INTRODUCTION TO THE U-M DESIGN GUIDELINES

Codes and Regulatory Agencies

Design Guideline [Section 1.0 “Codes and Regulatory Agencies”](#) outlines “Applicable Laws” as defined by the Design Professional Agreement. Design Professionals are contractually bound to meet the requirements of the codes and regulations referenced in Section 1.0. Any deviation from these Applicable Laws must obtain a formal variance from the University of Michigan Building Code Committee prior to contacting any Authority Having Jurisdiction (AHJ).

Design Guidelines

Remaining Design Guideline sections are intended to aid the Design Professional in the development of a successful project. The goal is to ensure that the University is provided with long lasting, sustainable buildings that can be maintained in a way that extends building lifespan and enhances user satisfaction. These guidelines are based on experience with existing campus buildings, systems, and maintenance. Design Professionals are contractually required to review the Design Guidelines and conduct project specific analyses to confirm that the direction provided meets the specific goals and requirements of the project. Design Professionals may propose deviations from the Design Guidelines as needed. Requests shall be submitted to and approved by the Design Manager in writing prior to incorporation in the project. Design Guidelines do not relieve Design Professionals of due diligence, contractual responsibilities, or regulatory compliance. Design Guidelines are only for use in connection with work performed for the University of Michigan.

Effective date

The effective date for Applicable Laws and Design Guidelines is fixed at the beginning of Design Development and remains in effect for the duration of the project. To enhance life safety, [Section 1.0 “Codes and Regulatory Agencies”](#) includes exceptions that require projects of extended duration to comply with more recent versions of the Applicable Laws and/or permitting requirements. All other Design Guidelines remain fixed at the date Design Development began. Design Guideline [Section 2.7 “Effective Date”](#) provides links to consolidated design guideline documents by month and year.

1.0 CODES AND REGULATORY AGENCIES

[Codes and Regulatory Agencies](#)  (formerly SID-F Codes and Regulatory Agencies) is an annotated list of all applicable building codes and standards for the University of Michigan. Issued July 18, 2018.

CODES AND REGULATORY AGENCIES

Introduction

The University of Michigan is a State of Michigan constitutional corporation, governed by a Board of Regents elected by the People of the State of Michigan and has a great deal of regulatory autonomy. It is exempt from local building and zoning ordinances and subject to State of Michigan laws and regulations that are clearly intended to apply to universities. In lieu of local building ordinances and State of Michigan laws and regulations that do not apply at the University, the University chooses to require that new construction adhere to a number of well-established building codes and standards, as listed in this Section.

Regardless of origin or enforcing agency, all of the applicable building codes and standards listed and codes and standards referenced within the codes listed below are to be followed. Note, for instance, that compliance with the State of Michigan Bureau of Fire Safety rules for schools and/or dormitories does not eliminate the need to also comply with the Michigan Building Code, and that compliance with the 2010 Americans with Disabilities Act does not eliminate the need to comply with the barrier free provisions of the Michigan Building Code. Additional codes may apply for particular situations, such as for Medical Center construction; these are to be considered on the case-to-case basis. Many times adherence to narrow scope codes and/or standards is required by the general codes listed below.

New editions of building codes are published from time to time. For each project, the edition of building codes cited in this section from which the University of Michigan is listed as the “Enforcing Agency” is to be as follows:

The edition of building codes is to be as listed in this section as of the beginning of the design development phase of a project unless construction documents are submitted to the University for final review more than a year after adoption of the new version of the code. If more than one year has transpired between adoption of the new code and submission of construction documents to the University for final review, the edition of the building codes listed in this section as of submission of construction documents applies.

The University employs building inspectors, who are the authority having jurisdiction on all University property. Refer to each code diction for authority having jurisdiction contact information.

Building Codes for University of Michigan

Michigan Building Code 2015 (adopted April 20, 2017) promulgated by the State of Michigan Department of Licensing and Regulatory Affairs Bureau of Construction Codes. Including rule 408.30401 Rule 401 as printed on the interior cover of the Michigan Building Code.

By local rule, the following exceptions/modifications are applied to the Michigan Building Code article 717.5.3, article 907.5.2.3.3, and article 1010.1.9.11:

Article 717.5.3 add exception number 6:

Exception 6. In other than I or H occupancies or Michigan Medicine owned and/or occupied facilities, when equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at shaft enclosures unless specifically required by other sections of the code. Instead, provide smoke dampers at locations and to function as prescribed in the 2012 edition of NFPA 90A - 'Standard for the Installation of Air-Conditioning and Ventilating Systems'.

Article 907.5.2.3.3 Group R-2 reference the following interpretation of the use of the word "capability":

In the sentence "all dwelling units and sleeping units shall be provided with the capability to support visible alarm notification appliances...". Capability of the fire alarm system shall be addressed by the spare capacity already required in all U of M fire alarm circuits and fire alarm panels. This spare capacity in the circuits (raceways, and installed conduit), shall be available immediately after the fire alarm system is commissioned. The spare capacity at the panel, may be in the form of power supplies sized for the expansion, and/or in the form of sufficient (spare) mounting space in the panel for the additionally needed power supplies. Refer to U of M Design Guideline and master specifications for spare capacity requirements.

Article 1010.1.9.11 add the following:

Exception 6. In existing buildings, doors on stair enclosures shall be permitted to be equipped with hardware that prevents reentry into the interior of the building, provided that egress is maintained and the doors are in compliance with the requirements of NFPA 101 - 2012, article 7.2.1.5.8

Section 907.5.2.3 Visual Alarms.

Add Exception 4. In all occupancies visual alarms are not required in the following:

- a) Offices less than 200 square feet.
- b) Closets and coat rooms.
- c) Electrical closets.
- d) Mechanical pipe chases.
- e) Crawl Spaces.
- f) Small restrooms with access inside classrooms.
- g) Custodial closets.
- h) Storage rooms less than 200 square feet.
- i) Unoccupied spaces.

Chapter 13 Energy Efficiency - Michigan Energy Code Part 10a rules incorporating the ASHRAE 90.1 2013 – Effective October 25, 2017

Chapter 32 Encroachments into the Public Right of Way: Within the public right of way adhere to City of Ann Arbor standards and specifications refer to the following web site for requirements:

<http://www.a2gov.org/departments/engineering/Pages/Right-Of-Way-and-Lane-Closure-Permits.aspx>

The following regulations take precedence over conflicting requirements in the Michigan Building Code:

Chapter 13 State of Michigan Part 10a Energy Code Efficiency incorporating ASHRAE Standard 90.1 2013 – Effective October 25, 2017. Refer to University Design Guidelines for additional requirements and items listed above.

State of Michigan Elevator Code.

State of Michigan Mechanical Code 2015 and Michigan Plumbing Code 2015.

State of Michigan Electrical Code incorporating “NFPA 70 --National Electrical Code”, 2014 edition with University of Michigan modifications.

“NFPA 13 2013 -- Sprinkler Systems”.

“NFPA 45 2011-- Fire Protection for Laboratories Using Chemicals”.

“NFPA 72 -- National Fire Alarm Code”, 2013 edition with University of Michigan modifications.

“Guide for Care and Use of Laboratory Animals” promulgated by US Department of Health & Human Services”.

University of Michigan Architecture, Engineering and Construction.

Michigan Residential Code 2015 (adopted February 8, 2016) promulgated by the State of Michigan Department of Licensing and Regulatory Affairs Bureau of Construction Codes. Including rule 408.30500 Rule 500 as printed on the interior cover of the Michigan Building Code which includes ASHRAE 2013.

Enforcing Agency —

University of Michigan Architecture, Engineering and Construction.

ADA Standards for Accessible Design 2010 (adopted March 9, 2011) As required to comply with Section 504 of US Rehabilitation Act of 1973 Title II of Americans with Disabilities Act of 1990 and updated September 15, 2010. Also note that the University maintains a space-by-space database of non-compliance. Contact Architecture, Engineering and Construction for database information. Notice of corrections are to be reported to Architecture, Engineering and Construction for the purpose of updating the database.

State and local government facilities must follow the requirements of the 2010 Standards, including both the Title II regulations at 28 CFR 35.151; and the 2004 ADAAG at 36 CFR part 1191, appendices B and D. In the few places where requirements between the two differ, the requirements of 28 CFR 35.151 prevail.

State of Michigan Plumbing Code 2015 Part 7 Plumbing Code Rules (Adopted April 20, 2017) (Incorporating International Plumbing Code 2015 and Michigan amendments) promulgated by State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Construction Codes.

By local rule the following modifications are applied to the Michigan Plumbing Code articles:

607.1 (2) (h): A 1070 mixing valve is permitted to control up to 5 accessible plumbing fixtures within the same room, The 1070 mixing valve shall be certified for a minimum flow rate of 1/2 GPM or less.

312.2 Drainage and vent water test. A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, at least the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points "

(517) 241-8847

Project jurisdiction MBC: University of Michigan Architecture, Engineering and Construction

State of Michigan Electrical Code 2017 Part 8 Electrical Code Rules (Adopted January 22, 2019) (Incorporating NFPA 70 – National Electrical Code (2017 Edition) and Michigan Amendments) promulgated by State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Construction Codes.

By local rule the following exceptions/modifications are applied to the Michigan Electrical Code:

Michigan Electrical Code Article 80: Article 80 of the Michigan Electrical Code applies with the following exceptions/modifications:

80.15 Electrical Board: Modify "electrical board" to "UM Building Code Committee".

80.19 Permits: Strike section 80.19.

80.23(B) Penalties: Strike section 80.23(B)

80.25 Connection to Electrical Supply: Modify language to read as follows:
"80.25. Connection to electricity supply. Connections to the electric supply shall conform to the following: It is unlawful for any person, firm, or corporation to make connection to a supply of electricity or to supply electricity to any electrical equipment installation for which permission from UM Electrical Utilities Engineering Group is required or that has been disconnected or ordered to be disconnected."

NEC 2017 Sections 700.32 and 701.27: The University may deviate from full selectivity (overcurrent protective device coordination within the emergency generator distribution system) in order to lower arc-flash energy levels for worker safety. All such deviations from full selectivity will be designed by, and reviewed by, registered professional engineers.

State of Michigan Issued NPDES Permit

In compliance with the provisions of the Federal Water Pollution Control Act, as amended (33 U.S.C. 1251 et seq; the "Federal Act"), Michigan Act 451, Public Acts of 1994, as amended (the "Michigan Act"), Parts 31 and 41, and Michigan Executive Orders 1991-31, 1995-4 and 1995-18, The University of Michigan (U-M) is authorized to discharge storm water from the municipal separate storm sewer system (MS4) operated by the U-M in various locations in Michigan, and is designated as an MS4 in accordance with the conditions set forth in U-M's National Pollutant Discharge Elimination System (NPDES) permit with the State of Michigan, Department of Environmental Quality (MDEQ).

Per the NPDES permit, projects that disturb greater than one acre of land must meet certain post-construction storm water management requirements. Contact EHS EP3 as soon as possible, at the beginning of a project, to discuss this requirement.

Please note that the City of Ann Arbor may also require post-construction storm water management, above what is required by the U-M's NPDES permit, including areas disturbing less than 1 acre. This will be between the City and the Project, with input and coordination from EHS and the U-M Planner.

**State of Michigan Contaminated Soil and Groundwater**

In compliance with Michigan Public Act 451, Part 201 (Environmental Remediation) owners/operators of properties where soil or groundwater is present above Part 201 Generic Residential Criteria have due care requirements. Due Care requirements include undertaking measures, as necessary, to prevent exacerbation of existing contamination, undertaking response activities to mitigate unacceptable exposures to contamination, taking reasonable precautions against the reasonably foreseeable acts or omissions of a third party, complying with any land use or resource use restrictions, and not impeding with the effectiveness or integrity of such restrictions.

Contact EHS EP3 as soon as possible, at the beginning of a project, to discuss any known contamination, recommended assessments, scheduling, compliance requirements, and budget development to evaluate possible contamination or manage known contamination.

State of Michigan Leaking Underground Storage Tanks

In compliance with Michigan Public Act 451, Part 213 (Leaking Underground Storage Tanks) owners/operators of underground storage tanks have requirements during the removal of underground storage tank systems to evaluate if a release to the environment has occurred. Tank removal contractors are typically obtained and managed by U-M EHS.

Contact EHS EP3 as soon as possible at the beginning of a project to discuss any tank removals, recommended assessments, scheduling, compliance requirements, and budget development.

State of Michigan Aboveground Storage Tanks (AST)

(Permitting only, commissioning by AEC) In compliance with Michigan Public Act 207, Parts 2 through 5 of the rules the Aboveground Storage Tank (AST) Program regulates the following:

- storage and handling of flammable and combustible liquids with flash point less than 200 degrees Fahrenheit.
- storage and handling of liquefied petroleum gases
- compressed natural gas vehicular systems

The regulatory authority is from the Fire Prevention Code, 1941 PA 207, as amended.

**Building Standards for University of Michigan construction that are required for subsequent licensing of the facility****State of Michigan Department of Licensing and Regulatory Affairs, Division of Health Facilities and Services**

The Health Facilities Engineering Section (HFES) 2007 Minimum Design Standards for Health Care Facilities in Michigan and all referenced codes and standards as listed within these rules, including but not limited to NFPA 99, NFPA 101, and other NFPA and ASHRAE standards. This document is posted at

www.michigan.gov/documents/mdch/bhs_2007_Minimum_Design_Standards_Final_PDF_Doc_198958_7.pdf

All areas used by inpatients, and all areas within state jurisdiction, are to be designed to comply with HFES regulations. In general, all areas used by outpatients that fall outside HFES jurisdiction are to be designed to comply with HFES regulations. Any areas of noncompliance should be reviewed and approved by the Michigan Medicine (MM) Design Manager.

HFES is the AHJ over all Inpatient Health Care Occupancies (defined as “Health Care Facilities” by NFPA and “I-2” by MBC. Further they are the AHJ over some “Ambulatory Health Care” Occupancies, including Outpatient Surgery and Outpatient Dialysis. The occupancy classification of “Ambulatory Health Care” needs to be carefully reviewed with the MM Design Manager. Not all AHC occupancies are subject state and federal regulatory authorities.

For assistance in determining which projects are subject to HFES plan review and inspection, MM has developed a flowchart available on the MM FPD website at [HFES Flowchart](#). This flowchart has been reviewed by HFES, however it is not intended to replace professional judgment. Jurisdiction should be verified with HFES directly when it is not clear. Affirm decisions with the MM Design Manager.

Biosafety in Microbiological and Biomedical Laboratories (BMBL)

An advisory document recommending best practices for the safe conduct of work in biomedical and clinical laboratories from a biosafety perspective. It is used for building design standards, grant, and contract requirements for laboratories that handle infectious microorganisms and hazardous biological materials or animals. Each biosafety laboratory must, at a minimum, meet the requirements for laboratory facilities as stated in the BMBL.

Center for Medicare and Medicaid Services (CMS)

As defined at <http://www.cms.gov/>. Compliance with NFPA 101, Life Safety Code, currently enforced version (2012 as of July 5, 2016) is required.

CMS is a federal agency that administers Medicare, works with states on Medicaid. It surveys and certifies Health Care facilities and labs for reimbursement, including Outpatient Surgery and Outpatient Dialysis. CMS also issues Survey and Certification memos and clarifications, including “Categorical Waivers” that the facility may choose to adopt. CMS requires facilities built before 2016 to comply with “Existing Health Care” and “Existing Ambulatory Health Care” chapters of NFPA 101. Facilities built after 2016 and all renovations are to comply with “New Health Care” and “New Ambulatory Health Care.”

The Joint Commission Requirements for Accreditation of Health Care Facilities

As defined at <http://www.jointcommission.org/>. The Joint Commission (TJC) is the largest and most recognized accreditation organization that the state and CMS recognize for licensure and reimbursement. TJC surveys to the codes adopted by CMS and has established requirements based on CMS standards. MM Accreditation staff may participate in design reviews of MM clinical projects to ensure compliance with TJC and CMS requirements.

State of Michigan Department of Licensing and Regulatory Affairs, MIOSHA--Radiation Safety Section / United States Nuclear Regulatory Commission” All projects which include ionizing radiation-producing equipment or devices used for clinical or research use. All electronic equipment producing ionizing radiation must be registered with the Michigan Department of Licensing and Regulatory Affairs through EHS/Radiation Safety Service prior to initial use. Irradiators or other similar devices using or producing radioactive materials for clinical or research use will require licensing by the U.S. Nuclear Regulatory Commission in advance. Approvals for registration or licensing may also require submitting shielding construction plans for prior approval by MIOSHA--Radiation Safety Section or the U.S. Nuclear Regulatory Commission depending on the type of equipment used and nature of the facility. Contact UM EHS / Radiation Safety Service for assessment.

2.2 DESIGN DELIVERABLES

As part of the deliverables for formal UM review at each of the major phases of design listed below, the Design Professional shall submit this [“Design Deliverables”](#) document to the University’s Design Coordinator. On the “Design Deliverables” document, the Design Professional shall indicate the status of each required item (a check mark is interpreted to mean that an item has been included in the deliverables). On or attached to the “Design Deliverables” document, the Design Professional shall address any item that is NOT included in the review package.

Note that design deliverables for the Design Development phase are to include all items listed in the Design Development column of the “Design Deliverables” table AND, except as specifically stated to the contrary in the table, all items listed in the Schematic Design column of the table (which are to have been further developed during Design Development).

Note that design deliverables for the Construction Document phase are to include all items listed in the Construction Document column of the “Design Deliverables” table AND, except as specifically stated to the contrary in the table, all items listed in the Schematic Design column and all items listed in the Design Development column of the table (which are to have been further developed during the Construction Document phase).

DESIGN GUIDELINE 2.1

OWNER'S PROJECT REQUIREMENTS AND BASIS OF DESIGN DOCUMENTS

Scope

Beginning in the Schematic Design phase and continuing until the project has been as-built, the Architect/Engineer with input from the project team shall develop and periodically update an Owner's Project Requirements (OPR) document and a Basis of Design (BOD) document. These two documents together shall provide a complete description of the project's design intent.

The OPR is an inclusive, detailed description of the Owner's goals and requirements for the project, and the Owner's expectations on how the project will be used and operated.

The BOD is an inclusive, detailed description of the Design Team's concepts, assumptions, calculations, decisions, product selections and operating conditions to meet the Owner's project requirements and to satisfy applicable codes, standards and guidelines. It shall be formatted to coordinate with and respond to the OPR.

These two documents will be benchmarks by which the completeness, adequacy and acceptability of the project will be judged. They will be the standards by which the project will be commissioned. They will answer Owner questions after occupancy, and they will be the foundation for maintenance programs and future renovation projects.

USGBC, "LEED® Reference Guide for Green Building Design and Construction"

USGBC, "LEED® Reference Guide for Building Design and Construction - Healthcare"

Execution

Contents

The OPR shall include at least the following information:

- Summary description of the building (functions of building, high or low rise, use and occupancy classifications, anticipated hours of operation, etc.).
- Project goals, assumptions, and known limitations.
- Donor and Sponsor program requirements.
- Building and site accessibility, architectural, landscaping and aesthetics goals.

- Building and site flexibility and expandability requirements (spare capacities, survivability, reliability, redundancy, back-up power and utilities, etc.).
- Operational assumptions (maximum occupancy on a room-by-room and aggregate basis), occupancy schedules, special activities, building diversity, potential future uses, potential future renovations, etc.).
- Building orientation and envelope aesthetic and materials criteria.
- Energy and water conservation goals.
- Environmental and sustainability goals.
- LEED Goals.
- Indoor services and technology requirements (clean room and bio-safety lab classifications, fume hood sizes and types, vivarium and environmental room conditions, furniture, marker boards, process water, gases, communications, data, security, card access control, audio/visual, etc.).
- Space-by-space design requirements (temperature, humidity, air change rates, room pressurization, sound level limits, light levels, glare limits, vibration criteria, EMF shielding, etc.).
- Space-by-space equipment heat loads and utility needs (water, gases, power, data, grounding, etc.).
- Anticipated types, classifications, and quantities of hazardous materials to be contained within the building.
- Architectural, mechanical and electrical systems operation and maintenance expectations.
- HVAC, lighting and audio/visual controls expectations.
- Summary of sole-sourced systems and equipment.
- Summary of Owner-furnished and Owner-installed equipment.
- Occupant and Maintenance training requirements.
- Project schedule.
- Project budget (UniFormat cost estimate). The U-M Design Manager will determine whether budget information should be included in the OPR or provided separately.

The BOD shall include at least the following information:

- Project background required to understand the design, including goals, requirements and decisions which significantly affect the design.
- Regulatory, site, schedule and budget limitations which affect the design.
- Codes, standards and guidelines applicable to the project.
- Code analysis describing code requirements specific to the project, e.g. smoke evacuation systems, if manifolded exhaust is permitted, special fire protection requirements, etc.
- Requirements of governing agencies (City, State, NIH, LEED, etc.).
- Climate, site, and utilities information.
- Architectural, mechanical and electrical systems descriptions (construction classifications, design loads, fire separations, base and spare capacities, diversity and reliability assumptions, redundancy, flexibility, back-up power, sub-metering, etc.).
- Outdoor summer and winter design conditions.

- Design assumptions (occupancy schedules, temperature, humidity, air change rates, room pressurization, sound level limits, light levels, glare limits, vibration criteria, EMF shielding, heat loads, water, gases, power, data, grounding, hazardous materials being stored, etc. for spaces not indicated in the OPR.
- Systems and equipment sequences of operation.
- Load calculations descriptions, including assumptions, software used, etc.
- Architectural, mechanical and electrical systems operation and maintenance requirements.
- Facility Condition Assessment list marked to indicate tasks included in the project.
- Appendices
 - Documentation of compliance to DG 3.2 (see Design Guideline 3.2 Appendices A and B for the Energy and Water Conservation Report standard format).
 - Energy Impact Statement (see Design Guideline 3.2 Appendix C for the Energy Impact Statement standard format).
 - LEED Checklist when required by Design Guideline 3.1.
 - Soils and utility services reports.
 - Building load calculations.
 - Systems and equipment sizing calculations.
 - Light level and watts/square foot calculations.
 - Effluent, dispersion, noise, vibration, and other studies.

Development and Updating

Identify key concepts and specific requirements from the project's program and design concept report for inclusion in the OPR. Develop the BOD with descriptions of the systems, assemblies and conditions designed to meet the Owner's Project Requirements. Update the OPR and BOD as the project goals and requirements are defined and clarified. Submit them at the end of the Schematic Design, Design Development and Construction Document phases along with the other Design Deliverables. Each update shall incorporate new and revised project information including:

- Progress in project design.
- Changes in project goals.
- Changes in project scope.
- Code interpretations.
- Input from Occupants, Construction Managers and Contractors.
- Input from Plant Operations, Department of Public Safety, E, etc.
- Architectural, mechanical and electrical design coordination meetings.
- Value engineering sessions.
- Test reports on existing conditions.
- Design calculations.
- Equipment selections.
- The final power system short circuit, protective device coordination and arc flash hazard study including the electronic data file for long term updating by the Owner.
- Energy and water conservation calculations and modeling.
- Updates to LEED Checklist.
- Sound, effluent, dispersion, CFD, vibration, and other studies.

- Bid Alternates and Owner's Options.
- A list of all design deviations from U-M Design Guideline requirements.
- A list of all uncompleted Facility Condition Assessment (FCA) items within the project boundary.

Format

Organize the OPR and BOD on a system-by-system basis, preferably in order by CSI Division, using a consistent style for each section. Organize each section from the more global to the more detailed and specific. Number each section and subsection in outline format. Provide a Table of Contents. Submit an electronic file copy along with the required number of printed copies.

As-Built OPR/BOD

At the conclusion of the project, a final OPR/BOD document with “as-built” information shall be submitted by the Architect/Engineer. It shall incorporate all changes that arose during construction or in the immediate post occupancy period that impact the OPR/BOD and that the A/E was involved with. The update shall include revisions to room data sheets where changes occurred. It shall also describe discoveries made during construction and compromises accepted at project completion.

To facilitate the production of an as-built OPR/BOD document, identify changes during construction that impact the final OPR/BOD and notify the U-M Design Manager accordingly. When writing addenda, CCD's and RFI's, mark them with “Impact on OPR/BOD” if they affect the OPR or BOD.

Pre-Design Deliverables

June 2017

As part of the deliverables for formal UM review at the end of Pre-Design, the Design Professional shall submit this "Pre-Design Deliverables" document to the University's Design Manager. On the "Pre-Design Deliverables" document, the Design Professional shall indicate the status of each required item (a check mark is interpreted to mean that an item has been included in the deliverables). On or attached to the "Pre-Design Deliverables" document, the Design Professional shall identify all items NOT included in the review package. Note Design Professional shall not contact City of Ann Arbor. Design Manager is the conduit for all communication between Design Professional and user groups, Campus Planning, City of Ann Arbor etc.

Item	Task	Required Yes / No	Date Received	Responsibility	Comment
Real Estate and Regulatory Review	1 Topographic survey required. Obtain Minimum Boundary/ Topographic Survey Requirements			Design Manager	Provide Link to actual topo survey requirements
	2 Identify anticipated impacts to adjacent private property (anticipated grading, staging, vegetation removal or trimming, access needs, utility work) to Campus Planning Prior to proceeding with a design that requires impacts.			Design Manager with Design Professional	Design Manager shall review impacts with Campus Planning early in Pre-design.
	3 Verify title search has been requested to ensure there are no encumbrances that will impact site development.			Real Estate Office requested by DM	Note topographical survey form indicates title search is surveyors requirement to obtain.
	4 Are any impacts to the City Right of Way anticipated (any new or modified drive way cuts, utility installations or connections et al, tree removals?) See City of Ann Arbor Preliminary plan review Check list			Design Manager shall provide City of Ann Arbor checklist	Link to City of Ann Arbor preliminary plan review checklist (on sharepoint)
	5 Related to above, will a temporary or permanent ROW Occupancy Agreement be required?			Design Manager with Design Professional	
	6 Are any temporary or permanent easements required?			Design Manager with Design Professional	
	7 Has a code review been conducted to ensure compliance with applicable regulation for interior and exterior spaces?			Design Professional	Understanding items like fire access limitations, egress issues etc. can more effectively ensure the project is properly programmed and the initial budget does not underestimate these items.

	8	Will new or renovated facility be Bureau Fire Services Compliant?			DM to clarify with user group	
	9	Identify any historically significant features that shall be protected and/ or restored			Design Manager with Design Professional	
UM Master Plan Review	1	Site Planning Principles to help guide the conceptual planning approach have been requested and received.			DM coordinate with Campus Planning (CP)	Site Planning Principles shall be incorporated into Basis of Design (BOD)
	2	Has the Project Team reviewed applicable State, City , UM traffic and transportation plans?			DM coordinate with CP	
	3	Has the Project Team met with CP to review the UM Master Plan to ensure compliance?			DM to coordinate with CP	
Environmental Review	1	Have sustainable goals been established for the project - including opportunities for Stormwater Best Management Practices?			DM coordinate with CP and AEC Sustainability Coordinator - site SD item 3	
	2	Are there any regulated water bodies of the State, wetland, drains and streams within the site boundary?			DM to review with EH&S	
	3	Is site greater than an acre or within 500' of water of the State? A soil erosion and sedimentation control plan may be required.			DM to review with EH&S	
	4	Has Project Team considered a post-construction storm water management plan if size of is greater or equal to an acre?			Design Professional	link to storm water management procedure if earth disturbance is greater than an acre
	5	Has a Floristic Quality Assessment been requested?			Design Professional	
	6	Has a Threatened and Endangered Species report been requested?			Design Professional	
	7	Has a Phase 1 Environmental Assessment been prepared?			DM to review with EH&S	
	8	Has the Project Team consulted existing data or requested a soils survey to determine the presence of contaminated soils or hazardous material?			DM to review with EH&S	

	9	Has the Project Team obtained a Tree Survey and Evaluation? Significant trees as identified in the Tree Evaluation shall be protected per the UM Tree Preservation Policy in design through to construction completion.			DM to contact Grounds Services	
Site	1	Has consideration been given to how the proposed building setbacks, drives, walks and parking relate to adjacent campus development (the campus neighborhood)?			DM to coordinate with CP	
	2	Does the site contain existing memorial trees, donor benches, plaques, sculpture, class gifts or the like? If proposing new furniture, specify U-M preferred site furnishings.			DM to coordinate with CP	Early notice is key to planning for preservation, relocation etc.
	3	Will public art be a component of the design of the site and building?			DM to coordinate with CP	Schematic Design Phase
	4	Develop a conceptual level lighting plan, consider light spill to neighbors. For context sensitive lighting consider a photometric analysis.			Design Professional	
	5	Establish site lighting goals, what areas to be illuminated, footcandle targeted goals, types of site lighting fixtures. Pedestrian, Parking etc.			Design Professional	
	6	If Non-Capital Planning project, has project received CEOC/EEDR review & support?			DM to coordinate with CP	
	7	Identify impacts from building/site generated noise, exhaust, shading, window reflections, site lighting, etc. on surrounding properties, and preliminary mitigation measures assumed, e.g. berms, sound attenuation.			Design Professional	

Circulation, Transit, Parking and Building Services	1	Will any existing U-M parking or loading spaces be impacted by the project? Verify any potential Downtown Development Authority (DDA) metered parking impacts.			DM to coordinate with CP	Note: At roughly \$75k per removed DDA metered space, this should be considered in the conceptual phase when project goals are being identified and updated as the project evolves.
	2	If parking is to be removed, has the Project Team provided a sound rationale and/ or plan for replacement parking?			DM to coordinate with CP	
	3	Has a traffic survey (including pedestrian counts) been performed to ensure proposed improvements do not negatively impact existing pedestrian, vehicular, transit and parking system?			DM to coordinate with CP	
	4	Coordinate with Building Services for waste management planning			DM	Site item 1j in SD
	5	Loading dock location evaluated including size and weight of trucks making deliveries			Design Professional	
	6	Has an adequate amount of strategically located bike parking been provided?			Design Professional	Evaluate if additional bike parking will be needed. Pre-planning location to be integral to site design is important.
	7	Will the project impact existing transit stops or propose new?			Design Professional	site selection and building entry location may be influenced by transit access
	8	Will project impact ADA egress?			Design Professional	Accessibility is good design and not an after thought
	9	Are any emergency access impacts anticipated?			DM to coordinate with EH&S - Fire Safety	
	10	Consider service vehicle parking need			Design Professional	
	11	Verify Fire Hydrant Coverage.			Design Professional	
Utilities & Infrastructure (U-M and Local)	1	Has a Systems Narrative been developed to ensure plan compliance and to ensure the existing utility systems (storm, electrical, ITCOM, gas, sanitary, domestic water, fire water, chilled water and steam) can support the proposed project requirements?			DM to Coordinate with City and CP	Document in Basis of Design
	2	Will the proposed development impact the existing water service configuration?			DM to Coordinate with City and CP	Link to City of Ann Arbor preliminary plan review checklist (on sharepoint)

	3	Has the Facilities Conditions Assessment (FCA) data base been reviewed by Project Team to determine if there are any deficient items to be picked up and funded within project scope?			DM to Coordinate	
Programming	1	Develop program for building occupancy, including overall square footage, MBC occupancy classification etc.			Design Professional	
	2	review Provost space use guidelines			Design Professional	
	3	Provide square footage estimates of each major space type, e.g. wet lab, dry lab, vivarium, office.			Design Professional	
	4	DG 2.1 Owner Project Requirements (OPR) - Outline Owner's Project Requirement and Basis of Design document providing all the information required in this checklist.			Design Professional	OPR and BOD shall be fully developed during the design phases.
	5	Note if building is a 'High Rise'			Design Professional	
Building Interior and Exterior	1	Describe special occupancy environmental requirements: temperature, humidity, vibration control, acoustical separation, etc. List the specific requirements as best know at this stage.			Design Professional	
	2	Define occupancy types			Design Professional	
	3	Is this a renovation project over \$10M construction cost? If so perform pre-construction infrared thermal imaging to detect areas of excess air leakage.			DM	
	4	Describe how the requirements of U-M DG 3.2 will be attained, in particular to achieve energy goals above code.			Design Professional	
	5	Identify proposed location of major M & E equipment, e.g. penthouse			Design Professional	

	6	Provide overview of envelope construction, e.g. curtain wall, mass, frame. Percentage using glass			Design Professional	
	7	Describe envelope enhancements to reduce energy, e.g. additional insulation, overhangs, electro chromatic glass, trombe walls.			Design Professional	
	8	For existing buildings, describe the approach planned to improve the envelope's energy performance.			Design Professional	
	9	For existing bldg.'s, description of how project will accommodate ASHRAE 90.1 energy code requirements for alterations.			Design Professional	
Elevators	1	Determine type of elevator			Design Professional	
	2	Backup power source identified, if required			Design Professional	
	3	Note if any of the elevators will be an accessible means of egress			Design Professional	
HVAC	1	Identify potential system types, multiple options are acceptable			Design Professional	
	2	Identify utilities source: chilled water, gas, steam, etc.			Design Professional	
	3	Identify special HVAC, hydronic, and exhaust systems: process air handlers, process CHW, smoke evacuation systems, laboratory exhaust, etc.			Design Professional	
	4	Identify major special MEP redundancy requirements, e.g. redundant vivarium AHUs on emergency power with dedicated chiller.			Design Professional	
Plumbing	1	Identify potential systems types, multiple options are acceptable			Design Professional	

& Piping	2	Identify utilities source: domestic water, fire protection water, storm, sanitary			Design Professional	
	3	Identify special plumbing and process systems: RO/DI, lab gases, acid waste, etc.			Design Professional	
Fire Protection (Mechanical) - continued Fire Protection (Mechanical)	1	fire suppression - required?			Design Professional	
	2	fire suppression - source			Design Professional	
	3	Identify special fire protection systems			Design Professional	
	4	Is fire pump required?			Design Professional	
Lighting	1	Lighting concepts identified for interior and exterior systems			Design Professional	
	2	Identify target footcandle levels for common space types			Design Professional	
	3	Identify common lighting control strategies			Design Professional	
Electrical Power Distribution	1	Conceptually, identify the approximate service size and from where will it be served (i.e.. campus loop, DTE, other?) Identify ductbank location in relationship to building			Design Professional	
	2	Substation location, in building or adjacent? Accessibility? Does the building need single-ended, double-ended, or multiple substations?			Design Professional	
	3	Note any high voltage or specialty power requirements			Design Professional	
	4	Does the facility require a lightning protection system?			Design Professional	
	5	Note emergency and standby power requirements. Emergency generator, is it needed? If needed consider location and fuel source			Design Professional	

	6	Allocated Space for electrical closets			Design Professional	
	7	Identify what types of loads are emergency and which ones are optional/ standby. Conceptually identify the approximate generator size.			Design Professional	
Fire Alarm and Emergency Communications	1	Determine if a fire alarm system is required.			Design Professional	
	2	Note if MOSCAD system will perform the functions as a Central Station Monitoring facility.			Design Professional	
	3	Identify building entrance selected for emergency response. Note fire alarm panel location.			Design Professional	
	4	Indicate if fire alarm system will be used as a mass notification system.			Design Professional	
	5	Note if project scope will include an Emergency Radio Responder Coverage System?			Design Professional	
	6	Identify if toxic/flammable gas or other special alarm systems are anticipated			Design Professional	
Communications (Including voice, data & video systems)	1	Identify Tele/Data service entrance point into building. BE room location and location of communication duct bank in relationship to the building.			Design Professional	
	2	Are any assistive listening systems required?			Design Professional	
	3	Identify audio/ visual system requirements.			Design Professional	
	4	Allocate space for IT closets			Design Professional	
	5	Note if ERRC system components will be installed in IT closets			Design Professional	
	6	Note if project scope will include a cell phone signal reinforcement system			Design Professional	
Security (including CCTV and Card Access	1	Identify security system needs (security cameras, card access, etc.)			Design Professional	
	2	Note is project scope includes CCTV			Design Professional	

Control Systems)						
LEED and Sustainability	1	Will project pursue formal LEED Certification?			Design Professional	
	2	Create a "simple box" energy model to identify and document energy and water reduction strategies, to include different building orientations. Provide estimated annual energy, Energy Use Index, and energy cost for the building. For buildings with atriums, break out energy, EUI, and energy cost for the atrium portion. Complete the LEED Integrative Process Worksheet to explain baseline assumptions used in the energy model and describe potential load reduction strategies. Provide preliminary peak diversified cooling and heating loads identified by the model.			Design Professional	
		List of project sustainability goals, including LEED, energy conservation measures, and storm water management.			DM coordinate with CP and AEC Sustainability Coordinator	
	3	Complete the LEED Site Assessment Worksheet to explain relationships between site features and how the features influenced the project.			Design Professional	
Cost and Design Timeline	1	provide estimated cost of construction			Design Professional	
	2	provide design timeline/estimated design phase durations			Design Professional	
Notes						

Design Deliverables

January 2017

As part of the deliverables for formal UM review at each of the major phases of design listed below, the Design Professional shall submit this "Design Deliverables" document to the University's Design Coordinator. On the "Design Deliverables" document, the Design Professional shall indicate the status of each required item (a check mark is interpreted to mean that an item has been included in the deliverables). On or attached to the "Design Deliverables" document, the Design Professional shall identify all items NOT included in the review package.

Note that design deliverables for the Design Development phase are to include all items listed in the Design Development column of the "Design Deliverables" table AND, except as specifically stated to the contrary in the table, all items listed in the Schematic Design column of the table (which are to have been further developed during Design Development).

Note that design deliverables for the Construction Document phase are to include all items listed in the Construction Document column of the "Design Deliverables" table AND, except as specifically stated to the contrary in the table, all items listed in the Schematic Design column and all items listed in the Design Development column of the table (which are to have been further developed during the Construction Document phase).

Item	Schematic Phase	Design Development Phase	Construction Document Phase
General Description (continued)	1 Scope of work narrative	1 Description of construction phasing	1 Documentation on drawings as required by building codes (specifically to include indication of maximum allowable number of people in each room)
	2 Comparison of capacities (see "Building Interior" for area comparison) to program	2 Description of any proposed occupancy within construction area	2 List of all code variances (on drawings cover sheet)
	3 List of applicable building codes on drawing title sheet	3 Description of water and vapor characteristics of roof and exterior walls	3 When special inspection or testing is required by building code, a separately bound "Statement of Special Inspections" as stipulated by Michigan Building Code
	4 Building code review (describe means of compliance for major code issues and building systems)		4 If multiple bid packages, clear indication of scope of each release
	5 List of anticipated building code variance request.		5 Identification of construction phasing, including temporary requirements during each phase

General Description

6	Anticipated building and space occupancy schedules.			6	Provide electronic, clean 2D files per DG 2.4 in Microstation or AutoCAD format (with or without the Design Professional's title block) of CD Phase drawings for use by U-M or the Construction Manager as backgrounds for special construction bid packs (e.g. telephone/data and audio/visual wiring bid packs) or creation of UM master floor plans.
7	Life Safety (egress) plans with identification of security and access control points			7	For projects over \$10 million construction cost, visual display that depicts sustainability initiatives and achievement as described in DG 3.1 "Sustainable Design Requirements"
8	For project over \$5 million construction cost, UM's list of outstanding Facility Condition Assessment improvement recommendations with notation as to which will be addressed by the project.				
9	Owner's Project Requirements and Basis of Design document as described in DG 2.0 "Design Intent Documents"				
10	Demonstration of compliance with DG 3.2 "Energy and Water Conservation". See DG 3.2 for deliverables requirements.				
11	List of sustainability features incorporated into project design as described in-DG 3.1 "Sustainable Design and LEED Requirements"				
12	For new building and addition projects over \$10 million construction cost, information as required to apply for LEED Silver (or higher) certification, and a project-specific LEED Checklist, both as described in DG 3.1 "Sustainable Design and LEED Requirements"				

Specifications	1	System & material narrative description	1	Outline or preliminary specifications indicating project specific features of major equipment as well as component materials, E.G. "welded Schedule 40 steel pipe", "quarter sawn oak", etc. w. same section numbering as final specification	1	Complete specification including draft front end documents
					2	List of items which are sole-sourced or dual-sourced and justification for not specifying three acceptable products
					3	For items listed in UM's "Preferred Manufacturers List", a table of specified items that are NOT indicated in UM's PML, and the justification for specifying these items.
					4	For door hardware sets that require electricity, indicate the proposed sequence of operations for the hardware.
Site (continued)	1	Site Plans to include the following:	1	General dimensions & elevations	1	Extent of construction area, construction fencing and gates
		a. Existing conditions (see site survey requirements)	2	Permanent exterior signage, for building and site elements	2	Area traffic plan, if existing roads/ walks are impacted
		b. Demolition	3	Parking/ roadway plans & elevations	3	Site development phasing
		c. Building outline (s)	4	Vehicle & pedestrian traffic controls (if required), includes pavement markings and signage location ref. DG 4.4.5	4	Construction site access
		d. Future expansion (accommodated, but UPO to determine if shown)	5	Grading Plan - 1' contours and critical spot elevations, include critical spot elevations for ADA requirements, such as ramps, at 10 scale	5	Staging area
		e. Site entrance	6	Site lighting plans simulations, specifications, equipment cut sheets and photometrics (as defined in Design Guideline 16521)	6	Construction signage
		f. Roads & driveways	7	Concept details of site fixtures & equipment	7	Site details, including hardscape
		g. Parking locations	8	Utility and ROW plans for local governing agency approval (preliminary plan review)	8	Utility profiles, elevations, details (including submittal for governing agency civil plan review)...
		h. Bus stop/ shelter (if required)	9	Refer to Sanitary Sewer Flow Mitigation Calculations	9	Utility pipe sizing calculations, engineer stamped submittal
		i. Loading dock location	10	Underground utilities plan (all underground utilities shown, including electrical and data, and coordinated with site features)	10	Refer to Storm water management procedure and deliverables

Site			11	Overall site plan, all visible site features shown and coordinated with utilities.	11	Copy of local government review comments on utilities and modifications in right(s)-of-way and approval to proceed with work.
		j. Waste/ recycling collection locations				
		k. Walkway locations	12	Plan to address existing hazardous/contaminated materials, if applicable	12	Fire apparatus route and required signage
		l. Stairway locations	13	Soil erosion and sedimentation control plan (for both construction and occupancy)	13	Pedestrian and vehicular pavement striping, directional signage, traffic signage, stop signs, no parking signs, restricted access signage etc. Ref. DG 4.4.5
		m. Emergency telephone locations	14	Soil erosion and sedimentation control "Design & Review Checklist" described in UM Design Guidelines Section 02215		
		n. Utility requirements	15	Dewatering plan		
		o. Site utilities and utility tunnels	16	Structural evaluation of existing tunnels for proposed construction logistics.		
		p. Preliminary grading plan	17	Fire apparatus route layout		
		q. Soil retention work, if needed	18	Refer to storm water management procedure and deliverables		
		r. Land encumbrances (deed restrictions, easements, etc.)				
		s. Fire/ Emergency Access Plan				
		2 Site plan for public use DG 2.4				
		3 Refer to storm water management procedure and deliverables				
		4 Preliminary site lighting plan				
Landscaping	1	Existing conditions	1	Planting plan	1	Protection for existing trees and significant plantings during construction
	2	Landscaping concept	2	Irrigation plan	2	Soil preparation & planting specifications
	3	Existing irrigation		Irrigation electrical and water source, including building penetration details and interior piping to panels.	3	Guying diagrams
				Irrigation controls	4	Irrigation Piping diagrams
					5	Irrigation Pipe sizes
					6	Landscape and irrigation details and legends
Structural (continued)	1	Structural Scheme plans	1	Foundation plan	1	Definition of control joints
	2	Written description	2	Typical floor framing plan	2	Beam, column & slab schedules
Structural			3	Framing plans at unique features	3	Mechanical and electrical concrete housekeeping pads
			4	Main member sizing	4	Foundation details

		5	Structural sections	5	Structural details	
				6	Structural notes	
				7	Structural calculations	
Building Exterior Envelope	1	Typical elevations	1	All building elevations w/ dimensional heights	1	Roof-mounted equipment
	2	Fenestration layout	2	Typical wall sections	2	Roof details
	3	Material designations	3	Parapet & coping details	3	Exterior details
	4	Overall building cross-sections	4	Roof & drainage plan	4	Flashing details
	5	Roof layout	5	Exterior door details	5	Control joint definition & details
			6	Typical window details		
			7	Details of unique features		
			8	Expansion joint locations		
			9	Large scale building cross- sections		
Building Interior	1	Typical floor plans (min. 1/16" scale) w/ legends	1	All floor plans (min. 1/16" scale)	1	Dimensioned floor plans
	2	Floor plans for room numbering & public use (see DG 2.4)	2	Submit floor plans for revised room numbers (see DG 2.4)	2	Enlarged plans
	3	Demolition Plans	3	Enlarged plans at elevation changes (such as stairs)	3	Partition details
			4	Enlarged plans at toilet rooms	4	Interior details
	4	Area use identification & area in square ft.	5	Reflected ceiling plans	5	Interior elevations
	5	Mechanical, electrical & other service closets & rooms	6	Wall types, fire ratings, smoke control zones	6	Finish schedules
	6	Circulating paths	7	Plan to address existing hazardous materials, if applicable	7	Door & hardware schedules
	7	Area tabulations compared to program requirements	8	Fixed seating	8	Room signage
	8	Show flexibility for expansion & alterations	9	Defined seating, serving, & kitchen facilities	9	Schedule of proposed movable equipment that is NOT indicated on documents (for reference)
	9	Preliminary layout of major spaces w/ fixed equipment	10	Equipment & furniture layouts	10	Schedule of lab fixtures (turrets, etc.), if applicable
			11	Important interior elevations		
			12	Details of unique features		
			13	Details of fixed equipment		
			14	Preliminary finish schedule		
			15	Preliminary door schedule		
			16	Informational signage		
Elevators	1	Elevator locations	1	Elevator shaft section	1	Dimensioned plans
	2	Equipment room locations	2	Equipment description	2	Sections & details of hydraulic cylinder, if applicable

				3	Description of shaft sump pits	
				4	Elevator car & equipment support details	
				5	Description of controls & Fixtures	
				6	Door & frame details	
				7	Interior details including lighting	
HVAC (continued)	1	Identify all systems	1	Overall building air flow diagram indicating air handlers, exhaust fans, duct risers, and duct mains	1	Detailed piping and duct design with all sizes indicated
	2	One- line diagrams for each air, hydronic, steam, condensate and all other HVAC related systems, and other materials as required to describe the fundamental design concept for all mechanical systems	2	Duct layout for typical spaces	2	Floor plans w/ all components and required service access areas drawn to actual scale. On the plans, indicate duct sizes and air flow quantities relative to each room, including CFM in and out of all doors. Indicate location of control panels.
	3	Indication of the amount of redundancy for all major pieces of mechanical equipment, e.g. "two pumps 100% capacity each"	3	Equipment schedules (major equipment)	3	Lab air valves and volume control boxes (note that each is to be identified by a unique number assigned by the engineer). Provide a schedule that indicates the control sequence that applies to each room (room #, room descriptor, control sequence #)
	4	Major equipment locations.	4	Equipment locations (w/ enlarged mechanical plans)	4	Detailed floor plans of mechanical rooms w/ all components and required service access areas drawn to actual scale
	5	Air intake & discharge locations	5	Indication of typical locations of fire dampers, smoke dampers, and combination F/S dampers	5	Cross-sections through mechanical rooms and areas where there are installation/coordination issues (tight space, zoning of utilities). Indicate required service access areas
	6	Gross HVAC zoning, and typical individual space zoning (e.g. VAV boxes per office =?)	6	Control diagrams (concept form) for all mechanical and plumbing systems	6	In common mechanical space, indication of space zoning by system
	7	Mechanical legend	7	Outline of major control sequences of operation	7	Connection to fire alarm & campus control systems
	8	Special occupancy zones	8	M/E smoke control schemes	8	Equipment details, including structural support requirements
			9	Preliminary floor plans of mechanical rooms w/ all components and required service access areas drawn to scale	9	Penetration/ sleeve details
			10	Preliminary calculations	10	Installation details
HVAC						

			11 Meter locations and types	11 Duct construction schedule (on the drawings), indicating materials and pressure class for each duct system
				12 Detailed controls drawings, including clear differentiation of trade responsibility for control, fire, and control power wiring
				13 Detailed sequences of operation including the specific set points and time delays
				14 Design calculations
Plumbing & Piping	1	One-line (riser) diagrams for every plumbing system (e.g. domestic water, sanitary, storm, gas, RODI, etc.) and other materials as required to describe the fundamental design concept for all plumbing systems	1 Updated design criteria for each plumbing system (including set points, water quality levels, etc.)	1 Water riser diagram, including assumed fixture counts per floor connection
	2	Indication of the amount of redundancy for all major pieces of mechanical equipment, e.g. "two pumps 100% capacity each"	2 Preliminary piping plans (domestic & process) with indication of required service access areas	2 Waste and vent riser diagrams including assumed fixture counts per floor connection
	3	Main water supply, storm, and sanitary leads	3 Meter locations and system submittals	3 Foundation drains
	4	Major equipment locations	4 Back flow prevention locations	4 Detailed piping design with all pipe sizes indicated
	5	Restroom location(s)	5 Fixture schedules, to include lab fixtures	5 Typical plumbing details, including structural support requirements
	6	Plumbing legend	6 Equipment schedules (major equipment)	6 Water heating piping details
			7 Preliminary floor plans of mechanical rooms w/ all components and required service access areas drawn to scale	7 Penetration sleeve details
			8 Provide water metering service system submittals for DM submission to City of Ann Arbor reference DG 6.2 220010 Plumbing Specialties	8 Design calculations
Fire Protection (Mechanical) - contiued	1	One-line diagrams for each fire protection system, and other materials as required to describe the fundamental design concept for all fire protection systems	1 Location of test headers and fire department connections	1 Fire protect, service entrance details
Fire Protection (Mechanical)	2	Report documenting adequacy of utility	2 Preliminary piping plans (domestic & process) with indication of required service access areas	2 Fire protection plans (incl. header and riser layout) with indication of any required service access areas

	3	Connection to utility	3	Preliminary floor plans of mechanical rooms w/ all components and required service access areas drawn to scale	3	Detailed piping design with all major pipe sizes indicated
	4	Location of fire pump and controller, jockey pump and sprinkler valves	4	Fire pump sizing calculations	4	Location of all sprinkler zone valves, drains, and fire hose connections
	5	Sprinkler legend			5	Zoning extents, for areas where the contractor will size the piping
	6	Optional F.P. systems			6	Typical sprinkler installation details, including structural support details
					7	Penetration/ sleeve details
					8	Design calculations
Lighting	1	Electrical symbols legend	1	Typical interior lighting and control plans	1	Interior and outdoor lighting plans, including control systems and devices, lighting panels, switching and circuiting
	2	General drawing notes	2	Outdoor lighting and control plans	2	Lighting control system schematics and wiring diagrams
	3	General photometric levels	3	Fixture types and schedule	3	Lighting control system detailed sequences of operation
	4	Fixture, lamp, and controls descriptions	4	Control system and control device descriptions	4	Installation details, including structural support details
	5	Preliminary interior lighting plans	5	Typical photometric calculations	5	Normal lighting photometric calculations
	6	Preliminary outdoor lighting plans	6	Dimming, daylighting and low voltage control zones	6	Emergency lighting photo metric calculations on 2'x2' grid for State BFS approval
					7	General notes on conduit and wire sizes for 20 amp single phase lighting branch circuits
Electrical Power Distribution - contiued	1	Electrical demolition	1	Manhole, duct bank, and building entry plans and details	1	Details of power service to building
	2	One-line and riser diagrams with equipment ratings	2	Normal power riser diagram with circuit breaker, fuse, conduit and wire sizes	2	Detailed power plans, including primary cable raceways, feeder conduits, electrical loads, duplex and special receptacles, and circuiting
	3	Manhole, duct bank, and building entry locations	3	Emergency power riser diagram with circuit breaker, fuse, conduit and wire sizes	3	Emergency power system plans, controls, and details
	4	Exterior equipment locations	4	Grounding riser diagram	4	Connections to other building systems, including fire alarm and HVAC systems
	5	Substation, generator and ATS descriptions	5	Substation standard detail	5	Details of non-standard electrical installations
Electrical Power Distribution	6	Substation, generator, and electric room locations	6	Substation front elevation	6	Final short circuit, coordination and arc flash hazard study

	7	Preliminary substation and generator room plans	7	List of equipment on emergency power	7	Conduit and wire sizes for services, feeders, and special branch circuits (other than 20 amp single phase)
	8	Electrical load calculations based on watts/sf	8	Electrical load calculations	8	General notes on conduit and wire sizes for 20 amp single phase branch circuits
			9	Panel schedules	9	Notes identifying locations of separate and shared neutrals
			10	Preliminary short circuit and protective device coordination study	10	MCC elevations
			11	Electrical equipment location plans	11	Grounding details
			12	Typical electrical outlet location plans	12	Roof, wall and floor penetration details
			13	Plan for temporary power during construction.		
Fire Alarm and Emergency Communications	1	System descriptions	1	Riser diagrams	1	Detailed FA and EC panel, device and appliance location plans including duct detectors, fire/ smoke dampers, sprinkler flow and tamper switches, monitor and control modules, door hold -opens, door lock releases, etc.
	2	FA and EC panel locations	2	Auxiliary panel, remote panel, device and appliance location plans including pull stations, smoke detectors, horns, speakers, strobes, etc.	2	Strobe light candela ratings
	3	MOSCAD panel location	3	MOSCAD standard detail	3	Risk analyses required by NFPA-72
	4	Preliminary FA and EC device and appliance location plans			4	General notes on conduit and wire sizes
					5	Details of connections to HVAC, fire pump, fire suppression, door hold-open, door lock, and MOSCAD systems
					6	MOSCAD antenna location plans and installation details
					7	Detailed sequences of operation and/or alarm matrix
Communications (Including voice, data & video systems) - continued	1	Manhole, duct bank, and building entry locations	1	BE and TR locations, sizes, and door swings	1	Detailed voice, data and video outlet locations
	2	Building Entrance (BE) and local Telephone Room (TR) locations	2	Backboard locations in BE and TR's	2	Details of telecommunications service to the building
	3	Riser diagram	3	Raceway and grounding riser diagrams	3	Floor box schedule
	4	Preliminary cable tray plans	4	Conduit and cable tray plans with conduit and cable tray sizes	4	Conduit, outlet box and floor box installation details
			5	Material cut-sheets	5	Power outlet locations in the BE and TR's

Communications (Including voice, data & video systems)			6	List of equipment to share telecom rooms		6	Locations of non-telecom equipment in the BE and TR's
			7	BE and TR heat loads			
			8	Typical voice, data and video outlet location plans			
			9	Emergency phone locations and types (wall or pedestal)			
			10	Courtesy phone locations			
Security (including CCTV and Card Access Control Systems)		1	System descriptions	1	Riser Diagrams	1	Detailed equipment location plans
		2	Panel locations	2	Equipment descriptions	2	Equipment schedules
		3	Preliminary device location plans	3	A/V equipment location plans	3	Wiring diagrams
				4	Clock and other equipment location plans	4	Installation details (including cabinets, hangers, and connection boxes)
						5	Detailed sequences of operation
Other Graphics		1	Renderings, models, or other graphics as necessary to clearly present concept	1	Updated renderings, models and graphics required only as appropriate for design development	1	Updated renderings, models and graphics required only as appropriate for construction document preparation
Cost		1	Preliminary cost estimate. For projects with cost greater than \$500,000, use format described in UM Design Guidelines 2.5 "Project Estimates"				
		2	Cost Benchmarking. For projects with const. cost \$5million or greater ref. DG 2.5 Project Estimates for Project Benchmarking Requirements				
Notes		1	All movable furnishings and artwork are considered to be independent of the architectural design project.				
		2	Submittals of deliverables for DD and CD phases are to be preceded by a complete response to UM review comments on the previous phase of design work.				
		3	No individual volume of drawings is to exceed 25 lbs. in weight. No individual specification book volume is to exceed three inches in thickness.				

Design Deliverables/Schematic Design/Site 3) Sanitary Sewer Mitigation Supplemental Information for the Design Professional

All developments with City of Ann Arbor sanitary sewer must mitigate new sanitary sewer flows per the [City of Ann Arbor Developer Offset-Mitigation Program](#). Calculations and offset-mitigation costs, as well as fees for City modeling to verify sewer capacity, are the responsibility of the project. Payment in lieu (of Footing Drain Disconnects), building removal, and plumbing retrofit fixtures are typical U-M forms of sanitary sewer offset mitigation accepted by the City.

The design team will calculate peak sanitary sewer flow based on type of facility or use(s) from the City of Ann Arbor's [Table A](#). If taking credits for removing sanitary flow, peaking factor and system recovery factor are to be applied after the average daily existing flows are subtracted from the proposed average daily flows. (Note that the system recovery factor changed in 2015 to 1.1, and the City's calculation example on the website may be out of date.)

The AEC Design Manager will review calculations with [U-M EHS](#) prior to submitting to the City. The Design Manager will also verify if credits for demolition of existing facilities or removal of flow are to be taken on the project and shown on civil sheets/City plan submittals. **Include sanitary sewer offset mitigation calculations in terms of GPM peak flow on the overall utility plan sheet for City preliminary plan review.** Allow a *minimum of three months* for City modeling to verify sanitary sewer capacity.

The AEC Design Manager will budget \$3,000 per 1 GPM of new/added peak sanitary flow (as of 7/2016). Rates are subject to change each fiscal year on July 1. The Design Manager will request a payment in lieu invoice letter from the City ([Alison Heatley](#)). Checks are made payable to the City of Ann Arbor and should be mailed or hand delivered to the City Engineering Department to the attention of Alison Heatley. The project is responsible to pay the associated sanitary sewer mitigation fee to the City prior to the water meter set. Send a copy of the payment invoice and receipt to [U-M EHS](#).

[Back to AEC Design Deliverables](#)

DESIGN GUIDELINE 2.3

OWNER'S REVIEW

Scope

Submit the project's design documents for University of Michigan (Owner) reviews at the conclusion of each major stage of design (generally at the end of SD, DD, and CD phases). The Owner's reviewers may include (but are not limited to) the U-M Project Director, U-M Design Manager, U-M Project Manager, external construction manager, U-M Planner's Office, U-M User groups, U-M Dept. of Public Safety and Security, U-M OSEH, U-M Architecture and Engineering, U-M Interior Design, U-M ADA Coordinator, U-M Commissioning and Plan Review, U-M Code Inspection, U-M Utilities and Plant Engineering, U-M Plant Operations Shops, U-M Key Office, U-M Building Services, U-M Maintenance, U-M Grounds and Waste Management, U-M Parking and Transportation, U-M ITSComm (telecommunications), U-M Risk Management, and Factory Mutual. The project's Design Manager will coordinate the Owner's review activities.

An Owner's review is a comprehensive examination of a project's design documents to evaluate if the design meets the Owner's intent. However, the Owner's reviews shall not serve as the A/E's design, drafting, or coordination checks. Coordinate and check the design documents before submitting them to the University for Owner's review.

Related Sections

U-M Design Guidelines:

[2.1 Owner's Project Requirements \(OPR\) and Basis of Design \(BOD\)](#)

[2.2 Design Deliverables](#)

[3.2 Energy and Water Conservation](#)

Execution

When the design documents are submitted to the University for review, include a Design Deliverables checklist which is marked to indicate the completeness of the design documents. Include an updated OPR and BOD in accordance with Design Guideline SID-B. Also include an updated Energy and Water Conservation Report and an Energy Impact Statement when required by Design Guideline SID-D.

When the design documents are received, the Design Manager will distribute them for review. Comments received by the Design Manager will be assigned action codes and sent to the A/E for resolution. On large or complex projects, the Design Manager may hold meetings with the A/E and reviewers to discuss the comments before action codes are assigned.

Upon receipt of the Owner's review comments:

- Incorporate all comments coded "A" (approved), or contest the comment in writing to the Design Manager.
- Provide the Design Manager with a written response to each comment coded "R" (A/E to review and reply) or "O" (other action required). Each response shall describe how the associated comment is being resolved.
- Request clarification of any comment that is not fully understood. A response similar to "Comment not understood" is unacceptable.
- Discuss with the Design Manager any comments that will significantly affect the project's schedule or budget and document these in a written summary of the review.

The Owner's reviewers will spot check the A/E's written responses to verify their review comments were understood. The reviewers will then spot check the next revision of the design documents to verify their comments were resolved. Comments that were ignored or not adequately resolved may be resubmitted as often as necessary until they are completely and acceptably resolved.

While the Owner's reviewers strive to provide appropriate comments as early in the design as possible, specifics of the design often do not appear in sufficient detail for the reviewers to comment on until the final review. Therefore, the lack of comments on a vague or incomplete aspect of the design during the earlier reviews shall not be construed as Owner approval of any iteration of the design.

DESIGN GUIDELINE 2.4
DOCUMENT STANDARDS AND PROCEDURES FOR PROJECT DELIVERABLES

Scope

This section provides guidance and instruction, to the Design Professional, for preparing and submitting documents to the University of Michigan.

Documents include but are not necessarily limited to the following:

- OPR/ BOD (Owners Project Requirements and Basis of Design)
- Area Summary (Gross Sq Ft)
- General CAD Drawing Standards
- Life Safety Plans
- Room Numbering Floor Plans
- Specifications
- Bid Sets
- Construction Sets
- Master Floor Plan Documents
- Record Documents
- BIM Model

Design Guidelines

[DG 2.1 OPR and BOD \(Owners Project Requirements and Basis of Design\)](#)

[DG 2.2 Design Deliverables](#)

[DG 4.3 Building Commissioning](#)

[DG 7.0 Master Specifications](#)

U of M Standard Details

[Line types for Life safety Plans .DGN format](#)

[Line types for Life Safety Plans .DWG format](#)

2.1 Owners Project Requirements and Basis of Design – OPR/BOD

- Provide BOD/OPR in electronic format
 - Provide in PDF format, ready to print
 - Document shall be formatted to print 2 sided
 - Start each section on a new odd number, right hand page
 - Provide gutter margin to accommodate binding
 - Headers and footers for each page shall include
 - Project number
 - Building Name and Number
 - Project phase SD DD CD
 - Date submitted
 - Page and section designation
 - Document shall be in color
 - Format size 8.5 x 11 or 11 x 17. Confirm with Design Manger their preference for size.

- Provide printed copies, number TBD based on project, as requested by Design Manager

2.2 Area Summary (Gross and Net Square Footage)

- The Design Professional shall calculate a Gross Construction Square Footage total as described below.
 - Complete calculation for each phase of the design.
 - Provide a floor plan for each floor with perimeters showing the Full, Half and Zero gross square footages.
 - Include sub-totals for full and half as well as the floor total.
 - Include on the first page the totals for each floor and the grand total for the building.

University of Michigan – Architecture, Engineering and Construction
Standard Method for Calculating Construction Gross Square Footage of a Building
 Modified after AIA Document D101, 1995 *Methods for Calculating Areas and Volumes of Buildings*

2.3 General Project Drawing/CAD Standards

The following are University of Michigan Architecture Engineering and Construction (AEC) drawing/CAD standards. At the beginning of the project, coordinate specific project requirements with the Design Manager.

- Standard sheet size should be Arch D - 24 inches wide by 36 inches long or Arch E1 - 30 inches wide by 42 inches long. Other drawing sizes require the approval of the Manager of U-M Space Information (arranged through the Design Manager). Format sheets with a minimum of 1-1/2 inch left hand margin for binding.
- File naming
 - Base all file names on the current National CAD Standards - Uniform Drawing System (Level 1 or Level 2).
 - Index of sheets should be the first file in the set and easily identified by its filename. Ex) G-001.dwg or GI001.dwg (UDS Level 1 or 2)
 - Sheet files should be named consistent with the Index of sheets and should be easily identifiable using UDS naming conventions
 - Model files should be named consistently and be easily identifiable using UDS naming conventions
- Reference Files
 - Deliver all reference files in the same folder to allow for any standard CAD viewer to easily open files with all references intact.
- Layer Names
 - Utilize current National CAD Standard layer names.

Drawing Information – include the following:

- Complete index to drawings on first or second sheet of the entire set and on first or second sheet of each discipline series and volume.
 - When sheets are added or deleted during the course of construction, final Record Drawing set shall have the index updated to reflect the final documents.
 - Complete symbol and abbreviation legend(s) applicable to each series (where a series is a subset such as Architectural, Electrical, etc.) on first or second sheet of each series. (Parts of the legend may be repeated on sheets throughout the sets or series as deemed appropriate by the A/E, but the legend on first or second sheet shall be comprehensive.)
 - Locations of all equipment to be shown on all drawings using accepted symbols from the Legend. Do not rely solely on notes. Examples include, but are not limited to: flow control and isolation valves, all types of dampers, turning vanes, access doors, clean-outs, etc.
 - Scale indicated by note and by graphic scale bar on each applicable drawing, detail and section. Any numbers or letters associated with the scale bar are to be a minimum 1/8 inch high. Where scale is applicable for entire drawing, scale references to be located near lower right corner of drawing.
 - Define font type and size
 - North arrows on plan sheets, consistently oriented on all plans, with the north arrow either oriented to the top or the right of the sheet.
 - Tagged column grid on all plan sheets (civil, architectural, mechanical, etc.), at all design phases.
 - Room names and numbers on all plan sheets (civil, architectural, mechanical, electrical, etc.) Design Development and Construction Document Phase. Room numbers on plans with a corresponding index on the same page is acceptable.
 - Where a portion of a plan or elevation appears on a sheet, a key plan shall be provided in the lower right portion of the drawing area to show the location of that portion relative to the whole.
 - Cross-reference all plans, elevations, sections, and details as applicable.
 - Floor live load capacities shall be listed on drawings.
 - Clearly demarcation between existing, demolition, new, and replacement work.
 - Screening, shading, crosshatching, other indications of materials or locations, and text shall not obliterate significant information, and shall be capable of being reproduced without "bleeding" when the document is reduced to half size. Use screen patterns equal to or coarser than 50 percent, 50 line.
 - All details shall be numbered.
 - Schedules shall be horizontal orientation.
 - Basic attributes of mechanical, electrical and plumbing equipment/ fixture shall be scheduled on the drawings.
 - Light fixtures shall be scheduled on drawings.
 - Number each paragraph in a sequence of operation narrative on drawings.
- Title Block Content:
 - The University will identify the Project Title, Building Number and Project Number, which the A/E shall put on each drawing.
 - Locate at the lower right corner of the sheet.
 - Include the following information
 - University of Michigan building number and building name
 - University of Michigan project number and/or Plant work order number
 - Project title
 - Sheet title: Be as descriptive as possible and unique within the drawing set.
 - Revision history block: Locate above project information. When submitting to the University any sheet with information not previously submitted, a note shall be included on one of the issuance lines on the title block, indicating purpose of submittal and date. This applies to design review and contract issuances as well as addenda, bulletins, etc. All such notations of issue shall remain on each sheet. In addition to the note on the issuance line, sheets which have already been released for bids shall have changes clearly delineated, by "clouding" or similar means.

- Additional items, professional stamps, Design Professional information, address etc. shall be vertically on the right hand side of the drawing.
- Plans and specifications issued for regulatory approval shall be sealed by the Architect or Engineer responsible for the work. Each drawing sheet is to include the name and address of the company primarily responsible for its content regardless of whether or not it is the prime design profession for the project.
- The title sheet, or second sheet, shall list all applicable building codes for the project, including but not limited to the building code, the electrical code, the mechanical code, and the plumbing code. The construction document drawings are to include all information required by the applicable codes to be present on the drawings.
- Contact the Design Manager to obtain a copy of AEC's CAD standards and a copy of our CAD seed files (which include AEC Title Blocks) and symbol libraries.

2.4 Life Safety Plans

University of Michigan requires consistency in information provided and formatting of line types on Life Safety Plans. The University has standardized the linetypes for smoke tight partitions, smoke barriers, fire barriers and fire separation walls. These partitions shall be delineated on the life safety plans. This information shall be part of the background file not sheet based. The goal is that the linetype is included in the file for use by the University in their various building management systems. Please reference page one of this Design Guideline “Standard Details” for dwg and/or dgn files for linetypes.

Legend below depicts the line types required for each partition type.

LEGEND

	STP	SMOKE TIGHT PARTITION
	SB	SMOKE BARRIER (1-HR)
	0.5	½-HR FIRE BARRIER
	1	1-HR FIRE BARRIER
	2	2-HR FIRE BARRIER
	3	3-HR FIRE BARRIER
	4	4-HR FIRE BARRIER
	2-FW	2-HR FIRE SEPARATION WALL
	3-FW	3-HR FIRE SEPARATION WALL
	4-FW	4-HR FIRE SEPARATION WALL
		EXIT STAIR
		EXIT

Include the following information, as applicable, on Life Safety Plans submitted to Univeristy of Michigan:

1. List of applicable codes, including year
2. Building construction type and occupancy assumptions
3. Plumbing fixtures counts and calculations, by floor
4. Boundary of any BFS compartments
5. Chemical control areas
 - a. Include boundaries and anticipated quantities stored in each control area.
6. Egress Component Capacity Symbols:
 - a. Egress doors: include symbol referencing egress capacity, planned number of occupants exiting, calculated width required (inches) and width provided (inches), reference exhibit A below.
 - i. Building Egress Doors
 - ii. Assembly Space Egress Doors
 - b. Egress stairs: include symbols referencing egress capacity, planned number of occupants exiting, calculated width required (inches) and width provided (inches), reference exhibit A below.
7. List of codes that are applicable, including year
8. Building construdtion type and occupancy assumptions
9. Plumbing fixtures counts/ calculations, by floor

Exhibit A

EGRESS COMPONENT CAPACITY SYMBOLS

2.4 Room Numbering Assignment Procedure

Design Professionals shall NOT assign room numbers. UM AEC-Space Information is responsible for all room numbering. The Design Professional shall submit all floor plans for room numbering to the Design Manager. Submittal of the floor plans for official room numbering should be according to the following format and schedule:

- **Schematic Design:** Submit PDF's of all floor plans for initial room numbering assignments. Plans should display only walls, doors, windows, structural, stairs, ramps, elevators and restrooms. Remove all architectural symbols, references, column lines etc. Insert blank room number boxes anywhere room numbers are needed. Include room names on plans if available. If plans include existing space not being renovated, include existing room numbers. These can be obtained by requesting existing plans directly from AEC-Floorplans@umich.edu.
- **Design Development/CD Phase:** Submit revised plans *as often as necessary* showing all architectural changes that result in new, deleted or moved rooms, doors and/or wall openings. Even simple changes may result in revised room numbers. Indicate areas that have been changed with revision bubbles and empty room number boxes wherever new room numbers are needed. Please also show any previously assigned room numbers. PDF should be clean and display only items as described above in the Schematic Design section.
- AEC-Space Information will provide the Design Professional and Design Manager with officially stamped "Approved Room Numbers" PDF document(s) within three (3) business days of the receipt of the request from the Design Manager.

2.5 Specifications Requirements

General

AEC maintains within its Design Guidelines both a [Preferred Manufacturers List](#) and [Technical Sections](#). These components of the Design Guidelines reflect the needs and experiences of the University in regards to the specific equipment being addressed. The A/E shall select manufacturers from the list that are able to supply the products needed for the given project and whenever possible, shall include at least three acceptable manufacturers. The Preferred Manufacturers List shall not substitute for the A/E's professional judgment. In the unusual circumstance where the listed products are not suitable, the A/E must present justification for using other products and must obtain the written approval for these products from the Design Manager. The A/E shall incorporate the standards in the Technical Sections in the project specifications.

University Architecture and Engineering maintains a limited [Master Specification](#) for use by in-house designers. A/Es may use these specifications, but must edit these specifications to make them project specific. However, they should not substitute these specifications for their professional judgment regarding the requirements of each individual project. Use of these specifications will not relieve the A/E from the obligations of the contract, stated or implied, that pertain to their performance or the performance of their product.

Project manuals shall contain Front End Documents in addition to general requirements (Division 1) and technical specifications (Divisions 2 through 32). See paragraphs below titled "University of Michigan Standard General Conditions" and "Other Standard Documents".

Specification Standard: The University recommends compliance with the principles and practices outlined in the CSI Manual of Practice.

Use of the 3-Part Section Format is mandatory.

Use of the Page Format is encouraged, but is not mandatory.

Use the 2012 CSI MASTER FORMAT Section numbers and titles for organizing Documents and specifications within Project Manuals. Comply with guidelines for contents of each Division and Section of the specifications.

Language and Terminology

Compliance with the recommendations of Manual of Practice Chapter 4 "Specification Language" is strongly encouraged. The following requirements are mandatory:

Write specifications as if addressed to the General Contractor. Do not address specifications to "This Contractor" or "The subcontractor." Where specific parties must be referred to for clarity, use language similar to the following: "Engage a licensed Professional Engineer to perform calculations," or "Require Installer to examine substrate prior to installation."

Eliminate the term "by others" from drawings and specifications. If work is not part of the Contract, say so directly using (N.I.C.) or similar constructions. If, for example, a mechanical item is shown on an architectural sheet for clarity, use the phrase "by mechanical trades."

Eliminate the term "or equal" from specifications. The University requires Contractors to bid only products specified as "approved." List not less than three alternative, equivalent manufacturers for each generic product specified, unless no other equivalent products exist.

University of Michigan Standard General Conditions

The University maintains its own [Standard General Conditions](#) and [Supplemental General Conditions](#). Obtain a copy of these documents and make sure the specification writer is fully familiar with it.

In general, Special Conditions are not required. However an A/E may wish to modify language concerning shop drawing review or other items. Coordinate use of Special Conditions with the Design Manager.

2.5 Submitting Bid Sets

- Provide documents to be issued for Bid in PDF format using the current PDF driver.
 - Drawing Sets
 - Provide a single Combined PDF that is ready for printing. Each volume should be a single PDF.
 - Volumes should be used when the Drawing sets contain more than 175 individual sheets. Each volume should include an index page. Volumes should be broken between disciplines whenever possible.
 - Format size will be full size drawings.
 - Specifications:
 - Provide a single Combined PDF that is ready for printing.
 - Volumes should be used when the Specifications contain more than 1200 individual sheets. Each volume should include an index page. Volumes should be broken between disciplines whenever possible.
 - Each division of specification will start with a header on the top of the page.
 - Document shall be prepared for 2 sided printing.
 - Format size 8.5" x 11"
- Printed copies are not required.
- University of Michigan electronic file transfer/sharing website shall be utilized for submitting documents.

2.6 Submitting Construction Sets

- Construction Documents (drawings and specifications) should consist of the original Bid Documents modified to include all addenda, accepted alternates and other contractually approved modifications.
- Provide documents to be issued for Construction PDF format using the current PDF driver. All Construction documents should be digitally signed and sealed by the design professional.
 - Drawing Sets
 - Provide a single Combined PDF that is ready for printing.
 - Volumes should be used when the Drawing sets contain more than 175 individual sheets. Each volume should include an index page.
 - Volumes should be broken between disciplines whenever possible.
 - Format size will be full size drawings.
 - Specifications:
 - Provide a single Combined PDF that is ready for printing.
 - Volumes should be used when the Specifications contain more than 1200 individual sheets. Each volume should include an index page. Volumes should be broken between disciplines whenever possible.
 - Each division of specification will start with a header on the top of the page.
 - Document shall be prepared for 2 sided printing.
 - Format size 8.5" x 11"
- Printed copies are not required.
- University of Michigan electronic file transfer/sharing website shall be utilized for submitting documents.
- OPR/ BOC shall be updated to reflect addenda and alternates accepted.

2.7 Floor and Site Plans – Public Use

On occasion users may request thematic floor plans (i.e., room types or assigned departments) and/or site plans to share project information publically (i.e., web page display, presentations, media use, etc.).

Graphics/ Floor Plans may also be requested for the following:

- Regents Graphic Summaries
- Construction plans indicating impact on neighborhoods
- Support for Neighborhood meetings
- Pedestrian Way finding during construction
- Planning Principles

Floor Plans

- Floor plans **should** contain:
Walls, Doors, Windows, Stairs, Elevators.
- Floor Plans **may** contain:
 - Fixed furniture in class rooms, offices, conference rooms, and laboratories (but **should not** contain labels identifying any fixed furniture in these areas)
 - Restroom fixtures
 - Thematic room type floor plans (See [Color & Label Guideline](#) below for suggested colors and labels.)
 - Thematic department floor plans, **with the exception of following**, all of which should be labeled as "Support Departments:"
 - Unit for Laboratory Animal Medicine (ULAM)
 - Plant Operations spaces, such as Mechanical, Maintenance, or Custodial
 - Telecommunication / Data spaces
- Floor Plans **should not** contain:
 - Utility tunnel information (tunnel walls, doors to tunnels, and/or access hatches)
 - Mechanical equipment, piping layouts
 - Card access control system information (card reader and control panel locations, and wiring diagrams)
 - Security system information (security sensor, camera, video recorder and control panel locations, and wiring diagrams)
 - Columns and column lines

Site Plans

- Site plans **should** contain:
 - North Arrow
 - Major street references
 - Contextual campus information
 - Graphic representation of new and existing hardscape surfaces
 -
- Site plans **may** contain:
 - Existing tree survey information
 - Pedestrian Paths during construction
 - Locations of nearest bus stop to construction
 - Location of nearest Barrier Free parking
 - Fire Emergency Access Routes
- Site Plans **should not** contain:
 - References (visual or textual) to utility tunnels, roof access, or mechanical and electrical spaces.

