
 2. ~~Pneumatic Medical, Au Gres, MCGassy Girl~~ (Matt Bussinger)

PART 2 - PRODUCTS

2.1 NOT APPLICABLE

PART 3 - EXECUTION

3.1 GENERAL SERVICE REQUIREMENTS:

- A. Inspection and testing shall be performed on all new piped gas systems, additions, renovations, temporary installations, or repaired systems to assure the facility, by a documented procedure, that all applicable provisions of NFPA 99C have been adhered to and system integrity has been achieved and/or maintained.
- B. The verifier will check all source equipment, piping distribution, valving, outlets & inlets and labeling for form, function and conformance. All alarm systems shall be tested for set points, signals, and pressures monitored. Piping systems are to be tested for purity, free of both gaseous and particulate contaminants.
- C. The duties of the medical gas certifier shall include:
 - 1. Coordination with project manager and project phasing in order to avoid delays in the project schedule. Certifications shall be conducted, certified and submitted for each phase of construction.
 - 2. Coordination with the project's UM mechanical inspector to ensure that medical gas installations are certified prior to mechanical inspection.
 - 3. Alerting UM Project Manager of any errors or violations that may impact project budget or schedule.
- D. If deficiencies are found, the certifier shall summarize in a deficiency report issued thru the UM Project Manager. The mechanical contractor shall make corrections as required and coordinate with the certification contractor for re-certifying the installation.

3.2 CERTIFICATION REPORT:

- A. The verifier is to inspect, test, and develop a document that proves that the installation meets all current code requirements and that it is safe and ready for patient use.
- B. Submit reports in conformance with NFPA 99C, specifications and the requirements listed below.
- C. Reports shall be signed by a licensed ASSE 6030 certifier.
- D. Reports shall be bound and include UM/ UMH project numbers (ie UM AEC Project # and UMH FPD RTN #) and project name (from project construction documents) clearly labeled on the cover sheet.
- E. Report shall include a list of all deficiencies, corrections made and final re-certification results. Reports shall not be submitted with outstanding, unresolved deficiencies within the scope of work.

3.3 MEDICAL GAS AS-BUILTS

- A. The University of Michigan Hospitals & Health Centers Facilities Planning & Development (UMHHC FPD) maintains a web-based, digital record drawing of all medical gas/ vacuum systems in use in UMHHC facilities. Access to viewing, printing and downloading the current medical gas as-built as well as uploading proposed changes to these documents is controlled thru a secure log-in thru the UMH FPD website:
 - 1. <http://www.med.umich.edu/facilities/plan/vn/>
- B. At the completion of the medical gas certifier's services, the certifier shall be responsible for generating an as-built of all source equipment, piping distributions, isolation valves, alarms and outlets/ inlets modified and/ or added in the scope of the project.
- C. The certification contractor shall be responsible for uploading the project medical gas as-built to the UMHHC FPD website to aid in the upkeep of accurate medical gas as-builts.
- D. Submitted as-builts will be incorporated into the hospital's master record drawings and re-posted to UMHHC FPD's website.

3.4 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 230593 - TESTING, ADJUSTING AND BALANCING (TAB)

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230593 - TESTING, ADJUSTING AND BALANCING (TAB)

REVISIONS:

10-12-00: SUBSTANTIALLY REVISED, APPROVED AS NEW MASTER

REVISED FOR HVAC MECH TECH TEAM BY D. KARLE, AUGUST 2008.

ADDED GAS CABINET BALANCE INSTRUCTIONS TO ARTICLE 3.8 (WORDING DUPLICATES MMC) D. KARLE NOVEMBER 2010.

ADDED (ARTICLE 3.8) THAT ALL ADJUSTMENTS TO LAB TERMINAL AIRFLOW UNITS ARE TO BE DONE BY THE LABORATORY CONTROLS CONTRACTOR, NOT THE TAB CONTRACTOR. D. KARLE, DECEMBER 2013.

ADDED 230910 AND 230920 AS RELATED SECTIONS. ADDED IN ARTICLE 3.8 TO VERIFY LTAU AIR FLOWS AT DESIGN MIN. AND MAX CFM. D. KARLE FOR HVAC MTT JUNE 2015.

AUGUST 2015: ADDED REQUIREMENT TO LABEL CHILLED BEAMS. ADDED REQUIREMENT TO VERIFY PURGE VOLUMES AND CROSS LEAKAGE OF AIR TO AIR HEAT EXCHANGERS. D. KARLE FOR HVAC MTT.

AUGUST 2017: ADDED REQUIREMENT FOR I.D. LABELS ON CEILING NEAR VAV BOXES PER PLUMBING MTT DUE TO REQUEST BY HOSPITAL FPD. D. KARLE.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Section 230910: Laboratory Air Flow Controls - DDC
 - 2. Section 230920: Laboratory Air Flow Controls - Analog

1.2 SCOPE OF WORK:

EDITOR: EDIT SCOPE CAREFULLY. CONSIDER OTHER SYSTEMS THAT MAY REQUIRE TAB WORK, SUCH AS PROCESS COOLING WATER SYSTEMS AND RODI SYSTEMS, AND ADD TO THIS SCOPE OF WORK SECTION. ALSO CONSIDER IF TAB DATA SHOULD BE TAKEN ON EXISTING SYSTEMS PRIOR TO NEW CONSTRUCTION. WHILE THIS SPECIFICATION IS INTENDED TO COVER GENERAL TESTS ASSOCIATED WITH FUME HOOD TESTING SUCH AS FACE VELOCITY READINGS, IT DOES NOT COVER ASHRAE 110 TESTING.

A. Adjust and balance the following systems:

1. Supply air systems
2. Return air systems
3. Exhaust air systems
4. Hydronic systems
5. Domestic hot water systems

B. Conduct the following systems testing:

1. Sound testing
2. Vibration testing
3. Fume hood testing

EDITOR: PERFORMANCE TESTING IS EXPENSIVE AND DIFFICULT TO ACCOMPLISH IN MOST CASES, AND IS THEREFORE NOT USUALLY SPECIFIED. FOR CRITICAL SYSTEMS, CONSIDER FACTORY TESTING RATHER THAN FIELD PERFORMANCE TESTING.

4. Equipment Performance Testing for the following equipment:
(none)

C. Hydronic Balancing shall include as a minimum all devices for which a GPM is indicated in the plans, schedules or specifications.

D. Air Balancing shall include as a minimum all devices for which a CFM is indicated in the plans, schedules or specifications.

E. Testing, Adjusting and Balancing Reports, as detailed in part 3.

1.3 QUALITY ASSURANCE:

A. The Contractor shall obtain the services of an independent (third party) Test, Adjust and Balance (TAB) Contractor.

B. Air balance and water balance shall be done by the same Test and Balance Contractor.

C. Testing and balancing shall be performed in accordance with standards of either AABC ("National Standards for Field Measurement and Instrumentation - Total System Balance", Current Volume and Supplements,) or NEBB ("Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems"), and ASHRAE Standard 111-1988.

D. The TAB supervisor shall be currently certified under the requirements of either NEBB or AABC, and shall directly supervise the project TAB activities. Supervisors shall be certified in all areas germane to the project's work scope: air, hydronic, fume hood and sound/vibration testing. Sound and vibration testing may be subcontracted to other qualified firms as approved by the Engineer.

E. Test equipment accuracies shall be no less than recommended by NEBB or AABC; provide higher accuracy test equipment if dictated by project needs. Test equipment shall have been calibrated within the time intervals recommended by NEBB or AABC, but in all cases shall have been calibrated within the last year.

1.4 ACCEPTABLE BALANCING CONTRACTORS:

A. The following are the only acceptable balancing companies:

1. Absolut Balance

2. Air Flow Testing
3. Enviro-Aire/ Total Balance, Inc.

1.5 SUBMITTALS

- A. Provide the following for approval:
 1. Test instrument list including the following information:
 - a. Instrument type and accuracy
 - b. Instrument manufacturer and model number
 - c. Instrument serial number
 - d. Copy of current calibration certificate
 2. Proof of TAB supervisor certification.
 3. Resume of the TAB supervisor and of all TAB technicians proposed for the project.
 4. Proposed reporting forms for each TAB procedure.

1.6 SEQUENCING AND SCHEDULING:

- A. Where performance testing is specified, equipment and systems must be tested under conditions that are near design conditions. Various components and systems shall be tested in summer or winter design conditions to accurately reflect specified conditions.

1.7 WARRANTY:

- A. For a period of 90 days after the acceptance of the balancing report, the TAB contractor shall recheck or reset any part of any system to meet the Owner's needs, where these variations are within the capabilities of the equipment.

PART 2 - PRODUCTS

2.1 NOT APPLICABLE.

PART 3 - EXECUTION:

3.1 PREPARATION

- A. Pre-Balancing Conference: Prior to the pre-balance conference, inspect system readiness for testing, adjusting, and balancing (TAB). Prepare and submit a list of system deficiencies. Afterwards, meet with the Project Engineer, Commissioner and contractors to resolve system deficiencies, to verify TAB procedures and system readiness for TAB, and to coordinate TAB activities and schedule.
- B. Coordinate testing, adjusting and balancing of fume hood exhaust systems with U-M OSEH.
- C. Phased Construction: Coordinate TAB procedures with any phased construction requirements for the project so that usable increments of finished work may be accepted for beneficial occupancy. Systems serving partially occupied phases of the project may require balancing for each phase prior to final balancing.

- D. Scheduling: Identify to the contractor anticipated durations for TAB work, and what items must be complete prior to proceeding with TAB work. Allow sufficient time in the construction schedule for TAB prior to final project inspection.
- E. Conduct final TAB after system has been completed and is in full working order. Prior to completing balancing, inspect and test systems and components to verify proper installation and operation, including but not be limited to:
 - 1. Verify strainers and filters are installed and clean.
 - 2. Verify motor and equipment rotation, lubrication and alignment.
 - 3. Align belts and pulleys. Adjust tension.
 - 4. Check operation of all automatic valves and dampers.
 - 5. Check position of isolation valves and dampers.
 - 6. Verify air has been vented from hydronic systems.
- F. In cooperation with other contractors, correct deficiencies.

3.2 TESTING, ADJUSTING AND BALANCING - GENERAL REQUIREMENTS:

- A. Notify Commissioner and / or University Project Engineer when testing and balancing activities are commencing.
- B. Immediately notify the Commissioner and University Project Engineer when any deficiencies are detected, whether associated with design, installation, or equipment.
- C. Properly repair any damage to mechanical systems resulting from TAB procedures, e.g. patch duct test holes, repair pipe insulation, etc.
- D. TAB contractor shall provide all required tools and equipment necessary to perform TAB services. Take measurements with certified and calibrated devices. Do not use field installed sensors and gauges.
 - 1. Exception: Magnetic flow meters may be utilized for flow measurements when available. However, the TAB contractor shall make secondary checks such as pump pressure readings and shall indicate the results of those tests in the TAB report.
- E. Take air and hydronic measurements on equipment at the same time, e.g. take air handler coil water flow data at the same time as air handler air side data.
- F. Measure the total air and water flow rate of each system and each major system component.
- G. Coordinate work with the building controls contractor(s).
- H. Measure motor and equipment speed (RPM) with strobe tachometer. Record full load and part load slippage, and calculate motor brake horsepower (BHP) using $BHP = \text{nameplate HP} \times (\text{part load slip} / \text{full load slip})$.

3.3 AIR BALANCING - GENERAL REQUIREMENTS:

- A. Place systems in operation with filters installed and control systems complete and operating. Temporarily block filters to simulate dirty filter pressure drop (obtain dirty filter pressure drop from drawing schedules. If not stated, contact design engineer to obtain). Balance systems to design ratings. Adjust each air terminal unit, inlet and outlet within plus or minus 10 percent of design requirements, but total air for each system shall be not less than shown.
- B. Check flow rates for all factory set air terminal units and reset if not correct.
- C. Adjust fan speeds by adjusting or replacing sheaves and belts. If replacement is required, follow project change order procedures and obtain authorization prior to proceeding.
- D. Set supply fan static pressure as low as practicable while maintaining required pressure at the most aerodynamically remote terminal units.
- E. Record pressure drop readings across all major system components and significant drops within duct systems.
- F. Verify the calibration of air flow measuring stations by taking traverse readings across associated ducts.
- G. For fans equipped with variable speed drives, set the drive to 60 hertz and measure motor and fan RPM to validate that, at the maximum drive speed setting, the fan rotates at the maximum design fan speed. The maximum design fan speed shall be as indicated on the approved fan curve. Assure that running the fan at maximum design speed will not cause any damage prior to making this test.
- H. Label all diffusers, chilled beams, registers and grilles with clear plastic adhesive labels indicating air flow rate, terminal unit number and outlet number corresponding to the balance report. Similarly label VAV boxes with terminal unit number and min./max. CFM, affixing label to ceiling grid or access panel at box location. Use nominal 3/16" high black block-style font.

3.4 AIR BALANCING - CONSTANT VOLUME SYSTEMS:

- A. Adjust fan speed to minimize wasted horsepower and noise at throttled balancing dampers.
- B. Verify each CAV box or zone for proper control: normally open or normally closed position, and type of control.

3.5 AIR BALANCING - VARIABLE VOLUME SYSTEMS (INCLUDING CAV AND VAV BOXES):

- A. Balance systems to minimize throttling losses and to optimize (reduce to lowest possible) end-of-line (E-O-L) differential pressure set points. Prior to beginning balancing, meet with the project Commissioner and agree to the exact procedures to be followed. Set static pressure set points to ensure the most hydraulically remote terminal unit can achieve design flow. Measure flow at each terminal unit individually to verify scheduled design flow is achieved at the lowest possible differential pressure set point. Reset E-O-L set point and re-measure flow at each terminal unit until the lowest E-O-L set point is achieved. For DDC systems, coordinate with DDC programmer to optimize E-O-L set point where the sum of the loads exceeds system capacity, the ratio of capacity/loads is defined as the system diversity factor. Calculate diversity factor and indicate calculated diversity factor in the balance report. Adjust belts and sheaves to achieve design flow. Test maximum equipment capacity with all boxes forced open to design maximum CFM. Document design diversity, actual diversity, E-O-L set point, and fan volume. Show all calculations
- B. Verify each VAV box for proper control: normally open or normally closed position, and type of control.
- C. Check each individual VAV box for minimum and maximum flow. Calibrate boxes as required to meet design CFMs. For electronically controlled boxes, check and correct correction factor at each box. Coordinate with the DDC programmer.
- D. Check supply and return fan tracking and assure compliance with design requirements.

SPEC EDITOR: ROOM PRESSURIZATION VERIFICATION (3.6.A.1) SHOULD BE INCLUDED FOR ALL LABS AND OTHER AREAS WHERE A PRESSURE RELATIONSHIP IS IMPLIED BY CFM DIFFERENTIAL BETWEEN SUPPLY AND EXHAUST. HOWEVER, TRUE ROOM PRESSURIZATION CONTROL (3.6.A.2 AND 3) IS INFREQUENTLY USED, TYPICALLY ONLY FOR ANIMAL ROOMS, CLEAN ROOMS, BIOSAFETY LABS, AND OTHER CRITICAL LABS.

3.6 AIR BALANCING - ROOM PRESSURIZATION VERIFICATION:

- A. Perform room pressurization verification on all systems where drawings indicate a pressure relationship between rooms based on a differential in supply, return and exhaust cfm. Test systems in each operational mode (e.g. close fume hood sashes, change room temperature set point, etc.) and verify that correct air flow direction at doorways and correct CFM offset between terminal units is maintained in any mode. Indicate if the room "passed" in the air balance report. In all cases, record room pressurization in cfm differential. Verify that all architectural patching of penetrations has been completed. Conduct final testing and balancing with all doors closed. Coordinate work with Laboratory Controls Contractor.
 - 1. For room pressurization designed with cfm offset:
 - a. Balance air flow to all terminal units.

- b. Verify the room pressure relationships implied by scheduled cfm. Smoke stick test all rooms and record results.
- 2. For room pressurization designed with controlled differential pressure offset:
 - a. Balance air flow to all terminal units.
 - b. Verify room pressure relationships. Document offset achieved in inches w.c. at design set points.
- 3. For room pressurization systems with adjustable or reversible controls: Verify room pressure relationships with controls set in both the positive and the negative direction. Test at maximum offsets and document offsets achieved in inches w.c. Set at design offset (if indicated) and document offset achieved in inches w.c.
- 4. For room pressurization designed with visual indicators (Ping-Pong balls or similar devices): Verify correct function of the visual indicators in each operational mode.

3.7 AIR BALANCING - AIR HANDLING EQUIPMENT AND SYSTEMS:

- A. Test air handling units, exhaust and return fans, and associated automatic dampers in all modes of operation. Determine the most restrictive operating mode and balance systems in this mode.
- B. In addition to values listed in ASHRAE Standard 111-1988, the following shall also be measured and reported:
 - 1. Minimum and maximum outdoor air quantities. (Include setting minimum outside air where applicable.)
 - 2. Power factor or watts for motors larger than 10 HP
 - 3. Component air pressure drops, including across open dampers.
- C. Record actual motor amps, volts, and rpm, and fan flow, static pressure and rpm.
- D. Check all equipment motors, belts, drives, bearings, filters.
- E. Check supply and return fan tracking/offset by traverse duct measurements and validate compliance with design requirements.
- F. For new air handling units, fan coils, or any other air handling equipment equipped with a condensate drain: In conjunction with the commissioner, test cooling coil condensate drain and trap performance. Artificially load filters to simulate dirty filter conditions. Verify drain pan does not overflow, and air does not blow by trap.
- G. Units equipped with air-to-air heat exchangers: Take measurements up and downstream of heat exchangers and calculate the leakage rate between the supply and exhaust/return sides of the unit to validate that leakage rates do not exceed design values. Measure leakage rates at design air flow volumes (producing corresponding pressure differentials), with filters blocked to simulate dirty filter pressure drop. For rotary heat exchangers, take air flow measurements with rotor rotating at maximum speed. Take air flow measurements after duct leak testing has successfully passed, as close to units as possible to limit impacts from duct leakage, but at locations that allow accurate measurement.

3.8 AIR BALANCING - LABORATORY SYSTEMS:

*EDITOR: THIS ARTICLE CONTAINS ITEMS SPECIFIC TO LAB SYSTEMS.
REVIEW AND EDIT CAREFULLY TO ADDRESS PROJECT REQUIREMENTS.*

- A. Test, adjust and balance laboratory air systems, including all laboratory terminal airflow units, fume hoods, bio-safety cabinets (exhausted, or partially exhausted type), snorkels, chemical cabinets, canopy hoods, etc.
 - 1. All adjustments to Lab Terminal Airflow Units (LTAUs) shall be done by the Laboratory Controls Contractor, not the TAB contractor. TAB contractor shall take flow readings to verify the accuracy of these devices, only.
- B. Test supply and exhaust tracking through full system performance range. Record room pressurization in cfm differential. Correlate to room air balancing plan.
 - 1. Verify the LTAU air flow against that reported by the LTAU controller at the following points: design minimum and maximum CFM.
 - 2. Measure differential pressure across the LTAU during each CFM verification measurement.
 - 3. Record air flow measured, air flow reported by LTAU controller, and differential pressure across the LTAU, for each verification point. In heavy black permanent marker, mark this data on the LTAU near the mfr.'s data.
- C. Fume Hoods: In conjunction with U-M OSEH and the laboratory air flow controls contractor:
 - 1. Adjust the fume hood terminal air flow unit to achieve the design fume hood face velocity with the sash set at the sash stop position.
 - 2. Measure the face velocity at sash stop position and at the fully open sash position.
 - 3. Verify operation of the fume hood alarm monitor (sash at sash stop position) by temporarily reducing air flow through the hood until the alarm set point indicated on the design drawings is achieved.
 - 4. Measure the hood face dimensions (sash at sash stop) and include this info along with the calculated face area and calculated face velocity in the balance report.
- D. Lab Exhaust Fans:
 - 1. Test operation of bleed-in dampers.
 - 2. Measure total exhaust air flow from the building to each exhaust fan/fan plenum.
 - 3. Test every fan on plenumized fan systems.
- E. Gas Cabinets:
 - 1. Balance exhaust to achieve an average face velocity at the face of gas cabinet access ports or windows (while open) of not less than 200 FPM, and a minimum velocity of 150 FPM at any point at the face of the access port or window.

3.9 HYDRONIC BALANCE - GENERAL REQUIREMENTS

- A. Perform final hydronic balance after all systems have been flushed, cleaned, and filled.
- B. Test hydronic systems in all modes of operation. In general, balance systems in the most restrictive operating mode.
- C. Hydronic balance includes performance readings (flow, pressures, temperatures) on all pumps, coils, heat exchangers, and flow measuring devices. For coils 3 gpm or less at terminal units, record flows only. Adjust pump flows to actual system heads by adjusting balancing valves (constant volume systems). Flow measuring devices take precedence over pump head readings. Record discrepancies for evaluation. Provide pump head and flow (i.e. flow determined from shut off head, operating head and pump curve) and flow measuring device data.
- D. Report pressure drop readings across all major system components both for flow determination and for deviations between actual and design values.
- E. Record the pressure drop across water filtering devices.
- F. Where Y or basket strainers are equipped with inlet and outlet pressure gauges, record the pressure drop.
- G. Record (on flow diagrams) the flows and pressures obtained in each of the various circuits and modes of operation. Measure flows in parallel pumping systems when operating independently and jointly.
- H. Adjust and set the memory stop for each balancing valve.
- I. For auto-balancing valves, record differential pressure with auto-balancing valve throttling against maximum flow mode. .
- J. For 3-way control valves, balance "bypass" flow to match "through" flow.

- K. In general, balance variable flow systems to achieve design flow at all units simultaneously. Where the sum of the loads exceeds system capacity, the ratio of capacity/loads is defined as the system diversity factor. Calculate diversity factor and indicate calculated diversity factor in the balance report. Balance variable flow systems to minimize throttling losses and to optimize (reduce to lowest possible) differential pressure set points. Prior to beginning balancing, meet with the project Commissioner and agree to the exact procedures to be followed. Set static pressure set points to ensure the most hydraulically remote load can achieve design flow. Measure flow at each load individually to verify scheduled design flow is achieved at the lowest possible differential pressure set point. Reset and re-measure flow at each load until the lowest differential pressure set point is achieved. Verify that no control valve "lifts" at the final differential pressure set point, by closing all other control valves, allowing the controls to settle to the differential pressure set point, and then verifying the valve remains fully closed. Record the final differential pressure set point in the TAB report. Throttle balance valves at loads only as required to obtain accurate flow data; generally balance valves should otherwise be left fully open. (Exception: throttle balance valves at stacked coil sections (or similar arrangements) to provide equal flow to each coil in the stack.) For DDC systems, coordinate with DDC programmer to optimize differential set point.

3.10 VIBRATION TESTING

- A. Perform vibration measurements for all rotating equipment 1/2 horsepower and larger, including compressors, pumps, fans and motors.
- B. Inspect vibration isolation system and alignment and report deficiencies.
- C. Allowable Vibration Tolerances: Self-excited, vibration maximum velocity shall not exceed the following limits, measured in inches per second RMS (not in mils peak to peak), filter in. Measure vibration at bearing caps of machine in vertical, horizontal and axial directions or at equipment mounting feet if bearings are concealed.
1. Except where noted otherwise: 0.20
 2. Pumps: 0.13
 3. Centrifugal Compressors: 0.13
 4. Fans: 0.09
- D. For variable speed equipment, inspect at full range of speeds. Verify the maximum safe speed the system can be run at before beginning tests. Modulate speed from minimum to maximum to test for possible harmonic vibrations. Record vibration at maximum operating speed and at any speed displaying harmonic vibration.
- E. Include in the report a summary sheet indicating pass / fail for each unit. For each unit of equipment, record detailed initial measurements, corrections made, retest measurements, and suggested course of action for equipment that still fails limits after contractor correction.

SPEC EDITOR: EDIT ACOUSTICAL TESTING SECTION TO MAKE PROJECT SPECIFIC. CONSIDER ALWAYS INCLUDING THE SECTION ON TESTING 6 ROOMS IN CASE NOISE ISSUES ARISE AFTER CONSTRUCTION IS COMPLETE.

3.11 ACOUSTIC TESTING

- A. Conduct acoustic testing with a calibrated sound level meter and octave band analyzer of the accuracy required by AABC or NEBB. Include dBA and individual octave readings. Use current ASHRAE manuals for reference levels, formulas and coefficients.
- B. Record sound pressure readings by octave and in weighted dBA scale. Plot dB by octave and calculate RC and NC values. Compare against specified levels indicated on drawings or in specifications.

SPEC EDITOR: THE FOLLOWING ARE RECOMMENDED ROOM CRITERIA (RC - THE NEW STANDARD) VALUES FOR VARIOUS ROOM TYPES. (NOISE CRITERIA, NC - IS THE OLD STANDARD):
OFFICES: RC 30-35 (N) FOR PRIVATE, RC 35-40 (N) FOR OPEN
LECTURE HALLS: RC 25-30 (N)
OPEN PLAN CLASSROOMS: RC 35-40 (N)
PUBLIC AREAS: RC 35-45 (N)
LABS: RC 30-40 (N) - OFTEN NOT ACHIEVABLE WITH HEAVY AIR FLOW.

EDIT LIST BELOW AND/OR THE DRAWINGS OR DELETE SOUND PRESSURE TESTING.

- 1. Conduct sound pressure testing:
 - a. In six rooms, designated by the Owner/Engineer.
 - b. Where RC/NC criteria appears on the drawings.

3.12 PERFORMANCE TESTING

SPEC EDITOR: THIS PARAGRAPH IS RARELY USED. ACCURATE PERFORMANCE TESTING IS DIFFICULT AND EXPENSIVE. SOME SMALL EQUIPMENT (EG: ARI FAN COIL UNITS) AND COMPONENTS IN LARGER EQUIPMENT (EG: AMCA FANS) CARRY PERFORMANCE CERTIFICATION. IF WARRANTED, FACTORY TESTING OF CUSTOM EQUIPMENT IS GENERALLY PREFERRED OVER FIELD PERFORMANCE TESTING.

- A. Equipment Performance Testing: For the equipment listed, test performance and verify that it meets scheduled capacity. Develop a system specific testing plan for review by the Architect / Engineer and the commissioner. Document all testing procedures, and corrections due to variations in actual testing condition versus scheduled performance.

SPEC EDITOR: THIS PARAGRAPH IS RARELY USED. WEATHER IS DIFFICULT TO PREDICT, AND RARELY COOPERATES WITH CONSTRUCTION AND OCCUPANCY SCHEDULES. IF USED, EDIT VERY CAUTIOUSLY.

- B. Seasonal Performance Testing: For the systems listed, conduct testing at or near design outdoor conditions. Test, adjust, and balance air conditioning systems during summer season and heating systems during winter season, including at least a period of operation at outside conditions within 5 deg F wet bulb temperature of maximum summer design condition, and within 10 deg F dry bulb temperature of minimum winter design condition. Take final temperature readings during seasonal operation.

3.13 COMPLETION SERVICES

- A. Final Check: Make final checks and complete any testing as directed.
- B. Acceptance: Final acceptance of the project will not be made until a satisfactory report is received. Owner reserves the right to spot check the report by field verification prior to final acceptance.

3.14 TESTING, ADJUSTING, AND BALANCING REPORT

- A. Submit TAB reports in compliance with specifications and the requirements listed below.
- B. Submit progress TAB reports within 3 days of balancing *each* air, hydronic, and plumbing system, and more frequently if requested by the project Commissioner. Submit the final TAB report within one week of completing all testing, adjusting and balancing
- C. Report all data in inch/pound units.
- D. Provide date and time all readings were taken.
- E. Include brief system descriptions, deficiencies, corrections made, unresolved problems, and recommendations.
- F. Provide as-built schematic sketches for each system indicating all equipment, balancing related components, terminal devices, diffusers, grilles, registers, and valves. Use equipment nomenclature as defined in construction documents. Indicate room numbers, and correlate all devices to the balance report data.
- G. Include a list of all testing equipment and devices used, including type, accuracy, manufacturer, model number, serial number, and calibration date.
- H. Include definition of all abbreviations and acronyms, and all formulas used in calculations.
- I. Provide the outside air dry bulb and wet bulb temperature at the beginning and end of each TAB day, correlated to the day's TAB work.
- J. Number all report pages. Tab major sections of the report and provide a report table of contents.
- K. Include complete nameplate data for all equipment.
- L. Include flows and pressures in all operating modes. Indicate final E-O-L differential pressure set points, and the results of all tests (e.g. smoke stick tests, etc.)
- M. Describe TAB procedures used; including procedure used in establishing differential pressure set point for variable speed drive controlled systems.

- N. Include performance data for all major equipment, including providing copies of the approved fan curves, pump curves, coil data sheets, flow element curves, and Cv characteristics. This is not required for terminal units 2000 cfm or less.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 230900 - MECHANICAL SYSTEMS CONTROLS

END OF CONTENTS TABLE

DIVISION 23
SECTION 230900 - MECHANICAL SYSTEMS CONTROLS

REVISION NOTES:

MAY 2019: ADD COMBINATION ROOM TEMP AND HUMIDITY SENSOR. ADD ROOM TEMPERATURE CONTROLLER ("RTC"). REVISE ROOM TEMPERATURE CONTROLLER FOR FAN COILS ("RTC-F"). REVISE BALL VALVE ACTUATORS TO MODULATING TYPE. ADDED FLN AND BLN WIRE COLORS. AS APPROVED BY HVAC MTT. D. KARLE.

DECEMBER 2018: ADD CONDENSATION SENSOR, ALARM INDICATION STATION, OCCUPANCY COUNTER. IMPROVE TEC SPECIFICATION LANGUAGE (2.5). REVISE ROOM DIFFERENTIAL PRESSURE INDICATING GAUGE TO CENTER ZERO MODEL. PART 3: INDICATED THAT SETPOINTS ON DOCUMENTS ARE PRELIMINARY AND MUST BE FINALIZED WITH THE ENGINEER AND COMMISSIONING AUTHORITY PRIOR TO PROGRAMMING. ADDED SELF CALIBRATION DEVICE REQUIREMENTS. PER HVAC MTT. D. KARLE.

MAY 2018: ADDED ONICON AS APPROVED FOR EM FLOW METERS (WATER) PER HVAC MTT. D. KARLE.

JUNE 2016: REVISED SECTION TO ADD CONSTANT VOLUME VENTURI (CVV) FUME HOOD LAB AIRFLOW CONTROLS. VAV FUME HOOD LAB AIRFLOW CONTROLS, INCLUDING ALL OTHER MECHANICAL CONTROLS IN THE VAV FUME HOOD LAB, REMAINS IN MS230910. REFER TO DESIGN GUIDELINE 230030 FOR ADDITIONAL GUIDANCE. ALSO ADDED INFO ON UTILITY METERING ("DATA ACQUISITION PANELS"). D. APPEL.

SEPTEMBER 2014: GENERAL REVISION INCLUDING: U-M TO PROVIDE UPS ENCLOSURE, REQUIRE THAT ALL COMPONENTS TO ACHIEVE THE SEQUENCE OF OPERATION BE PROVIDED, REQUIRE ALARMS BE PROGRAMMED, "ITEMIZE QUOTATION" REVISED TO "WHEN REQUESTED", "SUBMITTALS" REVISED TO REQUIRE DATA SHEETS BE ORGANIZED BEHIND TABS, VARIOUS TECHNICAL UPDATES INCLUDING: RELOCATED CONTROL VALVE RANGEABILITY REQUIREMENTS TO APPLY TO CONTROL VALVES, TEC ELECTRONIC ACTUATORS REVISED TO SPECIFY A MINIMUM STROKE LENGTH, "PNEUMATIC ACCESSORIES" REVISED TO ELIMINATE DRYERS WHEN USING TUNNEL AIR. REVISED STAT HEIGHT TO 44" A.F.F. TO MATCH ELECTRICAL SPEC.S AND ADA. D. KARLE FOR HVAC MTT.

DEC. 2013: REVISED BTU METER DESCRIPTION TO DELETE SPARLING (BTU COMPUTER NO LONGER AVAILABLE FROM SPARLING), IMPROVE DESCRIPTION, ADD BTU METER ENCLOSURE INFO. DELETED SOME MFR.S AS APPROVED FROM STM AND STM CONDENSATE LIST BASED ON FEEDBACK FROM U-M PLANT ON QUALITY PROBLEMS. D. KARLE FOR HVAC MTT.

OCT. 2011: ADDED REQUIREMENT TO PROVIDE UPS PANEL (ARTICLES 1.1 AND 2.11) OPEN WIRE (ARTICLE 2.6) AND IMPROVED THE DAMPER SPECIFICATION (ARTICLE 2.8) (DK, PER HVAC MECH TECH TEAM)

LATEST REVISION DATE: 1/4/11 - BY S. WOLDT FOR THE HVAC MECH/TECH TEAM

DEC. 2010: REVISED FOR COMPLIANCE WITH ASHRAE 90.1 2007 (DK, PER MECH TECH TEAM)

DEC. 2010: ADDED PART 2.3, SPEC. FOR FAN COIL CONTROLLER. ADDED SPEC FOR ELECTRICALLY ACTUATED BALL STYLE CONTROL VALVES (2.7) (DK, PER MECH TECH TEAM).

6/26/06: ADDED ADA REQUIREMENTS FOR DEVICE MOUNTING HEIGHTS, SECTION 3.1.B. (DK)

5/31/06: ADDED PARAGRAPHS C AND D TO ARTICLE 2.5, REQUIRING CONTROLS CONTRACTOR TO RUN 120 VAC POWER TO ALL CONTROL ACCESSORIES. THIS REQUIREMENT WAS ONLY PARTIALLY COVERED IN SOME SECTIONS. CLARIFIED IN 1.1.C.10 THAT CONTRACTOR DELIVERS AND PICKS UP LPI DOORS FROM U-M'S SHOP. (DK)

EDITOR'S NOTE:

THESE SPECIFICATIONS MUST BE CUSTOMIZED APPROPRIATELY FOR EACH PROJECT, E.G. ADDING SPECIFICATIONS FOR COMPONENTS NOT ALREADY SPECIFIED IN PART 2. HOWEVER, DELETING COMPONENTS SPECIFIED IN PART 2 IS NOT TYPICALLY NECESSARY OR RECOMMENDED. IN ADDITION TO THESE SPECIFICATIONS, THE PLANS ARE TO INCLUDE THE FOLLOWING, AS A MINIMUM:

SCHEMATIC LAYOUT OF EACH SYSTEM SHOWING ALL DDC AND CONTROL COMPONENTS. COMPONENTS TO BE INSTALLED IN AUXILIARY CONTROL PANELS (LOOP POWERED INDICATORS, E.P. RELAYS, P.E. SWITCHES, DIFFERENTIAL PRESSURE TRANSDUCERS, ETC.) SHALL BE SO INDICATED BY SOME METHOD. (I.E. ASTERISK)

LOCATIONS OF ALL DDC PANEL ARRAYS.

PROVIDE TWO 20 AMP POWER CIRCUITS AT EACH DDC/AUXILIARY PANEL LOCATION. ONE CIRCUIT IS FOR THE DDC PANEL, THE OTHER IS FOR THE AUXILIARY PANEL. ELECTRICAL POWER REQUIREMENTS TO BE COORDINATED WITH ELECTRICAL DRAWINGS.

WIRING DIAGRAMS FOR EACH SYSTEM TO SHOW INTENT OF AUTOMATIC OR INTERLOCKED OPERATION.

SCHEDULES FOR DAMPERS, AIRFLOW MEASURING STATIONS, STATIC PRESSURE PROBE LOCATIONS, HUMIDITY RESET, TEMPERATURE RESET, DAY/NIGHT CONTROL ZONE, ETC.

THE SCOPE OF THIS SPECIFICATION INCLUDES CONTROLS FOR ANY LAB ROOM WITHOUT VAV FUME HOODS WHICH INCLUDES HOODS WITH COMBINATION SASHES. IF A LAB ROOM INCLUDES THOSE HOOD TYPES, U-M MASTER SPEC 230910 MUST BE INCLUDED TO COVER ALL MECHANICAL CONTROLS IN THOSE ROOMS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

ALWAYS INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Division 26: Electrical
 - 2. 220523 Valves
 - 3. 233600 Air Terminal Units
 - 4. 230910 VAV Fume Hood Laboratory Air Flow Controls

1.2 SUMMARY

- A. This Section specifies mechanical systems controls applicable to all project controls except for labs with variable air volume (VAV) fume hoods, including combination (vertical/horizontal) sash fume hoods. Controls in rooms with VAV and combination sash hoods shall be in accordance with Section 230910.

IF THE PROJECT WILL NOT SPLIT THE WORK BETWEEN THE MECHANICAL SYSTEMS CONTROLS CONTRACTOR AND THE UNIVERSITY OF MICHIGAN AS DESCRIBED IN 1.3, REVISE 1.3 AND THE BALANCE OF THE SPECIFICATION ACCORDINGLY.

1.3 SCOPE OF WORK

- A. The complete control system work shall be split between the Mechanical Systems Controls Contractor and the University of Michigan as outlined below. As it relates to the extent of responsibility for work within this specification section, "provide" shall mean the identified party both furnishes and installs such item(s). "Furnish" shall mean the identified party furnishes the item for installation by others.
- B. The Mechanical Systems Controls Contractor shall be a direct Sub-contractor to the Contractor.
- C. Summary of work by the Mechanical Systems Controls Contractor- shall include, but not be limited to:
 - 1. Temperature control system consisting of all pneumatic and Direct Digital Controls (DDC) sensors, transducers, relays, switches, data communication network, etc. and all associated control wiring and conduit systems.
 - 2. Provide control work and programming of all TECs in all labs except in rooms with VAV hoods, including combination sash fume hoods.
 - 3. Provide fume hood monitors except in rooms with VAV hoods, including combination sash fume hoods.
 - 4. Install Terminal Equipment Controllers (TECs) on terminal equipment. Install Room Temperature Sensors (RTS's).

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 3

EDITOR: DRAWINGS SHOULD INDICATE LOCATION AND TYPE OF COMMUNICATION CONNECTION SHOWING NECESSARY CONDUIT TO THAT LOCATION (NEAREST DDC PANEL FOR EXISTING BUILDINGS OR NEAREST PHONE CLOSET FOR NEW BUILDINGS) .

5. Connection of new DDC panels to the Automation Level Network (ALN) to permit communication to the Building Automation System (BAS). Ethernet connection of Utility Meters to host computer. Connection to host computer via trunk connection to an existing DDC panel, communications closet, or local Ethernet data port, and as indicated on the drawings.
6. Engineering, submittals, as-built drawings, and operation and maintenance manuals. Configure modular DDC panel terminations such that analog inputs and analog outputs terminate on separate modules, do not intermix analog outputs and inputs on the same module.
7. Provide an auxiliary temperature control panel adjacent to each DDC panel. Provide additional auxiliary panels as required to house the required quantity of control components. Auxiliary panels shall not be smaller than 24"x24", and shall have a 1' high by minimum 2' wide (but not less than panel width) contiguous clear area which can be used for future expansion. Provide all wiring between the DDC panel and the auxiliary panel(s).
8. Provide a Loop-Powered Indicator (LPI) panel adjacent to the auxiliary panel. Provide additional LPI panels as required to house the required quantity of LPIs. Provide all wiring between the DDC panel and the LPI panel(s).
9. Install a UPS panel directly under the DDC enclosure. Provide all interconnecting power wiring between the DDC panel power supply and the UPS panel duplex receptacle.
10. Provide a 6"x 6" wiring trough extending over and between each DDC, auxiliary temperature control, and LPI panel.
11. Installation of U-M furnished DDC and UPS panel enclosures.
12. Provide thermostats, control valves, dampers, operators, meters, control air tubing, etc.
13. Provide gauges, indicating devices, electric and electronic control accessories, and other control system devices.
14. Provide setup/programming, calibration and start-up services of non-DDC control systems, e.g. electronic room temperature controllers.
15. Termination of all wires for input/output (I/O) devices external to the DDC panel, including, but not limited to: sensors, H/O/A switches, hard-wired safeties, relays, etc., TECs, RTS's, Field Level Network (FLN), and any other field devices.
16. Termination of all wires inside auxiliary panels.
17. For U-M Utility's energy metering, install U-M furnished data acquisition panel. Provide wiring from meters and transmitters to utility data acquisition panels. Provide communication wiring to utility data acquisition panels. Terminations inside panels by U-M.
18. Provide site supervision of mechanical control work and coordination with related electrical and fire alarm work and packaged controls.

19. Provide all control wiring and electrical components necessary for each system to permit automatic or interlocked operation, such as: air cooled condensing units, high level alarm circuits, damper end switches, fuel oil pumping/monitoring systems, chiller control/interface panels, boiler control/interface panels, early break contacts on disconnects to VSD's, cooling tower vibration switches, etc.
20. All other work and components required for complete and operational control systems, and that allows the sequence of operation indicated on the drawings or elsewhere to be achieved, except work specified as provided or furnished by the University of Michigan.
21. Start-up, calibration, and checkout of sensors, transducers, thermostats, control valves, dampers/damper operators, meters, and all other components provided.
22. Commission all mechanical controls provided. Provide a detailed list of every control point installed to the project Commissioning Authority (CxA), and verify proper operation of each component prior to commissioning the controls with the CxA. Include, in checklist format, a detailed procedure to verify all aspects of the controls' Sequence of Operation.
23. Training of U-M personnel to familiarize operations staff with the configuration, operation, and maintenance of provided controls.

D. DDC related work by the University of Michigan:

1. Termination of all wires and pneumatic lines within the DDC panel, excluding the power supply.
2. Termination of the I/O wires that run between the DDC panel and the auxiliary panel(s) (DDC panel end only).
3. Termination of the LPI wires within the LPI panel(s).
4. Point database entry.
5. Create, enter and checkout all "Powers Process Control Language" (PPCL) programming, excluding rooms designated as laboratories. To include all DDC panels and DDC Terminal Equipment Controllers.
 - a. Provide all programming required to achieve the sequence of operation and the control intent indicated on the documents.
 - b. Program the following alarms, whether specifically indicated in the sequence of operation or not. Include appropriate deadbands and time delays:
 - 1) For every indicated or implied setpoint, create a variation from setpoint alarm. Examples include air handler discharge temperature, chilled water temperature, end-of-line DP, etc.
 - 2) Status does not match command.
 - 3) Failed point.
 - 4) Exception: Unless specifically indicated, alarms are not required for Terminal Equipment Controllers controlling space temperature.
 - c. Programming lines shall be grouped into subparts and explained with comment fields. The comment fields shall include the related part of the project sequence of operation that each program subpart is intended to accomplish.
6. Provide temporary programming to provide building heating or cooling during construction.

7. Selection of the appropriate size, type, and quantity of DDC panels to be used.
8. Provide all DDC panel circuit boards, associated I/O modules, and communication hardware.
9. Furnish DDC panel UPS.
10. Furnish TECs and RTS's for all rooms types except labs with VAV fume hoods.
11. Furnish all DDC panel enclosures and UPS enclosures.
12. Provide data acquisition panels for metering of all utilities, including steam, condensate and BTU metering. Provide internal panel components including din rail, fuse, power terminal block, power supply, 24V terminal block, communication module, and read out modules. Terminate all input/output wiring and data connections to the panel. Start-up, configure and commission the panel.
13. Punch the LPI panel doors provided by MSCC. MSCC must drop off and pick up doors from U-M's shop.
14. Start-up and checkout of DDC panels and termination of associated sensors, transducers, and other components at the DDC panel.
15. Verify correct functionality of every DDC point associated with every DDC panel, and for every input and output associated with every TEC.
16. Configure trends for every analog (30 minute trend interval) and digital(change of value) input to DDC panels. Configure room temperature (or the controlled variable) trends for every terminal equipment controller, at a 30 minute interval.
17. Commission DDC panels and verify each sequence of operation including at TECs and similar DDC controllers, with the project CxA.
18. Training of U-M personnel on the various Sequences of Operation, the DDC panel and its connections, the LPI panel, the UPS panel, and the TECs or similar controllers and their related components that were provided by the University of Michigan.

1.4 ITEMIZED QUOTATION

- A. When requested, immediately provide an itemized bid breakdown to the Owner post bid, for review and approval. Include itemized material costs for all major components, installation labor costs, subcontractor labor and itemized material cost, and engineering costs, for base bid and for each alternate, for the entire work scope of the Mechanical Systems Controls.

1.5 ACCEPTABLE MECHANICAL SYSTEMS CONTROLS CONTRACTORS

- A. The following MSCCs are acceptable for the furnishing and installation of pneumatic, electric and DDC components as specified in this section:
 1. Siemens Building Technologies
 2. Honeywell, Inc.
 3. Johnson Controls, Inc.

EDITOR: CONTACT THE UM DESIGN MANAGER TO DETERMINE WHICH OF THE ABOVE CONTROLS INSTALLATION CONTRACTORS ARE TO BE LISTED AS ACCEPTABLE FOR YOUR SPECIFIC PROJECT. DO NOT LIST CONTRACTORS

**IN HIDDEN TEXT WITHOUT SPECIFIC PERMISSION FROM U-M DESIGN
MANAGER OR PLANT ENGINEER.**

1.6 COORDINATION

- A. Provide controls and control wiring compatible with equipment provided by others and with existing equipment and controls.
- B. Coordinate the installation of controls with the installation of other project equipment.
- C. Ensure all control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and installed by others.
- D. Coordinate with laboratory equipment suppliers (constant flow fume hoods, etc.) regarding dimensions and mounting location for alarm monitors and assure proper accommodation is made for the installation of other devices related to laboratory airflow controls.

1.7 SUBMITTALS

- A. The Mechanical Systems Controls Contractor (MSCC), prior to submitting the specified number of submittal drawings through the General Contractor (GC) or Construction Manager (CM) shall:
 - 1. Pre-submit two copies of preliminary shop drawing submittals directly to the designated Plant Operations Engineer and. Submit copies of the transmittal only to the GC or CM.
 - 2. The Plant Engineer will meet with the MSCC to discuss his review comments.
 - 3. The MSCC shall incorporate the review comments, as required, into the final shop drawing submittals. No work shall be done until the final submittals are approved.
- B. Shop drawings shall contain, as a minimum, the following:
 - 1. Schematic diagrams of all systems being controlled and/or monitored indicating all DDC points, point numbers (using UM conventions), sensors, relays, controllers, valves, dampers, complete control wiring schematics (including starter, VSD, DX system, etc. wiring diagrams), pneumatic tubing, DDC panel maps, etc.
 - 2. Wiring of each point to the DDC panels, including terminal block numbers.
 - 3. Layout of all auxiliary devices and panels, and wiring of relays, contacts, etc. Include terminal block numbers at all control panels, at all mechanical equipment, and at all control devices.
 - 4. Complete Sequence of Operation for each system being controlled, including set points, alarms settings, etc. in narrative format.
 - 5. Schematic diagram of the total DDC system layout, including all panels, trunk cables, peripheral devices, locations, etc.
 - 6. Pneumatic compressed air supply equipment, risers, and major tubing runs.
 - 7. Complete bill of materials to identify and quantify all devices.
 - 8. A schedule of all nameplates and associated wording.

9. An index of sheets for ease of access.
 10. Network diagram indicating routers, servers, and peripheral devices, including location of each device (room number) and indicating network connection points to Owner's BAS and/or Utility Meter data acquisition system.
 11. Wiring diagrams and locations of power supplies.
 12. Additional submittal items required for any room designated as a lab:
 - a. Equipment schedule for each room or zone, with the following information:
 - 1) Equipment tag, room served, occupied/unoccupied min., max., and offset CFM; lab subnet description, name, and network address; network and power trunk identifier.
 - 2) Model number of each control component.
 - 3) Function of each TAU and control component
- C. Submit, as a minimum, the following design data schedules indicating:
1. Airflow Measuring Probes:
 - a. Device tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Size, type, and location.
 - e. Station area in square feet.
 - f. Max/Min Range.
 - g. Magnehelic scale range.
 - h. Velocity pressure range.
 2. Air and water pressure sensors:
 - a. Device tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Size, type, and location.
 - e. Max/Min Range.
 3. Control Dampers:
 - a. Damper tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Blade configuration and orientation.
 - e. Size in width, height, and blade width.
 - f. Pressure drop.
 - g. Type of seals (blade and edge).
 - h. Normal position.
 - i. Size, quantity, type, and model number of actuators.
 - j. Method of actuator mounting and actuation.
 - k. .
 4. Control Valves:
 - a. Valve tag.
 - b. Equipment served/function.
 - c. Valve flow rate (GPM).
 - d. Line size.
 - e. Specified valve pressure drop (ft. head).
 - f. Valve size.
 - g. Valve Cv.
 - h. Actual valve pressure drop (ft. head).
 - i. Valve normal position.
 - j. Valve spring range.

- k. Valve shut-off rating (ft. head).
 - l. Valve body pressure/temperature rating.
 - m. Valve type/model number.
 - n. Actuator type/model number.
5. TECs:
- a. Device tag.
 - b. Equipment served/function.
 - c. Model number and application code.
 - d. Associated sensor location/tag.
 - e. Size, control values, etc.

D. Submittal Requirements

- 1. Shop drawings shall be 11" x 17" size (minimum).
- 2. All schematics and drawings shall be done on CAD. The electronic files shall be in IBM compatible Autocad version 2004 (or above) format.
- 3. Product data shall include description and complete engineering data for each control system component.
- 4. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. valves, dampers, relay & switches, thermostats, temperature transmitters, pressure transmitters, air flow stations, TECs, etc.).
- 5. Since many items are interrelated and should be checked concurrently, all of the MSCC's DDC related shop drawings shall be submitted at one time. No consideration will be given to partial submittals, except valve and damper submittals on approval only. Any partial submittals must be included in the complete submittal package.

E. Project Record Documents

- 1. Revise shop drawings to reflect actual installation and operating sequences and provide a final electronic file on CD.

F. Operation and Maintenance Manuals

- 1. The MSCC shall provide the specified number of copies of complete operation and maintenance instructions for all system components furnished.
- 2. Include as-built system schematic drawings and wiring diagrams.
- 3. Indicate final set points, settings, and adjustments of all components.
- 4. Include project specific catalog cuts and data sheets indicating installation, operation, maintenance, repair, wiring diagrams, calibration, calibration tolerances, inspection period, cleaning methods and cleaning materials for all components.

1.8 QUALITY ASSURANCE

A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

- 1. Where not indicated in Part 2, all devices shall be as manufactured by Honeywell, Johnson Controls or Siemens.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Underwriters Laboratory or Intertek (ETL) (listed and labeled).
 - 2. National Electric Manufacturer's Association (standards pertaining to components and devices for electrical control systems)
 - 3. National Fire Protection Associate NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems"
 - 4. National Electrical Code NFPA 70.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.10 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. DDC panels, including field and zone controllers/panels and all related software shall be the Siemens Apogee Building Automation System.
- B. Provide components compatible with new and existing DDC controller I/O modules, and with equipment provided by others. The MSCC shall become familiar with the DDC system's requirements, limitations, and characteristics.

IMPORTANT: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE LABORATORIES.

2.2 LABORATORY CONTROLS

- A. Provide laboratory controls for any space designated as a laboratory and where indicated, except for rooms with VAV fume hoods and hoods with combination sashes. System shall include: temperature, pressure, and other sensors/transmitters; control valves; control, network, and power wiring; power supplies; routers, servers, and all other devices required for a complete system.
 - 1. The system shall utilize conventional terminal air flow units for supply and general room exhaust and venturi style terminal air flow units for constant volume fume hoods and any other constant volume exhaust point. Refer to related section 233600.

2. Provide programming of all laboratory controls.
3. The system shall function to achieve the sequences of operation detailed on the drawings.
4. Each room or zone shall have a dedicated control system. Systems shall be independent and stand-alone from the Owner's BAS. Failures of the BAS system or network communications between the BAS and the system (cut communication cables, router or server failures, etc.) shall have no impact on individual laboratory control.
5. The system shall perform the following control functions:
 - a. Pressurization Control: Control supply and auxiliary/general exhaust at a volumetric offset to maintain lab pressurization (positive, negative, or neutral). Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms. Pressurization control shall consider networked devices, non-networked devices, and any number of constant volume devices.
 - b. Lab Temperature Control: Regulate lab space temperature through a combination of supply air volumetric control and control of reheat coils and other auxiliary temperature control devices, in response to temperature sensor(s).
 - c. Occupancy Control: Reset minimum volume settings and/or temperature control set points, based upon external signals from occupancy detectors, local over-ride buttons, and similar devices.
 - d. Constant volume fume hoods and other constant volume exhaust points (excluding general room exhaust): The self-actuated Constant Volume Venturi (CVV) Terminal Airflow Unit shall maintain a constant airflow set point.
 - e. Fume Hood Monitoring: Alarm unsafe condition at each fume hood.
 - f. Each lab room shall include a labeled Room Differential Pressure Indicating Gauge to indicate room pressurization relative to the adjacent room or corridor. Provide an engraved POS/NEG label (with 3/8" high lettering) adjacent to the gauge labeled "Correct Room Pressure Offset: X, where X = "POS" (positive) or "NEG" (negative) as indicated by the room volumetric offset indicated on the design documents.
 - g. Other control functions as indicated on the drawings.
 - h. Interface with the Owner's Siemens Apogee PPCL Building Automation System.

CONSIDER IF OTHER LABORATORY EQUIPMENT WOULD BENEFIT FROM BEING EQUIPPED WITH A FUME HOOD MONITOR AND INDICATE THAT EQUIPMENT ACCORDINGLY. EXAMPLES: EXISTING FUME HOODS, BIO-SAFETY CABINETS.

- B. Provide fume hood monitors for constant volume fume hoods and for other laboratory equipment where indicated.
 1. Monitor shall include audible alarm, visual LED alarm, and a common (single) alarm silence button.
 2. The fume hood monitor shall provide an alarm indication for the following conditions:
 - a. Low fume hood face velocity as detected by:

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 11

- 1) Insufficient differential static pressure as detected by the TAU- CVV pressure switch (Phoenix CVV Terminal Air Flow Units).
 - 2) Insufficient air volume, as detected by the air flow station (Siemens CVV Terminal Air Flow Units).
 - 3) Sash raised above sash stop position.
- b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
3. Sash position shall be sensed by using a vertical sash position sensor. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. Resolution shall be +/- 1/2 inch or better. A stainless steel, burr and snag-free cable shall be attached to the spring reel. Expected lifetime based on manufacturer's tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in a location on the fume hood easily accessible for service.
 4. Fume hood monitor shall be suitable for surface mounting on the front of the fume hood.
 5. Approved fume hood monitors:
 - a. Phoenix FHM530 Controller (Provide for Phoenix CVV Terminal Air Flow Units)
 - b. Siemens (Provide for Siemens CVV Terminal Air Flow Units)

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- C. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- D. Provide power supplies for lab airflow controls in NEMA 1 metal enclosures, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.

- E. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.

2.3 ELECTRONIC SENSORS, INDICATORS, TRANSDUCERS AND COMPONENTS

A. Temperature and Humidity Sensors:

- 1. Temperature sensor assemblies shall consist of a Resistive Temperature Device (RTD's) with a 4-20 mA 2-wire transmitter and gasketed utility box enclosure. Sensing element shall be platinum with 100 ohms resistance at 32 deg. F. Accuracy shall be +/- 1/2 deg. F over the entire range.
 - a. Single point duct temperature sensor shall be rigid bulb type with stainless steel (SS) sheath, aluminum tip, and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - b. Averaging element duct mounted temperature sensor shall have a SS minimum 25 ft. long continuous element sensor along the entire length, and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - c. Rigid averaging element duct mounted temperature sensor shall have a brass case, bendable sheath, continuous element sensor along the entire length, and have a calibrated span of 20-120 deg.
 - d. Outside air sensor shall be designed to mount on a conduit, include an elbow type enclosure, sun shield, and have a calibrated span of -58-122 deg.
 - e. Liquid immersion temperature sensors shall have 5 1/2" long probe with SS well, and weather tight enclosure. Transmitters for chilled water shall have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - f. Surface mount thermal-ribbon flexible sensor for pipe mounting shall have SS braid over lead wires, use pressure sensitive adhesive, must be properly insulated, and have a calibrated span of 30-250 deg. F.
 - g. Room temperature sensors (non-TEC) shall have a span of 20-120 deg. F, locking covers, and when pneumatic, match the pneumatic thermostats used.
 - h. Adjustable room temperature sensors (non-TEC) shall have a digital temperature display, high accuracy set point slide, flush mounted override button, and a temperature range of 55-95 deg. F.
 - i. Approved Manufacturers:
 - 1) TCS
 - 2) Siemens
 - 3) Minco
- 2. Outside Air Master Temperature and Humidity Sensors - Dual System:
 - a. Single point outside air temperature RTD shall be 1000-ohm thin film platinum resistor sensor with 4-20 mA 2-wire output transmitter with solar shield.
 - b. Outside air humidity sensor shall be thin film alumina substrate capacitance signal generating sensor with 4-20 mA 2-wire output transmitter with 0-100% relative humidity range within +/- 1% RH.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 13

- c. Approved Manufacturers:
 - 1) Vaisala
- 3. High Precision Temperature Sensors: (for temperature inputs used for BTU calculations)
 - a. Temperature transmitter with 100 ohm platinum RTD sensor and 4-20 mA 2-wire DC output. Zero and span shall be continuously adjustable. Sensor and transmitter shall be a matched assembly. Accuracy shall be +/- 0.1% of calibrated transmitter span, including combined effects of repeatability, hysteresis and linearity. Calibrated range shall be 20 to 120 deg. F. Both CHWS and CHWR sensor/transmitter assemblies shall have the same span and shall be factory calibrated as a matched pair.
 - b. Liquid immersion sensors shall have welded stainless steel thermowell. Transmitters shall be of the potted type or shall have a thermally isolated watertight enclosure. Length of sensor and thermowell shall be selected based on the diameter of the pipe to provide accurate, reliable and homogeneous sensing of the liquid temperature.
 - c. Approved Manufacturers:
 - 1) TCS
 - 2) Minco
- 4. Humidity Sensors:
 - a. Sensor element shall be thin film capacitive type or bulk polymer resistance type, accuracy of +/- 2% RH, range of 0-100% RH with 4-20 mA 2-wire linear output. Factory calibrate for maximum accuracy at mid-range of normal operating humidity. All humidity sensors shall be resistant to chlorine and other cleaning agents.
 - b. Room Sensors shall have locking cover.
 - c. Duct Sensors shall have duct probe and mounting plate.
 - d. Approved Manufacturers:
 - 1) Siemens
 - 2) TCS
 - 3) General Eastern
 - 4) Vaisala
- 5. Combination Room Temperature and Humidity Sensor:
 - a. Single enclosure wall mounted room temperature and humidity sensor. Without display unless indicated otherwise on the contract documents. White casing/cover/fascia color. With service port to enable two-point calibration using either a PC or Vaisala HUMICAP Handheld Humidity and Temperature Meter HM70. Unit supply voltage 20-28 VDC.
 - b. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA loop powered 2-wire output transmitter, 23-131°F temperature range, accuracy of +/- .54°F between 86-104°F.
 - c. Room humidity sensor shall have a 4-20 mA loop powered 2-wire output transmitter, humidity range of 0-90 percent RH, accuracy of +/- 1.7 percent RH at temperature range of 50-104°F, stability in typical HVAC applications of +/- 0.5 percent RH/year.
 - d. Provide with certificate of calibration.
 - e. Approved Manufacturers:
 - 1) Vaisala HMW92 Series
- 6. Vivarium Temperature and Humidity Sensors: (for wet service)

- a. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA 2-wire output transmitter. Transmitter shall be waterproof or shall be remote mounted.
- b. Room humidity sensor shall have a 4-20 mA 2-wire output transmitter, 0-100% relative humidity range, accuracy of +/- 2% RH, shall be waterproof, and shall be resistant to chlorine and other cleaning agents.
- c. Combination T & H units shall comply with the above, but shall be mounted in a single enclosure.
- d. All vivarium sensors shall have rust proof and waterproof covers and be protected by a stainless steel "U"-shaped guard firmly attached to the wall.
- e. Approved Manufacturers:
 - 1) Vaisala (combination temp. and humidity)
 - 2) TCS (temp. only)
 - 3) Siemens(temp. only)

B. Loop-Powered Indicators

- 1. All analog sensors (i.e., temperature, humidity, CO2, CO, etc.) shall be provided with a Loop-Powered Indicator (LPI) mounted on a separate dedicated LPI panel, except those sensors that are provided with a local display. Local displays shall be mounted at the DDC panel array.
- 2. Indicator shall be designed to display any 4-20 mA transmitter signal directly in the engineering unit of the measured media. The display shall be powered directly by the measured 4-20 mA signal without requiring an additional power supply. Indicator shall not impose impedance on the current loop beyond the capability of the transmitter.
- 3. Display shall have minimum 5/16" LCD digits, with 3-1/2 digit capability selectable decimal point and selectable scale. Accuracy of indication shall be 0.1% of scale.
- 4. Indicator shall be provided with a lettered plate indicating appropriate engineering units.
- 5. Approved Manufacturer:
 - a. R. E. Technologies, Inc. (Kele Assoc.)

C. Pressure and Flow Sensors

- 1. Air Differential Pressure Transducer:
 - a. Variable capacitance type with ranges not exceeding 150% of maximum expected input. Transducer shall have zero and span adjustment. Output shall be 2-wire 4-20 mA with 24 VDC input.
 - b. Safe over pressure rating shall be minimum 5 times the range.
 - c. Temperature compensated with thermal error of not greater than 0.04% of full scale in temperature range of 40 to 100 deg. F.
 - d. Accuracy shall be 1% of full scale.
 - e. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Setra
 - 3) Modus
- 2. Air Static Pressure Sensors:

- a. Duct mounted sensors shall be easily removable for cleaning, have multiple sensing ports, and fabricated of aluminum, copper, or SS. Sensors used in outdoor or condensing environments shall not be copper.
 - b. Wall or ceiling mounted sensors shall be shielded, suitable for surface or flush mounting, complete with multiple sensing ports, contain a pressure impulse suppression chamber, and fabricated of aluminum, paintable steel, or SS as required.
 - c. Outside air mounted sensors shall be shielded, complete with multiple sensing ports, maintain sensing accuracy regardless of wind flow direction or pattern, and fabricated of aluminum or SS.
 - d. Accuracy shall be 1% of actual pressure value.
 - e. Provide a companion 4" Magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor. Gauges shall be graduated in inches W.C. Provide a phenolic identification tag for each gauge.
 - f. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Siemens
 - 3) Dwyer
 - 4) Honeywell
3. Airflow Sensors:
- a. Provide where indicated amplified signal airflow traverse probe(s) or airflow stations, complete with straighteners when required, capable of continuously monitoring the fan or duct capacities (air volumes) it serves.
 - b. Each airflow array shall contain multiple total and static pressure sensors positioned at the center of equal and symmetrical cross-sectional areas, and interconnected by their respective averaging manifolds.
 - c. Sensors shall not protrude beyond the surface of the array, nor shall be adversely affected by particle contamination normally present in building airflow systems.
 - d. The airflow array shall be fabricated of galvanized steel or aluminum of adequate gauge to withstand the velocities to be encountered and with all required mounting brackets, plates, gaskets, and flanges.
 - e. Accuracy shall be a minimum of 3 percent of actual airflow over the designed range of flow.
 - f. Provide a companion 4" Magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor array. Gauges shall be graduated in CFM for airflow measurement. Provide a phenolic identification tag for each gauge.
 - g. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Tek-Aire
 - 3) Dietrich-Standard
 - 4) Ramsey Air
4. Steam/Liquid Differential Pressure Transducers: (flow only)

- a. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 125% of the normal differential pressure and up to 150-psig line pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transmitter.
 - b. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 0.25% of the span stated above throughout a minimum of a 6:1 turndown. Turndown ratio shall be based on the actual flow span.
 - c. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - d. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
 - e. Span and zero shall be individually adjustable.
 - f. Shall be 2-wire and 4-20mA output.
 - g. Approved manufacturers:
 - 1) Tobar
 - 2) ITT Barton
 - 3) Dietrich - Standard
 - 4) ABB
 - 5) Siemens
 - 6) Rosemont/Fischer
 - 7) Honeywell
5. Steam/Liquid Differential Pressure Transducers: (pressure only)
- a. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 200% of the normal differential pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transducer.
 - b. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 2% of the span stated above throughout a minimum of a 4:1 turndown. Turndown ratio shall be based on the actual differential span.
 - c. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - d. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
 - e. Span and zero shall be individually adjustable.
 - f. Shall be 2-wire and 4-20 mA output.
 - g. Approved manufacturers:
 - 1) Tobar
 - 2) ITT Barton
 - 3) Dietrich - Standard
 - 4) ABB

- 5) Siemens
6. Indication Gauges for Steam/Liquid Pressure Transducers:
 - a. Each transducer shall come with an indicating gauge that reads in GPM for flow measurement or inches WC for pressure sensing. The gauge shall be analog differential pressure type piped in parallel to the transducer.
 - b. The analog pressure gauge shall be selected and calibrated for the same span as the transducer it serves.
 - c. The accuracy, including linearity, hysteresis and repeatability, of the gauge for measuring differential pressure shall be better than 3% of the span stated above throughout its span. Calibration data shall be included on an embossed tag attached to each gauge.
 - d. The gauge shall not be damaged by pressures of up to 500 psig on either side of the gauge and all wetted parts shall be inert in the presence of up to 40% concentration of ethylene or polypropylene glycol in water.
 - e. Scale shall be a minimum of 4.5" diameter. Furnish and install two bleed fittings for each gauge and mounting brackets appropriate for the installation location.
 - f. Gauges shall be field mounted. Provide a LPI for readout at the DDC panel array. Provide a phenolic identification tag for each gauge and indicator.
 - g. Approved manufacturers:
 - 1) Beckman
 - 2) Moore
 - 3) Testoterm
 - 4) Dwyer
 - 5) Transducer manufacturer's gauge
7. Steam/Liquid Flow Sensors: (differential pressure type)
 - a. Uni-directional sensors shall be of the venturi type or velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
 - b. Bi-directional sensors shall be of the velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
 - c. Approved Manufacturers
 - 1) Preso
 - 2) Gerand
 - 3) Dietrich-Standard (Annubar Diamond II)
8. Three Valve Manifolds for Steam/Liquid Pressure Transducers:
 - a. Provide a three-valve manifold for each transducer. Pressures of up to 500 psig shall not damage the manifold. All wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - b. The manifold shall be designed for direct mounting on the transducer it serves and utilizes two quarter turn valves to provide zeroing, blocking and normal service modes.
 - c. Approved Manufacturers:
 - 1) D/A Manufacturing

EDITOR: CONTACT THE UTILITIES AND PLANT ENGINEERING DEPARTMENT VIA THE U-M DESIGN MANAGER FOR INSTRUCTIONS ON TYPE OF FLOW METER

TO USE FOR STEAM, CONDENSATE, CHILLED WATER, AND HEATING HOT WATER.

9. Liquid Flowmeters: (Electro-Magnetic Type)
 - a. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor shall be equipped with 150-lb. flanges. The meter system shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The meter shall be capable of bi-directional operation. The meter shall be sized appropriately for the range of flow for the system. The electrodes shall be SS or Hasteloy C. The transmitter shall be provided with a remote mounting bracket, cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow rate signal, and shall have a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. The primary flow sensor and transmitter shall be mounted in accessible locations. Unit shall have the capability to maintain flow total in non-volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - 1) Flowmeter Liner:
 - a) Heating hot water, domestic hot water, and other water systems operating at or above 110°F: Teflon
 - b) Chilled water, domestic cold water, and other water systems operating below 110°F: Polyurethane
 - c) Steam condensate: Teflon to 300°F, Ceramic over 300°F, and as suitable for the expected fluid conditions.
 - 2) Accuracy:
 - a) At 1 to 33 feet per second velocity: ±0.5% of rate.
 - b) At 0.3 feet per second velocity: ±2% of rate.
 - 3) Each unit shall be factory calibrated for the specified flow and shall be calibrated in both directions if the application is bi-directional. Calibration shall be a minimum of three point. Specific performance test data shall be furnished with the meter.
 - 4) Each meter shall provide two analog 4-20 mA signals or a single 4-20 mA signal and a digital contact closure on reverse flow.
 - 5) Meters for steam condensate shall be capable of sensing with condensate conductivity down to 6 µS/cm.
 - b. Provide a phenolic tag for each transmitter to identify service and meter ID number (i.e. SECONDARY CHILLED WATER FLOW, FM-1, etc.).
 - c. Approved Manufacturers (Water)
 - 1) ABB
 - 2) Siemens
 - 3) EMCO
 - 4) Rosemount
 - 5) Krohne

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 19

- 6) Onicon
- d. Approved Manufacturers (Steam Condensate)
 - 1) Rosemount
 - 2) Krohne
 - 3) ABB
- 10. Steam (Vapor) Flowmeters (Vortex-shedding type):
 - a. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor body and wetted parts shall be SS, and shall be flanged and suitable for the service rating. The meter shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The transmitter shall be provided with a remote mounting bracket and cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. Unit shall have the capability to maintain flow total in non-volatile memory. The primary flow sensor and transmitter shall be mounted in accessible locations. The flowmeter shall be provided with a 1-year warranty and application non-degradation performance guarantee. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - 1) Temperature range shall be -40 to +750°F.
 - 2) Accuracy shall be 1.0% of rate and 0.1% of full scale.
 - 3) Repeatability shall be 0.15% of flow rate.
 - 4) Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - 5) Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - 6) Meter shall be equipped with a temperature and pressure compensation feature.
 - b. Provide a phenolic tag for each transmitter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, etc.).
 - c. Approved Manufacturers
 - 1) Rosemount
 - 2) Krohne
 - 3) ABB
- 11. Steam (Vapor) Flow Meters (Differential-pressure type)

- a. The meter system shall consist of a differential pressure primary flow element, a differential pressure transmitter (or transmitters), and a flow monitor/computer. The flow sensor body and wetted parts shall be SS, and shall be equipped with 150-lb. flanges. The transmitter(s) and flow computer shall be provided with a remote mounting bracket and cable, integral LCD display, and NEMA 4X housing. Flow computer shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. Unit electronics shall have noise immunity. The transmitter shall be capable of being field calibrated and re-programmed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit shall have the capability to maintain flow total in non-volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - 1) Temperature range shall be -40 to +750°F.
 - 2) Accuracy shall be 1.0% of rate or better and 0.1% of full scale.
 - 3) Repeatability shall be 0.15% of flow rate.
 - 4) Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - 5) Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - 6) Meter shall be equipped with a temperature and pressure compensation feature.
 - 7) V-cone horizontal pilot lines shall be pitched back to steam lines and shall not trap condensate.
- b. Provide a phenolic tag for each meter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, FM-1 etc.).
- c. Approved Manufacturers
 - 1) McCrometer (V-cone-style meter)
 - 2) Preso (Venturi-style meter)
 - 3) Gerand Engineering (Venturi-style meter)

TWO METHODS OF CALCULATING ENERGY CONSUMPTION (BTUS), WITH THE RESPECTIVE EQUIPMENT REQUIRED, ARE SPECIFIED BELOW: (1) BY THE DDC SYSTEM OR (2) BY A "BTU METER". 12.b IS USED WHEN UTILITY (REVENUE) BILLING OF A SYSTEM IS PLANNED. 12.a IS USED WHEN ENERGY CONSUMPTION IS COLLECTED FOR INFORMATIONAL PURPOSES ONLY. ASSURE THE CONTROL DRAWINGS INDICATE WHICH METHOD, IF ANY, IS TO BE USED FOR EACH SYSTEM.

- 12. BTU Metering
 - a. DDC BTU metering shall be accomplished using the following equipment at each metering point:
 - 1) One (1) liquid flowmeter unit with transmitter as specified elsewhere in this section.
 - 2) Two (2) high-precision matched temperature sensor assemblies with transmitters as specified elsewhere in this section. Sensor with SS well shall be installed in each respective supply and return pipe as shown on project drawings.

- 3) These devices shall be wired to a local DDC panel. Calculations for instantaneous and totalized load shall be incorporated into the panel control code, and the necessary virtual points shall be created to allow remote monitoring and trending via the DDC system.
- b. When a BTU meter is indicated on the control drawings, provide a Flow/BTU computer which is programmable for various flow meter types including linear, square law, or multi-point linearization data interpretation.
- 1) Inputs shall include 4-20ma flow from flow meter, and 4-20ma from two temperature sensors.
 - 2) Flow and temperature inputs shall be simultaneously connected to this computer and looped to the local DDC panel.
 - 3) Flow/BTU computer shall operate in an environment of 0 to 50 C, shall include a keypad for data input and retrieval, and an EEPROM/nonvolatile RAM. Unit shall calculate and provide:
 - a) Two 4-20ma analog outputs indicating btu, mass or volume flow rate, temperature 1, temperature 2, delta temperature, pressure, density, and peak demand.
 - b) One isolated pulse output indicating btu, mass or volume total
 - c) Two NC/NO relay outputs assignable to trip according to various rate, total, temperature or pressure readings Programmable as latching or non-latching, or as pulsed output of a total.
 - 4) Outputs shall be stored in a battery backed data logger, selectable for continuous or periodic log modes.
 - 5) Unit shall have a real time clock and shall date stamp logged data. Unit shall have an RS-232 port and shall be capable of setup from a laptop computer. The supplier shall set up and verify BTU measurement and shall train U of M personnel in all aspects of BTU computer setup and operation.
 - 6) Computer shall calculate and display heat, mass or Volume flow rate, resettable total, non-resettable total, temperature input 1, temperature input 2, delta temperature, density, pressure, peak demand, and time/date stamp.
 - 7) Provide a phenolic tag for each transmitter and flow computer (as applicable) to identify service and ID number (i.e. CHILLED WATER BTU METER - LSI BUILDING, etc.).
 - 8) Mount Flow/BTU computer in a NEMA 4 enclosure: Minimum size 16" (H) x 14" (W) x 8" (D), hinged cover, padlockable latch, and stainless steel hinge. Provide cutout in enclosure face and mount computer in face. Where multiple computers are supplied, they may be mounted in a common enclosure.
 - 9) Approved Manufacturers and Models for Flow/BTU Computer:
 - a) Kessler-Ellis Supertrol II with MS816 enclosure.

D. Electronic to Pneumatic Transducers

1. Provide transducers to convert electronic signals from the Siemens analog output modules to linear proportional pneumatic signals for all DDC controlled modulating pneumatic devices. The transducer shall be a panel-mounted device, with hand/auto switch, override dial for manual override control, and a 0-30 psig output gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 0-10 VDC or 4-20 mA. Output accuracy shall be 1/4 psig at 75 Deg. F, producing a 0-15 psig pneumatic signal. Output repeatability shall be .05 psig maximum. Transducers shall be high capacity non-bleed devices with a minimum output capacity of 500 SCIM, except special circumstances that require a constant bleed controller with branch exhaust on signal loss.
2. Approved Manufacturers:
 - a. Non-bleed Type:
 - 1) Siemens
 - 2) ACI - PXP
 - b. Bleed Type:
 - 1) ACI - PXP

E. Pressure to Electronic Transducers

1. Provide transducers to convert linear proportional pressure signals to interface with the Siemens analog input modules. The transducer shall be a panel-mounted device, with input pressure snubber, as required, and gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 4-20 mA. Accuracy shall be 1 percent full scale. Thermal effect shall be less than 1 percent full scale on zero and less than 1 percent of reading on span. Transducer shall have elastomer seals and SS wetted parts.
2. Approved Manufacturers:
 - a. Siemens
 - b. Setra
 - c. Modus
 - d. ACI
 - e. Dwyer

F. Carbon Dioxide Sensors:

1. Carbon dioxide sensing cell shall consist of a non-dispersive infrared carbon dioxide gas cell that uses a pulsed source and has no free air optical path. Output shall be linearized 4-20 mA for use with 24 VDC input. The unit shall be specifically designed for the wall or duct application specified. Duct aspiration boxes shall be by the manufacturer. Unit shall have span adjustment. The unit shall have no moving parts.
2. Minimum requirements:
 - a. Range: 0-2,000 ppm
 - b. Accuracy: 3 % of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: less than 3 watts
 - e. Zero Drift at Constant Temp.: 100 ppm per 24 hrs (random not cumulative)
 - f. Max. allowable Drift in 1 year: 20 ppm
3. Unit shall not require calibration for a period of 1 year or more.
4. Approved Manufacturers:
 - a. Valtronics
 - b. Telaire

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 23

G. Carbon Monoxide and Combustible Gas Sensors:

1. Sensors shall be a micro-processor-based system for continuous monitoring and use catalytic, electro-chemical, diffusion cell, or solid-state type sensing. Output shall be linearized 4-20 mA for use with 24 VDC input with green LED normal operation indicator. Unit shall provide a SPDT pilot duty low voltage alarm contact with an adjustable set point. The unit mounting shall be wall, duct aspiration, or ceiling to suit application. The unit shall specifically designed for the application and shall be explosion proof, as required. Unit shall have single point set point and span adjustment. The unit shall have no moving parts. Units mounted outdoors shall be waterproof and rustproof.
2. Minimum requirements:
 - a. Range: as required for application; ppm, %, % L.E.L.
 - b. Accuracy: 3-5% of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: 5 watts or less
 - e. Relay contact rating: 5 amp at 24 VDC, 150 VA max. inductive
 - f. Zero Drift at Constant Temp.: 0 per 24 hrs (random not cumulative)
 - g. Max. allowable Drift in 1 year: 1% of full scale.
3. Approved Manufacturers:
 - a. Draegar
 - b. Vulcain

H. Current Sensing Relays

1. Provide current sensors with donut transformers capable of monitoring AC current, maximum input current ranges from 20 to 300 amp, peak, with digital output signals having adjustable high and low current trips. An LED shall provide visual indication and shall not bleed through.
 - a. Provide special current sensing relays designed to monitor belt breakage, when indicated or described in the Sequence of Operation.
2. Approved Manufacturer:
 - a. Neilsen Kuljian
 - b. Veris Industries

I. Liquid Detectors

1. Liquid detectors shall utilize microchip technology for detection of conductive liquids through one of the following types of sensors: gold-plated probes, self-adhesive sensor tape with copper electrodes and durable cotton cover, or rope type sensor. Detectors shall be selected based on the best use for the application. Power requirement shall be 11-27 VAC or VDC and have a green LED normal operation indicator. Unit shall have a SPDT pilot duty low voltage alarm contact. Unit shall be waterproof and rustproof. A red LED shall indicate the presence of liquid. Unit shall have an adjustable set point.
2. Approved Manufacturers:
 - a. R. E. Technologies, Inc
 - b. Water Alert

J. Condensation Sensor - Pipe Mounting Type

1. Sensor with built-in relay contact that opens upon detection of condensation, for sensing condensation when mounted on bare pipe.
 - a. Supply voltage: 24 VAC/VDC \pm 10%
 - b. Power consumption: Maximum 1.6 VA
 - c. Relays contacts: rated 1 amp @ 24 VAC/VDC
 - d. Operating temperature: -20... +50°C
 - e. Display: LED, green - power supply ok, red - condensation sensed, contact open.
 - f. With pipe mounting bracket.

K. Occupancy Counters (People Counters)

1. Dual Sensor - Differential Thermal Imaging Counter
 - a. General
 - 1) Provide combination BACnet-MS/TP and Analog Output counting devices for Dynamic Ventilation Reset Controls to be mounting where indicated on the plans and controlling ventilation to occupied zones as populations vary, in compliance with the Ventilation Rate Procedure in ASHRAE 62.1-2013 and 2016.
 - b. Counters shall provide data on net zone populations to dynamically calculate the ASHRAE Standard 62.1 Ventilation Rate.
 - 1) Each counter shall consist of a center-top door frame mounted counter, using a dual thermopile differential thermal imaging counters, an integral microprocessor-based design capable of providing net population data to the controls network for use in ventilation reset based on accurately measured real-time zone populations.
 - 2) Counter with steel enclosure shall have an overall size of: 6.12L x 2.94W x 1.36H inches and weigh approx. 0.25 lbs.
 - 3) Counters shall have an environmental operating range of no less than 65° F to 85° F and 5% - 95% RH, non-condensing.
 - c. Population Counter Design and Counting Performance
 - 1) Counter shall be mounted to provide zone entry and exit data to the network for maintenance of a net zone population value to less than \pm 5% of actual or \pm 3 people, whichever is larger.
 - 2) Counter design shall be optimized for single entry/exit interior doors, \leq 42 x \leq 96 in.
 - 3) Small deviations or accumulation in counts shall be adjusted when "population reset interval" is selected during configuration and set up. Upon activation, the total net population in memory shall be 'zeroed' based on the user-determined reset period selected or every 24 hours during a predetermined non-occupied period.
 - 4) Power, Connectivity and Communications
 - a) The BACnet / analog combination counters shall be capable of communicating with other devices using an RS-485 standard interface and BACnet-MS/TP protocol, implemented as a Master node.
 - b) Communication speed shall be field-selectable by dip switch between 9.6, 19.2, 38.4 and 76.9 kBaud.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 25

- c) The counter-network communications shall be capable of field configuration and setup using a simple dip-switch interface.
 - d) A simultaneous 0-10 VDC scalable and protected analog output shall also be available to provide net counts.
 - e) All counters shall be powered with individual 24 VAC transformers (22.8V to 26.4V under load) @1.2 V-A nominal.
2. The manufacturer's authorized representative shall review and approve counter position placement for each location indicated on the plans.
 3. Accepted Manufacturer: EBTRON, Inc. Model CENSUS - C100, Single-entry interior door occupancy counter.

L. Alarm Indication Station

1. Alarm indicating station with red alarm LED, alarm horn, horn momentary silence switch, adjustable alarm delay and alarm repeat time, and alarm status relay.
 - a. Supply Voltage: 24 VAC @ 100 mA or 24 VDC @ 34 mA.
 - b. Alarm Time Delay: None, or 1 to 31 seconds in one-second increments, or 10 to 310 seconds in 10-second increments.
 - c. Alarm Horn: Continuous or pulsed tone, 70 db minimum.
 - d. Alarm Repeat Time: None, or 1 to 7 minutes in one-minute increments, or 10 to 70 minutes in 10-minute increments.
 - e. Alarm Relay: SPDT, 0.5A @ 24 VAC, 1.0A @ 30 VDC, follows horn or lamp action, selectable.
 - f. Connections: Screw terminals, 22 - 14 AWG wires.
 - g. Mounting: Brushed stainless steel plate mountable to standard single junction box, with two screws provided.
2. Accepted Manufacturer: Kele Model RAD-1.

THE DESIGNATION "RTC" SHOULD BE USED ON THE CONTROL DRAWINGS WHEN THE BELOW TYPE OF CONTROLLER IS INTENDED.

2.4 ELECTRONIC ROOM TEMPERATURE CONTROLLER (RTC)- CHILLED BEAMS, FIN TUBE, AND SIMILAR TERMINAL DEVICES WITHOUT A FAN

A. Room Temperature Controller:

1. UL listed configurable electronic room temperature controller with LCD display. Use only where specifically called for on control drawings. With the following features:
 - a. Two part controller consisting of plastic base plate and detachable plastic controller housing, white casing/cover/fascia color. The base shall include screw terminals to allow all wiring to be terminated on the base, as opposed to directly on the controller. The controller housing shall mechanically and electrically engage the base and shall include all electronics and a built-in room temperature sensor.
 - b. LCD display shall display the measured room temperature in °F.
 - c. Control shall be by room temperature sensing.

REVISE OUTPUT REQUIREMENT TO FLOATING CONTROL WHEN FLOATING TYPE CONTROL VALVES ARE USED. FLOATING CONTROL IS NOT APPROPRIATE FOR APPLICATIONS THAT MAY DESIRE FAIL OPEN OR FAIL CLOSED CONTROL VALVES SUCH AS CHILLED BEAMS.

- d. Shall provide the number and type of inputs and outputs required to meet the sequence of operation.
 - 1) Provide a minimum of two analog outputs for 0-10VDC modulating valve actuators.
 - 2) Output Action (analog): Selectable normally open or normally closed.
 - 3) Inputs: Provide a minimum of two binary inputs and one universal input.
 - 4) Input and Output Ratings: As required for controlled devices.
- e. Setpoint Adjustment Buttons: The controller face shall provide an "up" setpoint adjustment button and a "down" setpoint adjustment button, or touch display, to allow occupant adjustment of setpoint.

NOTE THE AUTOMATIC CHANGEOVER MODE DESCRIBED BELOW. IF A MFR. DOES NOT OFFER THIS FUNCTION FOR 2-PIPE HEATING/COOLING APPLICATIONS, PIPING AT THE FAN COIL WILL NEED TO BE CONFIGURED WITH A SMALL BYPASS TO ASSURE THE CONTROLLER SENSES THE CURRENT 2-PIPE SYSTEM WATER TEMP.

- f. Automatic Changeover Mode (provide for two pipe applications): the controller shall detect if the system is in heating or cooling mode by measuring the system water temperature at the fan coil and automatically switching the controller to heating or cooling control mode. An icon on the controller LCD shall indicate which mode the system is in, heating or cooling. Provide a strap-on-pipe temperature sensor device wired to the controller, for measuring system water temperature. The controller shall also include a purge mode function to assure proper acquisition of system water temperature by the strap-on sensor. Purge mode function shall open the fan coil 2-way control valve (for an adjustable time period) at two hour intervals if the control valve has remained closed during that interval.
- g. The controller shall provide the following setpoint modes:
 - 1) Normal (Occupied) Mode: Controller maintains the heating and cooling occupant adjustable setpoint.
 - 2) Un-Occupied Mode: Controller maintains set-back/set-up heating and cooling setpoint; activated by a remote contact closure wired to a status input on the controller. Not occupant adjustable.
- h. Override Button or Touch Display: The controller face shall include a button or touch display that allows the occupant to temporarily switch to Normal (occupied) mode. The duration of the temporary occupied mode shall be adjustable from 0 to 24 hours. When override is activated, Normal Mode setpoint operation shall be invoked and the controller shall provide a network point to signal the Owner's DDC system via BACnet MS/TP that occupied mode has been requested.
- i. Operating Voltage: 24 VAC.

- j. Power Consumption: 12 VA maximum.
 - k. Control Transformer: Provide control transformer when required.
 - l. Control Deviation Including Sensor Inaccuracy at 77 °F: ± 1 °F maximum.
 - m. Programmable Features: It shall be possible to program (configure) the following controller functions without special software. These features shall be provided directly by the controller. Programming/configuration mode shall be accessible via either a password or by non-intuitive button activation sequences.
 - 1) Cooling setpoint range, all Modes: Adjustable 54 °F to 100 °F.
 - 2) Heating setpoint range, all Modes: Adjustable 40 °F to 90 °F.
 - 3) Heating maximum setpoint (adjustable 40 °F to 90 °F) and cooling minimum setpoint (adjustable 54 °F to 100 °F).
 - 4) Proportional band adjustable from 3°F to 10°F.
 - 5) Dead-band between heating and cooling adjustable in 1°F increments, over a range 2°F to 5°F.
 - 6) Other parameters as required to meet the requirements of this specification and the control sequence of operation.
 - n. Serial Communications: Provide Controller with BACnet Testing Laboratories certified BACnet MS/TP Communications compatible with Siemens controls.
 - o. BAS Connections: Connect to the Siemens DDC control panel controller FLN of the corresponding AHU serving the space (by MSCC).
2. Warranty: 18 month unconditional parts and labor warranty and 5 year unconditional warranty for all parts including sensors.
 3. Approved Manufacturers, subject to compliance with all the above requirements:
 - a. Schneider Electric SE7200 Series or Schneider Electric SE8300 Series
 - b. Viconics VT7200 Series or Viconics VT8300 Series

THE DESIGNATION "RTC-F" SHOULD BE USED ON THE CONTROL DRAWINGS WHEN THE BELOW TYPE OF CONTROLLER IS INTENDED.

2.5 ELECTRONIC ROOM TEMPERATURE CONTROLLER (RTC-F)- FAN COILS (FCU), UNIT HEATERS (UH), AND CABINET UNIT HEATERS (CUH)

A. Room Temperature Controller:

1. UL listed configurable electronic room temperature controller with LCD display, for modulating control of 2 or 4 pipe FCUs/UHs/CUHs. Use only where specifically called for on control drawings. With the following features (Fan speed relay board provided with the controlled equipment. Coordinate with equipment manufacturer and assure controller is compatible with relay board. Provide additional components to make compatible if required.):

- a. Two part controller consisting of plastic base plate and detachable plastic controller housing, white casing/cover/fascia color. The base shall include screw terminals to allow all wiring to be terminated on the base, as opposed to directly on the controller. The controller housing shall mechanically and electrically engage the base and shall include all electronics and a built-in room temperature sensor.
- b. LCD display shall display the measured room temperature in °F.
- c. Control shall be by room temperature sensing. Provide return air sensor where indicated as required.
- d. Outputs for modulating valve actuator and three-speed fan control or ECM fan control.

REVISE OUTPUT REQUIREMENT TO FLOATING CONTROL WHEN FLOATING TYPE CONTROL VALVES ARE USED. FLOATING CONTROL IS NOT APPROPRIATE FOR APPLICATIONS THAT MAY DESIRE FAIL OPEN OR FAIL CLOSED CONTROL VALVES SUCH AS CHILLED BEAMS.

NOTE THAT AS OF MAY 2019 VICONICS AND SCHNEIDER ELECTRIC CONTROLLERS FOR ECM FANS HAVE AVAILABLE ONLY ONE OUTPUT FOR CONTROL VALVES (2-PIPE OPERATION).

- e. Provide the number and type of inputs and outputs required to meet the sequence of operation.
 - 1) Provide a minimum of two analog outputs for 0-10VDC modulating valve actuators or 2-10VDC ECM fan control.
 - 2) Output Action (analog): Selectable normally open or normally closed.
 - 3) Inputs: Provide a minimum of two binary inputs and one universal input.
 - 4) Input and Output Ratings: As required for controlled devices.
- f. Fan Speed Selector Switch, Button, or Touch Display: that allows occupant to select high, medium, low or automatic fan speed. When setpoint dead-band is exceeded, the controller shall turn on the fan at the speed selected and modulate the control valve. In automatic mode, once the control valve opens to maximum position, the fan shall modulate from minimum speed/2VDC to maximum speed/10VDC.
 - 1) If controlling single speed equipment, provide ability to jumper or program the controller so that regardless of fan "switch position", controller turns on fan to fixed speed when setpoint dead-band is exceeded.
- g. Setpoint Adjustment Buttons: The controller face shall provide an "up" setpoint adjustment button and a "down" setpoint adjustment button, or touch display, to allow occupant adjustment of setpoint.
- h. It shall be possible to set the fan control for either continuous fan operation independent of room temperature, or for the fan to turn on and off dependent on room temperature.

NOTE THE AUTOMATIC CHANGEOVER MODE DESCRIBED BELOW. IF A MFR. DOES NOT OFFER THIS FUNCTION FOR 2-PIPE HEATING/COOLING APPLICATIONS, PIPING AT THE FAN COIL WILL NEED TO BE CONFIGURED WITH A SMALL BYPASS TO ASSURE THE CONTROLLER SENSES THE CURRENT 2-PIPE SYSTEM WATER TEMP.

- i. Automatic Changeover Mode (provide for two-pipe applications): the controller shall detect if the system is in heating or cooling mode by measuring the system water temperature at the fan coil and automatically switching the controller to heating or cooling control mode. An icon on the controller LCD shall indicate which mode the system is in, heating or cooling. Provide a strap-on-pipe temperature sensor device wired to the controller, for measuring system water temperature. The controller shall also include a purge mode function to assure proper acquisition of system water temperature by the strap-on sensor. Purge mode function shall open the fan coil 2-way control valve (for an adjustable time period) at two hour intervals if the control valve has remained closed during that interval.
- j. The controller shall provide the following setpoint modes:
 - 1) Normal Mode: Controller maintains the heating and cooling occupant adjustable setpoint.
 - 2) Standby Mode: Controller maintains standby heating and cooling setpoints. Not occupant adjustable.
 - 3) Economy Mode: Controller maintains set-back/set-up heating and cooling setpoint; activated by a remote contact closure wired to a status input on the controller. Not occupant adjustable.
- k. Standby Switch or Button: the controller face shall include a standby switch/button/touch screen that allows the occupant to activate stand-by mode by a single key stroke.
- l. Operating Voltage: 24 VAC.
- m. Power Consumption: 12 VA maximum.
- n. Control Transformer: Provide control transformer when required.
- o. Control Deviation Including Sensor Inaccuracy at 77 °F: ± 1 °F maximum.
- p. Programmable Features: It shall be possible to program (configure) the following controller functions without special software. These features shall be provided directly by the controller. Programming/configuration mode shall be accessible via either a password or by non-intuitive button activation sequences.
 - 1) Cooling setpoint range, all Modes: Adjustable 54 °F to 100 °F.
 - 2) Heating setpoint range, all Modes: Adjustable 40 °F to 90 °F .
 - 3) Heating maximum setpoint (adjustable 40 °F to 90 °F) and cooling minimum setpoint (adjustable 54 °F to 100 °F).
 - 4) Proportional band adjustable from 3°F to 10°F.
 - 5) Dead-band between heating and cooling adjustable in 1°F increments, over a range 2°F to 5°F.
 - 6) Two Pipe Applications:

- a) Heating/Cooling Changeover Cooling Switch Point:
<75 °F.
 - b) Heating/Cooling Changeover Heating Switch Point:
>77 °F.
 - c) Purge function active or inactive.
 - d) Purge function time duration.
 - 7) Fan Control in the Economy Mode: On or off.
 - 8) Other parameters as required to meet the requirements of this specification and the control sequence of operation.
- 2. Serial Communications: Provide Controller with BACnet Testing Laboratories certified BACnet MS/TP Communications compatible with Siemens controls.
 - 3. BAS Connections: Connect to the Siemens DDC control panel controller FLN of the corresponding AHU serving the space (by MSCC).
 - 4. Warranty: 18 month unconditional parts and labor warranty and 5 year unconditional warranty for all parts including sensors.
 - 5. Approved Manufacturers subject to compliance with all the above requirements:
 - a. Schneider Electric SE7300 Series or Schneider Electric SE8300 Series
 - b. Viconics VT7300 Series or Viconics VT8300 Series

2.6 DDC TERMINAL EQUIPMENT CONTROLLERS (TEC) AND RELATED ROOM TEMPERATURE SENSOR (RTS)

- A. Provide application specific DDC Terminal Equipment Controllers and related Room Temperature Sensors. TECs shall be provided with auto-zero modules and any required output modules. Auto-zero modules shall provide periodic recalibration of the air velocity transducer without changing the air volume delivered to the room. RTS shall have a digital temperature display, set point button, override button, and temperature range of 55-95 deg. F.
- B. When indicated, U-M will furnish DDC TECs and RTSS. U-M will also provide any required TEC output modules, including auto-zero modules.
- C. Provide all other devices except those indicated as furnished by the equipment manufacturer. Install equipment manufacturer provided devices when not pre-installed. The MSCC shall coordinate devices furnished by others and provide all devices not furnished by them to provide a complete operating system that achieves the sequence of operation requirements. Connect all TECs to the Siemens DDC control panel controller FLN of the AHU or system being served. The MSCC may send TECs to the equipment manufacturer for factory mounting, or may field mount TECs. All mounting costs are the responsibility of the MSCC.
 - 1. TECs shall be provided with metal enclosure, complete with conduit knockouts (enclosure provided by MSCC).
- D. Power to TECs and associated controlled devices shall be 24 VAC, provided by the MSCC.
- E. Approved Manufacturers:

1. Siemens

2.7 ELECTRIC COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.
- B. Low temperature detection thermostats shall be duct type, fixed 5 deg. F differential, range 30 to 60 deg. F. Sensing element shall have a 20-foot long capillary tube responding to the lowest temperature sensed along any 12 inches of bulb length. Switch shall be SPDT 120 VAC, UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset. Provide one thermostat for every 20 square feet of coil surface.
- C. High temperature detection thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset.
- D. Immersion electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- E. Remote-bulb electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- F. Wall-mounted electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- G. Strap-on electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- H. Differential Pressure Switches:
 - 1. Shall provide electrical switching action upon a sensed pressure differential increase between two points. Sensitivity shall be suitable for the application. Set point shall be adjustable over the full range of the device. Switching action shall SPDT. Electrical switch rating shall be 10 amps at 120 VAC, minimum.
 - 2. Pressure rating of switch and connecting tubing:
 - a. Fan - Rated for 12 inches WC.
 - b. Pump - Maximum deadhead system pressure.
 - 3. Switches used for safety shutdown applications shall be of the manual reset type.
 - 4. Approved Manufacturers:

- a. Honeywell
- b. Siemens
- c. Dwyer
- d. Cleveland Airflow

I. Limit Switches:

- 1. Limit switches shall be oil tight type with appropriate operator to provide required function.
- 2. Approved Manufacturers:
 - a. Honeywell
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

J. Control Relays and Contactors:

- 1. Relays shall be a minimum DPDT, of proper coil voltage, with neon indicator light, and of sufficient rating for specified purpose. Relay base shall be of the screwed terminal type.
- 2. Contactors shall be definite purpose type, have adequate number of poles, of proper coil voltage, and of sufficient rating for specified purpose. Contactors used for DDC interface control shall contain a Hand-Off-Auto switch.
- 3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

K. Selector Switches:

- 1. Switches shall be multiple position type, oil-tight, water-tight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.
- 2. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

L. Push Buttons and Pilot Lights:

- 1. Push button switches and pilot lights shall be, oil-tight, wa-tertight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.
- 2. Pilot lights shall be neon or LED, push-to-test type with replaceable lens. Lens shall be of the appropriate color for application served.
- 3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley

- d. GE
 - e. Square D
- M. Fuse Holder/Disconnects:
- 1. Fuse holder/disconnects shall be provided for all control circuits inside auxiliary control panels, and shall be of appropriate size/type for service.
 - 2. Approved Manufacturers:
 - a. Little Fuse
 - b. Dayton
 - c. Buss
 - d. GE
- N. Terminal Blocks:
- 1. Terminal blocks shall be modular, barrier type, direct mount, single pole, and snap together to any required number of poles. Units shall be rated for 300 volts, 20 amp., handle wire sizes from 22-12 AWG, and have a marking strip for identification.
 - 2. Approved Manufacturers:
 - a. Little Fuse
 - b. Dayton
 - c. Buss
 - d. GE
- O. Toggle Switches:
- 1. A toggle switch shall be provided for every auxiliary and local control panel that utilizes a 120 VAC power source as a means to turn off the power to that panel and shall be of appropriate size/type for service. Toggle switches shall be rated 120/277 volts, 20 amps, SPDT, specification grade, extra-heavy duty, back and side wired, with brown handles.
 - 2. Approved Manufacturers:
 - a. Leviton
 - b. Pass & Seymour
 - c. Hubbell
 - d. Arrow Hart
 - e. Bryant

2.8 ELECTRICAL ACCESSORIES

- A. Wiring and Conduit
- 1. The MSCC shall provide all DDC and related control wiring, conduit, and J-hook cable hanging system. Wire and cable shall be pulled from device or control point to the DDC, Auxiliary, UPS, or LPI panels and run between DDC, Auxiliary, UPS, or LPI panels, with 6'-0" spare coiled at the panel. All wire and cable shall be labeled and tagged 4 inches down from the point at which the wire enters the cabinet with the corresponding point number.
 - 2. All wiring carrying voltages greater than 24 volts shall be run in conduit.
 - 3. All wiring carrying voltages 24 volts nominal or less shall be run as follows:

- a. Wiring routed in shafts, walls, below grade, and in any concealed or inaccessible space, or above ceilings requiring the use of a tool to access or held in place by clips or similar devices: run wiring in conduit.
 - b. Wiring routed in exposed locations such as mechanical and electrical rooms or in rooms without ceilings (i.e. exposed to deck above): run in conduit.
 - c. ALN wiring: run in conduit.
 - d. Wiring above accessible lay-in ceiling areas: Utilize J-hook hangers.
 - 1) Provide UL Listed zinc electro-plated steel or plastic J-hooks, sky blue color, plenum use approved, with minimum 1-inch wide cable support area, rated for the cable type being supported. Provide with integral cable retainer strap to provide containment of cables within the hanger.
 - 2) Install J-hooks with J-hook bottoms a minimum of 10 feet A.F.F. and no less than 2 feet above the ceiling.
 - 3) Space hangers at maximum 5 foot intervals, with additional hangers located a maximum of 3 feet from both sides of any change in direction. Wiring shall not sag more than 12 inches between J-hooks. Install wiring and J-hooks in a neat and workman-like manner, routed parallel or perpendicular to the building column lines.
 - 4) Install to protect wire from damage and to allow for wire replacement. Do not exceed 50 % of the wire capacity specified by the J-hook manufacturer (first installation), or route control wiring in non-control-wiring J-hooks.
 - e. Wiring to wall mounted devices such as room sensors, switches, and similar devices: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Install wall box for device mounting.
 - f. Wiring to perimeter radiation valves and similar control devices requiring wiring to be routed in walls: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Provide maximum 12 inch long flexible metal conduit for the final connection to the device.
- 4. Conduits shall be sized on a maximum fill of 40% capacity.
 - 5. Four separate conduit systems shall be provided:
 - a. DO/DI and 120 VAC control wiring.
 - b. AO/AI wiring.
 - c. Pneumatic tubing.
 - d. ALN/FLN cables.
 Exception: DO's, DI's, AI's, and AO's (including pneumatic tubing) installed between VSD's and DDC panels may share the same conduit.
 - 6. All junction boxes and couplings on conduit containing DDC related wiring or pneumatic tubing shall be painted sky blue color. Alternative: Allied Tube True Color® EMT, color blue, may be used in lieu of painted fittings and junction boxes.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 230900 - - 35

7. Data transmission cabling and equipment grounding procedures shall meet the latest FCC guidelines for electromagnetic field generation.
 8. All control wiring sizes and types shall meet the equipment manufacturer's recommendations.
 9. DDC Wiring and Cable Requirements:
 - a. Digital Output: Minimum #14 AWG THHN
 - b. Digital Input: Teflon jacketed twisted pair #16 -or- #16 AWG THHN minimum
 - c. Analog Output: Twisted pair NEC-rated CMP #20 AWG
 - d. Analog Input: Twisted pair NEC-rated CMP #20 AWG
 - e. Data Transmission: Teflon jacketed twisted shielded pair #22 AWG 12-1/2 pico-ferrad, 6 twists/foot, with 22 AWG ground wire.
 - f. Data Transmission (BACnet MS/TP): BACnet Testing Laboratories certified communication cable.
 - g. Data Transmission (BACnet IP): BACnet Testing Laboratories certified Ethernet communication cable.
 - h. All wire sizes listed are for lengths up to 750'.
 10. All control wiring shall have insulation rated for 300 volts minimum, and be installed per NEC requirements. Exposed wiring running in return plenums, air handling devices, and where required by code shall be plenum rated.
 11. DDC panel to DDC panel (BLN) wiring insulation outer jacket color shall be orange.
 12. Terminal unit (FLN) wiring insulation outer jacket color shall be orange with blue stripe.
 13. TEC Wiring Requirements:
 - a. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. to TECs for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.
 - b. Terminal fittings or insulating bushings shall be used to protect wiring associated with TECs at enclosures, junction boxes, etc.
- B. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.
 - C. Provide conduit and wiring to power all 120 VAC control accessories such as flow meters, BTU meters, data acquisition panels, and actuators. Feed this power from an auxiliary control panel, with a separate disconnect and fuse for each device, located in the auxiliary panel.
 - D. For TEC's, provide 120 VAC conduit and wiring between electrical panels and TEC power supply transformers.

2.9 AUTOMATIC CONTROL VALVES AND ACTUATORS

A. General:

1. With the exception of TECs, actuators shall be pneumatic unless specifically noted otherwise on the drawings.
2. Valve bodies 2 inches IPS and smaller shall be single seated bronze, and shall have screwed end connections. Valve bodies 2-1/2 inches IPS and larger shall be cast iron, and shall have flanged end connections. Valve stem packing shall be tetrafluorethylene, spring-loaded, self-adjusting. Packless construction is acceptable. Valve linkage shall have an adjustment for valve lift. Valve to have rising stem, renewable seat and disc, repackable under pressure.
3. Valve rangeability shall be no less than 50:1 for valve $C_v \leq 1$, no less than 100:1 for valve $C_v > 1$.
4. When indicated, provide separate SPDT limit switches which actuate at the full open and full closed valve position.

- B. High performance butterfly valves may be used when approved for valves 2-1/2" and larger and shall be full lug, have carbon steel body, 316 stainless steel offset disc, one-piece stainless steel shaft and bearings with thrust surfaces, PTFE seat, Teflon stem packing and rated for 150 psi and 450 degrees F, and in compliance with Related Section "Valves".

STEAM CONTROL VALVES: REVISE THE VALVE PRESSURE DROP SPECIFIED BELOW TO THAT APPROPRIATE FOR YOUR PROJECT. FOR EXAMPLE, FOR LOCATIONS CLOSE TO THE CENTRAL POWER PLANT, A PRESSURE DROP HIGHER THAN THE INDICATED 4 PSIG WOULD BE APPROPRIATE. ALSO NOTE THAT THE BELOW VALVE SIZING CRITERIA ASSUMES THAT THE STEAM PRESSURE REQUIREMENT FOR THE EQUIPMENT SERVED BY THE CONTROL VALVE IS 1 PSI OR LESS. ALWAYS VERIFY THE EQUIPMENT PRESSURE REQUIREMENT AND MODIFY THE BELOW ACCORDINGLY.

- C. Steam valve bodies and trim shall be rated for scheduled saturated steam service pressures. Steam valve replaceable plugs and seats shall be stainless steel, hardened to not less than 500 Brinell. Valves shall have modified linear characteristics and shall be sized based on a 5 psig inlet pressure and a maximum drop of 4 psig.

ALTHOUGH AVAILABLE UP TO 4", BALL VALVES SHOULD TYPICALLY ONLY BE USED FOR SMALL CONTROL VALVE APPLICATIONS, E.G. FAN COILS. THIS SPECIFICATION IS ONLY FOR BALL VALVES UP TO 3/4" DIAMETER. DESIGNER SHALL SPECIFICALLY NOTE ON THE DESIGN DRAWINGS WHERE BALL STYLE CONTROL VALVES WITH ELECTRIC ACTUATORS ARE TO BE USED. BE AWARE OF THE MAXIMUM DIFFERENTIAL PRESSURE RATING (D.1.H) FOR THESE TYPE VALVES. NOTE THAT THE MINIMUM FLUID TEMP. RATING IS 35°F; THIS BALL VALVE SPEC IS NOT SUITABLE FOR LOW TEMP SERVICE, HOWEVER LOW TEMP TRIM IS AVAILABLE, CONSULT MFR.S.

- D. Ball Style Control Valve and Actuator Assembly (provide where specifically noted on the design drawings):

1. Control Valve Body: Quarter turn ball valves, 2-way and 3-way configuration as indicated, for 2 position or modulating service, with the following features:
 - a. 1/2" or 3/4" valve size.
 - b. Forged brass body with female NPT end connections.

- c. Nickel or chrome plated brass ball, with Teflon reinforced EPDM O-ring seals.
 - d. Blow-out proof brass stem with double O-ring EPDM seals.
 - e. Shall provide safe and reliable operation in water or in up to 50% glycol/water solutions, at fluid temperatures between 35°F and 212°F and static pressures up to 300 psi.
 - f. Ball and stem seals shall be formulated to prevent degradation by typical water treatment chemicals and Chloramines.
 - g. Minimum close-off rating: 200 PSI.
 - h. Differential pressure rating (valve operating): 30 PSID maximum.
 - i. Downstream leakage: maximum of 0.01% of design flow at rated close-off differential pressure.
 - j. 0 - 90 degree angle of rotation.
 - k. Valves for modulating service shall be equipped with a characterized ball (glass filled polymer flow insert) that provides an equal percentage flow characteristic.
 - l. Valves for two position control shall be reduced port type as required for the appropriate valve Cv.
 - m. Provide valves with the flow coefficient indicated, or if not indicated, subject to engineer's approval, with a Cv appropriate for good control and considering the system differential pressure available.
2. Actuators: UL listed electronic rotary actuator designed for operation with the ball type control valve, with the following features:
- a. The actuator shall be of the same manufacturer as the valve body and shall be integrally mounted to the valve at the factory.
 - b. For direct coupling to the valve shaft without the use of linkages, to an ISO-style mounting pad.
 - c. Minimum cycle life: 60,000 full strokes at maximum rated torque.
 - d. Torque: as required for smooth positioning and closure of the valve against a maximum differential pressure of 30 PSI and to provide close-off up to 200 PSI.
 - e. Motor runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - f. Spring return runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - g. For use with a 24VAC power supply with the ability to operate off the same power supply required for the temperature controller.