Document Format

- Provide one *pdf* file per floor.
- The original size should be either 8.5” x 11” or 11” x 17”

Direct questions regarding plans for public use to Project Design Manager.

2.8 “As-Built” Record Documents

- Record Documents shall show all significant changes to the Construction Set resulting from addenda, accepted or deleted alternates, field orders, construction change directives, RFIs, bulletins, mark-up prints or drawings and/or other data generated by the Contractor(s) during the course of construction of the Project.
 - Drawing Sets
 - Provide a single combined PDF.
 - Volumes should be used when the Drawing sets contain more than 175 individual sheets. Each volume should include an index page.
 - Volumes should be broken between disciplines whenever possible.
 - Format size will be full size drawings.
 - CAD
 - The Design Professional shall also provide a complete set of all original CAD files (AutoCAD, Revit, MicroStation, etc.) and associated electronic files (dependencies, drawings, data and models) required for the Owner to reproduce the Record drawings via CAD.
 - Provide BIM model. Electronic file should be able to be opened and edited without the need for additional software or programs. BIM Model should utilize only basic software without any proprietary upgrades. Goal is a user friendly model with generic software for maximum compatibility in the future.
 - The Design Professional shall also provide original (paper) and/or color scanned copies (PDF) of all supporting documents (contractor “As-Built” Mark-ups) provided by the Contractor for the purposes of updating the Record Drawings.
 - Specifications:
 - Provide a single Combined PDF.
 - Volumes should be used when the Specifications contain more than 1200 individual sheets. Each volume should include an index page. Volumes should be broken between disciplines whenever possible.
 - Each division of specification will start with a header on the top of the page.
 - Document shall be prepared for 2 sided printing.
 - Format size 8.5” x 11”
 - Provide O & M manuals for all equipment and materials, per DG 4.3 Building Commissioning

2.4.1: UMHHC - DRAWING AND CONSTRUCTION DOCUMENT STANDARDS (SID-H-H)

Related Sections

Basis Guideline: NA

For an explanation of the use of these guidelines, see "[Design Guidelines for UMHHC Facilities](#)"

General

All project deliverables, including meeting minutes, cost opinions, transmittals, drawings, emails and cost opinions, shall include the correct RTN number and CBN number.

Coordinate and communicate with assigned Facilities Planning team, including Mechanical and Electrical Engineers, Interior Designers and Equipment Planners. Coordinate preliminary furniture and equipment layouts. Obtain preliminary equipment cut sheets from Equipment Planner for major or unusual equipment.

Coordinate and communicate with security and telecommunications staff, and special systems vendors as appropriate.

Obtain current key plans from FPD.

Provide final schematic plan in electronic format to FPD for room number assignments in a format compatible with the version of AutoCAD in use by UMHHC Facilities Planning and Development. Electronic files submitted for the assignment of room numbers should be at 1:1 scale and should show new work only. Files should include only walls, doors, windows, and room types (names).

Review structural capacity of building for proposed use.

Conduct thorough code analysis. As appropriate, review proposed design with regulatory authorities.

Obtain pre-design air testing if required by CSA worksheet. A/E shall be responsible for coordinating the schedule and any special needs with the UMHHC Building Manager and respective Air Test & Balance Company. A copy of all completed air test and balance reports shall be forwarded in PDF format to FAC-projectdept@med.umich.edu. The e-mail should contain the project RTN #, CBN # (if available), Project Name, building name, building level and room numbers included in report.

At start of Design Development/Construction Document phase, confirm all assumptions in the Investigative Report, including all field observations.

If room configuration changes, obtain revised room numbering from FPD.

Submit Construction Documents to regulatory agencies if required, including BFS and HFES (submittal fees shall be paid by the A/E and listed as reimbursables on the CSA). UMH Design Manager will advise if preparation of the Operational Narrative will be part of the A/E scope of services. For leased buildings, coordinate submission of documents to local regulatory agencies with building owner's representative, who shall pay the plan review fees. Respond to all regulatory agency comments in writing within one week. Copy all transmittals and correspondence with regulatory agencies to Design Manager and Capital Construction for file.

Confirm security system, fire alarm and other special system assumptions made during the Investigation with the appropriate UMHHC staff.

Include a list of all applicable codes and a code analysis summary on the cover sheet of the Construction Documents.

Provide complete hardware sets and specifications, including all electrical hardware and wiring diagrams. A sequence of operation is to be included with all hardware sets.

Provide complete interior finish schedule and finish specifications for all finish materials as selected by Interior Designer.

Refer to and incorporate UMHHC Design Guidelines.

Project manual specifications are typically only required for AEC managed projects. Project manual shall comply with AEC requirements and conform to the 1995 CSI 16-Division format unless directed otherwise.

Minimum Drawing Requirements

All drawings submitted to UMHHC become the property of UMHHC. No drawings submitted at any stage of a project shall be copyright protected.

Standard drawing sheet size is 22"x34" (ANSI D-size). With permission of the UMHHC Design Manager, 30"x42" (E-size) drawings may be used where the UMH standard D-size would require a scale smaller than 1/8"=1'-0" or where the E-size sheet would allow for a complete floor plan on a single sheet. Final deliverables (as-builts) are to be black ink on white paper. Drawings included for reference must have "For Reference Only by RTN #####" stamped visibly on each reference drawing. Drawing sets are to be rolled, printed side out with titleblock visible. For bulletins or addendums, 8-1/2"x11" (A-size) are acceptable where small sizes are applicable. All final (as-built) submittals shall be accompanied with an electronic copy of the drawing(s) conforming to the standards listed herein for submission of electronic drawing files. Electronic drawing files shall include drawing files in both DWG and PDF format. All drawing sets submitted for review and/or construction are to be uploaded to UMHHC's reproduction website (currently Reprographics One - see [UMH FPD website](#) for link).

All drawing files issued in PDF format should be printed to black, i.e., no linetypes, equipment, furniture, or any other items shall be illustrated in color.

All drawings, including cover sheet, are to be printed on the UMHHC standard titleblock- see UMH FPD website for standard titleblock.

All lines are to be dark with crisp edges.

All text used on drawings shall be a minimum of 3/32" height (at full size) so that it is legible from a half-size set (i.e. 11"x17" for D-size).

Screening, shading, crosshatching and other indications shall not obliterate underlying information, and shall be capable of being reproduced without "bleeding".

All plans in a given project set are to be oriented in the same direction. In all cases, north is to be "up" or to the right. All plan drawings shall have a north arrow.

All floor plan drawings shall include a small scale building key plan with a shaded "area of work".

Building plans are to show a minimum of two vertical column lines and two horizontal column lines with their associated grid bubbles and identifications. Site plans to show a minimum of two coordinate points, preferably at the lower left and upper right of drawing area.

Base Plan Master Files of UMHHC buildings are located in model space according to UMH's survey grid and are available on FPD's virtual network (if AE does not have access to FPD's virtual network, contact your FPD project manager). AE shall maintain FPD's spatial coordinates so that plan sheets may be inserted as overlays to existing electronic drawings (i.e. plan views in CAD files should line up correctly when brought together electronically). Coordinate points should align in each file.

It is extremely important to field verify all dimensions, existing walls, doors, windows, built-ins, power, communications, fire alarm, special electrical systems, HVAC, plumbing, fire protection, etc. Any discrepancies found during design between actual field conditions and Base Plan Master Files are to be documented on marked up plots of the base plan master file(s) in question and communicated to UMHC's FPD CAD Coordinator, Facilities Planning and Development, 2101 Commonwealth, Ann Arbor, MI 48105-5759. Project drawings are to reflect actual field conditions.

Include a complete index of drawings on the cover sheet of the drawing set. All drawings, regardless of set size require a cover sheet. On projects with more than 30 sheets, include an index sheet on the first sheet of each series as well (a series is a segment of the drawing set such as the Architectural series or Electrical series). Index is to identify sheet number and title and indicate clearly if a drawing is included only for information and does not show work under the contract.

If drawings are added or deleted during the course of construction, A/E is to revise the index on the Record drawing set accordingly.

Include a complete symbol and abbreviation legend for each series on the first or second drawing of the series. (A series is a segment of the drawing set such as the Architectural series or Electrical series.)

Include a graphic scale bar on each plan drawing. Where scale applies to the entire drawing, the scale references are to be located near the lower right corner of the drawing area.

Where a portion of a plan or elevation appears on a sheet, use a reference keyplan drawing to show location relative to the whole. The preferred location for the keyplan is in the lower right corner of the drawing or in the titleblock area of the drawing, space permitting.

Cross-reference plans, elevations, sections and details. Identify sections on all plans; architectural, mechanical and electrical.

Distinguish clearly between existing, new, and replacement work.

Clear drawings shall be provided, indicating scope of any required demolition and new construction. All floor plan drawings shall include north arrows, graphic scales, and keyplans. Except for keyplans, a minimum scale of at least $1/8" = 1'-0"$ is required.

Produce drawings using standard AIA layering standards.

Provide proper line weight differentiation to assist in the readability of drawings.

All external referenced materials should have relative references and should be included with the original referenced drawing. If an external reference is not required in a drawing, the reference should be removed.

Utility shutdown information will be shown on the construction documents. Refer to Divisions 15 and 16 Basic Design Guidelines for specific format.

In order to fully coordinate all systems, architectural reflected ceiling plans are required. They are to show all ceiling mounted equipment including: lights, HVAC supply and return, smoke detectors, speakers, owner equipment, access panels, cameras and security devices, exit signs, IV tracks, curtain tracks, signage, (etc.). Generally equipment should be centered in ceiling tiles.

In renovation projects, existing equipment to remain is to be shown. If existing sprinkler heads are anticipated to remain, they must be shown on the reflected ceiling plan.

In order to provide access above the ceiling, care should be taken to provide "free" tiles, particularly below cable trays, filters, and other areas that require on-going maintenance.

For new and existing plans, fire and smoke rated walls and other assemblies are to be indicated clearly on the drawings. Style of drawing linetype symbols shall match the UMHC Fire Wall Keyplans.

Titleblock Content

Dates Issued: List purpose and date of all issues, including as appropriate, 50% CD, 95% CD, Regulatory Review, Construction and Record Drawings. Every issued document, not submitted for construction or bids, must be labeled "Not For Construction" in the titleblock.

Sheet Number: All drawing numbers are to include a prefix which designates the discipline of work included on the sheet. Examples of appropriate sheet numbers are as follows:

- A-8 Eighth sheet of (A)rchitectural series.
- CL-2 Second Sheet of a series that includes both (C)ivil and (L)andscaping information.
- M-6 Sixth sheet of a series that includes (M)echanical information.

Project Number: Indicate UMHHC project number (RTN # & CBN #). For projects managed by UM/Campus AEC, include AEC "P100" number. The first row under "project number" is to be the UM/Campus assigned number and the second row is to be the UMHHC RTN & CBN#'s.

Sheet Title: A sheet's title should uniquely identify a drawing sheet from others in a set and identify type of drawing using words such as:

- Plan
- Details
- Sections
- Elevations
- Schedules
- Risers
- Schematics

Identify the location. Where the project area requires multiple plan sheets, include unique building, level and zone in sheet title.

Project: UMHHC will provide a specific project name.

Approval/Issuance Area of Titleblock:

Keywords: Identify drawing content with appropriate keywords found in the Disciplines/Keywords table at the end of this document.

Location: Show Building, Level, Zone or other location information which is not already part of the Project Name or Sheet Title.

UM Design Mgr.: Identify the primary University Project Coordinator.

Approved/Checked/Coordination Checked: When submitting to UMHHC any sheet with information not previously submitted, note on one of the issuance lines the purpose of submittal and date (i.e. CONSTRUCTION MM/DD/YY). This applies to design review and contract issuances as well as addenda, bulletins, etc. All such notations of issue are to remain on sheets.

Issues for Dates: All documents issued must have a unique, current date. "Issued for" dates shall be noted as follows:

- Schematic Review (as needed)
- ___% DD Review (as needed)
- ___% CD Review (as needed)
- 100% CD Review (mandatory)
- Construction (mandatory)

All drawings issued after the construction set shall be noted "Bulletin #__" as directed by Design Manager. All changes shall be "bubbled" and all drawings shall be reissued as a complete set.

Special Notes for Capital Construction (UM Construction Services) CD's

Smaller construction projects are generally managed by UMH FPD Construction Coordinators, constructed by UM Construction Services and do not go out to bid to General Contractors. Consequently, much of the standard boilerplate and notes required for a competitively bid project are not required.

These projects do not need full specifications or after-hours information. They do need to be prepared with standard UMHHC title block 22"x34" (ANSI D.)

These documents should include all information required to order the materials; i.e. manufacturer and model numbers, colors, sizes, etc.

Documents should include phasing drawings and temporary partition locations, as required.

Obtain all finish information from UMHHC Interior Design and put all information on the documents, including manufacturer, model, color name and all model numbers,

Final construction documents are to be submitted in PDF format to the UMH Design Manager and uploaded to the printing vendor.

A/E will submit documents to BFS and HEFS and include plan submittal fees as reimbursable expenses, as required.

At the end of construction phase of the project AutoCAD & PDF file formats are to be provided to FPD.

Backups

A/E's shall retain available backups of electronic files for a minimum of 5 years from the close of the A/E's contract with UMHHC.

Software Platform

Internally, UMHHC Facilities Planning and Development uses AutoCAD. Electronic files submitted to UMHHC FPD shall be in a format compatible with the release in use by UMHHC FPD and in conformance with the standards outlined herein for electronically prepared drawings.

Electronic File Transmission and Requests

Electronic files submitted to UMHHC Facilities Planning and Development are to be submitted in AutoCAD format with one "hard-copy" sheet per drawing file and conform to standards herein for layer names and drawing content. In addition to AutoCAD files, all drawings shall be submitted in PDF format.

Electronic files submitted to UMHHC Facilities Planning and Development for Interior Design use should be at 1:1 scale and show new work only. File should include only walls, doors, windows, room numbers, room types (names) and locations of electrical and data outlets. Doors should be shown at 90 degrees open. Room numbers and room types should be on one layer.

Electronic files submitted to UMHHC Facilities Planning and Development for the assignment of room numbers should be at 1:1 scale and show new work only. File should include only walls, doors, windows, room numbers and room types (names).

Electronic drawing submittals shall not use external drawing references (x-ref). All external referenced materials should be permanently inserted in the drawing file.

Files translated from CAD programs other than AutoCAD shall have all "numbered" layers removed or replaced with appropriate AIA Guideline type layer names and translation routines should be written accordingly.

Electronic files may be transmitted to UMHHC Facilities Planning and Development via e-mail (FAC-projectdept@med.umich.edu), FPD Virtual Network, compact disc or posted to an FTP site accessible to UMHHC FPD except for final deliverables (Record Drawings). Final deliverables (Record Drawings) shall be transmitted on compact disc.

Room Numbering

Room numbering shall generally be provided by FPD.

Guidelines for assigning room numbers for University of Michigan Hospitals and Health Centers:

- UMH standard is a 4 digit room number, with the first digit being the floor. Rooms on floors with a 2 digit floor number (B1, 10, etc.) may have a 5 digit room number
- In a simple building start at the primary entrance and work counter-clockwise around the building with odd numbers on the perimeter and even numbers on the core.
- In a large, complex building with the potential to have more than 1000 rooms on a floor, divide the floor into wayfinding zones, each designated by a letter following the floor number. (Example: 1A101) In such cases, the wayfinding zones should correspond to any breakdowns in architectural construction drawings.
- Reserve numbers ending in 0 and 5 for corridors.
- For rooms where the primary entrance is from within another room, label the room number of the room it opens from with a letter suffix (example: where you get to a manager's office by going through the secretary's office, the secretary office would be 1001 and the manager office would be 1001A). Suites where all rooms open off a central core have the number of the central core room with a letter suffix (example, 1001, 1001A, 1001B).
- While they CAN be used in a large suite for general rooms, try to reserve the following letter suffixes for the following specific room types:
 - C—Communication Closets
 - E—Electrical Closets
 - I—avoid using due to confusion with the numeral 1.
 - J—Janitor Closets
 - M—Mechanical Closets
 - O and Q—avoid using due to confusion with the numeral 0.
 - T—Toilet rooms
 - V—Vertical Shafts
 - X—Stairwells and Elevators
 - Z—Corridors
- The above specific room types must have room numbers with the above suffixes (i.e. corridor 1000Z)
- If a room looks like it could be subdivided in the future, skip a number in the sequence to allow for future expansion.
- In an existing building, for a room that has been created by the dividing of a larger room, follow the pattern discernable from the existing surrounding area.
- If a room has 2 entrances assign the number based on which door is the primary entrance. If neither entrance is "primary", use the lower of the two possible room numbers.
- When a room has been created by combining two smaller rooms, use the lower of the existing room numbers.

Door Numbering

Door numbers shall relate to room numbers.

Disciplines/Keywords

Keywords are used by the UMH Archival Coordinator for archiving and logging each construction document sheet into a searchable software database. The following standard keywords (or combination thereof) shall be utilized on all CD sheets to indicate the sheet's content:

PRIMARY DISCIPLINE	KEYWORD	CONTENT/COMMENT
All disciplines	Demolition	Demolition / Existing conditions
	Details	
	Elevations	Interior or Exterior
	Index	
	New Work	
	Notes	
	Riser	
	Schedules	
	Sections	
	Specifications	
	Symbols	abbreviations, legend, key
(A)rchitectural	Title	
	Conveyance	Elevator / Escalator / RoboCarrier / P-Tube Cars, Tracks, Tubes
	Code	Fire/ Smoke Walls
	Dividers	Floor Plans/Information: Includes Partitions, Architectural Specialties, Interior walls.
	Enclosures	Exterior Walls, Windows, Window/Curtain Walls Roofs, roof stairs, Ladders, Railings.
	Equipment	Fixed, Movable & Misc. equipment.
	Finish	Room finish patterns, paint types
	Furniture	Freestanding, Furniture Systems, Plants. Woodwork, Millwork, Casework, Floor Coverings, Custom Cabinetry
	Phasing	Phasing Plans
	Reflected Ceiling	Grid, Penetrations, Suspended Elements
	Signs	Interior and exterior signs.
(C)ivil	Grading	Grading, Retaining walls, test borings, topographical.
	Roadways	Roads, Parking lots
	Survey	Property lines and survey benchmarks
	Utilities	Storm drainage, catch basins, exterior sanitary sewer, manholes, pumping stations, storage tanks, Site electrical substations and poles, Site communication (under/overhead), Fire hydrants and connections, natural gas manholes, meters, vaults and tunnels.
(E)lectrical	Auxiliary Systems	Lightning protection system, grounding system, Other auxiliary systems.
	Communications	Tel and Communication outlets, Data outlets, Sound or PA systems, TV antenna systems, Closed circuit TV, Nurse Call, Security, Paging systems, Central Dictation Systems, Bell systems, Clock systems, Misc. alarm systems, Intercom systems, Cable trays.
	Controls	Electric control systems, devices, wiring, VSD's
	Lighting	Lighting: special, emergency, roof, site; Switches, circuits
	One Line	
	Power	Panels, power equipment, switchboards, circuits, under floor/carpet raceways/wiring, feeders, busways.
(F)ire	Receptacles	
	Dividers	Firewalls
	Sprinklers	Sprinkler system, Standpipe system
(L)andscape	Improvements	Site improvements: fencing, walls, decks, bridges, pools, sports fields, play structures, site furnishings, telephone booths.

	Irrigation	Irrigation
	Planting	Trees, shrubs, flowers
	Walks	Sidewalks, steps
(M)echanical	Controls	Controls and instrumentation
	HVAC	HVAC Systems, diffusers, sheet metal, piping
	Medical Gas	Medical gas systems, Compressed air
	Special Systems	Special systems, Process systems, Dust and fume collection systems, Fuel system, Refrigeration systems, Snow melt systems.
(P)lumbing	Domestic Water	Domestic hot and cold water systems
	Equipment	Fixtures, Sump pumps
	Special Waste Systems	Acid, Alkaline, Oil Waste systems
	Waste Water	Sanitary drainage, Storm drainage systems, Interior
(S)tructural	Beams	lintels
	Columns	Piles/Piers, Anchors
	Foundation	Slab, deck, concrete
	Framing	wind bracing
	Load	
	Truss	

DESIGN GUIDELINE 2.5

PROJECT ESTIMATES

General

The procedures described in this section pertain to University of Michigan construction projects with a construction cost of \$500,000 or more. Though it is not required, it is suggested that the consultant or contractor follow these procedures on the smaller project, as well.

For projects with a construction budget of \$5 million or greater, Design Professionals are required to benchmark at least 3 similar projects. The benchmark information will be submitted utilizing the [Design Professional Cost Benchmarking Submission form](#). A Project Data Sheet is included with the form and shall be completed for **each** project that is benchmarked. The benchmarking information will be submitted in tandem with the program phase estimate.

Professionals performing estimating services for Architecture, Engineering and Construction (AEC) are mandated to use the following standard estimating formats.

- *Program Phase:* (Uniformat II) - [Estimate Uniformat2.xlsx](#)
- *Schematic Design through Construction Document Phases:* (CSI-2012) - [Estimate CSI 2012.xlsx](#)
- NOTE: CSI 2012 = Construction Specifications Institute, April 2012 “*Masterformat*” Specification Categorization

Professionals may complete these templates as provided, optionally using additional “tabs” for more specific levels of detail. NOTE: The Level 1 Summaries are entirely populated with data from the Level 2 Breakdowns. The professional estimator may opt to use proprietary software, provided that the “CSI and Uniformat 2 Level 1 Summaries” and “CSI and Uniformat 2 Level 2 Breakdowns” are formatted to accurately match the AEC templates. In both type estimates, the respective detail sheets relating to the Level 2 Breakdown and thus, the Level 1 Summary, must accompany the estimate and relate specifically to the CSI Masterformat categorizations of which they are intended to be a part. No modification or deviations from the Level 1 template will be allowed. Any advantageous or project-specific changes to the Level 2 template must be submitted to, in writing, and be approved by the AEC Design Manager or Construction Manager, prior to the creation of the estimate.

These templates have been created as “standards” for University of Michigan Project Cost estimate. Compliance with the intent of these templates are a mandate, not an option.

UM Hospitals and Health Centers (UMHHC) projects are exempt from these requirements and shall utilize the standard estimating format template found on the [UMHHC Facilities Planning and Development](#) web page.

Execution

Cover Sheet

Every estimate document shall be accompanied by a Cover Sheet or Sheets which include the following information:

- University of Michigan Building Name; Project Name; Brief Project Scope Description; University Project Number
- A List of Documents showing all documents used or referenced as the basis of the estimate. These documents shall include all the following accompanied by their listed dates:
 - Plans
 - Specifications
 - Sketches
 - Gross Area Summaries
 - Site Areas
 - Addendums
 - Meeting Notes
 - Schedules, etc.
- A List of Allowances showing either Lump Sum or Unit Price allowances included within the “*FIXED LIMIT OF CONSTRUCTION COST*”.
- Construction start and completion dates upon which the estimate is based.
- A detailed basis used for escalation calculations, i.e., “midpoint of construction”.
- A List of Exclusions from the “*FIXED LIMIT OF CONSTRUCTION COST*”, examples of which might be
 - Abatement
 - HazMat Removal
 - Utility Services Upgrades (not yet defined)
 - Connection Fees
 - Permit Fees
 - Owner-supplied Equipment
 - Moveable Furniture
 - Testing Fees, etc.
- A List of Clarifications relating to:
 - Incomplete Documents
 - Unusual Circumstances
 - Mitigation of Obvious Document Errors or Inconsistencies
 - Specific Exclusions
 - Allowances, etc.

Templates: Line-Specific Information

CSI & Uniformat 2 **Level 1 Summaries:**

The first portion of the Summary, “*CONSTRUCTION TRADES SUBTOTAL*”, [Sections A-G, Uniformat II and 00 00 00 – 33 00 00, CSI 2012] should account for all known direct labor and materials costs based upon applicable local market conditions at the time of the estimate. As noted on the last line of the Level 1 Summary, “*This template includes pre-set formulas,*

however, estimating professionals are ultimately responsible for the accuracy of the information submitted.”

The second portion of the Summary, “*TOTAL CONTINGENCY; ESCALATION & GENERAL CONDITIONS COSTS*”, should account for Design Contingency, Escalation, General Conditions, Management Fees, Indirect Costs and Profit. These costs will totaled separately and added to the “*CONSTRUCTION TRADES SUBTOTAL*”, to form the “*FIXED LIMIT OF CONSTRUCTION COST*”. Separate categories for “*ALLOWANCES*” and “*ALTERNATES*” will be listed and totaled separately. If applicable to the project, these optional costs may then be added to the “*FIXED LIMIT OF CONSTRUCTION COST*” to form the “*TOTAL UPPER LIMIT OF G.M.P.*”.

CSI & Unifomat 2 **Level 2 Breakdowns:**

The first eight rows of the Breakdown comprise the input areas of strategic project descriptors, i.e., Project Name, Gross Building and Site areas and Relevant Project Timeline Dates, for use in calculations throughout this worksheet. This section populates the parallel cells on the Level 1 Summary.

For the CSI 2012 estimate, the second section of note is category number “*01 00 00 – GENERAL REQUIREMENTS*”. The values of the categories within this breakdown parallel the cost inputs named in the section entitled “*TOTAL CONTINGENCY; ESCALATION & GENERAL CONDITIONS COSTS*”, below the “*CONSTRUCTION TRADES SUBTOTAL*”. The estimator will populate both of these sections at their own discretion, defining the cost components to produce an accurate total cost for these items. The University expects that estimator will utilize both quantifiable values for specific items or, amounts equaling a historical percentage of the “*CONSTRUCTION TRADES SUBTOTAL*”. The estimator will assure that the aggregate costs represented in these two categories do not overlap and represent an accurate portrayal of the expected “*01 00 00 – GENERAL REQUIREMENTS*” costs. This is the same expectation for both General Contract and Construction Management projects.

For the Unifomat 2 estimate, the “*GENERAL CONDITIONS COSTS*” will be carried as an historical percentage of the “*CONSTRUCTION TRADES SUBTOTAL*”.

The second section of this Breakdown comprises the categorical summations of the quantities and costs as described in the CSI 2012 *Masterformat* Numbers and Titles. Each line has only two “input” cells, the “*QUANTITY*” and the “*TOTAL DOLLARS*”, both of which comprise the automatically-calculated “*AVG PRICE*”. Specifically named for each *Masterformat* category, is the “*UNIT*” of measure in which the estimator will describe his “*QUANTITY*” input. [*Outside the right margin of the cost calculation data is a description of each abbreviated “UNIT” of measure*]

The third section of this Level 2 Breakdown comprises the source calculations for the difference between the “*CONSTRUCTION TRADES SUBTOTAL*” and the “*FIXED LIMIT OF CONSTRUCTION COST*”. The definitions of the line item descriptions contained therein follow.

- *Design Contingency* – A suitable allowance of cost, based on a “percentage” of the “*CONSTRUCTION TRADES SUBTOTAL*”, for items or options not yet fully-designed and which may be incorporated as the design progresses. Typical historical percentages are:

Schematic Design +10%; Design Development +5%; Construction Document +0% to 1%, based on the completeness of the CD documents on which the estimate is based.

- *Escalation* – A suitable percentage of the “**CONSTRUCTION TRADES SUBTOTAL**”, based on generally-anticipated cost increases between the date of the estimate and the scheduled Midpoint of Construction. Escalation factors may include: anticipated rates of “Inflation” or local “Market Conditions” affecting the cost of construction. [*Category-specific, anticipated cost increases, due to factors like material or labor shortages, should be accounted for within each specific category number and be noted as such*]
- *Escalation Calculation*: Is defined by the formula: $((1 + \text{Annual Rate of Escalation})^{\text{Total Days from the estimate date to the midpoint of construction, divided by 365.25 days}}) - 1$. This calculation is a mandate, not an option.
- *Escalation Example*: 460 days @ 3% per year: $((1 + 0.03)^{(460/365.25)}) - 1 = 3.79\%$. This is the University standard for the calculation of escalation for all projects.
- *CM or GC General Conditions*: These construction-support related costs are described in category number “01 00 00 – **GENERAL REQUIREMENTS**”. These costs may be based on a historical percentage at the Schematic Design phase, a combination of quantifiable costs and historical percentages at the Design Development Phase and completely-defined quantifiable costs at the Construction Document / Bid Phase.
- *CM/GC Personnel*: Cost for management staff, during the construction, as described in category number “01 00 00 – **GENERAL REQUIREMENTS**”. [*This may include project managers, superintendents, project engineers and estimators*]
- *CM Fee/GC Profit*: Construction Management Company Fee or General Contractor’s overhead and profit.
- *Pre-construction Services*: A fee for construction management support prior to commencement of construction. [*This is not applicable to General Contractor project delivery*]
- *CM Contingency*: An agreed-upon percentage of the “**CONSTRUCTION TRADES SUBTOTAL**” for mitigation of unforeseen conditions and other unanticipated costs that may occur during construction. [*This is not applicable to General Contractor project delivery*]
- *Related Construction Cost Allowances*: These costs are identifiable, essential Construction Cost items which may be paid directly by the University, be outside of the contract, or be added to the contract by the University. When these costs are carried as line items within the “**CONSTRUCTION TRADES SUBTOTAL**”, they should be identified as “*Related Construction Costs*” of the overall project budget. Beyond the Programming Phase these line items should be moved to “*Related Construction Cost Allowances*”, thus lowering the “**FIXED LIMIT OF CONSTRUCTION COST**”. Items in this category should be coordinated with the AEC Design Manager.
- Examples of *Related Construction Cost Allowances* are:
 - University Connection Fees
 - Utility Tie-in Costs and Fees
 - Sidewalk Closures
 - Project-specific Testing, etc.
- When these costs are carried as line items within the “**CONSTRUCTION TRADES SUBTOTAL**”, they should be identified as “*Related Construction Costs*” of the overall project budget. Beyond the Programming Phase these line items should be moved to “*Related Construction Cost Allowances*”, thus lowering the “**FIXED LIMIT OF**

CONSTRUCTION COST". Items in this category should be coordinated with the AEC Design Manager.

- *Alternates*: Are individual, independent "*FIXED LIMIT OF CONSTRUCTION COSTS*" for stipulated "Add" or "Deduct" construction items, based on the "*CONSTRUCTION TRADES SUBTOTAL*" for each alternate and the "*TOTAL CONTINGENCY; ESCALATION & GENERAL CONDITIONS COSTS*", as included in the overall project "*FIXED LIMIT OF CONSTRUCTION COST*".

The CSI 2012 and Uniformat 2 estimate formats are the standard for University of Michigan cost estimate of equal or greater value than \$500,000. No modifications to these formats shall be made without the express written approval of the Design Manager or Construction Manager.

2.5.1: UMHHC - PROJECT ESTIMATES (SID-P-H)

Related Sections

Basis Guideline: NA

For an explanation of the use of these guidelines, see [“Design Guidelines for UMHHC Facilities”](#)

General

Professionals performing estimating services for UMHHC are expected to use the estimating templates as follows:

- Investigations through Construction Document Phases – [CSI](#) (Construction Specification Institute) division template

In all cases the respective budget summary and detail sheets should be provided. Any proposed modification or deviations from these templates must be approved by the UMHHC FPD Project Manager prior to the creation of the estimate.

Execution

A coversheet with the following information must also accompany all estimates:

- Project title, description and project number
- Reference to documents that are the basis for the estimate including applicable drawings, specifications, sketches, meeting notes, schedules etc.
- Construction schedule time frame upon which the estimate is based if a schedule is not referenced.
- Clarifications.
- List of exclusions including abatement/removal of hazardous materials, potentially required utility services upgrades that are yet undefined, connection fees, permit fees, owner supplied equipment, moveable furniture, testing fees, etc.

The first portion of the estimate (0-16 CSI format) should account for all known direct labor and materials costs based upon applicable local market conditions at the time of the estimate. Contingency factors, general conditions, management fees, escalation, profit and other indirect costs will be factored in after the direct cost is totaled. Provide a line-specific note for line items where cost is based on an allowance rather than an estimate.

Line Specific Information:

- *99031- CM/GC General Conditions* - Construction support related costs, including trailer, fencing, signage, computers, and printing etc, usually based on a percentage of construction cost. Note that this GC cost is typically itemized under Division 1 “General Requirements” and hence this line is left blank.
- *99042- Pre-construction Services* - A fee for construction management support prior to construction (not applicable to General Contractor project delivery). ****Do not use unless directed by UM Proj. Manager.**
- *99032- CM/GC Personnel* – Cost for management staff during the construction phase of the project. This may include project managers, superintendents, project engineers or estimators. Note that this CM/ GC cost is typically itemized under Division 1 “General Requirements” and hence this line is left blank.
- *99033- CM Fee/GC Profit* – Construction management or general contractor’s profit.

- *99050- Allowances* – Project cost items such as connection fees, sidewalk closure allowances, etc., that will be paid directly by the University, outside of the contract. As an option, these costs can be carried in the construction estimate during programming but should be transferred by the Design Manager into the Total Project Costs of the overall budget by the Schematic Design phase. Once the costs go to Total Project Costs, the fixed limit should be adjusted downward, as appropriate.
- *99090- Alternates* – Full cost for any add or deduct alternate construction items, including direct material and labor costs, plus all other indirect mark-up listed above.

The following costs are **NOT** to be included in the A/E's construction estimate but are rather to be included in the overall project estimate prepared by the UMH Design Manager:

- Contingencies of any kind, including Design Contingency, Construction Contingency or User Contingency.
- Escalation
- Fees paid directly by UMH including Abatement, Utility Service/Connection Fees, Air & Water Testing and Balancing, and Soil/Environmental Remediation.
- A/E or UMH/UM Fees
- Furnishings & Equipment including moveable Medical Equipment, Furniture, Signage and Computers.
- Telecommunication cabling and hardware furnished by UM ITCOM or MCIT.

For projects that require a higher than average contingency or require atypical A/E fees, the A/E is requested to summarize these costs under a coversheet separate from the construction estimate.

DESIGN GUIDELINE 2.6 **INSURANCE UNDERWRITER**

Design Requirements

FM Global is the property insurance underwriter for the University of Michigan. As such, U-M attempts to comply with FM Global recommendations regarding construction, operation and maintenance of facilities, in an effort to prevent loss through fire, flood, wind etc. FM Global reviews U-M construction project designs with respect to loss prevention. FM Global publishes numerous data sheets to help guide design decision, however, FM is not an authority having jurisdiction (AHJ) with respect to any codes. The U-M Design Manager is responsible for all communications with FM Global.

The Design Manager shall invite FM Global to participate in all Owner reviews (all phases, SD, DD, CD).

UM AEC - Design Professional Cost Benchmarking Submission Form

AEC Project Name	
AEC Project Number	
A/E Consultant	
Project Phase	
Date	

Escalation Year	
GSF Area Breakdown	
New/Addition	
Renovation	

Instructions

Enter the project related information in all blue cells; using pull-down menus where applicable. Reference Worksheet 'A' (Regional Adjustment Factor) and Worksheet 'B' (Escalation Adjustment Factor) within this Excel working file to determine the adjusted construction cost for the given benchmark projects. The white will self-populate as blue cells are filled. Please also complete a Project Data Sheet for each listed benchmark project (please refer to separate tab within this file).

See Note in Header for Cost Explanation

Additional Notes

SOIL BORING REPORT REQUIREMENTS

PROJECT NAME AND NUMBER:

PROPOSAL DUE DATE:

REPORT DUE DATE:

DESIGN ENGINEER / ARCHITECT:

BACKGROUND INFORMATION:

Proposed development will be...*building description, with desired construction period loading, foundation bearing elevation, building foundation loading and hard surface site development.*

Proposed soil boring locations are as indicated on attached site drawing. Allowable access routes to soil boring locations are also indicated on attached drawing.

GEOTECHNICAL WORK REQUIREMENTS:

1. Geotechnical work is to be performed by qualified personnel under the supervision of a registered professional engineer.
2. The location, number and depth of soil borings are to be determined by the geotechnical engineer based upon provided information and site inspection, and are to be identified in the proposal.
3. The geotechnical engineer is to call Miss Dig (811) and to obtain information regarding existing buried utilities in the area of soil borings, and is to take necessary precautions to ensure safety and to prevent damage to property.
4. It is the responsibility of the geotechnical engineer to provide field surveying necessary to properly locate and set the elevation of each boring.
5. Before commencing work, the geotechnical engineer is to coordinate the date and time of drilling with the Owner.
6. Soil drilling and sampling is to be in accordance with current applicable ASTM standards.
7. Soil borings are to be plumb.
8. Following completion of soil boring work, the site is to be restored. Restoration work is to include backfilling borings, patching of slabs and pavements, and repair of lawn and plantings. All excess material is to be removed from the site.

9. After obtaining field information and after completing laboratory testing and analysis, provide a geotechnical report to the Owner and to the design professional. Geotechnical design report is to include the following:
- a) Discussion of the proposed project.
 - b) Soil boring logs with soil description, groundwater observations, sample type, standard penetration values, and moisture content.
 - c) Foundation design recommendations. To include allowable bearing pressures, recommended bearing elevations, anticipated settlements, and coefficient of friction for pile foundations.
 - d) Probability of encountering rock formations, and recommendations for excavating rock materials.
 - e) Design coefficients for use in seismic analysis per current building codes.
 - f) Frost penetration depth and effect.
 - g) Recommendations for management of ground water.
 - h) Fill material recommendations and compaction requirements for structures and pavements.
 - i) Design and inspection criteria for temporary excavation protection, including earth retention, underpinning of adjacent structures and dewatering.
 - j) Stability of slopes for excavations.
 - k) Analysis of soil to ascertain the presence of potentially expansive, deleterious, chemically active or corrosive materials or presence of gas.
 - l) Other geotechnical recommendations specific to the project.

Address Proposal to: James Bruce, Construction & MRO Commodity Manager
University of Michigan
326 East Hoover Avenue, Mail Stop D
Ann Arbor, MI 48109

Minimum Soil Infiltration Testing Requirements

PROJECT NAME AND NUMBER:

PROPOSAL DUE DATE:

REPORT DUE DATE:

DESIGN ENGINEER / ARCHITECT:

BACKGROUND INFORMATION:

Proposed infiltration locations are as indicated on attached site drawing. Allowable access routes to infiltration locations are also indicated on attached drawing if infiltration locations are not easily accessible or require designated routes.

GEOTECHNICAL WORK REQUIREMENTS:

1. Geotechnical work is to be performed by qualified personnel under the supervision of a registered professional engineer.
2. The geotechnical engineer is to call Miss Dig (811) and to obtain information regarding existing buried utilities in the area of soil borings/infiltration tests, and is to take necessary precautions to ensure safety and to prevent damage to property.
3. Before commencing work, the geotechnical engineer is to coordinate the date and time of drilling with the Owner.
4. The boring depths will extend past the bottom elevation of the proposed infiltration area noted on the location drawing*. Perform continuous sampling from the ground surface to depth of boring. Record groundwater levels in the borings during and immediately after drilling.

*If infiltration testing is to be performed through a borehole, a preliminary bore should be performed adjacent to the anticipated infiltration bore. This preliminary bore should extend to at least 3ft below the anticipated testing depth. The infiltration testing borehole shall be to the depth of the proposed bottom elevation of the infiltration system.

5. At least 2 bores (more on large sites or sites with complex stormwater management systems) shall extend to at least 10 feet beyond proposed infiltration bottom elevation in and near the infiltration area to verify soil strata below the infiltration area and depth to water table.

6. If suitable infiltrating soils are not found at potential infiltrating depths indicated in the graphic but are identified at other depths during soil boring operations, consult U-M Design Manager on adjusting soil infiltration testing depths based on actual soil conditions. In all cases, provide soil borings at least three (3) feet below anticipated infiltration to identify soils and verify there are no potential water table limitations.
7. Perform double ring infiltrometer infiltration tests (or other similar method such as double well casing down a borehole) according to the [Low Impact Development \(LID\) Design Manual for Michigan](#) developed by SEMCOG at the depth of the bottom of the proposed infiltration feature.
8. Summarize findings in a letter that will include:
 - a. A boring diagram
 - b. A log prepared for each boring that will include a description of the soils encountered and the results of the field and laboratory tests
 - c. A description of the site conditions and evaluation procedures
 - d. Specific details regarding the soil and groundwater conditions encountered in each of the borings
 - e. A description of the field and laboratory testing programs and an interpretive analysis of the results
 - f. An estimated permeability rate of the subgrade soils (e.g., inches per hour) based on the results from the infiltration testing and the boring logs
 - g. A table with Boring #, Test depth, soil at base of infiltration testing, duration of test, estimated field measured infiltration rate (inches/hour), recommended design infiltration rate
 - h. Geotechnical consultant's recommendation of design infiltration rate per hour for storm water management design and calculations is to be based on a minimum factor of safety of at least two (2) applied to the measured infiltration rate according to the [Low Impact Development \(LID\) Design Manual for Michigan](#) and is to be stated as such
 - i. Geotechnical Consultant's professional opinion if soils are not suitable for infiltration

ASSUMPTIONS:

The following assumptions are made regarding scope of services and professional services fee:

1. U-M will provide right-of-entry for Consultant to conduct the evaluation.
2. Consultant will contact Miss Dig to clear and mark the location of public underground utilities at the site prior to performing the field exploration.
3. Consultant will stake the boring locations at the time of the field exploration.
4. *Location is or is not (edit) accessible for truck mounted drill rig.*
5. Field services will be performed by consultant Monday through Friday during normal business hours unless prior arrangements have been made to accommodate project needs. *(Verify)*
6. Care will be exercised to reduce potential damage to existing ground surface areas during the field exploration. (insert) *will repair damaged landscaping. Pavement cores are required to be reinserted or backfilled with cold-patch material to avoid trip hazards.*

7. Soil boring cuttings shall be placed back in the borehole to the best extent possible. Remaining cuttings should be dispersed on-site if possible, in such a manner as to not cause sediment discharge from the site (i.e., not on impervious surfaces). If cuttings are from a site of known contamination, please contact the U-M Project Manager for guidance.

Address Proposal to: James Bruce, Construction & MRO Commodity Manager
University of Michigan
326 East Hoover Avenue, Mail Stop D
Ann Arbor, MI 48109

AEC STORMWATER MANAGEMENT PROCEDURES-ABBREVIATED

1.

PRE-DESIGN PHASE

Kickoff Meeting

- **Note:** storm water goals are set at programming phase.
- Discuss U-M storm water management plans and requirements (umstormwaterplanning@umich.edu)
- **Best Management Practices (BMPs)**
- Discuss maintenance concerns and stormwater outlet
- Confirm minimum soil boring/test pit requirements
- Review regulatory requirements

Soils Evaluation

- Geotechnical firm to determine site's suitability for retention (infiltration)
- Soil borings and infiltration testing to be performed at potential design depths
- Deep borings to be performed for investigation of soil composition and identification of water table

Preliminary Basis of Design (BOD)

- Project Team to create and document evolution of storm water management strategies:
 - Project name/number
 - General site description
 - Map with drainage boundary, including off-site drainage impacts
 - On-site drainage infrastructure
 - Adjacent projected drainage impacts
 - Water table elevation
 - Status of presence of known contaminated soils
 - Soil characteristics data
 - Evaluate drainage outlet capacity
 - List of preliminary BMP options with cost/benefits identified. Recommend viable options to pursue.

Meeting Minutes

- Project Team to record and distribute meeting minutes, including documenting action items/decision points

2.

CONCEPTUAL DESIGN

Preliminary Basis of Design

- Update information to include:
 - Limit of total earth disturbance
 - Volume of runoff (CF) generated on-site to be managed for multiple storm events
 - Brief drainage narrative describing proposed system
 - Infiltration/retention options
 - Feasibility of on-site infiltration/retention to meet permit requirements and effectively manage storm water or other options to be considered
 - Conceptual design storm water management target volume calculations (permit requirements and 100-year/24-hr storm event)
 - Potential options for managing storm water preliminary volume calculations for each option and at various storm events
 - **Above and beyond:** Identify opportunities for maximizing storm water on-site infiltration
 - Indicate and address existing site flooding issues
 - Verify no impacts to upstream, downstream, adjacent properties - identify need for no rise analysis
 - Expand and update BMP list with calculations
 - Conceptual layout for storm water management options and proposed drainage collection system

Meet With Storm Water Team

- Project Team and Storm Water Team to review information and determine best approach to schematic design
- Initiate internal review of regulatory requirements (City of Ann Arbor or Washtenaw County)

Meeting Minutes

- Project Team to record and distribute meeting minutes, including documenting action items/decision points

3.

SCHEMATIC DESIGN

Soils Evaluation/ Verification

- Infiltration testing to be performed at actual storm water infiltration proposed design locations and design depths

Update Basis of Design

- Update BOD to include:
 - Proposed topography to be affected by construction
 - Storm Water Management Plan incorporating **post-construction permit requirements, BMPs and Soil Erosion and Sedimentation Control Procedures (SESC)**
 - Schematic design layout for drainage collection system
 - Calculations used in designing storm water management systems components
 - Update cost/benefit analysis
 - Overall storm water management system (grading plan)

Meet With Storm Water Team

- Review plan refinements and calculations
- Review preliminary submittals (plans, and calcs with **narrative**) for regulatory requirements
- Follow **U-M plan format** for storm water management

Meeting Minutes

- Project Team to record and distribute meeting minutes, including documenting action items/decision points

4.

DD, CD, CONSTRUCTION AND POST CONSTRUCTION

Update Basis of Design

- Update BOD
- Provide storm water management plans meeting U-M and regulatory format for graphics, narrative, and calcs

Meet With Storm Water Team

- Meet with Storm Water Team as necessary and if there are changes to storm water management approach

AEC Project Review

- Follow AEC plan review process
- Follow post-construction storm water permit requirements
- Follow SESC design requirements

Regulatory Agency Submittal

- Follow AEC requirements for City of Ann Arbor plan submittal
- Work with EH&S and Storm Water Team if external agency regulatory requirements

Meeting Minutes

- Project Team to record and distribute meeting minutes, including documenting action items/decision points

Complete Storm Water Management Procedure is available [here](#).

Example summary storm water narrative for plan sheet – New connection to City system
The narrative is to be updated to be project specific, especially areas in yellow

STORM WATER NARRATIVE:

1. A NEW CONNECTION TO THE CITY STORM SEWER SYSTEM IS PROPOSED.
2. PROPOSED EARTH DISTURBANCE IS _____SF (_____ACRES.)
3. U-M NPDES PERMIT POST-CONSTRUCTION STORM WATER RAIN EVENT REQUIRES A MINIMUM USE OF THE RAIN DATA CONTAINED IN THE RAINFALL ATLAS OF THE MIDWEST, NOAA–1992. CALCULATIONS FOR THIS PROJECT *pick one* (ARE BASED ON THE RAINFALL ATLAS OR THE MIDWEST, NOAA-RAIN DATA) *or* (EXCEED THE PERMIT REQUIREMENT BY USING THE NOAA 2014 RAIN DATA)
4. EXISTING CONDITIONS STORM WATER SUMMARY (SEE SHEET CXX SUPPORTING CALCULATIONS):

EXISTING DRAINAGE IS OVER LAND IN A NORTH AND WEST DIRECTION TOWARD THE NORTHWEST CORNER OF THE SITE. THE DRAINAGE FLOWS INTO THE RAILROAD DRAINAGE DITCH AND TO THE NORTH, WITH ULTIMATE DISCHARGE TO THE ALLENS CREEK DRAIN.

EXISTING LAND USE SUMMARY

COVER TYPE	AREA (AC)	C	CN
GRAVEL PARKING	1.12	.85	85
OPEN SPACE (LAWN)	.88	.25	61
TOTAL	2.00	.59	74

EXISTING RUNOFF VOLUME = 3,484 CF

EXISTING PEAK RUNOFF RATE = 0.344 CFS

(VOLUME AND RATE SHOWN FOR 2-YR/24-HR STORM PER U-M CALCS PROVIDED ON SHEET CXXX)

5. PROPOSED CONDITIONS STORM WATER SUMMARY (SEE SHEET CXX SUPPORTING CALCULATIONS):

A NEW CONNECTION TO THE CITY STORM WATER SYSTEM IS PROPOSED. PROPOSED STORM DRAINAGE WILL BE DIRECTED INTO THE CITY’S STORM SEWER SYSTEM LOCATED IN THE NORTHEAST CORNER OF THE SITE BY CONNECTION TO THE EXISTING CITY STORM MAN HOLE. IN ACCORDANCE WITH U-M REQUIREMENTS, THE FIRST FLUSH VOLUME CALCULATED PER U-M NPDES PERMIT REQUIREMENTS WILL BE DISCHARGED THROUGH AND RETAINED IN AN INFILTRATION SYSTEM AT THE SOUTH END OF THE SITE. THIS FF VOLUME IS 6,647 CUBIC FEET AND EXCEEDS THE CITY’S FF REQUIREMENT OF 3,013 CF. WITH CITY FF REQUIREMENTS ACCOMMODATED WITHIN THE INFILTRATION SYSTEM, THE CITY’S DETENTION REQUIREMENTS WILL BE A TWO-STAGE SYSTEM, ACCOMMODATING THE BANKFULL AND DETENTION VOLUME REQUIREMENTS (LESS THE VOLUME ACCOMMODATED WITHIN THE INFILTRATION SYSTEM). THE PROPOSED STORM SYSTEM IS ROUTED THROUGH A TREATMENT UNIT AT THE NORTH END OF THE SITE PRIOR TO ENTERING THE UNDERGROUND DETENTION PIPING AND ULTIMATELY DISCHARGING INTO THE CITY STORM SEWER SYSTEM.

PROPOSED LAND USE SUMMARY

COVER TYPE	AREA (AC)	C	CN
PAVING/ROOF	1.12	.95	98
OPEN SPACE (LAWN)	.35	.25	61
TOTAL	2.00	.83	91

PROPOSED RUNOFF VOLUME = 10,091 CF

PROPOSED PEAK RUNOFF RATE = 0 CFS (INFILTRATION WITH NO DISCHARGE)

(VOLUME AND RATE SHOWN FOR 2 YR, 24-HR STORM PER U-M CALCS PROVIDED ON SHEET CXXX)

6. CHANNEL PROTECTION

U-M NPDES PERMIT

REQUIRED: 6,647 CF OF RETENTION

PROVIDED: 6,784 CF WILL BE PROVIDED WITHIN INFILTRATION CHAMBERS ON THE SOUTH END OF THE SITE

ELECTIVE: NOTE VOLUME AND LOCATION OF ANY ELECTIVE MEASURES THAT EXCEED WHAT IS PROVIDED TO MEET REQUIRED VOLUME

CITY OF ANN ARBOR

REQUIRED:

100-YR DETENTION = 21,967 CF (SUBTRACT 6,784 CF OF RETENTION PROVIDED) = 15,183 CF

BANKFULL FLOOD VOLUME = 13,558 CF (SUBTRACT 6,784 CF OF RETENTION PROVIDED) = 6,774 CF

FIRST FLUSH (FF) VOLUME = 3,013 CF (SUBTRACT 6,784 CF OF RETENTION PROVIDED) = NO FURTHER REQUIREMENTS

PEAK RUNOFF RATE = 0.30 CFS (0.15 CFS/ACRE FOR 2 ACRES)

PROVIDED:

RETENTION = 6,784 CF WILL BE PROVIDED WITHIN INFILTRATION CHAMBERS ON THE SOUTH END OF THE SITE

DETENTION = 15,168 CF WILL BE PROVIDED WITHIN DETENTION PIPING ON THE NORTH END OF THE SITE

ELECTIVE: ADDITIONAL NON-PERMIT REQUIRED INFILTRATION/DETENTION WILL BE PROVIDED WITHIN THREE INFILTRATION GARDENS LOCATED THROUGHOUT THE SITE, TREE WELLS ON THE EAST, AND A DETENTION POND ON THE NORTHWEST CORNER OF THE SITE. VOLUMES FOR THE 2 YEAR/24-HR STORM EVENT USING NOAA 2014 RAIN DATA FOR EACH ARE THE FOLLOWING:

Elective BMP #1, such as INFILTRATION GARDEN	XXXXX CF	INFILTRATION
Elective BMP #2 title	XXXXX CF	INFILTRATION
Elective BMP #3 title	XXXXX CF	INFILTRATION
Elective BMP #4 title	XXXXX CF	INFILTRATION
Elective BMP #5 title, such as DETENTION POND	XXXXX CF	DETENTION

7. MINIMUM TREATMENT VOLUME STANDARD – TSS REMOVAL

THE MINIMUM QUALITY TREATMENT IS DESIGNED TO REMOVE 80% OF THE TOTAL SUSPENDED SOLIDS (AS COMPARED TO UNCONTROLLED RUNOFF) FOR 90 % ANNUAL NON-EXCEEDENCE STORMS.

REQUIRED: QUALITY TREATMENT FOR ___ CF OF WATER WITH ___ TIME OF CONCENTRATION AND PEAK DISCHARGE OF ___ CFS.

PROVIDED: TWO STORM WATER TREATMENT UNITS ARE PROPOSED AND WILL BE EITHER CONTECH CDS UNIT OR AQUASWIRL BY AQUASHIELD (MODEL TO BE DETERMINED). THE UNITS WILL BE SIZED TO MEET THE REMOVAL AND PEAK DISCHARGE FLOW CRITERIA.

8. THE PROJECT WILL BE DESIGNED TO MEET THE U-M POST CONSTRUCTION NPDES PERMIT [if required](#) (AND CITY or COUNTY STORM WATER) REQUIREMENTS.

9. CONSTRUCTION AND OPERATION OF THE STORM WATER INFILTRATION AND DETENTION POND (AND OTHER BMP'S) ARE IN COMPLIANCE WITH THE REQUIREMENTS OF STATE AND FEDERAL WATER POLLUTION CONTROL LAWS.

EXAMPLE #1

For projects less than one acre and no new connections to the City/County storm sewers

- Storm Water Notes:
1. No new connections to city storm sewer systems are proposed.
 2. Proposed earth disturbance is _____ SF (_____ acres).
 3. U-M NPDES permit post-construction storm water management requirements are not applicable since the proposed earth disturbance is less than one acre.

Show chart of with change in impervious -see attached example chart. Increase in impervious must be reviewed/approved by U-M Campus Planning and project team may be directed to design additional storm water management BMPs.

Provide a list of elective storm water BMP's to be installed and quantify benefits, if feasible.

Include the language: "Construction and operation of the storm water (infiltration/detention pond) or (BMP's on the plans) is/are in compliance with the requirements of State and Federal water pollution control laws."

AREA COMPARISON (TOTAL SITE)

Summary Sheet

project number: _____ sheet number:
UM AEC : P00008399 **C104C**

EXISTING CONDITIONS

- Storm water sheet.
- Show drainage patterns of proposed and existing conditions with different hatching based on imperviousness. (See Campus Planning level of detail provided on U-M property)
- Provide narrative summarizing storm water as noted below.

STORM WATER NARRATIVE:

1. EXISTING CONDITIONS STORM WATER SUMMARY (SEE SHEET C104BC FOR SUPPORTING CALCULATIONS):
EXISTING DRAINAGE IS OVERLAND IN A NORTH AND WEST DIRECTION TOWARDS THE NORTHWEST CORNER OF THE SITE. THE DRAINAGE FLOWS INTO THE RAILROAD DRAINAGE DITCH AND TO THE NORTH, WITH ULTIMATE DISCHARGE TO THE ALLEN CREEK DRAIN.

COVER TYPE	AREA (AC)	C	CN
GRAVEL PARKING	1.32	85	85
OPEN SPACE (LAWN)	.88	25	83
TOTAL	2.20	39	78

EXISTING RUNOFF VOLUME = 3,884 CFS
EXISTING PEAK RUNOFF RATE = 0.344 CFS
(VOLUME AND RATE SHOWN FOR 2 YR, 24-HR STORM PER U-M CALCS PROVIDED ON SHEET C104BC)

2. PROPOSED CONDITIONS STORM WATER SUMMARY (SEE SHEET C104BC FOR SUPPORTING CALCULATIONS):
PROPOSED EARTH DISTURBANCE IS 9384 SF (2.13 ACRES). THIS INCLUDES DISTURBED AREAS OUTSIDE THE PROPERTY LIMITS THAT DO NOT CONTRIBUTE TO THE DRAINAGE SYSTEM. DISTURBED AREA CONTRIBUTING TO THE DRAINAGE SYSTEM IS 87,120 SF (2.00 ACRES).

A NEW CONNECTION TO THE CITY STORM WATER SYSTEM IS PROPOSED. PROPOSED STORM DRAINAGE WILL BE DIRECTED INTO THE CITY'S STORM SEWER SYSTEM LOCATED IN THE NORTHEAST CORNER OF THE SITE BY CONNECTION TO THE EXISTING CITY STORM MANHOLE. IN ACCORDANCE WITH U-M REQUIREMENTS, THE INCREASED VOLUME FOR 2 YEAR 24 HOUR STORM CALCULATED PER U-M NPDES PERMIT REQUIREMENTS WILL BE DISCHARGED THROUGH AND RETAINED IN AN INFILTRATION SYSTEM AT THE SOUTH END OF THE SITE. THE INCREASED RUNOFF VOLUME RESULTING FROM SITE DEVELOPMENT FOR THE 2 YEAR 24 HOUR STORM EVENT 85,241 CUBIC FEET, WHICH EXCEEDS THE CITY'S FF REQUIREMENT OF 2,304 CF. WITH CITY FF REQUIREMENTS ACCOMMODATED WITHIN THE INFILTRATION SYSTEM, THE CITY'S DETENTION REQUIREMENTS WILL BE A TWO-STAGE SYSTEM, ACCOMMODATING THE BANKFULL AND DETENTION VOLUME REQUIREMENTS (LESS THE VOLUME ACCOMMODATED WITHIN THE INFILTRATION SYSTEM). THE PROPOSED STORM SYSTEM IS ROUTED THROUGH A TREATMENT UNIT AT THE NORTH END OF THE SITE PRIOR TO ENTERING THE UNDERGROUND DETENTION PIPING AND ULTIMATELY DISCHARGING INTO THE CITY STORM SEWER SYSTEM.

COVER TYPE	AREA (AC)	C	CN
PAVING/ROOF	1.57	85	98
OPEN SPACE (LAWN)	.83	25	83
TOTAL	2.40	80	90

PROPOSED RUNOFF VOLUME = 5,075 CFS
PROPOSED PEAK RUNOFF RATE = 0.9 CFS (BASED ON SOIL TESTING, THE FIRST FLUSH VOLUME WILL INFILTRATE WITH NO DISCHARGE)
(VOLUME AND RATE SHOWN FOR 2 YR, 24-HR STORM PER U-M CALCS PROVIDED ON SHEET C104BC)

3. CHANNEL PROTECTION
U-M NPDES PERMIT
REQUIRED: 5,861 CF OF RETENTION REQUIRED FOR FIRST FLUSH VOLUME (DIFFERENCE BETWEEN EXISTING AND PROPOSED RUNOFF VOLUMES NOTED ABOVE)
PROVIDED: 9,408 CF WILL BE PROVIDED WITHIN INFILTRATION BASIN AT THE SOUTH END OF THE SITE

CITY OF ANN ARBOR
REQUIRED:
300 YR DETENTION = 23,088 CF (SUBTRACT 9,408 CF OF RETENTION PROVIDED) = 13,680 CF
BANKFULL FLOOD VOLUME = 13,068 CF (SUBTRACT 9,408 CF OF RETENTION PROVIDED) = 3,660 CF
FIRST FLUSH (FF) VOLUME = 2,304 CF (SUBTRACT 9,408 CF OF RETENTION PROVIDED) = NO FURTHER REQUIREMENTS
PEAK RUNOFF RATE = 0.30 CFS (0.13 CFS/AC) FOR 2 ACRES

PROVIDED:
RETENTION = 9,408 CF WILL BE PROVIDED WITHIN INFILTRATION BASIN ON THE SOUTH END OF THE SITE
DETENTION = 13,430 CF WILL BE PROVIDED WITHIN DETENTION PIPING ON THE NORTH END OF THE SITE

4. MINIMUM TREATMENT VOLUME STANDARD - TSS REMOVAL
THE MINIMUM QUALITY TREATMENT IS DESIGNED TO REMOVE 80 PER CENT OF THIS TOTAL SUSPENDED SOLIDS (AS COMPARED TO UNCONTROLLED RUNOFF) FOR 90 PERCENT ANNUAL NON-EXCESSIVE STORMS.
REQUIRED: QUALITY TREATMENT FOR 2,304 CF OF WATER WITH 15 MINUTE TIME OF CONCENTRATION AND PEAK DISCHARGE OF 0.30 CFS (THIS DOES NOT INCLUDE THE SEPARATE U-M SYSTEM, WHICH PROVIDES TREATMENT AND INFILTRATION FOR 9,408 CF OF WATER).
PROVIDED: TWO STORMWATER TREATMENT UNITS ARE PROPOSED AND WILL BE EITHER CONTECH CDS UNIT OR AQUASHIELD BY AQUASHIELD (MODEL TO BE DETERMINED). THE UNITS WILL BE SIZED TO MEET THE REMOVAL AND PEAK DISCHARGE FLOW CRITERIA.

THE PROJECT WILL BE DESIGNED TO MEET THE U-M POST CONSTRUCTION/NPDES PERMIT AND CITY STORM WATER REQUIREMENTS.

Storm water narrative

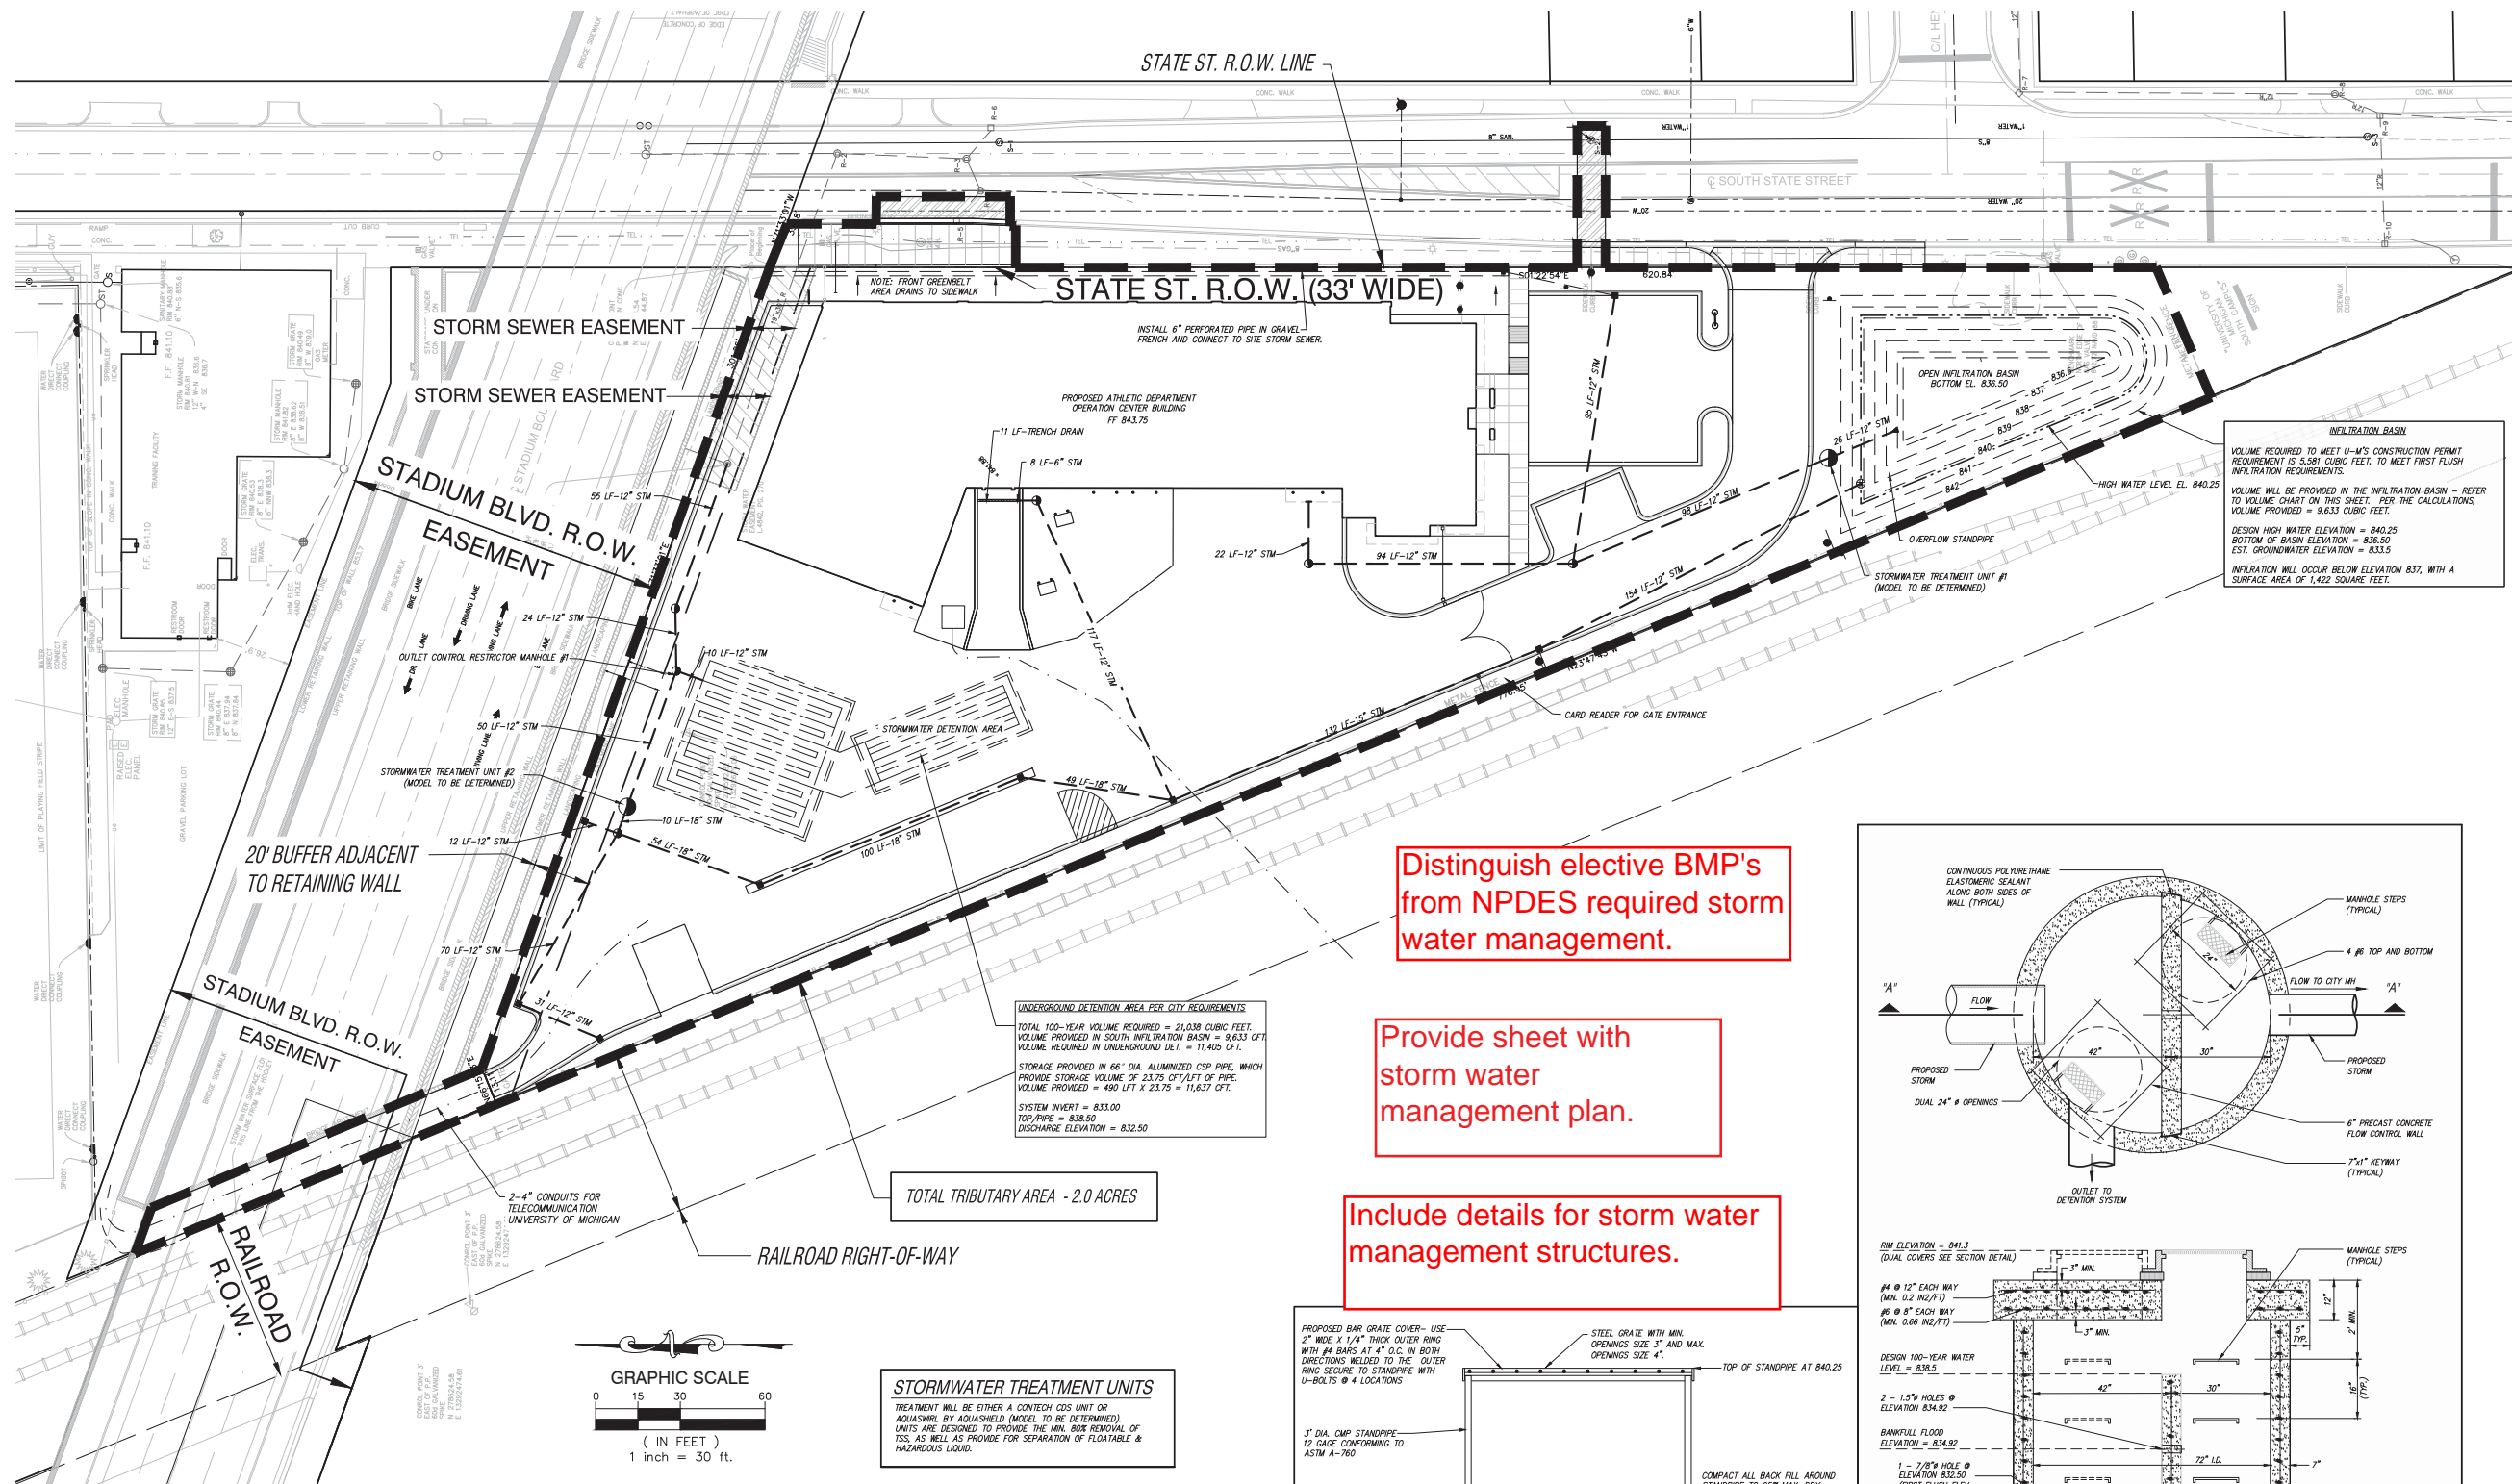

Adjust this graphic to provide hatching of surface based on imperviousness and remove site paving details

PROPOSED CONDITIONS

STORMWATER TREATMENT UNITS
TREATMENT WILL BE EITHER A CONTECH CDS UNIT OR AQUASHIELD BY AQUASHIELD (MODEL TO BE DETERMINED). UNITS ARE DESIGNED TO PROVIDE THE MIN. 80% REMOVAL OF TSS, AS WELL AS PROVIDE FOR SEPARATION OF FLOATABLE & HAZARDOUS LIQUID.

REFER TO SHEETS C104AC AND C104BC FOR SYSTEM LAYOUT, DETAILS AND CALCULATIONS

Distinguish elective BMP's from NPDES required storm water management.

Provide sheet with storm water management plan.

Include details for storm water management structures.

UNDERGROUND DETENTION AREA PER CITY REQUIREMENTS
TOTAL 100-YEAR VOLUME REQUIRED = 21,038 CUBIC FEET.
VOLUME PROVIDED IN SOUTH INFILTRATION BASIN = 9,832 CFT.
VOLUME REQUIRED IN UNDERGROUND DET. = 11,405 CFT.
STORAGE PROVIDED IN 66" DIA. ALUMINIZED CSP PIPE WHICH PROVIDE STORAGE VOLUME OF 23.75 CFT/FT OF PIPE.
VOLUME PROVIDED = 490 FT X 23.75 = 11,637 CFT.
SYSTEM INVERT = 833.00
TOP PIPE = 838.50
DISCHARGE ELEVATION = 832.50

TOTAL TRIBUTARY AREA - 2.0 ACRES

STORMWATER TREATMENT UNITS
TREATMENT WILL BE EITHER A CONTECH CDS UNIT OR AQUASWIRL BY AQUASHIELD (MODEL TO BE DETERMINED). UNITS ARE DESIGNED TO PROVIDE THE MIN. 80% REMOVAL OF TSS AS WELL AS PROVIDE FOR SEPARATION OF FLOTTABLE & HAZARDOUS LIQUID.

Contour (FT)	Area (SFT)	Volume (CFT)	Total Storage Volume (CFT)
840.25	4590.85	1111.44	9,832.79
840.00	4300.64	3758.92	8,521.35
839.00	3217.20	2737.39	4,762.43
838.00	2257.57	1839.67	2,025.05
837.00	1421.76	617.94	185.38 (30% void)
836.50	1050.00		

(NOTE: VOLUME BETWEEN 836.50 AND 837.00 WILL BE FILLED WITH STONE)

Volume Provided = 9,832.79 cft
Design water depth = 3.75 ft

Storm Water Management Procedures For Use By Project Team

Prepared by AEC and EHS (updated 1/23/2017)

Project storm water goals are set at the Pre-Design Phase, during programming, to ensure that storm water management planning is incorporated early into the planning process for all projects. The Design Manager (DM) is responsible for developing the storm water management strategy for projects under his/her assign. A [Storm Water Management Team](#) (“Storm Water Team”) consisting of U-M representatives from Environment, Health and Safety (EHS) and Architecture, Engineering and Construction (AEC) is available to assist Project Teams in determining what is required and in identifying strategies for storm water management before the project is too advanced. Meetings between the Project Team and Storm Water Team will be held at key decision points, as outlined below, for the purpose of reviewing and refining the overall storm water management options into a single approach for implementation. At a minimum, projects are required to meet Michigan Department of Environmental Quality (MDEQ) [Post-Construction Storm Water Management Requirements](#), regulated under the university’s National Pollutant Discharge Elimination System (NPDES) permit, *on-site* when feasible. When this is not possible, alternative strategies need to be developed and agreed upon before moving into Schematic Design.

The process is described in detail below and an abridged version is available in the [storm water management graphic](#).