BELOW PARAGRAPH ASSUMES MODULATING CONTROL. IF FLOATING POINT VALVE ACTUATION IS DESIRED, MODIFY THE BELOW ACCORDINGLY.

- h. For use with 0-10Vdc output proportional plus integral room controllers, fully compatible with the specified temperature controller. Unless indicated otherwise on the control drawings:
 - 1) Heating coil (non-vivarium applications): Normally open spring return actuation.
 - 2) Heating Coil(vivarium applications): Normally closed spring return actuation.
 - 3) Cooling coil: Normally closed spring return actuation.

- i. Electronic stall detection/overload protection. Actuator shall sense that maximum rotational position has been reached even when control signal is still applied and stop rotating prior to actuator damage.
 - j. Rotation mechanically limited by adjustable integral limit stops.
 - k. Mechanical range adjustment.
 - l. Valve position indicator.
 - m. Actuator/actuator housing: Brushless DC motor design, NEMA type 1 or 2 enclosure, die-cast aluminum alloy or UL 94 listed plastic housing, lubricated gears, with a thermal barrier to prevent condensation on the actuator parts when used for chilled water applications. It shall be possible to rotate the actuator to any of four rotational angles in 90° increments, relative to the valve body.
 - n. Ambient temperature operating range: -20°F and 120°F.
 - o. Maximum actuator noise level, running or spring return: 40 dBA.
- 3. 2 year unconditional warranty, parts and labor. 5 year unconditional parts warranty.
- 4. Approved Manufacturers:
 - a. Siemens
 - b. Johnson Controls
 - c. Belimo
- E. Hydronic system valve bodies and trim shall be rated for service pressures through 125 psig at 250 deg. F, globe style. Hydronic system valves shall have replaceable plugs and seats of SAE 72 brass or AISI 300 series stainless steel, selected for maximum lift under application conditions. Maximum pressure drop across any hydronic system valve at maximum flow and valve size shall be as indicated. Two-way valves shall have equal percentage characteristics for heating and cooling applications, either linear or equal percentage for other applications as appropriate, linear for three-way valves. When not indicated, valves shall be sized for a pressure drop of 3 psig for chilled water and 4 psig for hot water.
- F. Standard Valve Actuators:
 - 1. Pneumatic, rolling diaphragm, spring loaded, piston type.
 - 2. Spring range shall be as required for non-overlapping sequencing or as indicated on drawings.
 - 3. Ratio relays or cumulators used for sequencing valves are not acceptable unless specifically indicated on the drawings.
 - 4. Valves shall spring return to normal position as indicated.
 - 5. Select with sufficient close-off power for system pressure, pump shut off head, highest operating torque, and torque requirements of valves that may stick because of infrequent use.
 - 6. Select to provide smooth proportioning control under operating conditions normal to the system.
- G. Butterfly Valve Actuators:

1. Pneumatic actuators shall be rotary type with rack and pinion to provide constant output torque rated for at least 125 percent, pilot positioner with gauges, spring return, adjustable travel stops, factory tested, factory lubricated, self-draining body, integral pneumatic parting, localized mechanical position indicator readable at 25 feet, 0-90 deg. reversible operation, capable of operating in any valve mounting attitude, capable of being mounted in line or transverse to pipeline, and bolt directly to valve top plate. Valves shall be actuated with 60-psig air and 3-15 psig pilot service. Valves used for isolation do not require pilot positioners. Actuator shall include a manually operated hand wheel for manual override.

EDITOR: WHEN THE USE OF ELECTRIC ACTUATORS IS PLANNED THE METHOD OF GETTING POWER TO THOSE ACTUATORS MUST BE CONSIDERED. READ THE BELOW SPEC SECTION CAREFULLY AND NOTE THE SIZE RANGE FOR VARIOUS ACTUATOR VOLTAGES. THE CONTROLS CONTRACTOR SHALL NOT RUN POWER WIRING ABOVE 120V. THEREFORE:

FOR 120V ACTUATORS, POWER TO SUCH ACTUATORS IS THE RESPONSIBILITY OF THE CONTROLS CONTRACTOR AND IS TO BE ROUTED FROM THE DDC AUXILIARY PANEL (SEE SECTION 2.5). IF YOUR PROJECT HAS A LARGE NUMBER OF 120V ACTUATORS THE STANDARD (2) 20 AMP CIRCUITS RUN TO THE DDC AUX. PANEL MAY NOT BE ENOUGH. DETERMINE THE TOTAL AMPERAGE OF SUCH ACTUATORS AND DIRECT THE ELECTRICAL DESIGNER TO DESIGNATE ADDITIONAL 120V CIRCUITS TO THE DDC AUX. PANEL, IF REQUIRED.

FOR 208V OR 480V ACTUATORS, POWER TO THE ACTUATORS SHALL BE DESIGNATED AS THE RESPONSIBILITY OF THE ELECTRICAL CONTRACTOR. FOR THESE HIGH VOLTAGE ACTUATORS, DIRECT THE ELECTRICAL DESIGNER TO INDICATE POWER TO EACH ACTUATOR ON THE ELECTRICAL DRAWINGS. THIS POWER SHALL NOT BE RUN OUT OF OR THROUGH THE DDC AUXILIARY PANEL.

2. Electric actuators shall have permanent split capacitor, reversible electric motor which drives a compound epicyclic gear, thermal overload protection, factory tested, factory lubricated, localized mechanical position indicator readable at 25 feet, 0-90 degree reversible operation, bolt directly to valve top plate. Housing shall be weatherproof and suitable for outdoor location. Provide thermostatically controlled heater for prevention of condensation at low temperatures. Actuator voltage shall be 120 VAC through 12" and 208 or 480 VAC above 12". 120V actuators shall be fed out of the auxiliary panel with a separate disconnect and fuse. Disconnect and fuse to be located in the auxiliary panel. 208V or 480V actuator power shall be provided to 208/480V actuators by others. In all cases the MSCC shall provide the required control wiring to the actuators. Actuator ambient temperature range shall be -20 deg. F to +140 deg. F. Actuator shall include a manually operated hand wheel for manual override of the valve position.

- H. Electronic valve actuators used with TECs shall be 24 VAC and use 3-position floating control, 7/32" (5.5 mm) stroke minimum, shall be direct-coupled to valve bodies without the use of tools, shall have sufficient power to prevent valves from lifting off their seats, shall provide visual position indication, shall include manual override knob, and shall be UL-listed for plenum installations. Actuators shall be fail-safe or fail-in place as follows:
 - 1. Actuators shall be fail-safe open for perimeter heating applications.
 - 2. Actuators shall be fail-in-place for reheat control valves and cooling coil valves.
- I. Typical valve body/actuator control actions shall be as follows:
 - 1. Heating coil valves (non-vivarium) shall be normally open to flow through the coil.
 - 2. Heating coil valves (vivarium) shall be normally closed to flow through the coil.
 - 3. Heat exchanger valves (steam or water) shall be normally open to flow through the heat exchanger.
 - 4. Cooling coil valves shall be normally closed to flow through the coil.
 - 5. Humidifier valves shall be normally closed to flow through the humidifier.
 - 6. Condenser water valves shall be normally open to flow through the cooling tower.
 - 7. Isolation valves shall be normally open.
 - 8. Drain valves shall be normally closed.
- J. Approved Manufacturers:
 - 1. All control valves except butterfly type:
 - a. Siemens
 - b. Honeywell
 - c. Johnson
 - 2. High performance butterfly valves:
 - a. Jamesbury - 815L
 - b. Watts - QF series X
 - c. Dezurik - BHP
 - d. Xomox Pliaseal
 - e. Bray - Braylok Series 41

CONTROL DAMPERS SHALL BE SCHEDULED ON THE DRAWINGS. INDICATE THE DAMPER STATIC PRESSURE AND VELOCITY RATING IN THE SCHEDULE.

2.10 AUTOMATIC CONTROL DAMPERS

- A. Multi-blade type. Provide with parallel blades for two-position, throttling, and modulating service unless noted otherwise. Provide required drive axles, linkage, jackshafts, and accessories for proper damper operation. Damper blades, frames, linkages, jackshafts and other parts of the damper actuation system shall not distort or rack during operation. Dampers shall close tightly, and operate in a smooth, hesitation and slack-free manner over the entire range of travel, at the maximum air pressure and velocity at the mounting location. Additionally, multiple section dampers shall operate in unison section-to-section.

- B. Face and bypass dampers shall each be capable of passing 100% of unit rated CFM. Pressure drops shall be approximately the same in either extreme position, including the pressure drops of coils and bypass components.
- C. All automatic control dampers shall conform to these specifications, including those provided by equipment manufacturers.
- D. All control dampers shall be low leakage type and shall meet the following minimum requirements:
 1. Leakage: 6.0 CFM/sq. ft. max. at 3" WC.
 2. Frames: 13 gauge (minimum) galvanized steel, minimum 2 inch in frame depth, welded or riveted with corner reinforcement.
 3. Blades: 16 gauge (minimum) galvanized steel or aluminum airfoil type, maximum blade size 8 inches wide, 48 inches long. Axles and axle extensions shall be minimum 1/2 inch solid galvanized steel. Dampers which are required to have a static pressure rating over 4" WC shall have minimum 3/4 inch solid galvanized steel axles/axle extensions.
 4. Blade Seals: Synthetic elastomeric or neoprene, inflatable type, mechanically attached, field replaceable.
 5. Jackshafts: Provide to drive adjacent vertical sections of multiple damper assemblies to ensure uniform operation. Minimum 3/4 inch solid or 1" hollow (minimum 1/8 inch wall thickness) galvanized steel. Where jackshafts penetrate air handling casing walls, provide greasable ball bearing supports sleeved and sealed to prevent casing leakage. Provide intermediate greasable ball bearing supports bolted to damper frames for jack shafts extending across multiple damper sections.
 6. Jamb Seals: Stainless steel.
 7. Bearings: Oil impregnated sintered bronze or lubricant free, solid stainless steel. Provide thrust washers at bearings for all dampers that are to be mounted with blades in the vertical position.
 8. Linkages: Deflection and slack-free. Zinc plated, fully exposed, connected to blade faces (located in the air stream). Linkages may be located in-jamb for single damper flange mounting arrangements, provided linkage is external to the duct and easily accessible for maintenance.
 9. Static pressure Rating: As scheduled on the drawings, or provide dampers rated for the maximum pressure to be encountered at the mounting location but not less than 4" WC.
 10. Velocity Rating: As scheduled on drawings, or provide dampers rated for the maximum velocity to be encountered at the mounting location.
 11. Temperature Limits: -40 to 200 deg. F.
 12. Provide through-bolted connections for connecting axle or jack-shaft extensions. Set screw arrangements are not allowed.
 13. Selection and sizing criteria: Damper selection and sizing shall be based on damper schedule shown on the drawings. For dampers that are not scheduled on the drawings, selection and sizing shall be based on the procedure contained in Engineering Manual of Automatic Control, Honeywell, Inc., 1988.
- E. For dampers located in stainless steel ductwork, PVC coated ductwork, fume hood exhaust ductwork, and exhaust fan outside air bleed-in ductwork, fabricate and size as indicated above, with the following additional requirements:

1. Frames, blades, blade axles and extensions, blade seals, jackshafts, linkages, and all other components exposed to the air-stream: Type 316 stainless steel.
2. Bearings: Solid stainless steel.
3. Damper operators shall be mounted outside of air stream. Extend damper axles and jackshafts to permit mounting outside of air stream.

F. Approved Manufacturers:

1. Honeywell
2. Ruskin
3. Vent Products
4. American Warming & Ventilating
5. Arrow United Industries
6. White Environmental
7. Johnson Controls

2.11 DAMPER OPERATORS

A. General:

1. With the exception of TECs, operators shall be pneumatic unless specifically noted otherwise on the drawings.
2. Provide smooth, proportional control with sufficient power for air velocities 20% greater than maximum design velocity and to provide tight seal against maximum system pressures. Provide spring return to normal position. Damper operators shall be installed in accessible locations. Damper operators shall not be installed inside ducts or air units that convey hazardous exhaust.

B. Pneumatic Operators: Rolling diaphragm piston type with 8-13# spring range, as indicated on drawings, or as required to achieve specified performance.

C. Electric Operators: Maintenance free electric actuator, reversible, with push rod and bracket for swivel mounting and for the transmission of power. Synchronous motor with load independent running time providing parallel operation of several operators. Gear train with low noise level. Magnetic hysteresis coupling with magnetic transmission of torque, with no mechanical contact between the coupling members. The actuator shall be safe against blocking and overload proof even when operated continuously.

D. Electronic Operators: Maintenance free, 24 or 120 VAC, 4-20 mA or 0-10 VDC input, reversible, direct-drive or push rod and bracket, metal or aluminum housing, brushless DC motor with stall protection, quiet, low-power operation, have visual position indicator, and manual override.

E. Electronic damper operators used with TECs shall be 24 VAC 3-position floating control type and utilize a 90-degree rotation. Operators shall be direct-drive, have sufficient power to operate the damper against system pressures, provide visual position indication, have manual override, and shall be UL-listed for plenum installations. Operators shall be of the fail-in-place type.

F. Provide operator mounting brackets. Provide devices to connect operator drive shafts to dampers, damper linkages, and jackshafts.

- G. Quantity of operators: Provide a sufficient number to achieve unrestricted movement throughout damper range, such that one operator does not operate more than the maximum square footage of damper area as recommended in standard catalog of manufacturer. Provide sufficient number so dampers close tightly, operate in a smooth, hesitation and slack-free manner over the entire range of travel at the maximum air pressure and velocity at the mounting location, and so that multiple section dampers operate in unison section-to-section.
- H. Approved Manufacturers:
 - 1. Honeywell
 - 2. Johnson
 - 3. Siemens
 - 4. Belimo

2.12 PNEUMATIC COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.
- B. Electric-pneumatic relays shall be two-position, have a metallic body, can be field or panel mounted, have a 120 VAC coil, and 3 or 4 ports. Only Johnson E.P. relays are acceptable.
- C. Pressure-electric switches shall be two-position, appropriate range and element, suitable for the service, single or double pole, normally open or normally closed as required. Set point shall adjustable over the full range. Switch rating shall be 8.0 amps at 120 VAC, minimum.
- D. Differential pressure transmitter shall be one-pipe, 3-15 psig output, capable of measuring pressure differentials of positive or negative type, operate on the force-balance principal, have an over-pressure rating of 30" WC, accuracy of 5 percent full scale, and of the range suitable for the service.
- E. Pneumatic room thermostats shall be direct acting, dual (minimum 5°F dead band - 2 output branch lines) or single setpoint, 2-pipe, large capacity, adjustable proportioning type, containing dual or single bi-metallic elements, adjustable differential, minimum setting no greater than 1-1/2 deg. F over a range of 55 to 85 deg. F. Provide tamperproof covers with exposed setpoint indicator in black lettering, exposed thermometer, exposed setpoint adjustment in non-public areas and key operated setpoint adjustment in public areas.
- F. Pneumatic humidistats shall be of the adjustable proportioning, 2-pipe type, duct or wall mounted, reverse acting, adjustable sensitivity, sensitive hygroscopic membrane, temperature compensated, 20-90% RH range room, 25-65% RH range for duct, and 55-95% RH range for high-limit applications. Room type shall have tamperproof cover. Duct type shall come mounted inside a galvanized duct mounting box.

- G. Temperature transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1/2% of range for 200 deg. F span and plus or minus 1% for 50 deg. F span, with appropriate 50, 100, 200 deg. F temperature range, compensated bulb, averaging capillary, rod and tube or room transmitter operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.
- H. Humidity transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1% of range, temperature compensated, sensitive hydroscopic membrane, room or duct mounted, operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.
- I. Receiver-controllers shall be single or dual input models direct or reverse acting with mechanical set point adjustment, calibrated proportional band adjustment, and calibrated authority adjustment. Provide proportional control mode for temperature control applications, and proportional plus integral control mode for differential pressure control applications. Proportional band shall extend from 2 to 40% of primary sensor span, authority from 0 to 200% of primary sensor span and integral time from 1/2 to 20 minutes. Suitable for input signal of associated transmitter and output signal required by controlled device.
- J. Signal selector relays shall be capable of receiving two or more input signals and transmitting the highest or lowest pressure, with 1:1 input/output ratio.
- K. Booster relays shall be proportional type for increasing the volume capacity of an input signal to a directly proportional output signal.
- L. Pneumatic switching relays shall be snap acting, switching type with adjustable switching setpoint and fixed differential, single or double pole, and metallic body, for connecting a common port to either of two other ports based on the switching signal.
- M. Pneumatic multi-purpose relays shall be two-valve design, high accuracy, high repeatability, metallic body, internal relief, high capacity, proportional, with adjustable set point, capable of being used as direct or reverse acting, amplifying, signal advancing, minimum pressure output, or lower pressure transfer. Removal of main air to the relay causes the branch line output to go to zero.
- N. Pneumatic gradual position switches shall provide regulated pressure to a controlled device, with knob and pointer for manual adjustment, graduated scale plate with appropriate markings, suitable for surface or flush mounting on wall or panel as indicated.
- O. Pneumatic selector switches shall be two or three position with metallic bodies, have indicating plates with appropriate markings, and suitable for panel or wall mounting. Switches installed in finished rooms shall be recessed in wall and provided with faceplate.
- P. Field Mounted Gauges:

1. Provide 1-1/2" air pressure gauges on branch lines of pneumatic systems at controllers, transmitters, valve and damper operators, relays, switches, regulators; and DDC output points. Accuracy shall be 2.5 percent of full scale for the middle half of scale and 3.5 percent elsewhere. At dampers or devices that utilize multiple actuators, a single gauge in a readily visible location is acceptable.

Q. Panel Mounted Pneumatic Gauges:

1. All transmitters shall be provided with receiver gauges.
2. Door mounted analog indicator gauges shall be 3-1/2" diameter with a 1% accuracy.
3. Sub-panel mounted analog indicator gauges shall be 2-1/2" diameter with a 1% accuracy.
4. A 1-1/2" gauge shall be provided on the main air supply inside each control panel.

2.13 LOCAL, AUXILIARY, UPS, LPI AND SIMILAR PANELS

- A. Unitized cabinet type for each system under automatic control with relays and controls mounted in cabinet and temperature indicators, pressure gauges, pilot lights, push buttons and switches flush on cabinet panel face, or as detailed on drawings.
- B. Doors shall be removable, right or left hand hinged, locking, keyed alike and to other U-M control panels.
- C. Removable perforated subpanel to permit mounting of controls without drilling holes.
- D. Wall mounted or support kit or unistrut type frame for floor mounting.
- E. Unit shall have knockouts, NEMA Type 1, and listed under UL508 Industrial Control Panel Enclosures.
- F. UPS and LPI panel minimum size shall be 19-1/2" high by 16-3/8" wide by 5-3/4" deep.

2.14 AHU SAFETIES ENCLOSURES

- A. Enclosures shall utilize a standard 4-11/16" x 4-11/16" square electrical box and blank cover. One half of the blank cover shall be painted red and the other blue. A red neon indicator light shall be installed in the red half of the cover and a blue neon indicator light shall be installed in the blue half of the cover. A terminal strip shall be installed inside the electrical box with two terminals in one half, labeled "H1" and "H2" (for HVAC use), and two additional terminals in the other half, labeled "F1" and "F2" (for fire alarm use). The red neon indicator shall be wired to the F terminals and the blue neon indicator to the H terminals.

2.15 ROOM DIFFERENTIAL PRESSURE INDICATING GAUGES

- A. Dial (4" dia.) in metal case, diaphragm actuated, black figures on white background, front recalibration adjustment, center zero scale with scale range of 0.05-0-0.2" WC with 0.005 minor divisions, suitable for surface or flush mounting. Accuracy +/- 2% of full scale. With plastic gauge mounting plate for flush mounting and space pressure sensor consisting of pressure port, barbed tubing connection, and sensor plastic mounting plate suitable for mounting on a standard electrical junction box.
- B. Approved Manufacturers:
 - 1. Dwyer "Magnehelic" 2000-00N with A-465 pressure sensor and A-464 flush mounting plate (provide A-368 mounting bracket for surface mount applications)

THE UNIVERSITY'S HIGH PRESSURE AIR SUPPLY IS AVAILABLE ON CENTRAL CAMPUS VIA THE STEAM TUNNEL SYSTEM AND IS DELIVERED AT -50 DEG. F DEW POINT. THEREFORE CONTROLS USING THIS AIR SUPPLY SHOULD NOT NORMALLY REQUIRE REFRIGERATED OR DESICCANT AIR DRYERS, EVEN WHEN EXPOSED TO OUTDOOR AIR CONDITIONS.

2.16 PNEUMATIC ACCESSORIES

- A. Control Air Supply
 - 1. Control air supply shall be from the University's high-pressure (steam tunnel) air supply or from a temperature control compressed air station as indicated on the project documents. System shall be sized for expected use, including air usage of laboratory airflow units or process control actuators (whether this equipment is provided by the MSCC or not), plus 10 percent extra capacity. When providing a control Compressed Air Station, provide a Refrigerated Air Dryer if none of the pneumatic tubing or pneumatic components are exposed to outside air conditions. Provide a Regenerative Desiccant Air Dryer when pneumatic tubing or pneumatic components are exposed to outside air conditions. For projects utilizing the University's high pressure air supply, unless indicated otherwise on the drawings, no air dryers are required.
- B. Compressed Air Station
 - 1. Temperature control air compressors shall be reciprocating oil type through 25 HP, rotary screw over 25 HP, specifically designed for pneumatic controls, shall be of the simplex or duplex type, tank or base mounted unit assemblies, have combination intake filter/silencer, and totally enclosed belt guards. Compressors shall be sized based on no more than 1/3 run time with an appropriately sized tank and an average tank pressure of 70 psig for optimum performance. Simplex units shall only be used when backing up another control air supply.
 - 2. Tank shall be of adequate size and contain a shut-off ball valve, ASME safety relief valve, pressure switch operated start/stop control, 120 VAC electronic automatic drain with manual bypass and air pressure gauge.

3. Duplex models shall be complete with NEMA 1 enclosure, starters, disconnects, automatic alternator, H-O-A switches (left H position spring return for test only), low oil shutdown switch, push-to-test pilot lights, and 3-position switch for selection of: compressor 1 only/automatic alternate/compressor 2 only operation. PRV/filter/dryer assemblies may be mounted to the compressor/tank assembly.
4. Approved Manufacturers:
 - a. Quincy
 - b. ACP
 - c. Divilbis
 - d. Ingersol-Rand

C. Tubing

1. Copper tubing shall be new hard drawn, air grade, ASTM B75 for 3/8 inch and smaller or type L, ASTM B68 for 1/2 inch and larger, with solder joint or compression type fittings, at the option of the MSCC.
2. Plastic tubing (all sizes) shall be black virgin, polyethylene, ASTM D1248, Type 1, Class C, Grade 5, meeting crack test performance required by ASTM D1693 and be fire retardant (FR) rated. Multi-tube harness material shall be as specified above with a polyester film barrier and vinyl jacket not less than 0.062 inches thick. All non-metallic tubing shall be 1/4" O.D. minimum; micro-sleeve is not acceptable.

D. Pressure Reducing Valves:

1. Pressure reducing valves (PRV) shall be diaphragm operated, self-relieving, designed to provide precision control of air supply pressures, and shall be located after any filters or dryers.
2. PRV shall be capable of being mounted in any position, shall have locking set point handle, and SS inlet strainer.
3. PRV shall have metal or plastic body and shall be provided with 2-1/2" gauge of appropriate units.
4. PRV's that are not self-relieving shall be provided with a separate relief valve of appropriate range.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air
 - e. Johnson
 - f. Honeywell
 - g. Siemens

E. DDC/Auxiliary/Local Control Panel Air Filters:

1. Provide an in-line air filter for main air supply to each DDC, auxiliary and local control panels capable of removing solids and petroleum-based oils.
2. Filter efficiency shall be 99.9% of 0.5 micron particles.
3. Filter element shall be visible and shall change color to indicate when to be replaced.
4. Minimum capacity shall be 500 SCIM and 30 psig.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison

- c. Parker
- d. Van-Air

F. Coalescing Air Filters:

1. Provide a duplex set of coalescing air filters for the main air supply to all building temperature controls.
2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
3. Filter shall have a replaceable cartridge and drain port.
4. Filter shall be designed to remove oil and water droplets down to 0.01 microns and particulates down to 0.08 microns. Minimum capacity shall be 10 SCFM and 150 psig.
5. Coalescing filters shall be located downstream of refrigerated air dryers and upstream of chemical or desiccant dryers.
6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

G. Particulate Air Filters:

1. Whenever chemical or desiccant dryers are used, provide a duplex set of particulate air filters for the main air supply to all building temperature controls located downstream of chemical or desiccant dryers.
2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
3. Filter shall have a replaceable cartridge and drain port.
4. Filter shall be designed to remove particulates down to 0.1 microns. Minimum capacity shall be 10 SCFM and 150 psig.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

H. Refrigerated Air Dryers:

1. Provide a 120 VAC air-cooled refrigerated dryer capable of providing 35 deg. F dew point air.
2. Unit shall have power on light, high temperature light, valved air bypass piping, and air-to-air precooler/reheater.
3. Heat exchanger to be non-fouling, tube-in-tube, self-cleaning with smooth surfaces.
4. Compressor shall have hot gas bypass, as required, and shall be protected by thermal and current overloads.
5. Condenser fan shall have thermal overload protection.
6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

I. Regenerative Desiccant Air Dryers:

1. Provide a 120 VAC regenerative type desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing -40 deg. F dew point air at 150 psig.

2. Units shall have an adjustable solid-state timer and purge flow economizer valve, on/off switch, power on light, separate fill and drain ports for ease of desiccant replacement without piping removal, heavy duty purge exhaust mufflers for quiet operation, non-lubricated air control valves, Teflon seated check valves, visible moisture indicator, visible purge flow indicator, pressure relief valve, ASME code constructed/stamped pressure vessels, SS support screens and air diffusers, tower pressure gauges, structural floor frame and stand for large sizes, wall mounting brackets and supports for small sizes, pre-piped and wired, and complete with air bypass piping.
3. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

J. In-line Desiccant Air Dryers:

1. Provide an in-line desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing 4,000 cubic feet of -40 deg. F dew point air at 150 psig with a dryer inlet temperature of 68 deg. F.
2. Units shall have a removable bowl or fill port for ease of desiccant replacement without piping removal, visible moisture indicator, and air bypass piping.
3. Not to be used as a substitute for Regenerative Desiccant Air Dryers when providing a control compressed air station.
4. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

2.17 IDENTIFICATION AND LABELS

- A. The MSCC shall provide black phenolic nameplates with engraved white minimum 1/4" high lettering (3/8" high at room differential pressure indicators), for each DDC or auxiliary panel, panel door mounted devices, and all LPI's, permanently attached, to identify field panel number, building, area, service, etc.
- B. All control devices located within auxiliary panels shall be labeled with legible identification that corresponds with the as-built drawings via black permanent marker. Use plastic or metal tags when it is not possible to mark directly on the device.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install all system components as recommended by the manufacturer, including air compressors, dryers, filters, etc.

- B. Thermostats, room temperature sensors, push-buttons, and other adjustable devices meant for room occupant operation shall be mounted 44" to center above the finished floor. This requirement does not apply to control panels and devices mounted in penthouses, mechanical rooms, and other spaces normally inaccessible to room occupants.
- C. Zone thermostatic controls used to control both heating and cooling, e.g. a variable volume terminal unit also controlling a reheat coil and/or fin tube radiation, shall be programmed (DDC systems) or set up (non-DDC systems) with a heating setpoint of 71 deg. F and cooling setpoint of 76 deg. F, and a dead-band of 5 deg. F, unless indicated otherwise on the Drawings.
- D. System I/O's shall not be split between different DDC panels.
- E. AHU safeties enclosure shall be mounted at the wiring/tubing DDC panel array interface trough.
- F. Install all conduit, wiring, cable, tubing and equipment in a first-class manner, using proper tools, equipment, hangers, and supports, and in locations as required for a neat, attractive installation. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner. Conduit shall not be supported from work of other trades.
- G. Support all sensors and devices as recommended by the manufacturer. Space sensors shall be mounted on an electrical box.
- H. Provide a control air shut-off valve for each panel.
- I. Panels and meter enclosures shall be rigidly mounted.
- J. Plastic tubing may be used in all locations, except in mechanical rooms, shafts, or exposed locations, unless run in conduit.
- K. Tubing shall not be attached to conduits with current carrying conductors or fire protection piping. It shall be adequately supported with no noticeable sagging between supports, and protected from abrasion and galvanic corrosion. All pneumatic tubing shall be concealed in finished areas.
- L. A PRV shall be installed on each floor to provide control air supply.
- M. All wiring to devices installed inside auxiliary/local panels shall enter/exist via terminal strips, except twisted/shielded sensor wiring.
- N. Provide a pouch or other containing method inside each control panel and insert a copy of the corresponding system control drawings.
- O. Provide supplemental Hand-Off-Auto switches and contactors, as required, to permit automatic operation of equipment from the DDC system (i.e. single phase equipment which uses fractional motor starters, etc.).
- P. Extreme care shall be used in making connections to other equipment to see that the safeties on this equipment are not inadvertently bypassed or overridden by the DDC.

- Q. All equipment having moving parts and controlled by the DDC shall be provided with warning labels no less than 2 in. in height, and in bright warning color, stating that the equipment is remotely started by automatic controls. Such labels shall be posted clearly in the area of any moving parts, such as belts, fans, pumps, etc. The University of Michigan will furnish and install these warning labels.
- R. Ensure all dampers, valves, thermowells, flowmeters, and other miscellaneous control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and installed by others.
- S. Limit switches used on dampers shall be set at approximately 95% of full stroke (opened and closed). Where a single limit switch is indicated, set at approximately 75% of full stroke.
- T. MSCC shall provide all necessary equipment, test gases, etc. for calibration, and shall calibrate all sensors (i.e. CO₂, CO, combustible gas, etc.) in accordance with the manufacturer's recommendations. Specialized equipment, test gases, etc. shall be turned over to owner upon completion and acceptance.
- U. Flow meters shall be installed with at least 10 diameter of straight pipe length upstream and five diameter of straight pipe length downstream. Power supply to flow meters and BTU meters shall be 115 VAC from the auxiliary DDC panel, and power connection for each device shall be installed with a lockable local service disconnect. Flow meter transmitters/displays and BTU meters shall be mounted 4 feet above finished floor. They shall be located at the DDC panel array unless the maximum available cable length is exceeded. All meter components, including sensors, shall be mounted in accessible locations.
- V. Airflow sensors shall be installed with the appropriate upstream and downstream clearances per manufacturer's instructions.
- W. Remove any unused items that are part of renovations or demolition, including, but not limited to: conduit, wire, tubing, controllers, controlled devices, relays, enclosures, etc. Do not abandon in place.
- X. DDC sensor cabling shall not be spliced.
- Y. Locate all control components and accessories such that they are easily accessible for adjustment, service and replacement.
- Z. Participate in the commissioning process in accordance with the project commissioning documents.
- AA. All set points and alarm points shown on the documents are preliminary. Finalize with the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
- BB. For fan coil/terminal unit controllers and similar programmable electronic controllers, obtain approval of programmable settings from the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.

- CC. Install constant flow fume hood monitors surface mounted on the front of the fume hood. Furnish exact dimensions and location to the fume hood factory to allow for concealed wiring to the monitor.
- DD. Install constant flow fume hood sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal use, and allows vertical sashes to be positioned without binding, twisting or tangling.
- EE. Flush mount room differential pressure indicating gauges above one door outside of each lab, animal room, and where indicated, in the corridor wall at entrance expected to be most frequently used, or as otherwise shown. Surface mounting is permitted on non-drywall walls. Mount related pressure sensor in ceiling or wall of lab. Attach tubing to gauge so that the intended room offset is displayed on the largest scale range of the gauge. For example, if the monitored room is to be negative to a corridor, connect the room tube to the 0 - 0.2" port. Mount POS/NEG label adjacent to gauge and visible from floor.

3.2 CALIBRATION AND START-UP

- A. The MSCC shall provide calibration and start-up for temperature control devices and systems, including compressors, dryers, etc.
- B. Program all auto calibration routines to self-calibrate outside the hours of normal space occupancy. When this is not possible, program the self calibration to occur during hours of lowest occupancy. Establish with the Owner, working with the Commissioning Authority, a self calibration schedule that will be the least intrusive to building occupants. Phase self-calibration routines (as opposed to all devices simultaneously calibrating) to avoid negatively impacting air handler operation.
- C. After control components have been installed and connected, test, adjust and re-adjust as required all control components in terms of function, design, systems balance and performance. Control devices, linkages and other control components shall be calibrated and adjusted for stable and accurate operation in accordance with the design intent and to obtain optimum performance from the equipment controlled. All control valves shall be stroked and spring ranges verified and set. All dampers shall be stroked to verify proper and smooth operation. Cause every device to automatically operate as intended to ensure its proper functionality. Make systems ready for acceptance tests.
- D. Set constant flow fume hood monitor alarms as follows:
 - 1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.

- c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.
- E. After equipment has been accepted and operated in normal service for two weeks, check the adjustment of control components and recalibrate/replace where required.

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 230905 - MECHANICAL SYSTEMS CONTROLS (HOSPITAL PROJECTS)

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230905 - MECHANICAL SYSTEMS CONTROLS (HOSPITAL PROJECTS)

REVISION NOTES:

JULY 2019: UPDATED UPS MODEL REQUIREMENTS.

MAY 2019: ADD COMBINATION ROOM TEMP AND HUMIDITY SENSOR. REVISE BALL VALVE ACTUATORS TO MODULATING TYPE.

JANUARY 2019: MODIFIED REQUIREMENTS FOR HMI'S. ADD CONDENSATION SENSOR, ALARM INDICATION STATION, OCCUPANCY COUNTER. PART 3: INDICATED THAT SETPOINTS ON DOCUMENTS ARE PRELIMINARY AND MUST BE FINALIZED WITH THE ENGINEER AND COMMISSIONING AUTHORITY PRIOR TO PROGRAMMING. ADDED SELF CALIBRATION DEVICE REQUIREMENTS.

JUNE 2018: REVISIONS TO SCOPE OF WORK, ADDED ONICON TO FLOWMETER MANUF, NEW UPS REQUIREMENTS AND INSTALLATIONS, REDEFINED ROOM PRESSURE MONITORS AS HMI'S, NEW HMI REQUIREMENTS AND INSTALLATIONS, PANEL IDENTIFICATION AND POINT DESCRIPTION ID REQUIREMENTS, CHANGES IN DEMOLITION SCOPE.

MAY 2017: REVISED SECTION TO ADD CONSTANT VOLUME VENTURI (CVV) FUME HOOD LAB AIRFLOW CONTROLS. VAV FUME HOOD LAB AIRFLOW CONTROLS, INCLUDING ALL OTHER MECHANICAL CONTROLS IN THE VAV FUME HOOD LAB, REMAINS IN MS230910. REFER TO DESIGN GUIDELINE 230030 FOR ADDITIONAL GUIDANCE. ADDITIONAL EDITS INCLUDE CLARIFICATION TO CONTROL DEMOLITION SCOPE, MISCELLANEOUS FLOW METER CLARIFICATIONS, HMI CLARIFICATIONS, CHANGE REFERENCE OF MCIT TO HITS, ADDITIONAL VAV CONTROLLER REQUIREMENTS, CHANGES TO DDC WIRING REQUIREMENTS, IDENTIFICATION LABELLING REQUIREMENTS, AND OTHER MISC EDITS

MAY 2015: NEW SECTION, SPECIFIC AND APPROPRIATE FOR HOSPITAL FUNDED PROJECTS ONLY

APRIL 2016: DEFINED THAT DDC HMI SHALL BE PROVIDED & INSTALLED BY MSCC, PROGRAMMED BY SI. MODIFIED SUBMITTAL REQUIREMENTS. FURTHER DEFINED DDC ARCHITECTURE. ADDED TSTAT AUX COMM PORT. MODIFIED HMI & DIFF PRESSURE TRANSMITTER REQUIREMENTS. MODIFIED BACNET NAMING REQUIREMENTS. ADDED INSTALLATION REQUIREMENTS.

EDITOR'S NOTE:

THESE SPECIFICATIONS MUST BE CUSTOMIZED APPROPRIATELY FOR EACH PROJECT. IN ADDITION TO THESE SPECIFICATIONS, THE PLANS ARE TO INCLUDE THE FOLLOWING, AS A MINIMUM:

- TEMPERATURE CONTROL DIAGRAM / SCHEMATIC OF EACH SYSTEM (AIR HANDLING UNIT, CHILLED WATER, HOT WATER, AIR TERMINIALS, ETC.) INDICATING ALL CONTROL AND MONITORING INSTRUMENTS AND COMPONENTS. THE DIAGRAM SHOULD ALSO INCLUDE AN INPUT / OUTPUT SCHEDULE FOR THE DDC CONTROLLER, AND SEQUENCE OF OPERATION. AUXILIARY CONTROL COMPONENTS SHALL BE INSTALLED IN AUXILIARY CONTROL PANELS (LOOP POWERED INDICATORS, E.P. RELAYS, P.E.

SWITCHES, DIFFERENTIAL PRESSURE TRANSDUCERS, ETC.) SHALL BE SO INDICATED BY SOME METHOD. (I.E. ASTERISK)

- INDICATION OF ALL POINTS TO BE DISPLAYED ON THE HUMAN MACHINE INTERFACE (HMI) TOUCHSCREEN PANEL.
- LOCATIONS OF ALL DDC PANEL ARRAYS.
- PROVIDE TWO 20 AMP POWER CIRCUITS AT EACH DDC/AUXILIARY PANEL LOCATION. ONE CIRCUIT IS FOR THE DDC PANEL, THE OTHER IS FOR THE AUXILIARY PANEL. ELECTRICAL POWER REQUIREMENTS TO BE COORDINATED WITH ELECTRICAL DRAWINGS.
- WIRING DIAGRAMS FOR EACH SYSTEM TO SHOW INTENT OF AUTOMATIC OR INTERLOCKED OPERATION.
- SCHEDULES FOR DAMPERS, AIRFLOW MEASURING STATIONS, STATIC PRESSURE PROBE LOCATIONS, HUMIDITY RESET, TEMPERATURE RESET, DAY/NIGHT CONTROL ZONE, ETC.
- LOCATIONS OF ALL HITS DATA DROPS, SHOWN AT LOCATIONS FOR ALL BACNET BUILDING CONTROLLERS.

THE SCOPE OF THIS SPECIFICATION INCLUDES CONTROLS FOR ANY LAB ROOM WITHOUT VAV FUME HOODS WHICH INCLUDES HOODS WITH COMBINATION SASHES. IF A LAB ROOM INCLUDES THOSE HOOD TYPES, U-M MASTER SPEC 230910 MUST BE INCLUDED TO COVER ALL MECHANICAL CONTROLS IN THOSE ROOMS.

PART 1 - GENERAL

1.1 MECHANICAL CONTROL SYSTEM GENERAL REQUIREMENTS

- A. This Section specifies mechanical systems controls applicable to all project controls except for labs with variable air volume (VAV) fume hoods, including combination (vertical/horizontal) sash fume hoods. Controls in rooms with VAV and combination sash hoods shall be in accordance with Section 230910.
- B. The complete control system work shall be split between the Mechanical Systems Controls Contractor (MSCC), the Systems Integrator (SI) and UMH's HITS department as described under section 1.4 "Scope of Work".
- C. The Mechanical Systems Controls Contractor shall provide a fully integrated BACnet Mechanical Control System (MCS) incorporating electric, pneumatic, and direct digital control (DDC) components for the control and monitoring of heating, ventilating and air conditioning (HVAC) equipment and other related systems. Controllers shall natively use the most current ANSI/ASHRAE Standard 135 for communications and shall be BTL certified with BTL published PIC statements.

BuildingName

The Description of the Project

P00000000 0000 Issued for: (FILL IN) BID 230905 - - 2

- D. All controllers to be used as an integral part of the proposed MCS must be contained on the vendor's "Acceptable BACnet Controllers" list (including BTL PIC statements) on file with the UMHHC Facility Planning and Development (FPD) office and included in Table 1 on BMS Network Architecture Detail on the contract documents. All pre-qualified MSCC shall periodically update their product documentation for approved products to reflect the most current product configurations and features. All new or different parts to be used on this project shall either be submitted and approved prior to bid or specifically included as an alternate on the bid form, in accordance with the alternate product requirements contained general conditions of these specifications. UMHHC reserves the right to reject any part not pre-approved which could result in bid disqualification. Any part that is installed that is not on the "Acceptable BACnet Controllers" list will be removed at the contractor's expense and replaced with the pre-approved controller needed to meet the requirements of these project documents.
- E. UMHHC owns and maintains an existing Siemens Desigo CC BACnet Advanced Workstation (B-AWS). This software is installed on application servers- located in the HITS data center. Desigo client workstations are located in University Hospital, Systems Monitoring, Room B2C204. All MSC installations shall be integrated into this front-end thru BACnet IP over UMH HITS's network. Qualified personnel shall be provided to work with the UMH HITS and Systems Integrator personnel as needed to provide a fully functional system.
- F. The project shall provide a fully functional MCS comprised of BACnet Building Controllers (B-BC), advanced application controllers (B-AAC), application specific controllers (B-ASC) and Smart Sensors (B-SS), Smart Actuators (B-SA) and Operators Displays (B-OD). The MSCC shall configure, program and commission all controllers to provide the required functionality as defined in the sequence of operation located on the MCS drawings.
- G. The MSCC will be responsible to configure B-BC's to serve BACnet data to BACnet Clients installed on the HITS network. Each B-BC shall be configured and programmed to expose all BACnet Objects associated with controllers supervised by the B-BC. The MSCC shall configure the B-BC's to utilize a Change of Value subscription with the Desigo client (and other clients that may reside on the HITS network). Change of Value increments shall be set (tuned) to minimize HITS network traffic.
- H. All MCS communication to the Desigo BACnet Client requires the use of BACnet Broadcast Distribution Device configuration (BBMD). UMHHC maintains a BBMD server and will expand the BACnet Distribution Table (BDT) as needed for the project. Submit project requirements as detailed below to facilitate the BDT entries. Coordinate with UMH HITS to determine the proper server level setup for proper communication. The MSCC shall provide proper personnel skilled at BBMD and IT configuration to work with the UMH FPD personnel as needed.
- I. The role of Systems Integrator shall be performed by UMH Systems Monitoring staff, or an integration contractor hired by Systems Monitoring. All contracts for Systems Integration, if needed, shall be at the discretion of UMH Systems Monitoring staff and shall be direct contracts with UMH, external to the construction contract.

1.2 DEFINITIONS

- A. BMS: Building Management System
- B. BTL: BACnet Testing Labs <http://www.bacnetinternational.net/btl/>
- C. B-AAC: BACnet Advanced Application Controller
- D. B-ASC: BACnet Application Specific Controller
- E. B-AWS: BACnet Advanced Workstation
- F. B-OD: BACnet Operators Device
- G. B-BC: BACnet Building Controller
- H. B-SA: BACnet Smart Actuator
- I. B-SS: BACnet Smart Sensor
- J. BBMD: BACnet Broadcast Management Device
- K. BDT: BACnet Distribution Table
- L. DDC: Direct Digital Control
- M. FLN: Field Level Network
- N. FPD: Facilities Planning and Development (Hospital)
- O. HITS: Health Information Technology & Services
- P. HMI: Human Machine Interface Panel
- Q. MSCC: Mechanical Systems Controls Contractor
- R. MCS: Mechanical Control System
- S. SI: Systems Integrator
- T. Systems Monitoring: UMHC department responsible for owning & operating the hospital's Building Management System
- U. TC: Temperature Controls
- V. UMHC: University of Michigan Hospitals and Health Centers

1.3 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Division 26: Electrical
 - 2. 220523 Valves
 - 3. 233600 Air Terminal Units
 - 4. 230910 VAV Fume Hood Laboratory Air Flow Controls

1.4 SCOPE OF WORK

- A. The complete control system work shall be split between the Mechanical Systems Controls Contractor, the Systems Integrator and UMH's HITS department as described below and under section 1.5 "Related Work by Others". As it relates to the extent of responsibility for work within this specification section, "provide" shall mean the identified party both furnishes and installs such item(s). "Furnish" shall mean the identified party furnishes the item for installation by others.
- B. The Mechanical Systems Controls Contractor shall be a direct Sub-contractor to the Contractor.

SPEC WRITER NOTES: EDIT SCOPE OF WORK TO SUIT THE SPECIFIC NEEDS OF THE PROJECT

- C. Summary of work by the Mechanical Systems Controls Contractor shall include, but not be limited to:
 - 1. Providing a native BACnet-based (latest version of ANSI/ASHRAE 135) MCS consisting of programmable and application specific DDC controllers, electronic sensors, pneumatic actuators, electronic to pneumatic transducers, relays, switches, control panels, power supplies, twisted shielded pair (TSP) network cabling and all associated control wiring (excluding Ethernet network wiring) and low voltage conduit systems.
 - 2. Providing control panels for all DDC controllers and an auxiliary control panel for all ancillary control devices (electric and pneumatic relays, EP switches, contactors, etc.)
 - 3. Provide application specific controllers (B-ACS) or advanced application controllers (B-AAC) for terminal units (VAV, Dual Duct, Fan Coil Units etc.) including associated room temperature sensors, room temperature sensors with LED display, room temperature sensors with bias adjustment, and CO2 sensors.
 - 4. Create BACnet object names and tags according to UMHHC's point naming standard outlined at in Section 3 - Execution.

SPEC WRITER NOTES: DRAWINGS SHOULD INDICATE LOCATION AND TYPE OF COMMUNICATION CONNECTION SHOWING NECESSARY CONDUIT TO THAT LOCATION (NEAREST DDC PANEL FOR EXISTING BUILDINGS OR NEAREST HITS CLOSET FOR NEW BUILDINGS).

- 5. Final connection of control panels to the HITS Network from patch panels to the B-BC to permit communication between B-BC's to the existing Building Management System (BMS) server(s) via BACnet/IP. MSCC shall provide and install data connection raceway from panel to facility cable tray. UMHHC HITS department will provide network drops using biscuit jacks inside the control panels to patch panels installed in HITS Telecommunication Rooms. MSCC shall provide and install MS/TP communication trunk for BACnet AAC's, ASC's, SA's and SS's.
- 6. For UM Utility's energy metering, install UM furnished data acquisition panel for utility metering. Provide Ethernet connection of Utility Meters to host computer. MSCC shall provide and install data connection raceway from panel to facility cable tray. Provide wiring from meters and transmitters to utility data acquisition panels. Provide communication wiring to utility data acquisition panels. Terminations inside panels by UM Utilities.

7. Engineering, submittals, as-built drawings, and operation and maintenance manuals.
8. Provide an auxiliary temperature control panel adjacent to each DDC panel. Provide additional auxiliary panels as required to house the required quantity of control components. Small control installations with limited future expansion may be allowed to forego an aux panel and install all devices in a single DDC panel- contact project engineer for approval. Auxiliary panels shall not be smaller than 24"x24", and shall have a 1' high by minimum 2' wide (but not less than panel width) contiguous clear area which can be used for future expansion. Provide all wiring between the DDC panel and the auxiliary panel(s).
9. Provide & install all Human Machine Interfaces (HMI's). Provide all wiring and accessories required to enable HMI to function as specified.
10. Provide and mount all airflow measuring station/ flow meter LCD readout panels on wall adjacent to DDC panels.
11. Provide & install all UPS's and required enclosures. Provide all interconnecting power wiring between the DDC panel power supply and the UPS panel receptacle.
12. Provide a 6"x 6" wiring trough extending over and between each DDC, auxiliary temperature control, and LPI panel. Provide 1" conduit from trough to cable tray, bonded to tray, for HITS network connection (coordinate routing with HITS).
13. Provide and install all DDC panel and device enclosures.
14. Provide pneumatic thermostats (where applicable), control valves, dampers, operators, meters, control air tubing, etc.
15. Provide gauges, indicating devices, electric and electronic control accessories, and other control system devices.
16. Provide setup/ programming, calibration and start-up services of all DDC and non-DDC temperature control systems.
17. Provide site supervision of temperature control work and coordination with related, pneumatic, electrical, fire alarm work and packaged controls.
18. Provide all control wiring and electrical components necessary for each system to permit automatic or interlocked operation, such as: air cooled condensing units, high level alarm circuits, damper end switches, fuel oil pumping/monitoring systems, chiller control/interface panels, boiler control/interface panels, early break contacts on disconnects to VSD's, cooling tower vibration switches, etc.
19. The MSCC shall be responsible for completely removing and decommissioning all existing control devices, wiring, controllers, panels, supports, etc that are being affected by the project's control modifications, including decommissioning any existing DDC control programming on UMH's Siemens, Honeywell, Johnson Controls, or ASI DDC systems that are from points/ devices/ controllers removed or modified under the scope of the MSCC's work. The MSCC's decommissioning work shall include updating the vendor's engineering database, located on UMH central servers, from devices removed under the MSCC's scope of work as well as coordinating removed devices/ points with UMH Systems Monitoring so that the front end can be updated accordingly.
20. Re-establish and validate existing DDC controller communication modified by the scope of work.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **_(FILL_IN)_**BID 230905 - - 6

21. All other work and components required for complete and operational temperature control systems as specified herein, excluding work specified below in "Related Work by Others" section that is to be provided or furnished by the Systems Integrator.
22. Start-up, calibration, and checkout of sensors, transducers, thermostats, control valves, dampers/damper operators, meters, and all other components provided.
23. Commission all mechanical controls provided. Provide a detailed list of every control point installed to the project Commissioning Authority (CxA), and verify proper operation of each component prior to commissioning the controls with the CxA. Include, in checklist format, a detailed procedure to verify all aspects of the controls' Sequence of Operation.
24. Participation in point-to-point verification with Systems Integrator for all control points.
25. Coordination with Systems Integrator, UMHHC's HITS and Systems Monitoring groups.
26. Training of UMHHC personnel to familiarize operations staff with the configuration and operation of this project's MCS installations.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.

27. Provide fume hood monitors except in rooms with VAV hoods, including combination sash fume hoods.

1.5 RELATED WORK BY OTHERS

- A. BMS related work by the Systems Integrator:
 1. BACnet device and object discovery.
 2. BACnet object instantiation (creation of object classes, naming and location meta data)
 3. Generation of Desigo system graphics, alarm summary pages and point/object trend views.
 4. Removal/ decommissioning of all graphics, alarms, trends affected by DDC demolition.
 5. Configure all required alarming and point/object trending at the Desigo CC frontend.
 6. Generation of graphics and configuration of HMI at DDC panels.
 7. Point-to-point verification with MSCC for all control points.
- B. BMS related work by HITS:
 1. Providing IP Layer 3 networking for all peer-to-peer communication of DDC Building Controllers, utility acquisition panels and the front-end. The MSCC shall be responsible for coordinating implementation of the MCS on the HITS network without disruption.
 2. HITS will verify network connectivity and establish a TCP connection between the BMS server and the network drop termination.
 3. HITS will provide all required patch cables. MSCC shall be responsible for connecting all patch cables at respective controllers/ UPS's.

- C. BMS related work by Systems Monitoring:
 - 1. Management of existing and assignment of new:
 - a. IP addresses
 - b. BACnet Device Instance and Network numbers
 - c. BACnet Broadcast Management Device (BBMD) and Broadcast Distribution Table (BDT)
 - d. MS/TP MAC Addresses
 - 2. The SI shall be responsible for any changes from removed points, devices & controllers to UMH's BMS frontend and the engineering database.
- D. BMS related work by UM Utilities
 - 1. Provide utility meter data acquisition panels. Panels installed and wired by MSCC. UM Utilities to terminate all I/O wiring and data connections, as well as start-up, configure and commission the panel.

1.6 ACCEPTABLE MECHANICAL SYSTEMS CONTROLS CONTRACTORS

- A. The following MSCCs are acceptable for the furnishing and installation of pneumatic, electric and DDC components as specified in this section:
 - 1. Siemens Building Technologies
 - 2. Honeywell, Inc.
 - 3. Fontanesi & Kann (ASI Controls)

EDITOR: CONTACT THE UM DESIGN MANAGER TO DETERMINE WHICH OF THE ABOVE CONTROLS INSTALLATION CONTRACTORS ARE TO BE LISTED AS ACCEPTABLE FOR YOUR SPECIFIC PROJECT.

1.7 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Electrical Standards: Provide electrical products that have been tested, listed and labeled by UL and comply with NEMA standards as well as NFPA 70 (National Electric Code).
 - 2. NEMA Compliance: Comply with NEMA standards pertaining to components and devices for electrical control systems.
 - 3. NFPA Compliance: Comply with NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems" where applicable to controls and control sequences.
 - 4. Install all BMS components, panels, and wiring in compliance with NEC and all local electrical codes.
 - 5. DDC devices shall use the latest version of ANSI/ASHRAE Standard 135 "BACnet- Building Automation and Control Networking Protocol" standard for communications and have passed BTL certification as available.

6. UL Compliance: DDC Controllers for this project shall comply with UL916 Standard for Energy Management Equipment. DDC Controllers associated with equipment utilized in a smoke control application shall also comply with UUKL-UL 864 "Standard for Control Units and Accessories for Fire Alarm Systems".
7. National Institute of Standards and Technology (NIST), NIST IR 6392 Annex B: Profiles of Standard BACnet Devices.
8. Electronics Industries Association (EIA)
 - a. EIA-232: Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange
 - b. EIA-485: Standard for Electrical Characteristics of Generator and Receivers for Use in Balanced Digital Multi-Point System

1.8 COORDINATION

- A. Coordinate with UMHC's HITS and Systems Monitoring groups as specified in this section. All correspondence with Systems Monitoring shall be directed to Byron Anderson, byronca@med.umich.edu , (734) 232-0126.
- B. Coordinate with Systems Integrator. All correspondence with Systems Integrator shall be directed to Byron Anderson, byronca@med.umich.edu, (734) 232-0126. See section 3.10 for more details on coordination requirements with the SI.
- C. All correspondence with HITS, Systems Monitoring & SI shall be coordinated thru the owner's project manager.
- D. Ensure installation of components is complementary to installation of similar components in other systems.
- E. Coordinate installation of system components with installation of other mechanical system equipment.
- F. Coordinate control wiring requirements with mechanical equipment manufacturers.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.