The DM/Project Team is responsible for knowing and adhering to all environmental considerations as outlined in the [EHS website-Environmental Considerations for Construction Projects](#) and in the [AEC Design Guidelines](#). Some, but not all, of the related guidelines, requirements and tools are highlighted below:

- [EHS Storm Water Management Program Plan \(as prepared for NPDES certificate\)](#)
- [EHS Storm Water Management Post-Construction Requirements](#)
- [EHS Soil Erosion and Sedimentation Control Procedure](#)
- [EHS Best Management Practices for U-M](#)
- [Southeast Michigan Council of Governments Low Impact Development Manual](#)
- [Michigan Nonpoint Source Best Management Practices Manual](#)
- AEC [soil boring](#) and [infiltration testing](#) minimum requirements
- Examples of [plan sheets](#) and [narrative template](#) for plan sheet with new connection to City system

Procedure

Pre-Design (Program/Study Phase)

1. Kickoff meeting. The purpose of the meeting is to discuss U-M storm water management plans and requirements, review regulatory requirements, identify challenges and benefits of infiltration and green infrastructure, the initial minimum soil boring/test pit requirements (required to determine on-

site soil types, infiltration capabilities and limitations, and identify water table elevation limitations), [best management practices](#) (BMPs) proposed for use on the site, maintenance concerns, and the storm water outlet. This meeting may allow for a faster, more cost-effective site design by identifying the storm water management issues and determining regulatory environments early in the process.

2. Soils evaluation. If not already done, preferably as part of the initial Program/Planning Study Phase, initiate geotechnical soils investigation to determine the project site's suitability for storm water retention (infiltration). Soils evaluations are to be conducted by a qualified geo-technical firm with infiltration testing experience. At a minimum, the evaluation shall include soil borings and soil infiltration testing at potential design depths. Geotechnical investigation should also include water table investigation and some additional deep borings (as applicable) to determine infiltration layer thickness and to see if there are opportunities for deeper infiltration. If soils with favorable infiltration rates are found, the geotechnical firm shall make a determination as to whether they exist as isolated areas and are suitable for infiltration of storm water over time, or if the infiltrating soils are isolated areas with little benefit for storm water management.
3. The DM/Project Team will create and document the evolution of storm water management strategies (Basis of Design) throughout the course of the project and will review the most current design with the Storm Water Team **at each phase of the project.** The following information should be included, but not limited to, the following for this phase:
 - a. Project name and number
 - b. General site description/site plan
 - c. A map, at the U.S.G.S. scale, showing the drainage boundary of the proposed development and its relationship with existing drainage patterns, including any drainage originating outside the development that flows onto or across the development. Such offsite drainage shall be quantified.
 - d. Existing natural features (topography, land cover, water bodies, streams, wetland, etc.)
 - e. On-site drainage infrastructure
 - f. Off-site drainage patterns of adjacent properties
 - g. Water table elevation (minimum 3' buffer from seasonably high water table is typically required for infiltration)
 - h. Presence of known contaminated soils and/or groundwater (provide explanation)
 - i. General soil characteristics information – soil survey, soil borings, preliminary infiltration test data performed at potential locations/depths proposed for infiltration
 - j. Indicate proposed storm water management concepts and where the drainage will outlet, including if there will be the need for a new outlet to a surface receiving water, a new connection to City or County storm water systems, or if water from the site will enter the City storm system through a U-M storm line
 - k. Potential locations for infiltration BMPs and any other BMPs
 - l. Create a preliminary BMP list of potential options with cost/benefits identified. Recommend to the Storm Water Team viable options to pursue based on site specific information gathered.
4. Meeting minutes taken by the DM or DM's delegate (with action items/decision points).

1. Project Team to update the conceptual Basis of Design to include the following additional information:
 - a. Limits of total earth disturbance required (including consideration of topographical requirements for excavation and off-site utility connections)
 - b. The amount of runoff (CF) on the site for 2-yr/24-hr storm event, 10-yr/12-hr storm event, 25-yr/24-hr storm event and 100-yr/24-hr storm event
 - c. A brief drainage narrative describing the proposed storm water management system
 - d. Infiltration/retention options. If soil testing (based on boring logs and on-site infiltration) determines that infiltration is feasible, the Project Team shall evaluate and review with the Storm Water Team viable storm water management options and develop a conceptual plan that maximizes the use of the site by incorporating a combination of BMPs (or other site specific retention/green infrastructure practices approved by the Storm Water Team). Quantify/calculate the required volume of storm water infiltration/retention to meet [post-construction permit requirements](#) (minimum requirement). Quantify/calculate the volume of infiltration/retention so that there is no change in runoff for the change in impervious for the 100-year storm event as a targeted goal. When compiling a table of options for evaluation, the Project Team must factor in site specific infiltration rates (with applicable safety factor) and water table, rough cost, volume of water taken off-line, and area/depth needed to achieve the infiltration requirement.
 - e. If on-site infiltration is not feasible at the project site, the Project Team will need to evaluate off-site infiltration options within the applicable watershed or other retention/green infrastructure practices to meet [post-construction permit requirements](#). If off-site mitigation is to be utilized, the Project Team is to provide documentation of due diligence performed to determine on-site storm water mitigation is not a viable option. A 1.2x off-set mitigation penalty may be required, depending on how storm water is routed to the off-site infiltration BMP.
 - f. Detention in-lieu option. If infiltration is not viable for the project, the Project Team will need to evaluate the use of detention and other green infrastructure practices to reduce possible increases in flow volume and rate. Alternate options must be included within the evaluation table and will require close coordination and approval from the Storm Water Team and will require MDEQ submittals for approval. Note, if detention in lieu is to be utilized, a 1.2x minimum off-set mitigation penalty will be required.
 - g. Storm water volume calculations. When refining the BMP options for evaluation, the Project Team must factor in site specific infiltration rates (with applicable safety factor) and water table, rough cost, volume of water taken off-line, and area/depth needed to achieve the infiltration requirement.
 - i. Based on conceptual site design, calculate a preliminary number for the required volume of storm water infiltration/retention for no change in run-off volume/rate for a 2-yr/24-hr storm event to meet [post-construction permit requirements](#), (minimum requirement). Calculate a preliminary number for the volume of infiltration/retention for no change in runoff for a 100-yr/24-hr storm event as a targeted goal.
 - ii. Calculate preliminary storm water volume and rate per option based on concept level BMP potential option plans. Provide evaluation of various options to accommodate from a 2yr/24-hr storm event through a 100-yr/24-hr storm event, as well as evaluating the maximum viable volume of storm water management and the optimal volume of storm water management based on site specific data. All projects shall evaluate the potential to manage the full 100-yr/24-hr storm event (both

- volume and velocity). In addition, also evaluate the delta of the 100-yr/24-hr storm event (both volume and velocity) over existing conditions. Projects should work with the Storm Water Team to maximize or optimize for what is feasible and viable.
- iii. Above and Beyond: Opportunities for maximizing storm water onsite infiltration. In some cases, a determination may be made that a given project site is an ideal location to go beyond NPDES permit requirements for the purposes of good engineering practices to manage storm water runoff flooding, system capacity constraints and/or erosive velocities. Note, if site conditions are favorable for infiltration, the Project Team shall include within the storm water evaluation additional BMP options/calculations for both the maximum and the optimal site infiltration volumes.
 - iv. If development is proposed in an area where flooding problems exist or are anticipated, include a plan for how these issues will be addressed. This is required for all exterior impact projects and not exclusive to those that must meet NPDES permit requirements.
 - v. In addition to NPDES permit requirements, the project must ensure that there will be no impacts to upstream, downstream, or adjacent properties from changes in floodwaters that could be caused by the proposed project. Projects must ensure that impacts to receiving waters will not cause erosion, and in some cases, projects may be required to include some stream channel restoration/BMP implementation to mitigate potential impacts. This may require that a no-rise analysis be performed for the proposed site design if in a shallow flood zone x, and would be required if within a 100-year floodplain or floodway.
- h. Refine the Basis of Design with viable BMP option information and calculations including but not limited to the following:
- i. Change in impervious (increase/decrease)
 - ii. Volume of storm water/runoff on the site and/or available to be redirected into a storm water BMP for 2-yr/24-hr event, 10-yr/12-hr event, 25-yr/24-hr event and 100-yr/24-hr event
 - iii. Volume of storm water required to be infiltrated/retained to meet NPDES permit for no change in run-off volume/rate for a 2-y/24-hr storm event
 - iv. Volume of storm water for no change in run-off volume/rate for a 100-yr/24-hr storm event
 - v. BMP options considered, with treatment type noted (infiltration, retention, detention)
 - vi. BMP dimensions/area/volume for treatment of 2-yr/24-hr through 100-yr/24-hr storm events. Verify that the proposed topography can accommodate the calculated volumes and identify/include in costs any utility relocations.
 - vii. Soil types and infiltration rates at location of proposed BMPs
 - viii. Opinion of probable construction costs to implement each BMP option
 - ix. Construction cost per volume. Example: cost of infiltrating above ground/volume of storm water infiltrated.
 - x. Maintenance requirements of BMP, including frequency and costs
 - xi. Aesthetics
 - xii. Project tradeoff summary (missed opportunities)
- i. Conceptual layout for the BMPs and proposed drainage collection system.
- i. Conceptual site plan including soil boring/infiltration locations and BMP locations with storm outlets
 - ii. Proposed topography for the detention or retention basin(s) in one foot intervals

2. The Project Team shall meet with the Storm Water Team to review the items above to determine the best course of action before moving into Schematic Design – including initiating the City of Ann Arbor Project Review Process or [Washtenaw County Water Resource storm water plan submittal](#).
3. Meeting minutes taken by the DM or DM’s delegate (with action items/decision points). A list of BMP's considered should be updated and refined for each design phase until selection of BMP's.

Schematic Design

1. Project Team to initiate infiltration testing at each proposed infiltration location at design infiltration depths to verify infiltration rates are acceptable and that the design meets project and regulatory requirements. These tests are in addition to the early infiltration testing that was used to guide the design. Update calculations based on infiltration rates at actual infiltration locations. Multiple infiltration locations required multiple infiltration tests.
2. Project Team to update the Basis of Design to include the following additional information:
 - a. Proposed topography for all areas, both off and onsite, to be disturbed by construction. The proposed topography will be provided in one-foot contour intervals. If off-site grading is required, provide evidence of appropriate easements.
 - b. Storm Water Management Plan incorporating BMPs and [Soil Erosion and Sedimentation Control Procedures](#)
 - c. SD layout for the proposed drainage collection system
 - d. Calculations used for designing all components of storm water management systems
 - e. Updated cost/benefit
 - f. The overall storm water management system for the proposed development with structure rim and invert elevations, culvert and storm sewer lengths and sizes as well as all surface storm water conveyance top of bank and centerline elevations at 100' intervals
3. The Project Team shall meet with the Storm Water Team to review refinements to plans and calculations that will be submitted for AEC’s plan review process. Follow U-M format for plans, and calcs with storm water narrative and, if applicable, for other regulatory reviews.
4. Meeting minutes are to be taken and distributed by the DM or DM’s delegate (with action items/decision points). BMP's considered should be updated and refined for each design phase until the selection of BMP's.

Design Development, Construction Documentation and Post-Construction

1. Project Team to update the Basis of Design and graphics to reflect updated information and storm water management options incorporated into the design.
2. Meet with the Storm Water Team as necessary and if there are changes to the storm water management plan.

3. Follow AEC plan review process, [post-construction permit requirements](#), [SESC requirements](#), and incorporate storm water best management practices as feasible and practical.
4. Once the overall Storm Water Management Plan is developed, projects with other agency regulated storm water components shall follow AECs' plan review process for those agencies. (Allow 4 to 8 months for City or County plan approval.) During further development or ongoing review of storm water plans, the Project Team shall continue to update the Storm Water Team on any review comments and/or modifications to the Plan.
5. Final design specifications are to include templates for construction inspection checklists and require contractor/design engineer signatures of compliance.
6. Meeting minutes are to be taken and distributed by the DM or DM's delegate. BMP's considered should be refined and documented for each design phase until selection and design of BMP's for implementation.

1. LOCATION OF PROJECT

ADDRESS OF PROJECT

2. ACCEPTANCE OF BID (AWARD)

It is the intent of the Owner to award a Contract to the lowest qualified Bidder provided the Proposal has been submitted in accordance with the requirements of the Bidding Documents and does not exceed the funds available. The Owner shall have the right to waive informalities and irregularities in a Proposal received and to accept the Proposal which, in the Owner's judgment, is in the Owner's own best interests.

The Owner shall have the right to accept Alternates in any order or combination, unless specifically provided in the Bidding Documents, and to determine the low Bidder on the basis of the sum of the Base Bid and Alternates accepted.

The Owner reserves the right to award in part, in whole or not at all.

3. PROPOSALS AND SCOPE

- A. The Owner will receive electronically submitted Proposals (or alternatively sealed bids at the option of the Bidder) for work as set forth in the "Invitation for Bid" and until the bid due date and time stated in the Invitation for Bid".
- B. Bids that are submitted or that arrive after the time set for the bid opening, as determined by the Owner, shall not be opened or considered. The Owner reserves the right to waive informalities and irregularities in a bid as its interests may require.
- C. Proposals are invited for work in accordance with these specifications and the accompanying drawings prepared by the Design Professional.
- D. The Proposal must be submitted on forms that are furnished with the documents. The completed forms must not include interlineations, alterations or erasure; and must not contain recapitulation of the work to be done. Proposal dollar amounts must be stated in writing and numeric. In case of a discrepancy between the written

Building: **100XXXX – Building Name**

AEC Project #: P000XXXX

Project Name: **Project Description**

statement and the numbers, the written statement will govern. Proposal submitted in any other form will not be considered.

- E. Bidders must have a dedicated email address for the Owner's use to electronically transmit bid information to the Bidder, such as the "Invitation to Bid", Addenda announcements, and delivery of the "Notice to Proceed" to the successful Bidder.

Bidders shall submit their Proposals electronically to the ELECTRONIC BID BOX at email address umaecbid@umich.edu. The "subject" line of the email should read:

"BID FOR P000XXXX DUE: MM/DD/YYYY at _____ PM"

DO NOT USE THE ELECTRONIC BID BOX FOR ANY OTHER PURPOSE OTHER THAN THE PROPOSAL SUBMISSION. At the Bidders option, Proposals may also be submitted by the Bidder in an Opaque sealed envelope and dropped into the bid box located at the Owner's Office of Procurement –Facilities, 326 E. Hoover, Ann Arbor, MI 48109-1002, and addressed as follows:

<p>THIS ENVELOPE CONTAINS A PROPOSAL FOR THE PROJECT</p> <p>BUILDING NAME</p> <p>PROJECT NUMBER</p> <p>BIDPACK XX</p> <p>PROJECT TO BE RECEIVED: _____, 20____ at _____ p.m. LOCAL TIME.</p> <p>SUBMITTED BY: _____</p> <p>Company Name</p>
--

- F. After the time set for opening of Proposals, no Proposal may be withdrawn for a period of sixty (60) days without consequence. However, any Bidder may withdraw his Proposal prior to the time set for opening Proposals.
- G. Unless a bidder is selected to perform part of the work, they are required to destroy all copies of plans within 90 days of the Bid Due Date.
- H. The Owner's Standard General Conditions and any other amendments, included herein, by reference or by addendum, govern all operations that are to be conducted in the performance of any contract entered into for the Work described in the Invitation for Bid. The Standard General Conditions are available for examination and download at the Owner's website <http://www.umaec.umich.edu/for-vendors/contracts-agreements/>, or a hard copy may be requested from the Owner's AEC Project Controls Office.

4. MODIFICATIONS

Any Bidder may modify and resubmit, or withdraw their previously submitted bid prior to the scheduled due date and time without prejudice. Resubmit or withdraw the bid by Email to the ELECTRONIC BID BOX (Email Address: umaecbid@umich.edu).

5. EXAMINATION AND TOUR OF SITE

- A. All Bidders are expected to tour the site of the proposed project to acquaint themselves with the actual conditions. Refer to the Invitation for Bid Letter, sent to invitees, for the date, time and location of any required Pre-Bid site tour or orientation meetings scheduled by the Owner.
- B. Before submitting a Proposal, each Bidder must inspect the site of the proposed work to arrive at a clear understanding of the actual conditions under which the work is to be done. Bidders will be held to have compared the premises with the drawings and specifications to have satisfied the Bidder as to all conditions affecting the execution of the work.

- C. No allowance or extra compensation concerning any matter or thing about which the Bidder might have reasonably been informed through such examination will be allowed.

6. TAXES

Each Proposal submitted must include, and the successful Bidder will be required to pay, all taxes which are levied by Federal, State or Municipal Governments upon labor and materials entering into the Work. If indicated in the Bidding Documents and on the Form of Proposal, the contractor shall pay sales and use tax on equipment or material that is pre-purchased by the owner for installation by the contractor. The Owner reserves the right to require evidence of payment of such taxes prior to final payment.

For Tax-Exempt Hospital Projects:

TAX EXEMPT

The project is for a tax-exempt Hospital, granted such status by authorized taxing units of the State of Michigan, and is exempt from Federal Excise Tax and Michigan General Sales Tax (Re: Michigan Public Act 167 of 1933, Section 4 as amended).

7. OWNER'S OPTIONS / VOLUNTARY ALTERNATES

Reference in the Bidding Documents to any article, device, product, material, fixture, form, process, or type construction by name, make, type or style will be interpreted as establishing a standard of quality and not as limiting competition. However, substitutions will only be considered through the "Owner's Options/ Voluntary Alternates" provisions of the Bidding Documents as follows:

- a) where only one such name, make, type or style is specified in any instance, whether or not followed by the phrase "or other approved", "or equal" or other words to that effect, the contractor's Proposal must be based on the name, make, type or style so specified; and
- b) where the Bidding Documents mention more than one name of subcontractor, supplier or process, or more than one name, make type or style of article, material or equipment item, the Contractor's Proposal must be based on one of the named makes, types or styles; and
- c) when substitutions are proposed, the Contractor's proposal must clearly state, under the heading "Owner's Options / Voluntary Alternates", the names, makes, types or styles which the Contractor may propose other than those designated in the Bidding Documents together with the proposed cost adjustments, if any.

8. CONTRACT SECURITY

- A. The amount contained in each submitted Proposal must include the premiums and all other charges, if any, for the Performance and Payment bonds, each in the full amount of the Proposal sum.
- B. The Performance Bond is security for the faithful performance of the contract, and the Labor and Material Payment Bond, including both wages and fringe benefits for subcontractors' employees, as security for the payment of all persons performing labor and furnishing materials in connection with the contract. Bonds must reference the Owner as "The Regents of the University of Michigan" and all bonds and sureties must be acceptable to the Owner.
- C. Nothing in these Instructions to Bidders, any Addenda, the Standard General Conditions, the Specifications or Drawings relating to waiver and sworn statements regarding payments make the Design Professional or Owner liable for adequacy of waivers and sworn statements.

9. INTERPRETATION OF DOCUMENTS AND ADDENDA

- A. Before the Owner makes the award, neither the Owner nor Design Professional will give verbal answers to inquiries regarding the meaning of drawings and specifications, or verbal instructions. Any such verbal statements by any persons, prior to the award, are invalid.
- B. Any explanation desired by Bidders must be requested of the Design Professional in writing, and if explanation is necessary, a reply will be made in the form of an addendum, a copy of which will be forwarded to each Bidder who has received a set of the Bidding Documents and to such other prospective Bidders as have requested a copy of each addenda.
- C. No questions or inquiry relative to interpretation of bidding documents will be entertained within the last three (3) days before the bid due date.
- D. All questions and inquiries regarding the Project must be directed to:

Contact Name, Title, Firm Name, and Email Address

DO NOT USE THE ELECTRONIC BID BOX EMAIL ADDRESS FOR ANY INQUIRES REGARDING THE PROJECT.

- E. Any addenda issued to Bidders prior to the date and time of receipt of Proposals become a part of the Contract Documents and all Proposals are to include the work described in the addenda. Each Proposal submitted must list all addenda which have been received before the bid due date and time.

10. INSURANCE

The successful Bidder will be required to maintain Commercial General Liability, Auto Liability, Worker's Compensation and other insurance coverages applicable to the project in accordance with Section 11 of The University of Michigan Standard General Conditions. Insurance Policies adhere to the requirements set forth in Section 11.3 of the Standard General Conditions.

11. NOTICE TO PROCEED

The successful Bidder will be issued a "Notice to Proceed" to indicate the University's intent to award the Contract. This notice will indicate the Contract Sum and will itemize all accepted Alternates and Owner's Options /Voluntary Alternates included in the Contract Sum. Any action taken or costs incurred by the apparent successful Bidder prior to the issuance of the written notice will be at his own risk.

12. TIME OF STARTING AND COMPLETION

The date of the Notice to Proceed shall be the official "date of award" of the Contract. The successful Bidder must furnish the required project specific safety plan, bonds and insurance, to the Owner's AEC Project Controls Office and commence active work on the project, all within ten (10) days after date of official Notice to Proceed, as described above, unless a longer period is stated in the Bidding Documents, and must complete the work within the time stated in the Bidding Documents.

13. DOCUMENTS FOR BIDDING

The Bidding Documents, issued for the use of Bidders and upon which all Proposals are to be based, consist of those listed in the Table of Contents of the AEC Project Manual. If additional documents are required to explain revisions which are made during the bidding period or to give additional information to the Bidders, the Design Professional will prepare such documents in the form of an Addendum with accompanying drawings, if required, and will send copies, through the Owner's AEC Project Controls Office, to all prime Bidders, prior to the date for receipt of Proposals. All Proposals are to include the additional work described and indicated on such documents.

PROPOSAL

Pursuant to and in compliance with your Invitation for Bids dated _____, and the AEC Project Manual dated _____ relating to the above named project, the Undersigned proposes to enter into an Agreement with the Owner for:

BUILDING NAME
PROJECT DESCRIPTION
BIDPACK XX

Lump Sum Base Proposal:

in accordance with said Bidding Documents for the sum of _____
_____ Dollars

(\$ _____) as the Lump Sum **Base Proposal**.
Please round to nearest dollar

For Unit Price Proposal, use Page FOP-2 for calculation and complete above for Total Base Bid.

UNIT PRICES

This bid schedule of unit prices shall be submitted on the following form as part of the Proposal. Unit prices shall be based on materials completely installed in place and all costs related to construction; including but not limited to general conditions, labor, overhead and profit for general contractor and subcontractors. Failure to fill in all unit prices for all scheduled quantities or alteration of the bid schedule shown may result in disqualification of bidder. In case of discrepancy between the unit prices and the extended amount, unit prices will govern.

The quantities appearing in the bid schedule are approximate and prepared only for comparison of bids. Payment of the Contractor will be made only for the actual quantities of work performed and accepted in accordance with Sections 7.6.2.2 and 9.2 of the Standard General Conditions. Where the quantity of any item of unit price Work differs by twenty (20) percent or more and is materially and significantly different from the estimated quantity included in the bid schedule and there is no corresponding adjustment with respect to any other item of Work, the Contractor or the Owner may make a claim for an adjustment in the unit price, and the corresponding Contract Sum.

The Owner reserves the right to delete one or more line items contained within the bid schedule prior to the award of the project to best meet Owner’s requirements.

UNIT PRICES FOR CHANGES IN THE WORK

The following is to establish unit prices for changes in the work as outlined in Section 7.6.2.2 of the Standard General Conditions November 1, 2016; Rev. 6/18. The information shall be completed by the bidder and is considered part of the proposal. Unit prices shall be based on the complete installation cost and shall take into account all materials, labor, site conditions, overhead and profit for all contractors involved in the work. These unit prices are to be utilized for both add and deduct in scope. It is the option of the Owner whether or not the submitted unit prices will be accepted and included in the contract. If the unit prices are not accepted, one of the other methods listed in Section 7.6 may be utilized by the Owner, if changes in the work are warranted.

UNIT PRICE XX: Brief Description XX:\$ _____/(Unit of Measure)

UNIT PRICE XX: Brief Description XX:\$ _____/(Unit of Measure)

EQUAL EMPLOYMENT OPPORTUNITY STATEMENT

The undersigned Bidder warrants that it is an equal opportunity employer and that, during the performance of the Agreement, it will comply with Federal Executive Order 11246, as amended, the Rehabilitation Act of 1973, as amended, and the respective regulations thereunder, and the Michigan Civil Rights Act of 1976.

DESIGN GUIDELINE 3.1 **SUSTAINABLE DESIGN AND LEED® REQUIREMENTS**

Scope

The University of Michigan is committed to environmental stewardship and promotes implementation of sustainable design concepts to support U-M sustainability and Carbon Neutrality goals. Many of these concepts are incorporated directly into various sections of the U-M Design Guidelines and Master Specifications. This section addresses additional requirements and resources with respect to sustainable design and LEED requirements.

Design and Installation Requirements

Sustainable Design Requirements

All Projects

Prior to beginning Schematic Design, clarify the design objectives with respect to sustainable design, in conjunction with the U-M Design Manager. It is the University's expectation that sustainability be a consideration for all projects.

U-M Master Specification 015719 - Construction Air Quality shall be included in the contract documents and edited to be project specific. This specification provides requirements for construction air quality including requirements for bio-diesel fuel and exhaust after-treatment devices on construction equipment.

U-M Master Specification 017420 - Construction and Demolition Waste Tracking shall be included in the contract documents. This specification documents the disposal of waste through use of the U-M Waste Tracking Report. This specification shall not replace construction waste management specification sections and shall not be edited by the A/E.

Document all sustainability design concepts in the project OPR/BOD (Owner's Project Requirements/Basis of Design) document. 2.1 - Owner's Project Requirements and Basis of Design Documents provides a complete description of OPR/BOD requirements.

Upon completion of the Construction Documents phase, use the EPA website to determine if the project is eligible for Designed to Earn ENERGY STAR. A/E to process all required paper work should the project be eligible.

Projects Requiring Regental Approval

At the end of Schematic Design (SD) phase, assist the Design Manager with completing a Building/Project Sustainability Summary for posting on the AEC website. The Building/Project Sustainability Summary is to be updated at each design phase And a final summary shall be submitted at project completion.

Visual Display Requirements

Required for projects over \$10M construction cost.

Produce a visual display. Include, at a minimum, the following:

- Building name
- Project name
- Project description
- Photo or rendering of project (cross section, perspective, or elevation)
- Site plan to depict project location
- AEC Title Block and Sustainable Facts Diagram (revise to be project specific)
- Simplified, project specific visual graphics to depict sustainability features (e.g. diagrams to explain how system work). Do not provide generic LEED credit descriptions.
- Energy conservation measures
- Overall energy savings when compared to ASHRAE 90.1 baseline. Include ASHRAE 90.1 version used.
- Overall water savings based on the Energy Policy Act of 1992 fixture performance requirements.
- Recognitions and certifications received (e.g. LEED, Designed to Earn Energy Star). Include certification logos.

Design Manger to coordinate review and approval of visual display.

Submit a digital copy of the visual display with Design Deliverables at CD phase for Owner's Review.

After project completion, CD phase visual display to be updated to reflect all Owner's Review comments, accepted Alternates and Owner's Options, recognitions and certifications received. Final visual display to be submitted in the following format:

- 11x17 digital pdf file in high resolution (minimum 300 pixels/inch resolution).
- 24x36 digital pdf file in high resolution (minimum 300 pixels/inch resolution).

Contact the AEC Sustainability Coordinator for example visual displays.

LEED Requirements

New Buildings and Additions over \$10M construction cost (new construction only)

All new buildings and additions with an estimated construction budget greater than \$10 million shall contact the Project Design Manager to determine project-specific LEED certification requirements.

LEED Registration

All projects pursuing LEED certification will be registered with LEED Online by the U-M AEC Sustainability Coordinator; from that point on the A/E's designated LEED Project Manager will be responsible for assigning and managing the attempted credits within LEED Online. See the U-M LEED Project Registration Procedure for complete details.

LEED Checklist and Communication Process

The A/E's designated LEED Project Manager shall be responsible for the management and execution of the following checklist and communication process, in addition to other documentation, calculations and processes required for LEED certification:

- (a) At the conclusion of schematic design, develop a preliminary LEED Checklist utilizing the most current LEED Reference Guide for the appropriate rating system, including Addenda.
- (b) The checklist should identify all items for which credit can be achieved, items for which credit is under consideration, and items for which no credit can be achieved.
- (c) For items "under consideration", clarify steps required for this review and analysis, potential options, and potential cost and benefit. The U-M AEC Sustainability Coordinator and U-M Design Manager will assist in refining this list and provide direction on further action as design progresses to DD and CD phases.
- (d) At the conclusion of DD phase, update the LEED Checklist. A clear direction should be established for "under consideration" items. Items should be included in scope, deleted from consideration, or included as bid alternates.
- (e) At the conclusion of CD phase, update the LEED Checklist. The updated checklist should include any additions and/or subtractions to the project scope that may have occurred during design development and affect the total score anticipated at the conclusion of DD.

- (f) After GBCI® completes its review of the LEED application, the LEED Project Manager shall conference with the project team and the U-M AEC Sustainability Coordinator and present all technical advice received from the GBCI® reviewers. Describe strategies to respond to points denied or information forms not approved. Conduct such conferences after every LEED review phase.
- (g) At the completion of the construction phase, update the LEED Checklist. The updated checklist should include any additions and/or subtractions to the project scope that may have occurred during construction and affect the total score anticipated at the conclusion of CD.
- (h) Upon receipt of LEED certification, the A/E's designated LEED Administrator shall notify the U-M AEC Sustainability Coordinator. A/E to obtain authorization from the AEC Sustainability Coordinator prior to publishing LEED certification results on any media platform.

Existing LEED Certified Buildings

Projects within LEED certified buildings shall be implemented so as not to jeopardize sustainable design and the LEED certification. A complete list of LEED certified buildings is located in the Sustainability Section of the AEC website.

Additional Resources

Projects involving demolition are encouraged to divert waste from landfills by taking advantage of recycling opportunities currently available through outside companies. Below is a list of recycling programs that AEC is aware of. Contact the AEC Sustainability Coordinator with questions.

Vinyl Composite Tile

- Armstrong World Industries, Inc.

Acoustic Ceiling Tile

- Armstrong World Industries, Inc.

Carpet

- Calvert's Roll-Off Containers, Inc. (operated by Recycle Ann Arbor)
- Great Lakes Recycling - GLR

Carpet Padding

Great Lakes Recycling

DESIGN GUIDELINE 3.2 **ENERGY AND WATER CONSERVATION**

Summary

This Design Guideline applies to new buildings, building additions, building alterations and capital equipment replacements at the Ann Arbor, Dearborn and Flint campuses. Contact the Project Design Manager to determine when it applies to leased properties.

To support the U-M sustainability goals related to reduction in GHG emissions and carbon neutrality energy and water conservation shall be considered in all aspects of project design. Incorporate conservation measures as described herein and as requested by the Design Manager.

Throughout the design process, meetings shall be held to evaluate how the project is meeting the project's conservation targets and to review the conservation measures specific to the project.

Energy Conservation Compliance

All projects

- (a) Incorporate the Mandatory Energy Conservation Measures (ECMs) listed herein.
- (b) Evaluate the Potential ECMs listed herein and incorporate as appropriate.
- (c) Incorporate the Water Conservation Measures listed herein.

Projects between \$2M and \$10M construction cost

In addition to the requirements applicable to all projects, perform the following:

- (a) Utilize the United States Department of Energy's (DOE) *COMcheck* software (<http://www.energycodes.gov/comcheck/>) to demonstrate compliance.
- (b) Document the impact of the ECMs in accordance with the Documentation Requirements listed herein.

Projects over \$10M construction cost

In addition to the requirements applicable to all projects, perform the following:

- (a) Exceed ASHRAE 90.1 baseline requirements by the percentage established for the project.
- (b) Utilize the United States Department of Energy's (DOE) *COMcheck* software to demonstrate compliance.
- (c) In accordance with Appendix G: Performance Rating Method of ASHRAE 90.1, use a computer energy simulation program to establish a baseline energy consumption for the entire building and to calculate the percentage energy cost saved above the baseline.
- (d) Document the impact of the ECMs in accordance with the Documentation Requirements listed herein.
- (e) Provide an Energy Impact Statement as described herein.

Mandatory Energy Conservation Measures

The following ECMs shall be incorporated into every project as applicable to the project's scope.

- (a) Window Blinds/Shades: Provide interior blinds/shades on south and west facing windows.
- (b) Occupancy Schedules: Determine anticipated occupancy schedules in consultation with the Users and indicate these in the OPR/BOD Document, in the Energy Impact Statement, and in the energy simulation software output. Based on these schedules, indicate on the project control drawings the initial operating schedule for all mechanical and electrical systems and equipment.
- (c) Part Load Efficiency: Design mechanical and electrical systems to run efficiently at partial loads.
- (d) HVAC System Zoning: Zone HVAC systems by occupancy type, ventilation rate, and operating schedule to allow shutdown or setback during no/reduced occupancy. Utilize zoned shutdown for sections of systems where occupancy schedules vary widely and separate systems are not feasible.
- (e) DDC VAV Control: Control room air volume and temperature with direct digital controlled variable air volume (VAV) assemblies.
- (f) Standalone HVAC Systems: Provide standalone HVAC systems for areas that require 24/7 operation, to allow central systems to be shut down.
- (g) Laboratories: See U-M Design Guideline 15910 Laboratory Ventilation for information regarding ECMs in labs.
- (h) Building Envelope Thermal Scanning: For projects over \$10M construction cost, perform infrared thermal scans of any existing envelope during design to identify areas

- needing improvement. Perform scans of the new building envelope during construction. Correct deficiencies found.
- (i) Incandescent Lighting: Limit incandescent lighting to accent or special use.
 - (j) Lighting and Power Justification: Provide justification for any area that exceeds ASHRAE 90.1 lighting or electrical power limits.

Mandatory Evaluations of Potential Energy Conservation Measures

Evaluate the following ECMs in accordance with the Economic Evaluation of Energy Conservation Measures section of this Design Guideline. Incorporate any ECM into the project that meets the maximum payback criterion.

- (a) Below-Grade Insulation: Improve the below-grade insulation R-value above the ASHRAE 90.1 required minimum.
- (b) Wall Insulation: Improve the wall insulation R-value above the ASHRAE 90.1 required minimum.
- (c) Roof Insulation: Improve the roof insulation R-value above the ASHRAE 90.1 required minimum.
- (d) Glazing: Provide glass with reduced solar heat gain coefficients and fenestration systems with lower U values than the ASHRAE 90.1 required maximums.
- (e) Server Rooms: Instead of electronic data server rooms located inside the project building, consolidate servers into data centers located outside of the project building.
- (f) Chillers: Exceed ASHRAE 90.1 chiller efficiency. Include the impact of pump power reductions.
- (g) Free Cooling: Where there is a year-around chilled water load in the building, use “Free Cooling” as part of the chilled water system. Free Cooling shall utilize an evaporative cooling tower coupled with a heat exchanger, closed circuit evaporative fluid coolers, or dry coolers to produce chilled water when seasonal temperatures permit. Evaporative towers should be separate or be able to be decoupled from the main cooling tower array.
- (h) Heat Recovery: Where an air handling system’s minimum outside air percentage is greater than 40 percent, use a heat recovery system to transfer heat from exhausted air to the outside air entering the system. Evaluate heat recovery (enthalpy) wheels, flat plate air-to-air heat exchangers, heat pipes (including pumped type), and run-around coils. Include the impact of additional pressure drop through each device type.
- (i) Envelope Inspections: Increase the inspection of the exterior wall insulation and exterior fenestration systems. Energy savings evaluation to be based on a percentage reduction of the estimated annual energy consumed due to infiltration and thermal conduction through the building envelope.
- (j) Lighting Controls: Where occupancy in auditoriums, classrooms, conference rooms and offices varies with time of day, provide occupancy sensing and day-lighting control to achieve minimum space lighting times and ventilation rates, and close VAV boxes to zero position if no occupancy is detected.
- (k) Boilers: Exceed ASHRAE 90.1 boiler efficiency.
- (l) HVAC: Exceed ASHRAE 90.1 mechanical cooling and heating equipment efficiencies.

(m) Kitchen Hoods: Provide variable volume kitchen exhaust hood systems.

Additional Energy Conservation Opportunities

Consider additional energy conservation opportunities including those listed below for application on the project.

- (a) Optimum building aspect ratios (squareness and roof area vs. total area).
- (b) Optimum building siting to respond to the climate. Minimize west and south facing windows. Optimize glass orientation and area. Consider double glass wall systems for south or west facades with large areas.
- (c) Fenestration overhangs, setbacks, fins, or similar exterior shading devices.
- (d) Light shelves to promote day lighting.
- (e) Clerestories to reduce energy use while providing day-lighting, in lieu of horizontal glass surfaces or large windows.
- (f) Fritted glass, in particular for atriums, winter gardens, and similar type spaces with roofs containing a large percentage of glass.
- (g) For renovation projects where fenestration or glazing will not be replaced, consider window films to improve energy performance.
- (h) Vegetated roofs.
- (i) Improved ventilation air flow efficiency by reducing the pressure drop of air system components and ductwork. In particular, consider for air systems that run continuously 24/7.
- (j) Chilled beams for areas with large sensible loads and moderate ventilation air requirements.
- (k) Displacement/impingement ventilation systems for large spaces with high ceilings.
- (l) Heat recovery systems that recover heat from heat rejection equipment or from other available “waste” heat in the building.

Economic Evaluation of Energy Conservation Measures

It is the intent that ECMs incorporated by the project will have payback periods less than the maximum payback periods stated below.

ECM Simple Payback Calculations and Criterion

Evaluate the financial metrics of each ECM.

- (a) Calculate the simple payback period of each ECM using:

$$\text{Simple Payback Period} = \frac{\text{Incremental Capital Cost of the ECM}}{\text{Annual Energy Savings} - \text{Incremental Maintenance Costs of the ECM}}$$

- (b) Determine the service life of each ECM in accordance with the ASHRAE Handbook Chapter 36, “Costs of Owning and Operating Equipment.” For ECMs not covered in the ASHRAE Handbook, contact the Design Manager for U-M input on their service lives.

- (c) Where the service life of two alternative systems is significantly different from each other, include the replacement cost of the shorter lived system in the analysis.
- (d) Use the following table to determine whether each ECM meets the maximum simple payback criterion and should or should not be incorporated.

Service Life of ECM (years)	Maximum Simple Payback Period (years)
15	6
20 or More	8

- (a) For fenestration and glazing, use a maximum simple payback period of 10 years. For membrane roof insulation, use 12 years. For all other insulation, use a maximum simple payback period of 30 years.

Energy Calculations

Utilize a computer energy simulation program for energy use calculations that meets the requirements of ASHRAE 90.1.

Energy Costs

When evaluating ECMs, use the current utility costs available at <http://utilities.fo.umich.edu/services/energy-utilities/business-services/utility-rates/>.

Maintenance Costs

Include significant maintenance cost impacts if anticipated as a result of an ECM. Submit a comparative equipment list detailing the two options being analyzed to the Design Manager and request the necessary maintenance unit and annual costs.

Water Conservation Compliance

All projects

- (a) Incorporate water conservation measures that in aggregate use 20 percent less water than a baseline water use (not including irrigation) based on Energy Policy Act of 1992 fixture performance requirements (which are incorporated into the Michigan Plumbing Code).
- (b) Incorporate the following mandatory water conservation measures:
 - Dual flush water closets.
 - Waterless or 1/8 gallon per flush urinals.
 - 2 GPM shower heads.
- (c) Incorporate additional measures as required to meet the 20 percent water conservation target. (1/2 GPM aerators for lavatory faucets are required by the plumbing code and thus may not be used as a credit toward the 20 percent target.)

- (d) Document the impact of the Water Conservation Measures in accordance with the Documentation Requirements listed below.
- (e) Projects unable to meet this requirement shall obtain approval through use of the U-M Building Design Sustainability - Exemption Request Form.

Documentation Requirements

Provide documentation in accordance with Design Guideline 2.1, the Design Deliverables and as follows.

When using the Energy and Water Conservation Report Format form, assure hidden text is turned “on” and carefully review additional information and guidance notes.

Projects between \$2M and \$10M construction cost

Starting at the Schematic Design (SD) phase and expanding during the Design Development (DD) and Construction Documents (CD) phases, provide the following information utilizing the Energy and Water Conservation Report Format form provided as a Related Document.

- (a) A copy of a completed COMcheck compliance report.
- (b) If an energy model is run, provide complete data files (including all executable files necessary to allow U-M to “run” the energy model) from the energy simulation program including a breakdown of energy usage by at least the following components: lights, internal equipment loads, service water heating equipment, space heating equipment, space cooling and heat rejection equipment, fans, and other HVAC equipment (such as pumps).
- (c) Explanation of all ECMs evaluated for the project. Provide summary calculations demonstrating the simple payback period of each measure.
- (d) Explanation of all Water Conservation Measures applied to the project and their predicted results.
- (e) Explanation of which Mandatory Energy Conservation Measures and Mandatory Energy Evaluations apply to the project and how they will be implemented.

Update and submit the CD phase report after project award to reflect accepted Alternates and Owner's Options, include updated executable energy model files if an energy model was used.

Projects over \$10M construction cost

As part of the program and concept design report, identify the architectural, mechanical, and electrical energy conservation technologies specific to the project that will be utilized to provide an energy efficient building.

Provide the following information utilizing the Energy and Water Conservation Report Format form provided as a Related Document.

During the Schematic Design Phase, provide:

- (a) A copy of the completed COMcheck compliance report.
- (b) Explanation of all Water Conservation Measures applied to the project and their predicted results.
- (c) Explanation of which Mandatory Energy Conservation Measures and Mandatory Energy Evaluations apply to the project and how they will be implemented.
- (d) Explanation of any other ECMs to be applied to the project. Include summary calculations demonstrating the simple payback period of each measure (see the "Economic Evaluation of Energy Conservation Measures" section of this Guideline).

When an energy goal above the ASHRAE 90.1 baseline requirements has been established for the project, also provide the following:

- (a) Calculated values for the *baseline building performance*. The *proposed building performance*, and the percentage improvement is also strongly preferred but is not required at SD Phase.
- (b) Complete data files (including all executable files necessary to allow U-M to “run” the energy model) from the energy simulation program including a breakdown of energy usage by at least the following components: lights, internal equipment loads, service water heating equipment, space heating equipment, space cooling and heat rejection equipment, fans, and other HVAC equipment (such as pumps). The output reports shall also show the amount of time any loads are not met by the HVAC system for the *baseline building design* and the *proposed building design*. The proposed building design shall not have more “unmet hours” than the baseline building.
- (c) An explanation of any error messages noted in the simulation program output.
- (d) List ECMs planned for the *proposed building design* and indicate the relative contribution each will make toward exceeding ASHRAE 90.1. This list shall document all energy features that differ between the *baseline building performance* and the *proposed building performance* calculations.

During the Design Development and Construction Document phases, provide:

- (a) Calculated values for the baseline building performance, the proposed building performance, and the percentage improvement, when applicable.
- (b) Updates of all the energy and water conservation documentation required to be submitted at the SD phase.

Update and submit the CD phase report after project award to reflect accepted Alternates and Owner's Options, include updated executable energy model files.

Energy Impact Statement

For projects over \$10M construction cost, provide an Energy Impact Statement. Utilize the form provided as a Related Document.

ENERGY AND WATER CONSERVATION REPORT FORMAT PROJECTS BETWEEN \$2M AND \$10M CONSTRUCTION COST

2013-07-15: Revised to require yearly savings of KWH and Therms be reported, for DTE energy incentive programs.

Utilize the following report format to indicate compliance to U-M Design Guideline 3.2. Supplemental narratives and tables may be provided in addition to the information required below, but for the required tables indicated below, do not change the table explanations, format, headings, footnotes, or the order in which the tables are presented. The data in the tables in this sample report is for illustrative purposes only, update to project specific values.

Cover Page

Provide a cover page with the project name, project number, date and report version: SD, DD, CD, or FINAL. Provide similar information in the report footer.

Executive Summary

Energy conservation measures (ECMs) were evaluated per the requirements of U-M Design Guideline 3.2. The total estimated cost savings and first cost of the recommended ECMs for this project are summarized below:

Estimated Annual Energy Cost Avoidance w/ECMs:	\$152,300
Total Estimated First Cost of ECMs:	\$1,210,000
Over-all Simple Payback (years):	7.9

The estimated savings in energy units, reported below, is useful for utility incentive programs. When reporting this information, do not convert electrical energy savings to equivalent therms, or gas savings to equivalent KWH.

KWH/Year Savings:	XXXXX
Therms/Year Savings:	XXXXX

A requirement of U-M Design Guideline 3.2 is for designs to use 20% less water compared to designs that exactly meet the building code. The estimated water savings for this project are summarized below:

Estimated Total Annual Water Savings:	41,000 gallons
Annual Water use w/o Water Conservation Measures:	200,000 gallons
Percent Savings Versus Code Requirement:	21%

Project: <insert project name>

Report Version: <insert SD, DD, CD, or FINAL>

Page 1

Table 1: Summary of ECM Evaluations

Table 1 summarizes every energy conservation measure evaluated by the design team for this particular project, along with various ECM financial metrics.

Table 1: Summary of ECMs Evaluated

ECM No.	Description	First Cost Estimate	Annual Costs Savings	Simple Payback	ROI	Persistence ¹ H/M/L	Accepted Yes/No	Comments
1a	Additional 0.75" Wall Insulation	\$180,000	\$14,000	12.9	7.8%	H	N	
1b	Additional 1" Wall Insulation	\$300,000	\$16,500	18.2	5.5%	H	N	
1c	Additional 1.5" Wall Insulation	\$350,000	\$18,400	19.0	5.3%	H	Y	
2a	Glass SHGC =0.38	\$186,000	\$7,500	24.8	4.0%	M	N	
2b	Glass SHGC =0.33	\$190,000	\$8,000	23.8	4.2%	M	Y	
2c	Argon Filled Triple Glazed Glass SHGC = 0.26	\$265,000	\$13,400	19.8	5.1%	L	N	Seal life guaranteed only 10 years. Slight gray tint.
3	Day Lighting Sensors, Atrium	\$42,000	\$12,000	3.5	28.6%	M	Y	
4	Desiccant Wheel	\$200,000	\$40,000	5.0	20.0%	M	Y	
5	Exterior Shades, South Façade	\$78,000	\$15,000	5.2	19.2%	H	Y	
6	Increase Thermostat Deadband	\$0	\$7,000	N/A	N/A	L	Y	
7	Free Cooling Process Load	\$350,000	\$55,000	6.4	15.7%	H	Y	
8	Shower Heat Recovery Device	\$24,000	\$3,000	8.0	12.5%	L	N	Maintenance issues

Note 1: Persistence represents an opinion of the probability that the estimated energy savings will be fully realized.

Table 2: Water Conservation Measures and Predicted Results

Table 2 indicates the water saving measures and resulting percent water savings predicted for this project versus a project constructed to meet building code requirements (building code requirements are based on Energy Policy Act of 1992 fixture performance dictates). The requirement of U-M Design Guideline 3.2 is for designs to provide projects that use 20% less water than projects designed to exactly meet the building code.

Table 2: Water Conservation

Water Conservation Measure	Estimated Annual Savings (Gallons)
Dual Flush Water Closets	7,000
Waterless or 1/8 Gallon Per Flush Urinals	5,000
HVAC Condensate Used For Cooling Tower Make-Up	8,000
2 GPM Shower Heads	12,000
Gray Water Recovery	9,000

Estimated Total Annual Water Savings: 41,000

Annual Water use w/o Water Conservation Measures: 200,000

Estimated Percentage Savings: 21%

Tables 3 and 4:

U-M Design Guideline 3.2 requires that all projects implement certain "mandatory" energy conservation measures, and it requires that other energy conservation measures be "evaluated" for every project. Tables 3 and 4 indicate which of the mandatory and evaluated measures were found applicable to the project.

Table 3: Review of Mandatory Energy Conservation Measures

Table 5 reports the energy cost assumptions utilized for energy cost calculations.

Table 5: Energy Costs Assumptions

Energy Type	Cost	Comments
Electricity	\$0.079 /kwh	DTE Direct Purchase Rate
Natural Gas	\$0.842/therm	MichiCon Direct Purchase Rate
District Steam	\$1.90/therm	U-M Utility Rate
District Chilled Water	\$1.07/therm	U-M Utility Rate

Attach the following to this report in the order indicated:

- *Completed COMcheck compliance report demonstrating compliance to ASHRAE Standard 90.1.*
- *If the ECB method is used, complete data files from the energy simulation program. Include the name of the simulation program(s) used. The output reports shall also show the amount of time any loads are not met by the HVAC system for the baseline building design and the proposed building design. The proposed building design shall not have more “unmet hours” than the baseline building.*
- *An explanation of any error messages noted in the simulation program output.*

ENERGY AND WATER CONSERVATION REPORT FORMAT PROJECTS OVER \$10M CONSTRUCTION COST

2013-07-15: Revised to require yearly savings of KWH and Therms be reported, for DTE energy incentive programs.

Utilize the following report format to indicate compliance to U-M Design Guideline 3.2. Supplemental narratives and tables may be provided in addition to the information required below, but for the required tables indicated below, do not change the table explanations, format, headings, footnotes, or the order in which the tables are presented. **The data in the tables in this sample report is for illustrative purposes only, update to the project specific values.** Provide a cover page with the project name, project number, date and report version: SD, DD, CD, or FINAL. Provide similar information in the report footer.

Executive Summary

Energy conservation measures (ECMs) were evaluated using ASHRAE 90.1 Appendix G procedures. Appendix G requires estimated savings be compared to a *Baseline Building* that exactly meets ASHRAE 90.1 energy code requirements.

The version of the ASHRAE standard that this project was evaluated against was ASHRAE 90.1-XXXX <insert year>

The estimated total annual cost savings by implementing the recommended ECMs is <insert dollars>, which is equivalent to an annual percent savings of <insert percentage> compared to a ASHRAE 90.1 Baseline Building.

The estimated total annual water savings by implementing the recommended water conservation measures is <insert gallons>, which is equivalent to an annual percent savings of <insert percentage> compared to a building complying with the Michigan Plumbing Code.

Table 1: Recommended ECMs (ECM Interactions Not Accounted For)

Table 1 lists all the ECMs that are recommended for implementation on this project. It indicates the savings potential for each ECM without regard to the impact ECMs may have upon one another. Because of such "interactions", the actual cost savings for some ECMs will be less than when they are analyzed on a stand-alone basis. For example, the savings from an ECM that reduces lighting energy will be partially offset by increased space heating requirements due to less light energy heating the space. Table 2 accounts for such ECM interactions.

Table 1: Recommended ECMs (ECM interactions not accounted for)

ECM No.	Description	Dollars/Year Savings	First Cost
1c	Increase Wall Insulation to 2.75"	\$18,400	\$350,000
2b	Improved Window Performance, SHGC = 0.33, U = 0.44	\$8,000	\$190,000
3	Day Lighting Sensors, Atrium	\$12,000	\$42,000
4	Desiccant Wheel	\$40,000	\$200,000
5	Exterior Shades, South Façade	\$15,000	\$78,000
6	Increase Thermostat Deadband	\$7,000	\$0
7	Install Free Cooling System	\$55,000	\$350,000

Total First Cost: \$1,210,000

Project: <insert project name>

Report Version: <insert SD, DD, CD, or FINAL>

Total Savings (no interactions accounted for): \$155,400

Table 2: Summary ECM Savings (with ECM Interactions)

Table 2 reports the total estimated ECM savings with ECM interactions taken into account. Where combinations of ECMs are listed, it indicates that those ECMs interact with one another and therefore had to be analyzed as a group.

Table 2: Summary ECM Savings (with ECM interactions)

ECM No.	Description	Dollars/Year Savings
Combo 1	Combines ECMs 1c,2b,3,5	\$50,300
ECM 4	Desiccant Wheel	\$40,000
ECM 6	Increase Thermostat Deadband	\$7,000
ECM 7	Install Free Cooling System	\$55,000

Total Savings (interactions accounted for): \$152,300

Table 3: Energy Conservation Predicted Results

Table 3 indicates the percent savings for *<insert the building/project name>* versus a similar building constructed to exactly meet energy code requirements. The estimated annual energy cost for the building without the recommended ECMs is presented first; the energy cost for the same building with the recommended ECMs implemented is presented second.

Table 3: Energy Conservation Predicted Results¹

Estimated Energy Costs w/o ECMs ²	Dollars/Year
ASHRAE Base Building	\$420,000
Elevators	\$15,000
Process Cooling	\$12,000
Outdoor Lights	\$4,200
Total Energy Cost w/o ECMs:	\$451,200

Estimated Annual Energy Cost Avoidance w/ECMs: \$152,300

Estimated Percentage Cost Avoidance: 34%

Total Estimated First Cost of ECMs: \$1,210,000

Over-all Simple Payback (years): 7.9

Note 1: Compared to a baseline ASHRAE building using ASHRAE 90.1 Appendix G methodology. Actual energy use and savings may vary due to occupancy levels, occupancy schedules, utility rates, and other factors different than assumed in the analysis.

Note 2: Energy use break-down reported per ASHRAE 90.1 Appendix G requirements.

Table 4 provides a breakdown of ECM savings reported in energy units, useful for Utility incentive programs.

Table 4: Estimated Annual Savings in Energy Units, per ECM

Table 4 reports the estimated savings in energy units, with ECM interactions taken into account. Where combinations of ECMs are listed, it indicates that those ECMs interact with one another and therefore had to be analyzed as a group.

Table 4: Estimated Annual Savings in Energy Units, per ECM

ECM No.	Description	KWH/Year Savings	Therms/Year Savings
Combo 1	Combines ECMs 1c,2b,3,5		
ECM 4	Desiccant Wheel		
ECM 6	Increase Thermostat Deadband		
ECM 7	Install Free Cooling System		

Total:

Table 5: Water Conservation Measures and Predicted Results

Table 5 indicates the water saving measures and resulting percent water savings predicted for this project versus a project constructed to meet building code requirements (building code requirements are based on Energy Policy Act of 1992 fixture performance dictates). The requirement of U-M Design Guideline 3.2 is for designs to provide projects that use 20% less water than projects designed to exactly meet the building code.

Table 5: Water Conservation

Water Conservation Measure	Estimated Annual Savings (Gallons)
Dual Flush Water Closets	7,000
Waterless or 1/8 Gallon Per Flush Urinals	5,000
HVAC Condensate Used For Cooling Tower Make-Up	8,000
2 GPM Shower Heads	12,000
Gray Water Recovery	9,000

Estimated Total Annual Water Savings: 41,000

Annual Water use w/o Water Conservation Measures: 200,000

Estimated Percentage Savings: 21%

Table 6: Summary of ECM Evaluations

Table 6 summarizes every ECM evaluated by the design team for this particular project, along with various ECM financial metrics. For a detailed description and analysis of individual ECMs, please see the Appendices.

Table 6: Summary of ECM Evaluated

ECM No.	Description	First Cost Estimate	Annual Costs Savings	Simple Payback	ROI	Persistence ¹ H/M/L	Accepted Yes/No	Comments
1a	Additional 0.75" Wall Insulation	\$180,000	\$14,000	12.9	7.8%	H	N	SD design/estimate included insulation 1" thicker than required by code.
1b	Additional 1" Wall Insulation	\$300,000	\$16,500	18.2	5.5%	H	N	
1c	Additional 1.5" Wall Insulation	\$350,000	\$18,400	19.0	5.3%	H	Y	
2a	Glass SHGC =0.38	\$186,000	\$7,500	24.8	4.0%	M	N	
2b	Glass SHGC =0.33	\$190,000	\$8,000	23.8	4.2%	M	Y	
2c	Argon Filled Triple Glazed Glass SHGC = 0.26	\$265,000	\$13,400	19.8	5.1%	L	N	Seal life guaranteed only 10 years. Slight gray tint.
3	Day Lighting Sensors, Atrium	\$42,000	\$12,000	3.5	28.6%	M	Y	
4	Desiccant Wheel	\$200,000	\$40,000	5.0	20.0%	M	Y	
5	Exterior Shades, South Facade	\$78,000	\$15,000	5.2	19.2%	H	Y	
6	Increase Thermostat Deadband	\$0	\$7,000	N/A	N/A	L	Y	
7	Free Cooling Process Load	\$350,000	\$55,000	6.4	15.7%	H	Y	
8	Shower Heat Recovery Device	\$24,000	\$3,000	8.0	12.5%	L	N	Maintenance issues

Note 1: Persistence represents an opinion of the probability that the estimated energy savings will be fully realized.

Useful Information:

KWH: Kilowatt Hours

MBTU: Thousands of British Thermal Units

Therms x 100 = MBTU

KWH x 3.413 = MBTU

Appendix A

Table A1: Energy Cost Assumptions:

Table A1 reports the energy cost assumptions utilized for energy cost calculations.

Table A1: Energy Costs Assumptions

Energy Type	Cost	Comments
Electricity	\$0.079 /kwh	DTE Direct Purchase Rate
Natural Gas	\$0.842/therm	MichiCon Direct Purchase Rate
District Steam	\$1.90/therm	U-M Utility Rate
District Chilled Water	\$1.07/therm	U-M Utility Rate

Table A2: Accepted ECMs (no ECM interactions) Additional Information

Table A2 presents the estimated annual cost and energy savings, and the relative contribution each ECM contributed toward total savings. Electrical and gas savings for each ECM have been converted to energy units of MBTU and combined.

Table A2: Accepted ECMs (no ECM interactions) Additional Information

ECM No.	Description	Dollars/Yr Savings	% of Total \$ Savings	MBTU/Yr Savings	% of Total MBTU Savings	First Cost
1c	Increase Wall Insulation to 2.75"	\$18,400	11.8%	450	16.8%	\$350,000
2b	Improved Window Performance, SHGC = 0.33, U = 0.44	\$8,000	5.1%	183	6.8%	\$190,000
3	Day Lighting Sensors, Atrium	\$12,000	7.7%	350	13.1%	\$42,000
4	Desiccant Wheel	\$40,000	25.7%	600	22.4%	\$200,000
5	Exterior Shades, South Façade	\$15,000	9.7%	224	8.4%	\$78,000
6	Increase Stat Deadband	\$7,000	4.5%	170	6.4%	\$0
7	Install Free Cooling System	\$55,000	35.4%	700	26.1%	\$350,000

Total First Cost:

\$1,210,000

Total Cost Savings: \$155,400

Total Energy Savings:

2,677

Tables A3 and A4:

U-M Design Guideline 3.2 requires that all projects implement certain "mandatory" energy conservation measures, and it requires that other energy conservation measures be "evaluated" for every project. Tables A3 and A4 indicate which of the mandatory and evaluated measures were found applicable to the project.

Table A3: Review of Mandatory Energy Conservation Measures

Mandatory ECM No.	Description	Implemented Yes/No	Comments	ECM Cross Ref.
a	Window Blinds/Shades	Y		ECM 9
b	Occupancy Schedules	Y		
c	Part Load Efficiency	Y		
d	HVAC System Zoning	Y		ECM 8
e	DDC VAV Control	Y		
f	Standalone HVAC Systems	N	No process areas.	
g	Laboratory ECMs	N	Not a lab building.	
h	Building Envelope Thermal Scanning	Y		ECM 4
i	Limit Incandescent Lighting	Y		
j	Lighting and Power Justification	N		

Table A4: Review of Mandatory Energy Evaluations

Mandatory Eval. No.	Description	Implemented Yes/No	Comments	ECM Cross Ref.
a	Additional Below-Grade Insulation			
b	Additional Wall Insulation			
c	Additional Roof Insulation			
d	Improved Glazing (1)			
e	Eliminate Server Rooms			
f	High Efficiency Chiller (1)			
g	Free Cooling			
h	Heat Recovery			
i	Increased Envelope Inspections			
j	Occupancy/Daylight Sensing			
k	High Efficiency Boiler (1)			
l	High Efficiency HVAC Equipment (1)			
m	Variable Volume Kitchen Hoods			

Note 1: Performance/efficiency better than required by code.

Appendix B

Detailed ECM descriptions and analysis:

Provide a detailed description and evaluation for each ECM. Each evaluation shall include the summary table indicated below, located at the beginning of the ECM. Number similar ECMs -a,-b,-c etc. as per the example.

ECM No.	Description	First Cost Estimate	Dollars/Year Savings	Simple Payback	MBTU/Year Savings
1a	Additional 0.75" Polystyrene Wall Insulation	\$180,000	\$14,000	12.9	
1b	Additional 1" Polystyrene Wall Insulation	\$300,000	\$16,500	18.2	
1c	Additional 1.5" Polystyrene Wall Insulation	\$350,000	\$18,400	19.0	

Description:

The base building wall insulation requirement,
Per ASHRAE 90.7 2013 =

$$R = 11.9 \text{ hr-ft}^2\text{-F/Btu}$$

$$U \text{ value} = 0.084 \text{ Btu}/(\text{hr-ft}^2\text{-F})$$

This ECM would increase the insulation thickness as follows:

Increase 1.25" thick insulation to 2.0" Thick

$$R = 15.87 \text{ hr-ft}^2\text{-F/Btu}$$

$$U \text{ value} = 0.063 \text{ Btu}/(\text{hr-ft}^2\text{-F})$$

Increase 1.25" thick insulation to 2.25" Thick

$$R = 17.2 \text{ hr-ft}^2\text{-F/Btu}$$

$$U \text{ value} = 0.058 \text{ Btu}/(\text{hr-ft}^2\text{-F})$$

Increase 1.25" thick insulation to 2.75" Thick

$$R = 19.9 \text{ hr-ft}^2\text{-F/Btu}$$

$$U \text{ value} = 0.050 \text{ Btu}/(\text{hr-ft}^2\text{-F})$$

Construction Costs:

Describe the basis of the first cost estimate.

Project: <insert project name>

Report Version: <insert SD, DD, CD, or FINAL>

Appendix C:

Include the following in report Appendix C (in the order indicated):

- *Energy Impact Statement.*
- *A breakdown of energy usage by at least the following components: lights, internal equipment loads, service water heating equipment, space heating equipment, space cooling and heat rejection equipment, fans, and other HVAC equipment (such as pumps)*
- *Completed COMcheck compliance report demonstrating compliance to the mandatory provisions of ASHRAE Standard 90.1.*
- *Complete input data files and output reports from the energy simulation program. Include the name of the simulation program(s) used. The output reports shall also show the amount of time any loads are not met by the HVAC system for the baseline building design and the proposed building design. The proposed building design shall not have more “unmet hours” than the baseline building.*
- *An explanation of any error messages noted in the simulation program output.*

ENERGY IMPACT STATEMENT

For all projects with a construction budget over \$10 million, complete an Energy Impact Statement as required by the Design Guidelines 2.1, 2.2 and 3.2. Refine and update the Energy Impact Statement throughout the three design phases as more detailed information regarding the project becomes available. For comparison, prior estimates are to be shown on subsequent updates of the Energy Impact Statement.

The following describes the general methodology to be used for each utility section. Provide supporting information with the Energy Impact Statement for each phase where required.

Legend:

- ALL: Requirement for each phase
- SD: Schematic Design Phase
- DD: Design Development Phase
- CD: Construction Document Phase

Electrical:

- ALL: Describe methods and assumptions used to calculate electrical estimates.
- SD: Can use watts per square foot.
Identify any unusual loads.
Estimates can be developed using a computer simulation or a spread sheet listing peak demand, estimated diversity and annual consumption.
- DD & CD: Estimates based on actual design and not watts per square foot.
Estimates can be developed using a computer simulation program or a spread sheet listing peak demand, estimated diversity and annual consumption.
Indicate diversity assumptions or include schedules from computer simulation.

Low Pressure Steam:

- ALL: Describe methods and assumptions used to calculate low pressure steam estimates.
Provide list of significant loads showing peak demand and annual consumption.
- SD: Heating consumption estimate can be developed using ASHRAE Degree Day Formula or Bin Estimate Method.
- CD & DD: Develop heating consumption estimates using a computer simulation program utilizing 8,760 hours per year analysis such as Trane Trace, Carrier HAP or Elite EZDOE.

60 PSI Steam:

- ALL: Describe methods and assumptions used to calculate 60 PSI steam estimates.
Provide list of significant loads showing peak demand and annual consumption.

Chilled Water:

- ALL: Describe methods and assumptions used to calculate chilled water estimates.
Provide list of significant loads showing peak demand and annual consumption.
- CD & DD: Develop chilled water cooling estimates using a computer simulation program utilizing 8,760 hours per year analysis such as Trane Trace, Carrier HAP or Elite EZDOE.

Domestic Cold Water:

- ALL: Describe methods and assumptions used to calculate domestic cold water estimates.
Provide fixture count summary and site source for estimating peak diversified demand.

Domestic Hot Water:

- ALL: Describe methods and assumptions used to calculate domestic hot water estimates.
Provide fixture count summary and site source for estimating peak diversified demand.

Natural Gas:

- ALL: Describe methods and assumptions used to calculate natural gas estimates.

Storm Drainage system:

- ALL: Describe methods and assumptions used to calculate storm drainage estimates.

Building Description and Assumptions:

Provide a brief narrative describing various building related items and assumptions used to complete the Energy Impact Statement. Among these are the following:

- a. Building Gross Floor Area
- b. Building Hours of Operation (breakdown for various key areas as required)
- c. Utilities Required
- d. Mechanical Systems Description
- e. Chilled Water Design Entering and Leaving Temperatures
- f. Assumed Design Residual Pressure for the Domestic Cold Water System
- g. Electrical System Description

ENERGY IMPACT STATEMENT

SAMPLE

Building Description and Assumptions:

General:

- Central Campus building with mix of offices and classrooms. Some small labs.

Building Gross Floor Area:

- 40,000 GSF (4 Stories @ 10,000 GSF each)

Building Hours of Operation (breakdown for various key areas as required):

- 7 a.m. – 6 p.m. and as further defined in the attached calculations and computer simulation input schedules.

Utilities Required:

- Low pressure steam from Central Power Plant.
- High pressure steam from Central Power Plant.
- Domestic hot water from Central Power Plant.
- Domestic cold water from City of Ann Arbor.
- Natural gas from MichCon.
- Electricity from Central Campus sub-station.

Mechanical Systems Description:

- Single low pressure steam absorption water chiller.
- Roof mounted cooling tower.
- Two air handling units located in the basement mechanical room.
- VAV boxes with hot water reheat coils.
- Hot water perimeter heating via steam/hot water heat exchanger.
- Gas fired unit heaters at Loading Dock.
- High pressure steam for autoclaves.
- 44 F Entering Chilled Water Temperature, 56 F Leaving Chilled Water Temperature.
- Assumed design residual pressure for the Domestic Cold Water System is 30 psi.

Electrical System Description

- Electrical feed will come from Central Campus feeder 21-2.
- No emergency generator is required.

Project Name: XXXXXX Addition & Renovation U of M Project No.: Project No. P0000XXXX

Building Energy Summary:	Schematic Phase	Design Development Phase	Construction Document Phase
Project Affected Gross Area, (GSF)	40,000 <i>(See Exhibit A, 1.1)</i>	40,000 <i>(See Exhibit B, 1.1)</i>	40,000 <i>(See Exhibit C)</i>

ENERGY IMPACT STATEMENT
SAMPLE EXHIBIT A - SCHEMATIC DESIGN PHASE CALCULATIONS

In accordance with the Design Phase Deliverables; at the Schematic Design Phase, complete the following items which contribute to the development of the Energy Impact Statement:

- *Reviewed energy code requirements.*
- *Typical building elevations with window placement .*
- *Roof layout.*
- *Typical floor plans with identified area uses and resulting area square footage.*
- *Identified all needed HVAC systems with one-line flow diagrams.*
- *Conceptual plumbing and piping layout.*
- *Electric one-line diagrams based on conceptual electric requirements.*

Item No.	Building Energy Summary	Descriptions & Calculations
1.1	Project Affected Gross Area, (GSF)	40,000 Sq. Ft. per Schematic Design Phase Space Programming.
1.2	Annual Building Energy Consumption, (MBTU/year)	All Energy Input Converted to MBTU/year Electric = 2,730.4 MBTU/year [See Item 2.2] Low Pressure Steam = 11,301.0 MBTU/year [See Item 3.3] 60 PSI Steam = 236.4 MBTU/year [See Item 4.3] <u>Natural Gas = 250.0 MBTU/year [See Item 8.2]</u> Total All Sources = 14,519 MBTU/year
1.3	Annual Building Energy Consumption per Sq. Ft., (BTU/year/GSF)	14,519 MBTU/year / 40,000 SF = 363,000 Btu/year/SF

Item No.	Electrical	Descriptions & Calculations
2.1	Maximum Demand, (kW)	Assume: Lighting @ 2 Watts/SF Misc. Electric @ 5 Watts/SF <u>HVAC @ 5 Watts/SF</u> Results in 480 kW Peak Summer Load
2.2	Annual Consumption, (MWH/year)	Assume Annual consumption @ 20 kWh/year per SF. 20 kWh/year per SF X 40,000 SF = 800,000 kWh/year.
2.3	Lighting	<i>Breakout value not required for this item in Schematic Phase.</i>
2.4	Miscellaneous Power	<i>Breakout value not required for this item in Schematic Phase.</i>
2.5	HVAC Equipment	<i>Breakout value not required for this item in Schematic Phase.</i>

Item No.	Low Pressure Steam	Descriptions & Calculations
3.1	Summer Peak Load, (lbs/hr)	Cooling load assumed to be 125 SF/ton @ 40,000 SF = 320 tons/hr. Steam consumption for absorption chillers is approximately 20 lb/hr at 9 psi. Therefore, 320 tons X 20 lbs/hr = 6,400 lbs/hr.
3.2	Winter Peak Load, (lbs/hr)	Heating load assumed to be 45 Btu/SF X 40,000 SF Gross Floor Area /1160 BTU per lb @ 9 psi = 1,552 lbs/hr.
3.3	Annual Consumption, (MLB/yr)	<p>Cooling Consumption = 320,000 ton-hours/year [see Chilled Water, Item 4.3] X 20 lb-hour / 1000 lbs per MLB = 6,400 MLB/year.</p> <p>Heating Consumption = Using Heating Degree Day Method: (((1,552 lbs/hr peak load / (-10 °F - 72 °F)) X 6,258 Heating Degree Days [from ASHRAE 1984 Fundamentals, pg 24.25] X 24) / 1000 lbs per MLB = 2,843 MLB/year.</p> <p>Humidification + Domestic Water Re-Heating + Miscellaneous Steam Loads is assumed to be 500 MLB/year.</p> <p>Total Annual Consumption = Cooling + Heating + Miscellaneous = 6,400 + 2843 + 500 = 9,743 MLB/year.</p>
3.4	Heating	<i>Breakout value not required for this item in Schematic Phase.</i>
3.5	Humidification	<i>Breakout value not required for this item in Schematic Phase.</i>
3.6	Air Conditioning	<i>Breakout value not required for this item in Schematic Phase.</i>
3.7	Domestic Water Heating	<i>Breakout value not required for this item in Schematic Phase.</i>
3.8	Process	<i>Breakout value not required for this item in Schematic Phase.</i>

Item No.	60 PSI Steam	Descriptions & Calculations
4.1	Summer Peak Load, (lbs/hr)	Four Autoclaves: Assume 4 X 100 lbs/hour of 60 PSI steam required = 400 lbs/hour.
4.2	Winter Peak Load, (lbs/hr)	Same as Summer Peak Load = 400 lb/hr.
4.3	Annual Consumption, (MLB/yr)	Four Autoclaves: Assume 4 X 100 lbs/hour of 60 PSI steam required / 1000 lbs/hour per MLB/hr X 2 cycles/day X 250 days/yr = 200 MLB/year

Item No.	Chilled Water	Descriptions & Calculations
5.1	Summer Peak Load, (tons/hour)	Cooling load assumed to be 125 SF/ton @ 40,000 SF = 320 tons/hr.
5.2	Winter Peak Load, (tons/hour)	Assume winter peak load for computer server rooms and miscellaneous year-round cooling needs at 100 tons.
5.3	Annual Consumption, (ton-hours/year)	<p>Using Equivalent Full Load Hours Method: 320 tons peak load X 1000 hours equivalent full load operation [from ASHRAE 1984 Fundamentals, pg 28.5] = 320,000 ton-hours/year.</p> <p>Using Cooling Degree Day Method: (320 tons peak load/92 °F - 72 °F) X 687 Cooling Degree Days [from ASHRAE 1984 Fundamentals, pg 28.6] X 24 = 219,840 ton-hours/year.</p> <p>Conclusion: Use 320,000 ton-hours/year.</p> <p>Note: winter cooling load is handled by winterized cooling towers via free cooling system.</p>

Item No.	Domestic Cold Water	Descriptions & Calculations
6.1	Peak Demand, (GPM)	<p>Based on a review of the International Building Code, 2000 and International Plumbing Code, 2000 to determine maximum building occupancy levels and resulting minimum number of plumbing facilities, as well as a review of similar building types on campus, it was determined that the domestic cold water peak demand be based on 750 fixture units.</p> <p>From Table E102 of the International Plumbing Code, 2000, the resulting domestic cold water peak demand is 177 GPM.</p> <p>Additionally the cooling tower has an estimated peak domestic cold water demand of 23 GPM [Calculated using “Marley Cooling Tower Fundamentals”].</p> <p>Total DCW Peak Demand = 177 + 23 = 200 GPM.</p>
6.2	Peak Sanitary Demand, (GPM)	<p>Peak Sanitary Demand = Domestic Cold Water Demand [Item 5.1] + Domestic Hot Water Demand [Item 6.1] – Cooling Tower Make-up [Item 5.1] = 177 + 77 – 23 = 231 GPM.</p>
6.3	Annual Consumption, (gallons/year):	<p>Occupied DCW: 177 GPM X 25% Diversity X 2,000 hours/year = 5.31 million gallons/year.</p> <p>Unoccupied DCW: 177 GPM X 2.5% Diversity X 6,760 hours/year = 1.80 million gallons/year.</p> <p>Cooling Tower Make-up: 23 GPM X 20% Diversity X 8,760 hours/year = 2.42 million gallons/year.</p> <p>Total = 5.31 + 1.80 + 2.42 = 9.53 million gallons/year.</p>
6.4	Sanitary Sewer	<i>Breakout value not required for this item in Schematic Phase.</i>
6.5	Cooling Tower Evaporation + Drift	<i>Breakout value not required for this item in Schematic Phase.</i>
6.6	Cooling Tower Blowdown	<i>Breakout value not required for this item in Schematic Phase.</i>

Item No.	Domestic Hot Water	Descriptions & Calculations
7.1	Peak Demand, (GPM)	Based on a review of the International Building Code, 2000 and International Plumbing Code, 2000 to determine maximum building occupancy levels and resulting minimum number of plumbing facilities, as well as a review of similar building types on campus, it was determined that the domestic hot water peak demand be based on 250 fixture units. From Table E102 of the International Plumbing Code, 2000, the resulting domestic hot water peak demand is 75 GPM.
7.2	Annual Consumption, (million gallons/year):	Occupied: 75 GPM X 25% Diversity X 2,000 hours/year = 2.25 million gallons/year. Unoccupied: 75 GPM X 2.5% Diversity X 6,760 hours/year = 0.76 million gallons/year. Total = 2.25 + 0.76 = 3.01 million gallons/year.

Item No.	Natural Gas	Descriptions & Calculations
8.1	Peak Demand, (CCF/hour)	Two Gas Fired Unit Heaters in Loading Dock: Assume 2 X 250,000 BTU/hr = 500,000 BTU/hr / 100,000 BTU/CCF = 5 CCF/hour.
8.2	Annual Consumption, (CCF/year):	Two Gas Fired Unit Heaters in Loading Dock: Assume 2 X 250,000 BTU/hr X 2000 hours/year operation x 25% diversity / 100,000 BTU/CCF = 2,500 CCF/year.

Item No.	Storm Drainage System	Descriptions & Calculations
9.1	Design Peak Storm Volume, (GPM)	From 2000 International Plumbing Code, Section 1106: Assume roof area of 10,000 sf @ 2.75 inches/hr (100 year rainfall) = 286 GPM.