- G. Coordinate with laboratory equipment suppliers (constant flow fume hoods, etc.) regarding dimensions and mounting location for alarm monitors and assure proper accommodation is made for the installation of other devices related to laboratory airflow controls.

1.9 SUBMITTALS

- A. Prior to submitting shop drawings to the AE of record, the MSCC shall request BMS address assignments from UMH Systems Monitoring, including:
 1. IP addresses for new devices and the necessary IP addresses of other BACnet IP devices (for the BACnet Broadcast Distribution Table)
 2. BACnet Device Instance and Network numbers

3. BACnet BBMD (when required) and BDT
4. MS/TP MAC addresses

MSCC shall utilize the BMS Addressing Template available through the URL <https://umich.box.com/BMS-Addressing-Template> for all devices needing BMS addressing.

MSCC shall submit initial shop drawings to the Systems Integrator for coordination. MSCC shall also submit the approved submittal package to the Systems Integrator before construction begins so that front-end integration work at the central BMS server(s) may be performed while the Mechanical Controls System is being constructed.

- B. Submit shop drawings to the project AE of record for their review and approval.
- C. No work shall be done until the final submittals are approved by project AE.
- D. Shop drawings shall contain, as a minimum, the following:
 1. UMH BMS Addressing Template pre-filled in with all project specific DDC devices needing BMS addressing assignments.
 2. Schematic diagrams of all systems being controlled and/or monitored indicating all DDC points or BACnet objects, BACnet instance numbers, IP addresses, MS/TP MAC addresses, object names/numbers (using UMHHC standard point naming conventions), sensors, relays, controllers, valves, dampers, complete control wiring schematics (including starter, VSD, DX system, etc. wiring diagrams), pneumatic tubing, DDC panel maps, etc.
 3. Clearly indicate if DDC points are analog inputs (AI), analog outputs (AO), digital inputs (DI) or digital outputs (DO).
 4. Wiring of each point to the DDC panels, including terminal block numbers.
 5. Layout of all auxiliary devices and panels, and wiring of relays, contacts, etc. Include terminal block numbers at all control panels, at all mechanical equipment, and at all control devices.
 6. Complete Sequence of Operation for each system being controlled, including set points, etc. in written (text) format. Identify each piece of equipment that the sequence of operation applies to utilizing the equipment tags from the engineer's equipment schedules.
 7. Schematic diagram of the total DDC system layout, including all panels, trunk cables, peripheral devices, locations, etc.
 8. Pneumatic compressed air supply equipment, risers, and major tubing runs.
 9. Complete bill of materials to identify and quantify all devices and controllers.
 10. Protocol Implementation Conformance Statements (PICS) for all native BACnet controllers and BACnet IP routers.
 11. Location/ identification of BBMD including configuration details.
 12. A schedule of all nameplates and associated wording.
 13. An index of sheets for ease of access.
 14. Wiring diagrams and locations of power supplies.
 15. Additional submittal items required for any room designated as a lab:

- a. Equipment schedule for each room or zone, with the following information:
 - 1) Equipment tag, room served, occupied/unoccupied min., max., and offset CFM; lab subnet description, name, and network address; network and power trunk identifier.
 - 2) Model number of each control component.
 - 3) Function of each terminal airflow unit and control component
- E. Submit, as a minimum, the following design data schedules indicating:
- 1. Airflow Measuring Probes:
 - a. Device tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Size, type, and location.
 - e. Station area in square feet.
 - f. Max/Min Range.
 - g. Magnehelic scale range.
 - h. Velocity pressure range.
 - 2. Air and water pressure sensors:
 - a. Device tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Size, type, and location.
 - e. Max/Min Range.
 - 3. Control Dampers:
 - a. Damper tag.
 - b. Equipment served/function.
 - c. Model number.
 - d. Blade configuration and orientation.
 - e. Size in width, height, and blade width.
 - f. Pressure drop.
 - g. Type of seals (blade and edge).
 - h. Normal position.
 - i. Size, quantity, type, and model number of actuators.
 - j. Method of actuator mounting and actuation.
 - 4. Control Valves:
 - a. Valve tag.
 - b. Equipment served/function.
 - c. Valve flow rate (GPM).
 - d. Line size.
 - e. Specified valve pressure drop (ft. head).
 - f. Valve size.
 - g. Valve Cv.
 - h. Actual valve pressure drop (ft. head).
 - i. Valve normal position.
 - j. Valve spring range.
 - k. Valve shut-off rating (ft. head).
 - l. Valve body pressure/temperature rating.
 - m. Valve type/model number.
 - n. Actuator type/model number.
 - 5. DDC Controllers:
 - a. Device tag.
 - b. Equipment served/function.
 - c. Model number and application code.

- d. Associated sensor location/tag.
- e. Size, control values, etc.

F. Submittal Requirements

- 1. Shop drawings shall be 8-1/2" x 11" and 11" x 17" size.
- 2. All schematics and drawings shall be done on CAD. The electronic files shall be in the latest version of AutoCAD (or as noted otherwise)
- 3. Product data shall include description and complete engineering data for each control system component. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. valves, dampers, relay & switches, thermostats, temperature transmitters, pressure transmitters, air flow stations, controllers, etc.).
- 4. Since many items are interrelated and should be checked concurrently, all of the MSCC's DDC related shop drawings shall be submitted at one time. No consideration will be given to partial submittals, except valve and damper submittals on approval only. Any partial submittals must be included in the complete submittal package.

G. Project Record Documents

- 1. Submit Project Record Documents to Systems Monitoring at the time of substantial completion.
- 2. Revise shop drawings to reflect actual installation and operating sequences and provide final electronic files in PDF.
- 3. PDFs shall contain the following files in the indicated format:
 - a. As-built drawings in PDF format (separate file for each system's related drawings/sheets).
 - b. Sequences of operation in PDF. Provide separate files for each system's sequence of operation.
 - c. Product data and catalog specification sheets in PDF format (separate file for each product).
- 4. List of all BACnet IP and MSTP devices installed with their network IP addresses, BACnet Device Instance numbers and associated BACnet network numbers. MSCC shall be responsible for uploading the completed, as-built BMS Addressing Template required under section 1.9.A upon project substantial completion.
- 5. All files shall be dated and shall contain the UMHHC project RTN number and UM AEC P100 number when applicable.

H. Operation and Maintenance Manuals

- 1. The MSCC shall provide the specified number of copies of complete operation and maintenance instructions for all system components furnished.
- 2. Include hard-copies of all Project Record Documents described above in paragraph G.
- 3. Indicate final set points, settings, and adjustments of all components.
- 4. Include project specific catalog cuts and data sheets indicating installation, operation, maintenance, repair, wiring diagrams, calibration, calibration tolerances, inspection period, cleaning methods and cleaning materials for all components.

I. Posted Operating Instructions

1. Provide panel related as-built documents in protective binder or clear plastic display envelope for each control panel. These instructions shall include such items as as-built control diagrams and sequences of operation, simplified narrative instructions and materials necessary to aid in the operation of the equipment at the local control panels.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.11 WARRANTY

- A. The Building Management System shall be guaranteed for a period of one year after final approval has been granted by the Owner and the project Architect/Engineer. The warranty shall be provided for a completely installed system, including all components, parts and assemblies. The warranty shall cover parts, materials and labor to correct any defects in materials and workmanship.
- B. The MSCC shall initiate the warranty period by formally transmitting to the Owner commencement notification of the period for the system and devices accepted.
- C. Provide 24 hour per day emergency service during warranty period, with maximum next-day response. Provide phone number(s) for quick assistance by a Service Engineer regarding hardware or software problems.
- D. Provide any software or firmware revisions which are released by the DDC system manufacturer during the warranty period, at no additional cost to the Owner. Revisions that require updates at the central BMS server(s) will be coordinated with the SI at no additional cost to the Owner.
- E. The MSCC shall provide programming modifications necessary to fine tune equipment sequences during the warranty period, consistent with achieving the sequence of operation and design intent, at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCT MANUFACTURERS

- A. All pneumatic devices, valves, damper operators, EP relays, PE switches, low temperature detection thermostats, etc. shall be as manufactured by Honeywell, Johnson Controls or Siemens, unless noted otherwise in following sections. See "Products" for acceptable manufacturers for sensors, etc.

EDITOR: CONTACT THE UMHC FPD DESIGN MANAGER TO DETERMINE WHICH OF THE FOLLOWING DDC SYSTEM MANUFACTURERS ARE TO BE LISTED AS ACCEPTABLE FOR THE PROJECT.

- B. DDC controllers and related software shall be in accordance with the pre-approved parts list as manufactured by the respective MSCC listed under Part 1- ACCEPTABLE MECHANICAL SYSTEMS CONTROLS CONTRACTORS.

2.2 GENERAL DDC CONTROL ARCHITECTURE

- A. BACnet Building Controllers (B-BC) and IP capable Advanced Application Controller (B-AAC) shall provide IP routing capabilities to allow communication over UMH HITS's network (layer 3 IP) and between controllers. A secondary field level network (FLN) shall allow data to be exchanged between B-BC's and Advanced Application Controllers (B-AAC) and Application Specific Controllers (B-ASC) via BACnet MS/TP communication. BACnet objects shall be routed from the new MCS installation to the existing central BMS server(s) that reside on the HITS network. The SI will utilize these BACnet objects to generate system graphics at the existing BMS server(s).
- B. The complete Mechanical Control System (MCS) shall consist of the following:
 - 1. Data integration to UMHC's existing BACnet AWS servers and operator work stations.
 - 2. Peer-to-peer B-BC's communicating with other B-BC's and B-AAC (where IP capable) and UMHC's existing BACnet AWS over the HITS layer 3 IP network.
 - 3. Peer-to-peer B-AAC, B-ASC, B-SS, B-SA and B-OD's communicating with each other over a MS/TP FLN provided by the MSCC.
 - 4. Sensors, transducers, thermostats, actuators, wiring, etc. directly wired to their respective DDC controller for a complete and operational MCS.
- C. BACnet Broadcast Management shall be facilitated by one B-BC per IP Subnet and incorporate a BACnet Distribution Table, provided by System's Monitoring. B-BC's that handle BBMD's and I/O functionality shall be properly sized to handle memory & processing requirements.
- D. Terminal units (VAV, FCU, etc) that do not need the global command functionality that a B-BC could provide are allowed to be integrated to the Desigo B-AWS via the use of a BACnet IP Router. Router shall convert BACnet MS/TP to BACnet IP and function as a BBMD.
- E. The system shall be modular in nature and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, Building Controllers, Advanced Application Specific Controllers, Application Specific Controllers, expansion modules and operator devices.
- F. System architectural design shall eliminate dependence upon any single device for control execution. Each DDC controller shall operate independently by performing its own specified control, operator I/O and data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices. Data collection that requires a single mechanism for user notification or viewing is strictly prohibited.

- G. All controllers within a building shall be able to access any data from, or send control commands directly to, any other DDC controller or combination of controllers in the same building without dependence upon a central processing device (peer-to-peer).
- H. UMH's HITS Layer 3 Network is the preferred primary network communication means and will be required for communication between all Building Controllers (B-BC), IP capable B-AAC's and the BMS B-AWS, via BACnet IP. The use of MS/TP communications for interconnecting the said IP capable devices is strictly prohibited. HITS shall provide and install the primary network, based on coordination with the MSCC.
- I. The secondary FLN shall utilize the Master-Slave/Token-Passing (MS/TP) protocol, as acknowledged by the ANSI/ASHRAE 135 standard. This secondary network shall be provided and installed by the MSCC. Proprietary RS-485 or equivalent links will not be considered unless otherwise noted. The MS/TP link shall operate at a 38.4 Kbps minimum, and utilize no more than 2 repeaters in any instance. Multi-channel repeaters will not be permitted.
- J. All BACnet IP routers connected to the HITS network, whether integral to a controller or not, must support BACnet Broadcast Management Device (BBMD) service. Multi-casting or global broadcasting will not be permitted without the use of a BBMD.
- K. FLN data communications media shall be provided by a shielded twisted pair conductor.
- L. The FLN shall allow shared point and control information between BACnet DDC controllers. All required MS/TP repeaters, hubs, active links, gateways, etc. and associated power supplies shall be provided as required to provide shared point and control information between DDC controllers. Ethernet IP network devices and path shall be provided by UMH's HITS.
- M. Failure of any individual FLN installed BACnet controllers shall not cause the loss of communications between peer controllers.
- N. All data transmitted must be positively acknowledged as received or negatively acknowledged as not received. Negative acknowledgments shall cause a retransmission of the data. Network connected devices must send a "Heartbeat" message at a configurable time interval. Lack of a "Heartbeat" message after successive retries shall constitute a device failure and shall be recognized as such by the network and be reported as a network alarm at the BMS B-AWS.
- O. Error recovery and communication initialization routines shall be resident in each network connected device.
- P. UL864 controllers and devices installed for equipment utilized in a smoke control sequence shall not be on the same MS/TP network segment as non-UL864 controllers and devices. These devices shall be on their own MS/TP network segment.

Q. The MSCC shall provide an IP connected DDC controller in the same room as the equipment it serves, unless the contract documents explicitly direct otherwise. Designs that situate controllers in different rooms or on other floors than the equipment being served (ie remote I/O) shall not be allowed without special permission by FPD Engineer. IP connectivity to every DDC controller is preferred, however in an instance where multiple pieces of equipment are within a common room, a MS/TP bus of up to 5 MS/TP controllers shall be allowed.

1. Exceptions to this are the use of MS/TP connected DDC controllers for equipment that functions as a system, ie chiller plants utilizing chillers and cooling towers shall utilize an IP connected controller in the chiller plant and a MSTP subnetwork to a secondary controller serving the cooling towers on the roof. MS/TP controllers are preferred to remote I/O modules for these types of applications. Use of remote I/O shall not be allowed without special permission by FPD engineer.

SPEC WRITER NOTES: INCLUDE THE FOLLOWING PARAGRAPH "R" FOR ALL INPATIENT I-2 FACILITIES AND ANY OTHER CRITICAL FACILITIES (IE DATA CENTERS, ETC). OTHERWISE DELETE PARAGRAPH "R" BELOW.

R. In general, the MSCC shall provide a fault tolerant BMS architecture such that the loss of a single DDC controller does not inhibit the continued, automatic operation of that utility service (ie chilled water, heating hot water, airflow, etc). BMS architecture does not need to be fully redundant, but rather be capable of continuing to provide a partial capacity of the utility being produced. For example, do not control the entire facility chilled water plant (multiple chillers, pumps and towers) off a single DDC controller. Provide multiple (minimum of two) DDC controllers for all critical, major mechanical systems, including but not limited to:

1. Minimum of two (2) DDC controllers per chilled water plant (chillers, pumps, cooling towers, etc).
2. Minimum of two (2) DDC controllers per heating hot water plant (boilers, heat exchangers, pumps, etc).
3. A maximum of two (2) air handling units (AHU) on a single DDC controller. AHU's sharing a DDC controller shall not be designed as backup for one another, i.e. thru a header system or common SA or RA ductwork.
4. Air handling units (AHU) serving operating rooms (OR's) are required to utilize a dedicated DDC controller per AHU.

2.3 GENERAL DDC CONTROLLER REQUIREMENTS

A. Stand-alone microprocessor board with ROM and fully custom programmable RAM, EPROM, and/or EEPROM memory, integral interface equipment and power surge protection. DDC controllers shall be connected directly to sensors, controlled devices and the communication network.

- B. All DDC controllers shall use the latest version of ANSI/ASHRAE Standard 135 BACnet standard for communications, have passed BTL certification as available and be listed as compliant with UL916 Standard for Energy Management Equipment. DDC controllers used in smoke control applications must also be listed as compliant with UL864 Standard for Control Units and Accessories for Fire Alarm Systems.
- C. Controllers shall be listed by BACnet Testing Laboratories (BTL) as conforming to the required standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
- D. The "Present_Value" property of all analog output and binary output objects shall be writable so that Systems Monitoring personnel have the capability to override all system outputs from the central BMS server(s).
- E. Each DDC controller shall support firmware upgrades without the need to change hardware.
- F. Each DDC controller shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The DDC controller shall provide both local and remote annunciation of any detected component failures, low battery conditions or repeated failure to establish communication for any system.
- G. DDC controller types shall be one of three types, a BACnet Building Controller (B-BC), a BACnet Advanced Application Specific Controller (B-AAC) or a BACnet Application Specific Controllers (B-ASC).
 - 1. Building Controllers (B-BC) shall be used for all major mechanical equipment and/or systems (i.e. chilled water, heating hot water, large AHU's, etc.).
 - 2. Advanced Application Specific Controllers (B-AAC) shall be used, as an extension of a B-BC's performance & capacity, for control of all medium and small mechanical systems and/or terminal equipment.
 - 3. Application Specific Controllers (B-ASC) shall only be allowed to be used on terminal equipment including VAV boxes, FCU's, etc.
- H. See Table 1 under section 3.13 at the end of this specification, which compares integration functionality of the Desigo B-AWS to the various MSCC BACnet controllers. MSCC shall be responsible for ensuring minimum BIBB performance per Table 1.

SPECIFICATION EDITOR: UMH REQUIRES ALL BACNET BUILDING CONTROLLERS (B-BC) TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL B-BC LOCATIONS TO FACILITATE BACNET IP INTEGRATION TO FRONT END.

- I. BACnet Building Controller (B-BC):
 - 1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Building Controller (B-BC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.

2. Controllers shall support Internet Protocol (IP) for communications to other BC's and the BMS front-end and MS/TP communication to B-AAC's and B-ASC's.
3. Controllers shall have a 32 bit processor with an EEPROM, flash driven operating system. They shall be multi-tasking, multi-user, real-time digital control processors and permit I/O expansion for control / monitoring of up to 48 I/O. Controller size shall be sufficient to fully meet the requirements of this specification. Controllers shall be fully programmable while supporting standard energy management functions, including but not limited to:
 - a. Alarm detection and reporting
 - b. Automatic Daylight Saving Time switchover
 - c. Calendar-based scheduling
 - d. Closed loop PID control
 - e. Duty cycling
 - f. Economizer control
 - g. Equipment scheduling, optimization and sequencing
 - h. Event scheduling
 - i. Historical trend collection
 - j. Holiday scheduling
 - k. Logical programming
 - l. Reset schedules
 - m. Night setback control
 - n. Peak Demand Limiting (PDL)
 - o. Start-Stop Time Optimization (SSTO)
 - p. Temperature-compensated duty cycling
 - q. Temporary schedule override
4. Provide controller with integral power switch. If an integral switch is not provided by the manufacturer, the MSCC shall provide a separate dedicated transformer and switch within each enclosure for each controller present.
5. The operator shall have the ability to manually override automatic or centrally executed commands at the Building Controller via local, point discrete, hand/off/auto operator override switches for digital control type points and gradual switches for analog control type points. These override switches shall be operable whether the panel processor is operational or not.
6. Controllers shall provide local LED status indication for power, communications, status and each digital output for constant, up-to-date verification of all point conditions without the need for an operator I/O device.
7. All points associated with a given mechanical system (i.e., an air handling unit) will be controlled from a single Building Controller or point expansion panel(s) from the respective master. All expansion modules shall be located in the building controller enclosure or an attached enclosure. No points from a given mechanical system may be distributed among multiple panels - points must be run back to a single Building Controller dedicated to that mechanical system. Multiple mechanical systems shall be allowed on a single controller Closed-loop control must never depend upon network communications. All inputs, program sequences, and outputs for any single DDC control loop shall reside in the same Building Controller.
8. A variety of historical data collection utilities shall be provided for manual or automatic sampling, storing and displaying system point data.

- a. Building Controllers shall store point history data for selected analog and digital inputs and outputs:
 - 9. Building Controllers shall also provide high resolution sampling capability for verification of control loop performance. Operator-initiated automatic and manual loop tuning algorithms shall be provided for operator-selected PID control. Provide capability to view or print trend and tuning reports.
 - 1) Loop tuning shall be capable of being initiated either locally at the Building Controller or from a network workstation. For all loop tuning functions, access shall be limited to authorized personnel through password protection.
 - 10. Provide controllers that, upon full system power recovery, all clocks shall be automatically synchronized, and all controlled equipment shall be automatically re-started based on correct clock time and sequence of operation.
 - 11. Provide additional controllers or I/O modules if necessary in each DDC panel so that each panel has at least 20% spare universal I/O capacity for connection of future points. Provide all processors, power supplies, and communication controllers so that the implementation of adding a point to the spare point location only requires the addition of the appropriate expansion modules, sensors/actuators and/or field wiring/tubing.
 - 12. Controllers shall provide at least one data communication port for operation of operator I/O devices such as portable laptop operator's terminals. Controllers shall allow temporary use of portable devices without interrupting the normal operation of permanently connected printers or terminals. A USB port shall alternatively be available to support local HMI tools connection.
 - 13. Field bus adaptors may be used, as an extension of the B-BC, to facilitate communication between the B-BC and remote field devices (sensors, actuators). Adaptors shall be microprocessor based and utilize advanced diagnostics and configuration. Adaptor shall be housed in panel or junction box enclosure.
- J. BACnet Advanced Application Specific Controller (B-AAC):
- 1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Advanced Application Specific Controller (B-AAC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
 - 2. Controllers shall support MS/TP communication to B-BC's and other B-AAC's and B-ASC's. Also acceptable are B-AAC controllers that support Internet Protocol (IP) for communications to other BC's/ AAC's and the BMS front-end and MS/TP communication to B-AAC's/ ASC's.
 - 3. Controller shall be a microprocessor-based, 32 bit, multi-tasking, real-time digital control processor capable of stand-alone operation for medium sized mechanical systems and/ or control of roof-top units, VAV terminal units, CAV terminal units, dual-duct terminal units, fan-coil units, heat pump units.
 - a. If the hardware point requirements of any medium-sized system should exceed the I/O configuration of available B-AAC offerings then a B-BC must be used. Control of one piece of mechanical equipment may not be performed by more than one controller.

4. Controllers shall be peer-to-peer devices with hand/off/auto switches for each digital output. Switch position shall be supervised in order to inform the system that automatic control has been overridden. Switches will only be required for non-terminal applications (not required for VAVs, CAV's and other above terminal devices). All inputs and outputs shall be of the universal type, allowing for additional system flexibility
5. Each controller shall support its own real-time operating system. Controllers without real-time clock functionality will only be permitted for use on terminal or unitary equipment such as VAV boxes, fan coil units and auxiliary monitoring and control.
6. Provide each controller with sufficient memory to accommodate point databases and operating programs. All databases and programs shall be stored in non-volatile EEPROM. The controllers shall be able to return to full normal operation without user intervention after a power failure of unlimited duration.
7. Controllers must be fully programmable. All programs shall be field-customized to meet the user's exact control strategy requirements. Controllers utilizing pre-packaged or canned programs shall not be acceptable.
8. All points used for a single mechanical system shall be connected to the same B-AAC. Points used for control loop reset based on outside air, or space/zone temperature, or extremely remote differential pressure sensors on slow acting control loops are exempt from this requirement.
9. Provide spare additional I/O such that future use of spare capacity shall require providing only the field device, field wiring, point database definition and operational sequence programming changes as required. Additional point modules may be required to implement use of these spare points.
 - a. Provide at least one (1) spare universal input and one (1) spare universal output or 15% spare I/O of the total capacity of each B-AAC whichever is greater.
 - b. If B-AAC I/O is not universal then provide at least one (1) spare analog input, one (1) spare digital input, one (1) spare analog output and one (1) spare digital output or 15% spare I/O of the total capacity for each point type of each B-AAC whichever is greater.

K. BACnet Application Specific Controller (B-ASC):

1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Application Specific Controller (B-ASC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
2. Controllers shall support MS/TP communication to B-BC's, B-AAC's and other B-ASC's.
3. Controller shall be a microprocessor-based, 32 bit, multi-tasking, real-time digital control processor capable of stand-alone operation for control of mechanical terminal units, ie VAV terminal units, CAV terminal units, air terminal units, dual-duct terminal units, fan-coil units, heat pump units and rooftop units.
4. Each controller shall be capable of sharing point information with other B-BC, B-AAC, or B-ASC on a peer-to-peer basis via the BACnet network.

5. Controllers shall include all point inputs and outputs necessary to perform the specified control sequences. All inputs and outputs shall be of the universal type (outputs may be utilized either as modulating or two-state). Analog outputs shall be industry standard signals such as 24V floating control and 0-10VDC allowing for interface to a variety of modulating actuators.
 6. Provide each controller with sufficient memory to accommodate point databases and operating and application programs. All databases and programs shall be stored in non-volatile EEPROM. The controllers shall be able to return to full normal operation without user intervention after a power failure of unlimited duration.
 7. Each controller shall perform its primary control function independent of other DDC controller communications, or if communication is interrupted. Reversion to a fail-safe mode of operation during network interruption is not acceptable. Controller shall receive its real-time data from the Building Controller time clock to insure network continuity.
 8. Each controller shall include algorithms incorporating proportional, integral and derivative (PID) values for all applications. All PID values and biases shall be field-adjustable by the user via operator terminals. Controllers that incorporate proportional and integral (PI) control algorithms only, without derivative (D) control algorithms, shall not be acceptable.
 9. Controllers shall provide diagnostic LEDs for power, communications and processor status. The controller shall continually check the status of its processor and memory circuits
 10. All points used for a single mechanical terminal unit shall be connected to a dedicated B-ASC. Points used for control loop reset based on outside air, or space/zone temperature, or extremely remote differential pressure sensors on slow acting control loops are exempt from this requirement.
 11. Controllers shall perform and manage historical data collection. Minimum sampling time shall be configurable with a minimum sample rate of once per second. Controller shall store point history files for all analog & binary I/O's.
- L. Controllers used for air terminal units (VAV's, CAV's, dual-duct mixing boxes):
1. Provide electronic damper operators compatible with the controller and the air terminal units provided. Actuator shall utilize a brushless DC operator, min 35 in-lbs of torque, floating control (unless noted otherwise).
 2. Controllers shall have an internal differential pressure transducer(s) capable of utilizing the total and static pressure signals from the air terminal unit's velocity sensor. Transducer shall be capable of 5% accuracy throughout its range of 0-1"wc. Associated velocity sensor shall be furnished by air terminal unit manufacturer.
 3. Each controller shall have electronic outputs compatible with the electronically operated air terminal unit tempering coil control valve and perimeter radiation control valve where applicable.
 4. Provide a discharge air sensor, mounted on the discharge of the terminal box reheat coil and/ or the outlet of dual duct mixing boxes, interfaced with the controller.

5. DDC terminal controllers used in the following critical pressurized rooms shall not be permitted to modulate the terminal unit damper as part of a regular calibration cycle:
 - a. Operating Rooms/ Procedure Rooms/ Delivery Rooms (UMH Infection Control Room Type 1 and 2)
 - b. Cardiac Cath/ Angiography/ Interventional Radiology Rooms (UMH Infection Control Room Type 3)
 - c. Airborne Infection Isolation Room
 - d. Protective Environment Rooms
 - e. Pharmacies
 - f. Labs
 - g. Central Sterile Processing/ Instrument Processing
 - h. Autopsy Rooms

MSCC shall provide alternate controllers, proportional actuators and/or auxiliary devices (ie an 'auto-zero' auxiliary device(s) which functions to temporarily disengaging the transducer from the air velocity sensor so that a 0 cfm air volume reading is forced without changing the damper position) when serving these spaces to prevent negatively affecting room pressurization.

6. If coordinated with mechanical contractor, controllers shall be furnished to the unit manufacturer for factory mounting; otherwise, controls shall be field installed.
7. MSCC shall provide controllers with metal enclosure, complete with conduit knockouts.

M. Provide wall-mounted space sensors for each controller performing space temperature control. Sensor shall be thermistor, 55°F-85°F range, +/-0.18°F resolution and capable of being field calibrated. Provide sensor with auxiliary communications port to allow remote connection to VAV controller(s) with a laptop computer, to facilitate configuration and commissioning of controllers.

1. Space Sensors in private spaces (i.e. office, exam, patient room, etc.):
 - a. Provide with digital LCD temperature display
 - b. High accuracy set point adjustment
 - c. Flush mounted override button (only on systems where this function exists)
2. Space Sensors in public areas (i.e. corridors, waiting rooms, dining areas, etc.):
 - a. Provide without digital LCD temperature display, no adjustment or override button.
3. Space Sensors where occupant safety is a concern (i.e. psych. patient areas):
 - a. Install wall-mounted, blank-faced, stainless-steel temperature sensors with tamper-proof screws.
4. Space Sensors in areas subject to abuse (i.e. utility corridors, central sterile, OR's/ Procedure Rooms, etc.):
 - a. Provide appropriate sensor per above with 2-piece crash guard, consisting of heavy gauge, bent stainless sheet steel securely anchored to wall on either side of sensor, consistent with guards used thru ought medical campus.
5. Zone Sensors shall not be located on perimeter walls. Where explicitly indicated on drawings to do so and/or in locations near exterior walls and/or subject to drafts, sensors shall have insulated mounting bases to prevent false room temperature readings.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 22

N. BACnet IP Routers:

1. BACnet router between MS/TP and B/IP (BACnet over IP) as well as a BBMD (BACnet Broadcast Management Device) for transportation of BACnet broadcasts over an IP network with several sub-nets.
2. Router shall comply with latest version of ASHRAE Standard 135 for communications.
3. Routers shall be UL864 listed when connected to BACnet MS/TP network segments that contain UL864 listed devices being used in a smoke control application.
4. Device shall be capable of routing BACnet packets over layer 3 IP network and shall support both the router and BACnet Broadcast Management Device (BBMD) networking options. BBMD shall support registrations by Foreign Devices.
5. 24 VAC power supply required for router(s) shall be provided by the MSCC. Supply from UPS source at DDC controller panel.
6. Device shall be password protected with customizable password and security settings.
7. Acceptable Manufacturers: Loytec, Cimetrics.

SPECIFICATION EDITOR: SYSTEMS (AHU'S CHILLER, ETC) THAT ARE FED FROM EMERGENCY POWER SOURCES SHALL HAVE THEIR ASSOCIATED DDC CONTROLLERS AND DDC DEVICES FED FROM THE SAME EMERGENCY POWER SOURCE. A/E TO INDICATE PROPER CIRCUITS ON DOCUMENTS.

O. Controller Power Supplies:

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE SOURCE OF POWER FOR ALL DDC CONTROLS. POWER SOURCE (NORMAL VS EMERGENCY) & PRIORITY SHALL MEET OR EXCEED THAT OF THE EQUIPMENT BEING CONTROLLED.

1. Power to controllers and associated controlled devices shall be 24 VAC, provided by the MSCC. Power source (i.e. normal vs. emergency power & emergency power priority) shall match that of the equipment and/ or system being controlled.
2. See UNINTERRUPTABLE POWER SUPPLIES (UPS) INSTALLATIONS under section 3 of this specification for UPS applications.
3. Provide each DDC panel with a line filter, surge suppressor, electrical disconnect, control fuse, and control transformer. All sized and provided by the MSCC.
4. Provide fully enclosed power supplies located inside control enclosures with external 24 Vac terminals, on/off control, equipment overcurrent protection, power indication, high/low voltage separation, and convenience 120VAC outlets.
5. Provide insulated, modular, feed-through, clamp-style terminal blocks suitable for rail-mounting with end plates and partitions for the termination of all field wiring in control enclosures. Field wiring to equipment with integral terminals and/or unitary equipment (i.e., VAV's, EF's, etc.) shall not be required to have terminal blocks.
6. Provide a minimum of 72 battery backup hours for complete system RAM memory and clock, with automatic battery charger. The backup power source shall have sufficient capacity to maintain volatile memory in event of an AC power failure.

SPECIFICATION EDITOR: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE LABORATORIES. UMH REQUIRES ALL LAB CONTROLS TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL LAB INTEGRATION LOCATIONS.

2.4 LABORATORY CONTROLS

- A. Provide laboratory controls for any space designated as a laboratory and where indicated, except for rooms with VAV fume hoods and hoods with combination sashes. System shall include: temperature, pressure, and other sensors/transmitters; control valves; control, network, and power wiring; power supplies; routers, servers, and all other devices required for a complete system.
1. The system shall utilize conventional terminal air flow units for supply and general room exhaust and venturi style terminal air flow units for constant volume fume hoods and any other constant volume exhaust point. Refer to related section 233600.
 2. Provide programming of all laboratory controls.
 3. The system shall function to achieve the sequences of operation detailed on the drawings.
 4. Each room or zone shall have a dedicated control system. Systems shall be independent and stand-alone from the Owner's BMS. Failures of the BMS system or network communications between the BMS and the system (cut communication cables, router or server failures, etc.) shall have no impact on individual laboratory control.
 5. The system shall perform the following control functions:
 - a. Pressurization Control: Control supply and auxiliary/general exhaust at a volumetric offset to maintain lab pressurization (positive, negative, or neutral). Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms. Pressurization control shall consider networked devices, non-networked devices, and any number of constant volume devices.
 - b. Lab Temperature Control: Regulate lab space temperature through a combination of supply air volumetric control and control of reheat coils and other auxiliary temperature control devices, in response to temperature sensor(s).
 - c. Occupancy Control: Reset minimum volume settings and/or temperature control set points, based upon external signals from occupancy detectors, local over-ride buttons, and similar devices.
 - d. Constant volume fume hoods and other constant volume exhaust points (excluding general room exhaust): The self-actuated Constant Volume Venturi (CVV) Terminal Airflow Unit shall maintain a constant airflow set point.
 - e. Fume Hood Monitoring: Alarm unsafe condition at each fume hood.
 - f. Other control functions as indicated on the drawings.
 - g. Interface with the Owner's BMS thru BACnet IP.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- C. Provide power supplies for lab airflow controls in NEMA 1 metal enclosures, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 - 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 - 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 - 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
- D. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT. CONSIDER IF OTHER LABORATORY EQUIPMENT WOULD BENEFIT FROM BEING EQUIPPED WITH A FUME HOOD MONITOR AND INDICATE THAT EQUIPMENT ACCORDINGLY. EXAMPLES: EXISTING FUME HOODS, BIO-SAFETY CABINETS.

- E. Provide fume hood monitors for constant volume fume hoods and for other laboratory equipment where indicated.
 - 1. Monitor shall include audible alarm, visual LED alarm, and a common (single) alarm silence button.
 - 2. The fume hood monitor shall provide an alarm indication for the following conditions:
 - a. Low fume hood face velocity as detected by:
 - 1) Insufficient differential static pressure as detected by the TAU- CVV pressure switch (Phoenix CVV Terminal Air Flow Units).
 - 2) Insufficient air volume, as detected by the air flow station (Siemens CVV Terminal Air Flow Units).
 - 3) Sash raised above sash stop position.

- b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
- 3. Sash position shall be sensed by using a vertical sash position sensor. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. Resolution shall be +/- 1/2 inch or better. A stainless steel, burr and snag-free cable shall be attached to the spring reel. Expected lifetime based on manufacturer's tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in a location on the fume hood easily accessible for service.
- 4. Fume hood monitor shall be suitable for surface mounting on the front of the fume hood.
- 5. Approved fume hood monitors:
 - a. Phoenix FHM530 Controller (Provide for Phoenix CVV Terminal Air Flow Units)
 - b. Siemens (Provide for Siemens CVV Terminal Air Flow Units)

2.5 UNINTERRUPTABLE POWER SUPPLIES (UPS)

SPECIFICATION EDITOR: UMH REQUIRES ALL UPS'S TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL UPS LOCATIONS AND NETWORK COMM CARD INTEGRAL TO ALL UPS'S (SEE BELOW SPEC) TO FACILITATE SNMP INTEGRATION TO FRONT END.

- A. Provide local tower, dual conversion UPS for DDC Controllers and associated controlled devices. UPS shall meet the following minimum requirements:
 - 1. UPS shall be sized for continuous full load use of all components served plus an additional 25% for a period of at least 5 minutes. Minimum size shall be 300 VA/ 120V.
 - 2. UPS features:
 - a. Audible alarm when main power is not available
 - b. Automatic internal bypass to automatically maintain power to the load upon failure of the batteries.
 - c. Provide with a network communication card for remote monitoring by Web/SNMP thru UMH's layer 3 network.
 - d. RF noise filtering.
 - e. Over-voltage protection.
 - f. Four outlet receptacles minimum.
 - g. Visual status alert light.
 - h. Sealed maintenance-free batteries.
 - i. Batteries shall be replaceable while maintaining power to the load (hot-swappable)

3. UPS installations within electrical & telecommunication rooms free from dirt/ dust & damage shall mount the UPS exposed, with brackets securely anchoring the UPS to the wall. Installations elsewhere (i.e. mechanical rooms) shall mount the UPS in a dedicated, ventilated panel enclosure. Provide panel with filtered supply fan (Dayton 2RTE8, 120V, 3"dia, 40 CFM) powered from UPS with filter guard assembly (Dayton 4YD95) and 3" dia. aluminum screened outlet opening (Dayton 4YD77). The supply fan shall be mounted to blow through the filter into the panel so the panel is pressurized with filtered air.
4. Provide with and install UPS interface power control module, Functional Devices PSM2RB10. Do not cut plug head off UPS cords.
5. Integrate UPS into the MCS via dedicated HITS network connection.
6. Approved Manufacturers:
 - a. Eaton 9SX with Network Communication Card
 - b. APC SMART UPS SRT with Network Management Card

2.6 ELECTRONIC SENSORS, INDICATORS, TRANSDUCERS AND COMPONENTS

A. Temperature and Humidity Sensors:

1. Temperature sensor assemblies used with Loop Power Indicators (LPI's) shall consist of a Resistive Temperature Device (RTD's) with a 4-20 mA 2-wire transmitter and gasketed utility box enclosure. All other temperature sensor assemblies shall match the requirements of the associated temperature controller and shall be based upon 10k or 20k thermistors. Sensors using 4-20 mA transmitters are preferred and specified herein, however sensors utilizing voltage signal transmitters (i.e. 0-5 VDC) are allowed if required by controller input requirements and sensor accuracy is not affected by sensor cable length. Sensing element shall be platinum with 100 ohms resistance at 32°F. Accuracy shall be +/- 1/2°F over the entire range.
 - a. Single point duct temperature sensor shall be rigid bulb type with stainless steel (SS) sheath, aluminum tip, and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - b. Averaging element duct mounted temperature sensor shall have a minimum 25 ft. long continuous element sensor along the entire length, and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - c. Rigid averaging element duct mounted temperature sensor shall have a brass case, bendable sheath, continuous element sensor along the entire length, and have a calibrated span of 20-120 deg.
 - d. Outside air sensor shall be designed to mount on a conduit, include an elbow type enclosure, sun shield, and have a calibrated span of -58-122 deg.
 - e. Liquid immersion temperature sensors shall have 5 1/2" long probe with SS well, and weather tight enclosure. Transmitters for chilled water shall have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 27

- f. Surface mount thermal-ribbon flexible sensor for pipe mounting shall have SS braid over lead wires, use pressure sensitive adhesive, must be properly insulated, and have a calibrated span of 30-250 deg. F.
 - g. Room temperature sensors (non-VAV) shall have a span of 20-120 deg. F, locking covers and when pneumatic, shall match the pneumatic thermostats used.
 - h. Adjustable room temperature sensors (non-VAV) shall have a digital temperature display, high accuracy set point slide, flush mounted override button, and a temperature range of 55-85 deg. F.
 - i. Approved Manufacturers:
 - 1) TCS
 - 2) Siemens
 - 3) Honeywell
 - 4) Johnson Controls
 - 5) Minco
 - 6) ASI
 - 7) ACI (Automation Components Inc)
2. Outside Air Master Temperature and Humidity Sensors - Dual System:
- a. Single point outside air temperature RTD shall be 1000-ohm thin film platinum resistor sensor with 4-20 mA 2-wire output transmitter with solar shield.
 - b. Outside air humidity sensor shall be thin film alumina substrate capacitance signal generating sensor with 4-20 mA 2-wire output transmitter with 0-100% relative humidity range within +/- 1% RH.
 - c. Approved Manufacturers:
 - 1) Vaisala
3. High Precision Temperature Sensors: (for temperature inputs used for BTU calculations)
- a. Temperature transmitter with 100 ohm platinum RTD sensor and 4-20 mA 2-wire DC output. Zero and span shall be continuously adjustable. Sensor and transmitter shall be a matched assembly. Accuracy shall be +/- 0.1% of calibrated transmitter span, including combined effects of repeatability, hysteresis and linearity. Calibrated range shall be 20 to 120 deg. F. Both CHWS and CHWR sensor/transmitter assemblies shall have the same span and shall be factory calibrated as a matched pair.
 - b. Liquid immersion sensors shall have welded stainless steel thermowell. Transmitters shall be of the potted type or shall have a thermally isolated watertight enclosure. Length of sensor and thermowell shall be selected based on the diameter of the pipe to provide accurate, reliable and homogeneous sensing of the liquid temperature.
 - c. Approved Manufacturers:
 - 1) TCS
 - 2) Minco
4. Humidity Sensors:
- a. Sensor element shall be thin film capacitive type or bulk polymer resistance type, accuracy of +/- 2% RH, range of 0-100% RH with 4-20 mA 2-wire linear output. Factory calibrate for maximum accuracy at mid-range of normal operating humidity. All humidity sensors shall be resistant to chlorine and other cleaning agents.

- b. Room Sensors shall have locking cover.
 - c. Duct Sensors shall have duct probe and mounting plate.
 - d. Approved Manufacturers- Critical Applications (OR's/ Procedure Rooms, AHU's serving patient care, Central Sterile, animal research):
 - 1) Vaisala
 - e. Approved Manufacturers- Non-critical Applications:
 - 1) Siemens
 - 2) TCS
 - 3) General Eastern
 - 4) Vaisala
 - 5) Honeywell
 - 6) ACI (Automation Components Inc)
5. Combination Room Temperature and Humidity Sensor:
- a. Single enclosure, wall mounted room temperature and humidity sensor. Without display unless indicated otherwise on the contract documents. White casing/cover/fascia color. With service port to enable two-point calibration using either a PC or Vaisala HUMICAP Handheld Humidity and Temperature Meter HM70. Unit supply voltage 20-28 VDC.
 - b. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA loop powered 2-wire output transmitter, 23-131°F temperature range, accuracy of +/- .54°F between 86-104°F.
 - c. Room humidity sensor shall have a 4-20 mA loop powered 2-wire output transmitter, humidity range of 0-90 percent RH, accuracy of +/- 1.7 percent RH at temperature range of 50-104°F, stability in typical HVAC applications of +/- 0.5 percent RH/year.
 - d. Provide with certificate of calibration.
 - e. Approved Manufacturers:
 - 1) Vaisala HMW92 Series
- 6.
7. Vivarium Temperature and Humidity Sensors: (for wet service)
- a. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA 2-wire output transmitter. Transmitter shall be waterproof or shall be remote mounted.
 - b. Room humidity sensor shall have a 4-20 mA 2-wire output transmitter, 0-100% relative humidity range, accuracy of +/- 2% RH, shall be waterproof, and shall be resistant to chlorine and other cleaning agents.
 - c. Combination units shall comply with the above, but shall be mounted in a single enclosure, and shall be protected by a SS "U"-shaped guard firmly attached to the wall.
 - d. All vivarium sensors shall have rust proof and waterproof covers and be protected by a SS "U"-shaped guard firmly attached to the wall.
 - e. Approved Manufacturers:
 - 1) Vaisala (combination temp. and humidity)
 - 2) TCS (temp. only)
 - 3) Siemens (temp only)

SPCIFICATION EDITOR: LOOP POWERED INDICATORS, WHICH REQUIRE RTD SENSORS, ARE NOT TYPICALLY REQUIRED FOR NEW INSTALLATIONS, ONLY FOR MODIFICATIONS TO EXISTING LPI INSTALLATIONS. USE HUMAN MACHINE INTERFACE PANEL (HMI), SPECIFIED ELSEWHERE IN THIS SECTION, FOR AN OPERATOR INTERFACE AT ALL DDC PANEL INSTALLATIONS.

B. Loop-Powered Indicators

1. All analog sensors (i.e., temperature, humidity, CO₂, CO, etc.) shall be provided with a Loop-Powered Indicator (LPI) mounted on a separate dedicated LPI panel, except those sensors that are provided with a local display. Local displays shall be mounted at the DDC panel array.
2. Indicator shall be designed to display any 4-20 mA transmitter signal directly in the engineering unit of the measured media. The display shall be powered directly by the measured 4-20 mA signal without requiring an additional power supply. Indicator shall not impose impedance on the current loop beyond the capability of the transmitter.
3. Display shall have minimum 5/16" LCD digits, with 3-1/2 digit capability selectable decimal point and selectable scale. Accuracy of indication shall be 0.1% of scale.
4. Indicator shall be provided with a lettered plate indicating appropriate engineering units.
5. Approved Manufacturer:
 - a. R. E. Technologies, Inc. (Kele Assoc.)

C. Pressure and Flow Sensors

1. Air Differential Pressure Transducer:
 - a. Variable capacitance type with ranges not exceeding 150% of maximum expected input. Transducer shall have zero and span adjustment. Output shall be 2-wire 4-20 mA with 24 VDC input.
 - b. Safe over pressure rating shall be minimum 5 times the range.
 - c. Temperature compensated with thermal error of not greater than 0.04% of full scale in temperature range of 40 to 100 deg. F.
 - d. Accuracy shall be 1% of full scale.
 - e. For pressure transducers used to measure room differential pressure, see "Room Differential Pressure Transmitter", specified further on in this specification.
 - f. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Setra
 - 3) Modus
 - 4) Ashcroft
 - 5) ACI (Automation Components Inc)
2. Air Static Pressure Sensors:
 - a. Duct mounted sensors shall be easily removable for cleaning, have multiple sensing ports, and fabricated of aluminum, copper, or SS. Sensors used in outdoor or condensing environments shall not be copper.
 - b. Wall or ceiling mounted sensors shall be shielded, suitable for surface or flush mounting, complete with multiple sensing ports, contain a pressure impulse suppression chamber, and fabricated of aluminum, paintable steel, or SS as required.
 - c. Outside air mounted sensors shall be shielded, complete with multiple sensing ports, maintain sensing accuracy regardless of wind flow direction or pattern, and fabricated of aluminum or SS.
 - d. Accuracy shall be 1% of actual pressure value.

- e. Provide a companion 4" Magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor. Gauges shall be graduated in inches W.C. Provide a phenolic identification tag for each gauge.
- f. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Siemens
 - 3) Dwyer
 - 4) Honeywell
 - 5) ACI (Automation Components Inc)
 - 6) Setra

3. Airflow Sensors:

SPECIFICATION EDITOR: UMH HAS FOUND THAT TRADITIONAL AIRFLOW TRAVERSE PROBE ASSEMBLIES (IE PICKUP ARRAY MOUNTED IN THE BELL OF THE FAN) INDUCE SUBSTANTIAL PRESSURE DROP AND INCREASED MOTOR HP. DO NOT USE UNLESS AIRFLOW MEASUREMENT IS INTEGRATED INTO THE FAN BELL HOUSING, AS SPECIFIED IN PARAGRAPH "A" BELOW. IF USED, THIS DETAIL SHOULD BE REFLECTED IN THE FAN SPECIFICATION. INSTEAD, SPECIFY THERMAL DISPERSION TYPE AFMS UNDER PARAGRAPH B BELOW.

- a. Airflow Traverse Probe Type:
 - 1) Provide where indicated amplified signal airflow traverse probe(s) or airflow stations, capable of continuously monitoring the fan or duct capacities (air volumes) it serves.
 - 2) Each airflow array shall contain multiple total and static pressure sensors integrated into the bell housing of the fan, and interconnected by their respective averaging manifolds.
 - 3) Sensors shall not protrude beyond the surface of the fan bell housing so as not to induce a "system affect", nor shall be adversely affected by particle contamination normally present in building airflow systems.
 - 4) Accuracy shall be a minimum of 3 percent of actual airflow over the designed range of flow.
 - 5) Provide a companion 4" magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor array. Gauges shall be graduated in CFM for airflow measurement. Provide a phenolic identification tag for each gauge.
 - 6) Approved Manufacturers:
 - a) Air Monitor
 - b) Tek-Aire
 - c) Dietrich-Standard
 - d) Ramsey Air
- b. Thermal Dispersion Type:
 - 1) Sensors: Thermal mass flow, temperature and pressure compensating type.
 - a) Each sensor shall have an accuracy of +/-2% of reading over the entire operating airflow range. Each temperature sensor shall have an accuracy of +/-0.15 degree F (+/-0.07 degree C) over the entire operating temperature range. Each sensor assembly shall be calibrated to standards of the National Institute of Standards and Technology (NIST).

- b) The combined accuracy of all components that make up the air measuring device shall meet the performance requirements specified above throughout the measurement range.
- c) Multiple sensor circuits shall be equally weighted and averaged by the sensor multiplexing unit and communicate digitally to the control transmitter.
- d) The operating temperature range for the sensor assembly shall be -20 degree F to 160 degree F (-29 degree C to 71 degree C). The operating humidity range for the sensor assembly shall be 0-99% RH (non-condensing).
- e) The number of sensors for each probe array shall be:

Duct or Plenum Area (sq.ft)	Total # of Sensors /Location
<2	4
2 to <4	6
4 to <8	8
8 to <16	12
> = 16	16

- f) Fan Inlet Sensor Probe Assemblies shall either be contoured, low profile sensor housings mounted on the fan inlet bell to reduce pressure drop and effect on fan performance or shall be a face mount probe and bracket spanning the fan bell opening. Designs mounted in the throat of the fan bell are not allowed. The operating airflow range shall be 0 to 10,000 fpm.
 - g) Duct/ Plenum mounted assemblies shall utilize bead-in-glass sensors/ elements housed in an anodized aluminum tube, suitable for duct/ plenum mounting. The operating airflow range shall be 0 to 5,000 fpm.
- 2) Accessories: Include probe mounted transmitter junction box, connecting cables, transmitter and system electronic enclosure with a velocity profiler with digital display. Provide analog (4-20mA, 0-10VDC) transmitter outputs for interface with DDC BMS.
 - 3) Approved Manufacturers:
 - a) Fan Inlet Assemblies: Ebtron GOLD Series
 - b) Duct/ Plenum Assemblies: Ebtron GOLD Series, Air Monitor "Electra-flo"
4. Steam/Liquid Differential Pressure Transducers: (flow only)
- a. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 125% of the normal differential pressure and up to 150-psig line pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transmitter.

- b. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 0.25% of the span stated above throughout a minimum of a 6:1 turndown. Turndown ratio shall be based on the actual flow span.
 - c. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - d. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
 - e. Span and zero shall be individually adjustable.
 - f. Shall be 2-wire and 4-20mA output.
 - g. Approved manufacturers:
 - 1) Tobar
 - 2) ITT Barton
 - 3) Dietrich - Standard
 - 4) ABB
 - 5) Siemens
 - 6) Rosemont/Fischer
 - 7) Honeywell
5. Steam/Liquid Differential Pressure Transducers: (pressure only)
- a. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 200% of the normal differential pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transducer.
 - b. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 2% of the span stated above throughout a minimum of a 4:1 turndown. Turndown ratio shall be based on the actual differential span.
 - c. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - d. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
 - e. Span and zero shall be individually adjustable.
 - f. Shall be 2-wire and 4-20 mA output.
 - g. Approved manufacturers:
 - 1) Tobar
 - 2) ITT Barton
 - 3) Dietrich - Standard
 - 4) ABB
 - 5) Siemens
 - 6) Setra
6. Indication Gauges for Steam/Liquid Pressure Transducers:
- a. Each transducer shall come with an indicating gauge that reads in GPM for flow measurement or inches WC for pressure sensing. The gauge shall be analog differential pressure type piped in parallel to the transducer.