ENERGY IMPACT STATEMENT

SAMPLE EXHIBIT B - DESIGN DEVELOPMENT PHASE CALCULATIONS

In accordance with the Design Phase Deliverables; at the Design Development Phase, complete the following items (in addition to those completed during the Schematic Design Phase) which contribute to the further refinement of the Energy Impact Statement:

- *All building elevations with window placement and wall sections .*
- *Roof and drainage plan.*
- *All floor plans with identified area uses and resulting area square footage.*
- *Design criteria for each mechanical system.*
- *Equipment schedules for major mechanical items.*
- *Overall building airflow diagram.*
- *Conceptual control diagrams for all mechanical and plumbing systems.*
- *Preliminary calculations for HVAC systems.*
- *Design criteria for each plumbing system, including set points, etc.*
- *One-line diagrams for all plumbing systems.*
- *Plumbing and piping plans.*
- *Typical lighting plans.*
- *Lighting fixture schedule.*
- *Review of lighting energy code requirements.*
- *Normal power riser diagram.*
- *Power panel schedules.*
- *Electric load estimates.*

Item No.	Building Energy Summary	Descriptions & Calculations
1.1	Project Affected Gross Area, (GSF)	40,000 GSF per Design Development Phase Space Programming.
1.2	Annual Building Energy Consumption, (MBTU/year)	All Energy Input Converted to MBTU/year Electric = 2,684 MBTU/year [See Item 2.2] Low Pressure Steam = 9,749 MBTU/year [See Item 3.3] 60 PSI Steam = 148 MBTU/year [See Item 4.3] <u>Natural Gas = 200 MBTU/year [See Item 8.2]</u> Total All Sources = 12,781 MBTU/year
1.3	Annual Building Energy Consumption per GSF, (BTU/year/GSF)	12,781 MBTU/year / 40,000 GSF = 319,522 kBtu/year/GSF

Item No.	Electrical	Descriptions & Calculations
2.1	Maximum Demand, (kW)	<p>Data from Design Development Phase lighting and power panel schedules was input into a computer simulation program. See Table B.1, “Billing Details – Electric” for maximum electric demand.</p> <p>The maximum electric demand of 474 kW occurs in June.</p>
2.2	Annual Consumption, (MWH/year)	<p>Data from Design Development Phase lighting and power panel schedules was input into a computer simulation program. See Table B.1, “Billing Details – Electric” for annual electric consumption.</p> <p>The annual electric consumption for all components is 786,545 kWh.</p>
2.3	Lighting	<p>For electrical consumption by component, see Table B.2, “Energy Budget by System Component”. This table shows electrical energy as kBTUs. The estimated annual electrical consumption for lighting is listed under “Site Energy” as 1,181,170 kBTU per year. This converts to 346,080 kWh per year.</p>
2.4	Miscellaneous Power	<p>For electrical consumption by component, see Table B.2, “Energy Budget by System Component”. This table shows electrical energy as kBTUs. The estimated annual electrical consumption for miscellaneous power is listed under “Site Energy” as 724,809. This converts to 212,367 kWh per year.</p>
2.5	HVAC Equipment	<p>For electrical consumption by component, see Table B.2, “Energy Budget by System Component”. This table shows electrical energy as kBTUs. The estimated annual electrical consumption for HVAC is listed under “Site Energy” as the sum of the air system fans, pumps and cooling towers, or $536,896 + 53,690 + 187,913 = 778,499$. This sum converts to 228,098 kWh per year.</p>

Item No.	Low Pressure Steam	Descriptions & Calculations
3.1	Summer Peak Load, (lbs/hr)	Data from Design Development Phase was input into a computer simulation program to determine the estimated summer peak steam demand. See Table B.3, "Hourly Simulation – Summer Chiller Plant" for details. The peak summer steam demand includes steam for the absorption chiller. The peak summer steam demand of 6,080 lbs/hr occurs at 4:00 pm on July 22.
3.2	Winter Peak Load, (lbs/hr)	Data from Design Development Phase was input into a computer simulation program to determine the estimated winter peak steam demand. See Table B.5, "Hourly Simulation – Heating Plant" for details. The peak winter steam demand includes all heating loads plus humidification loads. The peak winter steam demand of 1,628 MBH or 1,403 lbs/hr occurs at 7:00 am on January 15.
3.3	Annual Consumption, (MLB/yr)	Total Annual Consumption = Heating [Item 3.4] + Humidification [Item 3.5] + Air Conditioning [Item 3.6] + Domestic Water Reheating [Item 3.7] = 2,436 + 8.94 + 5,957 + 2 = 8,404 MLB/year.
3.4	Heating	For steam consumption by component, see Table B.2, "Energy Budget by System Component". This table shows steam energy as kBTUs. The estimated annual steam consumption for heating is listed under "Site Energy" as 2,825,760. This converts to 2,436 MLB per year.
3.5	Humidification	For steam consumption by component, see Table B.2, "Energy Budget by System Component". This table shows steam energy as kBTUs. The estimated annual steam consumption for humidification is listed under "Site Energy" as 107,228. This converts to 8.94 MLB per year.
3.6	Air Conditioning	For steam consumption by component, see Table B.2, "Energy Budget by System Component". This table shows steam energy as kBTUs. The estimated annual steam consumption for air conditioning (steam absorption) is listed under "Site Energy" as 6,910,259. This converts to 5,957 MLB per year.
3.7	Domestic Water Heating	Domestic hot water is supplied from the Central Power Plant. Supplemental reheating of the domestic hot water is done with Plant steam to maintain the discharge water temperature set point. The annual consumption is estimated at 2 MLB per year.
3.8	Process	None required for this building

Item No.	60 PSI Steam	Descriptions & Calculations
4.1	Summer Peak Load, (lbs/hr)	During the Design Development Phase two autoclaves were eliminated. From the equipment schedules, the two remaining autoclaves require 125 lbs/hour. 2 X 125 lbs/hour of 60 PSI steam required = 250 lbs/hour.
4.2	Winter Peak Load, (lbs/hr)	Same as Summer Peak Load = 250 lbs/hr.
4.3	Annual Consumption, (MLB/yr)	Assume 2 X 125 lbs/hour of 60 PSI steam required / 1000 lbs/hour per MLB/hr X 2 cycles/day X 250 days/yr = 125 MLB/year

Item No.	Chilled Water	Descriptions & Calculations
5.1	Summer Peak Load, (tons/hour)	<p>Data from Design Development Phase was input into a computer simulation program to determine the estimated peak chilled water demand. See Table B.3, “Hourly Simulation – Summer Chiller Plant ” for details.</p> <p>The peak summer chilled water demand of 3,648 MBH or 304 tons occurs at 4:00 pm on July 22.</p>
5.2	Winter Peak Load, (tons/hour)	<p>Data from Design Development Phase was input into a computer simulation program to determine the estimated peak chilled water demand. See Table B.4, “Hourly Simulation – Winter Chiller Plant” for details.</p> <p>Winter free cooling operation (absorption chillers off) is assumed to occur between October and April.</p> <p>The peak winter chilled water demand of 984 MBH or 82 tons occurs at 2:00 pm on April 28.</p>
5.3	Annual Consumption, (ton-hours/year)	<p>Data from Design Development Phase was input into a computer simulation program to determine the annual chilled water consumption. See Table B.2, “Energy Budget by System Component” for details.</p> <p>The estimated annual chilled water consumption is listed under “Site Energy” as 3,574,272 kBTU. This converts to 297,856 ton-hours per year.</p> <p>Note: winter cooling load is handled by winterized cooling towers via free cooling system.</p>

Item No.	Domestic Cold Water	Descriptions & Calculations
6.1	Peak Demand, (GPM)	<p>Based on a review of the International Building Code, 2000 and International Plumbing Code, 2000 to determine maximum building occupancy levels and resulting minimum number of plumbing facilities, as well as a review of similar building types on campus, it was determined that the domestic cold water peak demand be based on 750 fixture units.</p> <p>From Table E102 of the International Plumbing Code, 2000, the resulting domestic cold water peak demand is 177 GPM.</p> <p>Additionally the cooling tower has an estimated peak domestic cold water demand of 23 GPM [Calculated using “Marley Cooling Tower Fundamentals”].</p> <p>Total DCW Peak Demand = 177 + 23 = 200 GPM.</p>
6.2	Peak Sanitary Demand, (GPM)	<p>Peak Sanitary Demand = Domestic Cold Water Demand [Item 5.1] + Domestic Hot Water Demand [Item 6.1] – Cooling Tower Make-up [Item 5.1] = 177 + 77 – 23 = 231 GPM.</p>
6.3	Annual Consumption, (million gallons/year):	<p>Occupied DCW: 177 GPM X 25% Diversity X 2,000 hours/year = 5.31 million gallons/year.</p> <p>Unoccupied DCW: 177 GPM X 2.5% Diversity X 6,760 hours/year = 1.80 million gallons/year.</p> <p>Cooling Tower Make-up: 23 GPM X 20% Diversity X 8,760 hours/year = 2.42 million gallons/year.</p> <p>Total = 5.31 + 1.80 + 2.42 = 9.53 million gallons/year.</p>
6.4	Annual Sanitary Sewer, (million gallons/year)	<p>Annual sanitary sewer volume is estimated as: The sum of the annual domestic cold water (DCW) consumption + annual domestic hot water (DHW) consumption + annual cooling tower blowdown.</p> <p>Occupied DCW = 5.31 million gallons/year. [Item 6.3] Unoccupied DCW = 1.80 million gallons/year. [Item 6.3] Occupied DHW = 2.25 million gallons/year. [Item 7.2] Unoccupied DHW = 0.76 million gallons/year. [Item 7.2] Cooling Tower Blowdown = 0.37 million gallons/year. [Item 6.6]</p> <p>Total = 5.31 + 1.80 + 2.25 + 1.80 + 0.37 = 11.53 million gallons/year.</p>
6.5	Cooling Tower Evaporation + Drift, (million gallons/year):	<p>Peak cooling tower evaporation is calculated using “Marley Cooling Tower Fundamentals” as: E=R/10/100 X Circulation Water Volume Where: E=Evaporation, GPM R=Temperature range. In this case 100 F – 85 F = 15 F. Circulation water volume is 4 GPM per ton of absorption chilling or 4 GPM X 320 Tons = 1,280 gallons of circulating water. E=15/10/100 X 1,280 = 18.1 GPM</p> <p>Peak cooling tower drift is calculated as: D=0.1% X Circulation Water Volume D=0.1% X 1,280 = 1.3 GPM</p>

		<p>Annual cooling tower evaporation + drift is estimated as: $(18.1 \text{ GPM} + 1.3 \text{ GPM}) \times 20\% \text{ Diversity} \times 8,760 \text{ hours/year}$ $= 2.04 \text{ million gallons/year}$.</p> <p>Note: This water volume is not included in the sanitary sewer calculation as it does not go to the sanitary sewer.</p>
6.7	<p>Cooling Tower Blowdown, (million gallons/year):</p>	<p>Peak cooling tower blowdown is calculated using “Marley Cooling Tower Fundamentals” as: $B = (((R/10) / (CC-1)) - 0.1) / 100 \times \text{Circulating Water Volume}$ Where: B=Blowdown, GPM R=Tower temperature range. In this case 100 F – 85 F = 15 F. CC=Concentration cycles. In this case 5 cycles is assumed. Circulation water volume is 4 GPM per ton of absorption chilling or 4 GPM X 320 Tons = 1,280 gallons of circulating water. $B = ((15/10) / (5-1)/100) \times 1,280 = 3.5 \text{ GPM}$</p> <p>Annual cooling tower blowdown is estimated as: 3.5 GPM X 20% Diversity X 8,760 hours/year = 0.37 million gallons/year.</p> <p>Note: This water volume is included in the sanitary sewer calculation as it does go to the sanitary sewer.</p>

Item No.	Domestic Hot Water	Descriptions & Calculations
7.1	Peak Demand, (GPM)	<p>Based on a review of the International Building Code, 2000 and International Plumbing Code, 2000 to determine maximum building occupancy levels and resulting minimum number of plumbing facilities, as well as a review of similar building types on campus, it was determined that the domestic hot water peak demand be based on 250 fixture units.</p> <p>From Table E102 of the International Plumbing Code, 2000, the resulting domestic hot water peak demand is 75 GPM.</p>
7.2	Annual Consumption, (million gallons/year):	<p>Occupied: 75 GPM X 25% Diversity X 2,000 hours/year = 2.25 million gallons/year.</p> <p>Unoccupied: 75 GPM X 2.5% Diversity X 6,760 hours/year = 0.76 million gallons/year.</p> <p>Total = 2.25 + 0.76 = 3.01 million gallons/year.</p>

Item No.	Natural Gas	Descriptions & Calculations
8.1	Peak Demand, (CCF/hour)	Two Gas Fired Unit Heaters in Loading Dock: From the Design Development Phase mechanical equipment schedules, the two gas fired unit heaters were downsized two at 200,000 BTU/hr each. $2 \times 200,000 \text{ BTU/hr} = 400,000 \text{ BTU/hr} / 100,000 \text{ BTU/CCF} = 4 \text{ CCF/hour.}$
8.2	Annual Consumption, (CCF/year):	Two Gas Fired Unit Heaters in Loading Dock: Assume $2 \times 200,000 \text{ BTU/hr} \times 2000 \text{ hours/year operation} \times 25\% \text{ diversity} / 100,000 \text{ BTU/CCF} = 2,000 \text{ CCF/year.}$

Item No.	Storm Drainage System	Descriptions & Calculations
9.1	Design Peak Storm Volume, (GPM)	Roof area from Design Development Phase Roof Plan is 10,560 SF. From 2000 International Plumbing Code, Section 1106: $10,560 \text{ SF} @ 2.75 \text{ inches/hr (100 year rainfall)} = 302 \text{ GPM.}$

ENERGY IMPACT STATEMENT

SAMPLE EXHIBIT C - CONSTRUCTION DOCUMENT PHASE CALCULATIONS

In accordance with the Design Phase Deliverables; at the Construction Document Phase, complete the following items (in addition to those completed during the Design Development Phase) which contribute to the further refinement of the Energy Impact Statement:

- *Complete specification.*
- *One-line diagrams for all mechanical systems.*
- *Duct layout and air flow volumes for each space.*
- *Detailed control drawings with sequences of operation.*
- *All design calculations.*
- *Lighting plans for all areas.*
- *Electrical power load summary.*
- *Electrical panel schedules.*

Because the majority of the information needed for accurate estimates in the Energy Impact Statement is available in the Design Development Phase, most projects will require very little modification of the Energy Impact Statement in moving to the Construction Document Phase. Also, there is no change in the methodology used to determine estimates in moving from the Design Development Phase to the Construction Document Phase.

For these reasons, it is assumed that (for this example) there is no change in the Energy Impact Statement. Estimates shown in the Design Development Phase column of the Energy Impact Statement are repeated in the Construction Document Phase column.

It is not unusual for projects to change significantly in moving from Design Development Phase to Construction Document Phase (usually due to budget constraints). In these cases there may be significant changes to the Energy Impact Statement which the Design Professional will be expected to document.

DESIGN GUIDELINE 3.3 **SUSTAINABLE PRODUCTS PORTFOLIO**

Scope

The [Sustainable Products Portfolio \(SPP\)](#) is maintained by the Sustainability Team at the University of Michigan (U-M) Department of Architecture, Engineering & Construction (AEC). The SPP consists of a list of sustainable products that the University has evaluated and which have been found to meet our sustainable selection criteria. The SPP is a resource that project teams are encouraged to use to select sustainable products. The SPP is not an all inclusive list of available sustainable products and technologies. It is not intended to limit competition or replace creative sustainable design solutions. Sustainable products not on the SPP shall be submitted to the AEC Sustainability Team for review.

Related Sections

[3.1 Sustainable Design and LEED® Requirements](#)

Sustainability Criteria

The criteria used to determine if a product is listed in the SPP include but are not limited to the following:

- Simple to install and easy to maintain
- Long term durability
- Simple to operate
- Reliable
- Aesthetically pleasing
- Competitively priced
- Proven track record
- Replacement parts readily available and fairly priced
- Good local service
- Sustainable manufacturing process
- Sustainability claims can be validated
- Made from Renewable and/or Recycled Materials
- Locally Harvested/Extracted/Manufactured
- Low VOC content

The weight given to each selection criteria will vary from product to product as appropriate for that particular product. The SPP is updated on an ongoing basis and is meant to provide a menu of sustainable products the A/E can select from in confidence knowing such products will ultimately meet U-M's sustainability goals. Additionally, products found not to meet university requirements, for example found unreliable after a "real world" installation period, will be removed from the SPP.

SPP Additions and Changes

Anyone requesting that a product be added to or changed on the SPP must use the [Request for Addition or Change to the SPP Listing](#) form available on the AEC website. The extent of evaluation will vary based on the product; therefore, time to evaluate requests will vary.

If an A/E desires to use a sustainable product not found on the SPP, provide information to the U-M Design Manager, who shall consult with the U-M Sustainability Team for a recommendation. A/Es should provide the information requested on the Request for Addition or Change to the SPP Listing form.

SPP Listing Categories

Products are listed in the SPP in one of three categories:

1. Approved Product (AP): Product has been evaluated and is approved for use on U-M projects
2. Conditional Product (CP):
 - a. Product has been used on select U-M projects; however, post-occupancy evaluation has not been completed. UM Design Manager shall seek approval from the Sustainability Team for the intended use of the product.
OR
 - b. Product has not been used on U-M projects yet; however, a preliminary evaluation of the product indicated that the product meets the UM sustainability criteria if it performs as anticipated. UM Design Manager shall seek approval from the Sustainability Team for the intended use of the product.
3. Not Recommended (NR):
 - a. Product has been used on U-M project(s) and did not perform to the required sustainability criteria. The Sustainability Team does not recommend this product.
OR
 - b. Product has not been used on U-M project(s); however results from an evaluation of the product completed by the Sustainability Team deemed that the product did not perform to the required sustainability criteria. The Sustainability Team does not recommend this product.

DESIGN GUIDELINE 3.4 **RECYCLING MATERIALS**

Introduction

This section addresses recycling and other diversion methods for materials that may be encountered in construction or demolition projects. This document provides guidance for identifying materials which are recyclable or otherwise able to be diverted and available methods for proper disposal.

Related Sections

U-M Design Guidelines:

[3.1 Sustainable Design and LEED® Requirements](#)

U-M Master Specifications:

[7.0 MS028400 – PCB Remediation](#)

Demolition Requirements

All Projects

Efficient construction and demolition waste management is encouraged on all construction, renovation and demolition projects. Coordinate and review materials with the U-M Design Manager and the U-M Project Manager to identify adequate on-site facilities for separating and storing materials to be recycled and salvaged.

Definitions

Construction and Demolition Debris: Building and site improvement materials resulting from construction or demolition operations.

Disposal: Removal off-site of demolition and construction debris and subsequent sale, recycling, reuse, or deposit in a permitted solid waste landfill.

Hazardous Waste: Waste which contains asbestos, lead-based paint or oil and other corrosive or toxic materials.

Recycle: Diversion of demolition or construction debris from the landfill for reuse.

Salvage: Recovery of demolition or construction debris and subsequent sale or reuse in another facility.

Onsite Reuse: Recovery of demolition or construction debris and subsequent incorporation into the Work.

Potentially Hazardous: Materials which are painted, stained, glazed, treated, odorous or contaminated from a chemical spill.

Primary Constituents of Construction and Demolition Debris with Potential for Recycling

Asphalt Pavement:

Asphalt can be recycled and can be transported to an asphalt-recycling facility.

Asphalt Shingles:

Asphalt shingles can be recycled in Michigan so long as they do not contain asbestos. Contractor and the project client shall determine if recycling is cost effective. Currently the nearest receiving facilities are in Lansing, Flint and Southfield.

Carpet:

Carpet and carpet padding may be recycled without restriction. Adhesives and tack strips need to be removed upon removal.

Ceiling Tile:

Major ceiling tile manufacturers offer no-cost pickup and recycling of many types of clean, unpainted, uncontaminated tile. Foil backed tile cannot currently be recycled in this area. To be recycled, tile must be tested for asbestos and must be located in an area where there is no above-ceiling asbestos. On-site requirements include a location for storing palletized and shrink-wrapped tile for pickup by the manufacturer. Specific requirements can be obtained by contacting the two manufactures that offer the service in this area; Armstrong and USG.

Concrete:

Clean (i.e. unpainted, uncoated, uncontaminated) concrete may be recycled or reused. Reuse options to be reviewed and coordinated with U-M Design Manager. Concrete that is painted, glazed, stained, treated, odorous or otherwise contaminated from a chemical spill must be tested by OSEH to determine disposal and recycling options.

Flooring:

Flooring may be recycled provided it is not painted, stained or contaminated from a chemical spill. Tile which is glazed/fired must be tested by OSEH.

Gypsum Board:

Clean gypsum can be diverted to recycling and reuse outlets by performing the following actions:

- Deposit clean gypsum scrap into source separated containers and protect from weather.
- Remove edge trim and sort with other materials.
- Remove and dispose of fasteners or other contaminants.

Materials which may be contaminated (i.e. painted, stained, or otherwise treated) shall be tested by OSEH. If paint has been treated and found to contain lead, the material must be further tested using Toxicity Characteristic Leaching Procedure (TCLP) to determine if it is a hazardous waste. Any attempt to clean or separate contaminated from uncontaminated material must be done with OSEH approval.

Masonry:

Masonry including, brick, block, and stone are recyclable provided they are not contaminated (i.e. painted, sealed, glazed). Materials which may be contaminated shall be tested by OSEH to determine appropriate disposal or recycling options.

Metals:

Metals including rebar, pipe, copper, aluminum, steel, lead and other metals may be recycled provided they are not hazardous. Materials which are painted, coated, or contaminated must be tested by OSEH prior to attempts to clean or separate contaminated from uncontaminated material. Clean materials may be reused on-site or taken off-site to recycle or to a donation center. Review and coordinate the reuse of materials with U-M Design Manager and verify whether MDEQ permits are required for proposed material reuse.

Packaging Material:

Boxboard, corrugated cardboard, and mixed paper may be recycled without restriction. When possible, require suppliers to remove pallets from Project site.

Plaster:

Plaster is recyclable when free of asbestos or lead paint. Old plaster is essentially concrete material and can be recycled as such. Lime plaster is also recyclable in most communities.

Wood:

Unpainted, untreated, and unstained wood, including scrap wood and untreated wood sawdust can be recycled, or can be used on site with OSEH approval. Materials which may be contaminated (i.e. painted, stained, or otherwise treated) shall be tested by OSEH. Any attempt to clean or separate contaminated from uncontaminated material must be done with OSEH approval.

Yard Waste:

Site-clearing wastes such as brush, branches and trees may be chipped on site. Contact Grounds Services to determine if resulting mulch is able to be composted on U-M property.

Vinyl Siding:

Clean vinyl siding may be recycled without restriction. If siding has been painted or otherwise treated, it must be tested by OSEH. Any attempt to clean or separate contaminated from uncontaminated material must be done with OSEH approval.

Other:

Other potentially recyclable materials commonly resulting from construction and demolition projects include glass, plastic, paper, rubber, textiles and appliances. Assuming asbestos and PCB's have been removed or are otherwise not present, these materials are recyclable if not potentially hazardous due to any chemical treatment or spills. If there is reason to believe these materials may be contaminated, OSEH should be contacted.

Flowchart for Recycling and Disposal of Building Construction & Demolition Debris

The attached Flowchart for Recycling and Disposal of Building Construction & Demolition Debris distinguishes what demolition and construction waste materials can be recycled offsite, reused onsite or sent to a type I landfill.

DESIGN GUIDELINE 3.5 **WASTE, RECYCLING, AND COMPOST**

Scope

Supplement guidelines provided by the Office Campus Sustainability related to waste, recycling, and composting containment.

Related Sections

Reference Documents:

[*Waste and Recycling Bin Standardization*](#)

Design and Placement Requirements

University of Michigan will provide waste, recycling, and composting containers and related signage. Reference Waste and Recycling Bin Standardization for bin types, sizes, signage, and detailed placement recommendations. Early in the design process, Design Professional shall consider and accommodate clear floor space for bins. Design Manager will coordinate with partner F&O units for supplemental guidance on placement and information regarding frequency of material removal.

All Building codes, standards, and guidelines for the University of Michigan shall be met.

Custom Built-in Bins:

Custom bins and built-in casework containing bins are strongly discouraged. Preference is to maintain continuity of containers/signage across the University and provide flexibility for potential operational changes. Review proposed custom applications with Design Manager.

Sustainability Facts

Building Name / Project Name

Building Use xxxx
 Location Ann Arbor, Michigan
 Size xx,xxx Square Feet
 Number of Occupants xxx

LEED version	v2009	
LEED certification level	Silver	
ASHRAE 90.1 version	2007	
Energy cost savings compared to ASHRAE baseline	xx%	
Total energy savings	\$xx,xxx / year	
Total electrical savings	xx,xxx KWh / year	
Total gas savings	xx,xxx Therms / year	
CO2 emissions avoided	xx,xxx tons	
Water fixture baseline	2012 Michigan Plumbing Code	
Total water savings	xx%	
On-site renewable energy generation (if applicable)	xx%	
Construction/Demolition waste diverted from landfill	xx%	
Insulation (R-Value)*	Code	Project
Wall assembly - above grade	xx	xx
Wall assembly - below grade	xx	xx
Roof assembly	xx	xx
Glazing - Curtain wall system		
U-value**	xx	xx
Solar Heat Gain Coefficient (SHGC)**	xx	xx
Glazing - Fixed assembly		
U-value**	xx	xx
Solar Heat Gain Coefficient (SHGC)**	xx	xx
Glazing - Visible Light Transmittance (VT)***	xx	
Project Team		
Owner	University of Michigan - School of Social Work	
Architect	xx	
Engineer	xx	
Contractor	xx	
Commissioning Authority	xx	
Project Management	U-M AEC	

Design Period: 01/2015 - 01/2016
 Construction Period: 01/2014 - 01/2015
 * The higher the R-value the better the insulating quality
 ** The lower the U-value and SHGC the more energy efficient the window
 *** The higher the VT value the more daylight in the space. VT is measured between 0 and 1

Energy Efficiency Measures

(Insert text description of energy goal/focus)

- (And list energy measures in bullet form)

Other Sustainability Features

- (List in bullet form)

Comprehensive Transportation Management University of Michigan

The University of Michigan has many commuter programs available for **<Insert project name>** occupants as well as faculty, staff and students in all U-M facilities. These programs manage vehicle parking and provide alternatives to individual transportation needs. Enticing more employees and students to use alternative transportation to commute to and around U-M and its surrounding area reduces drive-alone commuting and vehicle trips while supporting the University's commitment to sustainability. Transportation priorities at U-M currently include:

- Pedestrians
- Bus Services
- Bicycle Safety and Services
- Vanpools and Carpools
- Zip Car
- Permit Parking for Private Vehicles

Pedestrians

Walking in and around the U-M campus is enjoyable and safe. Walking is made enjoyable by the well-kept sidewalks, pedestrian cross walks and signage and natural and architectural features. Also, U-M's proximity to downtown Ann Arbor offers a diverse mix of restaurants, shopping and culture all within walking distance.

To keep pedestrians safe and encourage alternative forms of transportation, there are a variety of free taxi services and a free van service for students, faculty and staff. The taxi services provide reliable transportation to those who work late or need a ride in the event of an emergency. The reassurance of reliable transportation encourages walking to and around campus and therefore reduces the total number of trips of single occupancy vehicles.

Bus Services

Campus bus service is provided 360 days a year, with roughly 60 buses on routes that connect the four main Ann Arbor campuses, as well as the East Ann Arbor Health Center. Campus bus services have surpassed the 7 million ride mark and over 7,200,000 passengers are projected to ride U-M buses (includes fixed route and charter services) during FY2012 (estimates used for the last week of May and June based on FY2011).

Through the MRide contract with the Ann Arbor Transportation Authority (AATA), the University provides fare-free rides on all AATA bus routes for U-M faculty, staff and students. 2.39 million rides were taken via MRide in FY2011. As of the current date (through May 2012), FY2012 MRide ridership is projected at approximately 2.56 million, a 7.3% increase from FY2011 and 41% of total fixed route AATA passengers (6.24 million). MRide is estimated to reach 2.9 million rides in 2013 based on current trends.

ExpressRide offers commuter express bus service from Chelsea or Canton to U-M/ Ann Arbor operated by AATA. U-M continues to help AATA promote complimentary ten-ride tickets to boost use of the service and continues to subsidize both monthly and ten-ride passes (50% discount for U-M employees). An average of 31% of the Chelsea riders are U-M staff; an average of 65% of the Canton riders are U-M staff.

Related Projects/Programs

- U-M acquired 15 additional hybrid-electric sedans and 4 hybrid-electric buses in FY2012 as replacements to the existing campus fleet, further reducing petroleum-based fuel consumption. At the close of FY2012, over 64% of the U-M campus fleet is alternative fueled vehicles. Of 509 vehicles in the automotive class, 89% run on alternative fuel sources (54 Hybrid and 401 Ethanol). Of 504 vehicles in the truck class, 34% are alternative fuel vehicles (124 Ethanol; 15 Electric; and, 33 Biodiesel). In the bus class, all 58 vehicles are alternative fuel vehicles (4 Hybrid and 54 Biodiesel). As technology evolves, the capital bus replacement plan at U-M intends to transition the bus fleet to more fuel efficient and cost effective models in the future.
- A central campus transit facility was built along North University on Central Campus in 2010. The hub is shared by U-M bus service, AATA and incorporated transit, bicycle and pedestrian related improvements.
- Bus Operations Transition Plan: In 2010, a consultant was retained to develop a transportation technology overview that looked at high-capacity transit technologies to better connect the U-M campuses. In 2011, follow up work began on a transition operation plan for the U-M bus system, which included refinement of the bus route system to better serve campus growth (including North Campus Research Complex expansion) and address construction projects on the Medical Campus. In Spring of 2011, enhanced U-M bus service to Medical Campus and the university community was implemented. The changes to U-M bus service included earlier start times, increased frequency and more convenient service from commuter lots. In Fall 2011 the two new routes were fully implemented and helped achieve better utilization of the bus system and improved campus connections. U-M bus service was further enhanced in 2012 with additional North/Central (inbound and outbound) trips at peak times.
- Direct Marketing and Outreach: In 2011, a direct marketing plan and outreach efforts were implemented to better serve constituent groups on campus. With respect to U-M Health System, strategies have included providing express bus service between parking areas and Medical Campus during peak staffing periods, re-tasking existing parking areas on campus and direct marketing of transportation options (alternatives to single-occupancy vehicles) through focus groups and targeted emails (based on residence locations) to U-M Health System employees.

Bicycle Safety and Services

Bike lanes exist on many streets on the U-M campus and in the surrounding Ann Arbor area. Also, many of the roads on and around campus are low volume with low speed limits where bicycles are able to share the road easily with motorists.

Bicycle parking is made easy on and around campus through many convenient options including bicycle racks, lockers and covered parking. There are over 8,000 bike parking spaces on campus. Bicycles also work with other alternative transportation options such as the AATA's buses which have bike racks on them.

In March of 2012, U-M was one of only 35 campuses nationwide to receive the designation of a Bicycle Friendly University (BFU) by the League of American Bicyclists in recognition of its programs and commitment to bicycling on campus. The selection criteria consider a campus bike program's engineering, education, encouragement, enforcement, evaluation and planning.

Related Projects/Programs

- U-M has focused on expanding the campus bike network, including laneage and sharrow additions on roads within University control and contributing to the planning, design and financing of several additions to City roadways. Examples include the Palmer bikeway and bike lanes along Ann Street and North University. The Thompson Street Parking Structure Addition, constructed in 2010, includes an enclosed/secure bicycle parking facility with 50 spaces and an air compressor onsite. In addition to this facility, in recent years U-M has provided new and expanded parking areas on campus, including: Central Campus Transit Center (featuring extensive bike parking and bike travel lanes) and the North Quad Residential and Academic Complex (Central Campus) featuring covered parking. A campus-wide Bike Townhall Meeting was held in January of 2012, preceding the BFU announcement—the successful event announced progress on campus bike programs and obtained input from the campus community. Significant progress toward initiating campus bike rental and bike sharing programs was also made in 2012.
- “Blue Bikes” Rental Program, will commence on campus in early Fall 2012, featuring bicycles for shorter-term and semester-long rental at the North Campus Recreation Building (NCRB) and Outdoor Adventures Space (Elbel Field).
- Bike Sharing Project: In 2011, U-M began working collaboratively with the City of Ann Arbor, Ann Arbor Transportation Authority, Downtown Development Authority and Clean Energy Coalition to bring a modern bike sharing system to the campus and City of Ann Arbor. A pilot program is expected in 2013, featuring approximately 70 bicycles and ten stations in year one.
- The University of Michigan Outdoor Adventures program partners with Common Cycle, a community-based organization founded by U-M students, to offer bike maintenance clinics on a weekly basis (schedule varies by term). At these workshops, participants learn general bike maintenance including but not limited to brake adjustments, chain maintenance, tire truing, and cable adjustments. They also allow opportunity to share knowledge with others and learn while working on a bicycle. The same group also offers workshops within the community and at events on campus.
- There are a number of showers/locker facilities available to the campus community. Students are able to shower/use locker room facilities free of charge in three campus recreation buildings located on the Ann Arbor campus. Staff/faculty are eligible to purchase membership at rates reduced from typical gym memberships. Several academic buildings have showers/locker facilities available to faculty/staff/students through pincode access. There are also a number of buildings with showers/lockers available to building employees and/or students. Examples include Wolverine Tower, Art & Architecture, Fletcher Administration, Office of Campus Sustainability and DPS.
- In 2011, Planet Blue Student Innovation Grant Funding was awarded for a project involving installation of a bike fix-it stand and two public air pumps on campus. This project is currently in the planning process with locations under review.

- Each campus project goes through design review which ensures adequate and proper placement of new bicycle parking facilities for any new construction or renovation project. The City of Ann Arbor adopted a Complete Streets Policy (March 2011). The Complete Streets Policy objective is to construct streets that accommodate a full range of users from pedestrians, to bicyclists, to public transit, and private vehicles. U-M adheres to this policy for all City streets on or adjacent to campus property. All City and University streets are managed and maintained regularly providing safe traveling.
- City of Ann Arbor Non-Motorized Plan: U-M has been a robust leader in establishing Ann Arbor as a first-class bicycling city. As a positive civic and community partner, U-M has worked closely with civic and community groups to establish a comprehensive bike system, programs and services. U-M advised, planned and helped finance the City's 2007 non-motorized plan, which has led to the remarkable expansion of cycling and pedestrian amenities within Ann Arbor over the last few years. U-M is currently working with project partners on an update to the 2007 plan.

Ridesharing

Vanpools and Carpools

Vanpools provide transportation for up to six passengers and a driver. The vanpool participants meet each day in their community and ride together, are dropped off near work, and then the van is parked in a reserved parking place on campus. Joining and/or forming a vanpool is easy through the U-M site on GreenRide (<http://umich.greenride.com>) and by accessing the U-M vanpool welcome guide at: http://pts.umich.edu/alternative_transportation/welcome_guide.pdf. Vanpooling is sponsored by U-M and is available at low cost and can be deducted from payroll pre-tax. Dozens of communities surrounding U-M campuses are served by vanpools and U-M currently has 98 vanpools serving 600 university staff.

Carpool planning is enabled through the following website: <http://zimride.pts.umich.edu/>. Also, registering a carpool with U-M will allow riders to share a parking permit and thus reduce personal transportation costs. U-M has 20 registered carpools serving approximately 50 university staff.

Zipcar and Zimride

Zipcars are located around campus for use 24 hours a day, 7 days a week. U-M students, faculty and staff can become a zipcar member at a discounted rate.

Zipcar membership has grown 32 percent since 2010; now at 3,332 U-M members, with Zipcar fleet utilization averaging approximately 52%, which is above optimal. The Zipcar fleet is now at 21 vehicles in a total of 8 locations on campus.

Zimride partners with Zipcar as another ride-matching option, but with a social network application for well-informed (and safer) ride-sharing and to allow members of Zipcar to use a Zipcar reservation on Zimride as one of the options for sharing a ride. U-M Zimride has had 4,209 cumulative ride postings: 75% for one-time rides; 25% for regular commutes.

Permit Parking for Private Vehicles

Personal vehicles are typically not necessary for students and to assist in managing student vehicle parking, student parking permits are available only to junior, senior and graduate students that are registered for classes while freshman and sophomore students are eligible for Student Storage parking permits only.

Parking availability is limited on campus; therefore, U-M has established eligibility criteria for faculty, staff and students and each eligible person is limited to the purchase of one parking option.

Additional information on U-M programs that manage vehicle parking on campus, alternative methods of transportation available to individuals, and a demonstration of quantifiable deduction in personal automobile use through incentive programs is located on the following website: <http://pts.umich.edu/>. U-M is dedicated to maintaining safe, efficient and innovative transportation options which minimize single occupancy vehicle use and enhances the overall quality of life on campus and in the surrounding areas.

Other Projects/Outreach Supporting Commute Options—*In addition to the projects noted above, these are some projects the University has been involved in related to the promotion of commute options. Please note that this list is not comprehensive of all projects the University has been involved —*

- **Integrated Assessment:** U-M is deeply committed to sustainability and creating a healthy footprint as outlined by the ambitious goals of Mary Sue Coleman, University President. Unlike many peer institutions, U-M has taken an in-depth look at its practices through a comprehensive process of Integrated Assessments (IA). The IA for Transportation calls for a 25% reduction in greenhouse gas emissions campus-wide by 2025. The IA provides a basis for future directions at the University—strategies enhancing commute options, including cycling-related recommendations play a prominent role. U-M is truly committed to advancing the goals and recommendations of the IA, with cycling efforts already underway. (<http://www.graham.umich.edu/ia/campus.php>)
- **STARS:** U-M scored a Silver rating in its first year participating in the Sustainability Tracking, Assessment & Rating System, STARS (<https://stars.aashe.org/>). U-M is among 92 schools internationally to receive a Silver rating. Participating with 189 other institutions, the university's rating is based on data from all areas of the Ann Arbor campus, including the U-M Health System. Alternative Transportation was a component of this rating.
- **Electric Vehicle Charging Station Project:** This project is currently underway. U-M acquired DOE grant funding for the installation of Level II electric vehicle charging stations on campus. The project anticipates installation at four campus sites, servicing eight spaces. Installation will likely occur between Summer 2012-January 2013.
- U-M frequently conducts and is involved in transportation/traffic/pedestrian improvement studies to enhance operations at key intersections, corridors or as parts of larger projects. Recent examples include: Medical Center Traffic Study, CCTC Traffic Study, SC10 Lot Improvement Project along Kipke Drive.

- Ann Arbor Connector Feasibility Study: The Ann Arbor Connector Feasibility Study was a joint project of the University of Michigan, the Ann Arbor Transportation Authority (AATA), City of Ann Arbor and the Ann Arbor Downtown Development Authority initiated in 2010. Its mission was to determine the feasibility of a high-capacity transit line connecting major trip generators in Ann Arbor. High capacity modes, including modern streetcar, light rail, bus rapid transit, monorail and a variety of other possibilities were examined. The first phase of the study concluded in November 2010 and determined the modes with the highest potential to meet the University and City's short and longer term needs, along with their associated estimated costs and estimated ridership. This project was renewed in 2012 and the project's Alternatives Analysis will commence this year.
- AATA Countywide Master Plan: From early 2010 to summer of 2011, the AATA Act 55 Board and staff developed a 30-year vision, with input from community members and over 70 public meetings that called for improving transit options within Ann Arbor and Ypsilanti, creating connections with nearby communities, and investing in 21st century transportation technologies. In FY2012, the AATA released a 5-year program and U-M has been working closely with AATA on service changes and expansion that impact the campus community. With support from PTS in 2012, AATA introduced new AirRide shuttle service (<http://myairride.com/>) between Ann Arbor and Detroit Metropolitan Airport.

LEED 2009 ENHANCED REFRIGERANT MANAGEMENT

									Qtotal:	1				Subtotal:	0	
							(Total tons of refrigeration for project)									
												Average refrigerant atmospheric impact:			0.0	
If the average refrigerant atmospheric impact is greater than 100, the project does not qualify for the credit.																
GWPr:		Look up in table on Sheet 2.														
ODPr:		Look up in table on Sheet 2.														
Rc:		Obtain from submittal or mfr. for specific equipment used.														
Life (Yr.s):		Use most recent edition of ASHRAE Applications Handbook to obtain. Input the handbook edition (year) into the heading above. DO NOT LEAVE AS 1 YEAR!														
Leak Rate:		2% is the required default per LEED unless documentation proves otherwise. Low pressure chlr.s (R123) often can be shown to have lower leak rates, for these insert lower rate and provide documentation to LEED.														
Decom. Leakage:		Decommission leak rate. 10% is the required LEED default, but can try to convince LEED project's leak rate will be lower due to proper recovery program (probably difficult).														
Other Terms:		See 2009 LEED Reference Guide for details.														
Notes:		Equipment with 0.5 lb.s or less refrigerant charge (e.g. water coolers) does not need to be included per LEED. Portable cooling equipment (such as standard refrigerators) and temporary cooling equipment may be excluded per LEED. District Energy Systems: equipment at district plant must be included along with refrigerant containing equipment installed by the project.

LEED 2009 for New Construction and Major Renovation

Project Checklist

Project Name:

Date:

This checklist indicates which LEED credits are typically achievable on University of Michigan projects. Revise to make project specific.

Column Heading Key:

Y: Likely achievable for 90%+ of campus projects.

N: Likely not achievable for campus projects.

?: Credit could be achieved but is too project specific to assume percentage of achievement.

Point Range Comments

Y	N	?	Credit	Credit Title	Point Range	Comments	
16	1	9	Sustainable Sites*				Points Possible: 26
			SSp1	Construction Activity Pollution Prevention		See DG Technical Sections 013639, 310000, and 312500.	
1			SSc1	Site Selection	1	Undeveloped areas near wetlands and within floodplains may have issues achieving this credit.	
5			SSc2	Development Density & Community Connectivity	5	Central campus and many areas of north campus should be able to achieve this credit.	
		1	SSc3	Brownfield Redevelopment	1	Contaminated sites should investigate this credit through the standard compliance path or an alternate compliance approach if the standard path is not applicable.	
6			SSc4.1	Alternative Transportation - Public Transportation Access	6	Potential relocation of bus stop for compliance, however, careful planning will be required so that moving a stop location(s) does not increase distance from an existing LEED certified building.	
1			SSc4.2	Alternative Transportation - Bike Storage and Changing Rooms	1	Showers located within 200 yards of projects can be counted towards this credit.	
		3	SSc4.3	Alternative Transportation - Low-Emitting and Fuel-Efficient Vehicles	3	B&F buildings may be able achieve this credit by providing fleet vehicles & fueling stations for FTE occupants, providing discounted parking rates for fuel-efficient vehicles, or alternative compliance approach in lieu of standard path.	
2			SSc4.4	Alternative Transportation - Parking Capacity	2	Projects that don't provide new parking or increase the number of existing parking spaces will achieve this credit.	
		1	SSc5.1	Site Development - Protect or Restore Habitat	1	Achievement could potentially be obtained by setting aside and restoring open space on U-M property to remain undeveloped for the life of the project.	
		1	SSc5.2	Site Development - Maximize Open Space	1	Achievement could potentially be obtained by setting aside open space on U-M property to remain undeveloped for the life of the project.	
		1	SSc6.1	Stormwater Design - Quantity Control	1	Quantity of stormwater runoff is typically addressed through a larger SWM campus plan. However, projects will have to demonstrate achievement of this credit based on the individual project boundary.	
1			SSc6.2	Stormwater Design - Quality Control	1	For projects over 1 acre there should be no additional cost (see site requirements in DG Technical Section 312500 and the OSEH Storm Water Management Program Plan).	
		1	SSc7.1	Heat Island Effect - Non-roof	1	Projects can achieve this four ways: Under-cover parking, shading hardscape, provide high SRI concrete, and open-grid pervious paving; compliance can be in combination. Site DGs currently under construction will address the latter three.	
		1	SSc7.2	Heat Island Effect - Roof	1	Other than white EPDM, low-slope high-albedo roofs are not generally recommended. Energy modeling should be considered to determine potential savings for white (high-albedo) vs. black roofs; using high-albedo roofs does not guarantee energy savings. Some metal and vegetated roofs also comply.	
	1		SSc8	Light Pollution Reduction	2	If cut-off retrofit fixture is accepted, this credit may be achievable. Also, remote, stand-alone campus properties may also be able to comply more easily.	

4	0	6	Water Efficiency				Points Possible: 10
			WEp1	Water Use Reduction		See U-M DG 3.2.	
2		2	WEc1	Water Efficient Landscaping	2 to 4	See DG Technical Section 328400. Revisions to the DG for additional requirements are currently under construction.	
			X	Reduce by 50%	2		
				No Potable Water Use or Irrigation	4		
		2	WEc2	Innovative Wastewater Technologies	2	Typically only achievable if rain/grey water is used for waterclosets or by installing composting waterclosets and waterless urinals.	
2		2	WEc3	Water Use Reduction	2 to 4	See U-M DG 3.2.	
			X	Reduce by 30%	2		
				Reduce by 35%	3		
				Reduce by 40%	4

LEED® PROJECT REGISTRATION PROCEDURE

This procedure defines the process for LEED project registration for all University of Michigan projects pursuing LEED certification. All items below to be coordinated with the Design Manager.

- LEED Project Administrator to be a member of the University of Michigan Sustainability Team
- Design Manager to notify the LEED Project Administrator when Regental project approval is obtained and provide the following information to the LEED Project Administrator:
 - LEED Project Name: *University of Michigan <Building Name>*
 - Address (Street, City, State, Zip)
 - Anticipated construction start and end date.
 - Gross square footage
 - Project Type (Laboratory, Healthcare, Classroom, Housing, Office, etc)
 - Anticipated certification level
 - Provide the name and contact information of the A/E's designated LEED project manager. This person will be assigned as the LEED Project Manager in LEED Online.
- Tasks to be completed by LEED Project Administrator
 - Register the project in LEED Online.
 - Accept LEED Online version 3 *Terms and Conditions*.
 - Verify LEED Online version 3 *Minimum Program Requirements*.
 - Notify the Business Office to initiate Registration and Certification Payments through University of Michigan - Accounts Payable. The check shall be delivered to Project Administrator for mailing.
 - Assign the A/E's LEED Project Manager in LEED Online.
 - Notify the Design Manager when the project has been registered in LEED Online. The Design Manager shall then notify the A/E's LEED Project Manager.
 - From this point on, the LEED Project Administrator's tasks are complete.
- The LEED Project Manager will be responsible for assigning and managing the attempted credits within LEED Online and fielding administrative questions and review comments throughout the review process.
- At no time should the LEED Project Manager change the confidentiality classification in LEED Online.

Additional Information

LEED projects shall not choose Confidentiality within LEED Online because the information listed in the USGBC Project Directory (Certified & Registered) is limited to the following:

- LEED Project Name
- Registration Date
- LEED Rating System
- Address (Street, City, State, ZIP, Country)
- Owner Organization
- Owner Type
- Project Type
- Certification Level
- Gross Square Footage

(OS1) Green Cleaning System

University of Michigan - <Inset Project Name>

The University of Michigan is implementing a comprehensive cleaning system called (OS1) in U-M campus buildings. Upon construction completion, the (OS1) Green Cleaning System will be adopted by <Inset Project Name>. The (OS1) program includes a green cleaning policy, a high performance cleaning system, a custodial effectiveness assessment, the use of sustainable cleaning products and materials, the use of sustainable cleaning equipment, indoor chemical and pollutant source control and indoor integrated pest management. This system was created for U-M by ManageMen Inc. (<http://managemen.com/>).

Introduction

The (OS1) cleaning system at U-M works to improve the indoor environmental quality (IEQ) of U-M campus buildings. The principals behind this cleaning program are:

- Cleaning for health first and then for appearance
- Disposing of cleaning wastes in an environmentally-responsible manner
- Increasing worker safety and awareness
- Increasing the level of sanitation of building surfaces
- Removing pollutants from the facility responsibly
- Reducing chemical, particle and moisture residue
- Minimizing human exposure to pollutants

Green Cleaning Policy

In order to reduce the exposure of building occupants and maintenance personnel to potentially hazardous chemical, biological and particulate contaminants, which adversely affect air quality, human health, building finishes, building systems and the environment, <Inset Project Name> will adopt the (OS1) Cleaning System. Green Cleaning goals of (OS1) are to minimize the negative impact that cleaning services have on the environment and to institute the use of safe, low-impact cleaning chemicals, equipment and practices. U-M will work to continually improve its environmental performance by:

- Cleaning for health first, then for appearance,
- Going beyond compliance on safety regulations,
- Minimizing environmental harm,
- Training custodial staff to work in an environmentally-responsible manner,
- Ensuring that all staff members are aware of their responsibilities in implementing this policy,
- Conserving energy, water and other resources while providing a clean and sanitary environment,
- Complying with all current legislation and industry standards,
- Using cleaning products that are Green Seal, Environmental Choice or EPA's Design for the Environment-approved and low volatile organic compound (VOC) products whenever applicable,
- Using products with high post-consumer recycled content,
- Using equipment with superior filtration systems,
- Eliminating the use of products containing phosphates,
- Eliminating the use of aerosol products,
- Using concentrated products, as available,
- Using chemicals that are accurately diluted using cold water,
- Using products that are packaged with recycled materials and
- Maintaining an effective walk-off mat program.

The performance of the (OS1) system is measured through the use of building auditors from U-M Plant Operations Work Management department who inspect areas cleaned using the (OS1) Green Cleaning System.

Responsibility for ensuring that the green cleaning system of (OS1) is carried out in **<Inset Project Name>** is the team of custodial specialists that will be assigned to that building. (OS1) utilizes a “team cleaning” approach which involves an area being cleaned systematically using a team of specialists, including:

Light duty specialist: Dusting, emptying trash & recycling, spot cleaning

Vacuum specialist: Vacuum carpet and hard floors

Restroom specialist: Clean, sanitize and restock the restroom

Utility specialist: Clean lobby areas, spot clean glass, mop and scrub hard floors, haul trash and recycling to the appropriate dumpsters from central points.

Specialists’ duties are tailored to fit the needs of each building. Team member tasks and scheduling are based on the building’s size, layout and any special needs.

(OS1) begins with an assessment of the building’s cleaning needs. Tasks are divided into “routine tasks” to be done daily, “detail tasks” to be done in a specific area on a specific day of the week and “project work” which includes carpet extraction and floor stripping, focused on one day of the week. Once this assessment is complete, job cards are prepared for each team member. Job cards provide a checklist of specific tasks to be accomplished and an approximate schedule for completing those tasks.

As variability and flexibility must be a part of any housekeeping program, (OS1) is flexible in that it adjusts the work load and schedule for a normal level of absenteeism. If there is an absence of a team member, the (OS1) Absence Staffing Plan adjusts schedules and tasks to ensure that critical housekeeping tasks are covered. Additionally, (OS1) can accommodate unique needs of individual custodians should that situation arise. For example, those with temporary ailments or disabilities can be assigned as light duty specialists, allowing them to continue to function as a part of their team.

As (OS1) has been adopted by U-M campus buildings, this green cleaning system will be used in **<Inset Project Name>**.

Green Cleaning: High Performance Cleaning System

At the core of the (OS1) system is cleaning for health first, then for appearance. It employs in-depth training based on standardized tools and procedures. (OS1) is also a results-based process that includes gathering and tracking tangible data.

Various methods are used in (OS1) to help ensure the prevention of airborne particulate matter and the spread of viruses & bacteria within a facility. Backpack vacuums used in this system are CRI-certified under their “Green Label” program and meet stringent criteria associated with soil removal ability, dust containment and carpet appearance retention. Flat mops are used extensively alongside two-chamber buckets that minimize cross contamination between clean and soiled water, removing 96% of surface debris and bacteria.

Appropriate Staffing Plan

(OS1) utilizes a “team cleaning” approach. An area is cleaned systematically using a team of specialists which includes a:

Light duty specialist: Dusting, emptying trash & recycling, spot cleaning

Vacuum specialist: Vacuum carpet and hard floors

Restroom specialist: Clean, sanitize and restock the restroom

Utility specialist: Clean lobby areas, spot clean glass, mop and scrub hard floors, haul trash and recycling to the appropriate dumpsters from central points.

Specialists’ duties are tailored to fit the needs of each building. Team member tasks and scheduling are based on the building’s size, layout and any special needs.

(OS1) begins with an assessment of the building’s cleaning needs. Tasks are divided into “routine tasks” to be done daily, “detail tasks” to be done in a specific area on a specific day of the week and “project work” which

includes carpet extraction and floor stripping, focused on one day of the week. Once this assessment is complete, job cards are prepared for each team member. Job cards provide a checklist of specific tasks to be accomplished and an approximate schedule for completing those tasks.

As variability and flexibility must be a part of any housekeeping program, (OS1) is flexible in that it adjusts the work load and schedule for a normal level of absenteeism. If there is an absence of a team member, the (OS1) Absence Staffing Plan adjusts schedules and tasks to ensure that critical housekeeping tasks are covered. Additionally, (OS1) can accommodate unique needs of individual custodians should that situation arise. For example, those with temporary ailments or disabilities can be assigned as light duty specialists, allowing them to continue to function as a part of their team.

Staff training

In the (OS1) system, both supervisors and custodians are trained on all aspects of the program. Upper management attends Janitor University (<http://managemen.com/education/>), a 5-day leadership and professional development course focused on the (OS1) program. New supervisors are also required to attend the U-M Plant Operations' Supervisor Leadership Training program (http://www.plant.bf.umich.edu/director/Academy/pa_programs.php). Administered by U-M's Plant Academy, this year-long program includes training in leadership, customer service, ethics, facilities management, law & policy, diversity and change management. The culmination of this program is an on-the-job practicum project that takes classroom learning and applies it in the real world.

Custodial training consists of a 16-hour Boot Camp that emphasizes the (OS1) philosophy of cleaning:

- Treating custodians as first class citizens
- Cleaning for health first then appearance
- Simplification and economy in the cleaning process
- The "clean syndrome" – a generalized description of the systematic cleaning process
- Beyond compliance policy for safety regulations
- Minimization of environmental impact
- High performance culture of exceeding all expectations

Everyone who works with or is potentially exposed to chemicals receives information and training on the chemicals in their work area at the time of their initial assignment and whenever a new physical or health hazard is introduced to their work area. Training includes classroom instruction, handouts, discussion and hands-on demonstrations. The information and training program address the following:

- The requirements of the OSHA Hazard Communication Standard
- The location, availability and details of the Written Hazard Communication Program
- The location of Material Safety Data Sheets (MSDSs), how to read these to obtain hazard information and how this information can be used
- The color-coding of chemicals and related MSDSs and the safe handling of chemicals provided by using the single portion chemical packets
- Any operations in their work area where chemicals are present
- The physical and health hazards of chemicals in the work area
- The measures employees must take to protect themselves from these hazards including specific procedures implemented by U-M, such as appropriate work practices, emergency procedures and personal protective equipment (PPE) to be used
- How to detect the presence or release of hazardous chemicals in the work area
- The requirement that chemical packets are to be triple-rinsed prior to their return to the supervisor at the end of each shift

Additionally, custodians participate in Beyond Compliance and Protect Yourself trainings. Finally, U-M provides yearly compliance trainings for all (OS1) staff.

Chemical concentrates

In the (OS1) program, there are 3 concentrated, daily-use cleaning products utilized. Provided by PortionPac and Green Seal-certified, these pre-measured chemicals are always mixed one Pac to one bucket, bottle or tank of cold water, greatly reducing the opportunity for measuring mistakes. Training on proper dilution occurs during the (OS1) Boot Camp, after which cleaning staff are provided a sample kit to take home and use. All chemicals are color-coded to the correct dilution container (e.g. spray bottle, bucket) which have a fill line indicated on them.

Use of sustainable cleaning materials, products & equipment

Unger Micro Fibre Mops (#MM40Y & #MM40R) and Unger two-chambered mop buckets are used in the (OS1) program. The use of these reduces cross-contamination by separating fresh water from rinse water and provides for significantly higher levels of sanitation by removing 96% of surface debris and bacteria. Both are ergonomically-designed to help prevent employee injury.

Unger Microfibre Rags (#MF40R) are used for general cleaning on a daily basis. These rags are laundered and reused and remove 96% of surface debris and bacteria.

The Unger Ergo Toilet Brush, Ergo Toilet Swab and Nifty Nabbers are also ergonomically-designed to help prevent employee injury. Additionally, the Nifty Nabber prevents employees from coming into contact with debris in restrooms, protecting employee health and decreasing the chance of cross contamination.

Daily cleaning chemicals used in (OS1) are pre-portioned and provided to custodians prior to each shift according to their assignment and need, reducing the chances for chemical waste. The floor cleaner and general purpose cleaner, provided by PortionPac, are Green Seal-certified, while the restroom cleaner (also provided by PortionPac) is U.S. EPA-approved.

The chemical used for carpet care is provided by Spartan and uses a biodegradable surfactant, is phosphate-, fragrance- and dye-free and is pH neutral.

The glass cleaner used, provided by Spartan, is Green Seal-certified and EPA Design for the Environment-formulated.

As a part of the (OS1) program, the ProTeam Super CoachVac backpack vacuum is used. This vacuum reduces back strain and injuries and has lower particle emissions than traditional upright models. It is recognized by the U.S. Green Building Council (USGBC), is an American Lung Association Health Partner and is certified Gold as a part of the Carpet and Rug Institute's (CRI) Green Label Program.

The following equipment is also used in (OS1):

- The Tennant 1610 extractor is recognized by the USGBC and the CRI Green Label Program.
- The Advance Pacesetter and the Advance Advolution 20XP are both Green Seal-certified.
- Both the Tennant T-3 and Tennant T-5 floor scrubbers have received USGBC and NFSI (National Floor Safety Institute) certifications.

Toilet tissue used is Kimberly Clark #07006 which contains a minimum 20% post-consumer recycled content and is Forest Stewardship Council (FSC) certified.

Recycling bin liners are sourced from Petoskey Plastics, contain a minimum 70% post-consumer recycled content and are from a Michigan company.

Green Cleaning: Custodial Effectiveness Assessment

U-M building auditors inspect areas cleaned by the (OS1) Green Cleaning System using the APPA "Custodial Staffing Guidelines" to determine the appearance level of the facility. Using staff from another department helps

ensure an unbiased assessment of the aesthetics of areas cleaned using (OS1). On average, buildings participating in (OS1) achieve a 1.87 score on the APPA scale after 9 months in the program. Improvements to the cleaning approach will be made in any areas that fall below the occupying school or department's expected standard. Custodial effectiveness audits will occur at least annually for <Inset Project Name>, with all results documented and provided to the building's facility manager. Building auditors inspect a representative sample of each building by reviewing a subset of the areas and floors of each building. Handheld devices are used to record findings. These findings are later uploaded into a Work Management inspection program that allows reports to be generated and shared with building facility managers.

Auditors begin by assessing the building floor plan according to the APPA space categories and measure the space using gross square feet. Spaces to be audited are randomly selected. The auditors are staff from U-M's Work Control department, a department not affiliated with the (OS1) program, to ensure an unbiased assessment of the cleaning program. The auditors utilize the APPA scoring system of appearance levels. Audits are conducted without notice to custodial staff and occur during normal business operations. Once the audit is complete, the overall appearance level of the building is calculated for each space type.

Green Cleaning: Purchase of Sustainable Cleaning Products and Materials

Daily cleaning chemicals used in (OS1) are pre-portioned and provided to custodians prior to each shift according to their assignment and need, reducing the chances for chemical waste. Purchases are tracked by the custodial supplier. The floor cleaner and general purpose cleaner, provided by PortionPac, are Green Seal certified, while the restroom cleaner (also provided by PortionPac) is US EPA-approved.

The chemical used for carpet care is provided by Spartan and uses a biodegradable surfactant, is phosphate-, fragrance- and dye-free and is pH neutral.

Cleaning products

The general purpose cleaner used in (OS1) is the PortionPac ScrubPac Heavy Duty All Purpose Detergent (#102), which meets the Green Seal GS-37 standard.

The floor cleaner used in (OS1) is the PortionPac MopPaCLite pH Neutral Floor Cleaner (#1802 and #1804), which meets the Green Seal GS-37 standard.

The glass cleaner used in (OS1) is the Spartan Green Solutions Glass Cleaner (#102), which meets the Green Seal GS-37 standard.

Floor care products

The floor finish used in (OS1) is the Johnson Diversey Stride Citrus Neutral Cleaner, which meets the Green Seal GS-37 standard.

The stripper used in (OS1) is the Johnson Diversey Freedom Stripper, which meets the Green Seal GS-40 standard.

Janitorial paper products and trash bags

The bathroom tissue provided by PBGS through the (OS1) program is the Kimberly-Clark Scott Coreless JRT Jr. Bathroom Tissue (#07006), which meets the U.S. EPA Comprehensive Procurement Guidelines for Janitorial Paper.

The paper towel provided by PBGS through the (OS1) program is the Kimberly-Clark Scott Hard Roll Towels (#01040), which meets the U.S. EPA Comprehensive Procurement Guidelines for Janitorial Paper.

The plastic trash bags used in the recycling bins in (OS1) are Petoskey Plastics Recycling Bin Liners, which meet the U.S. EPA Comprehensive Procurement Guidelines for Plastic Trash Can Liners.

U-M's goal for sustainable cleaning product purchases (by cost) is 50%.

Green Cleaning: Safe Handling & Storage of Chemicals

Custodians are kitted daily with only the amount of product they need that day through the use of control cabinets and distribution trays. Access to these cabinets and trays are limited to a few individuals within each shop. Two-thirds of the daily-use cleaning products are greencertified and do not pose a risk to custodians or building occupants. The final daily-use product is our disinfectant and its use is limited to cleaning restrooms and drinking fountains.

All custodial and supervisory staff are trained to recognize the difference between hazardous and non-hazardous spills. Biological and/or infectious hazards (e.g. large amounts of blood) are handled by the University of Michigan's Occupational Safety & Environmental Health (OSEH) department, with U-M Plant Building and Grounds Services providing support, as needed. When such a spill occurs, the Plant Operations Call Center is contacted and OSEH is appropriately dispatched. Other spills that cause dangerous conditions (e.g. a slippery floor) are often defined as non-hazardous by OSEH and are instead addressed by the custodial crew.

Green Cleaning: Sustainable Cleaning Equipment

(OS1) utilizes custodial equipment that reduces the exposure of building occupants and maintenance personnel to potentially hazardous chemical, biological and particulate contaminants that adversely affect air quality, human health, building finishes, building systems and the environment. U-M maintains a log for all powered cleaning equipment to document the date of equipment purchase and all repair and maintenance activities. This log also includes vendor specification sheets for each type of equipment in use.

As a part of the (OS1) program, U-M uses the ProTeam Super CoachVac backpack vacuum. These ergonomically-designed vacuum and associated tools reduce back strain and injuries and have lower particle emissions than traditional upright models. It is certified Gold as a part of the CRI Green Label Program and operates with a sound level of 66dB.

The Tennant 1610 extractor is used by U-M in its administration of (OS1). This self-propelled extractor is certified by the CRI's "Seal of Approval" Testing Program for deep-cleaning extractors. Both the Tennant T-3 and Tennant T-5 floor scrubbers are also used. They are equipped with variable-speed feed pumps and on-board chemical metering to optimize the use of cleaning fluids. All are designed with safeguards to reduce potential damage to building surfaces.

There are two floor buffers used in (OS1): the Advance Pacesetter and the Advance Advolution 20XP. Both are equipped with vacuums, guards and/or other devices for capturing fine particulates, operate with a sound level of less than 70 dB and have adjustable angle handles.

Green Cleaning: Standard Operating Procedures

Standard operating procedures (SOPs) have been established for how our cleaning and hard floor and carpet maintenance system will be consistently utilized, managed and audited. All custodians attend the same series of trainings on the (OS1) system of cleaning and green floor care, ensuring that the way in which buildings are cleaned and floor care is administered is consistent. Examples of training materials are available by request. Management of custodial implementation of these SOPs is provided by custodial supervisors, who are then managed by area managers. This multi-tiered system of management increases adherence to the green cleaning program. Finally, adherence to the system is provided by both internal and external auditors. Plant Building & Grounds Services, the department that administers the campus green cleaning program, provides unannounced, internal audits of how well the cleaning and floor care systems adhere to the standard program. Additionally, auditors from another U-M department, Work Management, provide their own unannounced audits of spaces.

Green Cleaning: Indoor Chemical and Pollutant Source Control

The use of mats at public entryways is standard practice in the (OS1) program. Waterhog brand mats are placed at all public campus entryways and are at least 10 feet long. Mats are regularly vacuumed and are deep-cleaned on a scheduled basis. Regular mat cleaning is documented on custodial job cards and deep-cleaning is documented by the U-M supervisor who schedules all deep-cleaning on campus. Entryways are maintained through a daily

cleaning routine that includes vacuuming, dusting and mopping. The cleaning is documented through the use of (OS1) job cards.

Low-maintenance vegetation is installed a public building entrances and plants are selected based on an integrated pest management approach to eliminate pesticide applications that could be tracked into the building. Exterior walkways are maintained by blowing or sweeping pavement to completely remove dirt or other debris from pedestrian paving surfaces. This is achieved through the use of power air blowers, brooms or a combination of both. Dirt and debris are also removed from the flat surfaces of paving, corners between paving and walls, the tops of walls, if visible, from under site furniture, from stair treads and risers and from handicap ramps. This cleaning is documented both in the U-M Grounds Services work plan and on employee time cards.

Electrical outlets are provided at all public building entrances for maintenance and cleaning. While buildings may not have containment drains plumbed for the appropriate disposal of hazardous liquid wastes in areas where water and chemical concentrate mixing occurs for laboratory purposes, chemicals and hazardous wastes are contained until U-M OSEH (Department of Occupational Safety and Environmental Health) collects them for disposal.

Green Cleaning: Protecting Vulnerable Building Occupants

In order to protect building occupants who are disproportionately affected by cleaning practices, procedures exist to minimize cleaning product and equipment exposure to these groups. The majority of the procedures revolve around cleaning scheduling, where cleaning tasks are completed during evenings, nights and weekends. In rare cases, a different type of equipment that provides the same cleaning and environmental benefit may be used in the vicinity of the vulnerable occupant(s). It is standard that intensive cleaning activities, like carpet cleaning and floor stripping, are scheduled during academic breaks, when fewer occupants are in the building.

Green Cleaning: Indoor Integrated Pest Management

U-M has a Pest Management group available for all campus pest problems. For each campus building, an integrated pest management plan is created, followed and provided to the facility manager. Buildings are inspected on a monthly basis and a report is created after each inspection. Areas of the building, pests found (if any) and treatment strategies are all highlighted in these reports. Primary treatment strategies include physical or behavioral modifications of the area with the pest problem and those working or residing in that area. Physical modifications include structural repairs such as:

- Repairing and/or replacing window screens,
- Adding window screens where needed,
- Installing self-closing entrance doors with no more than 1/8" floor clearance and
- Using tight-fitting lids on refuse containers.

Behavioral modifications include training staff to do the following:

- Close doors,
- Maintain floor drains,
- Use sealable containers in food service applications,
- Rotate food stock,
- Immediately discard infested incoming stock,
- Check for leaks in plumbing and machinery,
- Avoid excess accumulation of paper goods,
- Rinse used beverage containers prior to recycling,
- Clean refrigerator drip pans routinely,
- Clean spilled debris promptly,
- Report any leaking or standing water and
- Cleaning the compactor area at the loading dock routinely. All cleaning methods employed at the loading dock shall comply with IEQ credits 3.1, 3.2, 3.3 and 3.4.

Once all non-toxic options are exhausted, the least-toxic pesticide is used for the pest issue. If a pesticide is recommended for a pest issue, treatments specific to the pest are applied in targeted locations.

Emergency applications of pesticides only occur when there is an immediate threat to building occupants and/or structural elements of the building. An emergency is defined as an immediate health threat to building occupants and/or a threat to the structural elements of the building.

When pesticide applications, including non- and least-toxic pesticides, are required for pest control, notices are posted at least 72 hours prior to the application of a pesticide and within 24 hours after an emergency pesticide application within a building. Treatment cards are left immediately following scheduled pesticide applications and contain information on the pesticide used and the location it was used in.

Green Cleaning: Occupant Feedback

Occupant feedback is essential to custodial operations at U-M and a variety of methods to collect feedback are utilized:

- Customer Survey: Every other year, the University of Michigan Business & Finance group (B&F) conducts a customer survey on a variety of services provided by associated units, including custodial services. This survey is sent electronically to U-M staff, faculty and students and provides a method for individuals to provide anonymous feedback about custodial services, cleanliness and opportunity to suggest new cleaning technologies, procedures and processes.
- Email: An (OS1)-specific email address is available for customers to submit concerns, complements and questions. This email address, os1help@umich.edu, routes emails to the Plant Building & Grounds Services business office to ensure timely and accountable responses.
- Facility Managers: Custodial supervisors and area managers are in regular contact with campus facility managers through regularly scheduled meetings, as-needed meetings, email and phone calls. Customers often voice comments and concerns to their facility manager whose responsibility it is to relay that information to the custodial supervisor. Also, these regularly scheduled meetings promote discussion on new cleaning technologies, procedures and processes.

Once feedback is received, it is handled in one of 3 ways:

- a. One-time service issues are remedied within 24 business hours.
- b. On-going issues are addressed with the customer and/or facility manager to determine the most acceptable solution to the issue given the green cleaning system, staff availability and funding availability.
- c. Praise and complements are shared with the building's custodial crew as well as the department as a whole through the departmental newsletter.

One-time and on-going issues, once addressed in the short term, are taken to Plant Building Services Lead Team meetings for discussion and brain-storming. Often, long term solutions are identified during these meetings. If not, a team member will conduct additional research on solutions, often by benchmarking against other green cleaning programs to determine how they have addressed the issue.

Green Cleaning: Hand Hygiene and Hand Soap

Hand hygiene is of utmost importance at U-M. Administered by U-M's Occupational Safety and Environmental Health (OSEH) department, the campus hand washing and hand sanitizer outreach program is designed to reduce the spread of illness within facilities. Hand washing posters are distributed throughout buildings and tips on proper hand washing technique and use of alcohol-based waterless hand sanitizers are available on the University's gateway website (see attached document).

Hand Soaps

The general hand soaps used in (OS1) are Spartan Lite'N Foamy Foaming PearLux and Spartan PearLux, both of which contain no antibacterial agents.

Hand Washing Safety Tips

- [About U-M](#)
- [Academics](#)
- [Research](#)
- [Athletics & Recreation](#)
- [Health & Medicine](#)
- [Libraries & Museums](#)
- [Arts & Culture](#)
- [State & Community](#)

How to wash your hands

First wet your hands with water. Then cover your hands with soap and rub your hands together vigorously for 20–30 seconds. Be sure to cover all of surfaces your hands and fingers and clean around and under your nails. Then rinse your hands with water and dry them completely. If possible, it's always best to use a dry paper towel to turn off the faucet.

You should remember to wash your hands when they're visibly dirty, before you eat or handle food, after you go to the bathroom, after blowing your nose, coughing, or sneezing, and after handling trash. You should also wash your hands after you change a diaper and before and after you help someone who's sick.

Hand washing instructions:

- Wet your hands with water
- Cover your hands with soap
- Rub your hands together vigorously for 20–30 seconds
- Cover all of surfaces your hands and fingers and clean around and under your nails
- Rinse your hands with water and dry them completely
- Use a dry paper towel to turn off the faucet

How to use hand sanitizer

Hand sanitizer works best if your hands aren't obviously dirty. You can use it in class, when you're on the bus, after petting an animal, after using the computer lab, and just generally when you want to clean your hands but there's no soap and water available.

To clean your hands, just put one pump — about a dime to a quarter sized amount — of hand sanitizer in the palm of your hands and rub your hands together. You want to cover all of your hands and fingers, including around and under your nails. Keep on rubbing your hands until the alcohol dries. If you used the right amount, it should take about 10–15 seconds for your hands to dry.

Hand sanitizer instructions:

- Apply quarter-sized amount to the palm and rub hands together
- Cover all surfaces of hands and fingers, including around/under fingernails
- Continue rubbing hands vigorously until alcohol dries
- If you applied the right amount, it should take at least 10–15 seconds before hands are dry

Green Cleaning: Performance Metrics

The performance of U-M's green cleaning program is measured through our quality assurance (QA) program. This program, administered by staff from another department to help ensure unbiased assessments, is based upon the Association of Higher Education Facilities Officers (APPA) cleanliness scores. A baseline score has been established based on APPA recommendations. Buildings that do not meet this standard are evaluated for staffing levels, scheduling and training and adjusted, as needed.

Green Cleaning: Time Period

UM's green cleaning policy is applicable indefinitely.

Green Cleaning: Responsible Parties

John Lawter

Associate Director

Plant Building & Grounds Services

109 East Madison

Ann Arbor, MI 48104

(t) 734.647.3852

(e) jlawter@umich.edu

- Responsible for ensuring departmental compliance in administering the green cleaning policy.

UM Plant Building & Grounds Services' Area Managers

Plant Building & Grounds Services

109 East Madison

Ann Arbor, MI 48109

(t) 734.764.0532

- Responsible for ensuring that custodial supervisors implement the green cleaning programs within their assigned buildings.
- Required to provide additional training supervisors, as needed, to ensure that the green cleaning policy is adhered to.
- Responsible for determining the steps to be taken in order for buildings not meeting the performance metric to meet the goal.
- Responsible for fielding questions and concerns from campus stakeholders about the green cleaning program.

UM Plant Building & Grounds Services' Custodial Supervisors

Plant Building & Grounds Services

109 East Madison

Ann Arbor, MI 48109

(t) 734.764.0532

- Responsible for ensuring that the green cleaning program is administered within their assigned buildings.
- Responsible for providing additional skills training, as needed, to custodians to ensure their successful participation in the green cleaning program.

UM Plant Building & Grounds Services' Custodians Plant Building & Grounds Services

109 East Madison

Ann Arbor, MI 48109

(t) 734.764.0532

- Responsible for cleaning their assigned facilities within the scope of the green cleaning program.

SUSTAINABLE PRODUCTS PORTFOLIO

General

The Sustainable Products Portfolio (SPP) consists of a list of sustainable products that the University has evaluated and which have been found to meet our sustainable selection criteria. For a complete list of criteria which are applied to products under review consult [3.3 Sustainable Products Portfolio](#). The SPP is a resource that project teams are encouraged to use to select sustainable products. It is by no means an all inclusive list of available sustainable products and technologies. It is not intended to limit competition or replace creative sustainable design solutions. Do not substitute this list for your professional judgment concerning appropriate products and materials.

Because the SPP is in the early stages of development it is currently quite short. As other products are reviewed the list will be updated.

This list is updated as needed.

Post Occupancy Thermal Comfort Corrective Action Plan

<Insert Date>:

<Insert Project # and Name>

<Insert Building# and Name>

IEQc7.2 Thermal Comfort, Verification

In complying with the LEED-NC v3.0 IEQc7.2 Thermal Comfort, Verification, the Architecture, Engineering, and Construction (AEC) Sustainability Team will administer occupant surveys between 6-18 months after occupancy. The survey results will be provided to the project Commissioner; issues resulting from the survey responses will be addressed in conjunction with the Enhanced Commissioning efforts of the project.

Thermal Comfort Survey

AEC will provide building occupants with an anonymous web-based survey based on the requirements of the LEED Reference Guide for Green Building Design and Construction and in accordance with ASHRAE Standard 55-2004 (with errata but without amendments). The survey will address areas of thermal comfort including temperature, airspeed, humidity, clothing, and activity. AEC and appropriate university personnel will review the results of the survey and identify any areas of concern. Please see the file named 'UM PostOccupancyThermalComfortSurvey.docx' for a copy of the survey instructions and questions.

Thermal Comfort Corrective Action Plan

Upon reviewing the responses of the thermal comfort survey, the project Commissioner, in conjunction with the design and construction and facilities maintenance teams, will identify the cause of the discomfort and will decide on the appropriate actions for addressing the occupant concerns. The results of the survey will also be compared to the Basis of Design thermal comfort design criteria established for the project.

Examples of corrective action may include adjustments to thermal controls (temperature set-points, schedules, operating modes) and diffuser airflow adjustments. If corrective action is necessary, a follow-up survey will be conducted as well as continued monitoring to ensure the thermal comfort issues have been fully addressed.

Permanent Monitoring System

A Direct Digital Control (DDC) system is included in the building to ensure that building performance meets the desired comfort criteria as determined by IEQc7.1 Thermal Comfort, Design. This system provides control and monitoring at both the room and building level. In turn, the DDC system is networked back to the University's Building Automation Services (BAS) department, which monitors DDC control points campus wide, and is staffed 24/7. Additional information can be found on the BAS website: <http://www.plantops.umich.edu/maintenance/shops/BAS/>. The DDC system has extensive capability to monitor room environmental performance. A typical space is served by a DDC controlled terminal unit, utilizing electronic sensors that measure room environmental conditions. These sensors are directly accessible by the DDC system for trend logging, point alarming, and troubleshooting purposes. This capability is used during commissioning as well as after occupancy to assure thermal comfort conditions are being maintained. Building environmental systems are similarly DDC controlled and monitored.

UNIVERSITY ARCHITECT'S OFFICE
326 East Hoover, Mail Stop E
Ann Arbor, MI 48109-1002
Phone: 734-764-2456
Fax: 734-763-3238

Dear Employee:

Architecture, Engineering, and Construction (AEC) would like to solicit your advice and feedback *on <Insert Building # and Name, insert project name and number>*. We appreciate that you are willing to take the time to participate in this survey.

AEC is responsible for the design and construction of U-M's new buildings as well as renovations. First and foremost, your response will help us fine-tune this building to be sure we are providing pleasant and productive workplaces for the employees and the public. Additionally, AEC will use your response to guide the design and construction of future projects.

Instructions:

Please complete the survey below. If you would like to provide more information or an opinion on any specific issue, you may provide comments in the box at the end of the survey.

All responses will be kept strictly confidential.

If you need any assistance in completing this form or need the survey supplied in a different format, please contact aec.sustainability.team@umich.edu.

Thank you for your time and assistance.

AEC Sustainability Team

Architecture, Engineering & Construction (AEC)

Background

Date:

Time:

Room Number:

For which department do you work?

Which floor is your primary workspace located?