- b. The analog pressure gauge shall be selected and calibrated for the same span as the transducer it serves.
 - c. The accuracy, including linearity, hysteresis and repeatability, of the gauge for measuring differential pressure shall be better than 3% of the span stated above throughout its span. Calibration data shall be included on an embossed tag attached to each gauge.
 - d. The gauge shall not be damaged by pressures of up to 500 psig on either side of the gauge and all wetted parts shall be inert in the presence of up to 40% concentration of ethylene or polypropylene glycol in water.
 - e. Scale shall be a minimum of 4.5" diameter. Furnish and install two bleed fittings for each gauge and mounting brackets appropriate for the installation location.
 - f. Gauges shall be field mounted. Provide a LPI for readout at the DDC panel array. Provide a phenolic identification tag for each gauge and indicator.
 - g. Approved manufacturers:
 - 1) Beckman
 - 2) Moore
 - 3) Testoterm
 - 4) Dwyer
 - 5) Transducer manufacturer's gauge
7. Steam/Liquid Flow Sensors: (differential pressure type)
- a. Uni-directional sensors shall be of the venturi type or velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
 - b. Bi-directional sensors shall be of the velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
 - c. Approved Manufacturers
 - 1) Preso
 - 2) Gerand
 - 3) Dietrich-Standard (Annubar Diamond II)
8. Three Valve Manifolds for Steam/Liquid Pressure Transducers:
- a. Provide a three-valve manifold for each transducer. Pressures of up to 500 psig shall not damage the manifold. All wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - b. The manifold shall be designed for direct mounting on the transducer it serves and utilizes two quarter turn valves to provide zeroing, blocking and normal service modes.
 - c. Approved Manufacturers:
 - 1) D/A Manufacturing
9. Liquid Flowmeters: (Electro-Magnetic Type)

- a. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor shall be equipped with 150-lb. flanges. The meter system shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The meter shall be capable of bi-directional operation. The meter shall be sized appropriately for the range of flow for the system. The electrodes shall be SS or Hasteloy C. The transmitter shall be provided with a remote mounting bracket, cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalize flow, shall have an isolated 2-wire 4-20 mA linear output flow rate signal, and shall have a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. The primary flow sensor and transmitter shall be mounted in accessible locations. Unit shall have the capability to maintain flow total in non-volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - 1) Flowmeter Liner:
 - a) Heating hot water, domestic hot water, and other water systems operating at or above 110°F: Teflon
 - b) Chilled water, domestic cold water, and other water systems operating below 110°F: Polyurethane
 - c) Steam condensate: Teflon to 300°F, Ceramic over 300°F, and as suitable for the expected fluid conditions.
 - 2) Accuracy:
 - a) At 1 to 33 feet per second velocity: ±0.5% of rate.
 - b) At 0.3 feet per second velocity: ±2% of rate.
 - 3) Each unit shall be factory calibrated for the specified flow and shall be calibrated in both directions if the application is bi-directional. Calibration shall be a minimum of three point. Specific performance test data shall be furnished with the meter.
 - 4) Each meter shall provide two analog 4-20 mA signals or a single 4-20 mA signal and a digital contact closure on reverse flow.
 - 5) Meters for steam condensate shall be capable of sensing with condensate conductivity down to 6 µS/cm.
- b. Provide a phenolic tag for each transmitter to identify service and meter ID number (i.e. SECONDARY CHILLED WATER FLOW, FM-1, etc.).
- c. Approved Manufacturers (Water)
 - 1) ABB
 - 2) Siemens
 - 3) EMCO
 - 4) Rosemount
 - 5) Krohne
 - 6) Onicon
- d. Approved Manufacturers (Steam Condensate)
 - 1) Rosemount

- 2) Krohne
 - 3) ABB
10. Steam (Vapor) Flowmeters (Vortex-shedding type):
- a. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor body and wetted parts shall be SS, and shall be flanged and suitable for the service rating. The meter shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The transmitter shall be provided with a remote mounting bracket and cable, integral LCD display, NEMA 4X housing, shall indicate flow rate, totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. Unit shall have the capability to maintain flow total in non-volatile memory. The primary flow sensor and transmitter shall be mounted in accessible locations. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - 1) Temperature range shall be -40-750°F.
 - 2) Accuracy shall be 1.0% of rate and 0.1% of full scale.
 - 3) Repeatability shall be 0.15% of flow rate.
 - 4) Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - 5) Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - 6) Meter shall be equipped with a temperature and pressure compensation feature.
 - b. Provide a phenolic tag for each transmitter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, etc.).
 - c. Approved Manufacturers
 - 1) Rosemount
 - 2) Krohne
 - 3) ABB
11. Steam (Vapor) Flow Meters (Differential-pressure type)
- a. The meter system shall consist of a differential pressure primary flow element, a differential pressure transmitter (or transmitters), and a flow monitor/computer. The flow sensor body and wetted parts shall be SS, and shall be equipped with 150-lb. flanges. The transmitter(s) and flow computer shall be provided with a remote mounting bracket and cable, integral LCD display, and NEMA 4X housing. Flow computer shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output signal and a pulsed output signal for totalization. Unit electronics shall have noise immunity. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit shall have the capability to maintain flow total in non-

volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:

- 1) Temperature range shall be -40-750°F.
 - 2) Accuracy shall be 1.0% of rate or better and 0.1% of full scale.
 - 3) Repeatability shall be 0.15% of flow rate.
 - 4) Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - 5) Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - 6) Meter shall be equipped with a temperature and pressure compensation feature.
 - 7) V-cone horizontal pilot lines shall be pitched back to steam lines and shall not trap condensate.
- b. Provide a phenolic tag for each meter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, FM-1 etc.).
- c. Approved Manufacturers
- 1) McCrometer (V-cone-style meter)
 - 2) Preso (Venturi-style meter)
 - 3) Gerand Engineering (Venturi-style meter)

TWO METHODS OF CALCULATING ENERGY CONSUMPTION (BTUS), WITH THE RESPECTIVE EQUIPMENT REQUIRED, ARE SPECIFIED BELOW: (1) BY THE DDC SYSTEM OR (2) BY A "BTU METER". 12.b IS USED WHEN UTILITY (REVENUE) BILLING OF A SYSTEM IS PLANNED. 12.a IS USED WHEN ENERGY CONSUMPTION IS COLLECTED FOR INFORMATIONAL PURPOSES ONLY. ASSURE THE CONTROL DRAWINGS INDICATE WHICH METHOD, IF ANY, IS TO BE USED FOR EACH SYSTEM.

12. BTU Metering

- a. DDC BTU metering shall be accomplished using the following equipment at each metering point:
- 1) One (1) liquid flowmeter unit with transmitter as specified elsewhere in this section.
 - 2) Two (2) high-precision matched temperature sensor assemblies with transmitters as specified elsewhere in this section. Sensor with SS well shall be installed in each respective supply and return pipe as shown on project drawings.
 - 3) These devices shall be wired to a local DDC panel. Calculations for instantaneous and totalized load shall be incorporated into the panel control code, and the necessary virtual points shall be created to allow remote monitoring and trending via the DDC system.
- b. When a BTU meter is indicated on the control drawings, provide a flow/BTU computer which is programmable for various flow meter types including linear, square law, or multi-point linearization data interpretation.
- 1) Inputs shall include: 4-20ma flow from flow meter and 4-20ma from two temperature sensors.
 - 2) Flow and temperature inputs shall be simultaneously connected to this computer and looped to the local DDC panel.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 37

- 3) Flow/ BTU computer shall operate in an environment of 0 to 50 C, shall include a keypad for data input and retrieval, and an EEPROM/nonvolatile RAM. Unit shall calculate and provide:
 - a) Two 4-20ma analog outputs indicating btu, mass or volume flow rate, temperature 1, temperature 2, delta temperature, pressure, density, and peak demand.
 - b) One isolated pulse output indicating btu, mass or volume total
 - c) Two NC/NO relay outputs assignable to trip according to various rate, total, temperature or pressure readings, programmable as latching or non-latching, or as pulsed output of a total.
- 4) Outputs shall be stored in a battery backed data logger, selectable for continuous or periodic log modes.
- 5) Unit shall have a real time clock and shall date stamp logged data. Unit shall have an RS-232 port and shall be capable of setup from a laptop computer. The supplier shall set up and verify BTU measurement and shall train U of M personnel in all aspects of BTU computer setup and operation.
- 6) Computer shall calculate and display heat, mass or Volume flow rate, resettable total, non-resettable total, temperature input 1, temperature input 2, delta temperature, density, pressure, peak demand, and time/date stamp.
- 7) Provide a phenolic tag for each transmitter and flow computer (as applicable) to identify service and ID number (i.e. CHILLED WATER BTU METER - LSI BUILDING, etc.).
- 8) Mount Flow/BTU computer in a NEMA 4 enclosure: Minimum size 16" (H) x 14" (W) x 8" (D), hinged cover, padlockable latch, and stainless steel hinge. Provide cutout in enclosure face and mount computer in face. Where multiple computers are supplied, they may be mounted in a common enclosure.
- 9) Approved Manufacturers and Models for Flow/BTU Computer:
 - a) Kessler-Ellis Supertrol II with MS816 enclosure.

D. Electronic to Pneumatic Transducers

1. Provide transducers to convert electronic signals from the DDC analog output modules to linear proportional pneumatic signals for all DDC controlled modulating pneumatic devices. The transducer shall be a panel-mounted device, with hand/auto switch, override dial for manual override control, and a 0-30 psig output gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 0-10 VDC or 4-20 mA. Output accuracy shall be 1/4 psig at 75 Deg. F, producing a 0-15 psig pneumatic signal. Output repeatability shall be .05 psig maximum. Transducers shall be high capacity non-bleed devices with a minimum output capacity of 500 SCIM, except special circumstances that require a constant bleed controller with branch exhaust on signal loss.
2. Approved Manufacturers:
 - a. Non-bleed Type:
 - 1) Siemens

- 2) ACI - EPC
- 3) Kele
- 4) Mamac
- b. Bleed Type:
 - 1) ACI - EPC

E. Pressure to Electronic Transducers

- 1. Provide transducers to convert linear proportional pressure signals to DDC analog input modules. The transducer shall be a panel-mounted device, with input pressure snubber, as required, and gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 4-20 mA. Accuracy shall be 1 percent full scale. Thermal effect shall be less than 1 percent full scale on zero and less than 1 percent of reading on span. Transducer shall have elastomer seals and SS wetted parts.
- 2. Approved Manufacturers:
 - a. Siemens
 - b. Setra
 - c. Modus
 - d. ACI
 - e. Dwyer

F. Carbon Dioxide Sensors:

- 1. Carbon dioxide sensing cell shall consist of a nondispersive infrared carbon dioxide gas cell that uses a pulsed source and has no free air optical path. Output shall be linearized 4-20 mA for use with 24 VDC input. The unit shall be specifically designed for the wall or duct application specified. Duct aspiration boxes shall be by the manufacturer. Unit shall have span adjustment. The unit shall have no moving parts.
- 2. Minimum requirements:
 - a. Range: 0-2,000 ppm
 - b. Accuracy: 3 % of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: less than 3 watts
 - e. Zero Drift at Constant Temp.: 100 ppm per 24 hrs (random not cumulative)
 - f. Max. allowable Drift in 1 year: 20 ppm
- 3. Unit shall not require calibration for a period of 1 year or more.
- 4. Approved Manufacturers:
 - a. Valtronics
 - b. GE/ Telaire

G. Carbon Monoxide and Combustible Gas Sensors:

- 1. Sensors shall be a micro-processor-based system for continuous monitoring and use catalytic, electro-chemical, diffusion cell, or solid-state type sensing. Output shall be linearized 4-20 mA for use with 24 VDC input with green LED normal operation indicator. Unit shall provide a SPDT pilot duty low voltage alarm contact with an adjustable set point. The unit mounting shall be wall, duct aspiration, or ceiling to suit application. The unit shall specifically designed for the application and shall be explosion proof, as required. Unit shall have single point set point and span adjustment. The unit shall have no moving parts. Units mounted outdoors shall be waterproof and rustproof.

2. Minimum requirements:
 - a. Range: as required for application; ppm, %, %L.E.L.
 - b. Accuracy: 3-5% of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: 5 watts or less
 - e. Relay contact rating: 5 amp at 24 VDC, 150 VA max. inductive
 - f. Zero Drift at Constant Temp.: 0 per 24 hrs (random not cumulative)
 - g. Max. allowable Drift in 1 year: 1% of full scale.
 3. Approved Manufacturers:
 - a. Draegar
 - b. Honeywell Analytics (Vulcain)
- H. Current Sensing Relays
1. Provide current sensors with donut transformers capable of monitoring AC current, maximum input current ranges from 20 to 300 amp, peak, with digital output signals having adjustable high and low current trips. An LED shall provide visual indication and shall not bleed through.
 - a. Provide special current sensing relays designed to monitor belt breakage, when indicated or described in the Sequence of Operation.
 2. Approved Manufacturer:
 - a. Neilsen Kuljian
 - b. Veris Industries
 - c. ACI (Automation Components Inc)
- I. Liquid Detectors
1. Liquid detectors shall utilize microchip technology for detection of conductive liquids through one of the following types of sensors: gold-plated probes, self-adhesive sensor tape with copper electrodes and durable cotton cover, or rope type sensor. Detectors shall be selected based on the best use for the application. Power requirement shall be 11-27 VAC or VDC and have a green LED normal operation indicator. Unit shall have a SPDT pilot duty low voltage alarm contact. Unit shall be waterproof and rustproof. A red LED shall indicate the presence of liquid. Unit shall have an adjustable set point.
 2. Approved Manufacturers- Spot Detectors:
 - a. DiversiTech "Wet Switch"
 - b. Water Alert
 3. Approved Manufacturers- Rope or Ribbon Detectors
 - a. RLE Technologies
 - b. Water Alert
 - c. Kele
- J. Condensation Sensor - Pipe Mounting Type
1. Sensor with built-in relay contact that opens upon detection of condensation, for sensing condensation when mounted on bare pipe.
 - a. Supply voltage: 24 VAC/VDC \pm 10%
 - b. Power consumption: Maximum 1.6 VA
 - c. Relays contacts: rated 1 amp @ 24 VAC/VDC
 - d. Operating temperature: -20... +50°C
 - e. Display: LED, green - power supply ok, red - condensation sensed, contact open.

- f. With pipe mounting bracket.
- K. Occupancy Counters (People Counters)
- 1. Dual Sensor - Differential Thermal Imaging Counter
 - a. General
 - 1) Provide combination BACnet-MS/TP and Analog Output counting devices for Dynamic Ventilation Reset Controls to be mounting where indicated on the plans and controlling ventilation to occupied zones as populations vary, in compliance with the Ventilation Rate Procedure in ASHRAE 62.1-2013 and 2016.
 - b. Counters shall provide data on net zone populations to dynamically calculate the ASHRAE Standard 62.1 Ventilation Rate.
 - 1) Each counter shall consist of a center-top door frame mounted counter, using a dual thermopile differential thermal imaging counters, an integral microprocessor-based design capable of providing net population data to the controls network for use in ventilation reset based on accurately measured real-time zone populations.
 - 2) Counter with steel enclosure shall have an overall size of: 6.12L x 2.94W x 1.36H inches and weigh approx. 0.25 lbs.
 - 3) Counters shall have an environmental operating range of no less than 65° F to 85° F and 5% - 95% RH, non-condensing.
 - c. Population Counter Design and Counting Performance
 - 1) Counter shall be mounted to provide zone entry and exit data to the network for maintenance of a net zone population value to less than ±5% of actual or ±3 people, whichever is larger.
 - 2) Counter design shall be optimized for single entry/exit interior doors, ≤ 42 x ≤ 96 in.
 - 3) Small deviations or accumulation in counts shall be adjusted when "population reset interval" is selected during configuration and set up. Upon activation, the total net population in memory shall be 'zeroed' based on the user-determined reset period selected or every 24 hours during a predetermined non-occupied period.
 - 4) Power, Connectivity and Communications
 - a) The BACnet / analog combination counters shall be capable of communicating with other devices using an RS-485 standard interface and BACnet-MS/TP protocol, implemented as a Master node.
 - b) Communication speed shall be field-selectable by dip switch between 9.6, 19.2, 38.4 and 76.9 kBaud.
 - c) The counter-network communications shall be capable of field configuration and setup using a simple dip-switch interface.
 - d) A simultaneous 0-10 VDC scalable and protected analog output shall also be available to provide net counts.
 - e) All counters shall be powered with individual 24 VAC transformers (22.8V to 26.4V under load) @1.2 V-A nominal.

2. The manufacturer's authorized representative shall review and approve counter position placement for each location indicated on the plans.
3. Accepted Manufacturer: EBTRON, Inc. Model CENSUS - C100, Single-entry interior door occupancy counter.

L. Alarm Indication Station

1. Alarm indicating station with red alarm LED, alarm horn, horn momentary silence switch, adjustable alarm delay and alarm repeat time, and alarm status relay.
 - a. Supply Voltage: 24 VAC @ 100 mA or 24 VDC @ 34 mA.
 - b. Alarm Time Delay: None, or 1 to 31 seconds in one-second increments, or 10 to 310 seconds in 10-second increments.
 - c. Alarm Horn: Continuous or pulsed tone, 70 db minimum.
 - d. Alarm Repeat Time: None, or 1 to 7 minutes in one-minute increments, or 10 to 70 minutes in 10-minute increments.
 - e. Alarm Relay: SPDT, 0.5A @ 24 VAC, 1.0A @ 30 VDC, follows horn or lamp action, selectable.
 - f. Connections: Screw terminals, 22 - 14 AWG wires.
 - g. Mounting: Brushed stainless steel plate mountable to standard single junction box, with two screws provided.
2. Accepted Manufacturer: Kele Model RAD-1.

2.7 ELECTRIC COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.
- B. Low temperature detection thermostats shall be duct type, fixed 5 deg. F differential, range 30 to 60 deg. F. Sensing element shall have a 20-foot long capillary tube responding to the lowest temperature sensed along any 12 inches of bulb length. Switch shall be SPDT 120 VAC, UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset. Provide one thermostat for every 20 square feet of coil surface.
- C. High temperature detection thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset.
- D. Immersion electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- E. Remote-bulb electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.

- F. Wall-mounted electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- G. Strap-on electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- H. Differential Pressure Switches:
 - 1. Shall provide electrical switching action upon a sensed pressure differential increase between two points. Sensitivity shall be suitable for the application. Set point shall be adjustable over the full range of the device. Switching action shall SPDT. Electrical switch rating shall be 10 amps at 120 VAC, minimum.
 - 2. Pressure rating of switch and connecting tubing:
 - a. Fan - Rated for 12 inches WC.
 - b. Pump - Maximum deadhead system pressure.
 - 3. Switches used for safety shutdown applications shall be of the manual reset type.
 - 4. Approved Manufacturers:
 - a. Honeywell
 - b. Siemens
 - c. Dwyer
 - d. Cleveland Airflow
- I. Limit Switches:
 - 1. Limit switches shall be oil tight type with appropriate operator to provide required function.
 - 2. Approved Manufacturers:
 - a. Honeywell
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D
- J. Control Relays and Contactors:
 - 1. Relays shall be a minimum DPDT, of proper coil voltage, with neon indicator light, and of sufficient rating for specified purpose. Relay base shall be of the screwed terminal type.
 - 2. Contactors shall be definite purpose type, have adequate number of poles, of proper coil voltage, and of sufficient rating for specified purpose. Contactors used for DDC interface control shall contain a Hand-Off-Auto switch.
 - 3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D
 - f. Functional Devices- RIB
 - g. IDEC
 - h. Omron

K. Selector Switches:

1. Switches shall be multiple position type, oil-tight, water-tight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.
2. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

L. Push Buttons and Pilot Lights:

1. Push button switches and pilot lights shall be, oil-tight, watertight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.
2. Pilot lights shall be neon or LED, push-to-test type with replaceable lens. Lens shall be of the appropriate color for application served.
3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

M. Fuse Holder/Disconnects:

1. Fuse holder/disconnects shall be provided for all control circuits inside auxiliary control panels, and shall be of appropriate size/type for service.
2. Approved Manufacturers:
 - a. Little Fuse
 - b. Dayton
 - c. Buss
 - d. GE

N. Terminal Blocks:

1. Terminal blocks shall be modular, barrier type, direct mount, single pole, and snap together to any required number of poles. Units shall be rated for 300 volts, 20 amp., handle wire sizes from 22-12 AWG, and have a marking strip for identification.
2. Approved Manufacturers:
 - a. Cooper-Bussman
 - b. Weidmuller
 - c. Kele
 - d. Buss
 - e. GE

O. Toggle Switches:

1. A toggle switch shall be provided for every auxiliary and local control panel that utilizes a 120 VAC power source as a means to turn off the power to that panel and shall be of appropriate size/type for service. Toggle switches shall be rated 120/277 volts, 20 amps, SPDT, specification grade, extra-heavy duty, back and side wired, with brown handles.
2. Approved Manufacturers:
 - a. Leviton
 - b. Pass & Seymour
 - c. Hubbell
 - d. Arrow Hart
 - e. Bryant

2.8 ELECTRICAL ACCESSORIES

A. Wiring and Conduit

1. The MSCC shall provide all DDC and related control wiring, conduit, and J-hook cable hanging system. Wire and cable shall be pulled from device or control point to the DDC, Auxiliary, UPS, or LPI panels and run between DDC, Auxiliary, UPS, or LPI panels, with 6'-0" spare coiled at the panel. All wire and cable shall be labeled and tagged 4 inches down from the point at which the wire enters the cabinet with the corresponding point number.
2. All wiring carrying voltages greater than 24 volts shall be run in conduit.
3. All wiring carrying voltages 24 volts nominal or less shall be run as follows:
 - a. Wiring routed in shafts, walls, below grade, and in any concealed or inaccessible space, or above ceilings requiring the use of a tool to access or held in place by clips or similar devices: run wiring in conduit.
 - b. Wiring routed in exposed locations such as mechanical and electrical rooms or in rooms without ceilings (i.e. exposed to deck above): run in conduit.
 - c. Network wiring: run in conduit to nearest cable tray.
 - d. DDC wiring above accessible lay-in ceiling areas: Utilize J-hook hangers and/ or utilize facility cable tray.
 - 1) Provide UL Listed zinc electro-plated steel or plastic J-hooks, sky blue color, plenum use approved, with minimum 1-inch wide cable support area, rated for the cable type being supported. Provide with integral cable retainer strap to provide containment of cables within the hanger.
 - 2) Install J-hooks with J-hook bottoms a minimum of 10 feet A.F.F. and no less than 2 feet above the ceiling.
 - 3) Space hangers at maximum 5 foot intervals, with additional hangers located a maximum of 3 feet from both sides of any change in direction. Wiring shall not sag more than 12 inches between J-hooks. Install wiring and J-hooks in a neat and workman-like manner, routed parallel or perpendicular to the building column lines.

- 4) Install to protect wire from damage and to allow for wire replacement. Do not exceed 50 % of the wire capacity specified by the J-hook manufacturer (first installation), or route control wiring in non-control-wiring J-hooks.
- e. Wiring to wall mounted devices such as room sensors, switches, and similar devices:
 - 1) NEW CONSTRUCTION: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Install wall box for device mounting.
 - 2) RETROFIT (EXISTING WALL CONSTRUCTION): Route wiring in wall, no conduit is required. Install wall box for device mounting.
- f. Wiring to perimeter radiation valves and similar control devices requiring wiring to be routed in walls: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Provide maximum 12 inch long flexible metal conduit for the final connection to the device.
4. Conduits shall be sized on a maximum fill of 40% capacity.
5. Four separate conduit systems shall be provided:
 - a. DO/DI and 120 VAC control wiring.
 - b. AO/AI wiring.
 - c. Pneumatic tubing.
 - d. Network cables.

Exception: DO's, DI's, AI's, and AO's (including pneumatic tubing) installed between VSD's and DDC panels may share the same conduit.
6. All junction boxes and couplings on conduit containing DDC related wiring or pneumatic tubing shall be painted sky blue color. Alternative: Allied Tube True Color® EMT, color blue, may be used in lieu of painted fittings and junction boxes.
7. All exposed DDC wiring shall utilize a sky blue insulation outer jacket color.
8. Data transmission cabling and equipment grounding procedures shall meet the latest FCC guidelines for electromagnetic field generation.
9. All control wiring sizes and types shall meet the equipment manufacturer's recommendations.
10. All control wiring shall have insulation rated for 300 volts minimum, and be installed per NEC requirements. Exposed wiring running in return plenums, air handling devices, and where required by code shall be plenum rated.
11. Wiring requirements for controllers on air terminal units:
 - a. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. to controllers for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 46

- b. Terminal fittings or insulating bushings shall be used to protect wiring associated with controllers at enclosures, junction boxes, etc.
- B. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.
- C. Provide conduit and wiring to power all 120 VAC control accessories such as flow meters, BTU meters, data acquisition panels and actuators. Feed this power from an auxiliary control panel, with a separate disconnect and fuse for each device, located in the auxiliary panel.
- D. For air terminal controllers, provide 120 VAC conduit and wiring between electrical panels and controller power supply transformers. Power for terminal controllers shall be from a dedicated 20A power circuit, as shown on construction documents (CD's). In general, only one circuit shall be allowed per electrical closet, unless otherwise directed by project engineer.
 - 1. For renovation work, MSCC shall utilize existing dedicated circuit when available and either utilize existing transformer if adequate or provide new transformer(s). When an existing dedicated circuit is not available, provide new per above and as shown on construction documents. When not shown on CD's, request proper circuiting by project engineer.

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE SOURCE OF POWER FOR ALL DDC CONTROLS. POWER SOURCE (NORMAL VS EMERGENCY) & PRIORITY SHALL MEET OR EXCEED THAT OF THE EQUIPMENT BEING CONTROLLED.

- E. Power source (i.e. normal vs. emergency power & emergency power priority) to all controllers and associated controlled devices shall match that of the equipment and/ or system being controlled.

2.9 AUTOMATIC CONTROL VALVES AND ACTUATORS

- A. General:
 - 1. With the exception of air terminal controllers, actuators shall be pneumatic unless specifically noted otherwise on the drawings.
 - 2. Valve bodies 2 inches IPS and smaller shall be single seated bronze and shall have screwed end connections. Valve bodies 2-1/2 inches IPS and larger shall be cast iron and shall have flanged end connections. Valve stem packing shall be tetrafluorethylene, spring-loaded, self-adjusting. Packless construction is acceptable. Valve linkage shall have an adjustment for valve lift. Valve to have rising stem, renewable seat and disc, repackable under pressure.
 - 3. Valve rangeability shall be no less than 50:1 for valve $C_v \leq 1$, no less than 100:1 for valve $C_v > 1$.
 - 4. When indicated, provide separate SPDT limit switches which actuate at the full open and full closed valve position.

- B. High performance butterfly valves may be used when approved for valves 2-1/2" and larger and shall be full lug, have carbon steel body, 316 stainless steel offset disc, one-piece stainless steel shaft and bearings with thrust surfaces, PTFE seat, Teflon stem packing and rated for 150 psi and 450 degrees F, and in compliance with Related Section "Valves".

STEAM CONTROL VALVES: REVISE THE VALVE PRESSURE DROP SPECIFIED BELOW TO THAT APPROPRIATE FOR YOUR PROJECT. FOR EXAMPLE, FOR LOCATIONS CLOSE TO THE CENTRAL POWER PLANT, A PRESSURE DROP HIGHER THAN THE INDICATED 4 PSIG WOULD BE APPROPRIATE. ALSO NOTE THAT THE BELOW VALVE SIZING CRITERIA ASSUMES THAT THE STEAM PRESSURE REQUIREMENT FOR THE EQUIPMENT SERVED BY THE CONTROL VALVE IS 1 PSI OR LESS. ALWAYS VERIFY THE EQUIPMENT PRESSURE REQUIREMENT AND MODIFY THE BELOW ACCORDINGLY.

- C. Steam valve bodies and trim shall be rated for scheduled saturated steam service pressures. Steam valve replaceable plugs and seats shall be stainless steel, hardened to not less than 500 Brinell. Valves shall have modified linear characteristics and shall be sized based on a 5 psig inlet pressure and a maximum drop of 4 psig.

ALTHOUGH AVAILABLE UP TO 4", BALL VALVES SHOULD TYPICALLY ONLY BE USED FOR SMALL CONTROL VALVE APPLICATIONS, E.G. FAN COILS. THIS SPECIFICATION IS ONLY FOR BALL VALVES UP TO 3/4" DIAMETER. DESIGNER SHALL SPECIFICALLY NOTE ON THE DESIGN DRAWINGS WHERE BALL STYLE CONTROL VALVES WITH ELECTRIC ACTUATORS ARE TO BE USED. BE AWARE OF THE MAXIMUM DIFFERENTIAL PRESSURE RATING (D.1.H) FOR THESE TYPE VALVES. NOTE THAT THE MINIMUM FLUID TEMP. RATING IS 35°F; THIS BALL VALVE SPEC IS NOT SUITABLE FOR LOW TEMP SERVICE, HOWEVER LOW TEMP TRIM IS AVAILABLE, CONSULT MFR.S.

- D. Ball Style Control Valve and Actuator Assembly (provide where specifically noted on the design drawings):

1. Control Valve Body: Quarter turn ball valves, 2-way and 3-way configuration as indicated, for 2 position or modulating service, with the following features:
 - a. 1/2" or 3/4" valve size.
 - b. Forged brass body with female NPT end connections.
 - c. Nickel or chrome plated brass ball, with Teflon reinforced EPDM O-ring seals.
 - d. Blow-out proof brass stem with double O-ring EPDM seals.
 - e. Shall provide safe and reliable operation in water or in up to 50% glycol/water solutions, at fluid temperatures between 35°F and 212°F and static pressures up to 300 psi.
 - f. Ball and stem seals shall be formulated to prevent degradation by typical water treatment chemicals and Chloramines.
 - g. Minimum close-off rating: 200 PSI.
 - h. Differential pressure rating (valve operating): 30 PSID maximum.
 - i. Downstream leakage: maximum of 0.01% of design flow at rated close-off differential pressure.
 - j. 0 - 90 degree angle of rotation.
 - k. Valves for modulating service shall be equipped with a characterized ball (glass filled polymer flow insert) that provides an equal percentage flow characteristic.

1. Valves for two position control shall be reduced port type as required for the appropriate valve Cv.
- m. Provide valves with the flow coefficient indicated, or if not indicated, subject to engineer's approval, with a Cv appropriate for good control and considering the system differential pressure available.
2. Actuators: UL listed electronic rotary actuator designed for operation with the ball type control valve, with the following features:
 - a. The actuator shall be of the same manufacturer as the valve body and shall be integrally mounted to the valve at the factory.
 - b. For direct coupling to the valve shaft without the use of linkages, to an ISO-style mounting pad.
 - c. Minimum cycle life: 60,000 full strokes at maximum rated torque.
 - d. Torque: as required for smooth positioning and closure of the valve against a maximum differential pressure of 30 PSI and to provide close-off up to 200 PSI.
 - e. Motor runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - f. Spring return runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - g. For use with a 24VAC power supply with the ability to operate off the same power supply required for the temperature controller.

BELOW PARAGRAPH ASSUMES MODULATING CONTROL. IF FLOATING POINT VALVE ACTUATION IS DESIRED, MODIFY THE BELOW ACCORDINGLY.

- h. For use with 0-10Vdc output proportional plus integral room controllers, fully compatible with the specified temperature controller. Unless indicated otherwise on the control drawings:
 - 1) Heating coil (non-vivarium applications): Normally open spring return actuation.
 - 2) Heating Coil (vivarium applications): Normally closed spring return actuation.
 - 3) Cooling coil: Normally closed spring return actuation.
- i. Electronic stall detection/overload protection. Actuator shall sense that maximum rotational position has been reached even when control signal is still applied and stop rotating prior to actuator damage.
- j. Rotation mechanically limited by adjustable integral limit stops.
- k. Mechanical range adjustment.
- l. Valve position indicator.
- m. Actuator/actuator housing: Brushless DC motor design, NEMA type 1 or 2 enclosure, die-cast aluminum alloy or UL 94 listed plastic housing, lubricated gears, with a thermal barrier to prevent condensation on the actuator parts when used for chilled water applications. It shall be possible to rotate the actuator to any of four rotational angles in 90° increments, relative to the valve body.
- n. Ambient temperature operating range: -20°F and 120°F.
- o. Maximum actuator noise level, running or spring return: 40 dBA.

3. 2 year unconditional warranty, parts and labor. 5 year unconditional parts warranty.
- E. Hydronic system valve bodies and trim shall be rated for service pressures through 125 psig at 250 deg. F, globe style. Hydronic system valves shall have replaceable plugs and seats of SAE 72 brass or AISI 300 series stainless steel, selected for maximum lift under application conditions. Maximum pressure drop across any hydronic system valve at maximum flow and valve size shall be as indicated. Two-way valves shall have equal percentage characteristics for heating and cooling applications, either linear or equal percentage for other applications as appropriate, linear for three-way valves. When not indicated, valves shall be sized for a pressure drop of 3 psig for chilled water and 4 psig for hot water.
- F. Standard Valve Actuators:
1. Pneumatic, rolling diaphragm, spring loaded, piston type.
 2. Spring range shall be as required for non-overlapping sequencing or as indicated on drawings.
 3. Ratio relays or cumulators used for sequencing valves are not acceptable unless specifically indicated on the drawings.
 4. Valves shall spring return to normal position as indicated.
 5. Select with sufficient close-off power for system pressure, pump shut off head, highest operating torque, and torque requirements of valves that may stick because of infrequent use.
 6. Select to provide smooth proportioning control under operating conditions normal to the system.
- G. Butterfly Valve Actuators:
1. Pneumatic actuators shall be rotary type with rack and pinion to provide constant output torque rated for at least 125 percent, pilot positioner with gauges, spring return, adjustable travel stops, factory tested, factory lubricated, self-draining body, integral pneumatic parting, localized mechanical position indicator readable at 25 feet, 0-90 deg. reversible operation, capable of operating in any valve mounting attitude, capable of being mounted in line or transverse to pipeline, and bolt directly to valve top plate. Valves shall be actuated with 60-psig air and 3-15 psig pilot service. Valves used for isolation do not require pilot positioners. Actuator shall include a manually operated hand wheel for manual override.

SPECIFICATION EDITOR: WHEN THE USE OF ELECTRIC ACTUATORS IS PLANNED THE METHOD OF GETTING POWER TO THOSE ACTUATORS MUST BE CONSIDERED. READ THE BELOW SPEC SECTION CAREFULLY AND NOTE THE SIZE RANGE FOR VARIOUS ACTUATOR VOLTAGES. THE CONTROLS CONTRACTOR SHALL NOT RUN POWER WIRING ABOVE 120V. THEREFORE:

FOR 120V ACTUATORS, POWER TO SUCH ACTUATORS IS THE RESPONSIBILITY OF THE CONTROLS CONTRACTOR AND IS TO BE ROUTED FROM THE DDC AUXILIARY PANEL (SEE SECTION 2.8). IF YOUR PROJECT HAS A LARGE NUMBER OF 120V ACTUATORS THE STANDARD (2) 20 AMP CIRCUITS RUN TO THE DDC AUX. PANEL MAY NOT BE ENOUGH. DETERMINE THE TOTAL AMPERAGE OF SUCH ACTUATORS AND DIRECT THE ELECTRICAL DESIGNER TO DESIGNATE ADDITIONAL 120V CIRCUITS TO THE DDC AUX. PANEL, IF REQUIRED.

FOR 208V OR 480V ACTUATORS, POWER TO THE ACTUATORS SHALL BE DESIGNATED AS THE RESPONSIBILITY OF THE ELECTRICAL CONTRACTOR. FOR THESE HIGH VOLTAGE ACTUATORS, DIRECT THE ELECTRICAL DESIGNER TO INDICATE POWER TO EACH ACTUATOR ON THE ELECTRICAL DRAWINGS. THIS POWER SHALL NOT BE RUN OUT OF OR THROUGH THE DDC AUXILIARY PANEL.

2. Electric actuators shall have permanent split capacitor, reversible electric motor which drives a compound epicyclic gear, thermal overload protection, factory tested, factory lubricated, localized mechanical position indicator readable at 25 feet, 0-90 degree reversible operation, bolt directly to valve top plate. Housing shall be weatherproof and suitable for outdoor location. Provide thermostatically controlled heater for prevention of condensation at low temperatures. Actuator voltage shall be 120 VAC through 12" and 208 or 480 VAC above 12". 120V actuators shall be fed out of the auxiliary panel with a separate disconnect and fuse. Disconnect and fuse to be located in the auxiliary panel. 208V or 480V actuator power shall be provided to 208/480V actuators by others. In all cases the MSCC shall provide the required control wiring to the actuators. Actuator ambient temperature range shall be -20 deg. F to +140 deg. F. Actuator shall include a manually operated hand wheel for manual override of the valve position.

H. Electronic valve actuators used with air terminal controllers shall be 24 VAC and use 3-position floating control, 7/32" (5.5 mm) stroke minimum, shall be direct-coupled to valve bodies without the use of tools, shall have sufficient power to prevent valves from lifting off their seats, shall provide visual position indication, shall include manual override knob, and shall be UL-listed for plenum installations. Actuators shall be fail-safe or fail-in place as follows:

1. Actuators shall be fail-safe open for perimeter heating applications.
2. Actuators shall be fail-in-place for reheat control valves and cooling coil valves.

I. Typical valve body/actuator control actions shall be as follows:

1. Heating coil valves (non-vivarium) shall be normally open to flow through the coil.
2. Heating coil valves (vivarium) shall be normally closed to flow through the coil.
3. Heat exchanger valves (steam or water) shall be normally open to flow through the heat exchanger.
4. Cooling coil valves shall be normally closed to flow through the coil.
5. Humidifier valves shall be normally closed to flow through the humidifier.
6. Condenser water valves shall be normally open to flow through the cooling tower.
7. Isolation valves shall be normally open.
8. Drain valves shall be normally closed.

J. Approved Manufacturers:

1. All control valves except butterfly type:
 - a. Siemens
 - b. Honeywell
 - c. Johnson Controls

- d. Belimo (Ball Style Control Valve & Actuator only)
- 2. High performance butterfly valves:
 - a. Jamesbury - 815L
 - b. Watts - QF series X
 - c. Dezurik - BHP
 - d. Grinnell - WINN
 - e. Xomox Pliaseal
 - f. Bray - Braylok Series 41

CONTROL DAMPERS SHALL BE SCHEDULED ON THE DRAWINGS. INDICATE THE DAMPER STATIC PRESSURE AND VELOCITY RATING IN THE SCHEDULE.

2.10 AUTOMATIC CONTROL DAMPERS

- A. Multi-blade type. Provide with parallel blades for two-position, throttling, and modulating service unless noted otherwise. Provide required drive axles, linkage, jackshafts, and accessories for proper damper operation. Damper blades, frames, linkages, jackshafts and other parts of the damper actuation system shall not distort or rack during operation. Dampers shall close tightly, and operate in a smooth, hesitation and slack-free manner over the entire range of travel, at the maximum air pressure and velocity at the mounting location. Additionally, multiple section dampers shall operate in unison section-to-section.
- B. Face and bypass dampers shall each be capable of passing 100% of unit rated CFM. Pressure drops shall be approximately the same in either extreme position, including the pressure drops of coils and bypass components.
- C. All automatic control dampers shall conform to these specifications, including those provided by equipment manufacturers.
- D. All control dampers shall be low leakage type and shall meet the following minimum requirements:
 - 1. Leakage: 6.0 CFM/sq. ft. max. at 3" WC.
 - 2. Frames: 13 gauge (minimum) galvanized steel, minimum 2 inches in frame depth, welded or riveted with corner reinforcement.
 - 3. Blades: 16 gauge (minimum) galvanized steel or aluminum airfoil type, maximum blade size 8 inches wide, 48 inches long. Axles and axle extensions shall be minimum 1/2 inch solid galvanized steel. Dampers which are required to have a static pressure rating over 4" WC shall have minimum 3/4 inch solid galvanized steel axles/axle extensions.
 - 4. Blade Seals: Synthetic elastomeric or neoprene, inflatable type, mechanically attached, field replaceable.
 - 5. Jackshafts: Provide to drive adjacent vertical sections of multiple damper assemblies to ensure uniform operation. Minimum 3/4 inch solid or 1" hollow (minimum 1/8 inch wall thickness) galvanized steel. Where jackshafts penetrate air handling casing walls, provide greasable ball bearing supports sleeved and sealed to prevent casing leakage. Provide intermediate greasable ball bearing supports bolted to damper frames for jack shafts extending across multiple damper sections.
 - 6. Jamb Seals: Stainless steel.

7. Bearings: Oil impregnated sintered bronze or lubricant free, solid stainless steel. Provide thrust washers at bearings for all dampers that are to be mounted with blades in the vertical position.
8. Linkages: Deflection and slack-free. Zinc plated, fully exposed, connected to blade faces (located in the air stream). Linkages may be located in-jamb for single damper flange mounting arrangements, provided linkage is external to the duct and easily accessible for maintenance.
9. Static pressure Rating: As scheduled on the drawings, or provide dampers rated for the maximum pressure to be encountered at the mounting location but not less than 4" WC.
10. Velocity Rating: As scheduled on drawings, or provide dampers rated for the maximum velocity to be encountered at the mounting location.
11. Temperature Limits: -40 to 200 deg. F.
12. Provide through-bolted connections for connecting axle or jack-shaft extensions. Set screw arrangements are not allowed.
13. Selection and sizing criteria: Damper selection and sizing shall be based on damper schedule shown on the drawings. For dampers that are not scheduled on the drawings, selection and sizing shall be based on the procedure contained in Engineering Manual of Automatic Control, Honeywell, Inc., 1988.

E. For dampers located in stainless steel ductwork, PVC coated ductwork, fume hood exhaust ductwork, and exhaust fan outside air bleed-in ductwork, fabricate and size as indicated above, with the following additional requirements:

1. Frames, blades, blade axles and extensions, blade seals, jackshafts, linkages, and all other components exposed to the air-stream: Type 316 stainless steel.
2. Bearings: Solid stainless steel.
3. Damper operators shall be mounted outside of air stream. Extend damper axles and jackshafts to permit mounting outside of air stream.

F. Approved Manufacturers:

1. Honeywell
2. Ruskin
3. Vent Products
4. American Warming & Ventilating
5. Arrow United Industries
6. White Environmental
7. Johnson Controls

2.11 DAMPER OPERATORS

A. General:

1. With the exception of air terminal units, operators shall be pneumatic unless specifically noted otherwise on the drawings.

2. Provide smooth, proportional control with sufficient power for air velocities 20% greater than maximum design velocity and to provide tight seal against maximum system pressures. Provide spring return to normal position. Damper operators shall be installed in accessible locations. Damper operators shall not be installed inside ducts or air units that convey hazardous exhaust.
- B. Pneumatic Operators: Rolling diaphragm piston type with 8-13# spring range, as indicated on drawings, or as required to achieve specified performance.
 - C. Electric Operators: Maintenance free electric actuator, reversible, with push rod and bracket for swivel mounting and for the transmission of power. Synchronous motor with load independent running time providing parallel operation of several operators. Gear train with low noise level. Magnetic hysteresis coupling with magnetic transmission of torque, with no mechanical contact between the coupling members. The actuator shall be safe against blocking and overload proof even when operated continuously.
 - D. Electronic Operators: Maintenance free, 24 or 120 VAC, 4-20 mA or 0-10 VDC input, reversible, direct-drive or push rod and bracket, metal or aluminum housing, brushless DC motor with stall protection, quiet, low-power operation, have visual position indicator, and manual override.
 - E. Electronic damper operators used with air terminal unit controllers shall be 24 VAC 3-position floating control type and utilize a 90-degree rotation. Operators shall be direct-drive, have sufficient power to operate the damper against system pressures, provide visual position indication, have manual override, and shall be UL-listed for plenum installations. Operators shall be of the fail-in-place type.
 - F. Provide operator mounting brackets. Provide devices to connect operator drive shafts to dampers, damper linkages, and jackshafts.
 - G. Quantity of operators: Provide a sufficient number to achieve unrestricted movement throughout damper range, such that one operator does not operate more than the maximum square footage of damper area as recommended in standard catalog of manufacturer. Provide sufficient number so dampers close tightly, operate in a smooth, hesitation and slack-free manner over the entire range of travel at the maximum air pressure and velocity at the mounting location, and so that multiple section dampers operate in unison section-to-section.
 - H. Approved Manufacturers:
 1. Honeywell
 2. Johnson
 3. Siemens
 4. Belimo

2.12 PNEUMATIC COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.

- B. Electric-pneumatic relays shall be two-position, have a metallic body, can be field or panel mounted, have a 120 VAC coil, and 3 or 4 ports. Only Johnson E.P. relays are acceptable.
- C. Pressure-electric switches shall be two-position, appropriate range and element, suitable for the service, single or double pole, normally open or normally closed as required. Set point shall adjustable over the full range. Switch rating shall be 8.0 amps at 120 VAC, minimum.
- D. Differential pressure transmitter shall be one-pipe, 3-15 psig output, capable of measuring pressure differentials of positive or negative type, operate on the force-balance principal, have an over-pressure rating of 30" WC, accuracy of 5 percent full scale, and of the range suitable for the service.
- E. Pneumatic room thermostats shall be direct acting, dual (minimum 5°F dead band - 2 output branch lines) or single setpoint, 2-pipe, large capacity, adjustable proportioning type, containing dual or single bi-metallic elements, adjustable differential, minimum setting no greater than 1-1/2 deg. F over a range of 55 to 85 deg. F. Provide tamperproof covers with exposed setpoint indicator in black lettering, exposed thermometer, exposed setpoint adjustment in non-public areas and key operated setpoint adjustment in public areas.
- F. Pneumatic humidistats shall be of the adjustable proportioning, 2-pipe type, duct or wall mounted, reverse acting, adjustable sensitivity, sensitive hygroscopic membrane, temperature compensated, 20-90% RH range room, 25-65% RH range for duct, and 55-95% RH range for high-limit applications. Room type shall have tamperproof cover. Duct type shall come mounted inside a galvanized duct mounting box.
- G. Temperature transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1/2% of range for 200 deg. F span and plus or minus 1% for 50 deg. F span, with appropriate 50, 100, 200 deg. F temperature range, compensated bulb, averaging capillary, rod and tube or room transmitter operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.
- H. Humidity transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1% of range, temperature compensated, sensitive hygroscopic membrane, room or duct mounted, operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.
- I. Receiver-controllers shall be single or dual input models direct or reverse acting with mechanical set point adjustment, calibrated proportional band adjustment, and calibrated authority adjustment. Provide proportional control mode for temperature control applications, and proportional plus integral control mode for differential pressure control applications. Proportional band shall extend from 2 to 40% of primary sensor span, authority from 0 to 200% of primary sensor span and integral time from 1/2 to 20 minutes. Suitable for input signal of associated transmitter and output signal required by controlled device.

- J. Signal selector relays shall be capable of receiving two or more input signals and transmitting the highest or lowest pressure, with 1:1 input/output ratio.
- K. Booster relays shall be proportional type for increasing the volume capacity of an input signal to a directly proportional output signal.
- L. Pneumatic switching relays shall be snap acting, switching type with adjustable switching setpoint and fixed differential, single or double pole, and metallic body, for connecting a common port to either of two other ports based on the switching signal.
- M. Pneumatic multi-purpose relays shall be two-valve design, high accuracy, high repeatability, metallic body, internal relief, high capacity, proportional, with adjustable set point, capable of being used as direct or reverse acting, amplifying, signal advancing, minimum pressure output, or lower pressure transfer. Removal of main air to the relay causes the branch line output to go to zero.
- N. Pneumatic gradual position switches shall provide regulated pressure to a controlled device, with knob and pointer for manual adjustment, graduated scale plate with appropriate markings, suitable for surface or flush mounting on wall or panel as indicated.
- O. Pneumatic selector switches shall be two or three position with metallic bodies, have indicating plates with appropriate markings, and suitable for panel or wall mounting. Switches installed in finished rooms shall be recessed in wall and provided with faceplate.
- P. Field Mounted Gauges:
 - 1. Provide 1-1/2" air pressure gauges on branch lines of pneumatic systems at controllers, transmitters, valve and damper operators, relays, switches, regulators; and DDC output points. Accuracy shall be 2.5 percent of full scale for the middle half of scale and 3.5 percent elsewhere. At dampers or devices that utilize multiple actuators, a single gauge in a readily visible location is acceptable.
- Q. Panel Mounted Pneumatic Gauges:
 - 1. All transmitters shall be provided with receiver gauges.
 - 2. Door mounted analog indicator gauges shall be 3-1/2" diameter with 1% accuracy.
 - 3. Sub-panel mounted analog indicator gauges shall be 2-1/2" diameter with 1% accuracy.
 - 4. A 1-1/2" gauge shall be provided on the main air supply inside each control panel.

2.13 LOCAL, AUXILIARY, UPS, LPI AND SIMILAR PANELS

- A. Unitized cabinet type for each system under automatic control with relays and controls mounted in cabinet and temperature indicators, pressure gauges, pilot lights, push buttons and switches flush on cabinet panel face, or as detailed on drawings.
- B. Doors shall be removable, right or left hand hinged, locking, keyed alike and to other U-M control panels.
- C. Removable perforated subpanel to permit mounting of controls without drilling holes.

- D. Wall mounted or support kit or unistrut type frame for floor mounting.
- E. Unit shall have knockouts, NEMA Type 1, and listed under UL508 Industrial Control Panel Enclosures.
- F. LPI panel minimum size shall be 19-1/2" high by 16-3/8" wide by 5-3/4" deep.
- G. UPS panel minimum size shall be 19-1/2" high by 20" wide by 10" deep. Confirm with UPS dimensions & clearances

2.14 AHU SAFETIES ENCLOSURES

- A. Enclosures shall utilize a standard 4-11/16" x 4-11/16" square electrical box and blank cover. One half of the blank cover shall be painted red and the other blue. A red neon indicator light shall be installed in the red half of the cover and a blue neon indicator light shall be installed in the blue half of the cover. A terminal strip shall be installed inside the electrical box with two terminals in one half, labeled "H1" and "H2" (for HVAC use), and two additional terminals in the other half, labeled "F1" and "F2" (for fire alarm use). The red neon indicator shall be wired to the F terminals and the blue neon indicator to the H terminals.

2.15 HUMAN MACHINE INTERFACE PANEL(HMI)- TYPE 1

- A. HMI shall be capable of measuring the differential pressure between two adjacent spaces at all locations shown on the prints. Each room shall have its own controller capable of stand-alone operation. Each monitor shall be capable of both visual and audible alarms.
- B. Room pressurization monitoring system shall consist of a differential pressure transducer, wall-mounted display, DDC controller, wall/ ceiling-pickups with stainless steel trim kits and tubing.
- C. Supply voltage shall be 24V AC. Monitors shall be capable of wipe down cleaning.
- D. Each monitor shall support up to four (4) individual screens.
- E. Each monitor shall have the ability to zero and set up the transducer as well as configure the alarm delay from the local interface.
- F. When used on rooms with ante-rooms, monitor shall be capable of monitoring up to (2) two separate rooms (i.e. Patient Room and Ante-Room) with separate room pressure readings for each.
- G. Provide a monitor with a full color TFT/ QVGA touchscreen interface, min. size of 7" corner to corner. Monitors with color touchscreen displays shall be flush mounted and user programmable. Home screen graphics shall indicate one of five (5) configurable room modes. Each mode will allow for customized color, verbiage and graphic. Monitor shall display relevant room values (pressure, temperature, humidity, airflow, status, etc) as indicated on Contract Documents. Display shall provide a change of color for visual indication of alarm status: green for normal, orange for warning alarm (with notice on monitor to close door) and red for alarm. Monitor settings shall be accessed via password protected touch screen.
- H. When used serving an Isolation Room or Protective Environment Room:

1. Monitor mode (i.e. Normal Patient Room or Isolation/ Protective Environment Room) shall be set by the user (clinician) thru touchscreen password access.
 2. Shall be provided with a separate remote mounted monitor panel, located at the respective nurse's station- see drawings. Remote panel shall be flush mounted LCD screen, set to monitor and alarm (visual only) multiple HMI's. Panel shall be capable of indicating respective room's status (isolation/protective vs. normal patient room) and alarm.
- I. Provide monitor with integrated room DDC controller, panel or valve mounted. Controller shall:
 1. Be non-proprietary and be fully configurable and commissionable thru the monitor touchscreen.
 2. Be native BACnet (MS/TP or IP), BTL listed high speed micro-processor based and integrated into the BMS.
 3. Comply with Part 1- "Quality Assurance".
 4. Be capable of direct connection to up to four (4) HMI's.
 5. NOT serve as the control for the space. All control shall reside within the MSCC's BMS. HMI- Type 2 DDC controller shall function as a pass-thru controller only.
 - J. Monitor shall generate a local visual alarm upon loss of room pressure after a time delay. Monitors used on patient spaces shall have their audible alarms silenced. See Contract Documents for alarm setpoints and time delay.
 - K. DDC interface: Device shall be integrated to the BMS front-end via BACnet MS/TP or IP.
 - L. Provide panel with Room Differential Pressure Transmitter, specified herein.
 - M. Approved Manufacturers: Critical Room Control CRC-IRC-TM

2.16 HUMAN MACHINE INTERFACE PANEL(HMI)- TYPE 2

SPECIFICATION EDITOR: UMH DESIRES TO UTILIZE A LOCAL INTERFACE TO SIMPLY DISPLAY CRITICAL INFRASTRUCTURE POINTS (IE AHU DISCHARGE AIR TEMPERATURES, DIFFERENTIAL PRESSURE, SUPPLY & RETURN WATER TEMPERATURES, ETC) AT THE TEMPERATURE CONTROL PANEL TO PROVIDE A QUICK VISUAL ON THE STATUS OF A SYSTEM. OLDER INSTALLATIONS HAVE USED LOOP POWER INDICATORS IN COMBINATION WITH RTD SENSORS (SPECIFIED ELSEWHERE IN THIS SPEC). NEW INSTALLATIONS SHALL UTILIZE HUMAN MACHINE INTERFACE PANELS AS SPECIFIED BELOW.

- A. The MSCC shall install a 7" TFT LCD industrial color touchscreen in the cover of the DDC control panel. The HMI shall be custom configured by the Systems Integrator to display controller status and critical system parameters (AHU discharge temperature, differential pressure, supply & return temperatures, etc) relevant to the equipment the DDC controller is controlling. Standard default view shall be a read only display.
- B. HMI shall utilize BACnet MS/TP direct to DDC controller as well as IP thru the HITs network for management and configuration of the device.

- C. HMI shall at a minimum satisfy BACnet Operator Device (OD) functionality as a local MS/TP device.
- D. HMI shall be suitable for operation in un-conditioned equipment room (32°F-122°F, 30%-90%RH).
- E. Approved Manufacturers:
 - 1. Loytec LVIS-3ME7-G2 with mounting frame

2.17 ROOM DIFFERENTIAL PRESSURE TRANSMITTER

- A. Provide room differential pressure transmitter and wall/ ceiling-shielded static air probes with trim kits and tubing.
- B. Transducer accuracy shall be minimum $\pm 0.4\%$ full scale including the effects of linearity, hysteresis and repeatability. The transducer shall be dead-ended and not allow air to pass from controlled space to reference. Transducer sensing diaphragm shall be non-metallic, silicon-based. The transducer max change shall be $\leq 0.25\%$ per year. Provide with bidirectional range of ± 0.10 in wc. Each transducer shall be digitally compensated using an application specific integrated circuit (ASIC). The transducer shall have an integral LED power/status indicator. The room pressure transducer shall be factory calibrated with NIST traceable standards. Span and zero shall be individually adjustable. Implied pressure measurement systems utilizing thermal hot wire or thermal mass air velocity measurement are not acceptable.
- C. Provide with aluminum or stainless steel flush mounted, shielded static air probes, complete with pressure impulse suppression chamber and airflow shielding. Probe shall be capable of sensing static pressure within 1% of actual pressure value while being subjected to airflow at 1,000 FPM. Air Monitor model "SAP" or CRC "RST".
- D. When used with HMI- Type 4 (Operating Rooms, Procedure Rooms, Cardiac Cath/ IR Rooms), or as shown on contract documents, provide with door contact switch(es) for all doors into room. See construction documents for details.
 - 1. Powered sliding doors shall utilize a relay in the door actuator as proof of door status, coordinate with door hardware.
 - 2. Hinged doors shall utilize a concealed, hermetically sealed magnetic reed switch, field mounted in the top of the door frame and correspondingly in the top of the door. Contact housing color shall match door frame. Contacts shall be UL listed, GE Sentrol Industrial series or CRC Solutions door contact.
- E. Acceptable Room Differential Pressure Transmitter Manufacturers:
 - 1. Ashcroft CXLdp
 - 2. CRC-DPT

2.18 PNEUMATIC ACCESSORIES

THE UNIVERSITY'S HIGH PRESSURE AIR SUPPLY IS AVAILABLE ON CENTRAL CAMPUS VIA THE STEAM TUNNEL SYSTEM AND IS DELIVERED AT -50 DEG. F DEW POINT. THEREFORE CONTROLS USING THIS AIR SUPPLY SHOULD NOT

NORMALLY REQUIRE REFRIGERATED OR DESICCANT AIR DRYERS, EVEN WHEN EXPOSED TO OUTDOOR AIR CONDITIONS.

A. Control Air Supply

1. Control air supply shall be from the University's high-pressure (steam tunnel) air supply or from a temperature control compressed air station as indicated on the project documents. System shall be sized for expected use, including air usage of laboratory airflow units or process control actuators (whether this equipment is provided by the MSCC or not), plus 10 percent extra capacity. When providing a control compressed air station, provide a Refrigerated Air Dryer if none of the pneumatic tubing or pneumatic components are exposed to outside air conditions. Provide a Regenerative Desiccant Air Dryer when pneumatic tubing or pneumatic components are exposed to outside air conditions. For projects utilizing the University's high pressure air supply, unless indicated otherwise on the drawings, no air dryers are required.

B. Compressed Air Station

1. Temperature control air compressors shall be reciprocating oil type through 25 HP, rotary screw over 25 HP, specifically designed for pneumatic controls, shall be of the simplex or duplex type, tank or base mounted unit assemblies, have combination intake filter/silencer, and totally enclosed belt guards. Compressors shall be sized based on no more than 1/3 run time with an appropriately sized tank and an average tank pressure of 70 psig for optimum performance. Simplex units shall only be used when backing up another control air supply.
2. Tank shall be of adequate size and contain a shut-off ball valve, ASME safety relief valve, pressure switch operated start/stop control, 120 VAC electronic automatic drain with manual bypass and air pressure gauge.
3. Duplex models shall be complete with NEMA 1 enclosure, starters, disconnects, automatic alternator, H-O-A switches (left H position spring return for test only), low oil shutdown switch, push-to-test pilot lights, and 3-position switch for selection of: compressor 1 only/automatic alternate/compressor 2 only operation. PRV/filter/dryer assemblies may be mounted to the compressor/tank assembly.

INCLUDE BELOW PARAGRAPH "4" FOR CRITICAL INSTALLATIONS REQUIRING COMPRESSED AIR REDUNDANCY WITHOUT CONNECTIONS TO THE UNIVERSITY'S HIGH PRESSURE AIR SUPPLY, OTHERWISE DELETE. EDIT ABOVE ACCORDINGLY

4. Provide (2) two fully redundant simplex or duplex air compressors, each sized for 100% of the total demand, per above requirements. Provide compressor alternating switch and associated piping and 120V power to automatically alternate lead compressor (similar to Ingersoll-Rand "Alternator Switch").
5. Approved Manufacturers:
 - a. Quincy
 - b. ACP
 - c. Divilbis
 - d. Ingersoll-Rand

C. Tubing

1. Copper tubing shall be new hard drawn, air grade, ASTM B75 for 3/8 inch and smaller or type L, ASTM B68 for 1/2 inch and larger, with solder joint or compression type fittings, at the option of the MSCC.
2. Plastic tubing (all sizes) shall be black virgin, polyethylene, ASTM D1248, Type 1, Class C, Grade 5, meeting crack test performance required by ASTM D1693 and be fire retardant (FR) rated. Multi-tube harness material shall be as specified above with a polyester film barrier and vinyl jacket not less than 0.062 inches thick. All non-metallic tubing shall be 1/4" O.D. minimum; micro-sleeve is not acceptable.

D. Pressure Reducing Valves:

1. Pressure reducing valves (PRV) shall be diaphragm operated, self-relieving, designed to provide precision control of air supply pressures, and shall be located after any filters or dryers.
2. PRV shall be capable of being mounted in any position, shall have locking set point handle, and SS inlet strainer.
3. PRV shall have metal or plastic body and shall be provided with 2-1/2" gauge of appropriate units.
4. PRV's that are not self-relieving shall be provided with a separate relief valve of appropriate range.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air
 - e. Johnson
 - f. Honeywell
 - g. Siemens

E. DDC/Auxiliary/Local Control Panel Air Filters:

1. Provide an in-line air filter for main air supply to all DDC, auxiliary and local control panels capable of removing solids and petroleum-based oils.
2. Filter efficiency shall be 99.9% of 0.5 micron particles.
3. Filter element shall be visible and shall change color to indicate when to be replaced.
4. Minimum capacity shall be 500 SCIM and 30 psig.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

F. Coalescing Air Filters:

1. Provide a duplex set of coalescing air filters for the main air supply to all building temperature controls.
2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
3. Filter shall have a replaceable cartridge and drain port.
4. Filter shall be designed to remove oil and water droplets down to 0.01 microns and particulates down to 0.08 microns. Minimum capacity shall be 10 SCFM and 150 psig.
5. Coalescing filters shall be located downstream of refrigerated air dryers and upstream of chemical or desiccant dryers.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 61

6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

- G. Particulate Air Filters:
 1. Whenever chemical or desiccant dryers are used, provide a duplex set of particulate air filters for the main air supply to all building temperature controls located downstream of chemical or desiccant dryers.
 2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
 3. Filter shall have a replaceable cartridge and drain port.
 4. Filter shall be designed to remove particulates down to 0.1 microns. Minimum capacity shall be 10 SCFM and 150 psig.
 5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

- H. Refrigerated Air Dryers:
 1. Provide a 120 VAC air-cooled refrigerated dryer capable of providing 35 deg. F dew point air.
 2. Unit shall have power on light, high temperature light, valved air bypass piping, and air-to-air precooler/reheater.
 3. Heat exchanger to be non-fouling, tube-in-tube, self-cleaning with smooth surfaces.
 4. Compressor shall have hot gas bypass, as required, and shall be protected by thermal and current overloads.
 5. Condenser fan shall have thermal overload protection.
 6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

- I. Regenerative Desiccant Air Dryers:
 1. Provide a 120 VAC regenerative type desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing -40 deg. F dew point air at 150 psig.
 2. Units shall have an adjustable solid-state timer and purge flow economizer valve, on/off switch, power on light, separate fill and drain ports for ease of desiccant replacement without piping removal, heavy duty purge exhaust mufflers for quiet operation, non-lubricated air control valves, Teflon seated check valves, visible moisture indicator, visible purge flow indicator, pressure relief valve, ASME code constructed/stamped pressure vessels, SS support screens and air diffusers, tower pressure gauges, structural floor frame and stand for large sizes, wall mounting brackets and supports for small sizes, pre-piped and wired, and complete with air bypass piping.
 3. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker

- d. Van-Air
- J. In-line Desiccant Air Dryers:
 - 1. Provide an in-line desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing 4,000 cubic feet of -40 deg. F dew point air at 150 psig with a dryer inlet temperature of 68 deg. F.
 - 2. Units shall have a removable bowl or fill port for ease of desiccant replacement without piping removal, visible moisture indicator, and air bypass piping.
 - 3. Not to be used as a substitute for Regenerative Desiccant Air Dryers when providing a control compressed air station.
 - 4. Approved Manufacturers:
 - a. Wilkinson
 - b. Hankison
 - c. Parker
 - d. Van-Air

2.19 IDENTIFICATION AND LABELS

- A. The MSCC shall provide black phenolic nameplates with engraved white minimum 1/4" high lettering, for each DDC or auxiliary panel, panel door mounted devices, and all LPI's, permanently attached, to identify field panel number, building, area, service, etc.
- B. Labelling convention for DDC Panels shall follow that set forth under the Field Device Identification section of Part 3 "BACNET OBJECT / CONTROL POINT NAMING", along with the room number where the panel is mounted, and shall include a list of systems controlled/monitored/alarmed by that field device. Examples of this include:
 - 1. 0316-PNL-B2C326 services 0316-AHU-0202 and FCU-B2345. Panel is mounted in room B2C326.
 - 2. 0517-PNL-4745-IO1 services 4th Floor VAV boxes (indicates a remote I/O module off PNL2)
- C. MSCC shall label panel power supply with power circuit and electrical panel information.
- D. All control devices located within auxiliary panels shall be labeled with legible identification that corresponds with the as-built drawings via black permanent marker. Use plastic or metal tags when it is not possible to mark directly on the device.
- E. Provide typed labels on all point terminals on DDC controllers, indicating point name and type.
- F. All wiring and pneumatic tubing shall be suitably identified by thermal print labels at controller and input/output device.

PART 3 - EXECUTION

SPECIFICATION EDITOR: ONLY USE THE FOLLOWING PARAGRAPH FOR ADDITION & RENOVATION PROJECTS. REMOVE THE FOLLOWING PARAGRAPH FOR NEW, STAND-ALONE FACILITIES.

3.1 DEMOLITION

- A. All existing control panels, devices, wiring and tubing that are to be abandoned as part of renovation work shall be demolished completely by the MSCC.
- B. All demolished controllers or control devices that are still in working condition shall be returned to UMHHC's HVAC maintenance department.
- C. Abandoned wiring shall be demolished back to the nearest connection point or junction box.
- D. Abandoned pneumatic tubing shall be demolished back to the nearest main-line tap and shall be capped with a mechanical fitting.
- E. The MSCC shall be responsible for completely removing and decommissioning all DDC control programming on controllers associated with demolished DDC points and devices.
- F. When controllers are removed, the MSCC shall ensure that the existing DDC panel communication bus is maintained during and after all demolition work.
- G. The SI shall be responsible for any changes from removed points, devices & controllers to UMH's BMS frontend and the engineering database.

3.2 INSTALLATION

- A. Install all system components as recommended by the manufacturer, including air compressors, dryers, filters, etc.
- B. Thermostats, room temperature sensors, push-buttons, and other adjustable devices meant for room occupant operation shall be mounted 44" to center above the finished floor. This requirement does not apply to control panels and devices mounted in penthouses, mechanical rooms, and other spaces normally inaccessible to room occupants.
- C. Zone thermostatic controls used to control both heating and cooling, e.g. a variable volume terminal unit also controlling a reheat coil and/or fin tube radiation, shall be programmed (DDC systems) or set up (non-DDC systems) with a heating setpoint of 71°F and cooling setpoint of 76°F, and a dead-band of 5°F, unless indicated otherwise on the Drawings.
- D. System I/O's shall not be split between different DDC panels.
- E. AHU safeties enclosure shall be mounted at the wiring/tubing DDC panel array interface trough.
- F. Install all conduit, wiring, cable, tubing and equipment in a first-class manner, using proper tools, equipment, hangers, and supports, and in locations as required for a neat, attractive installation. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner. Conduit shall not be supported from work of other trades.
- G. Support all sensors and devices as recommended by the manufacturer. Space sensors shall be mounted on an electrical box.
- H. Provide a control air shut-off valve for each panel.

- I. Panels and meter enclosures shall be rigidly mounted.
- J. Plastic tubing may be used in all locations, except in mechanical rooms, shafts, or exposed locations, unless run in conduit.
- K. Tubing shall not be attached to conduits with current carrying conductors or fire protection piping. It shall be adequately supported with no noticeable sagging between supports, and protected from abrasion and galvanic corrosion. All pneumatic tubing shall be concealed in finished areas.
- L. A PRV shall be installed on each floor to provide control air supply.
- M. All wiring to devices installed inside auxiliary/local panels shall enter/exist via terminal strips, except twisted/shielded sensor wiring.
- N. Provide a pouch or other containing method inside each control panel and insert a copy of the corresponding system control drawings.
- O. Provide supplemental Hand-Off-Auto switches and contactors, as required, to permit automatic operation of equipment from the DDC system (i.e. single phase equipment which uses fractional motor starters, etc.).
- P. Extreme care shall be used in making connections to other equipment to see that the safeties on this equipment are not inadvertently bypassed or overridden by the DDC.
- Q. All equipment having moving parts and controlled by the DDC shall be provided with warning labels no less than 2 in. in height, and in bright warning color, stating that the equipment is remotely started by automatic controls. Such labels shall be posted clearly in the area of any moving parts, such as belts, fans, pumps, etc. The University of Michigan will furnish and install these warning labels.
- R. Ensure all dampers, valves, thermowells, flow meters, and other miscellaneous control components are located and installed correctly so that the specified and intended performance and the Sequence of Operation is achieved, including components supplied and installed by others.
- S. Limit switches used on dampers shall be set at approximately 95% of full stroke (opened and closed). Where a single limit switch is indicated, set at approximately 75% of full stroke.
- T. MSCC shall provide all necessary equipment, test gases, etc. for calibration, and shall calibrate all sensors (i.e. CO₂, CO, combustible gas, etc.) in accordance with the manufacturer's recommendations. Specialized equipment, test gases, etc. shall be turned over to owner upon completion and acceptance.
- U. Flow meters shall be installed with at least 10 diameter of straight pipe length upstream and five diameter of straight pipe length downstream. Power supply to flow meters and BTU meters shall be 115 VAC from the auxiliary DDC panel, and power connection for each device shall be installed with a lockable local service disconnect. Flow meter transmitters/ displays and BTU meters, shall be mounted 4 feet above finished floor. They shall be located at the DDC panel array unless the maximum available cable length is exceeded. All

- meter components, including sensors, shall be mounted in accessible locations.
- V. Airflow sensors shall be installed with the appropriate upstream and downstream clearances per manufacturer's instructions.
 - W. Remove any unused items that are part of renovations or demolition, including, but not limited to: conduit, wire, tubing, controllers, controlled devices, relays, enclosures, etc. Do not abandon in place.
 - X. DDC sensor cabling shall not be spliced.
 - Y. DDC Wiring shall be terminated at DDC sensors, relays, transducers, switches and control panels. Intermediate stops or terminations at any other terminal strips are not acceptable.
 - Z. Locate all control components and accessories such that they are easily accessible for adjustment, service and replacement.
 - AA. Participate in the commissioning process in accordance with the project commissioning documents.
 - BB. All set points and alarm points shown on the documents are preliminary. Finalize with the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
 - CC. For fan coil/ terminal unit controllers and similar programmable electronic controllers, obtain approval of programmable settings from the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
 - DD. Install constant flow fume hood sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal use, and allows vertical sashes to be positioned without binding, twisting or tangling.
 - EE. Devices and wiring installations within panels shall be neat and concise.
 - 1. All wire and pneumatic tubing within the controls enclosure shall be neat and suitably bundled and contained in "Panduit" wire duct, or equivalent, parallel and/or perpendicular with enclosure. Free-hanging, loose installations are not acceptable.
 - 2. All panels, enclosures, sub-panels, junction boxes, pull boxes, troughs, trays, etc. shall not exceed 70% maximum conductor fill.
 - 3. Each input/output device shall be controlled from a dedicated 2-pair conductor.
 - 4. Each input/output device requiring power shall have a dedicated power wire run to the control enclosure and shall be terminated to a dedicated terminal strip.
 - FF. Except as specified otherwise, throttling ranges, proportional bands, and switching differentials shall be centered on the associated set point.
 - GG. All set points, unless otherwise indicated, are adjustable and shall be programmable for all control loops.

- HH. Where any sequence or occupancy schedule calls for more than one motorized unit to start simultaneously, the system start commands shall be staggered by 60-second (adj.) intervals to minimize inrush current.
- II. Optimal start/stop programs shall be applied to all regularly scheduled mechanical and electrical systems.
- JJ. Configure modular DDC panel terminations such that analog inputs and analog outputs terminate on separate modules, do not intermix analog outputs and inputs on the same module.
- KK. Provide temporary programming to provide building heating or cooling during construction.
- LL. Programming lines shall be grouped into subparts and explained with comment fields. The comment fields shall include the related part of the project sequence of operation that each program subpart is intended to accomplish.
- MM. MSCC shall be responsible for adding all DDC devices, logic, project files, etc. in the project scope of work to the UMHHC managed vendor specific engineering software to allow UMHHC to fully manage system code/logic, network settings, definitions, parameters, etc.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.
- NN. Install constant flow fume hood monitors surface mounted on the front of the fume hood. Furnish exact dimensions and location to the fume hood factory to allow for concealed wiring to the monitor.

3.3 HUMAN MACHINE INTERFACE PANEL(HMI) INSTALLATIONS

- A. MSCC shall provide Human Machine Interface Panel(HMI)- Type 1 for the following room types, or as shown on contract documents:
 - a. Airborne Infection Isolation Room
 - b. Protective Environment Rooms
 - c. Labs
 - d. Autopsy Rooms
 - e. Pharmacies
 - f. Central Sterile Processing/ Instrument Processing
 - g. Infection Control Room Type 1- Operating Rooms
 - h. Infection Control Room Type 2- Procedure Rooms
 - i. Infection Control Room Type 3- Cardiac Catheterization, Angiography, Interventional Radiology

SPECIFICATION EDITOR: THE AE SHALL EDIT BELOW AND CLEARLY INDICATE ON CD'S WHERE LOCAL DDC PANEL HMI'S ARE REQUIRED. IN GENERAL, DDC HMI'S SHOULD BE PROVIDED FOR ALL CONTROLLERS SERVING THE EQUIPMENT IDENTIFIED BELOW IN ALL INPATIENT FACILITIES AND AMBULATORY SURGERY CENTERS. INSTALLATIONS WITHIN OUTPATIENT BUILDINGS OR MEDICAL OFFICE BUILDINGS TYPICALLY DO NOT WARRANT THE NEED FOR DDC PANEL HMI'S.

- B. MSCC shall provide Human Machine Interface Panel(HMI)- Type 2 for the following room types/ applications, or as shown on contract documents:

- a. All DDC Panels as specified herein and/ or as indicated on contract documents. The exception to this are DDC HMI's are NOT required for:
 - 1) DDC controllers serving unitary/ terminal infrastructure (ie VAV's, CUHs, FCU's, etc).
 - 2) DDC controllers in non-Inpatient facilities and non-Ambulatory Surgery Centers (ie medical office facilities, outpatient facilities).
 - b. HMI shall be provided with a network connection to the HITs network as well as a connection to the local DDC controller.
 - c. MSCC shall be responsible for providing and installing the HMI- Type 2, including all required power, communication and associated raceway. MSCC shall mount HMI in DDC panel door. MSCC shall validate proper IP & MS/TP communication to HMI.
 - d. Systems Integrator (SI) shall be responsible for the configuration and generation of graphics on the HMI-Type 2.
- C. MSCC shall integrate HMI to the BMS. MSCC shall power monitors from an emergency power source, as shown on contract documents.
- D. Flush-mount room mounted HMI's adjacent to the door into each space, in the corridor wall. For rooms with an anteroom, mount monitor in corridor wall, outside anteroom.

3.4 ROOM DIFFERENTIAL PRESSURE TRANSMITTER INSTALLATIONS

- A. Transmitters shall be mounted in a wall mounted panel enclosure above the ceiling on the corridor side of the door into the space. Confirm mounting location with project engineer.
- B. The pressure port tube distance between transmitter and room pickup should be minimized as much as possible. Remote mounted transmitters utilizing extensive pickup tubing lengths have proven to yield inaccurate room pressure readings and are not allowed.

3.5 UNINTERRUPTABLE POWER SUPPLIES (UPS) INSTALLATIONS

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE ON CD'S WHERE LOCAL UPS'S ARE REQUIRED TO POWER DDC PANELS. IN GENERAL, UPS'S SHOULD BE PROVIDED TO PROTECT AGAINST DAMAGE DUE TO POWER QUALITY AND TO MINIMIZE DISRUPTION.

- A. Provide local UPS as specified herein for all front-end DDC panel installations and/ or as indicated on contract documents. Local UPS is NOT required for:
 - 1. DDC controllers powered from a central UPS system.
 - 2. DDC controllers serving unitary/ terminal infrastructure (ie VAV's, CUHs, FCU's, etc).
 - 3. DDC controller installations that can utilize an existing, local UPS on an adjacent DDC installation. MSCC shall provide all raceways & cabling needed to extend power to new DDC devices. MSCC shall be responsible for validating that the existing UPS is capable of supporting the additional loads.
 - 4. DDC controllers in non-Inpatient facilities and non-Ambulatory Surgery Centers (ie medical office facilities, outpatient facilities).

- B. Rigidly mount and anchor UPS to wall, either in ventilated panel enclosure or on wall brackets, per specification section 2.5. Do not mount UPS on floor.
- C. Connect HITS provided patch cable at UPS and configure network communication card to facilitate communication and SNMP integration to the Desigo frontend.

3.6 BACNET OBJECT / CONTROL POINT NAMING

- A. The contractor shall use the BMS point naming convention outlined below. In instances where character restrictions prohibit use of this convention, or for other unique systems not covered below, contact Colin Murphy in Systems Monitoring for direction (ctmurphy@med.umich.edu).
- B. The contractor shall provide a submittal for owner review and approval for the specific point naming convention proposed on the project. This shall be included in the BMS Temperature Controls submittal.
- C. All control points shall include three sections with decimal point separation: 4 digit UM Building number, system identification, point description identification. See the example below:
 - 1. 0316.AHU22.DAT = Discharge Air Temperature on air handler AHU-22 in the University Hospital Building (ID #0316).
- D. UM Building Number
Obtain the 4 digit UM building number from UMHC Systems Monitoring.
- E. Field Device Identification
 - 1. All field device identification shall include three sections with decimal point separation: 4 digit UM Building number, device identification and sequential number, and room where device is located. See the example below:
 - a. 0316.PNL1.3000M = DDC Panel #1 in room 3000M in the University Hospital Building (ID #0316).
 - 2. Device abbreviations shall conform to the following:
 - a. FCU = Terminal fan coil unit controller
 - b. HMI = Human Machine Interface Panel
 - c. MON = Terminal controller with monitoring points only
 - d. PNL = DDC Panel (Controller)
 - e. RTR = Router (BACnet IP)
 - f. UPS = Uninterruptable Power Supply
 - g. VAV = Terminal VAV box controller
 - h. PM = General Power Meter
 - i. PQ = Power Quality Meter
 - j. ATS = Automatic Transfer Switch
 - k. STS = Static Transfer Switch
 - l. GW = Gateway
- F. System Identification
 - 1. The point system identification shall associate a point with the system it is directly related to. A system shall be an air handling unit, a heating system, a chilled water system, a VAV box, etc.

2. System and equipment designations shall match those set forth on the equipment schedules in the project documents. When not clearly defined, systems shall be abbreviated in the point name as follows:
 - a. AHU = Air Handling Unit
 - b. CHW = Chilled Water and Primary Chilled Water Loop
 - c. CRAC = Computer Room Air Conditioning unit
 - d. CW = Condenser Water
 - e. DHW = Domestic Hot Water
 - f. FCU = Fan Coil Unit
 - g. HHW = Heating Hot Water
 - h. PCHW = Process Chilled Water
 - i. RTU = Rooftop Unit
 - j. SCHW = Secondary Chilled Water
 - k. TCHW = Tertiary Chilled Water
 - l. UH = Unit Heater
 - m. VAV = Variable or Constant Air Volume Box
3. If the system is one of multiple common systems in a building (AHU's, etc.), the System Identification shall include the system identifier. See the examples below:
 - a. AHU01 = Air Handling Unit AHU-1
 - b. AHUH52 = Air Handling Unit AHU-H5-2
 - c. AHUOA1 = Outside Air Handling Unit AHU-OA-1
4. Terminal equipment, such as VAV boxes or fan coil units, shall include the room number of the space served in the System Identification. If the equipment serves multiple rooms, the primary room or room including the thermostat shall be used for this identification. For areas such as operating rooms, where the room ID would be more commonly used than the actual room number, the ID shall be used (ie. OR-5 instead of 1C204). Terminal equipment served by central equipment shall include the central equipment ID as a prefix to the System abbreviation. See the examples below:
 - a. 12VAVB2C205 = VAV box serving room #B2C205 with ventilation supplied by AHU-12
 - b. HS01VAVOR5 = VAV box serving operating room OR-5 with ventilation supplied by AHU-HS-01

G. Point Description Identification

1. The point description identification shall identify the specific point and its function in the system. A Point Description shall identify and describe the field or virtual device, sensor, setpoint, mode, etc. It is understood and accepted that many terminal equipment controllers for VAVs, etc., will include pre-programmed Point Descriptions that do not match the identifications below.
2. Points shall not be bundled into combined points. For example, a motor start DO and status DI points shall remain fully independent points with a separate programmed alarm point when these two do not match (ie. Siemens L2SL points, or equivalent, are not acceptable).
3. Descriptions shall be abbreviated in the point name as follows:
 - a. BPV = Bypass Valve
 - b. BTU = Energy Units Btu
 - c. BTUH = Energy Rate Units Btu/hour
 - d. CCT = Cooling Coil Leaving Air Temperature
 - e. CCV = Cooling Coil Control Valve

- f. CFM = Air Volume Flowrate
- g. CH# = Chiller (ie. CH-1 is "CH1")
- h. CO2 = Carbon Dioxide
- i. CT# = Cooling Tower (ie. CT-1 is "CT1")
- j. CT#VFD = Cooling Tower VFD (ie. CT-1 VFD is "CT1VFD")
- k. DAPRS = Discharge Air Static Pressure
- l. DARH = Discharge Air Relative Humidity
- m. DAT = Discharge Air Temperature
- n. DECGPM = Decoupler Liquid Volume Flowrate
- o. DIFCFM = Air Volume Flowrate Differential
- p. DP = Differential Pressure
- q. EAT = Exhaust Air Temperature
- r. EODPRS = End of Duct Static Pressure
- s. FLT = Filter Differential Pressure
- t. FPM = Speed in Feet Per Minute
- u. FRZ = Freezestat
- v. GPM = Liquid Volume Flowrate
- w. HCV = Heating Coil Control Valve
- x. HUV = Humidifier Control Valve
- y. HX# = Heat Exchanger (ie. HX-1 is "HX1")
- z. KW = Kilowatt
- aa. KWH = Kilowatt Hour
- bb. LVL = Level
- cc. MAD = Mixed Air Dampers
- dd. MAT = Mixed Air Temperature
- ee. OACFM = Outside Air Volume Flowrate
- ff. OAE = Outside Air Enthalpy
- gg. OARH = Outside Air Relative Humidity
- hh. OAT = Outside Air Temperature
- ii. OAW = Outside Air Humidity Ratio
- jj. OCC = Occupied Mode
- kk. OS = Occupancy Sensor
- ll. P# = Pump (ie. P-12 is "P12")
- mm. P#VFD = Pump VFD (ie. P-12 VFD is "P12VFD")
- nn. PHT = Preheat Coil Leaving Air Temperature
- oo. PRS = Static Pressure
- pp. RACFM = Return Air Volume Flowrate
- qq. RAE = Return Air Enthalpy
- rr. RAFVFD = Return Air Fan VFD
- ss. RAF = Return Air Fan
- tt. RARH = Return Air Relative Humidity
- uu. RAT = Return Air Temperature
- vv. RAW = Return Air Humidity Ratio
- ww. RETT = Return Temperature (water)
- xx. RLA = % Rated Load Amps
- yy. RMT = Room Temperature
- zz. SACFM = Supply Air Volume Flowrate
- aaa. SAFVFD = Supply Air Fan VFD
- bbb. SAF = Supply Air Fan
- ccc. SCV = Steam Control Valve
- ddd. SUPT = Supply Temperature (water)
- eee. TON = Cooling Load Tons
- fff. UNOC = Unoccupied Mode
- ggg. V# = Isolation/2-Position Valve (ie. V-12 is "V12")
- hhh. VIBSW = Vibration Switch
- iii. VLT = Voltage

BuildingName

The Description of the Project

4. Point description shall include an underscore and additional tag for extra description such as setpoint, alarm, etc. Description add-ons shall be abbreviated in the point name as follows:
 - a. `_ALM` = Alarm
 - b. `_CMD` = Command
 - c. `_HLSP` = High Limit Setpoint
 - d. `_LLSP` = Low Limit Setpoint
 - e. `_SP` = Setpoint
 - f. `_STS` = Status
- H. See below for several examples of implementation of this point naming convention:
1. `0301.AHUC4.DAT_SP` = Discharge air temperature setpoint for AHU-C4 in the Cancer Center.
 2. `0316.AHU18.SAF_STS` = Status of supply fan in AHU-18 in the University Hospital Building.
 3. `5109.CHW.CH1SUPT` = Chilled water supply temperature from Chiller CH-1 in the Cardiovascular Center.
 4. `5109.CHW.SUPT` = Main primary chilled water loop supply temperature.
 5. `5109.SCHW.SUPT` = Secondary loop chilled water supply temperature in the Cardiovascular Center.
 6. `5173.HHW.HX1SCV` = Steam control valve on heat exchanger HX-1 in the Heating Hot Water plant in the Children's & Women's Hospital.
 7. `5173.SCHW.DP_SP` = Secondary chilled water loop differential pressure setpoint in the Children's & Women's Hospital.
 8. `5173.C9VAV9938."sub-points"` = Terminal DDC controller for a VAV box with a thermostat in room 9-938, served by Air Handling Unit AHU-C9 in the Children's & Women's Hospital. Terminal controller pre-programmed sub-points then follow in the Point Description Identification section.

3.7 TRENDING AND ALARMING

- A. All system trending, equipment schedules, and point alarm definitions shall be configured by the SI in coordination with Systems Monitoring and UMHHC standards.
- B. For all equipment where the MSCC has provided a command and status (ie fan, pump, valve with endswitch, etc), the MSCC shall program and broadcast a virtual point for alarming. Whenever the "enable" command does not match the status point, the virtual binary alarm point must change from normal to alarm.
- C. For every indicated or implied setpoint, MSCC shall create a variation from setpoint alarm. Examples include air handler discharge temperature, chilled water temperature, end-of-line DP, etc.
 1. MSCC shall disable variation from setpoint alarms when the associated equipment is not in use, i.e., disable discharge temperature alarm when the air handler is in unoccupied mode.
- D. Unless specifically indicated, alarms are not required for air terminal unit controllers (VAV's, etc) controlling space temperature.

3.8 CONTROLLER ADDRESSING

- A. Connection of new BACnet IP routers and B-BC Controllers to the HITS network shall be closely coordinated with HITS and the SI.
- B. The MSCC shall obtain IP addresses for new devices and the necessary IP addresses of other BACnet IP devices (for the BACnet Broadcast Distribution Table) from the HITS group thru Systems Monitoring.
- C. The MSCC shall obtain the BACnet Device Instance, Network numbers and MS/TP MAC address from the Systems Monitoring group.
- D. The MSCC shall deliver a list of Device Instance Numbers and Network Numbers to the UMHHC Systems Monitoring group at the close of each project.
- E. The MSCC shall begin Device Instance Numbers where they were left off on the last installation that the MSCC performed so that Device Instance Numbers are never duplicated. MSCC shall verify the next available Device Instance Number with UMHHC Systems Monitoring group prior to installation.

3.9 NETWORK CONNECTIONS

SPECIFICATION EDITOR: THE AE SHALL CLEARLY SHOW ON PROJECT CD'S WHERE HITS NETWORK CONNECTIONS/ JACKS ARE REQUIRED. LOCATIONS ON CD'S ARE REQUIRED SO AS TO COORDINATE HITS NETWORK REQUIREMENTS OF PROJECT.

- A. New MCS installations shall communicate with the existing Siemens Desigo CC servers over the HITS layer 3 network via BACnet IP communication. The following device types shall be provided with HITS network connections:
 - 1. DDC Controllers communicating BACnet IP (B-BC's and some B-AAC's)
 - 2. UPS's
 - 3. HMI-Type 4
 - 4. Routers (MS/TP to IP)
 - 5. Utility Meters
- B. The MSCC shall provide a single BACnet Broadcast Management Device (BBMD) per IP sub-net to properly broadcast a BACnet Distribution Table reflecting all BACnet devices connected to the BACnet network. This is required to permit streamlined and efficient integration with the BMS B-AWS. MSCC shall contact Systems Monitoring to determine if an existing BBMD is present or if new is required.
- C. Devices connected to the HITS network must meet HITS minimum security requirements. The HITS group may request to perform a security scan on network devices at their discretion. Submit network devices and all relevant information to the HITS group upon request.
 - 1. The MSCC shall remediate all critical, high and medium security vulnerabilities identified by the HITS security scan.
- D. The MSCC shall obtain IP addresses for new devices and the necessary IP addresses of other BACnet IP devices (for the BACnet Broadcast Distribution Table) from the HITS group thru Systems Monitoring.

- E. MSCC shall provide a 1" conduit from the DDC panel to the cable tray for network connectivity (cabling by HITS). In facilities where a cable tray system is not provided, the MSCC shall provide a 1" conduit raceway to the nearest Telecommunication Room. Coordinate routing with HITS thru Project Manager. HITS shall provide all network patch cables and biscuit jack inside the MCS enclosure; MSCC shall be responsible for connecting all patch cables at respective IP devices and establishing communication.

3.10 COORDINATION WITH SYSTEMS INTEGRATOR

- A. The MSCC shall provide all necessary coordination with the Systems Integrator (SI) to achieve an operational front-end user interface for the project.
- B. Provide all device PICS, a list of BACnet objects, approved submittals, as-built documents and all other relevant information to the SI before construction and at substantial completion as described in 1.9 "Submittals".
- C. Coordinate with SI as necessary to ensure that all system alarms that are generated by the DDC Controllers are communicated to the central BMS server(s) properly.

SPECIFICATION EDITOR: THE NUMBER OF REQUIRED COORDINATION MEETINGS DURING CONSTRUCTION AND COMMISSIONING WILL DEPEND UPON THE SIZE AND COMPLEXITY OF THE PROJECT. (2) ONE HOUR MEETINGS, DURING CONSTRUCTION & POST-CONSTRUCTION, IS THE MINIMUM; ADJUST UP BASED ON PROJECT SIZE & COMPLEXITY. COORDINATE WITH THE UMHC FPD DESIGN MANAGER.

- D. The MSCC shall be required to coordinate and attend:
 - 1. A (1) hour coordination meeting with the SI during construction. Meeting shall occur a minimum 2 weeks prior to releasing any points up to the Desigo CC front end and/or a minimum of 4 weeks prior to the scheduled substantial completion date.
 - 2. A (1) hour coordination meeting with the SI after construction, during system commissioning.
 - 3. All meeting requests shall be coordinated through the owner's project manager.

3.11 CALIBRATION AND START-UP

- A. The MSCC will start-up the DDC panels and provide calibration and start-up for temperature control devices and systems, including compressors, dryers, etc.
- B. Program all auto calibration routines to self-calibrate outside the hours of normal space occupancy. When this is not possible, program the self calibration to occur during hours of lowest occupancy. Establish with the Owner, working with the Commissioning Authority, a self calibration schedule that will be the least intrusive to building occupants. Phase self-calibration routines (as opposed to all devices simultaneously calibrating) to avoid negatively impacting air handler operation.

- C. After control components have been installed and connected, test, adjust and re-adjust as required all control components in terms of function, design, systems balance and performance. Control devices, linkages and other control components shall be calibrated and adjusted for stable and accurate operation in accordance with the design intent and to obtain optimum performance from the equipment controlled. MSCC shall utilize NIST calibrated devices for all device calibration/ verification. All control valves shall be stroked and spring ranges verified and set. All dampers shall be stroked to verify proper and smooth operation. Cause every device to automatically operate as intended to ensure its proper functionality. Make systems ready for acceptance tests.
- D. Perform point-to-point verification for all control inputs and outputs to confirm that all hardware points are terminated properly, ranges are calibrated and I/O's are functioning. MSCC shall schedule a verification exercise with the Systems Integrator for this exercise. Verification shall involve validating proper performance from device (i.e. sensor) to BMS graphic.
- E. Work with the SI to confirm that all control inputs and outputs are reporting properly to the BMS server(s) and that Systems Monitoring personnel are able to override all system outputs.
- F. After equipment has been accepted and operated in normal service for two weeks, check the adjustment of control components and recalibrate/replace where required.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.

- G. Set constant flow fume hood monitor alarms as follows:
 - 1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.
 - c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.

3.12 ACCEPTANCE PROCEDURE

- A. Upon successful completion of start-up and recalibration as indicated in this section, commission all mechanical controls provided. Provide a detailed list of every control point installed to the project Commissioning Authority (CxA), and verify proper operation of each component prior to commissioning the controls with the CxA. Include, in checklist format, a detailed procedure to verify all aspects of the controls' Sequence of Operation.
- B. Demonstrate, with the assistance of the Systems Integrator, operation of all control systems, including each individual component, to the University's Commissioning Agent.

- C. Validate that all security vulnerabilities identified by the HITS security scan have been remediated.
- D. After correcting all items appearing on the punch list, make a second written request to the University's Commissioning Agent for inspection and approval.
- E. After all items on the punch list are corrected and formal approval of the control systems is provided by the Architect/Engineer, the MSCC shall indicate to UMHC in writing the commencement of the warranty period.

3.13 OWNER INSTRUCTION AND TRAINING

SPECIFICATION EDITOR: THE REQUIRED AMOUNT OF TRAINING WILL DEPEND UPON THE SIZE AND COMPLEXITY OF THE PROJECT. FOR SMALLER, SIMPLER PROJECTS UMHC MAY REQUIRE ONLY A LIMITED AMOUNT OF TRAINING (IE 8 HOURS) OR NO TRAINING AT ALL. FOR LARGER PROJECTS WITH COMPLEX SYSTEMS, UMHC MAY REQUIRE SIGNIFICANT TRAINING HOURS (MIN 24 HOURS OF COMBINED ON-SITE & CLASSROOM INSTRUCTION) FOR BOTH MAINTENANCE AND SYSTEMS MONITORING PERSONNEL. TRAINING MAY ALSO NEED TO TAKE PLACE IN SEPARATE SESSIONS FOR DIFFERENT SHIFTS OF PERSONNEL. COORDINATE REQUIREMENTS WITH THE UMHC FPD DESIGN MANAGER IN THE DESIGN PROCESS AND MODIFY THE FOLLOWING PARAGRAPH AS NECESSARY.

- A. Provide a minimum of eight (8) hours of on-site instruction and training to UMHC Maintenance and Systems Monitoring personnel on the operation of the control systems for the installation.
- B. Training shall be a dedicated effort and not combined with other close-out services like start-up and commissioning.
- C. Instruction and training shall be performed by a competent Contractor representative familiar with the control systems operation, maintenance and calibration.
- D. UMHC may require that training hours be split amongst multiple groups or shifts of personnel. Coordinate division of training hours with UMHC prior to beginning training.

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 230910 - VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC

END OF CONTENTS TABLE

NEW SECTION: OCTOBER 2011.

JULY 2013: REVISED TO INDICATE THAT ALL PHOENIX CONTROLS SHALL BE LONWORKS® BASED AND THAT BACNET PROTOCOL IS NOT ACCEPTABLE, TO ASSURE PHOENIX CONTROL POINTS CAN BE MONITORED BY BAS. D. KARLE FOR HVAC MTT.

DECEMBER 2013: ADDED (ALL IN PART 3): DO NOT "CLIP" VALVES. LTAU VOLUME FOR VALVES SERVING HOODS WITH HORIZONTAL SASHES TO BE SET TO MAINTAIN THE REQUIRED FACE VELOCITY WITH THE SASHES IN THE POSITION THAT CREATES THE MAXIMUM FREE AREA OPENING. ALSO: ALARM SETTINGS FOR FLOOR MOUNTED HOODS. D. KARLE FOR HVAC MTT.

JUNE 2015: REVISED TO REQUIRE REHEAT COIL BE PROVIDED BY LCC, ADDED REHEAT COIL SPEC. ADDED REQUIREMENT FOR VALVE CALIBRATION CERTIFICATE UNDER SUBMITTALS, ADDED POST SUBMITTALS ARTICLE. IMPROVED DESCRIPTION OF VALVE OPERATION UNDER 2.3.A TO REQUIRE THAT CHARACTERIZED VALVE POSITION BE THE PRIMARY MEANS OF ACHIEVING AIR VOLUME SETPOINT, ADDED THAT ADDITIONAL OR FEWER AIR VALVES ARE THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE IF A MANUFACTURER OTHER THAN THE DESIGN BASIS IS SUPPLIED SINCE FLOW RANGE V. VALVE DIAMETER VARIES BETWEEN MFR.S, REQUIRED THAT +/-5% VALVE ACCURACY BE OVER THE ENTIRE CATALOGED VOLUMETRIC OPERATING RANGE OF THE LTAU, REQUIRED FUME HOOD MONITORS BE PROVIDED WITH A COMMON ALARM SILENCE BUTTON SINCE SOME MFR.S WERE PROVIDING MULTIPLE SILENCE BUTTONS. REVISED BUILDING AUTOMATION INTERFACE REQUIREMENTS TO REQUIRE PHOENIX MACRO SERVER AND SIEMENS PXC. STRENGTHENED REQUIREMENT THAT LTAU INDICATED AIR VOLUME NOT TO BE ADJUSTED BASED UPON FIELD MEASUREMENTS (ART. 3.2). D. KARLE PER HVAC MTT.

JUNE 2016: DO NOT USE THIS SPECIFICATION WITHOUT DISCUSSION WITH THE HVAC AND CONTROLS MECH TECH TEAM. SPECIFICATION REVISED FOR APPLICABILITY TO HVAC LAB CONTROLS, BUT ONLY IN LABS WITH VARIABLE AIR VOLUME FUME HOODS, INCLUDING COMBINATION SASH HOODS. ALL OTHER LABS ARE INCLUDED IN SCOPE OF MS230900. REFER TO DESIGN GUIDELINE 230030 FOR ADDITIONAL GUIDANCE. D. APPEL

SEPT 2016: IMPROVED WORDING IN "SUMMARY", IMPROVED WORDING IN "DIVISION OF WORK" REGARDING WHERE THIS SPEC APPLIES, I.E. ALL LABS CONTAINING VAV OR COMBO SASH HOODS. PER HVAC MTT. D. KARLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230910 - VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:

1. Section 115313: Laboratory Chemical Fume Hoods
2. Section 233300: Air Duct Accessories and RGDs
3. Section 230900: Mechanical Systems Controls
4. Section 230593: Testing, Adjusting, and Balancing (TAB)
5. Division 26: Electrical

1.2 SUMMARY

- A. Section Includes:

1. Controls and terminal airflow units for laboratories that contain variable air volume (VAV) and combination sash fume hoods, including controls for Laboratory Terminal Airflow Units (LTAUs), fume hoods, reheat coils, chilled beams, fin tube, and other devices to control laboratory (or other specialized spaces) pressurization, temperature, and other functions as indicated.
2. Reheat coils and sound attenuators for LTAUs.
3. Laboratory Control system interface with Owner's Building Automation System.

1.3 REFERENCES

- A. Abbreviations, Acronyms, Definitions (partial list)

1. BAS: Owner's Siemens Apogee brand Building Automation System.
2. Owner: The University of Michigan.
3. Laboratory: For the purposes of this specification, a broad designation for any space served by laboratory controls.

1.4 DIVISION OF WORK

IMPORTANT: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE TO BE SERVED BY 230910 "VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC" (I.E. THIS SPECIFICATION) VERSUS 230900 "MECHANICAL SYSTEMS CONTROLS". MAKE A CLEAR DELINEATION ON THE CONTROL DRAWINGS. NORMALLY, LAB

MECHANICAL CONTROL OF ANY SPACE NOT UTILIZING VAV FUME HOODS ARE INCLUDED IN THE SCOPE OF 230900, INCLUDING ANIMAL ROOMS.

- A. The VAV fume hood Laboratory Controls Contractor (LCC) shall provide a complete lab control system as described in this specification.
 - 1. Any space containing VAV or combination sash fume hoods shall be provided with the laboratory controls and terminal devices specified in this specification section.
 - 2. All items specified shall be provided by the LCC, including items specified in Related Sections, except where explicitly indicated otherwise.
 - 3. The LCC shall be an installer authorized by the laboratory controls manufacturer.
 - 4. Provide supervision and instruction to insure proper installation of all furnished laboratory control components.
- B. The LCC shall furnish LTAUs, LTAU sound attenuators, and LTAU reheat coils to the mechanical contractor. The mechanical contractor shall install in the duct work.
- C. The mechanical contractor shall provide duct transitions to connect to LTAUs/LTAU reheat coils, and all other components not specified in this specification section.

1.5 COORDINATION

- A. Provide controls and control wiring compatible with equipment provided by others and with existing equipment and controls.
- B. Coordinate the installation of controls with the installation of other project equipment.
- C. Ensure all control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and/or installed by others.
- D. Coordinate with laboratory equipment suppliers (fume hoods, etc.) regarding cut-out dimensions for alarm monitors and to assure proper accommodation is made for the installation of sash sensors and other devices related to laboratory airflow controls.

1.6 ITEMIZED QUOTATION

- A. The Laboratory Controls Contractor shall submit with bid, an itemized cost breakdown listing all major components, labor cost (including subcontractor labor and material cost), and engineering costs, for base bid and for each alternate, for the entire work scope of the Laboratory Controls. When requested, provide the itemized breakdown to the Owner post bid, for review and approval.

1.7 SUBMITTALS

- A. Submit the following for approval:
 - 1. A separate schematic drawing and wiring diagram for each laboratory room or zone, with sequence of operation. Indicate all set points and alarm settings.

2. Equipment schedule for each room or zone, with the following information:
 - a. Equipment tag, room served, occupied/unoccupied min., max., and offset CFM; lab subnet description, name, and network address; network and power trunk identifier.
 - b. Model number of each LTAU and control component.
 - c. Function of each LTAU and control component.
3. Equipment data sheets indicating performance, wiring diagram, dimensions, weights, required clearances, component locations, and location and size of each field connection.
 - a. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. LTAUs, control valves, sensors, etc.)
4. Accuracy certificate, certified by an officer of the company, indicating that LTAU control error will not exceed +/- 5% of flow set point, over the manufacturer's cataloged volumetric operating range of the LTAU.
5. Ductwork connection types and sizes.
6. Network diagram indicating routers, servers, and peripheral devices, including location of each device (room number) and indicating network connection points to Owner's BAS system.
7. Wiring diagrams for each network device.
8. Wiring diagrams and locations of power supplies.
9. Conduit and wire/cable data sheets.
10. Octave band and A-weighted sound power data for each LTAU, with and without sound attenuators.
11. Installation, operation, and maintenance instructions for each component. Include calibration method, calibration tolerance, inspection period, and cleaning method.

1.8 CLOSE-OUT SUBMITTALS

- A. Submit the following as a condition of final payment:
 1. As-built schematic drawings and wiring diagrams. Indicate set points, settings and adjustments of all components.
 2. Calibration certificate, signed by an officer of the company, indicating that each LTAU was factory calibrated at a minimum of 48 points and that the factory determined calibration data was loaded into the LTAU's respective controller. Indicate if calibration data was loaded into the LTAU controller at the factory or in the field.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Mark each LTAU before factory shipment with a unique identifier corresponding to the LTAU drawing schedule.
- B. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.10 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions unless noted otherwise.
 - 1. AMCA 610 Laboratory Method of Testing Airflow Measurement Stations for Performance Ratings.
 - 2. AHRI Standard 410 "Forced-Circulation Air-Cooling and Air-Heating Coils.
 - 3. AHRI 880 Performance Rating of Air Terminals.
 - 4. NFPA 70 National Electric Code.
 - 5. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
 - 6. ASTM C916 Standard Specification for Adhesives for Duct Thermal Insulation.
 - 7. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
 - 8. UL 916 Energy Management Equipment
 - 9. Components shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.11 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 3 years from the date of Substantial Completion.
- B. Provide 24 hour per day service during the warranty period, with a maximum response time from when service is requested of 24 hours.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Laboratory Controls Manufacturers:
 - 1. Phoenix Controls
 - 2. Siemens (Direct Digital Control venturi valve solution)

2.2 GENERAL

- A. Provide a complete laboratory control system for any space containing VAV or combination sash fume hoods. This shall include all devices specified in this section and programming, controllers, software; temperature, pressure, and other sensors/transmitters; control valves; control, network, and power wiring; routers, servers, and all other devices required for a complete system.
 - 1. Laboratory control system shall be Direct Digital Control (DDC) type.
 - 2. Laboratory control system shall function to achieve the sequences of operation detailed on the drawings.

3. Each laboratory shall have a dedicated laboratory control system. Laboratory control systems shall be independent and stand-alone from the Owner's BAS. Failures of the BAS system or network communications between the BAS and the Laboratory control system (cut communication cables, router or server failures, etc.) shall have no impact on individual laboratory control.
4. The laboratory control system shall perform the following control functions:
 - a. Lab Pressurization Control: Control supply and auxiliary exhaust LTAUs at a volumetric offset to maintain lab pressurization positive, negative, or neutral. Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms. Pressurization control shall consider networked devices, non-networked devices, and any number of constant volume devices.
 - b. Lab Temperature Control: Regulate lab space temperature through a combination of supply air volumetric control and control of reheat coils and other auxiliary temperature control devices, in response to temperature sensor(s).
 - c. Occupancy Control: Reset LTAU minimum volume settings and/or temperature control set points, based upon external signals from occupancy detectors, local over-ride buttons, and similar devices.
 - d. Constant Volume Control: The LTAU shall maintain a constant airflow set point.
 - e. Fume Hood Control: Control the face velocity of fume hoods indicated to be variable air volume (VAV) type.
 - f. Fume Hood Monitoring: Alarm various conditions at each fume hood.
 - g. Other lab control functions as indicated on the drawings.
 - h. Interface with the Owner's Siemens Apogee PPCL Building Automation System.
5. Input power requirements for laboratory control devices shall not exceed 120 VAC.
6. Each lab room shall include a labeled Room Differential Pressure Indicating Gauge to indicate room pressurization relative to the adjacent room or corridor. Provide an engraved POS/NEG label (with 3/8" high lettering) adjacent to the gauge labeled "Correct Room Pressure Offset: X, where X = "POS" (positive) or "NEG" (negative) as indicated by the room volumetric offset indicated on the design documents.

2.3 LABORATORY TERMINAL AIRFLOW UNITS

- A. The laboratory terminal airflow unit shall be of venturi control type utilizing a cone shaped element. The position of the valve cone assembly shall be factory characterized to determine a position versus air flow volume relationship. Air flow control shall be achieved by moving the valve cone assembly to the factory characterized position that provides the required air volume. Air flow control shall not be achieved by air flow measurement. However, air flow measurement shall be permitted at inlet velocities 350 fpm and greater, for fine tuning valve cone assembly position after movement to the factory characterized position. Control shall be pressure independent, accomplished by the cone/spring element continuously adjusting position relative to the venturi orifice to compensate for duct pressure fluctuations.
- B. Provide LTAUs of the diameter and volumetric range indicated on the drawings. Provide larger, smaller, fewer, or additional valves versus that indicated when necessary to match the volumetric range specified on the drawings (this may be necessary when providing valves from a mfr. other than the design basis).
 - 1. Include all required costs to adjust duct layout and provide any required transition fittings or additional duct necessary to accommodate the particular valves provided.
- C. LTAUs shall have an equal percentage flow characteristic to provide stable control at low flow values. Butterfly, opposed blade, or parallel blade style dampers or VAV boxes are not acceptable
- D. LTAUs shall provide pressure independent air flow control and the scheduled air flows over a pressure range of 0.3" WG to 3.0" WG static pressure drop across the valve. LTAU shall respond within 1 second of a change in duct static pressure/flow change under all conditions.
- E. Total LTAU control error (including the combined effects of nonlinearity, hysteresis, repeatability, temperature and drift over a one year period) shall not exceed +/- 5% of flow set point. Example: If the LTAU's current flow set point is 1000 CFM, the volume of air delivered by the LTAU shall be within +/- 50 CFM of that set point. This error shall not be exceeded regardless of duct inlet or exit configurations, over the entire manufacturer's cataloged volumetric operating range of the LTAU, and at any pressure drop across the LTAU from 0.3" WG to 3.0" WG static pressure.
 - 1. Systems using air flow sensors (Siemens):
 - a. The +/- 5% control error specified above shall be achieved when one straight equivalent duct diameter is provided upstream of the inlet to the LTAU, regardless of LTAU exit conditions.
 - b. Provide minimum one straight equivalent duct diameter upstream of the inlet to the LTAU. Transitions connecting to the inlet or outlet of the LTAU and associated reheat coils shall not exceed 30 degrees.
 - c. Airflow sensors shall be constructed of corrosion proof material for room supply, return, and general exhaust air. Construct of 316L stainless steel (parts exposed to exhaust air) for all other exhaust applications.

- F. Every LTAU shall be factory calibrated across the manufacturer's cataloged volumetric flow range using NIST traceable air flow stations and instrumentation with a combined accuracy of +/- 1 percent of signal over the entire range of measurement. Air flow shall be verified to be within an accuracy of +/- 5 percent of signal at a minimum of 48 different air flows. LTAU air flow shall be calibrated with 0.6" of static pressure across the LTAU. The resulting factory determined calibration data shall be loaded into the LTAU's respective controller, at the factory or in the field during installation. Provide factory calibration certificate for each valve, certified by an officer of the manufacturer.
- G. LTAUs shall be constructed of minimum 16 gauge aluminum. Shaft and shaft support brackets shall be 316 stainless steel. Pivot arm and internal linkage shall be aluminum or stainless steel. Springs shall be spring-grade stainless steel. Shaft bearing surfaces shall be made of Teflon, polyester, or polyphenylene sulfide composite.

NOTE BELOW PARAGRAPH. IF LTAUS OTHER THAN FUME HOOD LTAUS (EXAMPLE: SNORKELS HANDLING CORROSIVE CHEMICALS) NEED CORROSION PROTECTION, BE SURE TO INDICATE THAT FACT ON THE DRAWINGS. NOTE THAT LTAUS SHOULD NOT BE USED ON THE EXHAUST OF CAGE AND RACK WASH EQUIPMENT BECAUSE EVEN LTAUS WITH ENHANCED COATING SYSTEMS HAVE NOT PROVEN TO HOLD UP TO THE CORROSIVE EFFECTS OF THE EXHAUST FROM THESE DEVICES. RATHER, CAGE OR RACK WASHERS SHOULD BE EXHAUSTED BY DEDICATED EXHAUST FAN(S).