Which area of the building is your primary workspace located (north, east, south, west, core):

Equipment:

Is there equipment located within or near your workspace that may be adding or taking away from comfort?
(Fax machines, fans, copiers, additional lighting, space heater, etc.)

Please indicate type of equipment and quantity: _____

Occupant Activity Level

- Reclining
- Reading Seated, Keyboarding or other light physical activity
- Standing, Relaxed
- Light Activity, Standing
- Medium Activity, Standing
- High Activity

Personal Workspace

Which of the following best describes your primary personal workspace?

(Check one)

In addition to your primary personal workspace, if your job involves spending a significant amount of time in a **secondary location** please indicate such by marking a **2** next to your secondary workspace.

Office spaces:

- Private office with floor to ceiling walls and a door
- Shared office (with other people) with floor to ceiling walls
- Open area with cubicles
- Other, please specify: _____

Non-Office Spaces:

- Service desk
- Laboratory
- Multi-purpose space
- Other, please specify: _____

Comfort at your Primary Personal Workspace

How satisfied are you with the following aspects of air quality / thermal comfort:

	Very Satisfied	Satisfied	Somewhat Satisfied	Neutral	Somewhat Dissatisfied	Dissatisfied	Very Dissatisfied
a) Temperature	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Humidity	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Air movement	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Radiant Temperature (Floor, wall, etc. surface temp)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

If you indicated any *dissatisfaction* with the air quality / thermal comfort in your workspace, which of the following contribute to your dissatisfaction?

(check all that apply)

- Air is stuffy / stale
- Air seems dirty
- Air has odor
- Insufficient air flow
- Too much air flow
- Noisy air flow
- Air is too cold in summer
- Air is too hot in winter
- Other, please specify: _____

In general, how would you describe the thermal conditions of your workspace?

- Hot
- Warm
- Slightly warm
- Neutral
- Slightly cool
- Cool
- Cold

Additional Information

Please feel free to provide any additional comments or specific details related to the thermal comfort of your workspace or non-office public spaces within the building.

Contact Information (Optional)

Please provide contact information to better provide corrective action.

DESIGN GUIDELINE 4.1 **COMPATIBILITY WITH EXISTING CONDITIONS**

Related Documents

U-M Design Guidelines:

[4.5 Regulated and Hazardous Materials](#)

[4.6 University Provided Utilities](#)

Existing Conditions

A/E responsibilities:

- Review original building and renovation drawings located in the AEC Facilities Information Center (FIC).
- Visit the site prior to start of design to determine existing conditions. Review University provided Facility Condition Assessment (FCA) report with Design Manager for inclusion in project scope.
- Base design upon the actual conditions, not original or renovation design drawings and specifications.
- Update riser diagrams.
- If upgrades to any building central system is necessary to meet the new needs, review with Design Manger.
- University of Michigan Hospitals and Health Centers (UMHHC) Facilities Planning and Development
 - Contact UMHHC Facilities Planning for record documents (“as built”) of UMHHC buildings.
 - UMHHC Building keyplans are available on the [Facilities Planning website](#). Please contact Facilities Planning for password access.
 - UMHHC Facilities Planning and Development maintains a set of PDF keyplans on the website to record any corrections. When an error is found on as-builts FPD requests that a comment is made on the PDF utilizing Adobe and an email sent to FAC-ProjectDept@med.umich.edu noting the corrections.

Utility Sources

Utilize central utilities and building systems in lieu of stand-alone systems. Coordinate with the Design Manager early in the design phase of the project to determine the best sources for central services. The Design Manager will coordinate approval of sources prior to schematic design.

Utility Capacity

As part of schematic design, demonstrate that the proposed project will not adversely affect utility availability for existing users, nor utilize inordinate amounts of future capacity. When a utility is upgraded, provide for other planned consumers and future capacity.

Determine available capacity early enough in the planning / schematic design process for funding to be allocated within the renovation project for increased services if needed.

Existing Condition Assessment

As a part of schematic design, the Design Manager will provide a listing of any outstanding code deficiencies in areas to be renovated for incorporation into the project. Bring additional items uncovered during surveys and site visits to the attention of the Design Manager who will seek funding for incorporation of such items into the project.

Construction documents should include firestopping / patching of all existing and new openings in fire and acoustical separations to maintain performance of the system. Infill material shall match fire and / or acoustical properties of existing partition for continuity.

Existing Hazardous Materials

Design Manager shall provide surveys of existing building materials establishing the presence of hazardous materials such as lead, asbestos, PCB and regulated building materials. The surveys will be obtained from University of Michigan OSEH, Occupational Safety and Environmental Health. A/E shall include surveys in construction documents if there is hazardous material present. Design Manager shall coordinate with A/E and OSEH for process for removal of materials.

DESIGN GUIDELINE 4.2 **BUILDING ENVELOPE**

Scope

Building envelopes shall effectively control moisture migration, heat transfer and air leakage. This Design Guideline highlights areas requiring special attention and consideration with respect to building envelope design. This guideline also includes the U-M Building Envelope design review process and requirements.

Related Sections

U-M Design Guideline Sections:

ASTM E 783 Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors

ASTM E 2357 Test Method for Determining Air Leakage of Air Barrier Assemblies

ASTM E 2178 Standard Test Method for Air Permeance of Building Materials

Moisture Control

Moisture control shall be a primary consideration in the building envelope design of new buildings, additions and renovations. Moisture migration from bulk water, capillary water, vapor diffusion and air leakage shall be minimalized. Perform the following tasks to ensure moisture control in the design of the building envelope:

- Confirm the location of the water table and soil conditions prior to the start of design. Moisture prevention and control for below-grade walls shall be designed for the water table location and soil conditions specific to the project site.
- Perform dew-point analysis of exterior wall assemblies for all new buildings, renovations adding a significant amount of insulation to the envelope and when moisture load generated within the space is expected to increase significantly. Confirm that materials will be above the dew-point and will not accumulate moisture on the conditioned side or the inside of the envelope assembly.
- Provide comprehensive detail drawings for windows, doors, skylights, stacks, ducts, and all other envelope penetrations that will protect the building from water infiltration.

- Ensure efficient shedding of rainwater and prevent moisture infiltration into wall constructions. Provide adequate drainage and ventilation systems (e.g. weep holes) to prevent the collection of water in wall cavities.
- Provide designs that accommodate special programming conditions which impact the building envelope (e.g. an interior with high relative humidity levels).

Thermal Performance

Thermal performance shall be considered in the design of the building envelope to control heat transfer through conduction, radiation, and convection.

- Prevent conductive heat loss caused by thermal bridging in foundation and framing members.
- Minimize convective thermal loss with the prevention of air leakage through windows, doors and other penetrations in the building envelope.
- Select glazing and roofing materials to minimize radiative heat loss.
- Minimize thermal heat gain and maximize occupant comfort by shading exterior windows and the building envelope.
- Consider the orientation, size and performance of fenestration to minimize solar radiation while balancing the amount of daylighting with the amount of heat loss.
- Ensure reduction of heat loss by including details and specifications that identify the type and thickness of insulation for exterior walls, floors, ceilings, and roof areas.
- Carefully select materials and design placement of air barriers to ensure air tightness of the building envelope.

Continuous Air Barrier

For all new building construction and additions design a fully continuous air barrier for the entire building envelope that is capable of controlling air leakage into and out of the conditioned spaces.

- Design the air barrier assembly to withstand positive and negative air pressures due to design wind pressures, stack effect and fan pressures.
- Pay particular attention to the design of the air barrier at joints and points of intersection of two different building materials to maintain continuity. The design shall have enough strength and flexibility to accommodate differential movement of material substrates.
- Design the air barrier to remain in continuous contact with its substrate material in the building envelope.
- Select durable materials for the air barrier assembly, that will last the lifetime of the building.

For additions, design a complete air barrier for the addition enclosure as described above. Where existing walls and/or roof construction abut the new addition, continue the air barrier through the wall or roof construction in order to prevent air leakage at the juncture between the new and old construction.

- U-M does not have a preference for a particular type of air barrier or air barrier assembly. Select materials which are listed by the Air Barrier Association of America. It is acceptable to have a combined air barrier and vapor retarder; however, when they are combined the barrier must be located on the inside of the thermal insulation of the building envelope (for projects in Michigan).

U-M Building Envelope Design Review

Projects with a scope of work related to above and/or below-grade building enclosure elements will undergo a building envelope design review process. This review process will evaluate the materials, components, systems, and assemblies that comprise the above and/or below-grade building enclosure. Building Envelope Design Review shall begin at Schematic Design and continue until the end of Bid Documents phase.

Schematic Design Phase

- Establish the building envelope performance goals with building occupants and U-M Design Manager.
- Include envelope description and performance goals in the Owner's Project Requirements and Basis of Design (OPR/BOD) documents.
- Promote the use of construction mock-ups and other quality assurance techniques and participate in the evaluation of building envelope mock-ups.

Design Development Phase

- Further develop BOD document to include a building enclosure design description of materials, components, systems, and assemblies that make up the building envelope.
- Conduct a minimum of one meeting during DD dedicated to the presentation of the building envelope design to U-M and, when hired by U-M, a Building Envelope Specialist (BES). At the meeting, present drawings and specifications that demonstrate the envelope design concept as it relates to thermal protection, moisture control, and air leakage.
- During the Owner's Review of the DD documents, the BES shall provide written comments on the envelope design. Respond to the comments per U-M's document review procedures.

Construction Documents Phase

- Update BOD document to clarify and expand on the design description of materials, components, systems, and assemblies that make up the building envelope.
- Complete detail drawings of all transitions, perimeter sealing around fenestrations, doors, and penetrations through the exterior walls by structural members, parapet walls, etc.
- Provide specifications that include instructions about prepping surfaces and any primers needed to insure proper adhesion of air barrier materials.
- Include language for coordination of all trades whose work impacts the continuity of the air barrier. Reference the Air Barrier specification section in all of the affected trades.

- Include in the specifications the requirement for a pre-installation meeting with mandatory attendance by all trades whose work is related to the envelope, insulation, and the air and moisture barriers.
- Conduct a minimum of one meeting during CD dedicated to the presentation of building envelope design to U-M and the BES. Present drawings and specifications that demonstrate the effectiveness of envelope systems in controlling moisture migration, heat transfer and air leakage.
- During the Owner's Review of the CD documents, the BES shall provide written comments on the envelope design. Respond to the comments per U-M's document review procedures.
- At the end of CD phase, the BES shall provide a project specific version of the U-M Envelope Inspection Form. Review project specific U-M Envelope Inspection Form and submit recommendations for additional inspections and tests to the U-M Design Manager.

Inspection and Testing of Building Envelope

U-M will employ independent specialists, inspectors and testing agencies for projects involving building envelope work. To understand what will be inspected refer to the U-M Envelope Inspection Form. Consult with Design Manager regarding the scope of testing for this project.

DESIGN GUIDELINE 4.3

BUILDING COMMISSIONING

Scope

Most projects, especially those with extensive mechanical, electrical and plumbing (MEP) systems, will undergo a U-M building commissioning (Cx) process. The U-M Cx process is similar to Cx processes promoted by national trade organizations including ASHRAE, BCxA, NIBS and USGBC, but it includes more comprehensive design management and more extensive construction quality assurance. Detailed U-M Cx procedures ensure consistency among projects. Become familiar with, fully participate in and fully support this process.

NIBS Guideline 3, "Building Enclosure Commissioning Process"

USGBC, “LEED® Reference Guide for Green Building Design and Construction”

General

Commissioning is a systematic quality assurance process to assure a project is designed to meet the needs of its Owners, and is built, operated and maintained as intended by its Design Team and its Owners.

- Cx helps a project achieve its schedule, budget and quality goals by utilizing the University's vast design, construction, operation and maintenance experience to proactively identify and help resolve issues as early and inexpensively as possible.
- Cx generally begins during Programming and ends after Occupancy.
- Cx focuses primarily on the project's utilities, mechanical systems, electrical systems, plumbing systems and "powered" architectural systems. Cx of the building envelope is also important to minimize air leakage, moisture migration and heat transfer, but Cx activities related to the building envelope require different skills. Thus building envelope design and construction Cx are addressed in Design Guideline 4.2.
- Cx verifies conformance with the project's design intent as documented in the Owner's Project Requirements (OPR) and Basis of Design (BOD) documents.
- Cx verifies compliance with U-M requirements for effluent, noise, vibration, cleanliness, efficiency, maintainability, operation and maintenance manuals, and Owner training.
- Cx verifies that completed systems and equipment perform as intended in all modes of operation and under all operating conditions. However, Cx does not duplicate or substitute for code inspection. Cx does not provide routine quality control such as routine inspections for material substitutions, point-to-point wiring checks or poor quality workmanship.

The U-M Building Commissioning Process

Large projects with complex and challenging MEP systems will undergo design-phase and construction-phase Cx. Most smaller projects with MEP scope will undergo construction-phase Cx only. Tunnel projects will undergo construction-phase Cx only, and only if they include powered mechanical equipment. Cx activities will be coordinated by the AEC Commissioning and Plan Review Group who will assign a Commissioning Authority (CxA) to each project.

Design-Phase Commissioning

Most projects with complex and challenging MEP systems will undergo design-phase Cx. The CxA will assist the U-M Design Manager by participating in the MEP design meetings, technical study reviews, Owner's reviews and value engineering (VE) efforts. See Design Guideline 4.3.1. Throughout design, the CxA will promote a clear and precise OPR and BOD to facilitate proper construction-phase Cx. The CxA will make recommendations regarding commissionable architectural and MEP systems, and require compliance with industry and U-M standards. The CxA will require inclusion of clear sequences of operation, setpoints, acceptance criteria and other details required for construction-phase Cx. Incorporate the CxA's input into the project's design.

New buildings, building additions, major building renovations and projects seeking LEED certification will undergo an expanded level of design-phase Cx called MEP design management. One or more CxAs will assist the U-M Design Manager by actively managing (not just participating in) all technical aspects of the MEP design. See Design Guideline 4.3.2. Final decisions related to the project's scope, schedule and budget will remain the responsibility of the Design Manager, but collaborate with the CxAs for technical direction on MEP issues.

- During the Construction Documents (CD) design phase, edit the U-M Operation and Maintenance (O&M) Manual Master Specification Section 017823 and Commissioning Master Specification Section 019100 to make these sections project specific. If a CxA has been hired prior to the CD review the A/E shall obtain review comments on the project specific version of 019100 from the CxA. Insert these sections into the project's Division 01 specifications to define the Contractors' O&M manual and Cx requirements during construction. Reference these sections in the appropriate architectural, mechanical and electrical specification sections. To avoid conflicts with these sections, do not include any specific O&M manual or Cx requirements in the individual architectural, mechanical, electrical or plumbing specification sections.

Design-phase Cx generally will begin during the Programming phase and will continue until the project is bid and awarded.

Construction-Phase Commissioning

All projects with significant MEP scope will undergo construction-phase Cx. Construction-phase Cx will be performed by a commissioning team typically consisting of the U-M Project Manager and representatives from the A/E, the Construction Manager or General Contractor, the trade contractors, the Owners and Plant Operations. The team will be directed by and Cx meetings will be led by the CxA. Assign an A/E Representative to this Cx team.

Projects with complex and challenging MEP systems, especially those over \$5 million in construction cost, will undergo full construction-phase Cx. See Design Guideline 4.3.3 for a list of Cx activities. Projects that involve a small number of MEP system or equipment will undergo reduced scope construction-phase Cx. See Design Guideline 4.3.4 for a list of reduced scope activities. Participate in and assist the CxA with these activities.

Construction-phase Cx generally will begin when the project is issued for bids. It will continue through initial occupancy and may continue through the first year of occupancy.

Quality Assurance

Throughout a project's design and construction, the CxA will gather "lessons learned". As a means of continually improving the U-M design, construction and Cx processes, these lessons learned will be incorporated in the U-M Design Guidelines, Master Specifications and Cx Documents.

DESIGN GUIDELINE 4.3.1

DESIGN-PHASE COMMISSIONING

Scope

This design guideline describes the role and responsibilities the commissioner (a.k.a. Commissioning Authority, or “CxA”) is to perform for design-phase commissioning (Cx). Design phase commissioning is performed on projects with complex and challenging mechanical, electrical and plumbing (MEP) systems. Normally design phase commissioning is handled by internal U-M commissioning staff, when staff is available. Occasionally the University hires an outside commissioning firm for this task; when done, this document outlines the minimum required scope of work.

USGBC, “LEED® Reference Guide for Green Building Design and Construction”

General

The CxA will perform the following activities during the design phase:

1. Contact the U-M Design Manager, introduce themselves and describe their role. Find out the general schedule of the project and request to be invited to the appropriate MEP meetings.

- Recommend and establish with the Design Manager the frequency of the MEP meetings at each design stage (SD, DD, and CD). Also schedule a MEP kick-off meeting. Establish who will send out the meeting invitations, normally the Design manager.
2. Become knowledgeable about the project.
 - Attend at least one presentation regarding the project’s program by the Architect/Engineer (A/E) to become familiar with the scope, schedule, budget, and design intent. At the first meeting attended, introduce yourself and describe your role briefly.
 - Request and review available program documents to learn about the project scope, including:
 - Number of floors, square footage of each floor, extent of new building or addition work, extent of renovation work, division of space by function (clinical, laboratory, classroom, office, support space), division of space among departments, etc.
 - Connections to and interactions with surrounding buildings, including any related renovations in surrounding buildings.
 - Site requirements including proposed grade, roadway and utility changes.
 - Schedule for the schematic design (SD), design development (DD) and construction documents (CD) design phases, and for project bidding and award.
 3. Become knowledgeable about and promote adherence to the U-M Design Guidelines, Master Specifications, Standard Details, Preferred Manufacturers Lists and Design Deliverables list. Require that deviations from these standards be approved by the Design Manager and documented in memos, emails or meeting minutes, and the OPR/BOD.
 4. As early in design as possible, promote the incorporation of U-M sustainability goals. See Design Guidelines 3.1 and 3.2.
 - Explain these Design Guidelines in detail to the A/E and promote the early identification of energy conservation measures.
 - Promote optimization of the building’s aspect ratios, siting, glass orientation, glass area, glass type, exterior shading, daylighting features, envelope insulation, air and water barriers, etc.
 5. Conduct an MEP kick-off meeting. *(Not required when external Commissioning firms are hired for design phase Cx.)*
 - The MEP design management kick-off meeting is typically held as part of the first SD MEP meeting.
 - Use the “MEP Meeting Master Kickoff Notes”, found on the CPR drive, to conduct the first part of the meeting.
 - Revise the “Notes” to be project specific and pass them out at the meeting. Review/explain the items in the notes.
 - The level of review needed will depend upon how much work the A/E has done previously at U-M and whether they have been through a managed MEP process. Be cautious not to over-assume the A/E knows something.
 - Require the A/E to make the “Notes” an attachment to the meeting minutes.
 - Require the A/E communicate with Plant Operations, Department of Public Safety and Security (DPS), Occupational Safety and Environmental Health (OSEH), UH Facilities

Planning and Development (FP&D), and other U-M personnel through the CxA and Design Manager.

6. Participate in the MEP design meetings at SD, DD, and CD phases.
 - Assist the Design Manager determine the appropriate U-M personnel to invite.
 - Review the A/E's latest design including concepts, drawings and specifications.
 - Discuss the acceptability of the current concept for each system.
 - Review compliance with codes and U-M design standards.
 - Review for inclusion of Cx requirements in the design documents.
 - Identify incomplete design issues.
 - The A/E shall establish the agenda for the MEP meetings, but should obtain input from the CxA and other team members.
 - The A/E should distribute their design documents in advance when possible.
 - The A/E should publish detailed meeting minutes including an action list.
7. Participate in the A/E's development and maintenance of the Owner's Project Requirements (OPR) document as it pertains to system performance requirements and commissioned systems. See Design Guideline 2.1.
 - Review room data sheets produced by the A/E, Hospital Planner, Laboratory Planner, etc. for key project requirements that should be included in the OPR.
 - Help the A/E document the Users' expectations, goals, benchmarks and acceptance criteria for judging the project. Include issues such as indoor temperature and humidity limits, air change rates, air flow rates, sound and vibration limits, medical and laboratory gas needs, laboratory equipment needs, light levels and controls, telecommunications needs, audio/visual needs, access control and security needs, medical systems and equipment needs, training needs, etc.
 - Assure the acceptable ranges of performance are identified for each parameter, and to what extent Users will be able to adjust setpoints.
 - Ask detailed questions to obtain specific acceptance criteria for systems and equipment.
 - Emphasize to the User groups and the U-M Design Manager the importance of establishing acceptance criteria early. Describe the high costs of expanding or changing acceptance criteria later.
 - Periodically review the OPR and identify missing, incomplete and incorrectly documented project requirements.
8. Participate in the A/E's development and maintenance of the Basis of Design (BOD) document as it pertains to system performance requirements and commissioned systems. See Design Guideline 2.1.
 - Periodically review meeting minutes, the latest design drawings and specifications, and the room data sheets.
 - Periodically review the BOD for clarity, completeness, and documentation of deviations from the U-M design standards. Verify the BOD reflects the OPR. Identify missing, incomplete and incorrectly documented design decisions.
 - Require the BOD to contain detailed acceptance criteria needed to commission the MEP systems and equipment.

9. If the project is pursuing LEED v4 Certification, perform all design-phase Cx activities required for the Energy and Atmosphere Prerequisite “Fundamental Commissioning and Verification”.
10. If the project is pursuing LEED v4 Energy and Atmosphere Credit “Enhanced Commissioning”, contact the project’s LEED Coordinator for guidance and perform the design-phase Cx activities required for the paths and options the project has selected for this credit.
11. Assist the Design Manager to assure adherence to the U-M sustainability initiatives and to the U-M energy and water conservation measures. See Design Guidelines 3.1 and 3.2.
 - Attend meetings held by the Design Manager to discuss energy conservation measures and to assure U-M sustainability initiatives are met.
 - Recommend that major energy conservation measures such as envelope insulation and fenestration be optimized.
 - Review the A/E’s Energy and Water Conservation Reports and Energy Impact Statements for errors and omissions.
12. Recommend technical studies including studies on sound, vibration, smoke purge, effluent dispersion, electrical capacity, and energy and water conservation.
 - Emphasize the study reports will dictate many design issues, so they should be completed ASAP to minimize redesign.
13. Provide the A/E with sample U-M controls drawings and require adherence to U-M’s symbology and control drawing conventions. See Design Guideline 230900.
14. Require that control drawings include detailed sequences of operation, setpoints, allowable variance range from set point, alarm descriptions, and equipment operating schedules.
15. Help identify major equipment that must be pre-purchased to maintain project schedule or to improve quality.
16. Provide the design team with “lessons learned” from previous U-M projects.
17. Promote the use of construction mock-ups and other quality assurance techniques, and participate in the evaluation of MEP-related mock-ups.
18. Require that equipment maintenance access spaces, such as coil and tube pull spaces and electrical working spaces be accounted for in the MEP design and blocked out on plan drawings.
19. Assure means are provided for performing MEP maintenance.
 - Verify lifting rails are provided above chillers for hoisting end caps and motors.
 - Verify hoisting exists for replacing large pumps, large motors and other heavy equipment.

- Verify building egress paths and floor loading capacities are adequate for the future replacement of large equipment such as boilers, chillers and substations.
20. Assist with the Owner's review of technical study reports related to mechanical and electrical equipment (noise studies, dispersion studies, smoke evac. studies, etc.) . Review the reports, identify obvious erroneous assumptions or conclusions, and return your comments to the U-M Design Manager.
 21. Early in CD design, instruct the A/E to make Section 1.4 of operation and maintenance (O&M) manual Master Specification Section 017823 and Section 1.2 of Commissioning Master Specification Section 019100 project specific.
 - Instruct the A/E to incorporate the sections into the project's Division 01 specifications.
 - Instruct the A/E to not include O&M manual or Cx requirements in other specification sections, but rather just reference these Division 1 specification sections.
 22. Review and submit written comments to the A/E on the project's SD, DD and CD design documents during the Owner's reviews of the SD, DD and CD documents. See Design Guideline 2.3.
 - Check that the design appears to satisfy the OPR and BOD requirements that will be verified during construction phase Cx.
 - Identify errors or omissions related to design, codes, the U-M design standards, agreements made during MEP design meetings, and good engineering practice.
 - During the DD and CD reviews, generally verify the comments submitted during previous Owner's reviews were addressed.
 - Verify the documents reflect recommendations contained in the technical studies. This includes recommendations on MEP issues and also on architectural issues such as envelope and fenestration improvements which affect MEP issues such as energy efficiency.
 - During the CD review, verify the documents include complete testing and acceptance criteria (sequences of operation, setpoints, performance minimums, etc.) for the systems and equipment being commissioned. Identify missing information.
 - During the CD review, notify the Design Manager if the documents are not sufficiently complete to issue for bids.
 23. Participate in the SD, DD and CD phase cost estimate reconciliation efforts.
 - Spot-check for estimate errors and omissions.
 - Check for duplicate line items and line items assigned to the wrong funding sources.
 24. Participate in the SD, DD and CD phase value engineering (VE) efforts.
 - Recommend VE measures.
 - Assure VE measures do not effect compliance with the OPR.
 - Discourage VE measures that significantly reduce OPR compliance, energy or water conservation, reliability or maintainability.
 - Verify that approved MEP VE measures appear in the next phase of design documents.

DESIGN GUIDELINE 4.3.2 **MEP DESIGN MANAGEMENT**

Scope

This design guideline describes an expanded design-phase commissioning (Cx) process known as mechanical, electrical and plumbing (MEP) design management. It describes the roles and responsibilities the commissioner (a.k.a. Commissioning Authority, or “CxA”) will perform. The Commissioning and Plan Review Department will assign commissioner(s) to perform MEP design management on large and complex new building, building addition and building renovation projects, when staff is available.

General

The CxA will perform the following activities during the design phase:

1. Contact the U-M Design Manager, introduce themselves and describe their role. Find out the general schedule of the project and request to be invited to the appropriate MEP meetings.
 - Recommend and establish with the Design Manager the frequency of the MEP meetings at each design stage (SD, DD, and CD), typically two meetings during SD and DD and three

during CD phase. Also schedule a MEP kick-off meeting. Establish who will send out the meeting invitations, normally the Design Manager.

2. Become knowledgeable about the project.
 - Attend at least one presentation by the Architect/Engineer (A/E) to become familiar with the project's scope, schedule, budget, and design intent. At the first meeting attended, introduce yourself and describe your role briefly.
 - Request and review available program documents to learn about the project, including:
 - Number of floors, square footage of each floor, extent of new building or addition work, extent of renovation work, division of space by function (clinical, laboratory, classroom, office, support space), division of space among departments, etc.
 - Connections to and interactions with surrounding buildings, including any related renovations in surrounding buildings.
 - Site requirements including proposed grade, roadway and utility changes.
 - Schedule for the schematic design (SD), design development (DD) and construction documents (CD) design phases, and for project bidding and award.
3. Promote adherence to the U-M Design Guidelines, Master Specifications, Standard Details, Preferred Manufacturers Lists and Design Deliverables list. Require that deviations from these standards be approved by the Design Manager and that deviations be documented in memos, emails or meeting minutes, and the OPR/BOD.
4. As early in design as possible, promote the incorporation of U-M sustainability goals. See Design Guidelines 3.1 and 3.2.
 - Explain these Design Guidelines in detail to the A/E and promote the early identification of energy conservation measures.
 - Promote optimization of the building's aspect ratios, siting, glass orientation, glass area, glass type, exterior shading, daylighting features, envelope insulation, air and vapor barriers, etc.
5. Conduct an MEP design management kick-off meeting.
 - The MEP design management kick-off meeting is typically held as part of the first SD MEP meeting.
 - Explain the purpose for and format of the MEP design management process.
 - Use the "MEP Meeting Master Kickoff Notes", found on the CPR drive, to conduct the first part of the meeting.
 - Revise the "Notes" to be project specific and pass them out at the meeting. Review/explain the items in the notes.
 - The level of review needed will depend upon how much work the A/E has done previously at U-M and whether they have been through a managed MEP process. Be cautious not to over-assume the A/E knows something.
 - Require the A/E to make the "Notes" an attachment to the meeting minutes.
 - Require the A/E communicate with Plant Operations, Department of Public Safety and Security (DPS), Occupational Safety and Environmental Health (OSEH), UH Facilities

Planning and Development (FP&D), and other U-M personnel through the CxA and Design Manager.

6. Manage the MEP design meetings.
 - Develop the agenda for each meeting to assure all MEP topics are discussed in detail. Obtain input from the A/E and other team members. Use the outline agenda “MEP Meeting Master Agenda”, found on the CPR drive, as a starting point, revise to make project and meeting specific.
 - Inform the Design Manager of the appropriate U-M personnel to invite.
 - Require the A/E distribute their design documents in advance when possible.
 - Require the A/E to present their design including concepts, drawings and specifications.
 - Lead a detailed discussion on the acceptability of the current concept for each system.
 - Require compliance with codes and U-M design standards.
 - Require the inclusion of Cx requirements in the design documents.
 - Identify incomplete design issues and remind the A/E of the Design Deliverables required for design completeness at each phase completion. In particular in SD and DD phases, items in the Design Deliverables list such as one-line diagrams should be presented at the MEP meetings for review and discussion. Require these be refined for subsequent meetings.
 - Require the A/E publish detailed meeting minutes for your review within two weeks of each meeting.
 - Require the meeting minutes include an action items list at the end.

7. Manage the A/E’s development and maintenance of the Owner’s Project Requirements (OPR) document as it pertains to system performance requirements and commissioned systems. See Design Guideline 2.1.
 - Review room data sheets produced by the A/E, Hospital Planner, Laboratory Planner, etc. for key project requirements that should be included in the OPR.
 - Help the A/E document the Users’ expectations, goals, benchmarks and acceptance criteria for judging the project. Include issues such as indoor temperature and humidity limits, air change rates, air flow rates, sound and vibration limits, medical and laboratory gas needs, laboratory equipment needs, light levels and controls, telecommunications needs, audio/visual needs, access control and security needs, medical systems and equipment needs, training needs, etc.
 - Assure the acceptable ranges of performance are identified for each parameter, and to what extent Users will be able to adjust setpoints.
 - Ask detailed questions to obtain specific acceptance criteria for systems and equipment.
 - Emphasize to the User groups the importance of establishing acceptance criteria early. Describe the high costs of expanding or changing acceptance criteria later.
 - Periodically review the OPR and identify missing, incomplete and incorrectly documented project requirements.

8. Manage the A/E’s development and maintenance of the Basis of Design (BOD) document as it pertains to system performance requirements and commissioned systems. See Design Guideline 2.1.

- Periodically review meeting minutes, the latest design drawings and specifications, and the room data sheets.
 - Periodically review the BOD for clarity, completeness, and documentation of deviations from the U-M design standards. Verify the BOD reflects the OPR. Identify missing, incomplete and incorrectly documented design decisions.
 - Require the BOD contain detailed sequences of operation and acceptance criteria needed to commission the MEP systems and equipment.
9. If the project is pursuing LEED v4 Certification, perform all design-phase Cx activities required for the Energy and Atmosphere Prerequisite “Fundamental Commissioning and Verification”.
 10. If the project is pursuing LEED v4 Energy and Atmosphere Credit “Enhanced Commissioning”, contact the project’s LEED Coordinator for guidance and perform the design-phase Cx activities required for the paths and options the project has selected for this credit.
 11. Assist the Design Manager to assure adherence to the U-M sustainability initiatives and energy and water conservation measures. See Design Guidelines 3.1 and 3.2.
 - Lead meetings, along with the Design Manager to discuss energy conservation measures and to assure U-M sustainability initiatives are met.
 - Recommend that major energy conservation measures such as envelope insulation and fenestration be optimized.
 - Review the A/E’s Energy and Water Conservation Reports and Energy Impact Statements for errors and omissions.
 12. Recommend technical studies including studies on sound, vibration, smoke purge, effluent dispersion, electrical capacity, and energy and water conservation.
 - Emphasize the study reports will dictate many design issues, so they should be completed ASAP to minimize redesign.
 - Assist with reviewing the consultant proposals and getting the studies under contract.
 13. Coordinate with plant operations, DPSS, OSEH, UH FP&D, and other U-M personnel for their input on MEP issues. Challenge any scope increase requests from these organizations if they appear excessive, especially if they exceed code or their simple payback is excessive.
 14. Provide the A/E with sample U-M controls drawings and require adherence to U-M’s symbology and control drawing conventions. See Design Guideline 230900.
 15. Require that control drawings include detailed sequences of operation, setpoints, allowable variance range from set point, alarm descriptions, and equipment operating schedules.
 16. Help identify major equipment that must be pre-purchased to maintain project schedule or to improve quality. Participate in the development of the pre-purchase specifications and the evaluation of the pre-purchase bids.

17. Provide the design team with “lessons learned” from previous U-M projects.
18. Promote the use of construction mock-ups and other quality assurance techniques, and participate in the evaluation of MEP-related mock-ups.
19. Require that equipment maintenance access spaces, such as coil and tube pull spaces and electrical working spaces be accounted for in the MEP design and blocked out on plan drawings.
20. Assure means are provided for performing MEP maintenance.
 - Verify lifting rails are provided above chillers for hoisting end caps and motors.
 - Verify hoisting exists for replacing large pumps, large motors and other heavy equipment.
 - Verify building egress paths and floor loading capacities are adequate for the future replacement of large equipment such as boilers, chillers and substations.
21. Serve as the point of contact for the Owner's review of the technical study reports related to mechanical and electrical equipment (noise studies, dispersion studies, smoke evac. studies, etc.).
 - Review the reports and identify obvious erroneous assumptions or conclusions.
 - Distribute the reports for review by the appropriate U-M departments.
 - Consolidate all comments and return the comments to the Design Manager.
22. Early in CD design, instruct the A/E to make Section 1.4 of operation and maintenance (O&M) manual Master Specification Section 017823 and Section 1.2 of the appropriate Cx Master Specification Section 019100 project specific.
 - Instruct the A/E to incorporate the sections into the project’s Division 01 specifications.
 - Instruct the A/E to not include O&M manual or Cx requirements in other specification sections, but rather just reference these Division 1 specification sections.
23. Review and submit written comments to the A/E on the project’s SD, DD and CD design documents during the Owner’s reviews of the SD, DD and CD documents. See Design Guideline 2.3.
 - Check that the design appears to satisfy the OPR and BOD requirements that will be verified during construction phase Cx.
 - Identify errors or omissions related to design, codes, the U-M design standards, agreements made during MEP design meetings, and good engineering practice.
 - During the DD and CD reviews, generally verify the comments submitted during previous Owner’s reviews were addressed.
 - Verify the documents reflect recommendations contained in the technical studies. This includes recommendations on MEP issues and also on architectural issues such as envelope and fenestration improvements which affect MEP issues such as energy efficiency.
 - During the CD review, verify the documents include complete testing and acceptance criteria (sequences of operation, setpoints, performance minimums, etc.) for the systems and equipment being commissioned. Identify missing information.

- During the CD review, notify the Design Manager if the documents are not sufficiently complete to issue for bids.
24. Assist the Design Manager by assigning action codes to the MEP-related SD, DD and CD phase Owner's review comments.
 - Resolve conflicting review comments related to the MEP design.
 - Inform the Design Manager of special requests from Users and other U-M reviewers that are not cost effective or that will result in scope creep.
 - Indicate which comments should and which ones should not be incorporated.
 25. Participate in the SD, DD and CD phase cost estimate reconciliation efforts.
 - Spot-check for estimate errors and omissions.
 - Check for line items duplicated in multiple sections and line items assigned to the wrong funding sources.
 26. Participate in the SD, DD and CD phase value engineering (VE) efforts.
 - Recommend VE measures.
 - Assure VE measures do not effect compliance with the OPR.
 - Discourage VE measures that significantly reduce OPR compliance, energy or water conservation, reliability or maintainability.
 - Verify that approved MEP VE measures appear in the next phase of design documents.
 27. Participate in the MEP contractor bid evaluations and contractor pre-award interviews critical to successfully commissioned projects.
 28. Hold a meeting with the construction CxA and help the construction-phase CxA become familiar with critical OPR and BOD requirements.

DESIGN GUIDELINE 4.3.3

FULL CONSTRUCTION-PHASE COMMISSIONING PROCEDURE

Scope

This procedure defines the scope of work for the Commissioning Authority (CxA) when a project is identified as requiring full construction-phase commissioning (Cx).

ASHRAE Standard 202, “Commissioning Process for Buildings and Systems”

Building Commissioning Association, “The Building Commissioning Handbook”

USGBC, “LEED® v4 Reference Guide for Green Building Design and Construction”

General

All project systems and equipment shall be commissioned, including but not limited to the systems and equipment listed in the project’s commissioning specification and MS 019100 – Full Project Commissioning.

Perform the following construction-phase Cx activities. Reference the Related Sections above for additional requirements.

1. Develop a project-specific Cx plan by utilizing the U-M “Generic Sample Commissioning Plan (Manual)”. All activities and forms described in this sample plan shall be implemented for the Cx process.
2. Conduct an on-site Cx kick-off meeting.

- Require each contractor's lead field person and Cx lead person to attend.
 - Clarify the requirements and benefits of the Cx process.
 - Explain the Cx plan process.
 - Explain the O&M manual requirements.
 - Write and distribute Cx meeting minutes.
3. Issue the project-specific Cx plan to the Construction Manager (CM) or General Contractor (GC) for them to complete and maintain.
 4. Develop the Cx forms for contractor completion and insertion into the Cx plan.
 - The Cx forms include but are not limited to pre-installation, pre-start (or check/test/start) and functional test check sheets.
 - All major equipment shall have pre-installation and pre-start check sheets.
 - Review equipment installation/startup manuals for equipment being commissioned and incorporate manufacturers' requirements into the pre-start and functional test check sheets.
 - Distribute the forms in advance of the Cx activities.
 - Require each contractor to complete and insert into the Cx plan the portion of each form that relates to their work.
 5. Develop project specific Cx status check sheets. See the example in the U-M Generic Sample Commissioning Plan (Manual).
 6. Conduct periodic on-site Cx meetings (typically one every month at the beginning, increasing to one every week for the last third of the project).
 - Require CM or GC and contractor participation in the Cx meetings. Invite the U-M Project Manager to the Cx Meetings.
 - The purpose of Cx meetings is to track progress toward successfully commissioning each system and to resolve issues that could prevent successful commissioning. Utilize the Cx status check sheets to track progress.
 - Periodically review the draft O&M manual and verify O&M information is being added.
 - Write and distribute Cx meeting minutes.
 7. Assess the impact of commissioning each system or piece of equipment on the project schedule.
 - Develop a logical "order and timing" for each Cx event.
 - Facilitate the CM's or GC's integration of Cx events into the project's CPM schedule.
 - When a system or equipment is being started early to facilitate construction, remind the CM or GC that the early-started systems and equipment shall be commissioned once before startup and a second time before final acceptance.
 8. Participate in the contractor submittal review process and send comments to the A/E.
 - Require the CM or GC to forward contractor submittals simultaneously to both you (the CxA) and the A/E for a parallel review.
 - Review the submittals which are critical to the Cx process.

- Focus on identifying issues that will prevent successful commissioning. Typical examples include performance data that does not meet project requirements, alarm contacts not provided for DDC, unclear sequences of operation, inadequate service and electrical clearances.
 - Focus on compliance with plans and specifications and on issues that are often overlooked. Typical examples include un-approved manufacturers (including motors provided with equipment), sub-components (such as motors and valves) not in compliance with related specification sections, etc.
 - Require the A/E to incorporate Cx comments with their comments or contact you to discuss. Copy the U-M Project Manager when submitting comments to the A/E. Notify the U-M Project Manager if your comments were not incorporated.
 - Obtain a set of the A/E reviewed and stamped submittals or arrange for the storage of a set at the project site.
9. Identify equipment or systems (including pre-purchased equipment) requiring factory testing, manufacturer startup or other special documentation.
- Verify requirements are met and documentation is inserted into the Cx plan.
 - When the CxA will witness factory tests, the project will pay for travel-related expenses.
 - Review equipment test reports or similar reports significant to the commissioning effort.
 - Participate in the resolution of issues brought to light as a result of such testing or reports.
 - Document the final resolutions in the Cx manual.
10. Document any quality control deficiencies found during the Cx process.
- Maintain an Open Issues Log or equivalent and frequently provide a copy to the CM/GC.
 - Request the CM or GC incorporate Cx open issues into the project's open issues list.
11. Generate Requests For Information (RFIs) to the Architect/Engineer regarding questions about design intent or functionality issues of systems to be commissioned, and follow up on closure of all such issues.
12. Participate in the Coordination Drawing Process.
- Attend a minimum of two contractor coordination drawing meetings. Monitor the process to verify reasonable coordination is occurring between trades. Report on contractor progress.
 - Assist contractors in identifying required equipment maintenance access and require maintenance access spaces be delineated on the coordination drawings.
13. Monitor the proper protection from dirt, debris, and water, ducts, piping, air handlers, VFDs and similar equipment.
14. Validate proper flushing, cleaning and water treatment of plumbing and hydronic piping systems.
- Review the specification requirements for flushing and cleaning, disinfecting and chemical treatment. Validate contractor compliance throughout construction.

- Review and approve flushing and cleaning plans.
- Conduct a chemical pre-treatment conference with the contractors to verify treatment procedures, discuss coordination with existing piping networks, and to coordinate treatment activities with the construction schedule. Document the meeting in the Commissioning Report.
 - Ann Arbor central campus projects including Housing: Because the University's water treatment service company will become responsible for water treatment at project completion, invite them to the conference by contacting the U-M water treatment coordinator (Nicholas Vanderkolk (nevander@umich.edu)). If they or others bring up concerns during the meeting, address through normal commissioning protocols. (For U-M Hospital and Athletics projects and other U-M campuses, determine the equivalent University representative(s) to invite in consultation with the U-M Project Manager.)
- Witness flushing and cleaning of these systems.
- Assure chemical testing verifies proper rinse of the cleaned systems.
- Require that the initial water treatment of each hydronic system occurs immediately after flushing and cleaning is completed.
- Obtain reports verifying water treatment was maintained throughout construction and insert them in the Cx plan.
- Conduct a final chemical treatment turn-over meeting and insert the final validation report in the Cx plan. Document the meeting in the Commissioning Report.
 - Invite the same University representatives as invited to the pre-treatment conference; address any concerns that arise through normal commissioning protocols.

15. Participate in contractor duct leak testing.

- Review and approve duct leak testing plans.
- Verify a sampling of ductwork for cleanliness.
- Witness duct leak tests. Listen and feel for air leaks.
- Witness follow-up leak tests.

16. Participate in and document the initial energization of major power distribution system equipment.

- Review the final short circuit and protective device coordination studies provided by the A/E. Identify secondary fuse sizes, breaker settings and automatic transfer switch settings that are missing from the study.
- The electrical testing agency will document in test reports the fuse sizes, breaker settings and ATS settings installed in most of the equipment. Compare them with the A/E's report and identify discrepancies. Verify with contractor help the fuse sizes and equipment settings not included in test reports to achieve 100 percent verification.
- Verify electrical equipment and cables have passed the specified electrical testing.
- Verify electrical equipment is labeled and contains arc flash hazard warning labels.
- Witness the initial energizations of major electrical equipment.

17. Participate in and document the startup of major equipment.
 - When required by specification, assure a manufacturer's representative starts up the equipment.
 - Test all modes and sequences of operation, all interlocks and conditional control responses, and all specified responses to normal, abnormal, and emergency conditions under all operating conditions.
 - Verify sound, vibration and other specified tests are performed after startup.
 - Collect the check-test-start sheets for inclusion in the Cx plan.

18. Participate in the functional testing and commissioning of each system.
 - Participate in 100 percent of the functional testing of major equipment.
 - Functionally test 100 percent of terminal units that are controlled in any way by occupancy sensors.
 - Functionally test 100 percent of terminal units or zones that provide temperature, humidity, pressure, or similar control outside of what would be the design criteria for a typical office, e.g. those serving museum, special storage, or similar spaces.
 - Functionally test 100 percent of terminal units serving any space designated as a lab.
 - Otherwise, randomly sample 20% minimum of fan coil units, VAV boxes, chilled beams, plumbing fixtures, lighting occupancy sensors, and similar high unit count equipment. If significant issues are found, random sample in additional increments of 10% until no significant issues are found.
 - Verify each system and its components are installed per specification and manufacturer's requirements and with adequate maintenance accessibility.
 - Verify the testing of all system functions. Include all modes and sequences of operation, all interlocks and conditional control responses, and all specified responses to normal, abnormal, and emergency conditions under all operating conditions.
 - Verify all system controls, safeties and alarms.
 - Verify systems and components provide the OPR and BOD requirements.
 - Document all issues revealed as a result of Cx.
 - Verify all documented issues are resolved.
 - Advise the U-M Project Manager and A/E of design problems.
 - Document separately issues that cannot be corrected within the project scope.

19. Validate the test and balance (TAB) procedures and review the TAB report.
 - Conduct air and water balance "pre balance" conferences.
 - Verify air and water balance procedures proposed by the TAB contractor are appropriate for the project.
 - Monitor air and water balance activities.
 - Review air and water balance reports.
 - Document incorrectly balanced systems, incomplete balancing, insufficient balancing data, and system deficiencies identified as a result of the balance work.
 - Verify any incomplete TAB work is completed and any system deficiencies identified as a result of the TAB activities are rectified.

20. Commissioning of the following systems shall be limited to tracking that the required AHJs inspect and document their approval of the system. Correspond with the U-M Project Manager to assure these activities occur. Insert approval documentation into the Cx Plan.
- Fire alarm systems: State of Michigan BFS, U-M Fire Marshal, U-M Code Inspection.
 - The CxA shall verify and separately document, in advance of the AHJ's inspection, that any mechanical equipment controlled by the fire alarm system (directly or indirectly) operates per the intended sequence of operation. Examples: Smoke or fire/smoke dampers in AHUs and in ducts and smoke control zones, fans, actuated doors or door release mechanisms, stairway or smoke zone pressurization systems, atrium smoke control systems, etc..
 - Elevators: State of Michigan Elevator Inspector, U-M Plant Elevator Shop.
 - Emergency responder radio and cell phone signal enhancement systems: U-M ITSComm Engineer, U-M Code Inspection.
21. Additional requirements for certain systems: Verify the contractor demonstrates all modes of system operation including User programming of system functions to the appropriate User representative(s). Determine who the appropriate User representatives are in conjunction with the U-M Project Manager:
- Security Systems: Commission similar to any system, however assure the U-M Division of Public Safety and Security along with the appropriate user representative is involved
 - Access Control Systems: Commission similar to any system, however assure the appropriate user representative is involved.
 - Audio/visual, electronic messaging, room scheduler and similar electronic systems: Commission similar to any system but arrange for the User representative(s) to participate in the functional testing.
 - Cage and rack washers, sterilizers, and similar specialized User equipment provided by the project: Arrange for and attend a contractor demonstration of all modes of system operation and User programming functions presented to the appropriate User representatives. Once the User agrees the equipment functions per specification, document that fact in a report sent to the User and the U-M Project Manager. Insert such reports in the Cx Plan.
22. On projects providing a new or replacing or expanding an existing emergency power distribution system, perform a "pull the plug" test of the system.
- Arrange for a test in which normal primary power to the building is shut off.
 - U-M Inspection will verify engine-generator and/or battery systems start all emergency loads in their required times, and these loads operate as intended.
 - The CxA shall verify engine-generator and/or battery systems start all legally required standby loads (e.g. smoke pressurization fans) and optional standby loads in their required times, and these loads operate as intended.
 - Verify no normal loads receive engine-generator or battery power.
 - Verify all "loss of normal power", "transfer to generator power" and similar alarms function as intended.
 - Arrange for restoration of normal primary power to the building.

- Verify emergency and standby loads return to normal power and operate as intended.
- Verify all normal loads resume operation as intended.
- Verify engine-generator and/or battery systems return to standby mode.
- Verify all alarms return to normal.

23. Generate and issue periodic Cx Reports.

- Identify systems that do not meet the OPR or BOD.
- Document the Cx activities performed, problems identified, and Cx activities still outstanding. Include any quality control deficiencies found during the Cx process.
 - Identify the responsible party assigned to correct the problem or deficiency.
 - Distribute the report to the contractors, the U-M Project Manager, and the A/E.
- Immediately before Substantial Completion, provide the U-M Project Manager with an overall report documenting all Cx activities performed, problems identified and Cx still outstanding. Clearly identify any OPR or BOD requirements not met.
- If Cx activities will occur after Substantial Completion, issue an updated Cx report when all Cx activities are complete.

24. Review and approve the O&M manuals.

- Require that O&M manuals be submitted to the CxA using the project's submittal tracking process.
- Review for compliance to Specification 017823.
- Verify manual is logically organized, indexed and labeled.
- Verify manual is complete and project specific.
- When manual is approved, instruct CM or GC to produce three more copies.
- Transmit all four copies to the U-M AEC Project Manager who will forward to the AEC Facility Information Center (FIC).
- Insert the transmittal in the Cx plan.

25. Manage and conduct Owner training sessions.

- Verify the contractor organizes the vendor training required by the specifications.
- Determine attendance requirements via communication with the Owner's Plant Operations Training Coordinator.
- Propose training schedules for Owner approval.
- Notify Owner's personnel of each training session and track their attendance through completion.
- Develop an outline style training document generally describing each major system, areas served etc. that will assist maintenance personnel in becoming familiar with each system.
 - Provide such training in conjunction with equipment-specific training, where appropriate.
- If a vendor training session does not meet the specification requirements, require the vendor to provide the training session again.
- Document each training session (trainer, attendance, date, time, location, and brief report).

26. If the project is pursuing LEED, provide any commissioning activities required by the “LEED v4 Reference Guide for Green Building Design and Construction” to support the LEED effort.
27. If the project is pursuing LEED v4 Energy and Atmosphere Credit "Enhanced Commissioning", contact the project’s LEED Coordinator for guidance. Produce a systems manual and perform the other construction-phase Cx activities required for the paths and options the project has selected for this credit.
28. If the project is pursuing LEED v4 Indoor Environmental Quality Credit “Construction Indoor Air Quality Management Plan”, assist the U-M Project Manager with this effort.
 - Assist with developing an indoor air quality (IAQ) management plan that assures ductwork and air handling equipment are protected from dust and debris throughout construction and temporary use.
29. Perform Cx closeout.
 - Review and approve the final Cx plan submittal.
 - Generate and issue a Final Cx Report.
 - Verify that all project Cx requirements have been met.

DESIGN GUIDELINES 4.3.4

REDUCED SCOPE CONSTRUCTION-PHASE COMMISSIONING PROCEDURE

Scope

This procedure defines the scope of work for the Commissioning Authority (CxA) when a project is identified as requiring reduced scope construction-phase commissioning (Cx). Such projects are expected to require a low number of commissioning man-hours, often less than 50, because they involve a small number of systems or equipment needing commissioning.

Related Sections

U-M Design Guideline Sections:

[DG 4.3 – Building Commissioning](#)

[DG 4.3.3 – Full Construction-Phase Commissioning Procedure](#)

[DG 4.3.5 – Commissioning Plan Procedure](#)

[DG 4.3.6 – General Commissioning Procedures](#)

U-M Master Specification Sections:

[MS 017823 – Operation and Maintenance Manuals](#)

[MS 019100 – Project Commissioning](#)

General

All project systems and equipment shall be commissioned, including but not limited to the systems and equipment listed in the project's commissioning specification and MS 019100 – Project Commissioning.

Perform the following construction-phase Cx activities. Refer to Design Guideline 4.3.3 for a thorough description of each Cx activity.

Core Cx Activities

Develop pre-start check sheets and functional test Cx forms for contractor completion and return.

- Review installation manuals and incorporate manufacturers' requirements into the forms.
- Distribute the forms to the General Contractor/Construction Manager for distribution to contractors in advance of the Cx activities.
- Identify equipment requiring factory testing or manufacturer startup and assure it occurs.
- Collect factory test, start-up and field services reports from the contractors.
- Require each contractor to complete the portion of each form that relates to their work.

Conduct at least two Cx meetings; an introductory meeting at the start of construction and a second meeting during construction. Conduct the meetings as part of the project's regular construction meetings. Add more meetings when required due to project complexity.

- Introduce yourself to the contractors and describe the Cx requirements for the project.
- Indicate that all Cx issues discussed at the meetings shall be documented in the construction meeting minutes.
- Indicate the CxA is to be copied on all construction meeting minutes.
- Indicate what items are required in the Operation and Maintenance (O&M) manual and when the O&M manual is to be submitted to the CxA for approval.

Witness 100 percent of the functional testing of systems and equipment requiring Cx.

- Document the Cx activities performed, the issues identified, and the Cx still outstanding.
- When special tests are required, verify the tests are performed. Collect the documentation.
- Establish expected "ready for re-commissioning" dates. Verify contractor readiness prior to re-commissioning identified issues. Return and verify all identified issues have been resolved.

Additional Cx Activities

In addition to the core Cx activities, perform the following activities as applicable to the project. When Cx is being performed by an External Cx Firm, only the additional activities identified in the project's Request for Proposal are required.

1. Review contractor submittals which are critical to the Cx process and submit review comments to the A/E.
2. Participate in and document the initial energization of major power distribution system equipment.
3. Participate in and document the startup of equipment.
4. Validate proper flushing, cleaning and water treatment of plumbing and hydronic piping systems. Collect all water treatment reports.
5. Witness and document a "pull the plug" test of new or renovated power distribution systems.
6. Validate the test and balance (TAB) procedures and review the TAB report.
7. Review and approve the O&M manuals.
8. Manage and conduct Owner training.

Cx Reports and Closeout

Verify all project Cx requirements have been met.

After each functional test, email to the U-M Project Manager a summary report documenting the Cx activities performed, problems identified, and Cx activities still outstanding. Include any quality control deficiencies found during the Cx process.

Immediately before Substantial Completion, provide the U-M Project Manager with an overall report documenting all Cx activities performed, problems identified and Cx still outstanding. Clearly identify any OPR or BOD requirements not met. Include completed Cx forms and documents related to the Cx effort. These compiled documents serve as the commissioning plan. Provide this plan as a scanned PDF. Also send an electronic copy of the Cx report and plan to Laura North (lanorth@umich.edu).

If Cx activities will occur after Substantial Completion, issue an updated commissioning plan when all Cx activities are complete.

DESIGN GUIDELINE 4.3.5

COMMISSIONING PLAN PROCEDURE

Scope

This procedure defines the process for developing and maintaining a commissioning (Cx) Plan. The Cx Plan is the document that outlines the project specific requirements and responsibilities of the Cx process. The Cx Plan also stores all validating documentation related to the Cx process.

The Commissioning Authority (CxA) is responsible for developing, managing, and executing the Cx Plan. The CxA is also responsible for populating it with the required documentation, with the assistance of the contractors.

U-M Master Specification Sections:

[MS 017823 – Operation and Maintenance Manuals](#)

[MS 019100 – Project Commissioning](#)

General

Develop a project specific Cx Plan. Produce one copy for the Construction Manager (CM) or General Contractor (GC), and a second copy for yourself. Set up the Cx plan in 3-ring binder(s). Use the U-M "Generic Sample Commissioning Plan" as a template. The generic sample Cx plan is available at <http://www.umaec.umich.edu/wp-content/uploads/2013/08/Sample-Cx-Plan-Master.pdf>

1. Include all the processes, procedures and documents described in the U-M generic sample plan that are applicable to the project.
2. Produce the documents and forms described in the U-M Generic Sample Commissioning Plan template, e.g. the OPR/BOD summary, the Cx Status Check Sheets, the project specific list of equipment and systems to be commissioned, the prestart and functional test forms, etc.
3. Issue one copy of the Cx Plan to the CM or GC at an early commissioning meeting, preferably at the Cx kick-off meeting.
 - Explain the plan's organization and intent.
 - Review the commissioning process and procedures, using Section 1.4 of the Plan template as a guide.
 - Review the documentation to be provided by the various Cx Team members, and establish a process for the collection of that documentation.

- Explain that you will issue blank Cx forms for completion and insertion into the plan.
 - Require each contractor to fill out the portions of the forms that relate to their work, sign them and submit them along with copies to the CxA, to the CM or GC for filing in the Plan.
4. Execute commissioning in compliance with the project specific Cx Plan. Collect the forms, reports, and other required documentation as it is turned in or generated, and file it in the respective Tab 2 or Tab 3 section.
 5. When Cx has been completed, review and approve the final Cx Plan. Verify that all project Cx requirements have been met and documented.

At the end of Cx, scan the entire contents of the plan as a PDF. Prepare a transmittal memo and transmit the scanned copy of the Cx plan (including a final Cx report) to the U-M Project Manager, the AEC Facilities Information Center (FIC), and Laura North (lanorth@umich.edu) for archiving.

DESIGN GUIDELINE 4.3.6

GENERAL COMMISSIONING PROCEDURES

Scope

This procedure covers the minimum commissioning requirements for:

- Conducting commissioning (Cx) meetings
- Providing Cx reports
- Obtaining operation and maintenance (O&M) manuals for the Owner
- Managing and conducting Owner training

Related Documents

U-M Master Specification Sections:

[MS 017823 – Operation and Maintenance Manuals](#)

[MS 019100 – Project Commissioning](#)

Commissioning Meetings

Soon after becoming assigned or hired as the project's Commissioning Authority (CxA), contact the U-M Project Manager and schedule a Cx kick-off meeting.

- On large projects, the Cx meetings shall be separate from but perhaps directly after the Project Manager's construction meetings.
- On reduced scope construction-phase Cx projects, the Cx meetings should be held as part of the regular project construction meetings.

Commissioning meetings should have the entire Cx Team in attendance: U-M Project Manager, Construction Manager (CM) or General Contractor (GC), and the applicable contractors. Invite U-M trades (such as U-M Plant DDC Shop) that are performing work on the project when their responsibilities will be discussed at the meeting.

Take attendance at the Cx meetings.

At the Cx kick-off meeting, give an overview of the Cx process including reviewing the Cx specification and all the requirements outlined in the Cx Plan. Establish the reoccurrence of the Cx meetings.

At subsequent meetings, discuss the current status of each system being commissioned. Utilize the project's Cx Status Check Sheet as a guide.

- Discuss design, construction, and equipment issues affecting Cx.
- Discuss the Cx schedule. Identify issues that may prevent completion of Cx before Substantial Completion.
- Establish clear action items, dates, and responsible parties.
- Periodically review the progress of assembling the project O&M.
- Finalize Cx event dates, e.g. equipment start-ups, functional testing, owner training sessions, etc.
- Generally limit discussion to resolving issues that will allow each system to progress to functional testing and ultimately to final CxA sign-off.
- For design and construction issues that impact Cx and require lengthy discussion, schedule separate meetings inviting only those parties that need to be directly involved in the resolution.

Within a few days after the meeting, issue meeting minutes to the Cx team.

- List the Cx team and identify who attended the meeting.
- Organize the minutes to match the meeting agenda.
- Summarize the meeting discussions
- Include an action items list with responsible party and completion date.

Alert the U-M Project Manager of critical issues that are preventing the execution of the Cx process in a timely manner or that could prevent successful final commissioning and sign-off; do not rely entirely on meeting minutes for this purpose.

Commissioning Reports

Prepare an electronic Cx report and update it periodically. See the last pages of the Design Guideline for a suggested Cx report format (for interim and final reports). Other formats are acceptable if they present the information in a similar manner and contain the same information.

Each Cx report shall include the following:

- Report Data
 - Sequential report number and date of report
 - Building Name
 - Project Name
 - U-M Project Number
 - Report author and distribution list
- Executive Summary - Each report shall begin with an executive summary that indicates, since the last report issued:
 - The functional tests that have occurred
 - Major issues discovered
 - Any new or on-going impediments to commissioning

- the overall Cx progress
- Issues Discovered - This shall be followed by a updated list of all issues discovered during the Cx process

Quality control issues (code violations, material substitutions, poor workmanship, damage, etc.) that do not affect system function, functional testing, or that are not a significant concern or impediment to the Cx process should be included in the project's QC log. If no such QC log is available and the issue is significant, include it in the Cx report.

If a significant issue is found that exceeds the project scope, document it and discuss with the U-M Project Manager (resolution may or may not occur as part of the project).

Each issue should be assigned a unique number to allow ease of tracking. In the sample report format presented at the end of this Design Guideline, each issue is assigned a number consisting of the system tab number followed by a sequential number.

Periodically transmit an electronic copy of the Cx report to the Cx team including the U-M Project Manager and any others identified with an action item. **Issue a report at least monthly.**

Final Cx Report

Immediately before Substantial Completion issue a draft final commissioning report. Label the report "Final" and "Preliminary and Advisory". If Cx activities will occur after Substantial Completion, label the report "Provisional Final Report" (and "Preliminary and Advisory") and note the Cx activities that make the report provisional. In either case, provide an executive summary (same as for routine reports), and group remaining open issues in the report as follows:

- Cx Activities Still Outstanding. Identify incomplete Cx and its reasons (e.g. system not complete, addition to scope, etc.).
- Open issues directly related to the scope of the project (e.g. unresolved Contractor deficiencies, vendor equipment deficiencies, OPR/BOD requirements not met due to design deficiencies or other reasons (explain reasons), etc.).
- Issues beyond the scope of the project. Provide recommendations on how to resolve the issues when possible.
- Recommendations and Lessons Learned. Summarize any Cx recommendations and lessons learned.
- This shall be followed by a updated list of all the issues discovered during the Cx process.

Transmit an electronic copy of the final report to the Cx team, including the U-M Project Manager, for review and comment. Require comments within one week.

After the final report has been reviewed, revise the report to reflect any comments received as appropriate. Remove the "Preliminary and Advisory". Insert a copy of the report into the Cx

Plan. Electronically transmit the Cx Plan along with the final report (separated from the Cx Plan) to the following:

- U-M Project Manager
- Laura North (lanorth@umich.edu)
- Project's Commissioning Team
- U-M Plant Engineering (UPE): Ron Crawford <rhc@umich.edu>
- Project's Facility Manager
- Electronically transmit the Cx Plan to the AEC Facilities Information Center for archiving, retain a copy for the CxA's record.

If the report is a Provisional Final Report, issue a Final Report when Cx is finished, following the same procedure above.

Operation and Maintenance Manuals

During construction, assure that the contractors and the CM or GC assemble the O&M manuals as construction progresses.

- At the first (or a very early) commissioning meeting, thoroughly explain the O&M manual requirements to the contractors. Review the requirements of Specification 017823 and establish how the O&M sections provided by various contractors will be collated into one uniform manual. Instruct the CM or GC to take ownership of this coordination.
- Notify contractors that a draft copy of their O&M manual will be required in the near future, and agree upon a reasonable date for submittal of it. This draft copy should consist of the labeled binders with a complete table of contents and the appropriate binder tabs.
- Review the draft O&M manual when received. Verify the binders and table of contents are in compliance with Specification 017823, and the table of contents covers all the equipment for which O&M information must be submitted. Pay special attention to easily missed systems provided by minor subcontractors, such as automatic over-head doors. Identify required changes in arrangement and missed equipment which must be added. Note where additional table of contents entries may need to be added later as construction progresses. Remind contractors that O&M materials shall include installation manuals, and these materials should be collected throughout construction, starting with the submittal process. Remind contractors that manufacturers' sales literature and similar promotional materials are not to be included.
- Throughout construction, remind contractors and the CM or GC to gather operation and maintenance documentation and enter this data into the binders. Periodically instruct contractors to bring the binders to the next commissioning meeting for interim review.
- Remind contractors that four Owner-reviewed and approved O&M manuals must be submitted at least two weeks prior to Owner training. Remind them that completed O&M manuals are a prerequisite for Substantial Completion and final payment.

Review and approve the O&M manuals, and transmit the final O&M manuals to the U-M AEC Project Manager who will forward to AEC Facilities Information Services (FIC).

- Instruct contractors to submit one copy of the O&M manual for approval as soon as completed. Review the manual for completeness and conformance to Specification 017823. Verify the contents are marked so they are project specific.
- Depending upon the number of comments, mark the manual “Approved”, “Approved as Noted” or “Rejected - Revise and Resubmit”. Repeat this review process as necessary until the manual can be used to make the additional manual copies.
- When the four approved copies of the O&M manuals are received from the CM or GC, prepare a transmittal memo and transmit all four copies to the U-M AEC Project Manager. The U-M AEC Project Manager will forward to FIC, FIC will distribute the O&M manuals according to their procedures.
- If the O&M manuals are not complete at the time of transmittal, state in the transmittal that the manuals are not complete. When the CM or GC provides four copies of all of the missing pages required to complete the manuals, prepare a transmittal memo and transmit the four copies of the pages as above. State in the transmittal memo that each O&M manual holder shall insert the pages into his or her copy. Collect and transmit all of the missing pages only once. Multiple partial transmittals of additional pages are not acceptable.
- Test and Balance (TAB) reports shall be kept separate from but should be handled the same as O&M manuals. When the four approved copies of the TAB report are received from the CM or GC, prepare a transmittal memo and transmit all four copies to the U-M AEC Project Manager.

Owner Training

Manage and conduct Owner training sessions.

Develop, with the assistance of the contractors, a training plan consisting of overview training (to be conducted by the CxA and the contractors) and any equipment or system specific training which has been specified in the contract document technical sections (e.g. boiler training). Refer to U-M Master specification MS 019100 for training plan and training requirements.

Execute training in compliance with the requirements outlined in MS 019100.

- Develop a logical plan generally organized on a system-by-system basis.
- Assure all equipment of system training required by the technical specifications has been identified, and include it in the plan in a manner that makes the training most effective.
- Assure the training includes OPR and BOD requirements pertinent to the Cx process. For example, identify spaces with special temperature and humidity requirements, what those requirements are, and fundamentally how those requirements are achieved.

- Identify critical sensors, transmitters, and other components whose continued calibration or proper operation are essential for maintaining required performance levels, safety and energy efficiency.

Identify the appropriate parties to be invited to each training session. These shall include:

- U-M Plant. Appropriate plant personnel will be identified and informed of the training by the U-M Plant Training Coordinator once the Coordinator is notified of the training.
- The building facilities manager.
- Users of user equipment supplied by the project. Contact the building facilities manager and the user representatives that assisted in the functional testing of the user equipment (refer to U-M DG 4.3.3) to determine the persons to invite.
- Parties as identified by the U-M Project Manager (contact the U-M Project Manager)
- Other parties that have expressed a desire to attend training and are appropriate to attend.

Invite the appropriate parties.

- U-M Plant: U-M Plant Training Coordinators (send email notification to Gene Weincouff <eawein@umich.edu> and Christine Nedrow <cnedrow@umich.edu>)
- Other parties per the above.
- Include date, time, duration, and brief agenda. List the systems, equipment, and building areas served, and if personal protective equipment is required.
- Do not schedule training sessions that extend past 3:00PM. Avoid scheduling training sessions on Mondays and Fridays.
- Arrange for classroom space when classroom training is specified (work with the U-M Project Manager to identify a location)

Execute the training sessions.

- Execute the training plan including over-view training and specification required technical training sessions. Describe the design intent of each system and the OPR and BOD requirements applicable to each session.
- Review the contents of the O&M Manual as they relate to the training session.
- Take attendance at all training sessions. Attendees shall print and sign their name on the attendance sheet.
- E-mail a copy of the attendance list to the U-M Plant Training Coordinators after training is complete.
- Insert copies of the attendance lists into the Commissioning Plan.

DESIGN GUIDELINE 4.4.1 **LANDSCAPE**

Scope

Design guidelines for landscape considerations that reinforce a consistent appearance for campus streets, walks, open spaces and plantings and support university sustainability goals. This includes design requirements for new plantings, maintenance-priority levels across campus, soil preparation, pavement treatment, safety and security issues, plant selection and use of native or near native plants.

Design Requirements

In general, plantings should be used to:

- Enhance the campus tree canopy
- Accentuate key focal points, including campus gateways, nodes, building facades and entrances and special exterior features such as artwork installations
- Define special areas such as plazas and seating/gathering points

- Buffer unattractive views to service areas, dumpsters and mechanical equipment
- Create green buffer zones between parking areas and campus
- Control pedestrian access and circulation as needed
- Achieve sustainable design goals such as water conservation, storm water filtration and absorption, urban heat sink reduction and energy savings with the appropriate use of plants.

The Design Professional (DP) shall consult with Campus Planning (CP) for guidance for the landscape design including to determine appropriate function, scale and acceptable maintenance level. Planting designs should reflect the institutional scale of the campus and the particular setting in which they are located. Landscape plantings should be designed for maximum effect with limited maintenance, emphasizing broad sweeps of similar material. Areas of high visibility, such as the Central Campus Diag, should have a rich palette of native plants; areas of lower visibility, such as service docks, should minimize the use of turf grass by using native grasses and plantings.

Detailed and complex plantings should be reserved for courtyards and other areas of smaller scale. High maintenance planting displays should be limited to high visibility areas where such maintenance is warranted. Grounds Services (Grounds) has developed a maintenance priority system and corresponding campus maps based upon the levels of maintenance supported across campus. Consider the priority level of maintenance intensity for the landscape space being designed:

Level One Priority: Landscape spaces of high-visibility and high pedestrian traffic with the greatest visual impact that usually include public green spaces, plazas and gateways. These areas are typically iconic spaces comprised of complex foundation plantings and a high number of perennial beds, ornamental trees and shrubs. A moderate amount of special paving materials are featured and automatic irrigation is available. Landscape beds are weeded, edged and top dressed with shredded bark mulch annually.

Level Two Priority: Landscape spaces of moderate visibility and pedestrian traffic that typically include courtyards and building envelopes. Maintenance activities occur less frequently in these areas, which are comprised of moderate amounts of ornamental trees and shrubs, perennial beds and foundation plantings. Lawns are supported by automatic irrigation and planting beds are typically equipped with couplers or hose bibs nearby. A minimal amount of specialty paving materials are featured in these areas. Landscape beds are weeded, edged monthly and top dressed with shredded bark mulch biannually.

Level Three Priority: Landscape spaces of moderate to low visibility and pedestrian traffic that typically include campus perimeters and parking and service areas. Maintenance activities occur less frequently in these areas, which are typically comprised of minimal ornamental trees and shrubs, foundation plantings and perennial beds. Little to no irrigation and specialty paving can be found in these areas which largely consist of open lawn areas and landscape beds that are weeded monthly, not edged and top dressed with bark mulch every three years.

Conservation of the mature and healthy native flora is essential in areas of campus where mature vegetation stands remain. Native vegetation should be used where additional plant materials are

needed to highlight the natural edge.

The university is committed to using native or near native plantings whenever possible to protect and enhance the integrity of native plant communities, and to reduce the amount of water used for irrigation, maintenance requirements and chemical treatments. Consider rainwater gardens or similar, to assist with storm water management and create cross-functional landscapes. Review the overall aesthetic intent of the site design inclusive of hardscape, softscape and furnishings, etc. with CP for approval.

Avoid plantings within parking lot islands where heat and snow removal activities prohibit healthy growth. Instead, emphasize perimeter landscape treatments to buffer views and to provide shade. Ensure thoughtful snow storage design and site location, and carefully consider the impact on planting areas. Avoid planning for snow storage in storm water basins.

Reduce the amount of manicured lawn in favor of landscaping with native plants and groundcovers. The site's soil type, soil fertility and topology will guide plant selection and performing a soil survey is necessary.

Use of edging can be a site-specific design decision and is especially useful for planting beds where groundcover is used. It is also helpful to utilize edging to separate lawn areas from adjacent stone maintenance areas. In general, landscape beds with a natural edge are preferred except in Level One Priority maintenance areas. When edging must be used to maintain a defined planting bed edge, black anodized aluminum edging (3/16" thick by 4" high) should be specified unless noted otherwise on drawings. See Aluminum Edging Detail

Consult with Grounds to review needs for irrigation systems and related design. See 6.0 DG 328400 Irrigation for more information.

Soil Preparation

Soils specified for a project site should be locally available and supplied from off-site sources unless noted otherwise. If existing on-site soils do not meet specifications for planting, amendments will be required. If off-site topsoil does not meet specifications for planting, blended soils are required.

Prior to soil installation, existing subgrade should be prepared by scarification to a minimum depth of 12". Areas subject to construction access roads, laydown areas, staging or other construction operations should be ripped and scarified to a minimum depth of 24". Designers should specify the desired option for subgrade preparation and general instructions based on site specifics – it is preferred not to give the contractor the option to select any of the alternates, as they are not equal treatments. If different treatments are required, sub-grade and topsoil shall be mixed to reduce drastic soil horizons by preventing two very different soil textures from laying late on top of each other without being blended somewhat. At a minimum, specify mixing soils by scarifying the subsoil of the subgrade to a depth of 3-6" with the teeth of the back hoe or loader bucket, tiller or other suitable device immediately prior to installing the topsoil.

In lawn areas, new topsoil installation depth will be 6” and in planting beds 12”. Ensure final grade is down 1” from finish grade.

When existing soil consists of compacted subsoil because of previous grading, filling or dynamic or static compaction forces, it should be modified to support proposed plantings. The method of modification (soil fracturing, soil ripping or soil trenching) shall be determined by the designer of record based upon constraints of the site and project budget. Note that the modification alternatives are not equal treatments and should be directed by design rather than contractor. If different treatments are appropriate for different locations on the same project, be clear on the drawings the extent of each treatment. Include a project specific soil specification for detailed requirements.

Paving Treatment

Landscape should be complimentary and compatible with existing and proposed adjacent pavement systems, including pervious pavement. Avoid adjacent landscape treatments in which the selected plantings, corresponding maintenance requirements or migrating mulch would reduce permeability of adjacent paving systems.

Paving and concrete scoring patterns for new walkways should be designed to be consistent with adjacent walks and university standards. Standard campus arterial walkways should be designed to accommodate anticipated volume of pedestrian traffic and typically be consistent with a minimum 8’ wide concrete walk consisting of a standard 8’ x 8’ tooled joint scoring pattern.

Design of pavement treatments in high pedestrian traffic areas, facility doorways and in patient care areas should be deliberate to avoid future trip hazards and pavement system settlement.

Maintenance of pavement systems should be a factor in designs. Designs varying from the typical campus standard should be discussed in advance with the Campus Planner. Paving designs should be considerate of and coordinate with existing and proposed site features, landscaping and utilities.

When pavers are specified, utilize university standard details for paver on concrete base or paver on pervious concrete with concrete band/curb.

Existing Landscape Materials

Consider the impact of new construction/renovations on existing landscape materials. Avoid damage to significant vegetation by careful routing of walkways, placement of parking lots and utilities and incorporating existing specimen trees. Utilize robust tree protection during construction to prevent damage to existing landscape material.

Security and Safety Issues

Plantings shall be designed to provide open and unobstructed views and to eliminate concealment opportunities. For personal safety and security considerations, avoid planting arrangements that create zones of entrapment, limit visual access into gathering spaces or along walkways or otherwise

impede visibility from public view. Always consider a given plant's mature state when developing plant spacing diagrams – the spacing of new plants should be no less than 3/4 the mature spread of the plant.

Deciduous trees should be selected that, when mature, provide views beyond at a height of 6' to 7' from the ground plane to the canopy. Evergreen, ornamental or shade trees with lower canopy heights should not be used adjacent to walks, vehicular and bike parking areas or building entrances.

Shrubs that are proposed adjacent to walks, vehicular and bike parking areas or building entrances should generally be less than 36" tall at mature height. Larger shrubs should be restricted to areas where they will not limit visual access or should be used in arrangements that do not create large masses. Designs shall incorporate trimming or removal of shrubs that screen or limit views. Plantings that are intended to be hedges should be selected so that mature heights do not exceed 36".

Existing trees should be scheduled for trimming to remove any branches that impede adequate lighting or obstruct views between the grounds and the canopy. New trees and shrubs should not be planted adjacent to proposed or existing light poles to avoid disrupting light levels.

Consider the use of skateboard deterrents at walls, stairs, ramps, curbs, rails and benches. Edges of hardscape site elements should be protected by including skateboard deterrents either integral to the form of the concrete or metal deterrents installed on the edge surface.

Retaining walls should not be higher than 18" from grade to top of slope; otherwise, a handrail will be required. Screen walls should be placed so as to not impede visibility of vehicles.

Plant Selection

Plants will be selected to thrive in the conditions of the site. Consider the cultural and maintenance requirements for each plant before locating on a planting plan. Soil type, soil pH, topology, water requirements, sun/shade requirements, hardiness, disease resistance and maintenance requirements will guide plant selection. Use proper planting methods as recommended in U-M planting details and online through the Arbor Day Foundation.

The Design Professional's (DP) site designer/AEC DM should consult with Grounds regarding plant selections. A list of invasive species to avoid can be found online from the City of Ann Arbor. Submit for review a plant list of hardy materials with an emphasis on native plants.

In general, removing and/or planting trees or significant vegetation within the City of Ann Arbor's right-of-way (ROW) is not allowed. However, if approved, the DP must use the City of Ann Arbor's approved plants list when specifying planting plans within the ROW. In addition, they must work with the University Forester for any proposed tree removals. Tree value costs for trees removed both on campus and within the public ROW will need to be factored into the project budget. See the U-M Tree Preservation Policy and City of Ann Arbor Forestry's Trees and Development web site for specific details and other public ROW requirements.

Include the following installation requirements in the specifications:

- Perform a thorough weeding before planting the native vegetation. Adequate stabilization will be necessary to help establish the new plantings.
- Remove invasive species when encountered. Hand removal should be implemented wherever possible. (Note: Burning may be utilized for large areas where absolutely necessary. This must be discussed with the DM during design.)

The “Site Furnishings Standards Manual” is a companion to the “AEC Design Guidelines”, which designers must also adhere to (<http://umaec.umich.edu/for-vendors/design-guidelines/>).

Introduction

Intent: The “Site Furnishings Standards Manual” identifies design considerations and recommends specific products to be used on the University of Michigan Ann Arbor (U-M) campus. Unification of campus environment can be achieved through common landscape furnishings, colors and materials. The intent of these guidelines is to provide clear direction concerning site furnishings for the U-M campus and to promote consistent and predictable use of public art, lighting, furnishings and fencing.

Flexibility: The recommendations presented are strongly preferred; however, furnishings and materials might vary slightly from project to project and over time. It is recommended that the degree to which landscape features vary be minimized and that shared attributes, such as forms, materials, patterns, style, application-spacing and color be consistent. In special situations, alternatives may be evaluated on a case-by-case basis to ensure that the design standards are followed.

Exceptions: Any exceptions to the guidelines will require review by the Campus Planner’s Office (CP) and the [Exterior Elements Review Committee](#)(EERC).

Principles: Standard campus furnishings can help to integrate the campus environment and can further advance the sense and legibility of the place. The following principles summarize the intent of the guidelines.

- 1) Unification with common design elements
 - a. Develop uniform landscape and site treatments for common problems and issues.
 - b. Establish a more unified palette of materials for lighting, site furnishing and landscape and hardscape elements.
 - c. Enhance campus legibility and structure of campus.
- 2) Beautification and appearance of the campus
 - a. Maintain and improve the visual quality of campus landscape.
 - b. Establish a more visible and compelling public art presence.
 - c. Develop signature amenities and improvements throughout the campus areas.
 - d. Cluster furnishings to maximize effective use and minimize the negative visual impact within landscape.
- 3) Others
 - a. Minimize and standardize maintenance requirements.
 - b. Provide a safe and comfortable campus.
 - c. Consider the limitations and needs of persons with disabilities to minimize potential obstructions and hazards.
 - d. Minimize life-cycle costs by utilizing high quality products that are durable, backed by a solid warranty and vendor reputations and are comfortable and aesthetically pleasant.
 - e. Provide furnishings where there is an existing demonstrated or potential future need.
 - f. Install per U-M campus standards.

1. Campus Landscape Design Elements

The following section describes the recommended site furnishing material selection and design detail opportunities that will comprise the campus landscape design vocabulary. It is intended that repetitive use of this design vocabulary in the various campus development projects will result in a more organized, unified and beautiful campus. A single style of furnishings for each element described in the manual should be used exclusively to establish a unified and attractive campus character.

A. SEATING

1) Surface-Mounted/In-Ground Benches

a) Design Considerations

- Select bench locations in potential gathering areas to create comfortable settings conducive to conversation and security.
- Locate in a comfortable setting protected from vehicles/elements, and preferably with some landscaping and shading from the sun.
- Backless benches may be used in places where two-sided access and use are expected.
- Metal is preferred for durability.
- Complement existing standard furnishings, and landscape context and architectural features.
- Locate on and anchor to pavement. Benches should be set with a minimum setback of 12"-16" from edge of lawn to reduce damage from maintenance equipment.

b) Design Recommendations

- Plexus II collection from Landscape Forms is recommended as standard.

- Black powder coat is preferable.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

2) Wall-Mounted Benches

a) Design Considerations

- Wall-mounted benches are preferred when snow removal and other maintenance is a concern.
- Select bench locations in potential gathering areas to create comfortable settings conducive to conversation and security.
- Locate in a comfortable setting protected from vehicles/elements, and preferably with some landscaping and shading from the sun.
- Metal is preferred for durability.
- Complement existing furnishings as appropriate, and landscape context and architectural features.

b) Design Recommendations

- Plexus II collection from Landscape Forms is recommended as standard.

- Black powder coat is preferable.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

3) Chairs

a) Design Considerations

- Freestanding chairs should be considered in courtyards, atriums or places that can be secured. They should not be considered in public or unsecured areas.
- Select chair locations in potential gathering areas to create comfortable settings conducive to conversation and security.
- Locate in a comfortable setting protected from vehicles/elements, and preferably with landscaping and shading from the sun.
- Complement existing furnishings as appropriate, and landscape context and architectural features.
- Metal is preferred for durability.
- Locate on the pavement with a minimum setback of 12"-16" from edge of lawn to reduce damage from maintenance equipment.

b) Design Recommendations

- Verona collection from Landscape Forms is recommended as standard.
- Black powder coat is preferable. The recommended specification is a Verona freestanding arm chair.

- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

4) Memorial/Commemorative Benches

a) Design Considerations

- A limited number of options have been approved for use as memorial or commemorative benches; see [Guidelines for Standard Memorial or Commemorative Benches](#).
- Consult with CP regarding requests for memorial or commemorative benches.

B. TABLES

1) Café Tables

a) Design Considerations

- If patio areas will be plowed in the winter, coordinate placement with U-M Grounds Services (Grounds) depending upon the type of equipment to be used.
- Complement existing furnishings as appropriate, landscape context and architectural features.
- Provide trash receptacles in close proximity.
- Locate tables near dining and food vending areas.
- Consider umbrellas for shade wherever appropriate. Umbrellas must be permanently anchored to table; tables with umbrellas must be anchored to the ground.
- Locate on and anchor to pavement. Benches should be set with a minimum setback of 12"-16" from edge of lawn to reduce damage from maintenance equipment.
- Tables must be anchored on a clear, paved pathway in order to be wheelchair accessible.
- Five-seat table with an open space for wheelchair access is preferred.

b) Design Recommendations

- The recommended standard is Carousel by Landscape Forms. Back and backless seats are acceptable. Traditional rectangle picnic table styles are not preferred.

- Black powder coat is preferable.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

2) Freestanding Tables

a) Design Considerations

- Freestanding tables should be considered in courtyards, atriums or places that can be secured. They should not be considered in public or unsecured areas.
- If patio areas will be plowed in the winter, coordinate placement with Grounds depending upon the type of equipment to be used.
- Complement existing furnishings as appropriate, landscape context and architectural features.
- Provide trash receptacles in close proximity.
- Locate tables near dining and food vending areas.
- Locate on the pavement. Tables should be set with a minimum setback of 12"-16" from edge of lawn to reduce damage from maintenance equipment.
- Tables must be located on a clear, paved pathway in order to be wheelchair accessible.

b) Design Recommendations

- The recommended standard is a 36" Catena top by Landscape Forms with freestanding base.

- Black powder coat is preferable.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

3) End Tables

a) Design Considerations

- Select locations to create comfortable and multi-functional spaces.
- If patio areas will be plowed in the winter, coordinate placement with Grounds depending upon the type of equipment to be used.
- Complement existing furnishings as appropriate, landscape context and architectural features.
- Provide trash receptacles in close proximity.
- Locate end tables in potential gathering spaces and near existing buildings.
- Locate in a comfortable setting protected from vehicles/elements, preferably with landscaping and shelter to the back and shading from the sun.
- Locate on and anchor to pavement. End tables should be set with a minimum setback of 12"-16" from edge of lawn to reduce damage from maintenance equipment.

b) Design Recommendations

- The recommended standard is the backless Plexus II series bench by Landscape Forms.

- Black powder coat is preferable.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

C. UMBRELLAS

a) Design Considerations

- Consider umbrellas for shade wherever appropriate.
- Umbrellas must be permanently anchored to table.
- Complement existing furnishings as appropriate, landscape context and architectural features.

b) Design Recommendations

- The recommended standard is an 8" Equinox umbrella from Landscape Forms.

- Metal umbrella is preferred.
- Black is the preferred color for umbrella and pole; however, on certain occasions the color can complement surrounding architectural or site features. The powder-coated pole should match the color of the umbrella.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Victor Stanley, may be considered when approved by CP.

D. TRASH AND RECYCLING RECEPTACLES

a) Design Considerations

- Trash receptacles should be compatible with benches, other furnishings and building architecture.
- Group with other furnishings to mitigate visual impact.
- Place in unobtrusive locations with a minimum 3' setback along main pathways.
- Receptacles should be located in areas of high pedestrian traffic, such as sitting areas, building entries, patios, bus stops and campus plazas.
- Ensure trash receptacles design is simple, unobtrusive and easy to service.
- Provide removable insert to dump trash.
- Locate on and anchor to pavement. Set receptacles 12"-16" from edge of lawn to reduce damage from maintenance equipment.

b) Design Recommendations

- The recommended standard is Victor Stanley S-424, fabricated metal receptacle, 36-gallon capacity, with domed lid. This is the same standard for the recycling receptacle, except with a rain bonnet lid DSS-2A.

- Black powder coat for trash receptacles and blue powder coat with recycling labels for recycling receptacles are recommended.
- Alternative products on similar lines, including Forms + Surfaces, Sitescapes, and Landscape Forms, may be considered when approved by CP.

E. ASH RECEPTACLES

- Because the University of Michigan is a smoke free campus (as of July 2011), ash receptacles will not be installed on university property.

F. SITE LIGHTING

a) Design Considerations

- Establish lighting theme to complement nearby campus facilities.
- Develop landscape lighting in parking lots that complements street and pedestrian lighting.
- Select and install a uniform lighting equipment style to reinforce campus design theme. Coordinate selection of lighting equipment with campus standards.

b) Special Lighting Criteria

- Public art and landscape features may be accent lighted in conformity with campus standards and the lamp must be shielded from offsite view.
- Accent lighting equipment shall be of sufficient quality to resist vandalism and minimize maintenance. Preferred luminaries shall be flush to grade.
- Backlit, reverse pan channel signage systems are preferred for optimum readability of signage. LED systems are encouraged.
- Façade lighting shall require special review by EERC.
- Refer to U-M AEC's Master Specifications Section 265600 – Exterior Lighting for further details.

<http://umaec.umich.edu/for.archs/masterspec/26/MS265600.pdf>

G. BIKE RACKS

a) Design Considerations

- Select a bicycle rack or hoop style that complements other furnishings and is attractive within the campus environment.
- The design should be simple, space efficient and serviceable.
- Racks should be placed to avoid conflicts with pedestrians. Locate bike loops close to building entrances wherever possible.
- Locating bike hoops under building overhangs or other sheltered areas is preferable.
- Locate bike hoops close to bike paths if there isn't space close to a building entrance.
- Bike parking areas should be well lit.
- Work with CP to decide the appropriate quantity of racks for the site.
- Racks should be installed usually on a wide sidewalk with 8 or more feet of clear sidewalk space remaining.
- Space 3' on center or 2'9" if absolutely necessary. Offset 4'-5' from walks and 2' on ends and back-to-edge pavement.

b) Design Recommendations

- For general campus use, Matte Black PVC coated 1 and a 1/2" SCHD 40 1.9 O.D. bike hoop by S&G products 5117-546-9240 or approved equal.

H. EMERGENCY TELEPHONES

1) Free standing (kiosk)

a) Design Considerations

- Each new exterior project shall consider the installation of additional blue light emergency phones. Designers shall work closely with Division of Public Safety & Security (DPSS).
- Locations should be easily accessible to pedestrians, easy to maintain, and reviewed by DPSS prior to finalizing design.
- Stagger the emergency phones throughout pedestrian corridors and locate at major road and walk intersections, especially in areas with poor visibility from roads.
- Locate on a concrete pad paved up to walkway for accessibility per university construction standard detail.

b) Design Recommendations

- All telephone stanchion, telephone backbox, beacon, stanchion light, phone and phone line should be furnished and installed by U-M Information and Technology Services.

2) Surface Mounted

a) Design Considerations

- Locations should be easily accessible to pedestrians, easy to maintain, and reviewed by DPSS prior to finalizing design.
- Stagger the emergency phones throughout pedestrian corridors and locate at major road and walk intersections, especially in areas with poor visibility from roads.
- Surface-mounted phones should be considered when the surface below is occupied and creates limited conditions. Surface mounted is also preferred when a pedestrian way is located adjacent to a building, when trying to avoid any obstruction in snow removal from pedestrian ways, and where tunnels/vaults are located.

b) Design Recommendations

- All telephone stanchion, telephone backbox, beacon, stanchion light, phone and phone line should be furnished and installed by U-M ITCOM.

I. FENCING/RAILING

1) Ornamental Fence

a) Design Considerations

- Utilize along campus periphery, especially along roads and main corridors.
- Use within campus when aesthetically appropriate.

b) Design Recommendations

- Railing should be anodized aluminum with dark brown bronze powder coat finish. Other finish colors may be utilized depending on the location but require approval from CP.
- Railing should be J.G Braun company series 950 style B heavy-duty aluminum railing or any equivalent approved by CP.

2) Chain-Link Fence

a) Design Considerations

- Use minimally and with discretion for enhancing safety, for a special area that needs protection from pedestrian traffic and to restrict a vehicle from illegally leaving a parking lot.
- Minimize use along major pedestrian and vehicular thoroughfares.
- Use 2" spacing for general purpose and smaller openings for high-security areas.

b) Design Recommendations

- Black welded steel construction chain link is generally preferred.
- Use of black vinyl screen is recommended.
- Installation to follow U-M construction standards.

3) Post-and-Chain

a) Design Considerations

- Post-and-chain is generally used for pedestrian control and is not intended for security and safety. However, this should be used as a last resort when it is not possible to redesign the landscape to direct pedestrians away from a sensitive area.
- Use single-chain for vehicular control and double-chain design for pedestrian control.
- Used in areas where portable separation is needed, as it can be moved when necessary.

b) Design Recommendations

- Post and hardware available from South Lyon Fence. Chain is 5/16" black metal.

4) Exterior Hand Rails for Stairs and Ramps

a) Design Considerations

- Fabricate tube handrails with dimensions, spacing and anchorages that comply with requirements of Michigan Building Code, unless otherwise indicated.
- Comply with ADA, including that handrails shall have a continuous grab surface.
- Preferred shape for general campus exterior stair and ramp handrail is round. The preferred shape of cover flanges at the base of embedded rails is round.
- Embedded rail is preferred to surface mount at grade or slab level, and side mounting on retaining walls is preferred to top mounting. For outdoor installations, a weep hole is to be drilled in embedded posts to prevent water from collecting below ground level. Follow manufacturer's recommendations.
- Consider expansion joint locations in the concrete vs. rail post placement due to the potential for differential movement of the concrete and the rail to crack the concrete

b) Design Recommendations

- The recommended standard is Julius Blum Carlstadt System.
- Rail material/color shall be contextual to the building elements and to be approved by CP. If stainless steel, specify a minimum of Type 316 Grade Stainless Steel for any exterior element to protect against pitting and corrosion due to potential exposure to deicing agents.
- Alternative self-fabrication or products on similar lines may be considered when approved by CP.

J. INFORMATIONAL KIOSKS AND SORC POSTING BOARDS

1) Informational Kiosks for Flyers

a) Design Considerations

- Locate on top of vents that are along major pedestrian corridors.
- Location should not be an obstruction during snow removal.
- Placement to be approved by CP and EERC.

b) Design Recommendations

- The information kiosk is custom designed and built, see CP for details.

2) Student Organization Resource Center (SORC) boards

a) Design Considerations

- Locate along major pedestrian corridors and at major pedestrian gathering spots.
- Incorporate surfaces that display variety of information in a variety of directions.
- Location should not be an obstruction during snow removal.
- Placement of SORC boards is to be approved by CP.

b) Design Recommendations

- The posting board follows a specific design that requires custom construction.

- Provide appropriately sized space and furnishings that promotes social gatherings, sitting and group gatherings.
 - Create visual interest and encourage design responses that consider incorporation of appealing pavement patterns, seating, artwork, walls and spatial organization.
 - Avoid designs that create too much enclosure and security hazards.
 - Contact CP regarding design process.
- b) Design Recommendations
- Provide amenities like lighting and furnishings from a standard palette as a component of design.
 - Contact CP for guidance.

K. PLAZAS

a) Design Considerations

- Provide appropriately sized space and furnishings that promotes social gatherings, sitting and group gatherings.
- Create visual interest and encourage design responses that consider incorporation of appealing pavement patterns, seating, artwork, walls and spatial organization.
- Avoid designs that create too much enclosure and security hazards.
- Contact CP regarding design process.

b) Design Recommendations

- Provide amenities like lighting and furnishings from a standard palette as a component of design.
- Contact CP for guidance.

L. SKATEBOARD DETERRENENTS

a) Design Considerations

- Integrate deterrents into the architectural design of vulnerable hardscape elements, which can be executed in many different ways - with uneven edges, recesses, ground textures, railing design etc.
- Whenever low edges and surfaces such as planter boxes, benches and retaining walls could possibly create temptations for skateboarders, skaters and/or BMX bikers, incorporate skateboard deterrents either integral to the form of the hardscape element or on the edge surface with metal deterrents.
- Seating design should incorporate skateboard deterrents and be fabricated of durable materials.

b) Design Recommendations

- Contact CP for guidance.

M. SCREEN/RETAINING/SEAT WALLS

a) Design Considerations

- Screen walls should be placed so as to not block important views or impede visibility of vehicles.
- Retaining walls should not be higher than 18" from grade to top of slope; otherwise, a handrail will be required.
- Typical university concrete seat walls require a 1" chamfer edge. See U-M AEC Standard Details and Schedules for the Typical Concrete Seat Wall detail.

b) Design Recommendations

- For visible areas, use architectural concrete/stone or masonry.
- For less visible areas, concrete is appropriate.

N. BUS SHELTERS

a) Design Considerations

- The A/E should work with CP, Logistics, Transportation & Parking and DPSS to locate shelters.

b) Design Recommendations

- Contact CP for the standard model information.

O. BIKE SHELTERS

a) Design Considerations

- Locate in high-use areas where existing bike racks are exposed to the elements.
- Cluster bike parking in groups that serve multiple buildings.
- Ensure that the placement of the parking and shelter do not impede the flow of pedestrians or otherwise block the ingress/egress of fire and emergency vehicles or personnel.

b) Design Recommendations

- The recommended standard is Duo Guard's Parachute, modified to U-M specifications.
- Frosted glass top and black powder coat steel is preferred.

P. MOPED PARKING

a) Design Considerations

- Locate access to moped parking directly adjacent to a parking area or access drive if possible.
- Access to moped parking should not require travel along a pedestrian sidewalk path.
- Moped parking area should be separated from vehicle parking with an easily mounted curb.
- Moped parking areas will not be maintained in winter. Concrete slab shall be concrete 6" thick since snow removal equipment will not need access.
- Avoid locating near fire hydrants, fire department connections, building air intake locations or near residential windows.
- Consult with Logistics, Transportation & Parking for Moped parking sign locations and installation.

b) Design Recommendations

- Provide a center access lane 5' wide if two rows of stalls are specified.
- Stall dimensions are typically 6' long by 3' wide.
- Striping is yellow at 4" wide.
- Consult CP for direction on new parking location or with questions.

Q. BOLLARDS

a) Design Considerations

- Bollards have various uses around campus: as barriers due to loading restrictions, for public safety, to protect equipment, utilities and building facades, to separate vehicles and pedestrians or as gate control at parking lots.
- Types include fixed, removable and locking.

b) Design Recommendations

- Refer to U-M AEC Standard Details and Schedules for the Miscellaneous Bollard detail.
- Contact A/E Civil and CP when new bollards are proposed.

R. SIGNAGE

- Exterior signage follows specifications as set forth in the [Wayfinding and Signage Guidelines](#). Consult with CP in regards to all exterior signage.

S. PUBLIC ART

- Placement of public art on the campus grounds is administered by the President's Advisory Committee on Public Art (<http://www.public-art.umich.edu>), with site requirements determined by CP.

DESIGN GUIDELINE 4.4.5 **SITE SIGNAGE**

Scope

Scope: Provide all necessary signage for pedestrian and vehicular traffic flow, both on University property and within City of Ann Arbor Right of Way (ROW). Scope does not include or refer to University of Michigan building signage.

Related Sections

U-M Design Guideline Sections:

4.4.2 Site Furnishing Standards

Reference Documents:

Michigan Manual of Uniform Traffic Control Devices

[Michigan Department of Transportation Standards and Special Details](#)

International Fire Code

Michigan Department of Transportation

Fire apparatus access requirements

[International Code Council Section D103 Minimum Specifications](#)

Design and Installation Requirements

For all impacts to the City ROW ensure required signage for new or modified parking spaces, fire lane access points, bike lanes and midblock crosswalks have been included in the scope of the project. Include all permanent traffic and pedestrian traffic control.

Provide site signage, as applicable, for project. Including but not limited to:

- Permanent traffic control signage, stop signs, speed limit signs.
- Pedestrian traffic control signs, mid-block cross walk signage.
- Fire lane access points
- Bike Lanes
- Specific parking restrictions
- Signage marking no driving zones (weight limits due to underground tunnels)

Provide temporary site signage for pedestrian and vehicle traffic for construction.

DESIGN GUIDELINE 4.5 **REGULATED AND HAZARDOUS MATERIALS**

General

This section addresses the management and disposal of regulated and/ or hazardous materials that may be encountered in construction projects. University of Michigan (U-M) policies require proper management of regulated, hazardous and other construction waste to comply with local, state and federal regulations and to encourage environmental stewardship. Construction materials and waste included in this section are: asbestos containing materials (ACM), CFC & HCFC containing refrigerants, lead, mercury, PCBs, radioactive materials and miscellaneous regulated construction waste. A/Es should be aware that individual projects may encounter other materials requiring special handling that are not outlined in this section. The A/E shall work with the University Project Coordinator to identify a list of materials which are hazardous, regulated and/or require special handling and which are likely to be encountered during demolition and construction.

Asbestos and Asbestos-Containing Materials (ACM):

Introduction

The current OSHA asbestos standard requires that products used in the workplace be labeled if they contain greater than 1% asbestos and are likely to result in exposures above the permissible exposure limits during reasonable foreseeable use, handling, storage, disposal, processing, or transportation. Material Safety Data Sheets may contain one of the following synonymous names:

Chemical Name: Magnesium Silicate

Mineral Names: Chrysotile, Amosite, Tremolite, Crocidolite, Anthophyllite, Actinolite

Common Names: serpentine, amphibole, fibrous grunerite

ACM in Renovation Projects

Many U-M buildings contain ACM, particularly those constructed before the early 1980's. Prior to renovation activities all buildings, *including those built after the 1980's*, must be surveyed for asbestos containing materials. Contact U-M OSEH well in advance of the project to coordinate a survey of building materials for asbestos. Some U-M buildings have already been surveyed for asbestos containing materials. U-M OSEH maintains an ACM database for all U-M buildings previously surveyed for asbestos. OSEH conducts additional tests where required to identify additional ACM not already identified in the database. At U-M, some ACM is labeled in the field, but in many cases, labeling is impractical. Labeling of ACM, if deemed necessary, is generally conducted by OSEH.

In general, U-M strives to remove ACM, as opportunities present themselves. At a minimum, projects that require some abatement are responsible for minimum required abatement. In some cases abatement may be expanded to address all ACM of a certain type in a certain area. Coordinate ACM abatement scope with U-M Project Coordinator and OSEH.

In many cases asbestos abatement projects are designed and conducted by the University, and the University contracts separately for asbestos abatement. Therefore the A/E involved with the design of a renovation project may not be required to include asbestos abatement specifications in the Bid Documents. However, A/E's must make the University Project Coordinator aware if they suspect that asbestos may be encountered due to project activity. In addition, the A/E should advise the Contractor on the construction documents that asbestos may be present in the area or adjacent areas of the renovation project, and to conduct their work accordingly.

Refer to U-M Master Specification Section 15240 regarding reinsulation of abated mechanical insulation.

ACM in New Construction

U-M does not permit the use of new ACM in construction projects. A/E's should be aware that asbestos-containing products may still be legally manufactured, imported and sold in the United States, although very limited quantities are probably produced. Legal products include but are not limited to floor tile, floor tile adhesive, sealants, plaster, and roofing materials. Because of the possibility of encountering ACM, prohibitory language should be added to specification sections covering materials which might contain asbestos.

In the event that a particular performance requirement is identified that can only be satisfied by the use of ACM, the A/E should contact OSEH through the University Project Coordinator and submit a written request for authorization. Approval for new ACM usage must be obtained prior to specification and installation. If approval is received, proper documentation will be coordinated with OSEH.

CFC & HCFC-Containing Refrigerants:

The University requires that all work related to refrigerant contained in chillers, cooling coils, air conditioners, and similar equipment, including related piping, be handled in strict accordance with the referenced standards. A/Es should advise contractors of these requirements. In addition, the University has tracking procedures in place for CFC and HCFC refrigerants. When new refrigeration equipment is installed, when old refrigeration equipment is removed, or when refrigerant is disposed of, include language in the Contract Documents directing the Contractor to inform the Owner's Plant Operations Air Conditioning Shop. Refer to U-M Master Specification Section 01140. Copies of the required form are available at:

http://www.plant.bf.umich.edu/utilities/operations-engineering/CFC_Form.pdf

Recovered refrigerant shall be handled through the U-M Plant Operations Air Conditioning Shop. Direct the Contractor to contact the Plant Operations Air Conditioning Shop to properly handle the recovered refrigerant. In most cases, U-M A/C Shop will remove refrigerant for reclamation.

Ethylene Glycol

Ethylene glycol systems are used on campus in some heating, ventilation and air-conditioning systems. Ethylene glycol is regulated by the State of Michigan as a Liquid Industrial Waste. Consequently, the Contractor's disposal methods are subject to the oversight of U-M OSEH. Where mechanical devices or systems containing ethylene glycol are indicated to be demolished, direct the Contractor to legally dispose of ethylene glycol. The Contractor shall contact U-M OSEH Environmental and Hazardous Materials Management Program (734-763-4568) in the event of an accidental spill of ethylene glycol.

Refer to U-M Design Guideline Technical Section 15515 and U-M Master Specification 15515 for design and installation requirements for glycol systems.

Lithium Bromide

Lithium bromide is used on campus in most absorption chillers. Lithium bromide within these systems is contained within the machinery and does not circulate throughout the building. Where absorption chillers are indicated to be demolished, contact the U-M Plant Operations Air Conditioning Shop to determine whether the recovered lithium bromide can be used in other machinery.

If it is determined that the lithium bromide cannot be used in other machinery and it is to be disposed of, it is subject to regulation by the State of Michigan as a Liquid Industrial Waste. Direct the Contractor to coordinate removal activities with UM OSEH's tracking program and to legally dispose of lithium bromide. The Contractor must contact U-M OSEH Environmental and Hazardous Materials Management Program (734-763-4568) in the event of an accidental spill of lithium bromide.

Lead

Lead may be a component of building materials in many campus buildings. Materials likely to contain lead include latex and oil based paints (especially paints manufactured before 1978), radiation shielding materials, plumbing joints, solder, pipe wrap, flashing and other materials used as soundproofing. Construction activities that may result in lead exposure include sanding, scraping, cutting, grinding, welding and demolition. The University Project Coordinator will arrange to have a lead survey completed early in the design process, through U-M OSEH.

Procedures for working with lead-based paint (LBP) and other lead-containing material (LCM) depend on the type of work being completed and the type of building in which the work is occurring. Of particular concern are construction projects that create lead disturbances in child-occupied facilities (child care centers and family housing). For projects in or affecting child-occupied facilities, A/Es should work with the University Project Coordinator and OSEH early in the design process to develop custom specifications addressing specific project conditions and additional state and federal regulations.

For other University buildings, Master Specification Section 13285 outlines the University policy and procedures that have been developed in conjunction with OSEH to meet all applicable local, state and federal regulations for non-child occupied facilities.

Use of LCM in New Construction

The University discourages the use of new LCM in construction projects. In the event that a particular performance requirement is identified that can only be satisfied by the use of LCM, the A/E should contact OSEH through the University Project Coordinator and submit a written request for authorization. If approval is received, proper documentation will be coordinated with OSEH.

Lubricant or Other Oils

Introduction and Policy

Oils are regulated by the State of Michigan as a Liquid Industrial Waste. Consequently, the Contractor's disposal methods are subject to the oversight of UM OSEH. Where mechanical devices that contain lubricant or other oils are indicated to be demolished, direct the Contractor to legally dispose of the oils. The Contractor must contact UM OSEH Environmental and Hazardous Materials Management Program (734-763-4568) in the event of an accidental spill.

Mercury

Mercury-containing articles and equipment likely to be encountered during construction include but are not limited to controls, thermometers, thermostats, switches, manometers and gauges. Fluorescent lamps also contain mercury. See paragraph below regarding lamp recycling.

Mercury-containing articles and equipment are considered regulated construction waste and must be disposed of through the OSEH Environmental and Hazardous Materials Management Program. OSEH will package, pickup and dispose of properly staged Regulated Waste at no cost to the Contractor.

A/Es should direct the Contractor to handle mercury-containing articles and equipment with extreme care to prevent the release of elemental mercury. Mercury-containing articles and equipment must be properly packaged with adequate cushioning in only OSEH-provided containers. In the case of an accidental spill of elemental mercury, the affected area must be immediately evacuated, closed to traffic and OSEH or DPS contacted for clean-up.

PCBs

Bulk Product Waste

PCB (Polychlorinated Biphenyl) bulk product waste refers to waste derived from manufactured products containing PCBs in a non-liquid state. This includes applied dried paints, varnishes, waxes, or other similar coatings or sealants. The University Project Coordinator will arrange to have a PCB survey completed by UM OSEH early in the design process.

A/Es shall direct Contractors to dispose of PCB-containing waste in coordination with OSEH. There are no specific requirements for containerizing or segregating PCB bulk product waste, if the concentration of PCB's is less than 50 parts per million (ppm). It can be disposed with other construction debris in a municipal or non-municipal non-hazardous waste landfill licensed by the State of Michigan, Department of Environmental Quality. If the concentration of PCBs in the waste is greater than 50 ppm, it must be collected by UM OSEH for disposal. Coordination is required, since OSEH must notify the landfill, 15 days in advance, of the type of waste to be disposed. A PCB concentration less than 50 ppm does not require notification.

Liquid Waste (Older Electromagnetic Ballasts)

Older electromagnetic ballasts may contain liquid PCBs. A/Es shall advise the Contractor that the University requires recycling of all fluorescent lighting ballasts, along with tubular fluorescent, compact fluorescent and HID lamps as a part of the OSEH's Environmental Stewardship program. Master specification section 16010, "Basic Electrical Requirements" outlines proper packaging and pick-up requirements for fluorescent lamps and ballasts. Leaking electromagnetic ballasts shall be packaged separately from intact ballasts to avoid contamination. Contractor shall coordinate proper handling, packaging and decontamination of surrounding materials with OSEH for all leaking ballasts. Electronic ballasts do not contain PCB's and are to be packaged separately from electromagnetic ballasts.

Radioactive Materials

Common construction waste that may contain low levels of radioactivity includes but is not limited to smoke detectors and self luminescent exit signs.

Construction waste containing any level of radioactivity must be disposed of through the OSEH Environmental and Hazardous Materials Management Program. OSEH will package, pickup and dispose of properly staged Regulated Waste at no cost to the Contractor. A/Es should advise Contractors to handle and package self luminescent exit signs with extreme care. They contain fragile glass tubes filled with a radioactive gas, and care must be taken not to break the glass during demolition and recycling. Collect the frame of the exit sign as it may contain sign specific information. For radioactive smoke detectors, collect both the top and the bottom of the unit.

There are research laboratories on campus that use radioactive materials. When a lab that uses radioactive materials relocates or discontinues radioactive research, the lab will undergo a strict decommissioning process in coordination with OSEH Radiation Safety Services. If an A/E suspects that the radioactive materials may have been present in an area which will undergo renovation, immediately notify the University Project Coordinator, who will contact OSEH in order to schedule decommissioning. This process will be completed before a construction project is undertaken.

Regulated Construction Waste

The term “Regulated Waste” refers to building equipment or materials that will be demolished as part of a renovation or construction project, but cannot be disposed of as typical construction and demolition debris. Materials include but are not limited to the following:

- Batteries, including but not limited to lead-, nickel- and or mercury-containing batteries from exit signs, smoke detectors and backup power sources.
- Containers of paint and paint related materials, cleaners, pesticides, compressed gas cylinders and portable fuel cans.
- Fire extinguishers.

OSEH will package, pickup and dispose of properly staged Regulated Waste at no cost to the Contractor, provided that the waste has actually been removed from UM buildings. A/Es should instruct the Contractor to Contact OSEH Environmental and Hazardous Materials Management Program (734-763-4568) to schedule a pickup immediately after regulated waste has been staged. Incidental Regulated Waste that is not removed from UM buildings must be properly disposed of by the Contractor.

Suspect Contaminated Soil, Groundwater, or Unknown Material

During work activities, if suspect contaminated soil, groundwater, or other unknown material is encountered, the suspect material must be characterized to determine if special handling, or disposal protocol is required. Suspect contaminated soil may exhibit chemical or unusual odors, staining, unusual coloring, and/or contain man-made debris. Suspect contaminated groundwater may exhibit chemical or unusual odors, unusual coloring, and/or sheen.

A/Es shall direct the Contractor that if suspect contaminated soil, groundwater, or other unknown material is encountered, they shall immediately cease all excavation, dewatering, transport, or disturbance of the suspect material, and they shall contact the U-M Project Manager and U-M OSEH (763-6973) immediately. Direct the Contractor not to resume activities until given direction by the U-M Project Manager.

Bulk Chemical Storage (tanks and drums)

Secondary containment is required for all chemical or oil bulk storage (drums or tanks) according to the MDEQ, Michigan Part 5 Rules and the Ann Arbor Sanitary Sewer Ordinance.

Some options for secondary containment include building a berm (curb), using double wall tanks or using spill pallets. The University considers it preferable to construct a permanent berm rather than using spill pallets.

The secondary containment must have the capacity to hold the volume of the largest container or 10% of the combined containers, whichever is larger. If the room has no floor drains, and if the required volume can be completely contained without escaping through cracks in the floor and pipe penetration, over thresholds, etc., then the room itself may be considered sufficient secondary containment. If the room is considered the secondary containment ensure there is a lip at the door so no liquids can exit the room in the event of a leak. Consider use of leak detection and alarm for the secondary containment, depending on hazard posed, and on likelihood that a leak will be observed within in reason period of time.

DESIGN GUIDELINE 4.6

UTILITIES FOR UNIVERSITY BUILDINGS

Scope

This section discusses building utilities associated with U-M facilities; both utilities that are provided by the University from central sources, and utilities that are provided by non-University sources.

Related Sections

Special Building Areas:

[5.9 SBA-H Tunnels](#)

Design Guideline Technical Sections:

[220010 Plumbing Specialties](#)

[230050 Chilled Water Systems](#)

Utility Distribution Overview

The University distributes electricity to the Central, Medical, and North Campuses and parts of the Athletic/ South Campuses.

Central Campus Utilities provided by the University's Central Power Plant include:

- Electricity
- Low Pressure Steam (minimum of 6 psig, 230°F)
- Medium Pressure Steam (60 psig, 307°F)
- Steam Condensate (pressure varies throughout the system, consult with AEC Mechanical Group though U-M Design Manager for backpressure design requirements)
- Compressed Air (90 psig, minus (-) 50°F pressure dewpoint)
- Domestic Hot Water (50 psig, 120°F, un-softened, pressure varies throughout the system, consult with AEC Mechanical Group though U-M Design Manager for design requirements).

The utility properties described above are guaranteed at the point the utility enters the building.

In parts of the Athletic and South Campus, high pressure (60 psig) steam with condensate return is provided from the University's Hoover Street Heating Plant.

Other facilities may have regional or local steam systems capable of providing adequate capacities. Steam pressures may vary for these systems. Where these capacities exist, the proposed facility shall utilize them. Coordinate facility loads and intent with the U-M Design Manager. Utilities and Plant Engineering, through the U-M Design Manager, will determine and provide the locations and capacities of existing systems.

University Provided Utilities

Steam - Central Campus

Low pressure steam should be used for building heating and humidification loads and for absorption chiller cooling, because of the economy of generation and cogeneration in the Central Power Plant. Refer to Design Guideline Technical Section 230050 Chilled Water Systems and consult with U-M Design Manager before deciding on chiller type (absorption or electric).

Because of power plant economy, Central Campus High Pressure Steam (60 psig) use is generally limited to the following applications:

- For critical buildings such as research labs and medical clinics, where sufficient HPS capacity is available, HPS via a pressure regulating valve should be used to provide redundancy to the building low pressure steam supply during interruptions. Refer to Special Building Areas 5.9 Tunnels for additional discussion on requirements for PRV's and back-up steam.
- Special equipment requiring higher temperature source steam, such as sterilizers.
- Multi-zoned application of "clean steam" humidifiers. "Clean steam" is defined as the steam generated from campus steam via a heat exchanger, using high purity water for makeup. Single zone clean steam shall be generated from LPS, but where multiple and separately controlled building zones must be fed from a single steam generator, HPS may be used.

HPS steam shall not be used to boost existing nominal LPS pressure to higher pressures.

Steam Condensate

Central Campus condensate from low pressure steam shall be vented to atmosphere and pumped to the campus distribution system at minimum 30 psig pump discharge pressure. Condensate from high pressure steam shall be routed to a flash tank prior to connection to condensate receiver unit. Consult with AEC Mechanical Group through the U-M Design Manager for required backpressure at point of connection to tunnels. South/ Athletic Campus condensate shall be similarly returned to the Hoover Street Heating Plant.

Domestic Hot Water – Central Campus

New domestic hot water (DHW) connections on Central Campus should not make use of the central campus domestic hot water return (DHWR) system. Provide DHWR and return water re-heating system internal to the building, typically using low pressure steam and a shell and tube heat exchanger. Refer to Special Building Areas 5.9 Tunnels. Provide backflow prevention via a UL approved double check valve assembly on DHW as it enters the building. Refer to DG Technical Section 220010 regarding type of backflow prevention.

Chilled Water - Regional Plants

Chilled water from regional chilled water plants is available at some locations on North Campus and Central Campus. Where regional chilled water is available and suitable for the intended loads (temperature, reliability, seasonal variability etc.), it should be utilized. Contact the U-M Utilities and Plant Engineering Department through the U-M Design Manager for direction.

Non-University Provided Utilities

Within the City of Ann Arbor service area, potable/ city water shall be connected to City of Ann Arbor water system. Coordinate with U-M Design Manager on City of Ann Arbor review process and requirements.

Storm/ Sanitary Sewer: Coordinate with U-M Design Manager on City of Ann Arbor review process and requirements.

Natural Gas: Coordinate with DTE and U-M Design Manager on new or modified natural gas load or pressure requirements.

Utility Corridors

The U-M has defined Utility Corridors in many areas on campus. Wherever possible, new underground utilities shall stay within established corridors. Coordinate with U-M AEC University Planners Office via U-M Design Manager.

Easements

Non-University provided Utilities on University property and University provided Utilities on Non-University property (including City of Ann Arbor or M-DOT controlled property; sidewalks, streets and Right of Way) require an easement.

The review process and process of securing easements can often be lengthy. In addition to any City, State or Non-University Utility review processes, U-M AEC University Planners Office (U-M UPO) must approve all requests for easements and right of way agreements. All documents (excluding permits) will be processed through the U-M AEC Real Estate Office (U-M REO) Coordinate with U-M UPO and REO via U-M Design Manager

Metering

The following utilities shall be metered in accordance with methods and means specified in other sections of the Design Guidelines:

- Electricity.
- Central Campus Steam Condensate.
- Steam, where humidification loads are greater than 500 pounds of steam per hour.
- Chilled water from regional plants – flow and BTU metering.
- Domestic Cold Water
- Fire Protection Water (bypass only)
- Natural Gas

Where a regional chilled plant is part of a facility, metering or sub-metering shall be provided to measure the utilities consumed by the plant separately from the building metering.

Domestic Cold Water, cooling tower make-up water and cooling tower blow down, irrigation water and fire protection backflow prevention bypass (detector check bypass) shall be metered

separately in accordance with the City of Ann Arbor standards. Refer to Design Guideline 220010 Plumbing Specialties.

Domestic Hot Water (from Central Campus system) does not require metering as it enters the building.

DESIGN GUIDELINE 4.7 **BUILDING ACCESS CONTROL**

General

This section addresses minimum functional and technical requirements of the Building Access Control (BAC) system on the University of Michigan Ann Arbor Campus. Functional requirements apply to General Fund buildings. Technical requirements apply to all buildings connecting to the campus BAC system.

The following campuses and units maintain their own respective access control systems, standards, and hardware:

- Athletics: Contact Design Manager.
- North Campus Research Center (NCRC): Contact Design Manager
- University of Michigan Hospitals and Health Centers (UMHHC): Contact UMHHC Facilities Planning and Development.
- University of Michigan Housing (UMH): Contact Design Manager
- University of Michigan - Dearborn campus: Contact Design Manager
- University of Michigan - Flint campus: Contact Design Manager

Related Sections

U-M Design Guideline Sections:

[6.0 DG 087100 Door Hardware](#)

U-M Master Specifications:

[7.0 MS 087100 Door Hardware](#)

[7.0 MS 281300 Access Control and Monitoring System](#)

[7.0 MS 281600 Security Systems](#)

U-M Standard Details:

16725 Series - Request from Design Manager

Definitions

Building Access Control (BAC): Campus central electronic system (existing), local building panels, distribution and hardware that controls and monitors access to a building and areas within a building based on one or more of the following types of doors:

- *Monitored:* Use of door monitor switch and request to exit device to detect forced door openings and door held conditions.
- *Electronically scheduled:* Use of a central time clock to electronically schedule the locking and unlocking of doors plus functions described for monitored doors.
- *Card reader:* Use of a card to unlock a door plus functions described for monitored and electronically scheduled doors.

- *Card reader with auto door operator:* Use of a push button to initiate a low energy operator that is interfaced with BAC functions described for monitored, electronically scheduled, and card reader doors.

Mechanical or battery operated digital access control hardware: Stand alone mechanical locks that use keypads or other local methods of authentication to gain access to a secured area.

Surveillance systems: Surveillance systems shall include any Closed Circuit Television (CCTV) system installed for the purpose of viewing and/or recording video images for security or system troubleshooting purposes.

BAC: Minimal Functional Requirements

General:

- Access control system is intended to control the perimeter of secured spaces or buildings, not individual doors. For example: A building contains an interior suite that has multiple access points and is requesting access control, all doors accessing the suite shall be connected to the BAC system as appropriate for their intended use. After hour access points to suite shall be card reader, daytime access points shall be electronically scheduled, exit only doors shall be monitored. No keys will be issued to occupants for that secured area.
- Door operation for all access controlled doors:
 - Provide key cylinder and hardware capable of mechanical access on all card reader doors.
 - Do not provide handle or cylinder on exit only egress doors.
 - Provide hardware that allows manually-actuated egress requiring only a single operation at all times.
- Access control system is independent of the building fire alarm system. If connection is required at a specific opening, interface will occur at the door level, not the system level.

New buildings, additions and major renovations

Evaluate the physical and programmatic layout of the building as related to BAC locations and security requirements. Layout should avoid egress paths through secured areas, interior connections to adjacent buildings, and control points that are required by code to connect to the building fire alarm system. Review draft life safety egress plans identifying security and access control plans with Design Manager, representative from UM Key Shop, and other University stakeholders during schematic design phase.

Exterior Doors

Provide exterior doors that connect to the campus BAC system and meet the following minimum requirements:

- Card reader with auto door operator: At least one access point for authorized after- hour use. Locate at main accessible building entry door.
- Card reader doors: All locations needed for authorized after-hour use, including

- personnel doors to loading docks, mechanical, and high voltage areas.
- Electronically scheduled doors: All exterior entrance doors used for ingress during building hours of operations.
 - Monitored doors: All remaining exterior doors including loading dock, overhead, and roof access doors.
 - Other door types:
 - Exterior doors that provide access to building services spaces (mechanical, electrical, elevator machine, and grounds rooms) but do not provide access to the building interior may not require access control capability. Review with the Design Manager.
 - Doors equipped with an intercom or other communication device to allow a momentary remote unlocking of doors is permitted in select situations only. Review with Design Manager and Department of Public Safety.

Review location and quantity of each door type described above with the Design Manager.

Interior Doors

Required location:

- Telecommunications rooms housing HIPPA protected data.
- Reflection rooms.

Contact Design Manager early in the design process to review additional project specific interior security requirements. Consider preparing doors for future access control installation.

Elevator Doors

Do not connect elevator doors to BAC system

Special alarm systems

Contact Design Manager early in the design process to review the need for special alarm systems.

BAC - Technical Requirements

UM Master Specification Sections 281300 Access Control and Monitoring System and 281600 Security Systems shall be used as the basis for access control specification for all projects including access control doors connected to the campus central system. Edit to be project specific.

AEC maintains standard details for access control panel assemblies and commonly used door configurations. Request from Design manager. Edit to be project specific.

Access control system:

- Existing system: SoftwareHouse C-Cure 800 system
- Access control panel: iStar Pro Series
 - Locate panel assemblies in telecommunications rooms.
 - Provide pathway to Plant network switch for panel communication.

- Consider future system expansion when determining panel distribution in building.

Related Systems and Hardware

Surveillance Systems

Contact the Design Manager early in the design process to review the need for surveillance systems.

Mechanical or battery operated digital security hardware

Provide stand alone mechanical or battery operated digital security hardware for select interior applications only. Contact the Design Manager to review interior security requirements.

DESIGN GUIDELINE 4.8

FALL PROTECTION ON ROOFS

General

This section specifically includes design requirements and standards for fall protection measures on roofs and skylights. It does not address policies and procedures for employee fall protection.

References

Comply with the following:

MIOSHA Part 45 Fall Protection Standard for Construction Industry
MIOSHA Part 2 Wall and Floor Openings, Stairways and Skylights
ANSI/ASSE Z359.1-2007, Parts 3 and 5 and Z359.2-2007, Part 5

Related Sections

UM Design Guideline Sections:
[6.0 DG 075000 Roofing Systems](#)

Design Requirements

Rooftop Equipment Maintenance

Design rooftop areas containing a fall hazard of greater than four feet with specific regard to fall protection. Comply with the following passive protection measures wherever possible:

- Locate equipment (including roof drains) a minimum of six feet from the edge of the roof. This includes any pathways to or around the equipment. A clear pathway must be provided.
- Include permanent structures such as parapet walls or guard rails that meet MIOSHA regulations.. Note that the guard rails can form a perimeter around the equipment and service space rather than being mounted at the edge of the roof.

If the project budget or architectural considerations preclude using one of the two methods above, obtain the approval of the Design Manager to substitute a permanently mounted anchorage system and/or a horizontal lifeline system for personal fall arrest complying with the following:

- The anchorage system must be designed by a qualified engineer and installed under the supervision of a qualified individual.

- The anchorages must be located a minimum of ten feet from the roof edge and must be easily accessible.
- The interval between tie-offs must be spaced no more than fifty feet apart. Tie off point must accept a safety line that will use a trolley.
- Anchorages must be situated so as to minimize the fall distance and the possible damage to fall arrest lanyards from nearby sharp or rough edges.
- Anchorage points must be independent of any anchorage being used to support or suspend platforms.
- Anchorage points are mandatory for steep pitch roofs (greater than 4:12), whether or not passive protection is also provided.

Anchorage Point Certification

- Anchorage points need to be tested and certified upon installation.
- Documentation of certification, including location, weight, date tested, party responsible for testing etc. shall be submitted to owners representative prior to project close out.

Roofing Material Maintenance

- **If a parapet wall or guardrail around the edge of roofing is not installed, a permanently mounted anchorage system** and/or a horizontal lifeline system for personal fall arrest **must be installed to allow for the safe maintenance of the roofing material. Follow criteria cited above.**

Skylights

- Provide appropriate fall protection at all skylights. Guards and / or screens must comply with MIOSHA regulations and Michigan Building Code.
- Provide permanent signage on guards at perimeter of skylight noting designed weight limits.
- Provide permanent signage on guards at perimeter of skylight noting “Warning – skylight. Do not step stand or sit on skylight. Access only for cleaning and maintenance by approved personal.”

DESIGN GUIDELINE 4.9 **BIRD COLLISION DETERRENCE**

Scope

Projects with a scope of work related to the building façade and/or site structures shall evaluate bird-safe design strategies to minimize bird deaths by collision.

Related Sections

U-M Design Guideline Sections:

[Technical Requirements 6.1 DG 088000](#)

Reference Documents

LEED BD+C: New Construction - Bird Collision Deterrence SSPc55

Design and Installation Requirements

During the Design Development Phase, the Design Professional shall complete the following tasks and review findings with the Design Manager:

Building Façade:

- Determine the Threat Factor of building façade materials using guidance from LEED BD+C: New Construction Pilot Credit for Bird Collision Deterrence (SSpc55).
- Should any façade materials have a Threat Factor that exceeds LEED SSPc55 requirements, Bird Collision Threat Factor Rating Calculations shall be completed and the results shall be discussed with the U-M Design Manager. Overall façade composition shall be evaluated for compliance.
- Provide building elevations on which Façade Zones 1 & 2 are clearly identified and each façade material type, surface area and Threat Factor is indicated.
- Provide a completed LEED Bird Collision Threat Rating Calculation Spreadsheet when required.
- Notify the U-M Design Manager of building façades that exceed the maximum Bird Collision Threat Rating (BCTR) allowed by LEED SSPc55 and provide bird-friendly, alternative options for consideration.

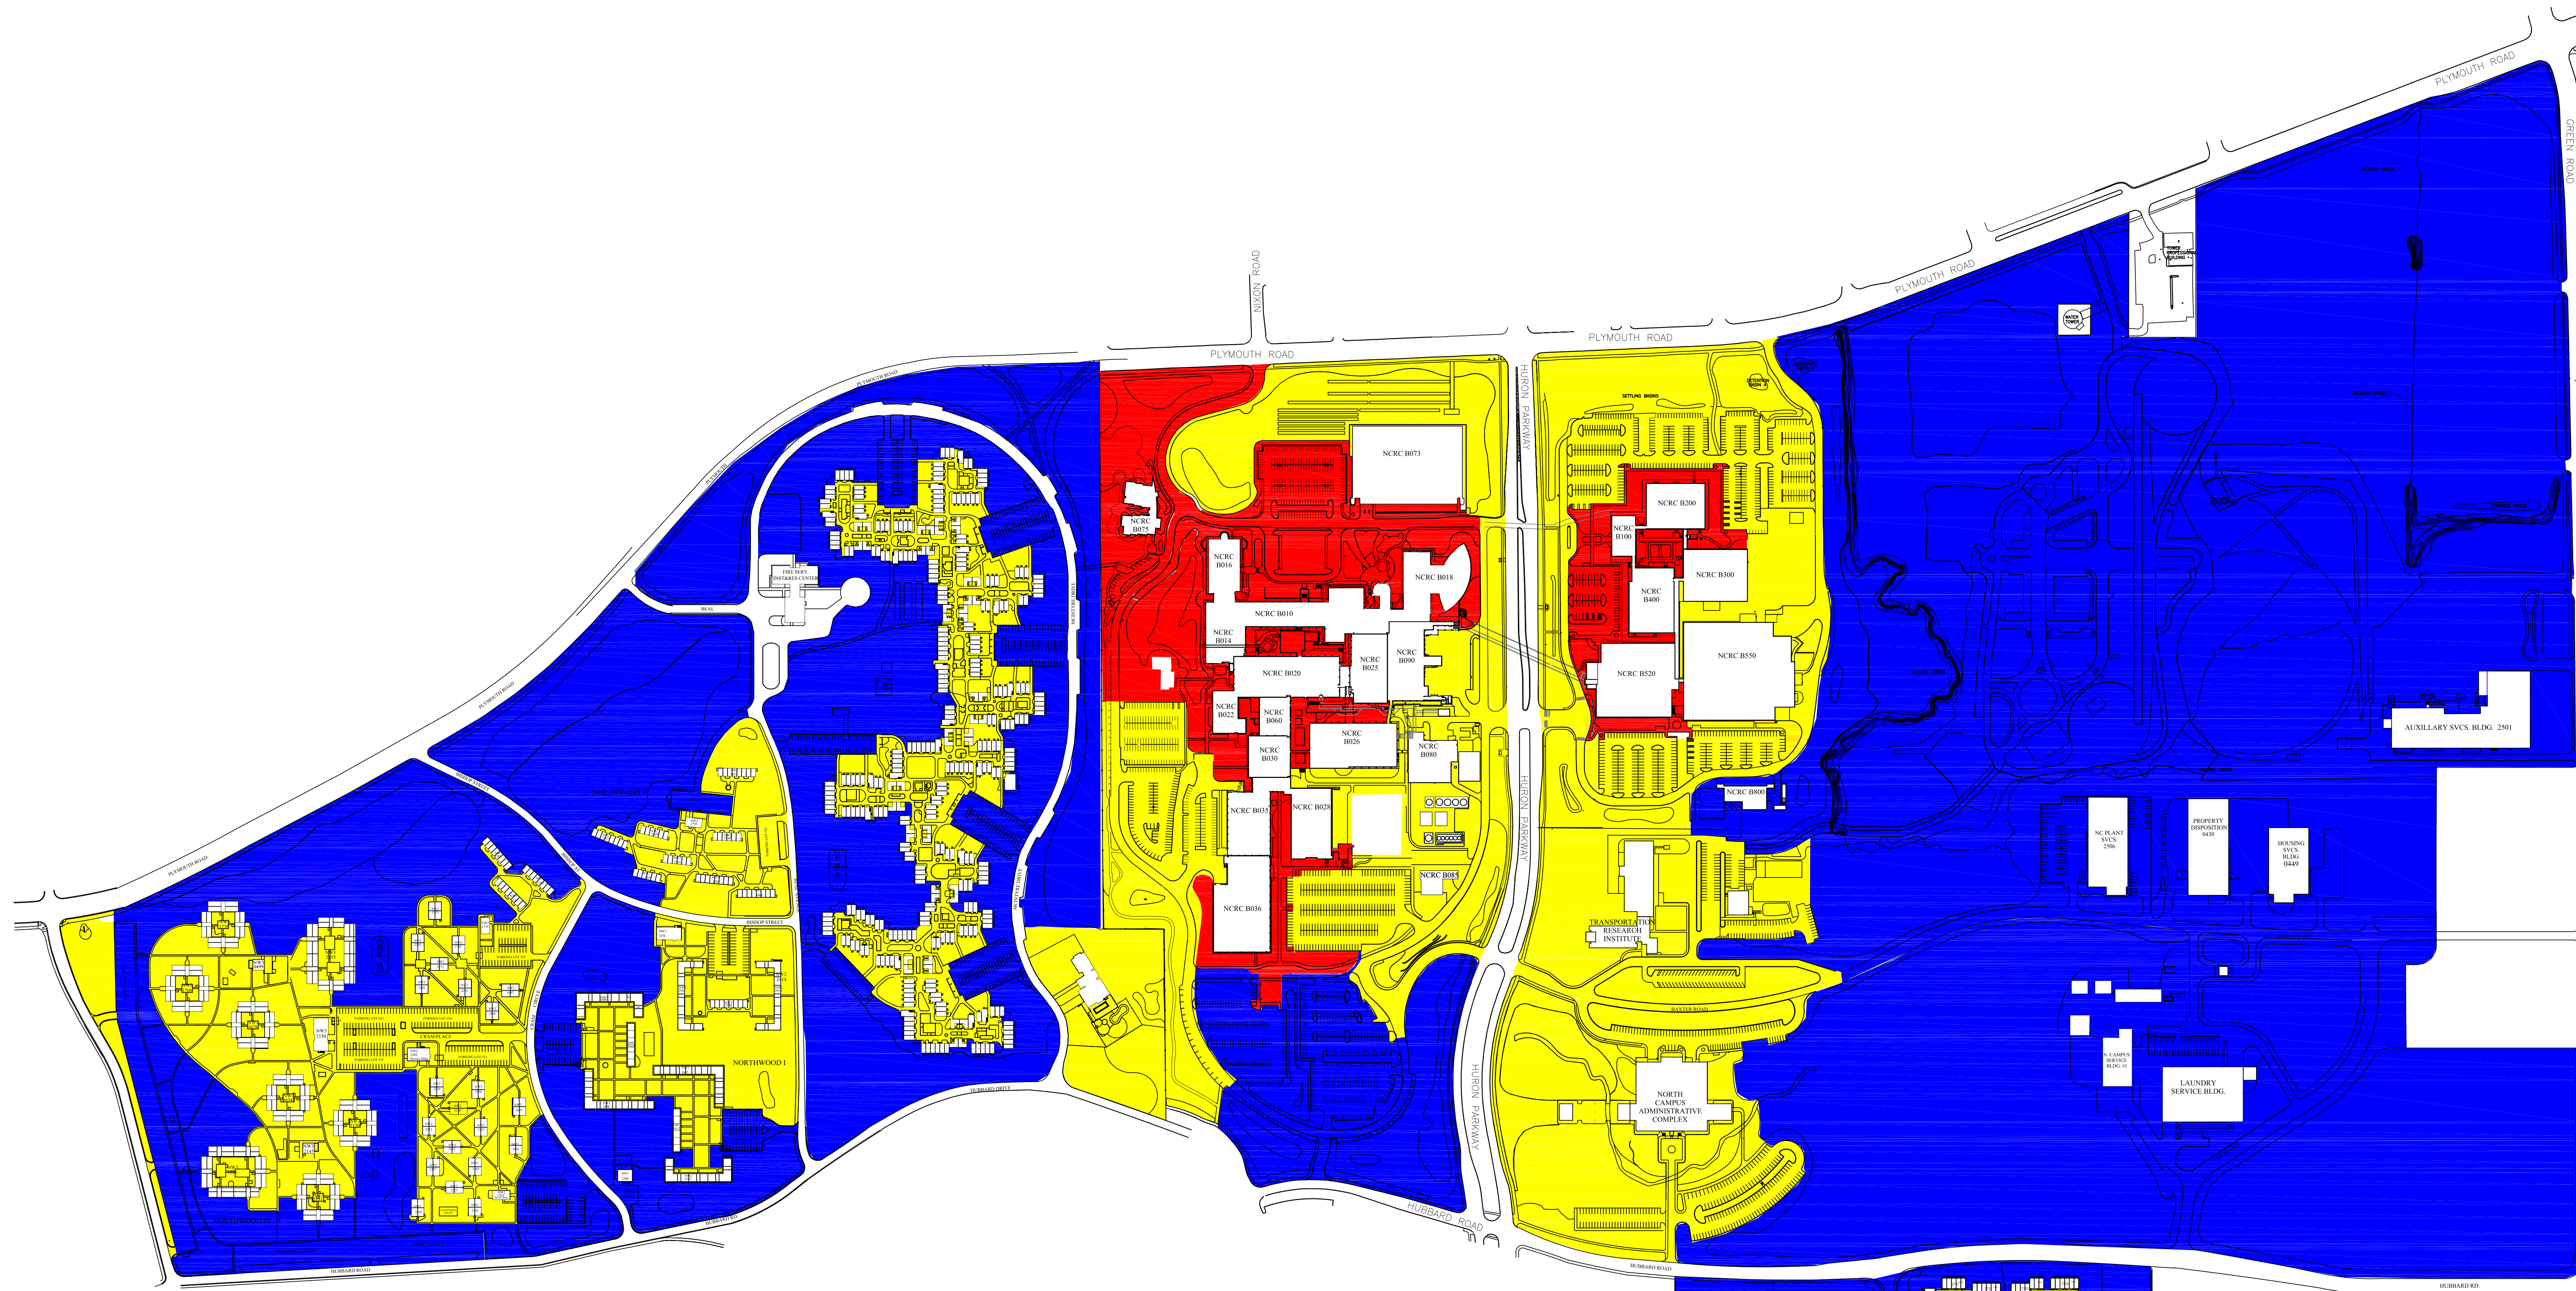

Site Structures:

- Determine the Threat Factor of site structures (e.g. handrails, guardrails, bus shelters etc.) using guidance from LEED BD+C: New Construction Pilot Credit for Bird Collision Deterrence (SSpc55).
- Provide project site plans on which the Threat Factor of each site structure is indicated.
- Notify the U-M Design Manager of site structures that exceed maximum threat score value required in LEED SSPc55 and provide bird-friendly, alternative options for consideration.

Comments

There are five Box elder on the northern edge, some are dead/dying and leaning over the proposed parking lot, which will pose future problems. Most are approximately 8" DBH. These will be removed in addition to the three #4 ranked Box elder on the western side of the site (as note here).

DESIGN GUIDELINE 5.2 **ANIMAL FACILITIES**

Scope

Obtain approval of the Provost's Office and Office of the Vice President for Research (OVPR) for all new animal facilities. Secure the written approval of the Provost's Office (Vice Provost for Academic and Budgetary Affairs) prior to finalizing program documentation. It is the responsibility of the unit requesting such spaces to obtain approval prior to initiating design activities.

In addition to the requirements of this Guideline, comply with the American Association for the Accreditation of Laboratory Animal Care (AAALAC) and the National Institutes of Health (NIH) criteria for the housing, handling and caring of laboratory animals. If a conflict should arise during the design of a specific project, the requirements of AAALAC and NIH will typically take precedence. Consult with the Design Manager who will coordinate with University Committee for the Use and Care of Animals (UCUCA) and the Attending Veterinarian (AV).

The Enforcing Agency for Animal Facilities is the UCUCA, which includes the University's AV. Design Manager will arrange for consultations with the UCUCA Office and the AV early in Schematic Design.

U-M Design Guideline Section:

[4.7 SBA Building Access Control](#)

[6.0 DG 230030 - Laboratory Ventilation](#)

[6.0 DG 263000 - Engine-Generator System](#)

Reference Documents:

"Guide for Care and Use of Laboratory Animals", promulgated by United States Department of Health and Human Services, and the Regulations of the Federal Animal Welfare Act 9, CFR Parts ,1 2 and 3

Project Documents

Eliminate sensitive terms from the project drawings, specifications, and other review and bidding documents. "Sensitive terms and descriptions" include both specific and general information regarding the animal species and research activities conducted in animal facilities. Appropriate terminology includes research laboratory, support space, procedure room, operating room, clean and/or dirty room, housing, etc. Consult with the Design Manager early in the design process to review terminology requirements.

Location

Separate animal suites including procedure rooms from offices and main pedestrian corridors to discourage unauthorized access and to mitigate odors.

Animal areas need to be secured with access restricted to only authorized personnel. Provide access control system connected to Campus or Hospital central system depending on the location of the facility.

Determine whether a closed circuit TV system is needed for the facility being designed.

Wherever possible, provide ready access to an elevator that can be segregated and secured from the public for the transportation of animals, cages, feed, bedding, waste, etc. Determine whether a dedicated elevator is required for the facility.

Do not locate the animal suite above electrical rooms, telephone/data rooms, or other rooms that could be damaged if water leaks down after wash-down of the animal rooms.

When positioned along a perimeter wall, do not install exterior windows in animal rooms.

House noisy species apart from other quieter species. Consider impacts of building environmental noise when locating individual species housing and procedure areas.

Strategically locate support areas (including but not limited to food and bedding storage rooms, hazardous agent storage rooms, clean and soiled cage holding rooms, cage washer rooms, refuse rooms, animal care equipment storage rooms, and animal care personnel lavatory, shower and locker rooms) to isolate housing rooms from rooms requiring more frequent / less restricted access.

Corridors

Main corridors shall be 7 feet wide. Branch corridors shall not be less than 5 feet-6 inches wide.

Surfaces

Surfaces shall be constructed of materials that are waterproof and easily sanitized.

Use epoxy painted cement block walls, epoxy painted plaster ceilings, and smooth texture acid and solvent resistant monolithic floors with integral coved base . All pinholes must be filled.

Protect walls with guard rails.

In renovations of existing facilities, certain less-desirable features may be unavoidable. The following compromises are examples. Obtain permission from Design Manager for these and other deviations from stated requirements:

- Water-resistant gypsum drywall-on-metal-stud partitions.
- Vinyl-covered gypsum lay-in suspended ceiling panel ceilings in galvanized grid with hold down clips.
- Projecting items such as thermostats are undesirable, but if absolutely necessary, shall be protected with bumpers or guards.
- Exposed overhead pipes and conduits. If required, the penetrations shall be sleeved and sealed. All floor penetrations shall have sleeves and be sealed watertight.
- Above-ceiling devices requiring service or maintenance. If required, provide waterproof access panels. Utility valves should be located above the corridor ceiling.

Doors

- Size: 42 inches wide by 84 inches high minimum
- Type: Galvanized hollow metal. Review viewing window and related light control requirements with Design Manager.
- Configuration: Typically in-swinging into housing rooms; however, direction may vary based on code requirements and traffic flow. In some locations, closing direction should be coordinated with air flow direction..
- Hardware:
 - University Standard mortise digital combination lock.
 - Delayed action closer.
 - Door protection - armor plates and trim protection.
 - Tight fitting self-sealing neoprene sweeps or surface mounted automatic door bottoms. Avoid projecting thresholds for ease of cart traffic.

Ventilation Systems

See Design Guideline technical section, *Laboratory Ventilation* for vivarium ventilation requirements.

Environmental Controls

Individual room temperature shall be DDC and have local setpoint adjustment. Review temperature and humidity requirements with Design Manger and ULAM management early in design process. Temperature (and to a lesser degree, humidity) must be tightly controlled to setpoints on a year-round basis. This stringency must be accounted for in all future constructions and renovations of animal housing facilities.

Temperature and pressure within the room shall be monitored in the hallway, and contained in a flush-mounted panel. Temperature alarms should provide feedback to the U-M central BAS.

Lighting, Power, Data, and Fire Alarm

Typically, illumination should be dual level with a high level of 100 to 140 fc (measured at 36" AFF with all lights on) and a low level of 50 to 70 fc (measured at 36" AFF with one half of lights on). A manual one-hour timer located just inside of the room door, under a

waterproof cover, should control one half of the lights. The other half of the lights should be controlled by the U-M central BAS. Optical sensors (photocells) shall provide feedback to BAS for the trending of both room light levels. In special rooms, one half of the lighting may require red lamps or standard lamps with red covers.

Provide waterproof lighting fixtures to prevent entry of insects and water spray from wash-down hoses. Electrical receptacles shall have waterproof covers, and may need to be explosion-proof. Provide GFCI receptacles in all areas subject to wash-down or within 6 feet of sinks.

Provide data jacks with waterproof covers in each animal housing and procedure room. Provide sufficient wireless points for complete coverage of animal facility. Review wall phone locations with Design Manager.

Provide waterproof fire alarm devices in all areas subject to wash-down. For animal suites that house mice or other small rodents, the fire alarm audible sound shall be a Temporal Code 3 slow whoop with a peak frequency of less than 500 Hz. If the building is a high rise, the Code-required evacuation message shall also be less than 500 Hz. Contact the AEC Electrical Department through the Design Manager for the latest recommendation on audible devices. Fire alarm visual devices (strobe lights) shall be located in corridors only because animal rooms are not considered public or common spaces.

Standby Power:

Standby power may be critical to maintain animal health in a power outage, especially in locations using ventilated racks. Early in the design process, review the following considerations with the Design Team:

- Need for standby power including, how much power, how quickly, and for how long.
- Specific loads requiring power.
- Spare capacity of existing generators.
- Ability to add a generator, including available space, available fuel, and exhaust, noise and vibration impacts.
- Cost impact on the project.
- Alternatives, such as moving the animals elsewhere, connecting a portable generator to the building within a few hours, etc.

Plumbing

Animal rooms should have hot and cold water and a stainless steel wall sink with a drain board. Heavy water use areas should have hot and cold water hose bibs located under the sink.

Floor drains capable of being capped (4") are desirable in all rooms, but may be excluded in certain circumstances. Heavy water use areas shall have the floor sloped 1/4" per yard and contain rim-flush drains. Drains should have locking covers and contain a bucket trap.

Large animal rooms have special plumbing requirements (eg., trench drains, flush drains).

Determine whether an automated animal drinking water system is required.

Operating Rooms

Operating rooms cannot be used as offices, laboratories, or storage rooms.

Air from operating rooms shall be 100% exhausted. Supply and exhaust grilles must be located to provide proper airflow within an occupied room. Typically non-aspirating (perforated) supply air diffusers should be selected and located so that incoming air does not disturb the natural thermal plume that develops over the surgical site. The room shall be maintained at a positive pressure with respect to the adjacent preparation area or corridor.

Typically provide the following:

- Surgical light
- Easily sanitized surgical table
- Appropriate scavenging vacuum or alternate means of gas exhaust
- Plumbed oxygen from a central tank location
- Hot and cold water
- Explosion-proof electrical receptacles and conductive flooring if explosive anesthesia is used

Surgical Support Rooms

Provide at least 2 surgical support rooms separate from the operating room. One is for surgeon preparation, and the other for animal preparation. The former may also be used for instrument and pack preparation and the latter for post-operative recovery. However, prolonged and complex post-operative recovery should be performed in a recovery room separate from both the surgeon preparation room and the animal preparation room. The surgeon preparation room should be contiguous with the operating room; whereas the animal preparation room need not be. Provide an autoclave in close proximity.

DESIGN GUIDELINE 5.3

LOADING DOCKS

Scope

Provide Loading Docks as described below and in accordance with the program requirements.

Design and Installation Requirements

Provide space for refuse containers, trash compactors, and utility carts. The specific type of refuse container or compactor shall be reviewed with the Grounds Department through the Design Manager early in the design process. Provide access for the large 34 cubic yard trucks to service the containers.

Recycling containers shall be located within the loading dock area. Coordinate with facility manager to determine size, quantity and removal schedules.

At dining facilities coordinate with Housing and Dining Services for location of extractor and required storage. Typically located within loading dock area, these elements require significant coordination and planning.

Canopies which extend beyond the edge of the dock should be installed with a minimum clear height of 13'-6" above the driveway to ensure truck clearance under the canopy, lights etc. Preferred clearance height is 14'-0". Confirm the clearance with the Design Manager. If it is not possible to achieve sufficient height, a 6" diameter galvanized and painted steel tube shall be chain hung at the leading edge of the canopy to alert drivers to impending impact. The support structure of the heads of the dock openings which are exposed to potential impact shall be sized and stabilized to withstand the impact.

Provide an overhead dock door (motorized if noted in the program statement), and an adjacent person door.

Provide dock levelers and truck restraints were required.

Provide a storm sewer catch basin in the dock well.

Provide power and control circuits to motorized door openers, dock levelers, and trash compactors. Motorized overhead doors shall have operators easily accessible for maintenance, safety beam and sensing edge safety devices, and keyed control stations inside and outside.

Provide GFCI duplex receptacles for other general purpose needs.

Provide an outdoor campus or emergency telephone and/or a card reader as noted in the program statement.

Provide photocell controlled LED wall pack or downlight outdoors to light the dock area. Specify appropriate cut-off to minimize direct glare to vehicles and pedestrians.

Do not install fire alarm system control panels, security system control panels, time clocks or other electronic panels in the loading dock areas because of the potentially harsh environment and to avoid abuse from the materials being moved through the area.

DESIGN GUIDELINE 5.4 **TELECOMMUNICATIONS ROOMS**

Scope

Voice and data systems for the Ann Arbor, Dearborn and Flint Campuses are provided by the U-M Information Technology Central Services, ITSComm Department. Voice and data systems for University of Michigan Hospitals and Health Care (UMHHC) facilities are provided by the Medical Center Information Technology (MCIT) Division, but UMHHC projects often include ITSComm involvement as well.

Coordinate with ITSComm or MCIT through the Design Manager and provide telecommunications rooms as described below and in accordance with the Program Documents. On new building, building addition and total renovation projects, provide additional infrastructure for Emergency Responder Radio Coverage (ERRC) to enable communication between emergency responders at the exterior perimeter of the building and emergency responders within the building.

ANSI/TIA/EIA-568-C	Commercial Building Standards for Telecommunications Cabling Standards
ANSI/TIA/EIA-569-C	Commercial Building Standards for Telecommunications Pathways and Spaces
ANSI/TIA/EIA-607-B	Commercial Building Grounding and Bonding Requirements for Telecommunications

Architectural Requirements

The Building Entrance (BE) room is the main termination point in a building for interconnecting cables external to the building (OSP cables) with cables internal to the building (ISP cables). A BE may also serve as a TR for the voice/data outlets in the nearby area. In addition, the BE may house voice/data racks, switches, routers, patch panels and terminations, an ERRC rack and headend equipment, and electrical equipment of other systems.

Telecommunications Rooms (TRs) are distribution and termination rooms that serve the voice/data outlets in the nearby area. In addition, TRs may house voice/data racks and equipment, ERRC node equipment and electrical equipment of other systems.

1. If the rooms will contain safety related systems or equipment, determine whether code requires the rooms to be separated from the remainder of the building by rated fire barriers.
2. Locate the BE within 50 conduit feet of the telecommunication service entrance to the building. If this is not possible, provide galvanized rigid steel conduits from the service entrance to the BE for the outside-plant cables.
3. Locate the TRs to allow for star distribution of cabling. Stack TRs vertically to provide short, direct, vertical paths for riser and network cables. See Standard Detail 27200001.
4. Provide a minimum of one TR per floor. Provide additional TRs to ensure:
 - One TR for every 10,000 square feet of floor area being served.
 - One TR for every 300 voice/data outlets being served.
 - The horizontal and vertical cable distance to the farthest voice/data outlet does not exceed 295'.
5. When providing for ERRC, design the BE to house an ERRC rack and headend equipment. Design one TR (two on floors over 25,000 square feet) on every other floor to house ERRC node equipment.
6. Size rooms according to the following rules:
 - Coordinate with ITSComm or MCIT to obtain the quantity and arrangement of voice/data and ERRC racks in each room. Assume each rack will be 8' tall by 32.5" wide (including side-mounted cable managers) by 36" deep. See Standard Detail 27200003 and include it on a drawing. Show the rack outlines on plan drawings.
 - Size the rooms to provide the National Electrical Code minimum working space of 3' in front, 3' in back, and 2' on one side of each rack.
 - Provide backboard-covered wall space for non-rack equipment including patch panels, terminations, and other electrical equipment. Comply with NEC minimum working space requirements in front of wall-mounted equipment.
 - In rooms designed for ERRC equipment, designate a 6' wide by 4' tall section of backboard for ERRC.
 - When a room is not square, the minimum short wall length shall be 8'.
 - Minimum size for the BE shall be 12' x 12'.

- Minimum size for the TRs shall be:
 - 12' x 12' for 10,000 square feet served.
 - 10' x 10' for 8,000 square feet served.
 - 8' x 10' for 5,000 square feet served.
- 7. Minimum room height shall be 9'-0".
- 8. Leave the rooms open to the decks above. No ceilings are allowed.
- 9. Cover three walls from 6" AFF to 8'-6" AFF with ¾ inch Class B fire retardant plywood backboards (smooth side out). Backboards shall be rigidly installed. Do not paint backboards. The fire rating stamps must remain visible.
- 10. Paint or seal the floors. No carpeting is allowed. Provide vinyl tile flooring only when requested by ITSComm or MCIT.
- 11. Doors shall be 36" wide by 80" high minimum and shall swing outward. Doors should be located near a corner of the room, and shall have storage room function hardware. Doors shall not have door sills. Double doors shall not have center mullions.
- 12. When noted in the Program Documents, provide or prepare the doors for card readers and electrified door hardware.

Mechanical/Electrical Requirements

1. Ductwork, piping, and other mechanical system components are not permitted in a BE or TR unless they serve the room.
2. Provide the BE and TR's with cooling 24 hours/day, all year around. Fan coil units located outside and ducted to the rooms are preferred. Room temperature shall be maintained between 68 degrees F (20 degrees C) and 77 degrees F (25 degrees C).
 - No room humidification or dehumidification is required.
 - Feed the cooling system with normal building power. The voice/data and ERRC equipment can operate at an elevated temperature during a power outage.
3. During project programming, assume an equipment heat load of 6,000 watts per room.
 - In rooms designed to house ERRC equipment, add 2,400 watts.
 - Add the heat loads of other electrical equipment in the room including uninterruptible power supplies (UPSs), fire alarm panels, security panels, card access control panels, CCTV panels, and Power Over Ethernet (POE) power supplies.
 - The resultant heat loads will be worst case. Confirm the heat loads during design and reduce the cooling to match the confirmed heat loads.
4. Provide chain-hung fluorescent fixtures to achieve a light level of 50 foot-candles minimum at 3 feet above the floor. Feed the lighting with generator-backed emergency lighting circuit when available. Otherwise, provide an emergency lighting battery pack fixture. Provide light switches. Time controls and occupancy sensors shall not be used.