1. Additional construction requirements for LTAUs connected to fume hood exhaust or where indicated on drawings:
 - a. Coat LTAU with minimum 5.0 mil dry film thickness Heresite P403 coating material, applied and baked per coating manufacturer's recommendations.
 - b. Shaft, pivot arm and linkage, and other internal metal parts (nuts, bolts, rivets, etc.) shall be stainless steel.
 - c. Shaft shall be Teflon coated.
 - d. Shaft bearing surfaces shall be made of Teflon or polyphenylene sulfide composite.

IF LOW LEAKAGE CONSTRUCTION IS REQUIRED, THE DESIGNER MUST SPECIFY THE MAXIMUM LEAK RATE PERMITTED FOR CASING LEAKAGE AND SHUT-OFF LEAKAGE. CONSULT MFR.'S CATALOGS TO DETERMINE AVAILABLE LEAKAGE PERFORMANCE OPTIONS.

- H. Low Leakage Construction
1. Provide where indicated.
 2. Provide low leak seal materials compatible with the severity of service indicated by the particular valve coating that has been specified.
- I. Supply air LTAUs shall come factory insulated with minimum 3/8" thick flexible closed cell polyethylene insulation with a flame/smoke rating not to exceed 25/50, K value not to exceed 0.270 btu-in/hr-ft²-°F @ 75°F mean temperature, and a permeability maximum of 0.08 Dry Cup. Perm-In. Rubatex Therma-Cel, AP/Armaflex, or equivalent. Insulation shall be installed per insulation mfr. recommendations using mfr. recommended adhesives and joint vapor barrier sealants.

DESIGNER SHALL PROVIDE PERFORMANCE DATA FOR THE SOUND ATTENUATORS ON THE DRAWINGS. DESIGNER MUST SPECIFICALLY INDICATE WHERE ATTENUATORS ARE REQUIRED. DESIGNER SHALL REVISE SPEC SECTION REFERENCE BELOW, IF REQUIRED.

2.4 LABORATORY TERMINAL AIRFLOW UNIT SOUND ATTENUATOR

- A. Furnish sound attenuators only when specifically indicated.
- B. Attenuator shall be properly matched to each individual LTAU to meet the sound performance scheduled. Provide stainless steel packless type attenuators for all fume hood and "wet" exhaust applications.
- C. Attenuator pressure drop shall not exceed 0.20 in. w.c. at the LTAUs maximum rated flow, unless indicated otherwise on drawings.
- D. Refer to Related Section "Sheet Metal Accessories" for additional attenuator specifications.

2.5 LTAU/LAB CONTROL

- A. The control devices (controllers) shall be microprocessor-based DDC type and shall linearly regulate airflow based on digital control signals. The device shall generate a digital feedback signal that represents its airflow.
- B. Laboratory controls shall be segregated into subnets at a lab room level. Provide commercially available routers to isolate each subnet from BAS communications, when required. All control points including all subnet points (both inputs and outputs) shall be available to the BAS for monitoring and trending. Laboratory control performance shall be unaffected by the quantity of points being monitored, processed, or controlled.
 - 1. Phoenix Controls: All control shall be LONWORKS® based. BACnet protocol is not acceptable.
- C. Speed of Response:
 - 1. Labs with VAV fume hoods or where indicated:
 - a. Speed of response shall be less than 1 second. High speed electronic actuators shall be provided.
 - 1) Phoenix Controls Accel II Venturi Valves/Celeris
 - 2) Siemens venturi style air valves with high speed actuators
- D. The control devices shall store control algorithms in non-volatile, re-writeable memory. The device shall be able to stand-alone or be networked with other room-level digital airflow control devices using an industry standard protocol.
- E. Room-level control functions shall be embedded in and carried out by the controllers using peer-to-peer distributed control architecture. Critical control functions shall be implemented locally.
- F. The control devices shall use industry standard 24 VAC power.
- G. It shall be possible to connect a notebook PC commissioning tool at each lab room and every point associated with that room's control shall be accessible from that connection point.

- H. The control devices shall have built-in integral input/output connections ("points") that address all network and non-network sensors switches and control devices indicated on the drawings and as necessary to accomplish the required sequence of operation. Unless explicitly indicated otherwise in the sequence of operation, every device controlled shall be controlled by an output dedicated to that device. For example, multiple actuators **shall not** be controlled by the same 0 to 10 Vdc or 4 to 20 mA output. At a minimum, the airflow controller shall have:
 - 1. Three universal inputs capable of accepting 0 to 10 Vdc, 4 to 20 mA, 0 to 65 K ohms, or Type 2 or Type 3 10 K ohm @ 25 degree C thermistor temperature sensors.
 - 2. One digital input capable of accepting a dry contact or logic level signal input.
 - 3. Two analog outputs capable of developing either a 0 to 10 Vdc or 4 to 20 mA linear control signal.
 - 4. One Form C (SPDT) relay output capable of driving up to 1 A @ 24 VAC/VDC.
- I. Provide any other devices necessary to accomplish the intended sequence of operation.
- J. Control devices shall meet FCC Part 15 Subpart J Class A and be UL 916 listed.
- K. Actuators

HIGH SPEED ELECTRONIC ACTUATORS CAN BE SET FAIL LAST POSITION AS WELL AS FAIL OPEN OR FAIL CLOSED.

- 1. High Speed Electronic:
 - a. UL 916 listed high-speed electronic actuator with an actuator stroke speed of 1 second or less when positioning the valve to respond to a flow change of 5:1. Factory mounted to the valve. Loss of main power shall cause the valve to position itself in a failsafe state. This position shall be maintained constantly without external influence, regardless of external conditions on the valve (within product specifications). Failsafe states shall be as indicated on drawings. Where not indicated, supply LTAUs shall fail normally closed-minimum position, exhaust LTAUs shall fail normally open-maximum position.

2.6 VAV FUME HOOD CONTROL

- A. The fume hood controller shall use a sash position sensor to measure sash opening to proportionally control the hood's exhaust airflow. Controller shall maintain an "average" constant face velocity to +/- 5% tolerance, over a minimum range of 20% to 100% of sash travel.
- B. The hood exhaust airflow control device shall respond to a change in sash position by reaching 90% of the final commanded position within one (1) second of the sash reaching 90% of its final position, with no more than a 5% overshoot or undershoot, and with no noticeable oscillation. This shall be accomplished at any sash movement rate up to 1-1/2 feet per second.

- C. The fume hood monitor shall receive sash position signals from sash sensors. The monitor shall compute the total open sash area and then output an exhaust airflow control command signal to the appropriate exhaust airflow control device (LTAU).
1. A vertical sash position sensor shall be employed to measure the height of each vertically moving fume hood sash. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. Resolution shall be +/- 1/2 inch or better. A stainless steel, burr and snag-free cable shall be attached to the spring reel. Expected lifetime based on manufacturer's tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in a location on the fume hood easily accessible for service.
 2. A horizontal sash position sensor shall be provided for each horizontal sash. The horizontal sash sensor shall consist of magnetic bars or a sensor strip/actuator block. Resolution shall be +/- 1/2 inch or better.
 3. Provide both vertical and horizontal sash position sensors for hoods with combination sashes.

2.7 FUME HOOD MONITORS

CONSIDER IF OTHER LABORATORY EQUIPMENT WOULD BENEFIT FROM BEING EQUIPPED WITH A FUME HOOD MONITOR AND INDICATE THAT EQUIPMENT ACCORDINGLY. EXAMPLES: EXISTING FUME HOODS, BIO-SAFETY CABINETS.

- A. Provide fume hood monitors for all chemical fume hoods and for other laboratory equipment where indicated.
1. Monitor shall include audible alarm, visual LED alarm, and a common (single) alarm silence button.
 2. The fume hood monitor shall provide an alarm indication for the following conditions:
 - a. Low fume hood face velocity as detected by:
 - 1) Insufficient differential static pressure as detected by the exhaust airflow LTAU pressure switch (Phoenix).
 - 2) Insufficient air volume, as detected by the air flow station (Siemens).
 - 3) Sash raised above sash stop position.
 - 4) Signal loss between the exhaust airflow LTAU and the fume hood monitor (VAV hoods only).
 - b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
 3. Sash position shall be sensed by using a vertical sash position sensor. Vertical sash position sensor shall be as specified under the article "VAV Fume Hood Control".
 4. Fume hood monitor shall be suitable for surface mounting on the front of the fume hood.
 5. Approved fume hood monitors:
 - a. Phoenix FHM430 Controller (Variable volume fume hoods)

- b. Siemens

2.8 SENSORS/TRANSMITTERS

- A. Except as noted below, sensors and transmitters shall comply with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.
 - 1. Room temperature sensors (RTS) shall have a digital temperature display, high accuracy temperature set point slide, and a minimum temperature range of 55-95°F. 10K Type 2 thermistor, inaccuracy of ±0.5°F or less between 55-95°F. Provide with integral communications jack.
 - a. Approved manufacturers: Phoenix, Siemens
 - b. Provide combination room temperature/humidity sensors where indicated.
 - 1) Features: same as RTS.
 - 2) Temperature: Thermistor, same as RTS.
 - 3) Humidity transmitter: 4-20 mA output, inaccuracy ±2% or less between 15%-95% RH at 25°C.
 - a) Approved manufacturer: Phoenix.

2.9 CONTROL VALVES

- A. Control valves shall comply with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.
 - 1. Unless noted otherwise, control valves for reheat coils, cooling coils, chilled beams, fin tube radiation, and other terminal devices shall utilize 3-position floating point electronic actuators as specified for "TECs" in Related Section Mechanical Systems Controls.
 - a. Fail-last-position: Reheat and cooling coils; chilled beams.
 - b. Fail open (maximum heat): Fin tube.
 - c. Fail closed (zero heat): Reheat coils serving animal rooms or ventilated cage racks.

2.10 ROOM DIFFERENTIAL PRESSURE INDICATING GAUGES

- A. Dial (4" dia.) in metal case, diaphragm actuated, black figures on white background, front recalibration adjustment, scale -0.25" WC to +0.25" WC, suitable for surface or flush mounting. Accuracy +/- 2% of full scale. With plastic gauge mounting plate for flush mounting and space pressure sensor consisting of pressure port, barbed tubing connection, and sensor plastic mounting plate suitable for mounting on a standard electrical junction box.
- B. Approved Manufacturers:
 - 1. Dwyer "Magnehelic" with A-465 pressure sensor and A-464 flush mounting plate (provide A-368 mounting bracket for surface mount applications)

2.11 MISCELLANEOUS COMPONENTS

- A. Except as specified in this section, laboratory controls shall be provided in compliance with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.

2.12 POWER SUPPLIES

- A. Provide all necessary power supplies/control transformers, power distribution wiring, etc. for a complete operating system. This includes but is not limited to power supplies for lab airflow controls, sensors/transmitters, control valves, and network devices such as routers and servers.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- C. Provide power supplies for lab airflow controls in NEMA 1 metal enclosures, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 - 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 - 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 - 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
 - 4. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.
- D. Provide network power supplies of type and size recommended by lab control manufacturer.

THE UPS SHOULD BE CONNECTED TO A STANDBY POWER CIRCUIT (EMERGENCY GENERATOR) WHEN STANDBY POWER IS AVAILABLE IN THE BUILDING. COORDINATE WITH ELECTRICAL ENGINEER.

- E. Provide an uninterruptible power supply (UPS) for any server provided to allow communication to the BAS system.
 - 1. Provide a UPS large enough to operate the server for a minimum of 5 minutes upon a loss of normal power.

2.13 INTERFACE TO BUILDING AUTOMATION SYSTEM

- A. The laboratory control system network shall digitally interface with the BAS system. The interface to the BAS shall be BACnet over IP/Ethernet communications protocol.
- B. Every room-level point shall be available to the BAS for monitoring, trending and control, both inputs and outputs. The laboratory controls system shall maintain a cache of all points to be monitored by the BAS. The room-level airflow control devices shall update this cache continually.
- C. Provide all equipment, including but not limited to routers, servers, software interface drivers, and network interface cards to allow communication between the laboratory airflow controls and the BAS.

DESIGNER MUST INDICATE ON THE DRAWINGS, THE QUANTITY OF FIELD LEVEL NETWORKS CONNECTING LAB CONTROLS TO THE U-M BAS, AND THE LOCATIONS WHERE THE NETWORKS CONNECT TO U-M BAS. TYPICALLY THIS WILL BE AT A DATA CLOSET OR AT BUILDING DDC PANELS. CONTACT THE U-M DESIGN MANAGER, WHO WILL OBTAIN A NETWORK RISER DIAGRAM FROM U-M PLANT DEPARTMENT FOR DESIGNER'S USE.

- 1. The LCC is responsible for providing the entire network up to and including final network connection to Owner's BAS via connection to an Ethernet switch at a building direct digital controller or data closet location(s), as indicated on the drawings.
- 2. Provide servers and routers specifically designed for the laboratory controls network and recommended by the laboratory control manufacturer.

THE NEXT PARAGRAPH SPECIFIES A "RMI (ROOM INTEGRATOR)" FOR PHOENIX AND A "PXC" SERVER FOR SIEMENS, WHICH ARE REQUIRED TO PROVIDE BACNET OVER IP/ETHERNET COMMUNICATION FOR CONNECTION TO U-M'S BAS SYSTEM. FOR RENOVATIONS, A MACROSERVER OR PXC MAY ALREADY EXIST THAT CAN BE UTILIZED FOR THE PROJECT. CONSULT WITH U-M PLANT ENGINEERING THROUGH THE DESIGN MANAGER TO DETERMINE, THEN EDIT THE NEXT PARAGRAPHS ACCORDINGLY.

- a. Phoenix Controls Server: Provide Phoenix Controls RMI Room Integrator.
- b. Siemens Server: Siemens model PXC100-E96.A BACnet IP controller with a PXC expansion module.
 - 1) Mount in a NEMA Type 1 metal control panel enclosure with removable door, right or left hand hinged, locking, with perforated subpanel, keyed to match other U-M control panels. Minimum size 19-1/2" x 16-3/8" x 5-3/4" deep. Provide 120 VAC service box, disconnect, power supply, UPS, and bus connection module. All components shall be in compliance with related articles of this specification.

BELOW PARAGRAPH INDICATES THAT NETWORK DEVICES SHOULD BE INSTALLED ABOVE LAB DOORS AND IN ELECTRICAL CLOSETS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. LAB CONTROL NETWORK EQUIPMENT SHOULD NOT BE INSTALLED IN BUILDING DATA CLOSETS DUE TO RESTRICTIONS ON THE PERSONNEL ALLOWED TO ACCESS DATA CLOSETS.

- D. Install routers secured to a wall and mounted above the doors to labs, or where indicated.
 - 1. Provide in a wall mounted metal enclosure, adequately ventilated to prevent overheating of the equipment, and separate from lab control power supply cabinets.
 - a. Routers may be mounted in lab control power supply cabinets.
 - b. Maximum cabinet projection from wall shall be 8 inches.
- E. Install servers and server UPS in building electrical closets, or where indicated.
- F. Label router and server cabinets "VAV Fume Hood Laboratory Controls Network" and with router/server tag number.
- G. Provide communication cable types, connectors, termination devices, and other accessories recommended specifically for the lab control networks by the lab control manufacturer.
- H. The Owner shall configure any BAS alarms, trending, or control commands at the BAS; LCC shall assist in trouble shooting the creation of such items for a period of one year after the final acceptance of the lab control system.

2.14 MISCELLANEOUS ELECTRICAL

- A. Provide all wiring in conduit and J-hooks per Related Section Mechanical Systems Controls, except as noted below:
 - 1. Wiring between occupancy sensors and lab controls shall be run in conduit at all locations.
 - 2. J-hooks shall be painted bright white color.
 - 3. Conduit fittings and junction box covers shall be painted bright white. Alternative: Allied Tube True Color® EMT, color white, may be used in lieu of painted fittings and junction boxes.
- B. Provide 120 VAC wiring from receptacle panels to power supplies and to any other equipment associated with the laboratory airflow controls.
- C. All electrical work shall conform to Related Sections Division 26 and Mechanical Systems Controls. Maintain all NEC clearances.

2.15 REHEAT COILS

- A. Acceptable Manufacturers:
 - 1. Trane, a business of Ingersoll Rand.
 - 2. York by Johnson Controls.
 - 3. McQuay International.
 - 4. Aerofin.
 - 5. Marlo DRS Technologies, Inc.
 - 6. Coil Replacement Co.
 - 7. Heatcraft Worldwide Refrigeration.
 - 8. USA Coil & Air.
- B. Provide coils factory-mounted to the LTAU, with capacities and characteristics as scheduled on the Drawings. Provide slip and drive or flanged connections to allow removal and reversal of coils in field.

- C. Coils: Maximum of 10 fins per inch, minimum 2 rows, same side supply and return piping connections, enclosed in a sheet metal casing to match the size of the attached terminal airflow unit.
- D. Coil Header and Connection Materials: Seamless copper with extruded tube holes to permit expansion and contraction without creating undue stress or strain. Copper connections.
- E. Rated for 200 psi working pressure, 250 deg. F, with 3/8 inch copper tubing, minimum wall thickness of 0.016 inch, and mechanically bonded aluminum fins, 1/2 inch or larger solder connectors, and manual air vent on return. Hydrostatically test coils at 250 psi, or at 250 psi air pressure under water. Maximum pressure drop at design flow shall not exceed 10 feet or as scheduled. Hot water shall be equally distributed through all tubes by means of orifices or a header design.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install all components in strict compliance with component manufacturers' recommendations.

DESIGNER SHALL LAY OUT SHEET METAL DUCTWORK TO PROVIDE ONE STRAIGHT EQUIVALENT DUCT DIAMETER UPSTREAM OF THE INLET TO ALL LTAUS (REGARDLESS OF BASIS OF DESIGN MFR.).

- B. Systems using air flow sensors (Siemens):
 - 1. Provide one straight equivalent duct diameter upstream of the inlet to the LTAU. Transitions connecting to the inlet or outlet of the LTAU and associated reheat coils shall not exceed 30 degrees.
- C. Install fume hood monitors surface mounted on the front of the fume hood. Furnish exact cut-out dimensions to the fume hood factory to allow for concealed wiring to the monitor.
- D. Install the sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal fume hood use, and allows horizontal and vertical sashes to be positioned in any combination without binding, twisting or tangling.
- E. Terminate wiring at all devices.
- F. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner.
- G. Installation shall also comply with Related Sections Mechanical Systems Controls and Division 26.
- H. Install components so that they are easily accessible for service and in conformance with NEC clearance requirements.

DESIGNER: NOTE THE PARAGRAPH BELOW AND INCLUDE U-M STANDARD DETAIL "SUPPLY AIR LTAU CLEARANCE" ON THE DESIGN DRAWINGS.

- I. Install LTAUs with proper NEC clearances at LTAU mounted controls, including at actuators.

3.2 SYSTEM START-UP

- A. Program, start-up, calibrate, and test all laboratory controls.
- B. Program, start-up, and test integration to the BAS system.
- C. Adjust LTAU air volume to provide hood face velocity to within +/- 5% of required setpoint. Operate the lab controls to assist the TAB Contractor in verifying that correct airflow rates and alarm settings are within +/- 5% tolerance.
 - 1. All adjustments to the LTAUs shall be done by the LCC, not the TAB contractor.
 - 2. TAB contractor shall take flow readings to verify that the air flow volumetric flow rate indicated by the LTAU matches the measured air flow volume, and to assist in setting alarms. Assist the TAB contractor in verifying measured LTAU air flow against that reported by the LTAU controller, at design minimum and maximum CFM.
 - 3. LTAU air flow shall not be adjusted based on field air flow measurements. If LTAU air flow verification indicates calibration is not within +/- 5% tolerance, do not field adjust. Notify Owner and return to factory for recalibration.
- D. Unless indicated otherwise, set controls to maintain hood face velocities as follows:
 - 1. VAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) for the entire sash travel, for all vertical and horizontal sash positions. Note: The LTAU's capacity may be insufficient to maintain the required air flow velocity through the entire travel of the sash as it is raised above the sash stop. Do not "clamp" hood LTAU air flow, allow the LTAU to open as far as it can in an attempt to maintain face velocity, except limit travel to the extent necessary so that the room cannot become more negative than indicated; clamp valve if necessary to prevent room from going more negative.
 - 1) Hoods with Horizontal Sashes: Set controls to maintain the required face velocity with the sashes in the position that creates the maximum free area opening. Example:, If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed)
- E. Set fume hood monitor alarms as follows:
 - 1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - b. LTAU valve cone at maximum travel.
 - 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.

- c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.
- F. Set other control parameters/alarms to comply with the laboratory airflow control drawings.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.
- B. Demonstrate that the laboratory controls perform per the sequence of operation and the design intent.
- C. Demonstrate every fume hood monitor alarm set point.
- D. Demonstrate that the laboratory control system communicates properly to the BAS system, including:
 - 1. Every point specifically indicated on the drawings as to be monitored, logged, or controlled by the BAS.
 - 2. For each pressure zone, a minimum of 10% of points. Specific points to be designated by the U-M Commissioning Authority (CxA).
 - 3. If more than 20% of the demonstrated points fail to communicate correctly, demonstrate that every point on the system communicates correctly to the BAS
- E. Demonstrate that UPS' support connected loads for the specified duration.
- F. Perform other demonstrations as may be required by the CxA.

3.4 CLOSEOUT ACTIVITIES

- A. Submit as-built documentation per article "Submittals". Obtain approval of as-built documentation prior to Owner training.
- B. Provide on-site training to Owner's maintenance personnel. Familiarize personnel with location of LTAUs, controllers, system components, power supplies, and network devices. Review the control concept for each lab and room type.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 230920 - LABORATORY AIRFLOW CONTROLS- ANALOG ELECTRONIC

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230920 - LABORATORY AIRFLOW CONTROLS-PNEUMATIC AND ANALOG ELECTRONIC

DECEMBER 2013: REVISED PART 1 TO MASTER SPEC TEMPLATE FORMAT. MOVED ITEMS IN PART 1 THAT BELONG IN PART 2. REVISED FUME HOOD MONITOR TO INCLUDE SASH ALARM, THE SAME AS REQUIRED FOR DDC LAB CONTROLS. REVISED 3.2 TO MATCH DDC LAB AIR FLOW CONTROLS SPEC. D. KARLE FOR HVAC MTT.

JUNE 2015: ADDED REQUIREMENT FOR VALVE CALIBRATION CERTIFICATE UNDER SUBMITTALS, ADDED POST SUBMITTALS ARTICLE. IMPROVED DESCRIPTION OF VALVE OPERATION UNDER 2.3.A TO REQUIRE THAT CHARACTERIZED VALVE POSITION BE THE PRIMARY MEANS OF ACHIEVING AIR VOLUME SETPOINT, ADDED THAT ADDITIONAL OR FEWER AIR VALVES ARE THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE IF A MANUFACTURER OTHER THAN THE DESIGN BASIS IS SUPPLIED SINCE FLOW RANGE V. VALVE DIAMETER VARIES BETWEEN MFR.S, REQUIRED THAT +/- 5% VALVE ACCURACY BE OVER THE ENTIRE CATALOGED VOLUMETRIC OPERATING RANGE OF THE LTAU. STRENGTHENED REQUIREMENT THAT LTAU INDICATED AIR VOLUME NOT TO BE ADJUSTED BASED UPON FIELD MEASUREMENTS (ART. 3.2). D. KARLE PER HVAC MTT.

CAUTION: ANALOG STYLE LTAUS TYPICALLY NOT AVAILABLE OR USED FOR CURRENT PROJECTS SO THIS SPECIFICATION SHOULD NOT NORMALLY BE USED, INSTEAD USE DDC VERSION (230910). IN THE UNUSUAL CONDITION THAT THIS SPEC IS USED, EDIT CAREFULLY TO MAKE PROJECT SPECIFIC.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:

1. Section 115313: Laboratory Chemical Fume Hoods
2. Section 233300: Air Duct Accessories and RGDs
3. Section 230900: Mechanical Systems Controls
4. Section 230593: Testing, Adjusting, and Balancing (TAB)
5. Division 26: Electrical

1.2 SUMMARY

- A. Section Includes:

1. Laboratory Airflow Control (LAC) system, including controls for Laboratory Terminal Airflow Units (LTAUs), fume hoods, and other devices to control laboratory (or other specialized spaces) pressurization, temperature, and other functions as indicated.
 2. Laboratory terminal airflow units.
 3. Sound attenuators for LTAUs.
- B. The Laboratory Controls Contractor shall be a direct Subcontractor to the Contractor.

1.3 REFERENCES

- A. Abbreviations, Acronyms, Definitions (partial list)
1. Owner: The University of Michigan.
 2. Laboratory: For the purposes of this specification, a broad designation for any space served by laboratory airflow controls.

1.4 DIVISION OF WORK

- A. As it relates to the extent of responsibility for work within this specification section, "provide" shall mean the identified party both furnishes and installs such item(s). "Furnish" shall mean the identified party furnishes the item to the project site for installation by others.

IMPORTANT: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE TO BE SERVED BY 230920 "LABORATORY AIRFLOW CONTROLS-DDC" (I.E. THIS SPECIFICATION) VERSUS 230900 "MECHANICAL SYSTEMS CONTROLS". MAKE A CLEAR DELINEATION ON THE CONTROL DRAWINGS. NORMALLY ANY SPACE UTILIZING LTAUS IS CONSIDERED LABORATORY CONTROL, BUT IN SOME CASES A SPACE MAY BE SERVED BY BOTH TYPES OF CONTROL (ANIMAL ROOMS ARE AN EXAMPLE WHERE THIS FREQUENTLY OCCURS). SUCH SPACES REQUIRE SPECIAL CARE TO INDICATE THE BOUNDARIES OF THE SPLIT.

- B. The Laboratory Controls Contractor (LCC) shall provide a complete LAC system as described in this specification.
1. Any space designated as a laboratory, served by LTAUs, or where indicated, shall be provided with a LAC system.
 2. All items specified shall be provided by the LCC, including items specified in Related Sections, except where explicitly indicated otherwise.
 3. The LCC shall be an installer authorized by the laboratory controls manufacturer.
 4. Provide supervision and instruction to insure proper installation of all furnished laboratory control components.
 5. Furnish and install all control wiring and pneumatic tubing related to laboratory controls, including interconnection tubing and wiring to thermostats, switches, etc. Temperature Control Contractor (TCC) shall provide and install the control air main tubing to the lab area to be used by the LCC. TCC shall also provide and install all room level control components, including thermostats, control valves (on LTAU reheats, fin tube, chilled beams, etc.), switches, etc.

6. Furnish and install differential pressure gauges at locations indicated on the drawings to indicate (visually) the room pressurization.

C. The LCC shall furnish LTAUs and LTAU sound attenuators to the mechanical contractor. The mechanical contractor shall install in the duct work.

D. The mechanical contractor shall provide reheat coils, duct transitions to connect to LTAUs/LTAU reheat coils, and all other components not specified in this specification section.

1.5 COORDINATION

A. Provide supervision and instruction to insure proper installation of all laboratory airflow components installed by others.

B. Coordinate work with Temperature Controls Contractor (TCC).

C. Coordinate work with Air Balancing Contractor.

D. Coordinate with Architectural Trades regarding location and exact dimensions of recessed components.

E. Provide controls and control wiring compatible with equipment provided by others and with existing equipment and controls.

F. Coordinate the installation of controls with the installation of other project equipment.

G. Ensure all control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and/or installed by others.

H. Coordinate with laboratory equipment suppliers (fume hoods, etc.) regarding cut-out dimensions for alarm monitors and to assure proper accommodation is made for the installation of sash sensors and other devices related to laboratory airflow controls.

1.6 ITEMIZED QUOTATION

A. The Laboratory Controls Contractor shall submit with bid, an itemized cost breakdown listing all major components, labor cost (including subcontractor labor and material cost), and engineering costs, for base bid and for each alternate, for the entire work scope of the Laboratory Controls. When requested, provide the itemized breakdown to the Owner post bid, for review and approval.

1.7 SUBMITTALS

A. Submit the following for approval:

1. A separate schematic drawing and wiring diagram for each laboratory room or zone, with sequence of operation. Indicate all set points and alarm settings.

2. Equipment schedule for each room or zone, with the following information:

- a. Equipment tag, room served, occupied/unoccupied min., max., and offset CFM.
- b. Model number of each LTAU and control component.
- c. Function of each LTAU and control component.
- 3. Equipment data sheets indicating performance, wiring and tubing diagram, dimensions, weights, required clearances, component locations, and location and size of each field connection.
 - a. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. LTAUs, controllers, sensors, etc.)
- 4. Accuracy certificate, certified by an officer of the company, indicating that LTAU control error will not exceed +/- 5% of flow set point, over the manufacturer's cataloged volumetric operating range of the LTAU.
- 5. Ductwork connection types and sizes.
- 6. Wiring diagrams and locations of power supplies.
- 7. Conduit and wire/cable data sheets.
- 8. Octave band and A-weighted sound power data for each LTAU, with and without sound attenuators.
- 9. Installation, operation, and maintenance instructions for each component. Include calibration method, calibration tolerance, inspection period, and cleaning method.

1.8 CLOSE-OUT SUBMITTALS

- A. Submit the following as a condition of final payment:
 - 1. As-built schematic drawings and wiring diagrams. Indicate set points, settings and adjustments of all components.
 - 2. Calibration certificate, signed by an officer of the company, indicating that each LTAU was factory calibrated at a minimum of 48 points and that the factory determined calibration data was loaded into the LTAU's respective controller. Indicate if calibration data was loaded into the LTAU controller at the factory or in the field.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Mark each LTAU before factory shipment with a unique identifier corresponding to the LTAU drawing schedule.
- B. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.10 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions unless noted otherwise.

1. AMCA 610 Laboratory Method of Testing Airflow Measurement Stations for Performance Ratings.
2. AHRI 880 Performance Rating of Air Terminals.
3. NFPA 70 National Electric Code.
4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
5. ASTM C916 Standard Specification for Adhesives for Duct Thermal Insulation.
6. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
7. UL 916 Energy Management Equipment
8. Components shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.11 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 3 years from the date of Substantial Completion.
- B. Provide 24 hour per day service during the warranty period, with a maximum response time from when service is requested of 4 hours.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Laboratory Controls Manufacturers:
 1. Phoenix Controls

2.2 GENERAL

- A. All control components except for pneumatic actuators shall be strictly analog electronic in nature.
- B. All laboratory airflow controls and laboratory terminal airflow unit system components shall be products of a single manufacturer.

2.3 FUME HOOD MONITORS AND CONTROLS

- A. Monitors
 1. Monitor shall include emergency exhaust control switch and LED (VAV hoods only), audible alarm, visual alarm, and alarm silence switch.
 - a. VAV system - Phoenix FHM430 Controller
 - b. CAV system - Phoenix FHM530 Controller
 2. Normal operation and alarm conditions
 - a. The fume hood monitor shall provide an alarm indication for the following conditions.
 - 1) Insufficient differential static pressure as detected by the exhaust airflow LTAU pressure switch.
 - 2) Signal loss between the exhaust airflow LTAU and the fume hood monitor(VAV hoods only).
 - 3) Sash raised above sash stop position.

- b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
 - 1) Sash position shall be sensed by using a vertical sash position sensor. Vertical sash position sensor shall be as specified under the article "VAV Fume Hood Controls".

B. VAV Fume Hood Controls

- 1. The fume hood controller shall use a sash position sensor to measure sash opening to proportionally control the hood's exhaust airflow. Controller shall maintain an "average" constant face velocity to +/- 5% tolerance at all sash positions.
- 2. Signal
 - a. The fume hood monitor shall receive the sash opening signals from the sash sensors. The monitor shall compute the total open sash area and then output an exhaust airflow control command signal to the appropriate exhaust airflow control device.
 - b. Vertical Sash Sensor
 - 1) A vertical sash sensor shall be employed to measure the height of each vertically moving fume hood sash. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. A stainless steel, vinyl coated cable shall be attached to the spring reel. Expected lifetime based on manufacturer's component data and tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in an easily accessible location on the fume hood for service.
 - a) Phoenix VSS
 - c. Horizontal Sash Sensor
 - 1) A horizontal sash sensor shall be provided for each pair of horizontal or overlapping sashes that are located on horizontal, combination or walk-in sash fume hoods. The horizontal sash sensor shall consist of two long flat bars for each pair of overlapping sashes. The first bar shall contain a magnetic element to send magnetic flux to the second bar. The second bar shall contain a multitude of magnetic sensors spaced every .75" or less. The bars shall be mounted at the top of each sash, one per sash. As the two sashes slide past each other, the bars shall overlap to determine the total amount of sash opening.
 - a) Phoenix HSS
 - d. Combination Horizontal & Vertical Sash Sensor
 - 1) Provide the required combination of vertical and horizontal sash sensors as required by the types of fume hoods to be controlled.
 - a) Phoenix CSS
- 3. Emergency Exhaust

- a. An emergency exhaust capability shall be provided to override the sash sensor and command maximum exhaust airflow. A push-to-start, push-to-stop, push button switch shall initiate this mode.
- 4. The fume hood control system shall respond to a step change in sash position by reaching 90% of the final position CFM value within 3 seconds with no more than a 5% overshoot or undershoot and with no noticeable oscillation.

C. Mounting of Monitor

- a. Fume hood monitor shall be suitable for surface or fully recessed mounting on the front of the fume hood.

2.4 LABORATORY TERMINAL AIRFLOW UNITS (LTAU)

A. Description

- 1. The laboratory terminal airflow unit (LTAU) shall be of venturi control type utilizing a cone shaped element. The position of the valve cone assembly shall be factory characterized to determine a position versus air flow volume relationship. Air flow control shall be achieved by moving the valve cone assembly to the factory characterized position that provides the required air volume. Air flow control shall not be achieved by air flow measurement. Control shall be pressure independent, accomplished by the cone/spring element continuously adjusting position relative to the venturi orifice to compensate for duct pressure fluctuations. All LTAUs shall have an equal percentage flow characteristic to provide stable control at low flow values. Butterfly, opposed blade, or parallel blade style damper or VAV boxes are not acceptable.

B. Accuracy

- 1. Total LTAU control error (including the combined effects of nonlinearity, hysteresis, repeatability, temperature and drift over a one year period) shall not exceed +/- 5% of flow set point. Example: If the LTAU's current flow set point is 1000 CFM, the volume of air delivered by the LTAU shall be within +/- 50 CFM of that set point. This error shall not be exceeded regardless of duct inlet or exit configurations, over the entire manufacturer's cataloged volumetric operating range of the LTAU, and at any pressure drop across the LTAU from 0.3" WG to 3.0" WG static pressure..

C. Calibration

- 1. Every LTAU shall be factory calibrated across the manufacturer's cataloged volumetric flow range using NIST traceable air flow stations and instrumentation with a combined accuracy of +/- 1 percent of signal over the entire range of measurement. Air flow shall be verified to be within an accuracy of +/- 5 percent of signal at a minimum of 48 different air flows. Provide factory calibration certificate for each valve, certified by an officer of the manufacturer.

D. Construction

EDITOR: IF VALVES OTHER THAN FUME HOOD VALVES (FOR EXAMPLE SNORKELS (THOUGH COATING IS NOT ALWAYS REQUIRED FOR SNORKELS)) NEED TO BE COATED VALVES, BE SURE TO INDICATE SO ON THE DRAWINGS.

1. LTAUs shall be constructed of heavy gauge aluminum. All bearing surfaces related to the control of airflow shall be made of Teflon or Teflon coated aluminum.
2. Supply air LTAUs shall come factory insulated with minimum 3/8" thick flexible closed cell polyethylene insulation with a flame/smoke rating not to exceed 25/50, K value not to exceed 0.270 btu-in/hr-ft²-°F @ 75°F mean temperature, and a permeability maximum of 0.08 Dry Cup. Perm-In. Rubatex Therma-Cel, AP/Armaflex, or equivalent. Insulation shall be installed per mfg. recommendations using mfg. recommended adhesives and joint vapor barrier sealants.
3. LTAUs on fume hoods or as indicated on drawings shall be coated with at least two baked coats of Heresite P403 coating material. The shaft and other exposed metal parts shall be made of 316 stainless steel. Stainless steel shaft shall be Teflon coated.
4. LTAUs used on cage or rack washer equipment shall be coated with two coats on all surfaces, including body, cone, shaft and hardware. Coating shall be suitable to eliminate corrosion for each installation application.

E. Electronically Controlled LTAUs:

1. Description
 - a. Valves shall be pressure independent and use closed loop control to regulate air volume linearly proportional to a 0-10 volt DC analog electronic control signal. Valves shall also generate a 0-10 volt DC feedback signal linearly proportional to valve airflow for internal volume control, monitoring, or airflow tracking control. Signal shall be factory calibrated using NIST traceable instrumentation.
2. Actuator
 - a. A pneumatic actuator shall be factory mounted to the LTAU body to vary the position of the internal cone from its minimum to maximum flows. Provide electronic "stops" to set maximum and minimum controllable airflows. Loss of control signal or power shall cause the units to fail to the position indicated on drawings. Fail-in-last-position actuators are not acceptable.
3. Flow Measuring Devices
 - a. No electronic (hot wire, thermistor, etc.) flow measuring devices may be used.
4. Power Supply to LTAU
 - a. Unless power supply is integral to a wall mounted control panel, provide a unit mounted power supply and disconnect switch on same side of LTAU as controller for each LTAU.
5. Static Pressure Switch:
 - a. Fume hood exhaust LTAUs shall include a unit-mounted static pressure switch to sense and alarm on a reduction in airflow below set point. The switch shall operate by measuring the pressure drop across the unit's orifice.

F. Pneumatically Controlled LTAUs:

1. Description

- a. LTAUs shall be pressure independent and shall have two factory calibrated min/max flow set points in the form of mechanical stops. Valves shall reposition between min/max flow set points based on a switched 0 to 20 psi pneumatic signal. Where required, LTAU shall generate a 0 to 10 volt feedback signal linearly proportional to LTAU airflow. Signal shall be factory calibrated to a stated CFM per volt scale factor using NIST traceable instrumentation.
- 2. Actuator
 - a. A pneumatic actuator shall be factory mounted to the unit body to vary the position of the internal cone from its minimum to maximum flows. Loss of pneumatic supply air shall cause the units to fail to the position indicated on the drawings. Fail-in-last-position actuators are not acceptable.
- 3. Flow Measuring Device
 - a. No electronic (hot wire, thermistor, etc.) flow measuring devices may be used.
- G. Constant Volume Airflow Control Valves:
 - 1. Valve Description:
 - a. Valve shall be pressure independent and shall maintain a constant volume set point. Valves shall be factory calibrated, NIST traceable and set for the desired airflow rate. Valves shall also be field adjustable to allow for future changes of airflow rate.

2.5 VAV FUME HOOD ROOM CONTROLLER

- A. Make-up/supply air and exhaust air controller shall control the airflow balance of the laboratory. The controller shall be unit mounted or wall mounted, as indicated on drawings. If no indication is given on drawings, provide wall-mounted controller.
- B. Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms.
- C. The controller shall generate signals linearly proportional to the airflow of each exhaust LTAU as indicated by the calibrated input signals. Similar outputs signals shall also be provided for the supply, other general exhaust (where appropriate), and total exhaust airflow volume signals.
- D. An integral power supply for each wall-mounted controller shall power the complete laboratory airflow control system from one (1) 120 volt AC line connection. Provide a labeled disconnect switch at each 120 volt AC connection. Locate switch above ceiling.

2.6 ENHANCED TRACKING CONTROL SYSTEM

EDITOR: ENHANCED TRACKING CONTROL REQUIRES MORE EXPENSIVE VALVES FOR PHOENIX SYSTEMS (AND FOR PHOENIX IS TYPICALLY CHARACTERIZED BY "MAV" AND "EXV" VALVE COMBINATIONS) AND IS TYPICALLY USED ONLY IN VAV FUME HOOD APPLICATIONS OR WHERE THERE IS A HIGH

PROBABILITY VAV FUME HOODS WILL BE USED IN THE FUTURE. SINCE IT REQUIRES MORE EXPENSIVE PHOENIX VALVES IT SHOULD NOT BE INDISCRIMINATELY SPECIFIED BY THE DESIGNER OR ACCEPTED FROM PHOENIX.

- A. Tracking controller shall control the operation of electronically controlled supply, exhaust, or return air LTAUs to provide proper room pressurization and airflow balance. Provide this system only when specifically indicated on the design drawings, and where VAV type fume hoods are indicated.
- B. The tracking controller shall be unit mounted and shall accept one input signal (multiple sources summed as one input) and produce one output signal.
- C. Tracking controller shall maintain a constant offset between the room's exhaust (return) and make-up/supply volumes. This offset shall be electronically adjustable.
- D. It shall be possible to electronically scale and calibrate the input and output signals. Both the minimum and maximum value of the tracking airflow shall be separately adjustable.

2.7 STANDARD TRACKING CONTROL SYSTEM

EDITOR: STANDARD TRACKING CONTROL CAN BE USED FOR MOST APPLICATIONS AND FOR PHOENIX IS TYPICALLY CHARACTERIZED BY "BSV" AND "EXV" VALVE COMBINATIONS.

- A. Tracking controller shall control the operation of supply, exhaust, or return air LTAUs to provide proper room pressurization and airflow balance. Provide this system unless specifically noted otherwise on the drawings. One LTAU within the system shall be electronically controlled; the other shall be pneumatically controlled with a feedback potentiometer.
- B. The tracking controller shall be unit mounted and shall accept one input signal (multiple sources summed as one input) and produce one output signal.
- C. Tracking controller shall maintain a constant offset between the room's exhaust (return) and make-up/supply volumes.
- D. Both the minimum and maximum value of the tracking airflow shall be separately adjustable.

2.8 LABORATORY TERMINAL AIRFLOW UNIT SOUND ATTENUATOR

EDITOR: DESIGNER SHALL PROVIDE PERFORMANCE DATA FOR THE SOUND ATTENUATORS ON THE DRAWINGS. DESIGNER MUST SPECIFICALLY INDICATE WHERE ATTENUATORS ARE REQUIRED. DESIGNER SHALL REVISE SPEC SECTION REFERENCE BELOW, IF REQUIRED.

- A. Sound attenuator shall be furnished by the LTAU manufacturer. Attenuator shall be properly matched to each individual LTAU to meet sound performance as scheduled. Provide packless type stainless steel attenuators for all fume hood and "wet" exhaust applications. Provide attenuators only where specifically indicated.

- B. Refer to other Division 23 sections for additional attenuator specifications.
- 2.9 FUME HOOD CALIBRATION BLAST GATE**
- A. Refer to other Division 23 sections for specifications for the blast gate used for low flow alarm calibration.
- 2.10 HOOD OCCUPANCY SENSOR**
- A. Provide manufacturer' standard occupancy sensors when specifically indicated on the drawings.
- 2.11 DIFFERENTIAL PRESSURE GAUGE**
- A. Provide where indicated. Dwyer Series 2000 Dual Scale (-0.25" to 0.25" W.G.)
- 2.12 ELECTRICAL**
- A. Provide all necessary power supplies/control transformers, power distribution wiring, etc. for a complete operating system. This includes but is not limited to power supplies for lab airflow controls, sensors/transmitters, etc.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- C. Provide power supplies for lab airflow controls in NEMA 1, metal, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
 4. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.

- D. Conduit fittings and junction box covers shall be painted bright orange.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install all components in strict compliance with component manufacturers' recommendations.
- B. Install fume hood monitors surface mounted on the front of the fume hood. Furnish exact cut-out dimensions to the fume hood factory to allow for concealed wiring to the monitor..
- C. Install the sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal fume hood use, and which allows both the horizontal and vertical sashes to be opened and closed in any combination without binding, twisting or tangling.
- D. Terminate wiring at all devices.
- E. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner. Installation shall also comply with Related Sections Mechanical Systems Controls and Division 26.
- F. Install components so that they are easily accessible for service and in conformance with NEC clearance requirements.

DESIGNER: NOTE THE PARAGRAPH BELOW AND INCLUDE U-M STANDARD DETAIL "SUPPLY AIR LTAU CLEARANCE" ON THE DESIGN DRAWINGS.

- G. Install LTAUs with proper NEC clearances at LTAU mounted controls.

3.2 SYSTEM START-UP

- A. Program, start-up, calibrate, and test all laboratory airflow controls.
- B. Adjust LTAU air volume to provide hood face velocity to within +/- 5% of required setpoint. Operate the lab airflow controls to assist the TAB Contractor in verifying that correct airflow rates and alarm settings are within +/- 5% tolerance.
 - 1. All adjustments to the LTAUs shall be done by the LCC, not the TAB contractor.
 - 2. TAB contractor shall take flow readings to verify that the air flow volumetric flow rate indicated by the LTAU matches the measured air flow volume, and to assist in setting alarms. Assist the TAB contractor in verifying measured LTAU air flow against that reported by the LTAU controller, at design minimum and maximum CFM.
 - 3. LTAU air flow shall not be adjusted based on field air flow measurements. If LTAU air flow verification indicates calibration is not within +/- 5% tolerance, do not field adjust. Notify Owner and return to factory for recalibration.
- C. Unless indicated otherwise, set controls to maintain hood face velocities as follows:

1. VAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) for the entire sash travel, for all vertical and horizontal sash positions. Note: The LTAU's capacity may be insufficient to maintain the required air flow velocity through the entire travel of the sash as it is raised above the sash stop. Do not "clamp" hood LTAU air flow, allow the LTAU to open as far as it can in an attempt to maintain face velocity, except limit travel to the extent necessary so that the room cannot become more negative than indicated; clamp valve if necessary to prevent room from going more negative.
 - 1) Hoods with Horizontal Sashes: Set controls to maintain the required face velocity with the sashes in the position that creates the maximum free area opening. Example:, If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed)
 2. CAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) at sash stop position.
- D. Set fume hood monitor alarms as follows:
1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - b. LTAU valve cone at maximum travel (VAV hoods).
 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.
 - c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.
- E. Set other control parameters/alarms to comply with the laboratory airflow control drawings.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents..
- B. Demonstrate that the laboratory controls perform per the sequence of operation and the design intent..
- C. Demonstrate every fume hood monitor alarm set point.
- D. Perform other demonstrations as may be required by the CxA.

3.4 CLOSEOUT ACTIVITIES

- A. Submit as-built documentation per article "Submittals". Obtain approval of as-built documentation prior to Owner training.

- B. Provide on-site training to Owner's maintenance personnel. Familiarize personnel with location of LTAUs, controllers, system components, power supplies, and network devices. Review the control concept for each lab and room type.

SECTION 230930 - REFRIGERANT DETECTION AND ALARM

REMOVED THE STATEMENT THAT U-M PROVIDES THE REFRIGERANT MONITOR AND CALIBRATES IT. PART 1 UPDATED TO THE CURRENT U-M MASTER SPEC FORMATTING TEMPLATE. PART 2 UPDATED TO PROVIDE TECHNICAL DETAIL ON REFRIGERANT MONITORS. PART 3 UPDATED TO REQUIRE FINAL SETUP AND CALIBRATION OF MONITOR BY A FACTORY SERVICE REP. D. KARLE FOR HVAC MTT OCT. 2014

AUGUST 2015: REVISED TO DELETE HORNS, LIGHTS, TUBING, WHICH WILL NOW BE PROVIDED BY THE MECHANICAL SYSTEMS CONTROLS CONTRACTOR (MSCC). REVISED TO DELETE CHILLGARD MODEL LE BECAUSE OF ONGOING RELIABILITY ISSUES REPORTED BY PLANT. D.KARLE FOR STEAM/HYDRONICS MTT.

NOV. 2018 REVISED TO ADD BACHARACH AS APPROVED, REVISE MSA MODEL NUMBER, REDUCE ACCURACY REQUIREMENTS, AND OTHER MINOR CHANGES. D. KARLE PER HYDRONICS MTT WITH INPUT FROM C. BUTCHER.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:
 - 1. Section 019110/019100 - Commissioning
 - 2. Section 221113 - Piping Materials and Methods
 - 3. Section 220500 - Common Work Results for Mechanical
 - 4. Section 230900 - Mechanical Systems Controls
 - 5. Division 26: - Electrical.

1.2 SUMMARY

- A. Refrigerant monitor/controller and accessories for detecting refrigerant leaks, controlling equipment, and providing local and remote alarms.

1.3 SUBMITTALS

- A. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, rough-in requirements, materials of construction, and operating and maintenance clearance requirements. Additionally include::
 - 1. Project specific wiring diagram indicating inputs and outputs to the refrigerant monitor/controller.
 - 2. Installation, operation, and maintenance instructions for all devices.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Michigan Mechanical Code.
 - 2. ASHRAE Standard 15: Safety Standard for Refrigeration Systems (ANSI Approved).
 - 3. ASHRAE Standard 34: Designation and Classification of Refrigerants.
 - 4. UL 2075: UL Standard for Safety Gas and Vapor Detectors and sensors.
 - 5. UL 61010-1: Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and accessories raised off the floor or ground on pallets and protected with coverings to prevent damage or contamination due to weather and construction activities. Provide temporary protective caps on pipe or tubing ends. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Protect from damage, dirt and debris at all times.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

DESIGNER TO PROVIDE REFRIGERANT DETECTION, ALARM, AND VENTILATION SYSTEM THAT COMPLIES WITH ASHRAE STANDARD 15 AND THE BUILDING CODE.

INDICATE ON THE DESIGN DRAWINGS THE NUMBER AND LOCATION OF WARNING HORNS AND LIGHTS THAT ARE ACTIVATED WHEN A REFRIGERANT LEAK IS DETECTED, AND THE NUMBER AND LOCATION OF SAMPLE POINTS.

PROVIDE A CONTROL DRAWING INDICATING THAT THE REFRIGERANT MONITOR PLACES THE MACHINERY ROOM INTO THE CODE REQUIRED VENTILATION MODE UPON DETECTION OF A REFRIGERANT LEAK. USE U-M STANDARD DETAIL MD 230930 001 "REFRIGERANT MONITOR CONTROL" FOR THIS PURPOSE, REVISED TO BE PROJECT SPECIFIC AND TO INDICATE THE REFRIGERANT TYPE(S) TO BE MONITORED ALONG WITH THE CORRESPONDING ALARM SET POINTS. THE LOW ALARM SET POINT SHALL BE 1/10 THE OEL, THE HIGH ALARM SET POINT SHALL BE 1/2 THE OEL, WHICH ARE LISTED IN CHAPTER 11 OF THE MICHIGAN MECHANICAL CODE, EXCEPT R123 SHALL BE SET FOR ≥ 30 PPM (LOW) AND ≥ 50 PPM (HIGH).

2.1 REFRIGERANT MONITOR

- A. Approved Manufacturers: Bacharach HGM-MZ, MSA Chillgard 5000
- B. Provide infrared technology refrigerant monitor and controller, capable of detecting the refrigerant types in the machinery room.
 - 1. Measurement range: 0-1000 ppm
 - 2. Minimum detection limit: +/- 1 ppm
 - 3. Accuracy: ±10% of reading
 - 4. Display resolution: 1 ppm
 - 5. 4-20mA isolated output indicating refrigerant concentration
 - 6. Manual alarm reset
 - 7. Capable of sensing the number of locations indicated on the design documents.
 - 8. With alarm beacon and horn mounted on the monitor cabinet.
 - 9. Capable of sampling up to 400 feet with 1/4" I.D. copper tube.
 - 10. Provide end of line sample tube filters, quantity to match the number of sensing locations indicated.
 - 11. 120 VAC power supply
- C. Provide remote relay modules and a multipoint sequencer, as required to accomplish the design intent expressed in the contract documents. At minimum provide outputs to provide the following functionality:
 - 1. A low alarm which activates by latching a normally open Form C (SPDT) contact.
 - 2. A high alarm which activates by latching a normally open Form C (SPDT) contact.
 - 3. A refrigerant monitor fault alarm, which de-energizes a normally closed contact to indicate there is problem with the refrigerant monitor system. The same contact shall de-energize upon a loss of power to the monitor.
 - 4. A reset switch that resets the high and low alarm states if the condition that caused the alarm has abated.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation shall comply with the refrigerant monitor manufacturer's recommendations and the contract documents.

3.2 FIELD QUALITY CONTROL

- A. Provide a manufacturer trained service technician to perform start-up services. The service technician shall perform the following:
 - 1. Verify correct installation of the monitor.
 - 2. Perform set-up and calibration of the monitor using a NIST traceable test mixture. Attach a calibration sticker on the monitor listing date of calibration and calibration details.
 - 3. Participate in the commissioning of the refrigerant monitor system.
 - 4. Provide all the monitor passwords to the Owner.

5. Fill out and submit the UM standard calibration and testing report form provided by UM. Provide a written service report prepared on site and submit both at the time of the service visit (with copies immediately provided to the Owner and Commissioner). Service report shall indicate services provided and list all controller settings and alarm setpoints.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 1 Section titled Commissioning and other requirements of the Contract Documents.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 231113 - FUEL OIL SYSTEMS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 231113 - FUEL OIL SYSTEMS

REVISIONS:

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. This Section includes fuel oil piping system and equipment, including:
 - 1. Piping, fittings, and specialties.
 - 2. Oil transfer equipment.
 - 3. Oil storage tanks and accessories.

SPEC EDITOR: LIST ONLY MATERIALS IN THIS PROJECT WHICH THE READER MAY EXPECT TO FIND IN THIS SECTION. VERIFY THAT LISTED SECTIONS ARE INCLUDED IN THIS PROJECT SPECIFICATION AND THAT THEIR TITLES ARE CORRECTLY INDICATED HERE.

1.3 DEFINITIONS

- A. Pipe sizes used in this Specification are Nominal Pipe Size (NPS).

1.4 QUALITY ASSURANCE

- A. Qualify welding processes and welding operators in accordance with ASME "Boiler and Pressure Vessel Code," Section IX, "Welding and Brazing Qualifications."
- B. Regulatory Requirements: Comply with provisions of the following codes:
 - 1. NFPA 31 - Standard for the Installation of Oil Burning Equipment, for oil piping materials and components, oil piping installations, and inspection, and testing of fuel oil piping systems.