5. Provide conduits and floor sleeves for telecommunication cables per Standard Detail 27200001. Conduits and floor sleeves shall be 4", shall extend into the room 4", shall be sealed water tight, and shall be fire stopped to match the wall construction. When providing for ERRC, provide 2 additional conduits or sleeves between the rooms for ERRC cabling. Provide spare conduits and sleeves for future use.
6. Extend cable trays a minimum of 6" into the room. Specify fire sealing of cable tray penetrations in fire rated walls using intumescent fire sealant bags or brick systems. Fire sealing shall be performed after cable installation.
7. Provide the following electrical power:
 - Dedicated 120 volt, 30 ampere, normal power circuits to NEMA L5-30R receptacles, and dedicated 120 volt, 20 ampere, normal power circuits to power strips on the voice/data racks. See Standard Detail 27200003.
 - If the BE is designed to house an ERRC rack, a dedicated 120 volt, 30 ampere, emergency power circuit to a NEMA L5-30R receptacle and a dedicated 120 volt, 20 ampere, emergency power circuit to a power strip on the ERRC rack. See Standard Detail 27200003.
 - Dedicated 120 volt, 20 ampere, normal power circuits to duplex receptacles 18" AFF and 10' apart on the voice/data plywood backboards.
 - In the BE and TRs designed to house ERRC equipment, two dedicated 120 volt, 20 ampere, emergency power circuits, each to a quad receptacle on the ERRC backboard.
 - One 120 volt, 20 ampere, normal power circuit to a duplex convenience receptacle on the wall near the door.
 - Coordinate all receptacle locations with ITSComm or MCIT.
8. Provide a 1" x 12" x ¼" thick copper ground bus bar in the BE and each TR. Connect it to the unit substation room ground bus bar and to the ground bus bars in the receptacle panels feeding the BE and TR receptacles. Use No. 6 AWG green insulated, stranded, copper ground cables. The resistance to building ground shall be 1 ohm maximum.

Division of Responsibilities

The following BE and TR equipment will be provided by others.

- Voice/data and ERRC racks and cable managers.
- Ladder-type cable racks above the voice/data and ERRC racks.
- Uninterruptible power supplies (when required).
- Telecommunication and ERRC equipment, patch panels, cables, splice boxes and terminations.
- Equipment of other systems.

5.4.1: MM TELECOMMUNICATION ROOMS

General

This SBA documents all of the specific requirements for telecommunications rooms and like infrastructure for Michigan Medicine (MM) facilities. This document completely supersedes 5.4 in all MM owned and long term leased facilities.

New buildings shall provide telecommunication infrastructure in full accordance with this document. Major renovations in existing buildings shall, when noted in the program statement, upgrade the telecommunications infrastructure also in full accordance with this document.

All voice and data systems services in MM facilities are provided by the Health Information Technology & Services (HITS) Division of MM. Also, in almost all cases, MM projects include AT&T (under HITS separate contract) for wire pulling and similar services.

In some cases, U-M (Campus) Information Technology Services (ITS) also has involvement as well. In these cases, there will be specific notation in the project scope statement noting their involvement and to what degree.

Coordinate through the Design Manager for the specific HITS requirements for each project and provide telecommunications rooms as described below and in accordance with the Program Documents.

When more stringent, BICSI and ANSI/TIA guidelines supersede other guidelines.

ASHRAE	HVAC Applications, Chapter 19, 2011 – Data Processing and Telecommunications Facilities

MM Definitions:

BE - Building Entrance

Building Entrance (BE) Room is a space that combines the functionality of two telecommunication industry standard spaces defined 1) Entrance Facility (also known as Main Distribution Frame -MDF) and 2) Equipment Room (also known as Main Telecommunications Room or Building Distribution Frame - BDF).

BE Room is the telecommunications service entrance to the building and main equipment room. This room is the main demarcation point for interconnecting cables external to the building (OSP cables) with cables internal to the building (ISP cables). It is a central space for telecommunications equipment that serves some or all building occupants. It contains the electronic equipment that transition between the core data, voice, and video backbones and the building backbone, patch panels, terminations, equipment racks, telephone switches, and other electronic equipment that servers the building.

TR - Telecommunications Rooms

Telecommunications Rooms (TR) are distribution and termination rooms that serve the user stations (work area outlet) in the immediate area of the TR. It is where the connections are made between the horizontal cabling to the outlets is made to the building vertical/backbone cabling occurs. TRs also house voice and data equipment, and auxiliary electrical equipment of other systems such as nurse call, fire alarm, etc.

Backbone (Riser) Cabling

The vertical cabling distribution system that provides connection between telecommunication spaces such as BE and TR.

Horizontal Cabling

The cabling between the TR and the Work Area (work area outlet) that carries voice, data and video signals.

Work Area Outlet

Any point of connectivity for voice/data/CATV and like services. These typically are at the user end (i.e. work area, desk, etc.).

Telecommunications Pathways

Conduits, cable trays or other supports with the sole purpose of carrying telecommunications cabling. Telecommunications pathways shall not be used by other low-voltage systems, including but not limited to: fire alarm, security systems, and or building automation wiring or air/vacuum tubes.

Outside Plant (OSP) Cabling

Telecommunications cabling and terminations primarily located outside the building footprint; including but not limited to copper and optical cabling, splicing and terminations, lightning and electrical protection, and work related to their construction.

Inside Plant (ISP) Cabling

Telecommunications cabling and terminations primarily located inside the building footprint; including but not limited to copper and optical cabling, splicing and terminations, lightning and electrical protection, and work related to their construction.

Outside Plant (OSP) Pathways

Telecommunications pathways primarily located outside the building footprint; including but not limited to conduits, maintenance holes, hand-holes and work related to their construction.

HITS

Health Information Technology & Services department provides information technology services to the entire MM campus – Hospitals, on and off campus medical centers and the Medical School.

Auxiliary Electrical Systems

Auxiliary electrical systems include any number of non-power, commonly low voltage, electrically operated systems for functions such as fire alarm, security, building management (BMS), nurse call, intercom, and like systems approved by MM/HITS

HITS Service Level for Telecommunications Rooms

Based on the area the TR serves and equipment installed within, each room is classified according to the below noted expected IT service availability and recoverability criteria. Design guidelines and this SBA will include specific power cooling and like infrastructure requirements for each service level. [Note: The response times noted below specifically relate to IT responses to failures. The infrastructure supplied to BE and TR rooms should be configured to allow building and operational personnel the tools and systems to respond in a similar manner.]

Bronze

Standard Class Service – Monday to Friday, 8 am to 5 pm operations.

Silver

Business Class Service – Monday to Saturday, 7 AM to 7 PM operations.

Gold

High Availability Environment – 24/7/365 operations.

Platinum

High Availability & Patient Safety Environment – 24/7/365 operations.

Note: As noted below, BE rooms typically are Platinum

General Requirements:

If not clearly stated in program statement, ask the Design Manager for the 'Service Level' standard required for the telecommunications infrastructure to be installed. For programing purposes, assume Platinum service level for inpatient & ambulatory surgery occupancy and assume Gold Service Level for outpatient / business occupancies. Building Entrances shall typically be considered Platinum Service Level.

Drawings shall clearly identify areas in each communication room dedicated for the IT services being installed as well as for each auxiliary electrical system being installed. Provide plans and elevations to clearly define location (typically wall space), heights, etc. to insure maximum available resource (space, etc.) is maintained for future changes.

Consider and show space (in plan views) for, working clearances needed for maintenance and operation, and code mandate clearances for all current and known future equipment planned for the room. Also provide and show the power and cooling infrastructure needed to support the entire room.

In existing buildings where a central UPS is present, and in new buildings where a building-wide UPS is part of the program statement, provide building UPS power for IT loads in communication rooms and emergency power for room cooling, lights and miscellaneous power. When noted in program statement, provide these also for major renovations. Where building wide UPS is not present, provide power to rack-mounted UPS systems of size and number defined by HITS

BE and TR shall be dedicated to this purpose with no other building services sharing the space.

If conditions allow the BE may be co-located with one TR room, when approved by HITS. When this is done provide a room sized for both functions.

Equipment, including racks, patch panels, cable management, etc. for each room to be specified by HITS for each project. Ask the Design Manager for the HITS specifications for each room.

See 272000-H for detailed specifications to each item below.

Architectural Requirements

1. Locate the BE where the telecommunication (OSP) cables enter the building and relatively close to the TRs. Preferably this is at or near the exterior wall of the facility. BE room should accessible for

deliveries (close to dock), away from potential sources of EMI, away from machinery that causes vibration such as air compressors, and away from sources of potential water leaks.

2. For in-patient buildings provide one BE and a hybrid TR/BE on the ground floor at opposite ends of the building. Bring telecommunication utilities to both rooms from separate sources.
3. For office buildings provide one BE on the ground floor.
4. Centrally locate the TRs to allow 'star' distribution of cabling to the user stations (work area outlets). Stack TRs vertically to provide short, direct, vertical paths for riser and network cables. (see Figure 1)
5. Provide a minimum of one TR per floor.
6. Provide additional TRs as required to ensure:
 - a. The maximum cable distance from the patch panel to the farthest voice/data outlet does not exceed 90 meters (~295').
 - b. One TR for every 1,152 voice/data outlets being served.
 - c. One TR for every 10,000 gross square feet in in-patient buildings.
 - d. One TR for every 15,000 gross square feet in office buildings.
7. These rooms shall be free of obstructions such as diagonal bracing, stairs, or other utilities. Infrastructure serving TR's & BE's shall be limited to that which directly serves the TR/ BE space. Do not place cooling and power equipment serving room directly above the IT racks and like equipment.
8. Coordinate with HITS to obtain the quantity and arrangement of equipment racks in each room. Show the rack outlines and needed working clearances on the plan drawings.
9. **BE** minimum size is based on the building gross square footage.

Building Gross Sq. Ft.	BE Sq. Ft.
Up to 20,000	130
20,001 to 50,000	140
50,001 to 75,000	200
75,001 to 200,000	240
200,001 to 400,000	340
400,001 to 600,000	390
600,001 to 900,000	430

10. **TR** minimum size for all service areas shall be 130 sq. ft.
11. The minimum short wall length for TR and BE rooms shall be 10', rectangular rooms are preferred.
12. Minimum room height is 9'-6" clear in entire room.
13. Leave the room ceilings open to the decks above. No ceilings are allowed. Fire-proofing of overhead steel shall be sealed and/or encapsulated behind drywall.
14. Seal all concrete surfaces
15. Paint or seal the walls and cover at least 3 walls from 12" AFF to 9' AFF with 3/4 inch Class B fire retardant plywood backboards (smooth side out). Backboards shall be rigidly installed and painted per 272000-H specifications.
16. Install anti-static vinyl tile on the floors, no carpeting or bare concrete is allowed.
17. Doors shall be 36" wide by 80" high minimum and shall swing outward. Doors should be located near a corner of the room, and shall have storage room function hardware. Doors shall not have door sills, and double doors shall not have center posts.

18. Provide card readers access with electric hardware sets (preferred), or electric strikes. Consult with Security on how to key each door.

Electrical Requirements

1. Provide fluorescent lighting per TIA/EIA-569-B Standard; typically, 8.5' high providing 50 vertical foot candles @ 3' AFF. Fluorescent lighting shall not be installed directly above equipment racks. Emergency lighting and power should be provided.
2. Provide manual switches for the lighting. Time controls and occupancy sensors are not allowed.
3. Floor sleeves shall be water tight and fire stopped. Provide spare sleeves and conduits for future use.
4. Extend conduits and cable trays a minimum of 3" into the rooms. Extend the tray to an area above the proposed location of the relay racks. Also provide a cable tray over the tops of all of the racks.
5. Supply BE & TR rooms, including lighting, with critical power (UPS & generator) when available within the building, unless otherwise specified. Cooling systems for these rooms shall be powered from emergency generator sources when generator power is in building, or part of program statement (UPS power not required).
6. If possible, locate the electrical panel serving the BE or TR room within the room (dedicated) or nearby to facilitate future modifications.
7. Provide the following power for each room at the equipment racks, unless specifically noted otherwise. For Platinum and Gold Service Level rooms see 'Gold and Platinum Service Level Requirements below.
 - a) 1x 30A 208V Critical (generator backed up) L6-30R outlet.
 - b) 1x 30A 208V non-critical or on a separate electrical branch L6-30R outlet.
 - c) 1x 20A 120V non-critical quad 5-20R outlet.
8. Along all walls install 20A/120V general purpose duplex NEMA 5-20R electrical outlets every 6' at 18" AFF. This should be below the plywood backboard and not on emergency power. Auxiliary electrical systems accepted.
9. If generator power is available install on the walls covered with the plywood backboard 20A/120V quads 5-20R at 60" AFF.
10. Provide a 1/4" x 2" x 12" copper ground bus (Panduit GB2B0306TPI-1) in the BE, and each TR room; Bond each rack independently to the ground bar; Follow design guideline 260526-H.

Mechanical Requirements

1. Ductwork, piping, and other mechanical system components (water/gas/fuel/drain/etc.) are not permitted in or through these rooms unless they serve these rooms.
2. Room temperature and humidity shall be designed per ASHRAE Handbook, HVAC Applications 2011, Ch 19; 24 hours a day, 365 days a year, maintained between 65°F- 80°F/ max 55% RH, positive pressure.
3. Cooling capacity for TR rooms shall be based on a minimum HITS equipment heat load of 5,000 watts per 130 sq. ft. room; plus that of all current and planned auxiliary electrical system equipment.
 - Confirm projected heating loads with HITS during design phase. Load shall include rack mounted UPS units.
4. Provide emergency power for the room cooling system if emergency power circuits are provided in the space. The need for 24/7/365, high density, emergency powered cooling typically dictates the use of a packaged dedicated HVAC system (i.e. fan coil unit [FCU] or split DX) for each room. UMH's standard is to utilize a chilled water FCU when an emergency source of chilled water is available (i.e. process chilled water - PCHW).

5. Ideally the FCU shall be mounted outside of the room, typically in an adjacent corridor, and ducted into and out of the space. Provide minimum ventilation air off of the central AHU for each room. If the room is large enough, or if adjacent space is too limited, locate the dedicated FCU within the room, at the door. All piping serving the FCU within these rooms, including chilled water and condensate piping, and the fan coil itself, shall be provided with an auxiliary drain pan. Pan shall not impinge on maintenance of the FCU.
6. All TR/ BE rooms shall be remotely monitored and alarmed thru the DDC BMS by MM Systems Monitoring. BMS shall monitor space temperature and alarm when space temperature is <65°F or >80°F. When a possible source of water leak exists in the room (i.e. FCU or water/ drain piping), provide a floor-mounted leak detector, located in the corner of the room out of the path of travel, integrated to alarm thru the BMS.
7. Route sprinkler piping over aisles, not directly over IT equipment. All exposed sprinkler heads shall utilize protective cages.

Bronze and Silver Service Level Requirements

All requirements stated above.

Gold and Platinum Service Level Requirements

- 1) All requirements stated above.
- 2) Provide the following power for each room at the equipment racks in-lieu-of those mentioned in lower service levels.
 - a) 2x 30A 208V Critical (generator backed up) L6-30R outlets.
 - b) 2x 30A 208V non-critical or on a separate electrical branch L6-30R outlets.
 - c) 2x 20A 120V on separate branch circuits, one on generator one on emergency, quad 5-20R outlets.
- 3) Cooling capacity for TR rooms shall be based on a minimum HITS equipment heat load of 10,000 watts per room.
 - a) Confirm projected heating loads with HITS during design phase. Load shall include rack mounted UPS units and non-HITS devices (CCTV amplifiers, etc.) where appropriate.
- 4) Cooling capacity for BE rooms shall be based on a minimum HITS equipment heat load of 20,000 watts per room.
 - a) Confirm projected heating loads with HITS during design phase.

Figure 1 – Typical Building BE/TR Room Riser Diagram
No Scale

Notes:

1. The number of TR rooms per floor shall be noted above in paragraph 4. The above riser assumes a building with a floor area of more than 10,000 square feet, but less than 20,000 square feet.
2. The number of total risers will reflect the total area of the typically floor. I.e. a building with around 30,000 square feet would have three total risers, instead of the two shown above.
3. Each stack of TR rooms will be connected to the BE room as noted above.
4. The second OSP building entrance noted above, going into TR/BE room is required in buildings having Platinum service levels, and is highly desirable in buildings with Gold or Silver service levels. It is never required in buildings having Bronze service levels.
5. Provide 4-4" ducts for the OSP cabling, from the manhole or service point

NOTE:

1. CONVENIENCE OUTLETS EVERY 6'-0" ARE NOT SHOWN.
2. ELECTRICAL QUAD RECEPTACLE 20/120V 5-20R.
3. ELECTRICAL SINGLE RECEPTACLE 30/208V L6-30.

NOTE:

1. CONVENIENCE OUTLETS EVERY 6'-0" ARE NOT SHOWN.
2. ELECTRICAL QUAD RECEPTACLE 20/120V 5-20R.
3. ELECTRICAL SINGLE RECEPTACLE 30/208V L6-30.

DESIGN GUIDELINE SBA 5.5 **CUSTODIAL SUPPORT SPACE AND INFRASTRUCTURE**

Scope

Provide Custodial Support Spaces as described below and in accordance with the program documents. Scope also includes infrastructure requirements for outlet locations within facility to accommodate custodial staff.

Related Sections

U-M Standard Details:

[Proposed layout Custodial Room](#)

[Proposed layout Custodial Suite](#)

Design Requirements

Miscellaneous Outlet locations:

Labs: Provide 1 outlet on a separate circuit located at room entry, preferred below fire extinguisher, for use by custodial staff. Outlets from multiple labs can be circuited together. Intent is to provide outlet for custodial staff on a separate circuit from lab equipment. Provide label indicating “general maintenance use only”.

Stairwells: Provide 1 convenience outlet on every other floor level for use of custodial staff.

Minimum Building Requirements for custodial support space:

Custodial Room - (approx. 100 s.f.) – 1 for buildings less than 90,000 s.f. optional plan layout.

- Provide lockers for employees, half size, able to hold a back pack and hang up coat.
- Equipment Storage cabinet 18” x 48”
- Restroom cart parking spot 24” x 48”
- Gondola storage
- Control cabinet 48” x 18” deep
- 24” x 48” wire shelving rack
- Trash Barrel w/ cleaning supplies 24”x24”
- Vacuum space 24”x24”
- Floor Sink 24”x24”
 - Provide eyewash over floor sink. Option: Wall mounted eye/face wash, ANSI Z358.1 compliant.
- Provide 42” out swinging door with store room lock function

Custodial Suite – 1 for buildings over 90,000 s.f. optional layout plan

- Custodial Office 120 s.f.
 - 1 data line for computer
 - 1 voice line
- Custodial Staging Room 200 s.f.
 - Supply cabinet 48” W x 18” D X 60” H metal, lockable, heavy duty
 - 2 data lines for shared computer workstation and timeclock.
 - Employee lockers, half height size, able to hold backpack and hang a coat.
 - Provide table and chairs based on crew size or designated conference room that can be utilized by custodial staff. Design Manager to coordinate.
 - Dry erase marker board
 - Bulletin board
 - Provide 42” door with kick plate on push side and storeroom function lock.
- Custodial Equipment Area 150 s.f.
 - 2 electrical convenience outlets on separate circuits for charging battery powered auto scrubbers and burnishers, outlets shall be 3 feet off floor
 - Provide wall mounted hooks, with support blocking, at 48” o.c. for vacuum back packs. Provide adjacent outlet (3 feet above floor) for battery charging.
 - Provide (4) GFCI duplex outlets, locate on walls 40” above floor.
 - Provide dedicated outlet for floor polisher equipment. DM to provide current equipment specifications.
- Custodial Bulk Storage 120 s.f.
 - 2 electrical convenience outlet, 40” o.c. a.f.f., 1 located near entry the other on opposing wall.
 - Chrome wire shelving unit, 4 shelves, 86”H x 60” W x 30” D
 - Laundry stacked unit – verify necessity with Design Manager

Pantry – 1 per every grouped mens and womens toilet rooms.

- Pantries shall provide storage for 1 month supply of paper products.
- Standard wire shelving rack 18” x 48”.
- May be combined with Custodial Closet.

Custodial Closet – size 64 s.f., provide 1 per every 6,000 SF; 1 per floor recommended.

- Floor sink w/ backsplash (provide 1 per floor)
 - Service sink are to be floor type, precast, chemical and stain resistant receptors, 20” by 32” or larger, with an external sidewall depth of 6”. Sinks shall include a 6’ hose, a hose bracket, and a double supply spout no lower than 5’ above the floor.
 - Provide eyewash over floor sink. Option: Wall mounted eye/face wash, ANSI Z358.1 compliant.
- Provide floor drain, in center of room, with the floor sloped a minimum of ¼ inch per foot toward the drain.
- 1 electrical, GFI type, outlet 36” above the floor by door
- Shelving Chrome wire unit 4 shelves, 63” H x 48” W x 18” D

- Provide out swinging door, 42” wide with kick plate on push side.

General Design Requirements for Custodial Spaces:

- Locate Custodial Room/ Suite with adjacency to loading dock.
- Doors to custodial spaces shall have store room lock function.
- Flooring shall be slip resistant, non-porous flooring.
- Walls- provide robust walls to withstand cart traffic. Surfaces shall be impermeable and washable from floor to 6’-0” above finished floor. Ceiling heights shall be minimum 8’-0”
- Provide out swinging door, 42” wide w/ kick plate on push side.

Custodial support spaces should not share spaces that contain mechanical equipment, exits to the roof, or equipment to which other personnel or building occupants must have access. The closets shall not contain electrical panels or any other electrical devices except for the lights and receptacles required for custodial tasks. Custodial support spaces can be combined where practical.

5.5.1: MM CUSTODIAL CLOSETS

Related Sections

This document lists the requirements for Custodial Closets in MM Facilities.
For an explanation of the use of these guidelines, see "[Design Guidelines for MM Facilities](#)"

General

There shall be one a minimum of one Custodial Closet per inpatient nursing unit; a minimum of one Custodial Closet per floor per outpatient clinical building, as required by code, and as dictated by the program.

The Custodial Closets shall include 4-6 coat hooks, with a duplex power receptacle adjacent to the coat hooks.

The doors shall swing out, shall be as wide as practical (min. 42" wide), and shall have stainless steel door and frame protection. Provide a classroom function lock.

Typically provide 30 linear feet of sturdy shelving for paper and cleaning products; additional shelving may be required depending on the program.

Provide a wall mounted hand sanitizer near the doorway.

The room must have a minimum width of 5'-0". Provide parking for (2) two 22" x 48" carts plus vacuum cleaner, mop bucket(s) and ladder(s). Review design for new rooms with Environmental Services Director.

Provide a minimum 24" square floor sink with rim guard, rough chrome plated brass faucet, wall mounted 36" above the floor with wall bracket, pail hook, vacuum breaker, wall mounted mop holding bracket, and 3'-0" rubber hose connected to hose end of faucet. In addition, provide a separate, dedicated non-potable CW connection for chemical mixing/ dilution, consisting of a 1/2" CW with hosebibb connection, fed from a RPZ backflow preventer racked on the wall, for ease of servicing. Mount hosebibb over mop sink. Provide sign over non-potable hosebibb indicating "Chemical Connection Faucet Only". Locate the sink close to the door, so that it is accessible without having to move carts out of the way. Provide location for rack of cleaning product concentrate bottles (typically four bottles) adjacent to the sink.

Provide adequate light, controlled by an occupancy sensor.

Provide room exhaust on a 24/7 basis.

Provide slip-resistant flooring with a fully sloped threshold at the door, and wall protection to 48" AFF, minimum. Provide full height corner guards.

General Design Requirements

The parking structure design shall incorporate the standard requirements of this Design Guideline and any Parking and Transportation Services (PTS) requirements unique to the structure.

The U-M Design Manager shall assume the responsibility for coordinating the transfer of additional information required by the design professional to and from U-M Departments.

Identify the parking structure as an ‘Enclosed Parking Garage’ or a ‘Ramp Access Open Parking Garage’ in accordance with Code. All separations from adjacent occupancies or structures shall be clearly identified.

Obtain approval from the City of Ann Arbor for all construction/impacts within the City of Ann Arbor right-of-way that support the parking structure.

Design parking structures to provide a 75 year life.

Driver visibility shall be free of blind spots at all turning points along the drive lanes.

Bumper blocks and wheel stops shall not be used.

Provide motorcycle designated parking outside of gate-controlled parking areas. Provide a dedicated entrance for motorcycles. Incorporate PTS requirements for multi-modal (bicycle, moped, etc.) parking.

Parking spaces shall be 90 degrees to the drive lanes. Each space shall be striped on the floor with 4 inch wide yellow stripes, and shall be a minimum of 8 feet 6 inches wide when measured from center of stripe to center of stripe. Provide wider spaces for special access vehicles per PTS requirements.

Provide ADA-compliant accessible parking spaces as required by code and PTS. Accessible spaces shall be striped in yellow (not blue). Accessible parking signage shall be furnished and installed directly by PTS. Do not paint accessible parking symbols on the deck.

Architectural Design Requirements

Structure

Structures shall have a live load capacity of 70 lbs./sq. ft. minimum. Provide a minimum additional 30 lbs./sq.ft. capacity at roof levels or meet the current Code requirement for snow loads, whichever is greater.

Structure decks should be constructed with precast or cast-in-place reinforced concrete double tees and 4 inches thick minimum top of tee, not including overlay. Both precast and cast-in place structural systems shall be evaluated during schematic design. Wherever cast-in-place concrete is used for beams, parts of the deck, or other horizontal elements, provide epoxy coated reinforcing steel.

Where precast construction is used, provide galvanic anodes at shear connectors.

Decks should have a clear span of at least 62 feet wide. At grade level and below and at levels with ADA parking, provide a minimum clearance of 8 feet 2 inches from the finished floor to the underside of any building component or pipe (including lighting fixtures and fire suppression sprinklers). Above grade level, provide a minimum clearance of 7 feet 6 inches to the underside of any building component and a minimum clearance of 7 feet 4 inches to any projecting or protruding object.

Decks shall have a protective overlay of 1-5/8 inches to 2 inches latex modified concrete or micro silica flume sand on top of the precast double tees. This overlay shall not be designed as a structural member, but as a protective overlay only, and shall be able to be replaced in the future. If a micro silica overlay is selected, provide a penetrating sealer (40 percent solids, silane sealer).

Ramped floors in the structure should not exceed a 6 percent slope where vehicles park adjacent to a drive lane, and then shall not exceed a 10 percent slope for speed ramps without adjacent parking.

Interior

Provide an enclosed lobby at each elevator landing.

Lobby and stairwell doors shall be unpainted aluminum with brushed finish and safety glass vision panels except as required by Code to be fire rated. Fire rated door assemblies shall be factory painted galvanized hollow metal with safety glass vision panels of the maximum allowable dimensions. Coordinate color with PTS paint specifications. Lobby and stairwell door hardware requirements are to be as follows:

- All doors shall have quarter panel kick plates (both sides of door) and closers.
- Exterior doors shall have panic device assemblies with locks and latches.
- Interior doors shall have push/pull hardware unless otherwise required by Code.
- Provide low energy ADA compliant door operators at all ADA accessible routes into and out of the structure. Evaluate other types of automatic operators that may be required for specific PTS applications.

Provide safety glazing in lobbies and all other areas required by Code. Window sills shall be no lower than 30 inches above the finished floor. Windows should be as large as practical to provide good visibility from the outside. Perimeter windows should utilize tinted low-E glass to minimize solar heat gain.

Evaluate public safety issues that exceed code requirements, such as security cameras in stairwells and exterior glazings that provide full viewing within stairwells.

Seal all floor penetrations water tight.

Where pre-tension or post-tension construction is used, provide cast-in-place or double-cored galvanized steel sleeves flush with floor levels and concrete-filled or covered. Provide block-outs or PVC sleeves for all wall and beam penetrations.

In general, the finish on all walls, columns, and ceilings shall be white per PTS Painting Specifications. Mechanical and electrical equipment, electrical conduits, and conduit expansion joints shall not be field painted. Mask all unpainted equipment to avoid overspray. Water, gas and fire system lines shall be painted.

Paint elevator shaft interior walls with white latex ceramic wall paint per PTS Painting Specifications to insulate the shaft against heat loss and moisture damage.

Painting of floors is not required, including stair landings, stair treads, and lobby floors. Concrete stair landings, stair treads and lobbies shall have an anti slip surface consisting of a quartz aggregate sealed with either polyurethane or methacrylate. PTS will provide aggregate color and finish.

Evaluate the use of traffic topping on exposed parking levels per PTS requirements.

Protect vertical pipes, conduits and valves from vehicle damage. Protection methods shall include either steel covers painted safety yellow or galvanized steel pipe bollards filled with concrete.

Provide movable precast concrete bollards for use in controlling traffic. See the U-M Standard Details for bollard requirements.

Provide a telecommunications room. Refer to U-M Design Guidelines for room specifications.

Provide a non-public ADA accessible toilet room on the ground level.

Provide a parking structure maintenance room, preferably on the ground level. Maintenance room minimum requirements are as follows:

- Room size minimum: 500 sq. ft.
- Room depth minimum: 18 ft.
- Roll-up door minimum: 9 ft. x 7 ft. (WxH) Obtain the door specification from PTS.
- Pedestrian Door: 42 inches wide.
- Plumbing: Utility tub and janitor's sink with hot and cold water.
- Power: 4 GFCI duplex receptacles and a separate 120 volt, 20 amp compressor circuit.
- Lighting: Ceiling fluorescent lighting with occupancy sensor control.
- Heat: Heater with wall mounted thermostat to maintain room above 45 degrees F.

Entrances/Exits

If parking controls (including electronic signage, attendant booths, gates, vehicle detection loops, and Automated Vehicle Identification (AVI) equipment) are to be provided, the equipment will be furnished and installed by others and directly through PTS. Provide concrete housekeeping pads, safety bollards installed in the pads, power and communications conduits and wiring, and lighting in accordance with PTS requirements. If no parking controls are to be installed, provide conduits for power and communications for the future addition of parking controls.

If attendant booths are to be provided, they shall be a minimum of 5 feet by 7 feet and located on 6 inch concrete housekeeping pads. At least one booth shall be ADA accessible. Incorporate PTS booth and bollard cover specifications.

The structure shall have illuminated pedestrian entrances away from the drive lanes.

Signage

Provide an illuminated facility identification sign at each entrance, LED type signs over entrance and exit lanes, and a clearance pipe above each entrance in accordance with PTS requirements.

Provide facility and level identification, directional, traffic and parking control signage in accordance with PTS requirements.

Mechanical Design Requirements

Elevators

Traction elevators shall be used. Hydraulic elevators shall not be installed in parking structures.

Provide a securable ladder with slip resistant rungs to access the roof of each elevator machine room. On machine room roofs, provide appropriate fall protection as required by Occupational Safety and Health Administration regulations.

Provide rigidized stainless steel wall panels and Class I fire-rated, slip-resistant rubber flooring in the elevator cars.

Elevator hoist ways shall be heated and cooled to maintain the temperatures specified by the elevator manufacturer. Elevator lobbies shall not be heated.

Heat and air condition elevator machine rooms to maintain an ambient temperature between 55 degrees F and 90 degrees F under all weather conditions. No heating or air conditioning equipment or piping shall be located in the machine rooms, except that which serves the rooms.

Provide stainless steel elevator door headers, frames, struts, and stainless steel or nickel-silver sills.

Provide floor drains in elevator lobbies, and slope floors downward from the room and elevator doors to the floor drains.

If the elevator(s) are considered part of the parking structure's "accessible path" or if the parking structure is classified by Code as a high rise structure, then the elevators, elevator HVAC, associated lighting and receptacles shall be connected to the emergency generator. Additionally, ingress and egress from and to the elevator and between the elevator machine room and the elevator must be "safe and reasonable" as defined by the Michigan Elevator Code.

Snow Melt System

Provide a snow melt system with the chute and control equipment on the roof. Provide a concrete housekeeping pad for the system and design the structure to support the additional weight.

The snow melt system shall be natural gas fired. Size the unit to service at least the entire roof level of the parking structure. Contact the system manufacturer for electrical, water, drainage and gas pressure requirements. Verify that required gas pressure is available. Connect a control panel "trouble" output contact to the DDC panel. Provide electric heat tracing for the water supply and drain lines that are exposed to air.

Enclose the snow melt system in a wire mesh fence with sliding gates for snow melt system operation and swing gates for personnel access to the control panel. Provide a level, skid-resistant path for personnel to safely access the control panel.

Natural Gas Service

Coordinate with the local utility to provide a natural gas service large enough to serve the snow melter, generator, and any additional equipment requiring natural gas service.

Ventilation

For structure levels that require mechanical ventilation to control CO levels, provide variable speed fans controlled by CO sensors. Connect CO “high-high” alarm output contacts to the Building Automation System DDC panel.

Evaluate the need for ventilation in glass-enclosed stairways.

Controls

Unless one is available in a close-coupled building, provide a Building Automation System Direct Digital Control (DDC) panel for connection to structure systems and equipment.

Additional Plumbing

Provide one standard hose bib on each parking level outside of stair and elevator towers. Hose bibs shall be drainable for winter.

Drainage

Provide positive drainage on all decks. Provide trench drains at the bottom of ramps from the plaza or roof levels.

Drain lines shall be 4 inch minimum and shall be heat traced where exposed to air.

Elevator and stair tower roof drains shall discharge to storm drains via lines located inside of lobbies or the parking structure. Downspouts shall not discharge directly onto the roof level floor deck.

Contact the City of Ann Arbor or other Authorities Having Jurisdiction to determine sanitary and storm water drainage restrictions and requirements. These requirements may include installation of an oil separation system.

Fire Protection

Provide drainable standpipes with 2½ inch fire hose connections on each level at each egress stairway, with additional standpipes located throughout the structure such that all portions of the structure are within 100 feet of a standpipe hose connection, or as otherwise required by Code.

Standpipe risers shall be painted red. One column immediately adjacent to each standpipe hose connection shall be marked on each side with a 6-inch wide strip of reflective red tape running perpendicular to the floor, from floor to deck, and the top 24 inches of the column should be painted red. It is not necessary to mark columns located inside enclosed stairways.

Provide a fire department connection for the standpipe system as required by the Code and NFPA 14. The fire department connection shall face the street, and shall be located within 100 feet of a fire hydrant. The fire hydrant shall be located such that a temporary meter, valve, and hose assembly can be connected for use by PTS for cleaning of the structure in accordance with City of Ann Arbor requirements.

For structures that require fire protection sprinklers, provide a dry pipe system. If available, plant air should be used to pressurize the dry pipe system. The dry pipe sprinkler valve and air compressor (if needed) should be located in the maintenance room. Provide a sprinkler system electrical failsafe contact that open if the system becomes charged, and connect it to the DDC panel.

The fire protection system shall be designed with the capability of draining down a charged system into the sanitary sewer/oil separation system for proper disposal of water.

All exposed control valves for the fire protection system shall be lockable or within lockable tamper resistant boxes.

Electrical Design Requirements

Lighting

Provide the following horizontal light levels on the floor:

<u>Area</u>	<u>Minimum</u>	<u>Average</u>
• Egress routes while on emergency power:	Per Code	Per Code
• Interior drive lanes and parking spaces:	3fc	5fc
• Uncontrolled and unattended entrances/exits:	5fc	10fc
• Vehicle entrances and exits:	10fc	25fc
• Stairways and lobbies:	10fc	25fc
• Maintenance room:	10fc	25fc
• Top deck:	1fc	2fc

Note: Deviations from the light levels listed above may be necessary to meet the lighting power density (watts/sq.ft.) restrictions of ASHRAE 90.1-2007.

Light reflectance from painted ceilings and walls shall be used during calculation of lighting levels.

Provide light levels in elevator lobbies, cars, machine rooms, and pits in accordance with the Michigan Elevator Code.

Normal lighting should have an average-to-minimum uniformity ratio of not more than 4:1, and emergency lighting should have an average-to-minimum uniformity ratio of not more than 10:1. Deviations from these ratios may be necessary to meet restrictions set forth by ASHRAE 90.1

Provide exit signs to direct traffic toward exits and pedestrians toward stairs and pedestrian exit ways. Exit signs shall be vandal-resistant LED type. Do not provide battery-backed exit signs.

Select lighting fixture cut-off to minimize direct glare into driver's eyes and to limit the amount of light exiting the structure.

Fixtures shall be vandal-resistant, UL listed for wet locations, with gasketed, high impact polycarbonate lenses secured with vandal-resistant screws, and cold weather ballasts.

Fixtures should operate at 277 volts. Do not provide battery-backed emergency lights.

Evaluate use of the following fixture types. Obtain the currently approved fixture manufacturers and models from PTS.

- 4 foot fluorescent vandal resistant wraparound fixture. Fixture to be surface or pendant mounted, with two or three 32 watt, 3500 degrees K, rapid start, T-8 fluorescent lamps and cold weather (0 degree or lower) electronic ballast. UL listed for wet locations.
- Induction lamp parking garage type, surface or pendant mounted, with 3200-3500 degrees K, 80 CRI lamp rated 100,000 hours, and electronic ballast.
- Solid state lighting (SSL) fixtures. Note: LED lighting is an emerging technology and should be evaluated as appropriate fixtures become available.
- Obtain PTS approval of the fixture type selected.

Lighting fixtures in stairways, lobbies, and elevators shall be vandal-resistant fluorescent with 3500 degrees K lamps and cold weather rated (0 degrees F or less) electronic ballasts.

Lighting in stairways, elevator lobbies, maintenance rooms and the substation room shall be connected to emergency circuits.

Lighting fixtures shall be cord and plug connected, with cords secured to conduits. Provided photometric requirements can be met, lighting fixtures over parking spaces should be located at the drive lane end of the parking spaces such that the fixtures can be repaired or replaced even if parked vehicles are present.

Lighting fixtures on the roof deck shall be metal halide or the latest PTS-approved emerging technology, shoebox type, mounted on round, tapered, hinged, aluminum poles to allow lowering the fixtures for maintenance. Refer to U-M Master Specification 16521 for additional requirements. Minimum lighting levels shall be maintained, but fixture wattage and pole height may be reduced to minimize light trespass on surrounding areas.

Lighting Controls

Circuit the interior deck lighting fixtures in rows that parallel the outer walls. Provide daylighting controls to turn off rows of lights near the outer walls when the incoming daylight is adequate.

Provide photocell controls to turn off the top deck lights when the daylight is adequate.

Provide daylighting controls in lobbies and stairwells exposed to natural daylight to turn off unneeded lights when the incoming daylight is adequate.

Power

Provide an indoor, single-ended, 13.2 kV–480Y/277 volt unit substation utilizing U-M Master Specification 16315. Locate the substation on a 4 inch minimum concrete housekeeping pad in a separate room complying with Design Guideline SBA-F. Exception: If the parking structure is close coupled to a building having sufficient power to serve the parking structure, a secondary voltage feeder may be utilized. If this is done, the feeder shall have a separate meter installed of the type specified in Master Specification 16315.

Provide a natural gas fueled engine-generator in accordance with Design Guideline 16231 to supply emergency power. Propose a location indoors in a room or outdoors in an enclosure for approval by PTS. During schematic design, evaluate sizing the generator large enough to provide power to all lighting in the structure to avoid the costs of separate emergency lights, multiple automatic transfer switches, and two conduit and wiring systems.

Provide one 120V GFCI duplex electrical outlet in the elevator lobby on every level. Provide a hinged, lockable cover on the outlet.

Raceways

Conduit should be exposed, except conduits to parking controls and attendant booths shall be embedded. Horizontal conduit runs below structural beams and vertical conduit runs should be located near columns and away from drive lane areas. Conduits located where they may be struck by vehicles shall be guarded.

Exposed conduits shall be Schedule 80 PVC and embedded conduits shall be Schedule 40 PVC, both with matching fittings, expansion fittings, and weatherproof junction and outlet boxes. Structural support channels shall be fiberglass with fiberglass or stainless steel hardware.

Exposed ½" and ¾" conduits shall be strapped to the structure with Carlon "Snap Strap" sliding clamps every 3 feet maximum. Exposed 1" through 2" conduits shall be strapped to the structure with Carlon "Snap Strap" sliding clamps every 5 feet maximum. Conduits 2" and smaller shall not be suspended on hangers. They shall be installed so no gaps exist between the conduits and the structure large enough for someone to grip the conduits and pull them down.

Exposed conduits larger than 2" shall be strapped with standard 2-hole PVC clamps, but the clamps shall be spaced off of the structure or hanger by a nylon or PVC washer under each hole of each clamp. The washers shall be thin enough so the 2-hole clamps continue to provide conduit support, but thick enough so the conduits slide through the clamps during conduit expansion and contraction.

Expansion fittings shall be provided in sufficient quantities to accommodate the expansion and contraction of a 120 degree F temperature change. Expansion fittings shall be provided within 3 feet of lighting fixtures and within 5 feet on both sides of bends and elbows. Expansion fittings shall be installed expanded or contracted as appropriate for the specific temperature existing at the time of installation.

Drain holes ¼" in diameter shall be drilled in the bottom of exposed junction and outlet boxes.

Fire Alarm

Provide a fire alarm system only when and where required by Code. Provide fire alarm devices that are UL listed for the environment in which they will be located.

Fire alarm junction boxes, covers and fittings shall be painted red or installed in red conduit throughout. Exception: The fire alarm raceways exposed in finished areas may be painted to match wall color.

Sprinkler system water flow and trouble alarms must be monitored in accordance with Design Guideline 16720. In parking structures without a fire alarm system, the sprinkler water flow and trouble alarms shall be monitored directly through the campus MOSCAD system. Monitoring of water flow and trouble alarms in Hospital parking structures by the UMHC Facilities Control Center may also be acceptable, in accordance with direction received from the Design Manager.

Emergency Telephones, Elevator Telephones, and Data Connections

Provide DDC monitoring and alarms in the BAS Operations Center for snow melt system trouble, exhaust fan running and shutdown, CO "high-high" level, VSD trouble, generator running and trouble, automatic transfer switch transfer to generator power, loss of natural gas pressure, sprinkler system water flow and trouble, heat tracing trouble, and trouble from any other mechanical or electrical systems.

Provide U-M standard wall-mounted emergency telephones with integrated blue lights. Kiosk-style telephones shall not be used. Provide power and communications conduits and wiring for the emergency telephones. The lights operate on 120V power. Consult the U-M Standard Details. Some redesign may be required because the existing standard details may not always apply. Installation locations shall provide for maximum visibility and accessibility.

Provide one communication line for each elevator that will serve as the emergency telephone service from the elevator to an outside monitored source. In addition, provide one telephone line for use as a modem line for each group of elevators. All communication lines must terminate in junction boxes in the elevator machine room.

Provide conduit and cable from the telecommunications room for data circuits to be used for gate control systems, programmable signage and other applications.

Provide conduit and cable from the telecommunications room to the substation for recording power meter communications.

DESIGN GUIDELINE 5.7 UNIT SUBSTATION ROOMS

Scope

This guideline applies to rooms that contain unit substations. The guideline covers basic design requirements for associated architectural, mechanical and electrical systems.

[7.3 MS 261102 - Installation of Pre-Purchased Unit Substations](#)

Reference Documents:

- International Commission on Non-Ionizing Radiation Protection (ICNIRP) Guidelines
- NESC, “National Electrical Safety Code”
- Michigan Building Code (MBC)

Architectural Design Requirements:

Separate the room from occupied spaces or provide sound-proofing so the 60 Hz hum is not audible to occupants (sound level of 40dB or less) in adjacent areas, including those rooms above and below the substation room. Sound proofing, if required, shall be solid sheet material. Spray-on and friable sound proofing material is prohibited.

Separate the room and large secondary feeder circuits leaving the room from areas containing computers, computer servers, telecom equipment, electronic instruments and other electronic equipment which could be affected by electromagnetic fields (EMF). University studies have shown that substation transformers and secondary feeder circuits 400 amps and larger can produce EMF of sufficient strength to impact nearby electronic equipment. If applicable, perform a study to determine the effects unit substations may have on adjacent sensitive electronic equipment.

Review locations of unit substations with University of Michigan Occupational Safety & Environmental Health (OSEH).

When the electrical service to the building is a medium voltage, loop style circuit, the substation room shall be design as a transformer vault as required by MBC. Provide fire rated walls and doors, extend the walls from the floor to the deck above. Required fire ratings shall apply to room floors, decks above and associated steel structure. Spray-on and friable fire proofing materials are prohibited.

Wall construction for substation rooms shall be reinforced concrete or CMU block (as a listed assembly). Stud and wallboard construction, expanded metal mesh, woven wire mesh or chain link fence are not acceptable for unit substation rooms.

Provide a minimum of 6 feet clear above the substation primary switches and secondary switchgear. Obtain Design Manager's approval of primary and secondary conduit and cable tray routes and installation details before providing less clear space above this equipment.

Exit doors shall swing outward from the room.

- Exit doors shall be equipped with listed fire exit devices, gaskets and bottom edge door sweeps. Door locks shall be keyed with High Voltage Shop series cores.
- One door shall be large enough for the passage of the largest shipping section of the substation. Typically, this means a minimum 8 foot tall by 7 foot wide double door with a removable mullion.
- Where two or more doors are provided, the other exits may be single doors. These doors should be a minimum 36 inches wide.

If floor drains are provided, slope the floor toward the drain. The floor drain shall be the low point of the floor.

Provide a 4 inch minimum housekeeping pad under each piece of floor-mounted equipment.

- Pads shall conform to the footprint of the equipment and shall be the full width and depth of the equipment, but shall not extend beyond the equipment by more than 4 inches. Pad edges shall be chamfered.
- Pads shall be smooth and level to 1/8 inch per 6-foot distance in any direction. Pads that fail to meet this criteria shall be corrected before installation of the equipment. Correcting deficiencies of an uneven pad by the use of leveling shims is not acceptable.

Provide 2 coats of water-borne epoxy paint over a compatible primer on the concrete floor and exposed portions of housekeeping pads. Provide paint on the walls and ceiling.

Provide a 10 pound Type ABC fire extinguisher at each exit.

Provide an unobstructed route to the building exterior to permit replacement of the largest shipping section of the substation. Entire equipment access pathway, including egress route exterior door, and all intervening doors shall have free and clear area that complies with size requirements for substation room doors listed above. Interior intervening doors/frames and other secondary systems constructed to be easily removable are an acceptable alternative. Design the floor of the entire route for the weight of the largest transformer.

Mechanical Design Requirements

Access to unit substation rooms is limited to authorized personnel, making it difficult for others to perform maintenance inside the room. Avoid locating mechanical equipment including fans and fan coil units inside the room.

Ductwork, piping, clean-outs, and other mechanical system components are not permitted in the room unless they serve the room.

Provide wet sprinklers if the building will be sprinkled.

- Locate the sprinkler heads and route the piping over aisles, not over the electrical equipment.
- Provide wire guards on the sprinkler heads.

Provide a pre-action sprinkler system, in substations rooms serving patient care facilities and the unit substation has been designated as 'essential' by UMHHC.

In below-grade substation rooms only, provide a floor drain at the low point of the room floor. Locate the floor drain in front or behind the middle of the substation and tight to the front or rear wall. Provide a backwater check valve for the floor drain. Locate the check valve outside of the room.

When a floor drain is provided, provide a water leak detector adjacent to the floor drain and tight to the wall so it isn't a trip hazard. The leak detector shall be outside of the working space of the substation. Connect its alarm contact to the nearest Building Automation System DDC panel.

Ventilation systems shall be designed for a year-around set point temperature of 70 degrees F (knowing the summer space temperature will rise to a maximum of 10 degrees F over outside ambient). Provide ventilation to remove equipment heat and maintain equipment within their ambient temperature ratings under all weather and electrical load conditions. Typically, provide supply and exhaust fans with variable speed control to maintain the set point temperature. Avoid supplying unheated outside air directly into the room, which can freeze sprinkler lines. Mix return air with outside air so that tempered air above freezing is discharged into the room.

- Design for a summer design space temperature of 10 degrees F over outside ambient.
- Base cooling load calculations on actual equipment heat rejection data and on the projected peak diversified load.
- Design the supply and exhaust to produce a slightly positive room.
- Filter the supply air to the room. Minimum filter efficiency shall be 65 percent.
- Air condition the room only if the room cannot be ventilated with outside air. If building chilled water is used, verify the chilled water system operates all year long.
- Heating shall be provided to maintain the room temperature to a minimum of 45 degrees F based on minimum substation loading.

Electrical Design Requirements

Do not locate ancillary equipment in the room; including power distribution panels, lighting and receptacle panels, central UPS systems, Building Automation System DDC panels, fire alarm control panels, security panels, or MOSCAD panels.

Do not locate emergency or standby power system equipment, including transfer switches and panels, in the unit substation room. Level 1 Emergency Power Supply System equipment shall not be installed in the same room with the normal power service equipment, per NFPA 110.

Provide a 1/4 inch x 2 inch solid copper ground bus bar on the wall behind each substation. Extend it the full length of the substation and mount it 18 inches AFF. Where not continuous, connect multiple ground bus bars together using #4/0 AWG copper grounding conductors. Do not wrap ground bus bars around the room doors.

- Connect both ends of each substation internal ground bus bar to its room ground bus bar using #4/0 AWG copper grounding conductors embedded in the housekeeping pad and floor. Connect the internal ground bus bars of other equipment to the room ground bus bar in a similar manner.
- For renovation projects only where the floor is not being cut, connect the substation ground bus bar to the room ground bus bar by routing the grounding conductors overhead.
- Connect the room ground bus bar with #4/0 AWG copper grounding conductors to all available grounds including the ground grid, concrete-encased foundation rebar, building steel, incoming water services, duct bank ground conductors, lightning protection ground rods, and the ground bus bars in other electrical rooms in the building. Grounding conductor to telecommunications main grounding bar shall be sized per DG 5.4.

Terminate the incoming primary duct bank with end bells that are embedded in and flush with the inside of the room wall, and as high off of the floor as possible. Slope the duct bank away from the room. If a duct bank must enter the room from below floor level, stub it up along the inside of the wall. Obtain permission through the UPE Primary Systems Engineer before stubbing ducts up into the bottoms of the primary loop switches.

Provide 36 inch wide aluminum ladder-type cable tray with 36 inch minimum radius fittings to route the primary cables up the wall and across the ceiling of the room. Locate the tray 3 feet minimum above the primary switches, but low enough to provide 24" clear above the tray to accommodate cable pulling. Provide cable tray roll-outs where the cables drop down into the primary loop switches.

Provide switched LED lighting in front of and behind each substation, and in front of other electrical equipment. Connect this lighting to emergency power. Provide a battery-backed lighting fixture or an emergency lighting battery pack in front and behind each substation. If emergency power is not available, provide battery-backed lighting fixtures or battery packs throughout the room.

Provide exit signs above the exit doors.

Provide warning signs outside of exit doors "DANGER - HIGH VOLTAGE - KEEP OUT" prior to energizing substations. UPE will furnish and install permanent warning signs at completion of construction.

Provide duplex receptacles and connect them to standby power.

Provide two hard-wired IT data connections to each substation.

To protect unit substation equipment from water damage by activation of the fire protection sprinkler system, provide fire alarm system, multi-sensor, smoke/heat detectors to give an early warning of a possible fire. Also provide one combination audible/visual appliance. Fire alarm system devices shall be installed in accordance with Specifications 283100, Fire Detection and Alarm System and/or 283102, Fire Detection and Alarm System (Hospital Projects).

Provide full size copies of the building's One Line Diagrams and Riser Diagrams on the wall in front of the unit substation. Drawings shall be minimum 24"x36", installed in wooden frames and protected by glass.

DESIGN GUIDELINE 5.8

PERSONAL ROOMS

General

During the programming phase for each new building or major renovation project, perform an assessment of the necessity of providing personal rooms for lactation, health needs and other special personal uses requiring privacy.

Consider the following:

- Projected staff, faculty, and student needs.
- Proximity and suitability of existing accommodations in adjacent buildings.
- If a single room is designated to meet multiple needs (lactation, health, meditation, etc.) consider compatibility of proposed uses.

Personal rooms are strongly encouraged in each building. If included in the project, locate personal rooms in a space that is not a restroom and is accessible to all building occupants. Space can be shared with other compatible program elements. Review access provisions and security requirements with Design Manager.

Minimum Standards for Personal Rooms

Personal rooms included in the project shall meet the following minimum standards:

- Door which can be locked from the inside and includes occupancy indicator. In collaboration with the Design Manager and user, review the specific operation of the lockset, including consideration if it should revert to locked or unlocked state if the latch is retracted.
- If room contains windows, provide blinds, shades or other accommodations to prohibit views into the room.
- Electrical outlets.
- Acceptable environmental requirements (heating, cooling, lighting, etc.) equivalent to what is provided in other occupied areas of the building.
- Size room to accommodate at least a comfortable chair and table (to be provided by client). Alternatively, provide a shelf, minimum 12" deep, in lieu of the table.
- Access to a clean sink. If a sink is not provided in the room, a clean sink should be available nearby.

Optional Features

Review the following optional additional amenities with the Design Manager:

- Sink.
- Additional electrical outlets and space to accommodate the following Owner provided equipment:
 - Small refrigerator
 - Microwave for sterilizing equipment
 - Electric breast pump.

- Telephone and data jacks.
- Signage which includes a sign-up schedule for the room.
- Electronic access control - keypad stand-alone battery operated unit or card reader connected to central access control system.

DESIGN GUIDELINE 5.9 **TUNNELS**

Scope

The University of Michigan central campus has an extensive array of tunnels used for distribution of utilities, primarily from the Central Power Plant. This section identifies key design considerations for tunnel related projects.

U-M Standard Details:

[Tunnel Toolkit](#)

U-M Utilities Tunnel Access/Use Protocol

General

All work in or near tunnels must be coordinated with the Utilities and Plant Engineering (UPE) – Tunnels Department, in conjunction with the U-M Project Manager.

All tunnel related projects shall be designed with long-term serviceability and maintainability in mind.

Phasing and sequencing is a primary consideration for virtually all tunnel projects, due to the fact that systems operate year-round and disruption to utilities directly impacts U-M's core mission. Proposed design alternatives should consider phasing and sequencing to minimize near and long-term interruption of utilities. Construction documents must clearly define phasing and sequencing requirements. Designs must incorporate all necessary work (valves etc.) to achieve this requirement.

Tunnel Types

Standard Utility Tunnel: Most of the tunnel system consists of racked utility piping on one side and a walkway on the other. Some include piping on both sides. Construction of existing tunnels includes poured concrete, pre-cast concrete, and brick. Typical dimensions are approximately 7 feet wide x 7 feet high, although size must be assessed on a project specific basis. Tunnel should be walkable, and allow for removal and replacement of valves, expansion joints etc. Tunnels are accessed through buildings or through sidewalk hatches.

Utility Tunnels Running Through Buildings: While most of the utility tunnel system is “outside”, i.e., beyond the footprint of buildings, tunnel services continue through several buildings on campus. Special care is required in designing and installing these projects to ensure tunnel security is maintained, and to ensure piping is properly designed. Minimal connections should be made to the Utility main, typically one branch line per service for each building.

Box trench: Where cost of a standard tunnel cannot be justified, box trenches, and crawl trenches are occasionally used. Access and maintainability must be considered. Use of a box trench system for utility piping must be approved by UPE.

Direct Buried Piping Conduit Systems: Direct buried piping is used in some locations for utility piping. Use of a conduit system for utility piping must be approved by UPE.

Building (non-utility) Tunnel: Some buildings contain “non-utility” tunnels that fall within the footprint of a building and serve only the building it is under. Building tunnels should be treated the same as building mechanical rooms, and don’t typically require coordination with the UPE-Tunnels department.

Tunnel Piping Utilities

The tunnel system was designed for the following piping utilities that emanate from the Central Power Plant: Low Pressure Steam, High Pressure Steam, Steam Condensate, Domestic Hot Water, Domestic Hot Water Return and Compressed Air. These utility systems are operated and maintained by the UPE – Tunnels department. The utility properties guaranteed at the the point the utility enters the building are defined in U-M Design Guideline 4.6 Utilities for University Buildings. Most pipe materials and design considerations for these utilities are described in referenced U-M Design Guidelines and Master Specifications listed above. Additional considerations within the tunnel system are noted below:

- While normally saturated, due to the fact that both the HPS and LPS are a byproduct of the co-generation steam turbines, these systems experience occasional temperature excursions. Temperature of the steam can reach 450F if the desuperheater fails. As such, all HPS and LPS piping in the tunnels shall be designed for expansion associated with an excursion temperature of 450F with duration of not more than one hour and not more than 80 hours per year. Cast iron, malleable iron, brass and bronze components are prohibited.

- Low Pressure Steam (LPS) –
 - LPS shall be designed for a Design Pressure of 15 psig. Operating pressure varies from roughly 6 psig to 12 psig depending on overall system load and location within the tunnel systems. U-M Utilities guarantees 6 psig operating pressure at building entrance.
 - U-M maintains a flow model for the LPS distribution, and as such, generally defines required pipe sizes for LPS piping in the tunnels.
 - Use stainless steel inverted bucket traps on LPS. Do not connect LPC from traps directly to the tunnel LPC system. Use condensate return unit to pump into the LPC main.
 - All LPS valves 2-1/2 " and larger shall be metal-to-metal seated butterfly valves.
- High Pressure Steam (HPS) – Design pressure of 80 psig.
 - Pressure Reducing Valves are used in some locations from the HPS system to the LPS system, for back-up and pressure maintenance during peak conditions. PRVs should be provided for critical buildings such as hospital, medical clinics, research labs, special use facilities and large scale housing. For buildings that do not fit these criteria, a business case may be made to Utilities by the building occupants for a PRV backup. For establishing the capacity of the PRV backup, 60% of total connected load is recommended. Associated relief valves should be routed to a safe location outside the tunnel. Where no safe location is available outside the tunnel, a code compliant tandem PRV station may be provided.
 - Use stainless steel inverted bucket traps on HPS. Do not connect HPC from traps directly to the tunnel LPC system. Use an LPS flash tank and condensate return unit to pump into the LPC main.
 - All HPS valves 2-1/2 " and larger shall be metal-to-metal seated butterfly valves.
- Steam Condensate Return (LPC)
 - The steam condensate is typically metered at individual buildings, and pumped into the LPC. While the system is under some backpressure at certain points, it is generally considered to be a low-pressure gravity return system. Do not directly connect LPC from building loads or drip and traps to LPC main. Use an LPS condensate return unit.
 - Drip and traps from HPS should not be routed directly to the LPC. Use flash tank and pumped condensate return unit.
 - Condensate return units (CRUs). A combination of electric and air pressure powered CRUs are used in the tunnels.
- (Domestic) Hot Water (HW) and Hot Water Return (HWR) - Design pressure 80 psig
 - Existing piping is primarily Type-L grooved copper piping using Victaulic fittings and peroxide-cured EPDM gaskets. U-M has an ongoing program to replace remaining steel piping with copper. Unless directed otherwise, use grooved copper piping for all HW and HWR in tunnels.
 - U-M has experienced numerous problems with expansion joints in HW and HWR systems. Refer to U-M Master Specification 220516 – Pipe Expansion Joints for current specification requirements.

- All flexible connectors on HW and HWR shall be of all stainless steel construction. Valves on HW and HWR shall be constructed of 316 stainless steel.
- All new buildings are required to have their own internal HWR system, typically with a small shell and tube heat exchanger and pump to reheat the HWR back to 120F. New building HWR connections to the tunnel are prohibited. For existing building connections, where practical, connections to the tunnel HWR system should be eliminated, and replaced with an internal return system. HWR system within the tunnel is designed only to keep HW within the tunnel within acceptable limits (roughly 120-125F)
- Compressed Air (CA) - operating at 90-100 psig (refer to DG 4.6 for clarification)
 - For building take-off, include two check valves installed in series to protect tunnel piping from possible contamination, and to protect the building compressed air loads from sudden loss of pressure if compressed air is turned off.

Other Piping Considerations

Piping Expansion and Stress Analysis:

For new connections to tunnel piping, analyze piping expansion and stress, and anchoring forces up to and including first anchor on either side of new connection. Provide pipe stress calculations to prove new and existing piping is not overstressed.

Three Valve Arrangements for Building Take-Offs:

In general, branch take-offs for individual buildings should include a three valve arrangement, to allow the building to be fed from either direction in the utility loop. Refer to Tunnel Toolkit for details.

B31 Requirements:

Refer to Master Specification Sections 221113 – Piping Materials & Methods and 232216 – Steam & Condensate Piping Specialties for welding requirements on utility piping.

Insulation:

Aluminum jacketing is required on all insulated LPS, LPC and HPS piping in tunnels. Refer to Master Specification Section 220719 - Mechanical Systems Insulation for materials and required thickness.

Other Piping and Utilities in Tunnels

Chilled Water (CHW):

Chilled water is not generally distributed via the tunnel system, although CHW piping is routed between buildings, through the tunnels in several areas. If routing of CHW through tunnels is approved by Utilities, additional insulation will be required.

Fire Protection Water:

In some locations, fire protection piping may be routed through the tunnels, especially where a fire pump is shared between buildings.

City Water, Sanitary, and Storm:

Beyond the building footprint, these services are generally owned and maintained by the City of Ann Arbor, and should not be routed through the tunnels without approval by the City and UPE-Tunnels. Coordinate modifications to these services with the City of Ann Arbor through U-M University Planners Office, U-M AEC Civil department and U-M Project Manager.

Architectural and Structural Requirements and Considerations

Load bearing capacity:

Tunnels shall be designed for H-20 (Highway) loading. In general, wall and roof sections should be a minimum of 8” thick reinforced concrete. Some older sections of the tunnel system do not meet this loading requirement and may need shoring where heavy loads must cross the tunnel. Confirm structural design requirements with U-M Project Manager.

Vaults:

Vaults are required in many areas at key junctions in the tunnel piping. Vault shall be designed to accommodate installation and maintenance of intersecting pipes, including flash tanks, condensate return units, etc. Provide a sump and simplex, high temperature sump pump at low point of each vault, discharging to sanitary.

Waterproofing:

Top and sides of tunnels should include waterproofing, typically membrane type. Coordinate with U-M Design Manager for waterproofing requirements.

Separation between Buildings and Tunnels:

Appropriate separation is required between buildings and tunnels. At a minimum, a lockable door is required at the tunnel (using U-M standard core). Fire rated separation is not typically required. Confirm separation requirements with U-M Project Manager.

Hatches:

Hatches are often required to maintain reasonable access to sections of the tunnel system. Location of hatches must be carefully coordinated with U-M project coordinator and UPE-Tunnels. In general, hatches must be designed to allow installation of 20 foot long pipe sections. All sidewalk or grade level exits will be equipped with a crash bar type opening mechanism and sufficient lifting assistance mechanisms to allow a worker in a diminished physical state to fully open the hatch with one hand. Include steel ladder at each hatch. Refer to Tunnel Toolkit detail.

General Requirements and Design Considerations

Coordination with City of Ann Arbor:

Work on tunnels is often affected by City of Ann Arbor requirements associated with right of ways, street closings and paving, etc. Review proposed concepts and issues with the City of Ann Arbor in early stages of design. Coordinate all contact with the City through the U-M University Planners Office, U-M AEC Civil department and U-M Project Manager.

Coordination with U-M University Planners Office, U-M AEC Civil department:

Coordinate soil erosion control, tree protection, and staging through the U-M University

Planners Office, U-M AEC Civil department and U-M OSEH department, in conjunction with the U-M Project Manager.

Tunnel Access and Confined Space:

The Tunnel Access/Use Protocols and Work Rules must be read and the Acknowledgment Form signed and returned to the Tunnel Supervisor prior to any personnel accessing the Tunnels. In addition, portions of the tunnel system are considered “confined space”, and are therefore subject to associated U-M OSEH requirements.

Field Surveys:

Design must be based on actual field surveyed conditions. U-M has extensive records on modifications made in the tunnels. However, design must be validated by field inspection prior to release of construction documents.

Mechanical Requirements and Considerations

Ventilation:

Provide thermostatically controlled ventilation on all tunnel projects. Confirm ventilation needs with U-M Design Manager and Utilities. Tunnels are ventilated primarily with outside air, through the use of supply and/or exhaust fans. Kiosks are used extensively to house ventilation intake and relief. In some areas of campus, a more aesthetically sensitive alternative may be necessary. Design ventilation system to maintain no more than 115F, based on entering outside air at 90F.

Water Detection:

U-M is concerned about rapid detection and response to water leaks in the tunnel system, and has installed water sensors at several system low points. Confirm water detection requirements during design. Typically, install a water sensor at low point in any new tunnel section if any point in the new tunnel section is lower than the connection point to the existing tunnel. Water sensors should be connected to the Building Automation System.

Drains:

Tunnel system does not typically include floor drains, footing drains or sumps. However, a sump with a simplex high temperature sump pump should be installed at vaults and building entrances.

Electrical Requirements and Considerations

Lighting:

Lighting shall be designed to maintain a minimum light level of 25 FC at the walk surface. Fixtures shall be 24 watt minimum, compact fluorescent type, with globe glass and guard. Lighting should be controlled by 20 amp manual dial timer (12-hour) located at tunnel entrances, and at intervals of 200 feet.

Electrical Receptacles:

Duplex Receptacles are typically required throughout the tunnel system. Receptacles shall be 20 amp GFCI type with waterproof covers. They shall be installed at each tunnel entrance, and at intervals of 300 feet throughout the tunnel.

Cable Trays:

All tunnels shall include an aluminum ladder-type cable tray for future use for ITCOM, and other services. Tray should be approximately 12" wide x 4" deep, with 9" rung spacing and 12" minimum bending radius, unless project specific requirements are higher. Tray should be located just outside the piping supports, near the ceiling.

Conduit:

Conduit in Utility tunnels, and box trenches shall be fiberglass-reinforced epoxy, or Schedule 80 PVC, with matching fittings. Provide expansion joints every 100 feet and on both sides of every change in direction. In utility tunnels that are completely dry, consult U-M Design Manager as to whether rigid galvanized steel conduit may be specified instead. Building tunnels (non-Utility tunnels) may use EMT conduit.

Fire and Smoke Detection and Alarm:

The Utility Tunnel system does not typically require a fire alarm system or notification appliances.

DESIGN GUIDELINE 5.10 **GENDER INCLUSIVE ROOMS**

Scope

Each new building or major renovation project requires the inclusion of at least one single occupancy gender inclusive restroom, as part of the project. Buildings that contain locker rooms, shower rooms, or other gender specific facilities shall include at least one single occupant, gender inclusive room for each function. Exceptions may be granted by Associate Vice President for Facilities and Operations, only under unusual, well-documented circumstances provided in writing by the unit or division funding the project.

Related Sections

U-M Design Guideline Sections:

[6.0 DG 101400 Signage](#)

[6.0 DG 102800 Toilet Accessories](#)

[8.2 Architectural Preferred Manufacturers List](#)

Design and Installation Requirements

Gender inclusive rooms shall be barrier free and located on a barrier free path of access. Construction documents and room signage shall label them simply by room function (i.e. “Restroom”, “Shower”, etc.).

Restroom: Locate at least one restroom so that it is convenient for the majority of building occupants. Signage shall include room name “Restroom” or "Gender Inclusive Restroom", room number, international symbol of accessibility, and changing table pictogram (if provided).

Locker room: Locate locker room near separate gender locker rooms and with equivalent access to adjoining rooms and facilities. Review quantity needed with Design Manager. Signage shall include room name “Locker Room”, room number, international symbol of accessibility, locker pictogram, and changing table pictogram (if provided).

Shower: Locate shower room near separate gender shower rooms and with equivalent access to adjoining rooms and facilities. Review quantity needed with Design Manager. Signage shall include room name “Shower”, room number, international symbol of accessibility, shower pictogram, and changing table pictogram (if provided).

Provide the following:

- Door with a privacy lock (lockable with thumb turn inside, single function for egress, keyed override, and room occupancy indicator)
- Equivalent amenities to separate gender facilities.
- Restroom:

- Water closet and lavatory as a minimum. Where other restrooms in the building provide showers, changing areas or other amenities, include those as well.
- Applicable restroom accessories. Consider additional accessories such as a baby changing station.

DESIGN GUIDELINE SBA 5.11 **FIRE COMMAND CENTER**

Scope

This design guideline clarifies how certain Michigan Building Code (MBC) requirements for Fire Command Centers are to be applied on University of Michigan projects.

Related Sections

Design Guideline Technical Sections:

[DG101400 – Signage](#)

[DG230900 – Mechanical System Controls](#)

[MS283100 – Fire Detection and Alarm System](#)

References:

NFPA 72, “National Fire Alarm and Signaling Code”

Fire Command Center Room

Locate the Fire Command Center (FCC) on the ground floor and near the building entrance designated for first response by the Division of Public Safety and Security (DPSS) and the Ann Arbor Fire Department. Provide access to the room from the interior of the building. If possible, also provide access directly from the exterior of the building. Provide room dimensions and fire separation as required by the Michigan Building Code.

Using the room to incorporate other building functions such as a reception desk, security office, or DPSS mini-station shall be reviewed with the U-M Fire Marshal and the State of Michigan Bureau of Fire Safety (if applicable). The layout, location and features of the FCC shall be reviewed with the U-M Fire Marshal to obtain approval of the room and the locations of the various control panels to be located in the room.

Connect safety-related equipment, lighting, and duplex receptacles within the room to the building’s emergency power system.

Arrange for the Key Office to key the interior door lock for a special machine room series key. Arrange for the building’s Facilities Manager to receive a copy of this special machine room series key. This will enable the DPSS and Plant Operations Shop personnel with machine room master key as well as the Facilities Manager to have immediate access to the room.

If there is an exterior door into the FCC, equip it with a card reader. Arrange for the Key Office to key the exterior door lock for a restricted access series key.

Provide signage at each door with “Fire Command Center” in 1” high, bold red letters. Provide an additional ceiling or wall mounted sign above the door that is clearly visible from the exterior entrance when the FCC is not directly adjacent to the entrance.

Provide a control switch for simultaneously unlocking stairway doors. The control switch shall not unlock exit discharge doors to the outside that are locked by the card access control system.

Provide as-built building floor plans marked by the Architect to indicate the code-required building features. Provide a drawing hanging flat file stand on wheels with a minimum of eight clamp-type drawing sticks.

Provide a Building Information Card containing all the information required by the MBC.

Fire Alarm Control Unit

Locate the fire alarm control unit (FACU) in the FCC. Specify the following FACU features in accordance with NFPA 72 and Specification MS283100:

- An emergency voice/alarm communication system control unit. If the fire alarm system includes building-wide mass notification, also specify pushbuttons capable of initiating the mass notification tones and alert messages.
- A fire department two-way communications system including six pluggable portable handsets, except if the building contains Emergency Responder Radio Coverage (ERRC), do not specify a fire department two-way communications system.
- The FACU’s digital annunciator shall display the status of sprinkler valves and waterflow detectors.
- The FACU’s digital annunciator shall display the status of the fire pump.
- If the building contains ERRC, the FACU's digital annunciator shall display the status of the ERRC.
- The FACU’s digital annunciator shall store and display several hundred past events. No printer is required.

Generator Supervision Requirements

Provide a generator remote annunciator panel and a generator manual start and transfer panel. The generator manual start and transfer panel may be manufactured by the automatic transfer switch (ATS) vendor or field fabricated, and shall include the following:

- A green “normal power” and a red “generator power” indicating light for each emergency and standby power ATS to indicate the position of the ATS. Label each pair of lights to indicate the generator and ATS equipment numbers and whether the loads connected to the ATS are emergency or standby.
- One Plexiglas guarded, two position, maintained contact, non-keyed “AUTO-RUN” selector switch to manually start all generators and enable all ATSs to transfer.
 - The selector switch shall have one Form-C maintained contact for each ATS (except do not provide a contact for a fire pump ATS that is integral to the fire pump controller).

- Provide control wiring from each switch contact to its ATS.
- In the “AUTO” position, each switch contact shall place its associated ATS in normal stand-by mode.
- In the “RUN” position, each switch contact shall simulate a loss of normal power to its ATS. This shall cause each ATS to start its generator and then transfer to generator power when its generator reaches proper voltage and frequency. However, if the building has multiple generators and paralleling switchgear, the generators shall start but the ATSS shall not transfer until normal power is lost.
- A nameplate identifying the panel as “Generator Manual Start and Transfer”.

Fire Fighter’s Smoke Control Panel

Include in the design documents, a diagram of the fire fighters smoke control panel face. This diagram shall include:

- Schematic diagram of the smoke control system showing all related exhaust fans, air handlers, dampers, actuated doors, etc. with graphical indication of the building area served by each smoke control component. Example: indicate which stair a stairwell pressurization fan serves.
- A legend for the various components on the panel face diagram.
- Labeling required for each component, e.g. SEF-1, West Fire Shutter, etc.
- Location of all switches on the panel face and required labeling, e.g. "OFF-AUTO-ON".
- Location and color of all indicator lights.
- A simplified sequence of operation for the smoke control system(s).
- A clear indication of the direction of airflow.
- The relationship of components relative to one another.

Air Distribution Supervision Requirements (Equipment not associated with smoke control)

To meet the MBC requirements for “Status indicators and controls for air distribution systems” in the FCC, provide the following as a separate DDC building automation system panel:

- Provide a separate air distribution system status panel that shows graphically the location and operating condition of the major air handlers serving the building (not associated with building smoke control). Show the air handler status with two indicating lights - Red and Green.
 1. Air handler is off - the status red light is on.
 2. Air handler is on - the status green light is on.
- Label the air handlers, and depict graphically the area served.
- Provide "OFF-AUTO" switches to turn the air handlers off.

Small air handling equipment such as that serving substation and emergency generator rooms, fan coils, toilet exhaust fans, etc., typically are not required to be included on the status panel. The building automation system will provide the signaling necessary to control the air distribution supervision status lights and switches. The air distribution supervision status panel should be shown as part of the control drawings.

DESIGN GUIDELINE 5.12 **LAB DESIGN AND SAFETY**

Scope

Lab Design and Safety addresses safety related design considerations for layout and space separation, security, chemical use, safety equipment / supplies, and utilities. Guideline is applicable to both teaching and research laboratories. The intent of this guideline is to illustrate some basic health and safety elements that will contribute to providing a safe environment for researchers to conduct their work. Secondary intent is to allow flexibility for continued safe use as research changes and evolves.

Research takes many forms and involves different risks. The scope of this document is not intended to be comprehensive. It is expected that this document will serve as a springboard for project team discussions that seek to anticipate and evaluate health and safety hazards of planned research. Use this information to design research space in a way that minimizes hazards and facilitates consistent compliance with operational safety requirements. Safety discussions during the design process will contribute to a user education and a culture of safety.

MIOSHA

National Institutes of Health Design Requirements Manual for Biomedical Laboratories and

NFPA 45 Standard On Fire Protection For Laboratories Using Chemicals

"Safe Handling of Radioactive Materials", National Council on Radiation Protection (NBS Handbook 92)

Definitions:

- **Laboratories:** A room equipped for scientific experiments, research, or teaching, or for the production of drugs, chemicals, or other research materials. This includes both wet and dry lab space as well as lab support.
- **Non-lab areas:** Rooms and areas used for research data analysis, documentation, and discussion in which physical research materials are not used or stored. These typically include offices, researcher desks, meeting rooms, break rooms, etc.
- **PPE:** Personal Protective Equipment, requirements are based on specific research hazards.

Laboratory design requirements:

Layout and space separation:

- Provide physical separation between lab areas and non lab areas.
 - Individuals in a laboratory must wear appropriate attire and PPE. Physical separation of allows researchers to remove PPE while in non-lab areas.
 - It is prohibited to store or consume food/drink, apply make-up, or chew gum within laboratories. This includes desk areas in an open lab. Physical separation of desks from the lab allows for food/drink consumption.
 - Physical separation consists of a partition, floor to ceiling with doors and closers. If a visual connection is desired for safety or operations: consider glass partitions, borrowed lites etc.
 - Some laboratory areas may need to be separated from other research activities depending on research activities.

Access, security, and egress:

- Evaluate security level required for each lab space with user groups. Coordinate with Design Manager.
 - Consider levels of security from public to private. Sequence security from public corridor (low level security), to researcher work space (mid-level security), to lab enclosure (higher security).
- Arrange circulation to allow access to and egress from non-lab areas without going through lab areas.
 - This minimizes lab access and need for PPE.
- Arrange egress pathways to progress from higher hazard to lower hazard areas. Consider placement of fume hoods, equipment, furnishings, and cart storage when laying out egress pathways.

Safety equipment and supplies:

- Provide wall space on corridor side adjacent to lab entry doors for posting laboratory safety signage.
- Provide lab space for a safety station at main entry. Contents of safety station will vary but minimally includes PPE, spill kit, and first aid kit. Provide consistent

location in each lab to encourage researcher use and facilitate safe emergency response.

- In each lab room (separated by a door) that utilizes animals or chemical, biological, or radiological materials, provide hand wash sink with space for adjacent soap and paper towel dispensers.
 - It is important that hands are washed when leaving a laboratory to avoid spreading contaminants. Consider locating sink near egress point.
- Provide emergency shower and eyewash stations as required by MIOSHA regulations and letters of interpretation. Review optional related provisions with user and Design Manager including shower curtains, floor drains, and flow alarms.
- Provide wall phone or emergency hands free phone in each lab or lab suite, to accommodate emergency call. Relying on cell phones is not acceptable.