SPEC EDITOR: MODIFY BELOW BY SUBSTITUTING PLUMBING CODE ENFORCED BY THE AUTHORITY HAVING JURISDICTION. INSERT THE EDITION IN FORCE.

- 2. BOCA Basic National Mechanical Code.
- C. UL Compliance: Provide fuel oil piping components and storage tanks which are listed and labeled by UL.

1.5 SEQUENCING AND SCHEDULING

- A. Coordinate the size and location of concrete ballast pads and fill and sounding boxes for underground storage tanks, and housekeeping equipment pads for oil transfer pumps. Cast anchor bolt inserts into pad. Concrete reinforcement and formwork requirements are specified in Division 3.

1.6 WARRANTY

SPEC EDITOR: BE CAUTIOUS NOT TO REDUCE THE PROTECTION THE OWNER MIGHT OTHERWISE BE ENTITLED TO, BY INCLUDING UNINFORMED REQUIREMENTS FOR WARRANTIES. SEE EVALUATIONS AND DIVISION 1 SECTION "WARRANTIES AND BONDS."

SPEC EDITOR: RETAIN THIS ARTICLE WHEN SPECIFYING STEEL TANKS WITH STI-P3 CATHODICALLY PROTECTED TANKS.

- A. Special Product Warranty: Submit a written warranty for the underground fuel oil storage tanks, executed by the manufacturer, agreeing, at the manufacturer's option, to repair the failure, replace the failed tanks limited to delivery of new tank to the site of original installation, or refund the original purchase price of the tanks, provided the tanks are installed in accordance with the manufacturer's instructions. Warranty shall protect the Owner for a period of 30 years from the date of original purchase, against structural failures of the tanks, including cracking, breakup, or collapse; and failure of the tanks due to external corrosion, and internal corrosion when the tanks are used for storage of fuel oils at temperatures not exceeding 150 deg. F. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the Contract Documents.

SPEC EDITOR: USE THE ARTICLE BELOW WHEN SPECIFYING GLASS-FIBER REINFORCED PLASTIC TANKS.

- B. Special Project Warranty: Submit a written warranty for the underground fuel oil storage tanks, executed by the manufacturer, agreeing, at the manufacturer's option, to repair the failure, replace the failed tanks limited to delivery of new tank to the site of original installation, or refund the original purchase price of the tanks, provided the tanks are installed in accordance with the manufacturer's instructions. Warranty shall protect the Owner for a period of 30 years from the date of original purchase, against failure of the tanks due to external corrosion, and internal corrosion when the tanks are used for storage of fuel oils at temperatures not exceeding 150 deg. F. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the Contract Documents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Vertical Ball Check Valves:
 - 1. Keystone
 - 2. Milwaukee
 - 3. Grinnell
 - 4. APCO
 - 5. Crane
 - 6. Stockham

- B. Strainers:
 - 1. Armstrong Machine Works.
 - 2. Hoffman Specialty ITT; Fluid Handling Div.
 - 3. Metraflex Co.
 - 4. R-P&C Valve; Div. White Consolidated Industries, Inc.
 - 5. Spirax Sarco.
 - 6. Trane Co.
 - 7. Victaulic Co. of America. (low pressure applications only)
 - 8. Watts Regulator Co.

- C. Oil Transfer Pumps:
 - 1. ITT Marlow.
 - 2. Roper Pump Co.
 - 3. Viking Pump Div.; Houdaille Industries, Inc.
 - 4. Webster Electric Co; Sub. of Sta-Rite Industries, Inc.

- D. Oil Piping Specialties:
 - 1. McDonald Mfg. Co., A.Y.
 - 2. OPW Division; Dover Corp.

- E. Steel Underground Oil Storage Tanks:
 - 1. Adamson Co., Inc.
 - 2. Buffalo Tank, Div. Bethlehem Steel Corp.
 - 3. Highland Tank & Mfg. Co.
 - 4. Modern Welding Co., Inc.

- F. Glass Fiber Reinforced Plastic Underground Oil Storage Tanks:
 - 1. Lifetime Fiberglass Tank Co.
 - 2. Owens-Corning Fiberglas Corp.
 - 3. Xerxes Fiberglass Inc.

2.2 PIPE AND TUBE MATERIALS

SPEC EDITOR: SELECT ONE - ANNEALED COPPER IS NOT TO BE USED INDOORS.

- A. Steel Pipe: ASTM A 120, Schedule 40, seamless, black steel pipe, with beveled ends, with threaded joints and fittings for 2 inch and smaller, and with welded joints for 2-1/2 inch and larger.

- B. Copper Tubing: ASTM B 88, Type L, hard drawn copper tubing with wrought copper fittings and brazed joints for 2 inch and smaller, above ground, within building. Use Type K, annealed copper tubing for 2 inch and smaller without joints, for underground installations.

2.3 FITTINGS

SPEC EDITOR: FITTINGS BELOW ARE ALSO AVAILABLE IN CLASS 250.

- A. Cast-Iron Threaded Fittings: ANSI B16.4, Class 125, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.

SPEC EDITOR: FITTINGS BELOW ARE ALSO AVAILABLE IN CLASS 300.

- B. Malleable Iron Threaded Fittings: ANSI B16.3, Class 150, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.
- C. Steel Fittings: ASTM A 234, seamless or welded, for welded joints.
- D. Wrought-Copper Fittings: ANSI B16.22, streamlined pattern.

SPEC EDITOR: FLANGES BELOW ARE ALSO AVAILABLE IN CLASS 250.

- E. Cast-Iron Threaded Flanges: ANSI B16.1, Class 125; raised ground face, bolt holes spot faced. Threads shall conform to ANSI B1.20.1.

SPEC EDITOR: BELOW FLANGES AND FITTINGS ARE AVAILABLE IN SEVERAL CLASSES, MATERIALS, FACINGS, AND END CONNECTIONS. VERIFY WITH PROJECT REQUIREMENTS.

- F. Steel Flanges and Flanged Fittings: ANSI B16.5, including bolts, nuts, and gaskets of the following material group, end connection and facing:
 - 1. Material Group: 1.1.
 - 2. End Connections: Butt Welding.
 - 3. Facings: Raised face.

2.4 JOINING MATERIALS

- A. Brazing Filler Metals: AWS A5.8, Classification BAgl (silver).
- B. Gaskets for Flanged Joints: Gasket material shall be full-faced for cast-iron flanges and raised-face for steel flanges. Select materials to suit the service of the piping system in which installed and which conform to their respective ANSI Standard (A21.11, B16.20, or B16.21). Provide materials that will not be detrimentally affected by the chemical and thermal conditions of the fluid being carried.

2.5 PIPING SPECIALTIES

- A. Y-Pattern Strainers: 125 psig working pressure; cast-iron body conforming to ASTM A 126, Class B; flanged ends for 2-1/2 inch and larger, threaded connections for 2 inch and smaller, bolted cover, perforated stainless steel screen, and plugged blow-down drain.

SPEC EDITOR: THE FOLLOWING ARE FOR 1-1/2 INCH PIPE AND SMALLER.

- B. Flexible Connectors: minimum 150 psig working pressure, maximum 250 deg F operating temperature; stainless steel bellows with woven flexible bronze wire reinforcing protective jacket. Connectors shall have flanged or threaded end connections to match equipment connected; and shall be capable of 3/4 inch misalignment.

2.6 GENERAL DUTY VALVES

- A. General duty valves (i.e., gate, globe, ball, and butterfly valves) are specified in Division 22 Section "Valves". Special duty valves are specified in this Article by their generic name. Refer to Part 3 below, Article "VALVE APPLICATION" for specific uses and applications for each valve specified.

2.7 SPECIAL DUTY VALVES

SPEC EDITOR: INTEGRAL RELIEF VALVE ON OIL TRANSFER PUMP MAY BE SUFFICIENT TO ELIMINATE INLINE SAFETY RELIEF VALVES.

- A. Oil Safety Valves: 250 psig maximum working pressure, 550 deg. F. maximum operation temperature; ASTM B 61 bronze body and bronze bases and discs, and field adjustable cadmium-plated carbon steel springs factory-set at 20 percent above operating pressure. End connections shall be inside threaded with threads conforming to ANSI B1.20.1. Valve shall be UL-listed for flammable or volatile liquids.
- B. Vertical Ball Check Valves: Class 200, 400 psig maximum operating pressure, 2-piece bronze construction with threaded end connections; integral bronze seats and replaceable stainless steel ball.

2.8 FUEL OIL TRANSFER PUMPS AND ACCESSORIES

SPEC EDITOR: CAPACITY IN GPM MAY BE PRESENTED IN A SCHEDULE IF THERE ARE SEVERAL PUMPS WITH VARIOUS CAPACITIES, OR MAY BE SPECIFIED HERE. ALSO AVAILABLE WITH FLANGE MOUNTING MANY OPTIONAL FEATURES AVAILABLE TO SUIT UNIQUE PROJECT REQMTS, CONSULT MFR LITERATURE.

- A. General Description: single-stage, positive displacement rotary type, with the following features and accessories; foot-mounted, cast-iron housing, steel gears, bronze bearings, steel shaft, standard mechanical seals; built-in pressure relief bypass; steel base; and drive coupling. Provide pumps with capacities and electrical characteristics as scheduled for number 2 or 3 fuel oil. Pumps shall be constructed in accordance with UL 343, and be UL-listed and bear the UL label.

SPEC EDITOR: SELECT FROM THE FOLLOWING 2 DRIVE OPTIONS.

- B. Drive: V-belt drive, with belt guard.
- C. Drive: direct drive, close coupled.
- D. Motor: Split phase for single-phase motors; capacitor-start, induction-run, totally enclosed for 3-phase motors.

2.9 STEEL UNDERGROUND STORAGE TANKS AND ACCESSORIES

SPEC EDITOR: SELECT ONE OF 2 OPTIONS BELOW. INDICATE SIZE AND CAPACITY ON THE DRAWINGS.

- A. General Description: single-wall factory-fabricated and tested, cathodically-protected, and bearing UL and sti-P3 labels. Fabricate wall and headers using hot-rolled carbon steel plates or sheets, as specified in UL 58. Size and capacity as indicated.
- B. General Description: double-wall, factory-fabricated and tested, cathodically-protected, and bearing UL and sti-P3 labels. Fabricate inner and outer walls and headers using hot-rolled carbon steel sheets or plates, as specified in UL 58. Size and capacity as indicated.
- C. Fabrication: Tanks shall be fabricated for operation at atmospheric pressure; to store liquids with specific gravities up to 1.1, and with maintained temperatures of up to 150 deg. F. Fabricate shell and head joints, lifting lugs, manholes, masonry supports, and pipe connections in accordance with UL 58. Fabricate tanks for the following internal and external loads:
 - 1. External Hydrostatic Pressure: 3'-0" depth of bury from top of tank and hole fully flooded; withstand general buckling with safety factor of 2:1.
 - 2. Surface Loads: H-20 axle loads when installed in accordance with manufacturer's installation instructions.
- D. Tank Fittings and Accessories: Provide storage tank with the following factory-installed fittings and accessories:

SPEC EDITOR: INCLUDE TANK DETAILS ON DRAWINGS INDICATING LOCATION OF FITTINGS. FLANGED FITTINGS ARE ALSO AVAILABLE.

- 1. Tank Manhole: 24 inch diameter, bolted, flanged, and gasketed manhole, with extension collar, for access to inside of tank.
- 2. Threaded pipe connection fittings on top of tanks, for fill, supply, return, vent, gages, heating coils, and hot-well in locations and of sizes as indicated. Provide cast-iron plugs for shipping.

3. Anchor Straps: Provide manufacturer's standard anchoring system (straps, cables, turnbuckles, etc.) with the strength of at least 1-1/2 times the maximum uplift force of the empty tank without backfill in place.
4. Lifting Lugs: Provide lifting lugs to facilitate handling and installation.

SPEC EDITOR: IF PARAGRAPH BELOW IS RETAINED, INDICATE LADDER LOCATION ON TANK DETAIL ON DRAWINGS.

5. Ladders: Provide carbon steel ladder inside tank, anchored to top and bottom, and located as indicated.
6. Masonry Supports: (2) 6" x 6" x 3/8" steel angles 6' - 0" long located longitudinally on each side of the manhole and continuously welded in place.

SPEC EDITOR: SELECT FROM 2 OPTIONS BELOW, BUT ONLY FOR HEAVY OIL STORAGE TANKS. HOT-WELLS ARE USED IN SOME AREAS IN LIEU OF HEATING COILS FOR HEAVY OIL. EDIT AS DESIRED. SCHEDULE HEATING CAPACITY OR INDICATE ON DRAWINGS.

7. Heating Coils: Provide heating capacity as scheduled. Coils shall be continuous spiral having a 3 inch slope, made of Type K soft annealed copper with no joints within the tank.
8. Hot-Wells: Provide 8 inch diameter hot-well extending from 4 inch above tank top to 4 inch above tank bottom. Provide tappings above tank for connection of oil suction and return piping. Provide 2 inch hole in well, just below top of tank, for venting.
9. Supply Tube: Provide extension of transfer pump suction line fitting into tank, terminating 6 inch above tank bottom and cut at 45 degree angle.
10. Vent Cap: cast iron threaded tee inlet; 40 mesh brass wire cloth screen.
11. Fill Box: Flush heavy duty, waterproof, cast iron body and top cap, and brass inner cap with lock with key wrench.
12. Remote Oil Gages: Balanced hydraulic type providing a true volumetric indication. Gage volume range to suit capacity storage; UL-listed and labeled.

SPEC EDITOR: RETAIN ONLY ONE OF THE 3 PARAGRAPHS BELOW, DEPENDING UPON REQUIREMENTS WITHIN YOUR LOCAL AREA. AUTHORITY HAVING JURISDICTION MAY WAIVE THE REQUIREMENTS FOR CORROSION PROTECTION WHERE EVIDENCE IS PROVIDED THAT SUCH PROTECTION IS NOT NECESSARY.

- E. Corrosion Protection System: Tanks and their piping shall be protected by a properly engineered, installed, and maintained corrosion protection system in accordance with the Steel Tank Institute of Standard No. sti-P3 "System for External Corrosion Protection of Underground Steel Storage Tanks." Provide means monitoring cathodic protection by either "Protection Prover 1" or "Protection Prover 2" monitoring system.

2.10 SOURCE QUALITY CONTROL

- A. Perform tests at the factory after fabricating and prior to shipment in accordance with sti-P3.

2.11 GLASS-FIBER-REINFORCED POLYESTER UNDERGROUND STORAGE TANKS

- A. General Description: double-wall factory-fabricated and tested, in conformance with ASTM D 4021; bearing UL label. Tanks shall be designed to be vented and operated at atmospheric pressure; designed to store liquids with specific gravities up to 1.1, and with maintained temperatures of up to 150 deg F; and shall be chemically inert to petroleum being stored, plus their additives.

SPEC EDITOR: COORDINATE ELECTRICAL CONNECTIONS.

- B. Hydrostatic Monitoring System: Include a brine antifreeze solution, UL listed reservoir sensor, and UL listed electronic control panel to monitor leaks in inner and outer tank walls. Controls shall operate with 120 volts A.C.
- C. Tank Fittings and Accessories: Provide storage tank with the following factory-installed fittings and accessories:

SPEC EDITOR: INCLUDE TANK DETAILS ON DRAWINGS INDICATING LOCATION OF FITTINGS. FLANGED FITTINGS ARE ALSO AVAILABLE.

1. Tank Manhole: 24 inch diameter, bolted, flanged, and gasketed manhole, with extension collar, for access to inside of tank.
2. Threaded pipe connection fittings on top of tanks, for fill, supply, return, vent, gages, heating coils, and hot-well in locations and of sizes as indicated. Provide cast-iron plugs for shipping.
3. Anchor Straps: Provide manufacturer's standard anchoring system (straps, cables, turnbuckles, etc.) with the strength of at least 1-1/2 times the maximum uplift force of the empty tank without backfill in place.
4. Lifting Lugs: Provide lifting lugs to facilitate handling and installation.

SPEC EDITOR: IF BELOW IS RETAINED, INDICATE LADDER LOCATION ON TANK DETAIL ON DRAWINGS.

5. Ladders: Provide carbon steel ladder inside tank, anchored to top and bottom, and located as indicated.

SSPEC EDITOR: ELECT FROM 2 OPTIONS BELOW, BUT ONLY FOR HEAVY OIL STORAGE TANKS. HOT-WELLS ARE USED IN SOME AREAS IN LIEU OF HEATING COILS FOR HEAVY OIL. EDIT AS DESIRED.

6. Heating Coils: Provide spiral type heating coil of capacity as scheduled, installed in tank manhole.
7. Hot-Wells: Provide 8 inch hot-well extending from 4 inch above tank top to 4 inch above tank bottom. Provide tappings above tank for connection of oil suction and return piping. Provide 2 inch hole in well, just below top of tank, for venting.
8. Supply Tube: Provide extension of transfer pump suction line fitting into tank, terminating 6 inch above tank bottom and cut at 45 degree angle.
9. Vent Cap: cast iron threaded tee inlet; 40 mesh brass wire cloth screen.
10. Fill Box: Flush heavy duty, waterproof, cast iron body and top cap, and brass inner cap with lock with key wrench.

11. Remote Oil Gages: Balanced hydraulic type providing a true volumetric indication. Gage volume range to suit capacity storage; UL-listed and labeled.

2.12 GRADE MANHOLE

- A. Precast Concrete Manhole Sections: ASTM C478, base and concentric cone sections with integral ladder.
- B. Cast-Iron Ring and Cover: heavy-duty, water-resistant, cast-iron manhole frame, gasket, and bolted lid; 24 inch diameter inside opening dimension; 8 inches overall height.

PART 3 - EXECUTION

3.1 PIPE INSTALLATIONS

- A. General: Refer to Section 221113 - Piping Materials and Methods" for basic piping installation instructions.
- B. Install supply, return, fill, and vent piping at a uniform grade of 1/4 inch in ten feet downward in the direction of the storage tank.

3.2 UNDERGROUND TANK INSTALLATION

- A. Perform air pressure test on tanks prior to placing into excavations. Test pressure shall not exceed 5 psi. Apply a soap solution to joints.
- B. Excavate to a sufficient depth for a minimum of 3 foot earth cover from top at tank to grade; allowing for cast-in-place, reinforced concrete ballast pad, plus 6 inches of sand or pea gravel between ballast pad and tank. Excavation shall extend one foot around the perimeter of the tank.

SPEC EDITOR: BALLAST PAD SIZE AND REINFORCING SHOULD BE SUFFICIENT TO HOLD DOWN EMPTY TANK COMPLETELY SUBMERGED IN WATER.

- C. Place reinforcing and concrete as specified in Division 03. Excavation floor and walls may serve as forms. Use ASTM C150 Portland Cement concrete, Type I, with normal weight aggregate conforming with ASTM C33, and having a 28 day compressive strength at 3,000 psi.
- D. Set tiedown eyelets for hold-down straps in concrete ballast pad and tie to reinforcing steel.
- E. Place 6 inches of clean sand or pea gravel on top of ballast pad.
- F. Set tank on fill materials.

SPEC EDITOR: RETAIN BELOW FOR STEEL TANKS.

- G. Protect anodes during tank placement and backfilling operations.
- H. Install holddown straps.
- I. Make piping connections.

- J. Backfill excavation with clean sand or pea gravel. Tamp backfill to consolidate.

3.3 FIELD QUALITY CONTROL

- A. Test oil piping in accordance with NFPA 31.
- B. Remake leaking joints and connections using new materials.

3.4 COMMISSIONING

- A. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.
- B. Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance.
- C. Review data in Operating and Maintenance Manuals. Refer to Division 01 section "Project Closeout."
 - 1. Schedule training with Owner through the Architect, with at least 7 days advance notice.
- D. Before activating system perform these steps:
 - 1. Open valves to full open position. Close bypass valves.
 - 2. Remove and clean strainer screens.
 - 3. Check pump for proper direction of rotation.
 - 4. Fill oil storage tank with proper fuel type.
 - 5. Check operating controls of fuel burner units.
 - 6. Check operation at automatic bypass valves.
 - 7. Check and set operating temperature controls on oil heaters.
 - 8. Check corrosion monitoring systems for proper operation.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 231123 - FACILITY NATURAL-GAS PIPING

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 231123 - FACILITY NATURAL-GAS PIPING

REVISIONS:

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide piping, fittings, and specialties for Natural Gas Systems

1.3 WORK BY OTHERS - UTILITY COMPANY:

SPEC EDITOR: GAS METERS ARE TYPICALLY FURNISHED AND INSTALLED BY THE MICHCON, WITH CHARGES BILLED DIRECTLY TO THE OWNER. IF OTHER THAN MICHCON, CONTACT THE UTILITY SERVING THE SITE FOR INFORMATION AND COORDINATE WITH CONSTRUCTION MANAGEMENT. VERIFY AVAILABLE PRESSURE WITH MICHCON AND REQUIRED PRESSURE AT APPLIANCES. MICH CON GENERALLY LIMITS PRESSURE TO 14"WC UNLESS YOU CAN PROVE THE NEED FOR HIGHER PRESSURE.

- A. Gas meter, pressure regulator and related valves will be furnished and installed by MichCon.
- B. All gas piping outside the building, upstream of the gas meter is provided by MichCon.
- C. Contractor shall coordinate installation of meter and related components with MichCon and owner.
- D. Expenses and fees for MichCon work shall be paid for by the owner.

1.4 QUALITY ASSURANCE:

- A. Comply with the requirements of NFPA 54 - National Fuel Gas Code, for gas piping materials and components, and gas piping systems installation, inspection, testing, and purging.

PART 2 - PRODUCTS

2.1 GAS LINE PRESSURE REGULATORS:

SPEC EDITOR: DO NOT SPECIFY APPLIANCE PRESSURE REGULATORS HERE IF THEY ARE SPECIFIED TO BE INTEGRAL WITH GAS APPLIANCE IN EQUIPMENT SECTION. GAS LINE PRESSURE REGULATORS ARE NORMALLY FURNISHED BY GAS SUPPLIER, AND BY GAS-FIRED EQUIPMENT MANUFACTURER. ADDITIONAL PRESSURE LIMITING AND RELIEF VALVES ARE NOT REQUIRED IN ALL CASES. CONSULT NFPA 54 AND GAS SUPPLIER.

SPEC EDITOR: IF USED, INCLUDE SCHEDULE OR OTHERWISE INDICATE INLET AND OUTLET PRESSURES AND FLOW

- A. Single stage, steel jacketed, corrosion-resistant gas pressure regulators; with atmospheric vent, elevation compensator; with threaded ends for 2 inch and smaller, flanged ends for 2-1/2 inch and larger; for inlet and outlet gas pressures, specific gravity, and volume flow indicated.

SPEC EDITOR: VEN WILL ADD NAMES BELOW

- B. Manufacturers:
 - 1. _____
 - 2. _____
 - 3. _____
 - 4. Etc..

2.2 LUBRICATED PLUG VALVES:

SPEC EDITOR: THIS GAS ISOLATION VALVE IS TYPICALLY SPECIFIED FOR LARGER PIPING ONLY, AT BOILERS ETC. FOR LAB ISOLATION, USE BALL VALVES SPECIFIED IN 220523. DELETE PARAGRAPH 2.2.A IF BALL VALVES ARE SPECIFIED FOR 2" AND LESS IN SECTION 220523.

- A. Gas Cocks 2 Inch and Smaller: 150 psi WOG, bronze body, straight-away pattern, square head, threaded ends.
- B. Gas Cocks 2-1/2 Inch and Larger: MSS SP-78; 175 psi, lubricated plug type, semi-steel body, single gland, wrench operated, flanged ends.
- C. Manufacturers: Jenkins Bros., Lunkenheimer Co., NIBCO, Inc., Powell Co., Stockham

2.3 MASTER GAS SHUT OFF VALVE AND VALVE BOX

SPEC EDITOR: THIS WAS REQUIRED ON LABS AT ONE TIME, BUT IS NO LONGER. SPECIFIC APPLICATIONS MAY WARRANT ITS USE. ADDITIONAL RESEARCH SHOULD BE DONE PRIOR TO SPECIFYING. CONSIDER CHEMTROL.

- A. Master gas shut off valve shall be bronze body ball valve. Recessed valve box constructed of extruded aluminum with aluminum back plate and frame cover. Assembly shall include clear flexible window with emergency pull ring. Permanently affix the following to the window:

CAUTION: MASTER GAS SHUT OFF VALVE

a) CLOSE ONLY IN EMERGENCY

B. Manufacturers: Ohmeda, Mueller

PART 3 - EXECUTION

SPEC EDITOR: DELETE ARTICLE 3.1 AND 3.2 FOR NEW PROJECTS.

3.1 PREPARATION:

A. Precautions: Before turning off gas, turn off all equipment valves. Perform a leakage test to determine that all equipment is turned off.

3.2 HANDLING FLAMMABLE LIQUIDS:

A. Remove and legally dispose of liquid from drips in existing gas piping. Handle cautiously to avoid spillage or ignition.

3.3 NATURAL GAS PIPING INSTALLATION REQUIREMENTS:

A. See Section 221113 for piping materials and installation requirements.

B. Install, inspect, test, and purge natural gas systems in accordance with NFPA 54, and local utility requirements.

C. See Section 220523 for valve installation requirements.

SPEC EDITOR: INDICATE ON THE DRAWINGS, THE ROUTING AND TERMINATION LOCATION OF THE CONDUIT VENT PIPE.

D. Gas piping in air plenum ceilings shall be continuously welded or installed in air-tight conduit constructed of Schedule 40 seamless black steel pipe with welded joints. Vent conduit to the outside and terminate with a screened vent cap. Valves shall not be installed in plenums.

E. Drips and Sediment Traps: Install a drip leg at inlet to terminal equipment, points where condensate may collect, and at the outlet of the gas meter. Do not install drips where condensate is likely to freeze. Construct drips using a tee with plugged or capped bottom outlet. Drip shall be minimum of 3 pipe diameters long, same size as pipe. Locate drips to permit cleaning and emptying.

3.4 GAS LINE PRESSURE REGULATOR INSTALLATION:

SPEC EDITOR: REFER TO NFPA 54 FOR OVERPRESSURE PROTECTION.

A. Install a gas isolation valve upstream of each gas pressure regulator. Where two gas pressure regulators are installed in series in a single gas line, a valve is not required at the second regulator.

B. Install pressure relief or pressure limiting devices so they can be readily operated to determine if the valve is free; so they can be tested to determine the pressure at which they will operate; and examined for leakage when in the closed position.

C. Install vent line from pressure regulators to outdoors.

3.5 ELECTRICAL BONDING AND GROUNDING:

- A. Install above ground portions of gas piping systems, upstream from equipment shutoff valves electrically continuous and bonded to a grounding electrode in accordance with NFPA 70 - "National Electrical Code."
- B. Do not use gas piping as a grounding electrode.
- C. Conform to NFPA 70 - "National Electrical Code," for electrical connections between wiring and electrically operated control devices.

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232116 - HYDRONIC PIPING SPECIALTIES

REVISIONS:

06-03-08: ADDED TACO

AUGUST 2016: REVISED TO ADD THRUSH AS APPROVED MFR. FOR COALESCING SEPARATORS. D. KARLE PER FP/PLMG MTT.

JANUARY 2017: IMPROVED COALESCING SEPARATOR SPEC. M. MAU FOR FP/PLMG MTT.

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide hydronic specialties for the following systems:
1. Chilled Water System
 2. Condenser Water System
 3. Hot Water Heating System
 4. Process Cooling Water System

PART 2 - PRODUCTS

2.1 AUTOMATIC AND MANUAL AIR VENTS:

SPEC EDITOR: INCLUDE THE U-M STANDARD DETAILS FOR AIR VENTS ON THE PROJECT DOCUMENTS.

- A. Manual air vents shall be ¾" ball valve per Section 220523.
- B. Automatic air vents shall be non-ferrous, rated for 150 psig maximum operating pressure.
1. Manufacturers:
 - a. For pipe sizes 2" and less. Bell & Gosset model 87, Armstrong model 75, Taco Hy-Vent
 - b. For pipe sizes 2 ½" and larger. Hoffman model 78, Armstrong model 75.

2.2 SUCTION DIFFUSERS:

- A. Provide angle pattern suction diffusers rated at 175 psig, 250 F., having cast iron or ductile iron body, with flanged (grooved piping if grooved piping is specified for system) connections. Provide a stainless steel combination diffuser-strainer cylinder with 3/16" or 1/8" diameter perforations, stainless steel flow straightening inlet vanes, a 16 mesh bronze start-up strainer, a permanent magnet and an adjustable support foot.
- B. Manufacturers: Bell & Gossett, Armstrong, Wheatley, Taco, Grinnell, Victualic

2.3 TRIPLE DUTY VALVE:

- A. Provide a straight or angle pattern combination bubble tight shut-off, calibrated balancing and non-slam check valve rated at 175 psig working pressure and 250 degrees F. Body shall be cast iron or ductile iron, with flanged or grooved piping connections.
- B. Valve shall have a bronze seat, replaceable bronze disc with EDPM seat insert, stainless steel stem and spring. Provide brass readout valves with integral check valves to measure differential pressure readings across the orifice.
- C. Valve design shall permit re-packing under full system pressure.
- D. Manufacturers: Bell & Gossett model 3D or 3DS, Armstrong, Wheatley, Taco

2.4 WATER PRESSURE REGULATING/REDUCING VALVE:

SPEC EDITOR: THIS IS USED ON LASER COOLING WATER AND MAKE UP TO CLOSED HEATING & COOLING SYSTEMS, 1/2" THROUGH 3"

- A. Bronze valve body, renewable stainless steel seat. Adjustable reduced pressure range, built-in bypass, diaphragm type with spring cage and orifice. Pressure to be adjustable from a top screw on the valve.
- B. Manufacturers: Watts model 223BHP, Bell & Gossett, Hoffman

2.5 WATER PRESSURE RELIEF VALVE:

SPEC EDITOR: THIS IS USED WITH REGULATOR LISTED ABOVE

- A. ASME rated, sized for the full installed capacity of the low pressure side of the regulating station. Factory set valve at not more than 20% above low side pressure. Furnish seat material suited for the service.
- B. Manufacturers: Consolidated, ITT Bell & Gossett, ITT McDonnell Miller, Watts

2.6 COALESCING SEPARATOR:

- A. Provide coalescing type air/dirt or dirt separator, type and sized to match main system piping or as indicated on the drawings. Air/dirt separator shall include separate air chamber for air removal and a lower vessel extension for dirt separation.
- B. Separator shall be welded carbon steel fabricated with ANSI B16.5 flange connections and rated for 150 psig design pressure and 250F design temperature. Separator shall include an internal assembly of rigidly constructed vertical tubes of stainless steel or copper wire matrix designed to coalesce microbubbles out of solution and form larger air bubbles that rise to the top of the vessel and to separate dirt particles that collect at the bottom.
- C. Separators shall include manufacturer's integral high capacity air vent or cast iron air vent as specified in Section 2.1, flanged lower head to allow coalescing media removal, side tap valve to facilitate system filling and bottom drain connection with ball valve for draining.
- D. Separators shall be capable of removing 100% of the free air, 100% of the entrained air, and up to 99.6% of the dissolved air in the system fluid. Dirt separation shall be at least 80% of all particles 30 micron and larger within 100 passes.
- E. Approved Manufacturers:
 - 1. Spirotherm
 - 2. Thrush Aar-O-Vent

2.7 EXPANSION TANKS:

SPEC EDITOR / DESIGNER: INCLUDE THE U-M STANDARD DETAIL FOR EXPANSION TANKS ON THE PROJECT DOCUMENTS.

- A. Provide expansion tank, constructed of welded steel with butyl rubber bladder, replaceable and full acceptance volume, ASME stamped for 125 psig at 240F. Tank shall have capacity, size and operating pressures as shown on drawings.
- B. Manufacturer: Bell & Gossett, Wessels, Amtrol, Armstrong or Taco.

2.8 CENTRIFUGAL SOLID SEPARATOR:

SPEC EDITOR: THIS IS FOR REMOVAL OF HEAVY SOLIDS (RUST, SCALE, DIRT ETC.), PRIMARILY IN OPEN LOOP CONDENSER WATER WITH PLATE AND FRAME HEAT EXCHANGERS. PERFORMANCE MUST BE SCHEDULED ON DRAWINGS, PIPING CONNECTIONS SHOULD BE DETAILED.

- A. Provide centrifugal solids separator, with efficiency of 98% to 40 microns, as scheduled and detailed on drawings. Body shall be steel, ASME stamped for 125 psig, with flanged connections and factory painted exterior. Provide 4"x6" cleanout for lower section, and flanged upper dome for easy maintenance access.

- B. Provide automatic recovery tank with bag filter (solids collection vessel) as scheduled and detailed. Controlled continuous flow, 25 micron solids collection bag, 600 cubic inches capacity, manual isolation valves, sight glass for flow verification and differential pressure switch, Annunciator in an independent junction box, contacts rated for 4 amps at 115 volts, set at 10 psid with a range of 4 to 25 psid.
- C. Manufacturers: LAKOS, Griswold Controls

2.9 IN -LINE FILTER:

- A. Cartridge type impingement filter, with replaceable 100 micron or 300 micron filter media. Size and capacity shall be as indicated on drawings.
- B. Manufacturers: Bruner, Culligan, Cuno, Dollinger, Honeywell.

PART 3 - EXECUTION

3.1 INSTALLATION OF AUTOMATIC & MANUAL AIR VENTS

INCLUDE THE U-M STANDARD DETAILS FOR AIR VENTS ON THE PROJECT DOCUMENTS.

- A. Install automatic air vents at high points (where pipe drops in direction of flow) in hydronic systems. Isolate the auto air vent with an isolation valve.
- B. Where manual air vents are indicated, they shall consist of an isolation valve terminated with an elbow, threaded hose connection, and hose cap.

3.2 INSTALLATION OF SUCTION DIFFUSERS:

- A. Install to allow complete removal of strainer elements. Remove 16 mesh bronze start-up mesh after system start-up and flushing is complete. Replace with standard operating strainer. Adjust support foot to carry weight of suction piping (to inertia pad where applicable).

3.3 INSTALLATION OF EXPANSION TANK:

INCLUDE THE U-M STANDARD DETAIL FOR EXPANSION TANKS ON THE PROJECT DOCUMENTS

- A. See drawings for locations, support and piping details. Document initial and operating pressures, and temperature, and submit report for approval.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232123 - PLUMBING AND HYDRONIC PUMPS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232123 - PLUMBING AND HYDRONIC PUMPS

THIS SECTION SPECIFIES CENTRIFUGAL PUMPS FOR HVAC SYSTEMS (CHILLED WATER, CONDENSER WATER, HEATING HOT WATER), PROCESS COOLING, AND DOMESTIC HW RETURN PUMPS. STEAM CONDENSATE PUMPS AND RECEIVERS, SMALL HVAC CONDENSATE PUMPS, CW BOOSTER PUMP PACKAGES, AND HEAT TRANSFER PACKAGES, SUMP PUMP, FIRE PUMPS ARE SPECIFIED ELSEWHERE.

7/16/12: ADDED THAT PUMP SEALS SHALL BE UNAFFECTED BY CHLORAMINES. ADDED NSF 61 REFERENCE UNDER QUALITY ASSURANCE.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

2016-10-31: ADDED TO PART 2 - WET ROTOR, ECM VARIABLE SPEED IN-LINE CIRCULATOR PUMP FURNISHED AS AN ASSEMBLY WITH SPEED CONTROLS. WPG FOR HYDRONICS/STEAM MTT.

APRIL 2018: ELIMINATED A-C PUMPS, NOT OFFERED AS A HVAC PUMP BY B&G. D. KARLE FOR HYDRONICS MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220513: Motors.
 - 2. Section 220548: Vibration Control
 - 3. Division 26: Electrical.

1.2 SUMMARY

- A. Includes pumps for hydronic and domestic hot water return service. Includes process pumps except those covered in other specification sections.
 - 1. Does not include steam condensate, domestic booster package, sump, or fire pumps.

1.3 SUBMITTALS

- A. Submit the following product data for approval:
 - 1. Manufacturer information.

2. Dimensions and elevations.
3. Performance data/pump curves.
4. Materials of construction.
5. Motor data including motor manufacturer.
6. Vibration isolation and inertia bases

1.4 QUALITY ASSURANCE:

- A. **Manufacturers and Products:** The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. **Reference Standards:** Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 1. **Hydraulic Institute Compliance:** Design and manufacture pumps in accordance with ANSI/ Hydraulic Institute Standards.
 2. **National Electrical Code Compliance:** Provide components complying with NFPA 70 National Electrical Code.
 3. **UL Compliance:** Provide HVAC pumps which are listed and labeled by UL, and comply with UL Standard 778 "Motor Operated Water Pumps."
 4. **Pumps used for potable water service:** National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 5. **Pumps used for potable water service:** U.S Safe Drinking Water Act.
- C. **Single Source Responsibility:** Obtain pumps from a single manufacturer.

SPEC EDITOR: REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL PUMP REQUIREMENTS:

- A. Unless noted otherwise, provide pumps meeting these general requirements.

SPEC EDITOR: NOTE THE GENERALIZED PUMP AND SEAL T/P RATINGS AND THE NOTATION "SUITABLE FOR SERVICE," INDICATED BELOW. EDIT THE SPECIFIC PUMP SECTIONS IF YOUR PROJECT HAS SEVERE SERVICE OR MORE DEMANDING T/P REQUIREMENTS.

- B. Suitable for the service, rated for the temperature and pressure indicated. When not indicated, pump and pump seals shall be rated for not less than 175 psig working pressure and 225 degrees F continuous water temperature. Provide pumps with capacities and performance as scheduled on the Drawings.
- C. Pumps shall have steel shaft, cast iron case, and cast bronze or stainless steel impeller. Flanged pumps shall have suction and discharge taps in flanges, and drain and vent taps in the volute. Piping connections shall be flanged for connection sizes 2 1/2 inches and larger.
- D. Pumps shall have statically and dynamically balanced impeller, with a constantly dropping head curve from shutoff to cutoff, and shall not overload their respective motors on any point throughout the head capacity curve. Key and lock impeller to shaft.
- E. Motors shall be factory coupled to pump and comply with requirements of Related Section Motors, with rpm, voltage and HP as scheduled. Single phase motors shall have built-in overload protection.
- F. Where flexible coupling is specified, coupling shall be EPDM, center dropout type, capable of absorbing torsional vibration and shaft misalignment, complete with ANSI B15.1/OSHA 1910.219 coupling guard.
- G. Pumps for domestic water systems shall be lead free (less than 0.25 percent lead by weight in all wetted surfaces) all bronze or stainless steel construction.

SPEC EDITOR: FOR PUMPS USED FOR GLYCOL SERVICE, SILICON CARBIDE SEALS SHOULD BE SPECIFIED. HOWEVER, ENGINEER MUST VERIFY WHICH MFR.S CAN OFFER SILICON CARBIDE SEALS, AND THEN EDIT THE SPEC ACCORDINGLY.

- H. Pump seals shall be unaffected by chloramines.
- I. Pumps used for glycol shall have seals rated for glycol service.
- J. Pump selection:
 - 1. Select pumps so an impeller/volute is sized to accommodate 10 percent more head than at duty point, unless noted otherwise on pump schedule.
 - 2. Select pump no greater than 85 percent of end of curve flow.
 - 3. Select pump at the point of best efficiency for a given impeller-casing combination. Deviations shall be within 3 percent of maximum efficiency point on the increasing capacity side of the maximum efficiency point.
 - 4. Maximum Pump Suction velocity:
 - a. Inline: 12 fps.
 - b. End Suction: 13 fps.
 - c. Double Suction: 15 fps.

- K. Balance pumps per ANSI / Hydraulic Institute procedures. Perform electronic vibration analysis for all pumps 1/2 hp and above. Unless noted otherwise, the maximum allowable RMS (filter in) velocity at maximum pump motor speed, measured at each pump and motor bearing, shall not exceed 0.13 inches/sec in the vertical, horizontal and axial directions. For pumps to be applied in variable speed applications, balance and test to assure this vibration limit is not exceeded at any pump speed. Pumps may be field tested after installation by an independent testing agency. Any pump found to exceed the specified vibration limits shall be corrected to perform within those limits without cost to the Owner.

2.2 IN-LINE CIRCULATORS

SPEC EDITOR: GENERALLY NOT RECOMMENDED FOR MORE THAN 1/2HP. SYSTEM LUBRICATED/NO OILING. 3-PIECE OIL LUBE MODELS TO BE PHASED OUT. TYPICAL CONSTRUCTION HAS MOTOR CARTRIDGE REPLACEABLE WITH ROTOR ATTACHED. SLEEVE TYPE BEARINGS IN LIEU OF BALL TYPE. NO MECHANICAL SEAL. AVAILABLE METALLURGY CI BODY W/ BRONZE IMPELLER; CI BODY W/ STAINLESS STEEL IMPELLER. THESE PUMPS ARE USUALLY SUPPORTED BY THE PIPE; DO NOT USE INLET/OUTLET FLEXIBLE PIPE CONNECTORS. THEY COME IN STANDARD SIZES; IMPELLER TRIMMING IS NOT DONE; SINGLE PHASE MOTORS.

- A. Domestic Hot Water: Close coupled, single suction, lead free bronze or stainless steel impeller and body. System-lubricated, ceramic shaft. Permanently lubricated, bronze or carbon sleeve bearings.
- B. Hydronic Systems: Close coupled; single suction bronze or stainless steel impeller. System-lubricated, alloy steel shaft, Cast iron body. Permanently lubricated sleeve bearings.
- C. Rated for 150 psig working pressure, minimum.
- D. Acceptable Manufacturers:
1. ITT Bell & Gossett.
 2. Armstrong.
 3. Grundfos.
 4. Weinman.
 5. Taco In-Line Circulators.
 6. Patterson.

NOTE THAT FACTORY-ASSEMBLED ECM CIRCULATORS WILL NOT COMPLY WITH UM MASTER SPEC REQUIREMENTS FOR MOTORS AND VARIABLE SPEED DRIVES.

2.3 IN-LINE WET ROTOR VARIABLE SPEED ECM CIRCULATORS

THE FOLLOWING SECTION COVERS SMALL CAPACITY AND HEAD SINGLE PHASE FRACTIONAL TO 1 HORSEPOWER, SINGLE PHASE, ELECTRONICALLY-COMMUTATED MOTOR DRIVEN SINGLE STAGE CIRCULATING PUMPS. TYPICAL CONSTRUCTION HAS BUILT-IN, FACTORY ASSEMBLED VARIABLE SPEED DRIVE AND CONTROLS FURNISHED AS AN ASSEMBLED PRODUCT. SLEEVE TYPE BEARINGS TYPICAL V. BALL TYPE. NO MECHANICAL SEAL. THESE PUMPS ARE USUALLY SUPPORTED BY THE PIPE; TYPICALLY DO NOT USE INLET/OUTLET FLEXIBLE PIPE CONNECTORS. EDIT THIS SECTION CAREFULLY FOR THE SPECIFIC APPLICATION.

- A. Factory-assembled and tested, self-regulating, in line wet rotor type circulator pump, with synchronous, permanent-magnet type motor and integrated variable speed electronically commutated motor.

Construction Features:

1. Single phase, 120 VAC or 208-230 VAC as scheduled, 60 Hz.
 2. Pump Shaft: Stainless steel.
 3. Bearings. Metal impregnated carbon sleeve or ball bearing type.
 4. Connection Style: Flanged
 5. Rating: 145 psig at 230 F
- B. Domestic Hot Water: Lead free bronze, glass-filled polypropylene engineered composite or stainless steel impeller; lead free bronze or stainless steel body.
- C. Hydronic Systems: cast iron, glass-filled polypropylene engineered composite, or stainless steel impeller. System-lubricated, cast iron body.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. UL 778 listed for motor-operated water pumps, including protection against over/under voltage, thermal over-load (motor and electronics), over current, and protection for locked rotor and dry run/no-load condition.
- E. Terminal Box to include gasketed cover, NPT power cable/conduit connection, with coded terminal strip indicating common/neutral/ground.
- F. Controls: Single Phase Electronic Control Converter.

SPEC EDITOR: SELECT THE APPROPRIATE CONTROL SCHEME BELOW. EDIT FOR PROJECT-SPECIFIC PUMP CONTROL REQUIREMENTS. SOME PUMPS PROVIDE THE LISTED FUNCTIONS WITH THE ON-BOARD CONTROLLER VIA INTERNAL ALGORITHM OR SENSOR, SOME REQUIRE AN EXTERNAL SIGNAL, AND SOME CAN ACCOMMODATE EITHER. SOME LISTED FUNCTIONS ARE NOT OFFERED BY ALL THE LISTED MFRS. FURTHER, THE CHOSEN CONTROL SCHEME WILL DICTATE WHETHER THE PRODUCT REQUIRES A DIGITAL RS-485 COMMUNICATION CONNECTION (BACNET, MODBUS, OR LONWORKS), A 4-20MA EXTERNAL SIGNAL, OR CAN USE A SENSORLESS METHOD. CONTROL VIA DIGITAL COMMUNICATIONS WOULD LIKELY REQUIRE AN ADDITIONAL CONTROL MODULE.

1. Sensorless Control: Integral electronic variable speed controller shall provide the following user selectable modes of operation without the use of external(remote)sensors:
 - a. Proportional Pressure/Maintain Flow Set Point.
 - b. Constant Differential Pressure/Maintain Pressure Set Point.
 - c. Constant Speed.
 - d. Constant Temperature/Maintain Temperature Set Point
 - e. Constant Temperature Rise/Differential
 - f. Proportional P-T/Maintain Pressure Proportional to Varying Temperature
2. Sensor Control: The integral electronic variable speed controller shall accept an external sensor input of 4-20 mA and provide the following user selected modes of operation:

- a. Proportional Pressure/Maintain Flow Set Point.
 - b. Constant Differential Pressure/Maintain Pressure Set Point.
 - c. Constant Temperature/Maintain Temperature Set Point
 - d. Constant Temperature Rise/Differential
 - e. Proportional P-T/Maintain Pressure Proportional to Varying Temperature
3. Remote Communication and Local Display: Provide single port BACnet 3-wire communication cable CAT 5/6 connection. The local display shall be field adjustable for horizontal or vertical position, allow control mode and set point changes, and display the following information:
- a. Operating Status - On/Off.
 - b. Control Mode.
 - c. Current Set Point Parameter.
 - d. Fault and Warning Signals.

SPEC EDITOR: BASIS OF DESIGN: GRUNDFOS MAGNA 3; WILO STRATOS; B & G ECOCIRC XL.

G. Acceptable Manufacturers:

- 1. ITT Bell & Gossett.
- 2. Wilo.
- 3. Grundfos.

2.4 IN-LINE HORIZONTAL CLOSE COUPLED PUMPS - HANGER SUPPORTED

SPEC EDITOR: SIZE GENERALLY 1/4 TO 3HP. KEEP MOTOR IN HORIZONTAL POSITION WHERE POSSIBLE, BUT UNIVERSAL MOUNT MOTOR ALLOWS FOR ANY PIPE ORIENTATION. SUPPORT PUMP VIA PIPES, NOT MOTOR. TYPICALLY DO NOT USE FLEXIBLE COUPLINGS. CONSIDER ADDING CAST IMPELLER (VS STAMPED) AS REQUIRED.

- A. Close/rigid coupled, single suction impeller. Ceramic mechanical seal. Permanently sealed, permanently lubricated.
- B. Domestic Hot Water: Lead free.
- C. Pump shall be equipped with an internally flushed seal assembly.
- D. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings. Motor shall be provided with heavy-duty, permanently lubricated ball bearings rated for the maximum load for which the pump is designed.
- E. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett Series 60.
 - 2. Armstrong.
 - 3. Grundfos.
 - 4. Weinman.
 - 5. Taco Series 1600.
 - 6. Patterson.

2.5 FLOOR-MOUNTED, VERTICAL IN-LINE SPLIT COUPLED PUMPS

SPEC EDITOR: GENERALLY, FOR SIZES MORE THAN 3HP; TO 1000 HP. TYPICAL SPLIT-COUPLED PUMPS CAN BE DIRECT-COUPLED OR FLEXIBLE-

COUPLED. CONSTRUCTION HAS BALL BEARINGS, MECHANICAL SEAL; THESE PUMPS ARE SUPPORTED/ANCHORED TO CONCRETE PAD, WITH INLET/OUTLET FLEXIBLE PIPE CONNECTORS. CONSIDER ADDING REQUIREMENT FOR FLEXIBLE COUPLING (DODGE, OMEGA, DURA - FLEX) FOR SEPARATE REMOVAL/REPLACEMENT OF LARGER (+15 HP) MOTORS. USE SLOWER SPEEDS 1800/1200 RPM FOR HIGH FLOW, LOW HEAD APPLICATIONS. VERTICAL MOTOR ORIENTATION OFFERS LOWER VIBRATION/NOISE, LOWER IMPELLER/SHAFT LOADING (LESS PRESSURE IMBALANCE), LOWER CAVITATION POTENTIAL. NO SUCTION DIFFUSER REQUIRED.

- A. Split-coupled, single suction enclosed impeller. Mechanical seals. Carbon graphite throttle bushing.
- B. Pump shall be equipped with an externally flushed seal assembly with manual air vent valve.
- C. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings. Motor shall be provided with heavy-duty, greaseable or permanently lubricated ball bearings rated for the maximum load for which the pump is designed.
- D. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett Series 80-SC.
 - 2. Armstrong.
 - 3. Grundfos.
 - 4. Weinman.
 - 5. Taco KS Vertical Split coupled.

2.6 FLOOR MOUNTED, DOUBLE SUCTION PUMPS

SPEC EDITOR: THIS SECTION CAN BE USED FOR VERTICAL OR HORIZONTAL SPLIT CASE. EDIT TO SUIT PROJECT REQUIREMENTS. VERTICAL SPLIT CASE PUMPS SAVE SPACE BUT ARE SINGLE SOURCE AND SHALL ONLY BE SPECIFIED WITH THE PERMISSION OF THE U-M DESIGN MANAGER.

- A. Single stage, double suction centrifugal, bronze fitted, base mounted, flexibly coupled pump.
- B. Vertical or horizontal split case as indicated, cast iron volute with integrally cast feet, gauge ports at nozzles, vent, and drain ports. Horizontal shaft unless specifically indicated otherwise.
- C. Stainless steel shaft designed for less than 0.002 inch deflection, with mechanical seals suitable for temperature and service scheduled, with re-greaseable bearings. Bearing life shall be L10 50,000 hr. life minimum. Bearing grease shall be rated to 700 Deg F and resist water/condensation washout.
- D. Mechanical carbon face seal rotating against a stationary silicon carbide face.
- E. Pump shall be equipped with an internally flushed seal assembly.
- F. Impeller shall be of the enclosed double suction type made of low zinc silicon brass or bronze, hydraulically and dynamically balanced and keyed to shaft.
- G. The pump bearings and mechanical seals shall be serviceable without disturbing the upper casing half, piping connections or electrical motor connections.

- H. Base: Pump and motor shall be mounted on a single, rigid, groutable, welded, structural steel frame.
- I. Acceptable Manufacturers Vertical Split Case Pumps:
 - 1. ITT Bell & Gossett VSX.
- J. Acceptable Manufacturers Horizontal Split Case Pumps.
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Paco.
 - 5. Patterson.

2.7 END-SUCTION, CLOSE-COUPLED PUMPS

SPEC EDITOR: BASIS OF DESIGN: SERIES 1531 BELL & GOSSETT. OCCASIONALLY USED FOR HYDRONIC SERVICE, OFTEN USED FOR DOMESTIC BOOSTERS.

- A. Single stage, end suction centrifugal, bronze fitted, close-coupled with base plate.
- B. Provide lead free when used for domestic water service.
- C. Mechanical seals with ceramic seal seat and carbon seal ring. Oil or grease lubricated, bronze sleeve bearings. Provide slinger on motor shaft between motor and seals to prevent liquid that leaks past pump seals from entering the motor bearings.
- D. Back pull-out design to allow pump bearings and seals to be serviced without disturbing piping.
- E. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings.
- F. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Taco.
 - 5. Patterson.

2.8 FLOOR-MOUNTED, END-SUCTION, FLEXIBLY-COUPLED PUMPS

SPEC EDITOR: BASIS OF DESIGN: SERIES BELL & GOSSETT 1510

- A. Single stage, end suction centrifugal, bronze fitted, base mounted pump, flexibly-coupled.
- B. Vertical split case back pull-out design to allow pump bearings and seals to be serviced without disturbing piping connections or electric motor connections.
- C. Wear Rings (if provided as standard): Replaceable, bronze.
- D. Mechanical seals with ceramic seat and carbon seal ring. Oil or grease lubricated, bronze sleeve bearings.
- E. Base: Pump and motor shall be mounted on a single, rigid, groutable, welded, structural steel frame.

- F. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Taco.
 - 5. Patterson.

PART 3 - EXECUTION

3.1 GENERAL PUMP INSTALLATION

- A. Install the pump as recommended by the manufacturer and as shown on the Drawings. Provide adequate clearance for service access.
- B. Independently support piping from the pump casing, regardless of what is recommended by the manufacturer. Demonstrate to the Commissioner that the piping is independently supported.
- C. Fill and vent the system of all air. Purge the pump of air as recommended by manufacturer; check for proper rotation.
- D. Place the pump in service and check for proper operation. When required by the Commissioner, record voltage and amperage draw (separate from the T&B contractors work) and provide report to Commissioner.

3.2 IN-LINE PUMP INSTALLATION

- A. Install suction and discharge flexible connectors as recommended by the manufacturer and as shown on the drawings.
- B. Verify pump is designed for the intended orientation; horizontal versus vertical motor/shaft orientation.
- C. Support the pump as recommended by manufacturer. Do not attach supports to motor.

3.3 FLOOR-MOUNTED PUMP INSTALLATION

- A. Set pump base level, using stainless steel shims and metal blocks designed for leveling machinery bases. Anchor/attach to base as recommended by the manufacturer. Pre-align, connect piping, re-check alignment, and then grout with non-shrink grout.
- B. Provide final alignment in field via laser alignment device, by the manufacturer's representative. Submit alignment test data for approval. If report indicates pump cannot be aligned properly, correct conditions and re-laser-align.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.5 MANUFACTURER INSPECTION AND START-UP