Chemical use, storage, and disposal:

- Obtain chemical types, concentrations, quantities, and storage needs for each laboratory space early in design phase to inform building planning and related requirements. Coordinate with Design Manager.
- Provide adequate chemical storage that physically separates incompatible chemicals/gases. Do not locate chemical storage shelves above sinks. Do not locate toxic or corrosive liquid storage above bench top.
- Provide adequate space and related provisions for waste materials / containers expected. Consider related safety requirements such as shielding, security, flammability, and separation of incompatible waste materials.
 - Chemical, biological, and radiological wastes are required to be stored in the lab in which they are generated, not in centralized accumulation areas. They are periodically collected and sent to a disposal/ recycling center.
- Although chemical hygiene plans prohibit dumping chemicals into the drain, provide a chemical resistant lab waste system connected to lab sinks, fume hood cup sinks, and similar plumbing fixtures in labs using chemicals.
 - The intent is to prevent damage to piping from spills or accidental discharges.
 - The lab waste system shall normally combine with sanitary waste near the point where sanitary waste exits the building.
- For laboratories using compressed gases provide designated areas for cylinders in use and associated restraints. Separate incompatible gasses and provide ventilated cabinets as required by code.
 - Review delivery, staging for spare / used cylinders, and pick-up requirements with researcher, building manager, and Design Manager to ensure that adequate routes and spaces are provided.

Utilities:

- Control lighting with occupancy or vacancy sensors wherever possible, but provide manual switches in areas where the sudden loss of light could be hazardous. Utilize lighting control occupancy sensors to control lab ventilation to conserve energy where approved by OSEH.

- Provide duplex receptacles adjacent to doors in labs and lab support areas for housekeeping. Connect to normal power circuits separate from lab receptacles. Multiple housekeeping receptacles may be on the same circuit. Label as "housekeeping".
- Provide sufficient fire alarm speakers to ensure sound detection when equipment and fume hoods are operating. Design fire alarm strobe light locations and intensities to ensure strobe detection despite visual obstructions such as island benches and suspended lab storage and services.

Renovation of existing laboratories:

For renovation of labs the Design Professional should evaluate if any items of Lab Safety Design Guideline can be incorporated.

Laboratory renovation projects face multiple challenges related to the limitations of existing space and infrastructure, as well as established practices of the building occupants. Physical limitations may dictate the extent to which this guideline is followed. It is expected that the AE, in conjunction with OSEH and the Design Manager will lead discussions, with the user, related the safety and operational impacts of design decisions. At minimum, the following topics should be addressed and documented as a part of the OPR/BOD:

- Relationship between areas for lab and non-lab activities
- Lab access, egress, and security
- Hazardous material use, storage, and disposal
- Safety equipment and supplies
- Compromises in designed functions and features due to existing condition limitations.
- Risks associated with dependence on existing reused systems and utilities

Separation between lab and non lab spaces will affect operational uses. Design Manager shall facilitate discussion between Design Professional, OSEH and users to develop a design that meets the goals of the users and the safety requirements of OSEH. Level of separation required may differ based on lab function.

5.13: MM HEALTHCARE PROCEDURE ROOM INFECTION CONTROL TYPES AND REQUIREMENTS

General

This Special Building Area (SBA) guideline applies to new procedure rooms within Michigan Medicine (MM) inpatient and outpatient facilities, owned or leased. This SBA applies to clinical areas where invasive to minimally invasive procedures are performed.

The definition for, and the use and understanding of, the various procedure rooms names used within a healthcare setting (i.e. "Operating Room", "Procedure Room", "Treatment Room", etc) varies greatly amongst healthcare codes, industry standards, design professionals, and UMH healthcare staff. Therefore, the room types noted below and throughout the document were developed by MM to better clarify the needs and requirements of the various procedure rooms.

This SBA was therefore created to establish a universal understanding amongst our design professionals, construction coordinators and staff, clinicians, infection control, and maintenance on how these spaces should be designed and operated. The information expressed in this SBA is meant to standardize the design and performance of procedure room types and requirements across the MM campuses and is based on close coordination with the State of Michigan Department of Community Health and the MM Infection Control and Epidemiology Department (ICE), along with industry-wide best practices. Where the information in this SBA seems to exceed that of regulating healthcare codes, the AE shall nevertheless utilize the information expressed here in this SBA. Where the information in this SBA would serve to conflict or be in direct violation of regulating healthcare codes, the A/E shall bring this to the attention of the University Project Manager. At no time shall governing healthcare codes be violated.

The use and application of these procedure room types is governed by MM Infection Control and Epidemiology (ICE) in conjunction with the MI Health Facilities Engineering Section (HFES). All determinations on room types, and the procedures performed within, shall be made by MM ICE and MI HFES. MM Infection Control and Epidemiology shall be the authority on room type classifications for specific procedures.

Please refer to SBA 5.16 "MM Requirements for Critical Pressure Sensitive Rooms" for information on detailing and other requirement where air pressure is critical.

MM Definitions:

Semi-Restricted Corridor/Rooms: The corridor area within the "Red Line" where proper attire is required, including scrubs or protective coveralls ("Bunny Suit") and hair coverings.

Restricted Corridors/Rooms: The sterile core or other restricted areas where proper attire is required, with the possible addition of a surgical face mask as directed by Infection Control.

Operating Room: A room licensed by the state as an Operating Room. (Infection Control "IC" Room Type 1 room as noted below)

Treatment, Procedure Rooms: General clinical room names used to describe clinical rooms where various surgical and non-surgical "procedures" are performed, varying in invasiveness from an Operating Room to an Exam Room. The goal of this document is to clarify these room names by the use of the IC Room Types 1 through 7.

Clear Area (Clear Square Footage): All room areas are to be calculated based on the actual clear floor area, excluding any built in cabinetry, boxed out low wall air returns, columns and the like.

Equipment List: A list of all equipment for a room or space, provided by MM Facilities Planning and Development (FPD) Capital Equipment Planner.

Equipment Plan: A scaled 2-D or 3-D architectural plan which shows all “equipment”, furniture, built-ins and other items graphically within a room or space. These may include floor plans, reflected ceiling plans, and interior elevations, and are prepared by the A/E. “Equipment” here includes all items located in the room, as noted on the Capital Equipment “Equipment List”, Contractor installed equipment and infrastructure items, times provided by Interior Design, Medical Center Information Technology (MCIT) supplied equipment, and/or re-use items.

Equipment Plan and Room Size:

The size of each room type listed below is the minimum per code. In many cases, however the Equipment Plan will dictate that the room needs to be larger than the code minimum based on the equipment to be used within the room and staff movement paths.

For example, a room required to be 400 clear square feet might have overall dimensions within the interior walls of 24' x 24' (576 SF) within the walls if 2' of built-ins, air returns and equipment around the perimeter are required. Additional equipment and staff movement paths may dictate the room be even larger.

Prior to finalizing room size, the A/E shall create Equipment Plans, including all fixed and movable equipment and furnishings to be used in the room for the specific cases expected in the room. If multiple procedures or equipment layouts are expected, each case should be laid out individually. Any equipment to be stored in the room when not in use for a particular case shall be accounted for. The Equipment Plan must include patient and staff locations, and include adequate circulation space (min. 30”) for staff to circulate fully around the perimeter of the room, and through the doors to the room, during the case. A Reflected Ceiling Plan should be created where ceiling mounted equipment are planned. Particular attention should be made to all boom and lighting layouts, and the “Sterile Field” created with the air supply. If a sterile field is to be created, it should be superimposed on the Equipment Plan. In all layouts, the location of the patient must be within the sterile field.

In addition to Equipment Plans, the cases should be mocked up with the actual equipment. The Equipment Plans shall be reviewed and approved by the Clinical department, ICE, and FPD.

Classification of Infection Control Room Types

In an effort to clarify the various types of surgical and procedure rooms and the procedures performed in each, UMH standardizes on (7) seven infection control room types for these spaces. These room types are defined in Table 1 below. MM Infection Control and Epidemiology Department shall maintain a separate list of procedures for each room type.

TABLE 1

Infection Control Room Type	Surgical Procedure/ Invasiveness	Common Terminology (1)
1	Invasive, major surgical procedures, above or below fascia, may involve bone or implants	Licensed Operating Room (OR)/ ASHRAE Class C Surgery/C-Section
2	Invasive, minor surgical procedure, minimally invasive- below fascia, may involve bone or implants	Procedure Room/ Minor Surgical Procedure Room/ ASHRAE Class C Surgery
3	Cardiac Catheterization, Angiography and Interventional Radiology	Procedure Room/ Angiography/ ASHRAE Class B Surgery
4	Minimally invasive- above fascia only	Treatment Room/ ASHRAE Class A Surgery
5	Endoscopic, non-invasive	General Endoscopy/ ASHRAE D&T
6	Bronchoscopy	Bronchoscopy/ ASHRAE D&T
7	Needle guided procedure	Exam Room/ ASHRAE D&T
8	Minimally invasive- above fascia only	Exam Room/ASHRAE D&T

(1) Terminology per HFES Minimum Design Standards for Healthcare Facilities in Michigan, AIA Guidelines and/or ASHRAE Standards.

The A/E shall clearly indicate the Room Name & Room Type (i.e. Procedure Room- IC Type 3) on the preliminary and final construction contract documents, and in the Operational Narrative.

IC (Infection Control) Room Types

The A/E shall ensure that all rooms identified under this SBA shall conform to the criteria stated under Table 2 "Architectural", Table 3 "Electrical" and Table 4 "Mechanical" at the end of this document.

IC Room Type 1 and IC Room Type 2:

Architectural

Due to the need to maintain space pressurization control, the A/E shall give special attention to providing a sealed space envelope; including extending all walls to the structure above and sealing all floor, wall and ceiling penetrations (i.e. light switch back boxes, conduit and pipe penetrations, etc) as well as the intersection of the wall and underside of the structure above.

In an effort to maintain a sealed, pressurized room envelope, the A/E shall limit the infrastructure (i.e. ductwork, piping, conduit, etc) passing over an IC Type 1 or 2 room to only that which serves the space. All items requiring regular maintenance (i.e. terminal air boxes, etc.) or accessibility (i.e. valves, etc.) shall be located outside of the room envelope so as to preclude the need to access such devices from within the space.

The stretcher access doors shall be automated with touch-less hand actuated sensors. The width will be determined by clinical needs and site conditions; a typical room might have a pair of doors totaling 6 feet wide. A wall mounted shut-off switch for these doors will be located on the room side to prevent accidental usage during a procedure. Where possible, a bi-directional "man-door" should be used for staff traffic. Push paddle hands-free type hardware should be used so that it is possible to enter the room without using hands or arms. All doors shall have closers. The door material should be carefully considered for durability, for example fiberglass rather than painted hollow metal, and door frame protection should also be installed.

Provide properly sized and placed access hatches to allow for maintenance and related activities associated with any equipment placed, or may be placed, above the ceiling. Properly sized meaning they are big enough for a normally sized person, to access and maintain the equipment easily and safety. Where shoulder clearance is required, access hatches shall be a minimum of 24" x 24".

The Architect shall provide carefully and completely laid out reflected ceiling plan showing all diffusers, lights, surgical column supports, fire suppression sprinklers, smoke detectors, access hatches, A/V equipment, and any other equipment to insure coordination and utility of the design. Also, provide cross-section of above ceiling space, sufficiently detailed to insure proper space and accessibility for all installed systems is available above the ceiling. The ceilings will consist of a gasketed accessible ceiling system. The ceiling tiles shall have a washable surface and must stay in place during the washing process. Tile clips will only be allowed where tiles are less than 2 square feet in size or as directed otherwise by the Design Manager.

All room finishes will be selected by MM FPD, Interior Design, in consultation with IC and other MM staff. Monolithic, non-porous wall surfaces, such as PVC or FRP are preferred. Flooring material and base material shall be terrazzo.

Colors of ceilings, walls and floors shall be selected with consideration of their effects on the lighting levels in the room in all room types. Reflectance levels of less than 80% for ceilings, 50% for walls and 20% for floors shall be allowed for in the lighting design.

Flooring patterns may be desired to indicate the sterile field. If provided, construction documents must indicate that floor patterns match the extent exactly. Floor patterns may be desired to indicate other operational or equipment limits, such as gauss lines.

Mechanical

Rooms shall be served by a dedicated HVAC control zone to actively maintain the room's thermal comfort and pressurization (typically either a dedicated AHU or supply and return terminal airflow control boxes in conjunction with a reheat coil). System shall be controlled to maintain room temperature and balanced to maintain room pressurization, as measured via a differential pressure monitor across the main doorway from the clean corridor. Dynamic pressure control is neither required nor desired. Return airflow shall be

controlled to maintain the active measured supply airflow minus a fixed airflow offset setpoint (initially assume an offset of 300-500 CFM, depending on number & size of doorways into space). Airflow offset shall be determined by test & balance contractor, as required to maintain a room pressurization of 0.04"-0.06"wc.

See Table 4 for mechanical requirements for these spaces.

Space temperature and humidity sensors shall be mounted in the common return air main from the room. DDC shall monitor the door status (ie open/ closed) of all doors into the space. Provide a wall mounted human machine interface (HMI) panel within the room that displays room temperature, temperature setpoint, humidity, occupied/ unoccupied mode, space pressurization, door status and airchange rate. All points shall also be integrated into the BMS frontend. Panel shall allow the users to adjust temperature within the room. Panel shall provide local indication if room humidity, air change rate, or pressurization are outside of acceptable limits. Protect wall-mounted panel with a stainless steel "crash-guard" where applicable. HMI shall provide the following local status/ alarms to surgical staff:

Criteria	Normal (Blue)	Alarm (Red)
Room Humidity	60%RH- 20%RH	>60%RH or <20%RH
Airchange Rate	≥15 ACH	<15 ACH
Room Pressurization (1)	≥0.01" wc	<0.010" wc for ≥ 15 min
Temperature	NA	NA
Occupancy Status	Occupied	Unoccupied
Door Status	Closed	Open

(1) Room pressurization alarms to the BMS frontend shall be disabled when door status is open.

Additional front-end alarms may be required, contact UMH project engineer for standard sequence of operation for OR HVAC systems.

A/E shall clearly state the room pressurization requirement (i.e. goal is 0.04"-0.06"wc) on the design drawings and indicate a means of achieving pressurization (i.e. throttle return/ exhaust airflow).

Rooms shall include controls to automatically reduce ventilation during unoccupied periods for energy conservation. This control system shall include at least two ceiling or wall mounted dual technology (passive infrared plus microphonic sensing) occupancy sensors per room, selected for full room sensing coverage, to automatically determine room occupancy. All room sensors must simultaneously detect unoccupied conditions for a period of not less than 30 minutes in order to enable unoccupied mode operation. The system must be designed such that a failure at any level (i.e. loss of power to sensor, cut or disconnected communication wire, etc.) will cause the system to assume occupancy and operate in an occupied mode. During unoccupied mode operation, airflow shall be controlled down to the minimum level necessary to maintain required room pressurization, and to maintain the room temperature setpoint.

MM preference is to provide humidity control in each room via a central AHU humidifier (set to maintain a discharge air humidity level) in conjunction with a dedicated duct-mounted "booster" humidifier for each room to fine-tune humidity levels to meet individual room set points. Where dedicated room humidifiers are not provided, the maximum number of rooms on a common humidifier shall be limited to four (4) rooms. The A/E shall verify requirements with HFES and MM Mechanical Engineer.

Where ceiling booms are used for medical gas service, in addition to those gases provided on the boom, provide the following properly labeled medical gas outlets on the wall at the head end of the table: (2) MVAC with slides, (1) OX, (1) WAGD, and (1) MA.

Electrical

These rooms shall be served by critical power derived from two separate transfer switches, distributed on separate power risers and served from separate panels. Since these rooms are to be considered 'wet locations', isolated power supplies (IPS), with line isolation monitors, shall be installed in each room – two per room. The isolated power supplies shall be connected to the two critical power sources noted above.

A minimum of 48-outlets (24-duplexes) shall be installed in each room, with 50% fed from one IPS and the balance from the other IPS. Please note that 48 is the minimum, provide more when the program

dictates the need for more. [This number of outlets is in addition to any normal power supplied outlets that may be required by code.] The outlets shall be conveniently, and evenly, spaced around the room-including those installed in the surgical booms. All outlets shall be hospital grade.

Outlets shall be served by 20-ampere circuits, using XHHW-2 wire. Normally no more than 4-outlets (2-duplexes) shall be connected to each circuit – unless the circuit is being dedicated to a single purpose. [A good policy is to limit power to 1000-watts per circuit.]

Lighting shall be 5000-K fluorescent, with a maintained room lighting level of minimum 150-footcandles within 6-feet of operating table/theatre. The balance of the room shall have minimum 75-footcandles. Provide switching and controls to permit reduced lighting during portions of the procedures that may mandate this, as noted in the program. All of the lighting will be on critical power, served from two circuits that are fed from different transfer switches. Approximately 33% of the lighting fixtures shall be battery back-up to one of the ballasts in the fixture, to provide illumination during the period before emergency power is restored. [All of the above are in addition to the lighting provided by the surgical lights themselves.]

Provide power receptacles, and data outlets, for at least three large, wall-mounted, video display units (large computer screens) at locations defined by OR staff. Carefully coordinate the mounting elevation, and locations, of these with the staff.

Provide a raceway, junction and pull box system, power and data outlets, for installation of A/V equipment that may be provided either in the base project, or at a future date. A detail drawing will be made available to assist in this.

At least 50% of the power outlets, and lighting, in scrub area, shared imaging rooms, and/or adjacent equipment rooms shall be on critical power, but not necessarily on IPS power. The outlets not on IPS shall have GFCI. Coordinate exact needs for power and data with equipment planners and OR staff. In addition, imaging systems, critical for completion of the surgeries, shall be served by critical power.

When program notes need for laser power outlets, these outlets may be supplied by a shared IPS serving several rooms. Carefully coordinate with Capital Equipment Planner, Bio-Medical Engineering and OR staff in the placement and sizing of these outlets.

Provide open channel communications system (in essence hands free) to allow communication for persons anywhere in the room to other defined remote locations. Said locations needing this system will be defined during DD.

No fire alarm strobes or speakers shall be installed in these rooms. Nor shall they be in adjacent corridors, if intervening walls have extensive glass. These instead will be placed in control rooms, or scrub areas not in line of sight of staff working on the patient.

IC Room Type 3:

Architectural

Due to the need to maintain space pressurization control, the A/E shall give special attention to providing a sealed space envelope; including extending all walls to the structure above and sealing all floor, wall & ceiling penetrations (i.e. light switch back boxes, conduit & pipe penetrations, etc.) as well as the intersection of the wall and underside of the structure above.

In an effort to maintain a sealed, pressurized room envelope, the A/E shall limit the infrastructure (i.e. ductwork, piping, conduit, etc) passing over a Type 3 room to only that which serves the space. All items requiring regular maintenance (i.e. terminal air boxes, etc.) or accessibility (i.e. valves, etc.) shall be located outside of the room envelope so as to preclude the need to access such devices from within the space. The stretcher access doors shall be automated with touch-less hand actuated sensors. A wall mounted shut-off switch for these doors will be located on the room side to prevent accidental usage during a procedure. Where possible a bi-directional "man-door" should be used for normal procedure traffic. Push paddle hands-free type hardware should be used. All doors shall have closers.

Provide properly sized and placed access hatches to allow for maintenance and related activities associated with any equipment placed, or may be placed, above the ceiling. Properly sized meaning they are big enough for a normally sized person, to access and maintain the equipment easily, and safety. The number of hatches shall be based upon equipment installed above ceiling; however, at least two shall be installed regardless. Where shoulder clearance is required, access hatches shall be a minimum of 24" x 24".

Architect shall provide carefully and completely laid out ceiling plan showing all diffusers, lights, surgical column supports, fire suppression sprinklers, smoke detectors, access hatches, AV equipment, and any other equipment to insure coordination and utility of the design. Also, provide cross-section of above ceiling space, sufficiently detailed to insure proper space and accessibility for all installed systems is available above the ceiling. The ceilings will consist of a gasketed accessible ceiling system. The ceiling tiles shall have a washable surface and must stay in place during the washing process. Tile clips will only be allowed where tiles are less than 2 square feet in size or as directed otherwise by the Design Manager.

All room finishes will be selected by MM FPD, Interior Design, in consultation with IC and other MM staff. Terrazzo flooring with integral base shall be provided where there is heavy equipment traffic. Flooring patterns may be desired to indicate operational limits. If provided, construction documents must indicate that the floor patterns match the limits exactly.

Mechanical

See requirements for IC Room Type 1 & 2 above.

Electrical

These rooms shall be served by critical power derived from two separate transfer switches, distributed on separate power risers and served from separate panels, two per room. Since these rooms are to be considered 'wet locations', isolated power supplies (IPS), with line isolation monitor, shall be installed in each. The isolated power supplies shall be connected to the one of the critical power sources noted above.

A minimum of 36-outlets (18-duplexes) shall be installed in each room, with 50% fed from one IPS and the balance from the second IPS. Please note that 36 is the minimum, provide more when the program dictates the need for more. [This number of outlets is in addition to any normal power supplied outlets that may be required by code.] The outlets shall be conveniently, and evenly, spaced around the room-including those that may be installed in the surgical booms. All outlets shall be hospital grade.

Outlets shall be served by 20-ampere circuits. Use XHHW-2 wire for all wiring in these rooms. Normally no more than 4-outlets (2-duplexes) shall be connected to each circuit – unless the circuit is being dedicated to a single purpose. [A good policy is to limit power to 1000-watts per circuit.]

Lighting shall be 5000-K fluorescent, with a maintained room lighting level of 75-footcandles within 6-feet of operating table/theatre. (IR shall have 150 fc) The balance of the room shall have min 25-footcandles. Provide switching and controls to permit reduced lighting during portions of the procedures that may mandate this, as noted in the program. All of the lighting will be on critical power, served from two circuits that are fed from different transfer switches. Approximately 33% of the lighting fixtures shall be battery back-up to one of the ballasts in the fixture, to provide illumination during the period before emergency power is restored. [All of the above are in addition to the lighting provide by the surgical lights themselves.]

Provide power receptacles, and data outlets, for at least two large, wall-mounted, video display units (large computer screens) at locations defined by OR staff. Carefully coordinate the mounting elevation, and locations, of these with the staff.

Unless noted otherwise in the program statement, provide a raceway, junction and pull box system, power and data outlets, for installation of A/V equipment that may be provided either in the base project, or at a future date. A detail drawing will be made available to assist in this.

At least 50% of the power outlets, and lighting, in scrub area, shared imaging rooms, and/or adjacent equipment rooms shall be on critical power, but not necessarily on IPS power. The outlets not on IPS shall have GFCI. Coordinate exact needs for power and data with equipment planners and OR staff. In addition, imaging systems, critical for completion of the surgeries, shall be served by critical power.

When program notes need for laser power outlets, these outlets may be supplied by a shared IPS serving several rooms. Carefully coordinate with Capital Equipment Planner, Bio-Medical Engineering and staff in the placement and sizing of these outlets.

Provide open channel communications system (in essence hands free) to allow communication for persons anywhere in the room to other defined remote locations. Said locations needing this system will be defined during DD.

No fire alarm strobes or speakers shall be installed in these rooms. Nor shall they be in adjacent corridors, if intervening walls have extensive glass. These instead will be placed in control rooms, or scrub areas not in line of sight of staff working on the patient

IC Room Type 4:

See Tables 2, 3, 4. All doors shall have closers.

IC Room Type 5 and 6:

See Tables 2, 3, 4

IC Room Type 7:

See Tables 2, 3, 4.

IC Room Type 8:

Architectural

Refer to typical Infection Control Room Type layout drawings on [Standard Details](#) page. Doors should be 3'-2" minimum. Privacy should be provided at doorway by way of curtains and/or hinge gasketing. Walls should be full height to structure above, and acoustically insulated. If plenum returns are used, walls should extend as far as practical above ceiling plane and return-air acoustical boots should be installed. Wall finishes should be durable and cleanable. Wall protection should be installed. Sink should be located as close to the doorway as practical. Flooring should be seamless, with an applied cove base typically.

TABLE 2: ARCHITECTURAL

Infection Control Room Type	Access Restrictions	Minimum Room Size (Clear Square Footage) Actual size determined by Equipment Plan	Min. Room Ceiling Height (ft)	Floors Monolithic	Base	Walls
1	Access from semi-restricted hall in a semi-restricted suite, room is restricted during procedure	400 sq. ft. min. clear/ 600 for ortho, cardiac. Equipment may dictate significantly larger	10'-0"	Yes	Integral	FRP/PVC
2	Access from semi-restricted hall, room is semi-restricted or restricted during procedure Not to be a shared semi-restricted hall that also serves Room Type 1 above.	250 sq. ft. code minimum; Equipment may dictate significantly larger	10'-0"	Yes	Integral	FRP/PVC
3	Access may or may not be from a restricted hall, room is unrestricted when sterile field not present	400 sq. ft. code minimum. (Note 1) Equipment may dictate significantly larger	10'-0"	Yes	Integral	FRP/PVC
4	Access may or may not be from a restricted hall, room is unrestricted when sterile field not present	250 sq. ft. code min. Equipment may dictate significantly larger	9'-0"	Yes	Applied	Washable
5	Unrestricted access and room	250 sq. ft. code min. Equipment may dictate significantly larger	9'-0"	Yes	Integral	Washable
6	Unrestricted access and room	250 sq. ft. code min. Equipment may dictate significantly larger	8'-0"	Yes	Integral	Washable
7	Unrestricted access and room	Highly dependent upon equipment	Highly dependent upon equipment	Yes	Applied	Washable
8	Unrestricted access and room	120 sq. ft. (inpatient) 100 sq. ft. (outpatient) Code min.	8'-0"	Yes	Applied	Washable

8	No	1 (Note 16)	No	0	16	Yes	Yes	No	Yes	No	No	No	No	No

General Notes:

- In room types 1, 2, 3 and 4 provide sufficient battery backed lighting to maintain a minimum of 30-fc, in at least the sterile field area of the room, for the 10-seconds required to bring on line the generator power.
- In rooms needing green lighting, provide multi-lamp fixtures with individual switching controls for at least the sterile field area of the room. Critical Power shall be provided as noted in the following example. The green color shall be achieved through the use of standard 5000-K lamps, but with green color sleeves over the lamps. [One such design scenario might include the use of six-lamp fluorescent fixture system, in the area of the sterile field. In such a design the middle two (5000-K) lamps would be tied to a Critical Power circuit and would have battery back-up, the two lamps nearest the sterile feed (5000-K) would be tied to a second Critical Power (but with no battery back-up), and the final two would be the green color lights, also tied to Critical Power.]
- Nurse station area in the room, shall have dimmable task light - LED or equivalent.
- Newer Type 1, 2, and 3 rooms have been equipped with lighting control system to control all lighting in the room. Base systems have typically had 6-buttons – up to 5 'scenes' plus off. Control stations at entrance to room from sterile corridor, and another at the nurse's station in the room. Provide manual over-rides to accommodate failure of lighting controller when appropriate.
- Low, recessed, wall mounted lighting (LED or equivalent) shall be provided for the safety of the staff in the room, when main lighting is off as may be required for any given procedure.
- All receptacles served from Critical Power shall be red, with red cover plates. Those fed from normal power shall be ivory, or brown, to match the building standard.
- When Normal Power is the second source to a room, the number of equally spaced receptacles shall be similar to the number of Critical Power receptacles. In rooms with only one power source being needed, and that source is from the Critical Power branch, also provide at least one normal power receptacle on each wall.

-
- In room types 4, 5, 6, and 7, located in buildings without generators, provide battery-backed power in the overhead lighting fixtures (or by separately mounted wall 'bug-eye' fixtures) to provide a minimum of 15-foot-candles of lighting for 20-minutes or more.

Notes:

1. When two sources of power are required as noted above, and there is Critical Power from independent transfer switches, use these two Critical Power sources. In other cases use one Critical power source, and one normal source.
2. The noted number of outlets indicated is minimum number required by codes to meet clinical needs, supply additional outlets as clinical needs and/or good practice requires. (Note that the number indicated here is for the number of 'outlets', the number of duplexes is half of these numbers).
3. The outlets from the two sources shall be equally spaced around the room, except as modified by Note 5.
4. Normally not a wet location. Ask chief clinician if any of the Type 4 rooms will have procedures that should be considered 'wet'. If wet location designation applies to any (or all) such rooms, provide one isolated power (IP) system in those room(s). Rooms, not defined as 'wet location', and not having isolated power, should have a sign at the entrance noting "Room is not equipped with isolated power supplies".
5. When only one isolated power (IP) system is noted or required, confer with clinician on placement of IP outlets within room (evenly spaced or not).
6. Noted rooms shall normally be designed for green (color) lighting as a supplement to the white lighting. This green lighting is used in cases where normal white lighting is inappropriate. Affirm need with chief clinician assigned to project team.
7. Confer with chief clinician assigned to project team regarding the procedures to be done in some, or all, of the Type 3 rooms in project scope.
8. At minimum, intercom shall be among noted rooms and main nurse station (or control station) in suite. Ask if additional locations need to be included in the hands free intercom system.
9. Provide microphone, camera and speaker boxes in ceiling with raceways to an A/V 'hub' location in the room. Also, provide one 2" conduit from each boom to the hub, and two 2" conduits from the hub to a 12"x12" recessed box at nurse's desk. Provide power from isolated power system to the hub location, and to the nurse's desk. Affirm details on quantities of boxes and raceway sizes with assigned Electrical Engineer and Capital Equipment Planner.
10. Normally provide a duplex outlet, and data outlet, on wall at locations defined by chief clinician and/or their designee.
11. Provide power, data, A/V, gases, and other services to booms, confer with Capital Equipment planner.
12. Verify if dimming of lights is also required for certain procedures.
13. Imaging machines and associate controls shall be served by UPS power or sufficient space shall be allotted in the machine room for a future stand-alone UPS unit.
14. Critical power source required with one receptacle in room served by normal power.
15. Normal power source is acceptable with one receptacle in room served by critical power.
16. Normal power source is acceptable.

Notes:

1. Consideration must be given to user requests for elevated temperatures and / or rapid increase of room temperature based on the protocol of the procedures being performed, for example the need to maintain a 90 degree room temperature. Where non-aspirating supply is required, controls must be in place to maintain the air flow pattern (i.e. "sterile field") while the temperature is increased.
2. Confirm minimum and maximum humidity levels with imaging or other equipment.

5.14: MM PATIENT CARE AND SUPPORT SPACES ROOM TYPE REQUIREMENTS

GENERAL

This Special Building Area (SBA) guideline applies to new and renovated patient care and support space types within Michigan Medicine (MM) that are not covered by 5.13 – “MM Healthcare Procedure Room Infection Control Types and Requirements”. That document addresses room types such as Operating and Procedure rooms. This document addresses all of the subsequently listed room types in MM either owned or leased.

The information included in this SBA is meant to standardize the design and performance of a variety of typical spaces across the MM campuses and is based on close coordination with the State of Michigan Department of Community Health and MM Infection Control Department, along with industry-wide best practices. Where the information in this SBA exceeds that of regulating healthcare codes, the A/E shall utilize the information expressed in this SBA. Where the information in this SBA would serve to conflict or be in direct violation of the governing regulating healthcare codes, the A/E shall bring this to the attention of the University Project Manager. Under no circumstances shall the governing healthcare or any other code be violated.

In general, use the latest edition of the Facilities Guidelines Institute’s “Guidelines for the Design and Construction of Health Care Facilities” as a design guideline. Review any discrepancies with the Design Manager.

Please refer to SBA 5.16 "MM Requirements for Critical Pressure Sensitive Rooms" for information on detailing and other requirement where air pressure is critical.

PUBLIC AND/OR STAFF TOILET ROOM.....	10
BEHAVIORAL HEALTH AREAS.....	10

PROTECTIVE ENVIRONMENT (PE) & AIRBORNE INFECTION ISOLATION (AI) ROOMS

All PE & AI rooms shall be designed per 2003 CDC HICPAC "Guidelines for Environmental Infection Control in Health Care Facilities" to facilitate an immunocompromised patient with an airborne infectious disease."

Architectural

All Protective Environment, Airborne Infection Isolation and Combination rooms shall have Anterooms, with self-closing doors. The Anteroom shall be sized to accommodate storage of personal protective equipment and space for staff to don PPE. Disposal of PPE shall be considered. All room exit doors shall have self-closing doors. Rooms shall have monolithic ceilings and seamless floors with an integral base. Walls and furnishings shall be easily cleanable. Viewing panels for patient observation shall be installed in doors and/or walls, with blinds or privacy curtains.

Due to the need to maintain space pressurization control, the A/E shall give special attention to providing a sealed space envelope; including extending all walls to the structure above and sealing all floor, wall & ceiling penetrations (i.e. light switch back boxes, conduit & pipe penetrations, etc) and the intersection of the wall and underside of the structure above.

In an effort to maintain a sealed, pressurized room envelope, the A/E shall limit the infrastructure (i.e. ductwork, piping, conduit, etc) passing over a PE/AI Room to only that which serves the space. All items requiring regular maintenance (i.e. terminal air boxes, etc.) or accessibility (i.e. valves, etc.) shall be located outside of the room envelope so as to preclude the need to access such devices from within the space.

Mechanical

Rooms shall be served by a supply and return/ exhaust constant volume terminal box (ie CAV), balanced to maintain a room airflow offset (typically 150-200 CFM/ door), as required to maintain a room pressurization of 0.02" wc (measured at the door between patient room and anteroom). The supply CAV shall utilize a HW reheat coil to actively maintain the adjustable setpoint of the room's thermostat.

Airborne Infection Isolation room pressurization design shall follow CDC guidelines. Confirm with Design Manager if intent of isolation rooms is to serve patients with airborne infectious diseases or for immunocompromised patients with airborne infectious diseases.

Room shall utilize a room differential pressure monitor mounted on the corridor wall adjacent to the door into the patient room/ anteroom. Monitors for rooms with ante-rooms shall monitor space pressurization between the patient room and ante-room as well as the ante-room and corridor. All monitors shall be integrated back to the BMS.

A/E shall clearly state the room pressurization requirement (i.e. design of 0.02" wc, to meet minimum requirement of 0.01"wc) on the design drawings and indicate a means of achieving pressurization (i.e. throttle return/ exhaust airflows).

PREPARATION/RECOVERY BAY/ROOM

These areas are used for holding patients prior to or after medical procedures and/or surgeries and are part of a larger suite that include support spaces for this particular function. **Note: A full size mock-up of this space type is required during the design phase to validate all design elements. Reference Architectural Design Guideline 102500-H – 'Service Wall.**

Minimum Standards

- Three walls + cubicle curtain at front for visual privacy
- Minimum 10' 6" wide bay.
- Minimum 4' clear on each side of bed. Holding area shall be designed to allow for routine movement of patients and equipment without infringing on the individual cubicles or designated areas. Designs should strive to maximize self-sufficiency with a maximum visibility of patients by staff and minimum travel distances.

- Provide a minimum four normal and four critical power duplexes, as well as two data outlets for computer. Charting and patient monitoring equipment requires one critical power quad as well as two data outlets installed in close proximity to each other.
- Provide necessary medical gases
- Air supply should be located in “corridor” area with air return in bay/room.
- Lighting should be ambient/reading/exam combination fixture.
- Staff assist button on each side of bed.
- Equipment rail system for BP monitoring, glove boxes, sharps container, etc.
- Wall protection on head and side walls
- Guest and/or patient seating (at least one bariatric)

Optional Features

- Consult with user group for specific design requirements (such as bariatric beds, etc.)

NURSING STATION

These areas are used for nursing staff to attend to tasks other than direct patient care. Nursing station should include furniture/furnishings to provide for minimum storage, ergonomic seating and work surfaces for computers and/or paperwork. The station should be separated from the corridor or from other general traffic to provide a modicum of privacy for information exchange between shifts or consultation among care staff.

Minimum Standards

- Station to accommodate a minimum of two staff - more as unit requires
- Systems furniture panels for separation and acoustic control.
- Outside “walls” of panels should be hard surface, not fabric.
- Minimum of 42” high counter/transaction top + 30” high section for wheelchair accommodation.
- Work surface for writing and computing.
- Binder bins with sloped tops and locking doors.
- Light switch specific to night lighting over workstation (on critical power)
- Tackspace, whiteboard and tasklighting.
- Pencil drawer
- Box/pedestal drawer
- Ergonomic, adjustable armless task seating with casters (appropriately specified for either carpet or hard surface flooring).
- “Slatwall” components for organizing paperwork.
- Power (regular + critical hardwired)/data/phone, nurse call, intercom outlets and control ‘stations’ appropriate for size of station.
 - Separate raceway paths for normal power, for emergency power, and for data, including wiring management provisions.
- Finishes to coordinate with adjacent corridor (sheet vinyl/base, painted walls, etc.)
- Dedicated HVAC zone of control
- Medical gas alarm panel (on back or adjacent wall)

Optional Features

- Master nurse call
- Emergency phone
- Monitoring/CIC equipment, etc. (on back or adjacent wall)
- Wall protection
- Sign to clearly identify station

MEDICATION ROOM

These rooms are used to securely store medications for easy access by authorized personnel.

Minimum Standards

- Door with key pad or card reader. Door shall include glazing.
- Sink with splash guard (see 064040-H – 'Architectural Woodwork')
- Omnicell with adjacent undercounter refrigerator
- Sharps container
- Work counter
- Computer + OMP + printer
- Critical power for Omnicell, refrigerator and OMP (provide normal power outlets for when repairs to critical power are required)
- Wire carts for storage
- Angled shelving
- Tackboards
- Hooks for IV prep
- Sheet vinyl flooring / base with painted walls

Optional Features

- n/a

NOURISHMENT ROOM

These areas are used to store and provide patient nourishment on inpatient floors. Access to these areas should be clear and convenient to the patient.

Minimum Standards

- Refrigerator (full or undercounter)
- Coffeemaker with instant hot water
- Ice Machine
- Sink – solid surface single bowl integral with countertop (see 064040-H – 'Architectural Woodwork')
- Paper towel and soap dispensers
- Waste & Recycling Receptacle
- Cold and hot drink cup storage
- Locked overhead/undercounter cabinets + drawer storage for surplus supplies and condiments
- Minimum 36" wide countertop

Optional Features

- Door on room
- Low level night lighting (multi-level)

SOILED UTILITY/SOILED HOLDING ROOM

This room receives and stores soiled items from clinic or inpatient areas. The room must be closed off from other clinic or inpatient areas to insure proper infection control measures are enforced.

Minimum Standards

- Door(s) with keypad or card reader (TBD during design)
- Stainless steel or solid surface counter with integral sink compartment
- Open compartment under sink (no storage)
- Open shelving above counter or wire carts
- Space for soiled carts + recycling and biohazard containers
- Wall protection (stainless steel, solid surface or vinyl, etc.)
- Floors should be vinyl tile or sheet vinyl with standard 4" wall base
- Standard fluorescent light fixtures with occupancy sensor

Optional Features

- Sheet vinyl floor with integral base if excessive water is used in this area.

CLEAN UTILITY/CLEAN HOLDING ROOM

This room type is used to store clean items/supplies for clinical and/or inpatient areas.

Minimum Standards

- Door(s) with keypad or cardreader
- Wire cart or plastic bin storage
- Quad outlets (minimum of two) for recharging equipment
- Data outlets
- Vinyl tile or vinyl sheet flooring with standard 4" wall base
- Painted walls
- Standard fluorescent light fixture with occupancy sensor
- Size of room depends on location within clinic/inpatient area – Generally 80 – 300 SF with minimum width of 6 feet

Optional Features

- n/a

CONFERENCE ROOM

This room type is used for meetings with multiple participants. Larger conference rooms may have video conferencing capabilities.

Minimum Standards

- Minimum size for conference room should be 10' wide x 12' long. Example: This size room has an 8-10 person capacity.
- Room size should not be less than 10 SF per person.
- Rectangular table or tables (can be ganged or simply abutted)
- Chairs around table should be arm chairs with casters
- Supplemental seating around perimeter of room should be stacking; casters preferred
- Markerboard (minimum of 4' x 4')
- Tackboard (minimum of 4' x 4')
- Clock
- Adjustable lighting level (dual switching for small rooms; dimming for large – 20 + occupants)
- Projection screen/overhead projector with data and power cabling in larger rooms
- Data outlets
- Credenza storage (for supplies or audio-visual equipment)
- Speaker phone
- Coat hooks
- Two large waste receptacles
- Acoustical considerations (keep conversation within room and attenuate sounds from entering room, i.e. sound attenuators on ductwork serving the space, as needed)
- Dedicated HVAC zone of control
- Door(s) with lite; key lock
- Carpeted floor; painted walls; acoustical ceiling

Optional Features

- Video conferencing capability
- Table top power/data access
- Podium
- Motorized projection screen

- Flat screen monitor w/anti-theft lock
- Wall mounted house telephone outside rooms with 20+ occupants
- Acrylic holder outside room for posting daily meeting schedule (Size: 8-1/2" x 11")

CLASSROOM

This room type is used primarily for teaching and should be set up for flexibility to accommodate various teaching styles (traditional instructor at front of class or circular set-up). Secondary use is for meetings.

Note: *Lecture halls/auditoriums (building location and user specifics are not addressed in this SBA.)*

Minimum Standards

- Classrooms should accommodate a minimum of 20 participants with a minimum of 10 SF per person
- Tablet arm chairs should be used (some accommodating left handed participants). Tablet arms should be able to swing out of the way if the participant chooses not to use it. Chairs should stack or nest and be easily movable for maximum flexibility.
- Podium for instructor w/adjacent power/data outlets
- Speaker phone
- Motorized projection Screen/overhead projector
- Video Equipment display/storage or credenza
- Markerboard (minimum two 4' x 6')
- Tackboard (minimum 4' x 4')
- Clock
- Data outlets (at podium)
- Door(s) with lite; key lock
- Adjustable lighting level fixtures (dual switch for small rooms; dimming for large)
- Two large waste receptacles
- Coat hooks
- Hard surface floors; painted walls
- Dedicated HVAC zone of control

Optional Features

- Narrow, rectangular folding tables and chairs in lieu of tablet arm chairs
- Video conferencing capability
- Folding tables and chairs in lieu of tablet arm chairs
- Power/data outlets at tables
- Flatscreen monitor w/anti-theft lock
- Wall mounted telephone outside room

CONSULTATION ROOM

A small room for a physician or other clinical support to discuss treatment, protocol and/or follow up with a patient and their family/caregiver. This often is accomplished via A/V equipment or paper format.

Minimum Standards

- Room size to comfortably accommodate 4-6 people in either lounge seating or around a table with chairs (20 SF per person). Room for A/V equipment.
- 4' x 4' markerboard
- 4' x 4' tackboard
- Small credenza or desk to accommodate computer (to be viewed by all in room) and paper storage (take away instructions, brochures, etc.)
- Binder bin or "slatwall" components
- Speaker phone
- Power/data outlets for A/V equipment/computer
- Flatscreen television monitor

- Variable light levels in room – both overhead and table lamps
- Acoustical privacy
- Carpet; painted walls

Optional Features

- Staff assist button
- Additional square feet depending on location (OR, ICU, ED, etc.)

ON-CALL ROOM

These rooms are sleeping/resting rooms for on-call residents. House Officers Association should be consulted before moving or renovating and for current contractual requirements for these rooms.

Minimum Standards

- Room to be located in proximity to inpatient floor or service unit
- Minimum size to be 80 SF (8'x 10')
- Room to accommodate one single or one bunk bed with ladder, small desk for computer, desk chair
- One phone per bed
- One computer per room
- Power/data outlets
- Coat hooks
- Lockable storage bins or lockers, one per bed. Full length lockers preferred
- Door with key lock or keypad lock
- Acoustical privacy

Optional Features

- Lounge chair/recliner
- Wall mounted television
- Designated toilet room in reasonable proximity to on call room
- Clock
- Reading lamp(s)
- Baseboard night light
- Door with card reader
- Toilet/shower – accessible from on-call room
- Small refrigerator

PATIENT WAITING ROOM/AREA

These rooms/areas are used by patients & visitors to wait for clinic or procedure visits. Patient privacy is important as is maintaining a clear view across the waiting area by reception/check-in staff. Accommodations must be made for varying levels of patient ambulation and ability.

Minimum Standards

- Provide at least 15 SF per person
- Supportive, comfortable and easily cleanable seating
- Some bariatric seating and some double seating for parents/caregiver and children/patient
- Occasional and end tables
- Coat storage (hooks or closet)
- Wall mounted television (controlled by staff)
- Tackspace for patient notices
- Magazine rack(s)
- Computer workstation(s) for patients/visitors
- Artwork
- Visual access to reception/check-in

- Power/data as appropriate
- "Hot phone" for patients (insurance verification, appt. scheduling, etc.)
- Direct and indirect lighting with dual switching
- Borrowed lite to corridor or lite in door
- Acoustical isolation
- Carpet; paint

Optional Features

- Refreshment station
- Wall protection/chair rail
- Lounge chair/recliner (inpatient rooms)

BILLING OFFICE

This office is used for patient consultation regarding matters of charges for services, arranging payment plans and other clinical financial matters.

Minimum Standards

- Office must be a minimum of 10' x 12' with two doors
- Door for patient access must have window to corridor or waiting room
- Door for billing clerk should be at back of office for exit away from office guest (security measure) with card reader
- Desk and workspace for billing clerk with desk chair
- Lockable binder bins above or behind desk
- Small office safe (stored under desk)
- Cash drawer
- Computer/printer
- Desk telephone
- Phone/data outlets
- Two guest chairs in front of desk
- General ceiling lighting with some lighting at work surface
- Acoustical privacy within office
- Carpet; paint

Optional Features

- Security buzzer/alarm system mounted to underside of desk (for clerk)

RADIOLOGY IMAGING ROOM

A suite of rooms for clinical imaging such as mammography, CT scans, fluoroscopy, etc. Usually consists of a control room, an imaging room and occasionally an equipment room.

Minimum Standards

- Minimum 9' high ceiling
- Shielding according to code or as required by equipment type, manufacturer and University physicist
- Minimum acceptable working clearance around equipment to be determined by manufacturer
- Room humidification to be controlled per manufacturer's recommendations
- Ground wire size to be in compliance with manufacturer's requirements
- Floor slab to be sufficient depth to accommodate floor trough to equipment type & weight
- Power sources to mechanical/electrical systems to be coordinated (both on emergency or normal power)
- EPO shall be open contact parallel configuration
- Data/power outlets to be specific to equipment
- Lighting to include direct and indirect fixtures and dimmable downlights

- Heavy duty door (See FPD Design Guidelines)
- Window blinds in control or imaging room
- Sheet vinyl flooring, paint on walls, vinyl wall protection
- Recessed pulls on cabinetry
- Wall sign listing existing shielding installed within walls, ceilings and floors of imaging room
- Handwash sink, paper towel and soap dispenser, waste receptacle
- Apron rack and coat hooks
- Guest chair (*note: in MRI room, no metal fasteners may be used in chair*)
- Step stool (to assist patient access to equipment)

Optional Features

- Automatic door operator
- Intercom between control and imaging rooms
- Cubicle curtain
- Sharps container/glove boxes
- View boxes
- Patient Lift
- Art panel in ceiling light fixture
- Isolated power supply
- Tack board/marker board

RADIOLOGY READING ROOM

A room with one or more reading stations for reviewing/diagnosing digital images.

Minimum Standards

- Minimum cubicle size 7' x 7' for each reading station
- Lighting – not to exceed more than one foot candle (or below)
- Provide appropriate lighting levels for housekeeping
- Sufficient lighting for exiting
- Full length black cubicle curtain (no mesh at top of curtain)
- Black or charcoal acoustical wall covering and black acoustical ceiling
- Dark carpet
- Additional sprinkler heads to coordinate with curtain layout according to code
- Arm and armless chairs at workstations
- Specialty workstations for digital imaging reading
- Adequate ventilation to coordinate with curtain layout
- Power/data to accommodate workstations
- Layout of fire alarm notification appliances to take into account acoustical surfaces, ceiling-to-floor curtains and dark finishes

Optional Features

- n/a

STAFF LOUNGE/BREAK ROOM

This is a space for multiple staff to rest, renew and/or lunch away from the work environment. The room should be enclosed for privacy and adjacent to or in the work area.

Minimal Standards

- Door with lock
- Occupancy sensors for lights
- Lounge seating and/or tables and chairs
- Sink + counterspace (*Note: soap and paper towel dispensers at sink*)

- Refrigerator with ice maker, microwave oven (mount on millwork shelf under overhead cabinet – deep enough to accommodate plug with dedicated circuit), commercial coffeemaker (per current UM contract).
- Restricted appliances: toaster oven and popcorn popper
- Space for drinking water dispenser (outlet needed) + water bottle storage
- Large waste receptacle and recycling bins
- Tackboard, markerboard and fire board
- Clock
- Coat hooks
- Sheet vinyl floor with rubber base; painted walls

Optional Features

- Dishwasher and/or garbage disposal
- Vending machine(s)
- Computer workstations
- Staff mailboxes and/or magazine holders
- Adjacent toilet room(s)
- Card reader (at door)
- House phone and/or nurse call staff station (intercom)
- Staff lockers (size to be determined on each individual project)

PUBLIC AND/OR STAFF TOILET ROOM

These rooms can be single occupancy or multiple “stall” toilet rooms.

Minimum Standards

- Single occupancy – sheet vinyl floor, rubber base, painted walls (semi-gloss)
- Multiple occupancy – ceramic tile floor and walls
- Acoustical ceiling tile
- Solid surface counter with integral sink with mirror above
- Soap dispenser
- Hand dryer and/or paper towel dispenser
- Stainless steel partitions; floor mounted with ceiling support
- Fold-down “purse” shelf within stall; coat hook within stall
- Toilet paper dispenser per current UM contract
- Lighting over mirror/sink; recessed cove lighting at back of stalls
- New construction: floor mounted bariatric water closet
- Renovation: address bariatric requirements for existing water closet
- Occupancy sensor

Optional Features

- Ceramic tile floor/wall in single occupancy toilet room
- Hard ceiling
- Hands free entry door for multiple stall toilet room
- Hands free plumbing fixtures (sinks, water closets & urinals)
- Diaper changing deck

BEHAVIORAL HEALTH AREAS

Minimum Standards

- Apply design principles from the latest version of the “Design Guide for the Built Environment of Behavioral Health Facilities”.
- All tamper resistant screws shall be the “snake eye” type.

5.15: MM PATIENT AND STAFF PROTECTION: FALLS, BARIATRICS, LOW VISION, ERGONOMICS

GENERAL:

In general, follow the guidelines below when specifying and designing facilities for Michigan Medicine (MM). Unless specifically indicated otherwise, these guidelines are not intended to restrict or replace professional judgment. Comply with all building and accessibility codes listed in [1.0 Codes and Regulatory Agencies](#). However, note that codes are minimums, but may not be best practice.

Architects, Engineers, Equipment Planners and Interior Designers shall take patient and staff safety into consideration throughout the design of facilities.

Many patients have low vision, limited mobility, and/or medical equipment issues. Staff areas should be designed with ergonomics in mind.

Note that Safety Management Services and Nursing have guidelines and staff training on Safe Patient Handling.

Integration of Safe Patient Handling and Movement program (SPHM) within MM Capital Projects

The typical stages of a capital project that includes construction or renovation of a clinical space providing patient care are summarized below. At each project stage, roles and responsibilities have been clarified for integrating SPHM into capital projects.

1. Project Request:

- a. Request for a construction investigation is entered into PDS2, using the “Facilities Planning and Development” link on the Support Services LINK web page.
<https://uhintwebspr1.mcit.med.umich.edu/hos/link/>
- b. Facilities Planning and Development (FPD) Design Manager is assigned and shall include Safety Management Services (SMS) in the initial project investigation kickoff meeting for clinical projects. This ensures SPHM is addressed in step one of the process.

2. Investigation Phase:

- a. SPHM Assessment initiated by SMS with the Unit/Clinic Area Manager.
- b. SPHM Manager Planning checklist is completed by Unit/Clinic Area Manager with assistance from SMS, and signed off by SMS Representation and Unit/Clinic Area Manager.
- c. SPHM Manager Planning checklist identifies facility and equipment needs for scope and budgeting purposes, and is provided to FPD Design Manager for inclusion in project budget and documentation.

3. Design Phase (after funding is obtained):

- a. Upon project funding, the FPD Design Manager or AEC Project Manager will schedule a design kickoff meeting with the project team, including the Unit/Clinic Area Manager and SMS Representative. Any change in the original project funding request and final funding obtained will be brought forward at the design kickoff meeting, and problem solved with the Unit/Clinic Area Manager and FPD Design Manager to determine next steps.
- b. The Design Manager will work with the Unit/Clinic Area Manager, Capital Equipment Planner, and SMS representative to integrate SPHM identified from the checklist into the design.
- c. Design documents are developed and updated through the design process, and any funding changes are addressed.

- d. FPD Design Manager to distribute 95% review drawings for final project team review. SMS representative and Unit/Clinic Area Manager shall review and provide comments on drawings to ensure that SPHM design requirements are met, prior to construction initiation.

4. Construction and Activation Phase

- a. Project team shall problem solve any SPHM unexpected consequences as they arise.
- b. Unit/Clinic Area Manager and FPD Design Manager shall agree upon on any design/construction changes that impact SPHM.
- c. Unit/Clinic Area Manager will confirm SPHM requirements in the project have been completed within the construction schedule, and will notify the FPD Design Manager of any concerns.

PATIENT PROTECTION GUIDELINES:

Colors and patterns should be selected to clearly differentiate between floors and walls. Floor and wall patterns with sharp contrast should be avoided; however a contrast between floor and wall is desirable.

Corridor handrails should be provided in in-patient areas and outpatient settings where dictated by program. Note that sloped floors less than the code minimum for ramps may require handrails and intermediate landings to make travel ergonomic.

Designated barrier-free toilet and bathing facilities must meet code, but all patient toilet and bathing facilities should be equipped with grab bars. All patient showers should be equipped with built in, folding seats capable of supporting a minimum of 900 pounds.

All toilets should support a minimum of 1000 pounds, which requires they be floor mounted. Special bariatric toilets, capable of supporting even greater weights, should be considered where clinically appropriate.

Provide patient emergency nurse call pull cords in toilet rooms and in bathing facilities within clinical areas. Outpatient clinics should include these pull cords unless specifically not required by clinical and risk management review. Refer to MM door hardware design guidelines for emergency access requirements into patient toilet and bathing facilities.

The distance between the patient bed and the toilet facility should be minimized. Ideally a handrail should be installed between the bed and toilet facility. A nightlight should be provided to light the path. Do not install grab bars or towel bars on doors.

Slip resistant flooring and walk off mats should be specified. Loose walk off mats should not be provided.

All accessories and fixtures should be installed with in-wall blocking to secure the item to the wall. Exceptions would be small items that are not expected to bear weight, such as soap dispensers and hand sanitizers.

Seating choices in an area should accommodate bariatric patients, and include chair arms in many locations. Wheelchairs must be accommodated within the seating arrangement.

Additional clearances should be considered for oversized wheelchairs and transportation, and in bariatric service areas.

Glare should be minimized in materials, exterior windows, daylight control and in lighting selection. Within the sight path, maximum to minimum lighting levels should not exceed a factor of 10. Consider the effect of windows and finish materials.

Even small thresholds and building expansions joints can be problematic for patients and staff moving IV poles or other equipment, or using canes, crutches or walkers. Changes in floor elevation should be avoided; when unavoidable, care should be taken to create a smooth transition.

Many patients at MM are in oversized wheelchairs or scooters, and spaces should be designed to accommodate them. Rooms accessed by patients should be provided with oversized doors per the door design guidelines, and consideration given to door hold open devices, automatic operators, and delayed closers.

To the greatest extent possible, all outpatient areas should be accessible by stretcher.

Staff and patient ergonomics, length of reach, and flexibility for individual ergonomics should be considered in the design, for example: reception desks, work stations, appliances and equipment locations, trash receptacles. Height adjustable treatment and transport surfaces should be included.

Safety Management Services has extensive information available on patient lift design and installation. For permanently installed lifts, consider:

- Structural design of the floor or roof deck above.
- Ceiling locations of sprinklers, smoke detectors, lighting and HVAC supply and returns, soffits, booms, telemetry and wireless repeaters, privacy curtain tracks, IV tracks and AV equipment.
- Wall location of cabinetry, AV and medical equipment in relation to the lift tracks and travel.
- An accessible location for the lift parking station with a dedicated electrical outlet, normal power, for charging.

In locations where mobile lifts might be used, working clearances and maneuvering space to operate the chosen devices, including:

- Turning radius
- Door and pathway width clearance
- Load/unload clearance at all transfer destinations.
- Smooth, level, low friction finished floor surface without significant threshold barriers or obstacles to allow free base movement during use.
- Retrieval clearance at high risk fall locations, to allow transfer of fallen patient from the floor.
- Compatibility of the furnishings with the base support of the lift.
- Storage area for each piece of equipment and accessories identified where it will be convenient and readily available.
- Electrical outlet for charging in storage location for all battery powered equipment.

At all locations where lifts or other SPH (Safe Patient Handling) equipment are used, storage should be planned for clean equipment, soiled holding space for soiled equipment, space for a laundry hamper for soiled slings and fabric equipment, staging area for clean delivery and soiled pick up.

At off-site locations, consider an on-site laundry washer/dryer or drying rack.

Point of service cleaning of safe patient handling items, including space to allow fabric items to hang to dry after disinfection.

Facilities should be designed to accommodate the future installation of patient lifts.

Any glass doors and guardrails should be designed to clearly indicate glass is present; i.e. patterns or other materials included in the design.

No power, data, other cords or other trip hazards should run across walking paths on floors.

5.16: UMHC - REQUIREMENTS FOR CRITICAL PRESSURE SENSITIVE ROOMS

GENERAL:

The following guidelines are prepared for detailing critically pressurized rooms. Please refer also to Design Guideline 5.13 "Healthcare Procedure Room Infection Control Types and Requirements" and 5.14 "Patient Care and Support Spaces Room Type Requirements" for additional information on these types of rooms.

A complete list of pressurized room requirements UMHC is required to comply with can be found in the following codes, design standards and operating guidelines:

- 2007 MINIMUM DESIGN STANDARDS FOR HEALTH CARE FACILITIES IN MICHIGAN
- ASHRAE STANDARD 170- *VENTILATION OF HEALTH CARE FACILITIES*
- AAMI ST79- *COMPREHENSIVE GUIDE TO STEAM STERILIZATION AND STERILITY ASSURANCE IN HEALTH CARE FACILITIES*
- USP 797- *PHARMACEUTICAL COMPOUNDING, STERILE PREPARATIONS* and USP 800- *HAZARDOUS DRUGS, HANDLING IN HEALTHCARE SETTINGS*

The purpose of this guideline is to establish good design practice for the design and construction of all pressurized rooms. In addition, UMHC has established a list of "critical" pressurized rooms that can have a direct impact on patient care and safety and hence need to be held to a higher standard:

CRITICAL PRESSURIZED ROOMS

- Operating Rooms (Type 1 Infection Control Room Type per SBA 5.13)
- Procedure Rooms (Type 2 & 3 Infection Control Room Type per SBA 5.13)
- Airborne Infection Isolation Room
- Protective Environment Rooms
- Pharmacy Compounding Areas (see SBA 5.17)
- Cleanrooms (i.e. ISO-7, etc.)
- Nuclear Medicine Labs, including Hot Labs
- Instrument Processing- Clean Workroom, Sterile Storage and Decontamination
- Autopsy Rooms
- Laboratories

Completely enclosing the space and sealing the penetrations is key to the success of achieving the required pressure relationships. Each project must be approached individually. The following are examples of ways to seal the room(s) in order to achieve the required pressure relationships for critically pressurized rooms.

SIGNAGE:

UMHS Sign Shop has established a standard sign, to be installed adjacent to the entry door to these room. Signage is typically OF/OI.

ENCLOSURE:

The entire perimeter of the space must be sealed. This would include the walls, floor, and ceiling. Due to the number of penetrations in ceilings, even "hard ceilings" or gasketed lay-in ceilings tend to have numerous penetrations. Therefore, every effort should be made to extend the walls of the room to the structural deck above, and the joints between the wall and the floor, the walls and utility penetrations, and the wall and the structure above, must be sealed.

If it is not possible to extend the perimeter walls to the structure above, the ceiling system should be a "hard" ceiling such as gypsum board, as even sealed and gasketed lay-in ceilings are difficult to completely seal. Clipped down ceiling panels make maintenance very difficult, and over time tend to not be re-clipped as needed. The ceiling system must be carefully designed to be as air-tight as possible, and all utilities, such as light fixtures and sprinkler heads, should be gasketed. Any access doors should be gasketed. Light fixtures should be sealed type fixtures with gaskets at the perimeter.

The use of joint assemblies that have been tested and are listed for smoke tightness in cold conditions will help ensure the air-tightness of the space. Sealants and joints that rely upon intumescence are not acceptable. Firestopping, or a smoke and acoustic sealant, rated for air leakage of less than 1 CFM per linear foot should be installed at all joints between materials above the ceiling or otherwise hidden from view.

PENETRATIONS:

Penetrations through the membrane of the walls, floor and structure above must be completely sealed. Electrical outlet boxes and other breaks in the membrane should be gasketed to prevent air leakage, including the use of gasketed cover plates at power, communications, light switches, and other junction boxes. Piping, ductwork, conduit and other materials penetrating the wall membrane should be sealed; specifying a UL smoke rated penetration assembly will help ensure the air-tightness of the space.

DOORS:

The perimeter of all doors should be gasketed. Double doors should have solid astragals, and air-tight automatic door bottom seals should be considered (seals that lower when the door is closed and rise when the door is opened. Unless there is heavy wheeled traffic, automatic door bottoms should be paired with a threshold. Doors must have closers. Note that doors with automatic operators will stand open a certain length of time and will allow the room to lose its required pressure relationships. The use of vestibules is required at entry locations such as sterile reprocessing and should be included whenever possible. At doors that are only used in emergency situations, the vestibule can be omitted.

If required programmatically for "Clean Rooms" and other locations, the vestibule doors may be required to interlock to only allow one door at a time to be open under normal operation, to maintain pressure relationships between rooms. Emergency egress codes would apply.

See "Mechanical" below for information on door contacts reporting to the room pressurization monitors.

OPERABLE WINDOWS OR EQUIPMENT PENETRATIONS:

Operable windows in the perimeter should be avoided. Pass-thru windows, where required operationally, should be of the "air-lock" type, utilizing a double pass-thru assembly that prevents the simultaneous opening of both windows at once. Flexible strip doors or windows may be supplemental to hard doors and solid windows, but should not be relied upon to maintain air pressure.

All equipment that penetrates the perimeter, such as washers and tray returns, must be designed with a sealed perimeter, and seals integral to the operable portions of the equipment.

ELEVATORS:

Elevators or lifts that are open to these critical pressure rooms can wreak havoc on maintaining pressure. They act like large pistons, pushing and pulling air in and out of the room. If elevators are required operationally in pressure sensitive rooms, an elevator vestibule/airlock should be included. If this is not possible, all elevator doors should have airtight seals and the elevator shaft should be designed with some means of pressure/ airflow relief to minimize the impact elevators have on critical pressurized rooms.

MECHANICAL:

All critical pressurized rooms defined in this guideline shall be provided with local room pressure monitors set to monitor and alarm the relevant room pressure. Room pressure monitor shall be wall mounted outside the room immediately adjacent to the door into the room (See SBA 5.13, 5.14 & 5.17). In some special cases like Operating Rooms (Type 1) and Procedure Rooms (Type 2 & 3), room pressure monitor shall be mounted within the space (See SBA 5.13).

All room pressure monitors shall be integrated into the hospital's building management system (BMS).

For Operating Rooms (Type 1), Procedure Rooms (Type 2 & 3) and Pharmacy Compounding Areas, all doors into the space shall be monitored with fully concealed door contacts, specified by the mechanical engineer and provided by the mechanical systems controls contractor. Door contacts shall relay door position to the room pressure monitor. See SBA 5.13.

A/E shall clearly state the room pressurization requirement on the design drawings and indicate a means of achieving pressurization (i.e. throttle airflow). In all cases, critical pressurized rooms shall be designed and balanced to a room pressure that exceeds the minimum code required value so that the space is not always on the edge of being out of compliance. UMH's standards for critical room pressure are as follows (positive or negative per code):

Room Type	Room Design Pressurization	Room Pressure Alarm Setpoint (Code Minimum)
Operating Rooms (Type 1) & Procedure Rooms (Type 2 & 3)	+0.04" to +0.06" wc	+0.01" wc
Pharmacy Compounding Areas – Category 2 Ante-Room & Non-Hazardous Compounding	+0.03" to +0.06" wc	+0.02" wc
Pharmacy Compounding Areas – Category 2 Hazardous Compounding & Hazardous Storage	-0.02" wc	<-0.01" wc or >-0.03" wc
Nuclear Medicine Labs	+0.03" to +0.06" wc	+0.02" wc
All other critical pressurized spaces	+0.02" to +0.06" wc	+0.01" wc

Refer to Hospital Controls Specification 230905 "Mechanical Systems Controls" for standards on pressure monitors and alarm management settings.

COMMISSIONING:

AE shall specify a means to test the air-tightness of all critical pressurized rooms, i.e. "blower door" test.

Minimum leakage should be specified in order to maintain the pressurizations listed above, and/or required programmatically. Refer to "ASTM E779-10 Standard Test Method for Determining Air Leakage Rate by Fan Pressurization" and NEEB (National Environmental Balance Bureau) publications.

GENERAL:

The following guidelines are provided for designing spaces where pharmaceutical drugs are compounded and stored.

DESIGN PROCESS

- Engage pharmacy staff stakeholders early during the design process. Pharmacy staff will be responsible for defining the types and risk categories for all drug compounding that will be performed within the pharmacy per United States Pharmacopeia Convention (USP) definitions.
- Compounding must be performed within a PEC. Pharmacy staff determine the number of PECs.
- The following USP types and risk categories will be defined by the pharmacy stakeholders:
 - Type - Sterile and/or Nonsterile Drug Compounding
 - Type - Hazardous and/or Nonhazardous Drug Compounding
 - Risk Categories (For Compounded Sterile Preparations)
 - Category 1 (BUD 12 Hours or Less)
 - Category 2 (BUD greater than 12 Hours)
- Ante Room is required for all Hazardous Drug Compounding (Michigan Medicine Policy). Therefore, segregated compounding areas are not allowed for Category 1 Hazardous Drug Compounding. Provide ante room and HD Compounding per Category 2 requirements.

CODES and GUIDELINES

The following codes/guidelines are to be complied with:

- FDA 503a
- USP 795 Pharmaceutical Compounding - Nonsterile Preparations
- USP 797 Pharmaceutical Compounding - Sterile Preparations
- USP 800 Hazardous Drugs - Handling in Healthcare Settings
- USP 825 Radiopharmaceuticals Compounding
- Future USP for Nutritional Standards
- 2007 Minimum Design Standards for Health Care Facilities in Michigan
- FGI Guidelines for Design and Construction of Healthcare Facilities, latest edition
- ASHRAE Standard 170 Ventilation of Health Care Facilities
- NRC (Nuclear Regulatory Commission) For Radiopharmaceutical Compounding Only
- FDA (Food and Drug Administration) For Radiopharmaceutical Compounding Only

A/E shall Reference the following related Michigan Medicine Design Guidelines for additional compliance requirements: [SBA 5.16 - Requirements for Critical Pressure Sensitive Rooms.](#)

TERMINOLOGY

- BSC:** Biological Safety Cabinet - Device (PEC) used for hazardous CSPs. Michigan Medicine has standard to use Class II A2 BSCs.
- BUD:** Beyond-Use Date.
- CSP:** Compounded Sterile Preparation.
- C-PEC:** Containment - Primary Engineer Control for hazardous CSPs. Examples include biological safety cabinets and containment isolators.
- C-SEC:** Containment - Secondary Engineer Control for hazardous CSPs. This type of room is designed with negative pressure to the adjacent ante room to prevent spill contaminated air from exiting the room.
- Controlled Pharmacy Space:** A dedicated compounding space within which people must follow handwashing practices and be garbed. All materials passed into the controlled space must be disinfected. Controlled pharmacy space must be separated from general pharmacy/office space by either physical separation (walls/door) or a line of demarcation. Types of controlled pharmacy spaces include SCA, SEC, and C-PEC.
- HMI:** Human Machine Interface.
- ISO Class:** An air quality cleanroom classification from the International Organization for Standardization
- LAFW:** Laminar Airflow Work Bench - Device (PEC) used for nonhazardous CSPs.
- PEC:** Primary Engineering Control - A zone or device that provides an ISO Class 5 environment, e.g. laminar airflow work bench or biological safety cabinet.
- PPE:** Personal Protective Equipment.
- SCA:** Segregated Compounding Area (Category 1 Risk Category Only): An unclassified area allowed for nonhazardous CSPs that are defined as risk Category 1 (BUD of 12 hours or less)
- SEC:** Secondary Engineering Control - Environment (room) where the PEC is located and meets ISO Class 7 air quality standards.
- USP:** United States Pharmacopeia.

PHARMACY ROOM TYPES

Refer to Sample Layouts included above for Category 1 and Category 2 compounding areas.

- Ante Rooms (Required for Category 2 CSPs Only): Required for CSPs that have a beyond use date (BUD) greater than 12 hours.
- Buffer Rooms (Required for Category 2 CSPs Only): Required for CSPs that have a BUD greater than 12 hours. Applicable to hazardous and nonhazardous CSPs.
- Hazardous Drug Compounding Room (C-PEC): A type of buffer room required for hazardous CSPs.
- Nonhazardous Drug Compounding Room (PEC): A type of buffer room used for nonhazardous CSPs.
- Radiopharmaceutical Room: A type of buffer room used for compounding radioactive drugs.
- Unclassified Area: Any space not required to meet air cleanliness classification based on the International Organization for Standardization. Segregated Compounding Areas are considered unclassified. Defined as any area that does not require an ISO Classification.
- Hazardous Drug Storage: Storage room dedicated for hazardous drug storage only.
- Office Space: Office space needed adjacent to or within proximity to the compounding Pharmacy must be discussed during the space programming stage of the project. Pharmacy staff must provide input during this stage of the project. Office space must be separated from controlled pharmacy spaces through a physical barrier (walls and door) or a line of demarcation is allowable in a SCA.

ARCHITECTURAL & ENGINEERING REQUIREMENTS FOR CLASSIFIED SPACES

- All classified buffer and ante rooms meet ISO class 7 requirements. ISO class 5 rooms may be specified for smaller classified areas, but cost of mechanical building systems, maintenance and functional use must be thoroughly investigated. Note: Ante rooms only adjacent to positive pressure buffer rooms may be classified as ISO 8.
- Room finishes for Category 1 segregated compounding areas shall be consistent with Category 2 areas.
- Pre-fabricated clean rooms should be considered and meet the requirements mentioned herein.
- Unnecessary walls/partitions within the buffer rooms should be avoided as they inhibit room air circulation and may affect particle counts and viable sample.
- Square footage adjusted upwards from minimum to provide adequate work clearances for multiple PECs and other equipment planned within space. Ideally some additional space for future growth and flexibility.
- Sink and eyewash drench hose should be easily accessible and located outside of the compounding area. Sink must be a minimum of 1 meter from compounding room entrance, and a minimum 1 meter from any PEC or C-PEC. Sink shall be scrub sink grade, all SS, large enough to facilitate washing of hands to the elbow while preventing water from splashing on adjacent walls. Provided with fully encased piping and handsfree faucet.
- All epoxy paint shall be 2-part, non-pre-catalyzed marine grade epoxy, similar to Benjamin Moore Waterborne Corotech V440.
- Caulk all dissimilar materials within segregated compounding and classified areas. All caulking shall be similar to GE SCS 1700 Silicone sealant. Caulk should be applied after general cleaning of the areas is completed. Caulk should be free of dust and debris.
- All surfaces easily cleanable and sealed to prevent accumulation of dust and debris.
- All materials and sealants must withstand aggressive cleaning solutions.
- All exposed fasteners should be stainless steel.
- Eliminate horizontal surfaces wherever possible including door frames, pass thru cabinets, window sills, above hoods, etc. Horizontal surfaces should be reduced by multiple means including the following: flush mounting, vertical soffit, vertical enclosure, or sloped top when vertical surface is not possible.
- Room envelope should be designed to adequately maintain the required room pressurization. All room penetrations must be sealed.
- Smooth seamless flooring with integral cove base and embedded demarcation lines.
- Monolithic, smooth, cleanable, hard surface walls without seams or loose trim joints based on "Altro Whiterock" with seamless welded joints or Crane Composites FRP board with smooth finish & flush-tooled polyurethane sealant joints. Seal corners between wall and ceiling.
- Epoxy painted, drywall ceilings. Juncures of ceiling to walls shall be covered or caulked (sealed) to avoid cracks or crevices where dirt can accumulate. Cleanroom ceiling grid with "drop in" panels are not allowed by Michigan Medicine. Specify gasket and sealed access panels, diffusers and lighting fixtures that are designed for cleanroom use. Minimum access panel size is 24"x24".
- Doors shall be waterproof, completely encased, seamless hinged or sliding aluminum, or stainless steel door with matching welded frame material.
- Automatic door operators shall have touchless door actuators, e.g. hand wave. Provide with concealed closer, hospital tip hinges & hospital stops on frame.
- Closed cell gaskets and/or seals for doors: easily cleanable and not collect debris.
- All pass-throughs between classified, Compounding rooms and non-classified (Workroom) spaces must be stainless steel, have tempered glass (not acrylic), have a HEPA filtered purge, and include interlocking mechanisms to prevent doors on both sides from being opened simultaneously.
- Shedding devices and objects, such as corrugated boxes, shall not be located within classified areas and/or segregated compounding areas. Printers, where required, should have low wall returns adjacent to the printer location to control dust.
- No floor drains or water source allowed in buffer rooms or within the perimeter of an SCA.
- HD drugs must be stored in the C-PEC or HD storage room (negative pressure, unclassified air). HD storage will require space for both room temperature and refrigerated storage locations.

- Radiopharmaceutical Room:**
 - See USP 825 Radiopharmacy guidelines when available from USP.
 - Radiopharmaceutical Compounding must comply with USP 797 and all the requirements outlined in Section 17 of USP 797, Radiopharmaceuticals as CSPs" which includes requirements provided by the NRC and FDA.
 - Radiopharmaceuticals require air containment similar to hazardous pharmaceuticals. Buffer rooms must be maintained at negative pressure (refer to C-PEC standards).
 - These buffer rooms are preferably placed in areas that are adjacent to the clinical functions that they serve (i.e. nuclear imaging and oncology departments).
- Mechanical:**
 - Because of the difficulty in accessing ceiling utilities as well the risks of leaks, utilities located above the ceilings of classified spaces shall be only those that directly serve the classified space. All valves serving plumbing fixtures within the classified space (i.e. anteroom sink) shall be located outside of the classified space, in an accessible location.
 - Dedicated temperature control zone for each classified room. Dedicated HVAC system for each pharmacy (buffer and ante rooms).
 - HVAC systems serving classified spaces shall be fully ducted, no plenum circulation (SA or RA) is allowed.
 - All airflow serving classified spaces shall utilize HEPA filtration at the point of entry into the room, either thru HEPA filtered diffusers or HEPA fan filter units (FFUs), utilizing HEPA type C or J filters. FFU shall be fully accessible/maintainable from room side. FFUs shall utilize SS screen and frame, aerosol challenge port manifold upstream and port downstream of filter (accessible from room side), local/package controls and room-side display of FFU status and alarm. Mount FFU in plaster frame to allow easy removal of FFU. Monitor FFU general alarm thru BMS.
 - External aerosol injection ports in ductwork upstream of FFU's/HEPA filtered diffusers, one per FFU. Pipe injection ports to aerosol injection port assembly mounted in a SS panel mounted in the ceiling of the unclassified pharmacy workroom. Injection ports by CEPA Operations, Inc.

- Sprinklers shall be recessed and concealed type.
- Additional air changes beyond the minimum may be required to reduce microbial counts. It is recommended that AE's should base new designs on 60 AC's within Ante Rm and HD Compounding rooms and 30 AC's within Non-HD Compounding. Recirculation is allowed thru HEPA FFU's within the Ante Rm and Non-HD Compounding Rms. No recirculation is allowed within HD Compounding.
- Ducted exhaust from BSCs to dedicated rooftop exhaust system with 10'-0" high discharge stack. Locate exhaust termination minimum 30' away from any supply air intakes. Room air exhaust from C-PECs also needs to be externally vented with no re-circulation.
- Airflow within classified buffer and ante rooms shall utilize a minimum of two low air return grilles. Ceiling return or exhaust grilles are not allowed. Provide return/exhaust grille inlets behind all refrigerators within classified areas, mounted adjacent to compressors. Where compressors are on top of refrigerator, provide SS ventilated shroud around top of refrigerator.
- BSCs within HD compounding rooms shall be provided with a local alarm for loss of central exhaust airflow via a pressure switch in the exhaust air duct connection to the BSC. Provide gas-light damper immediately downstream of pressure switch to test alarm and commission the BSC.

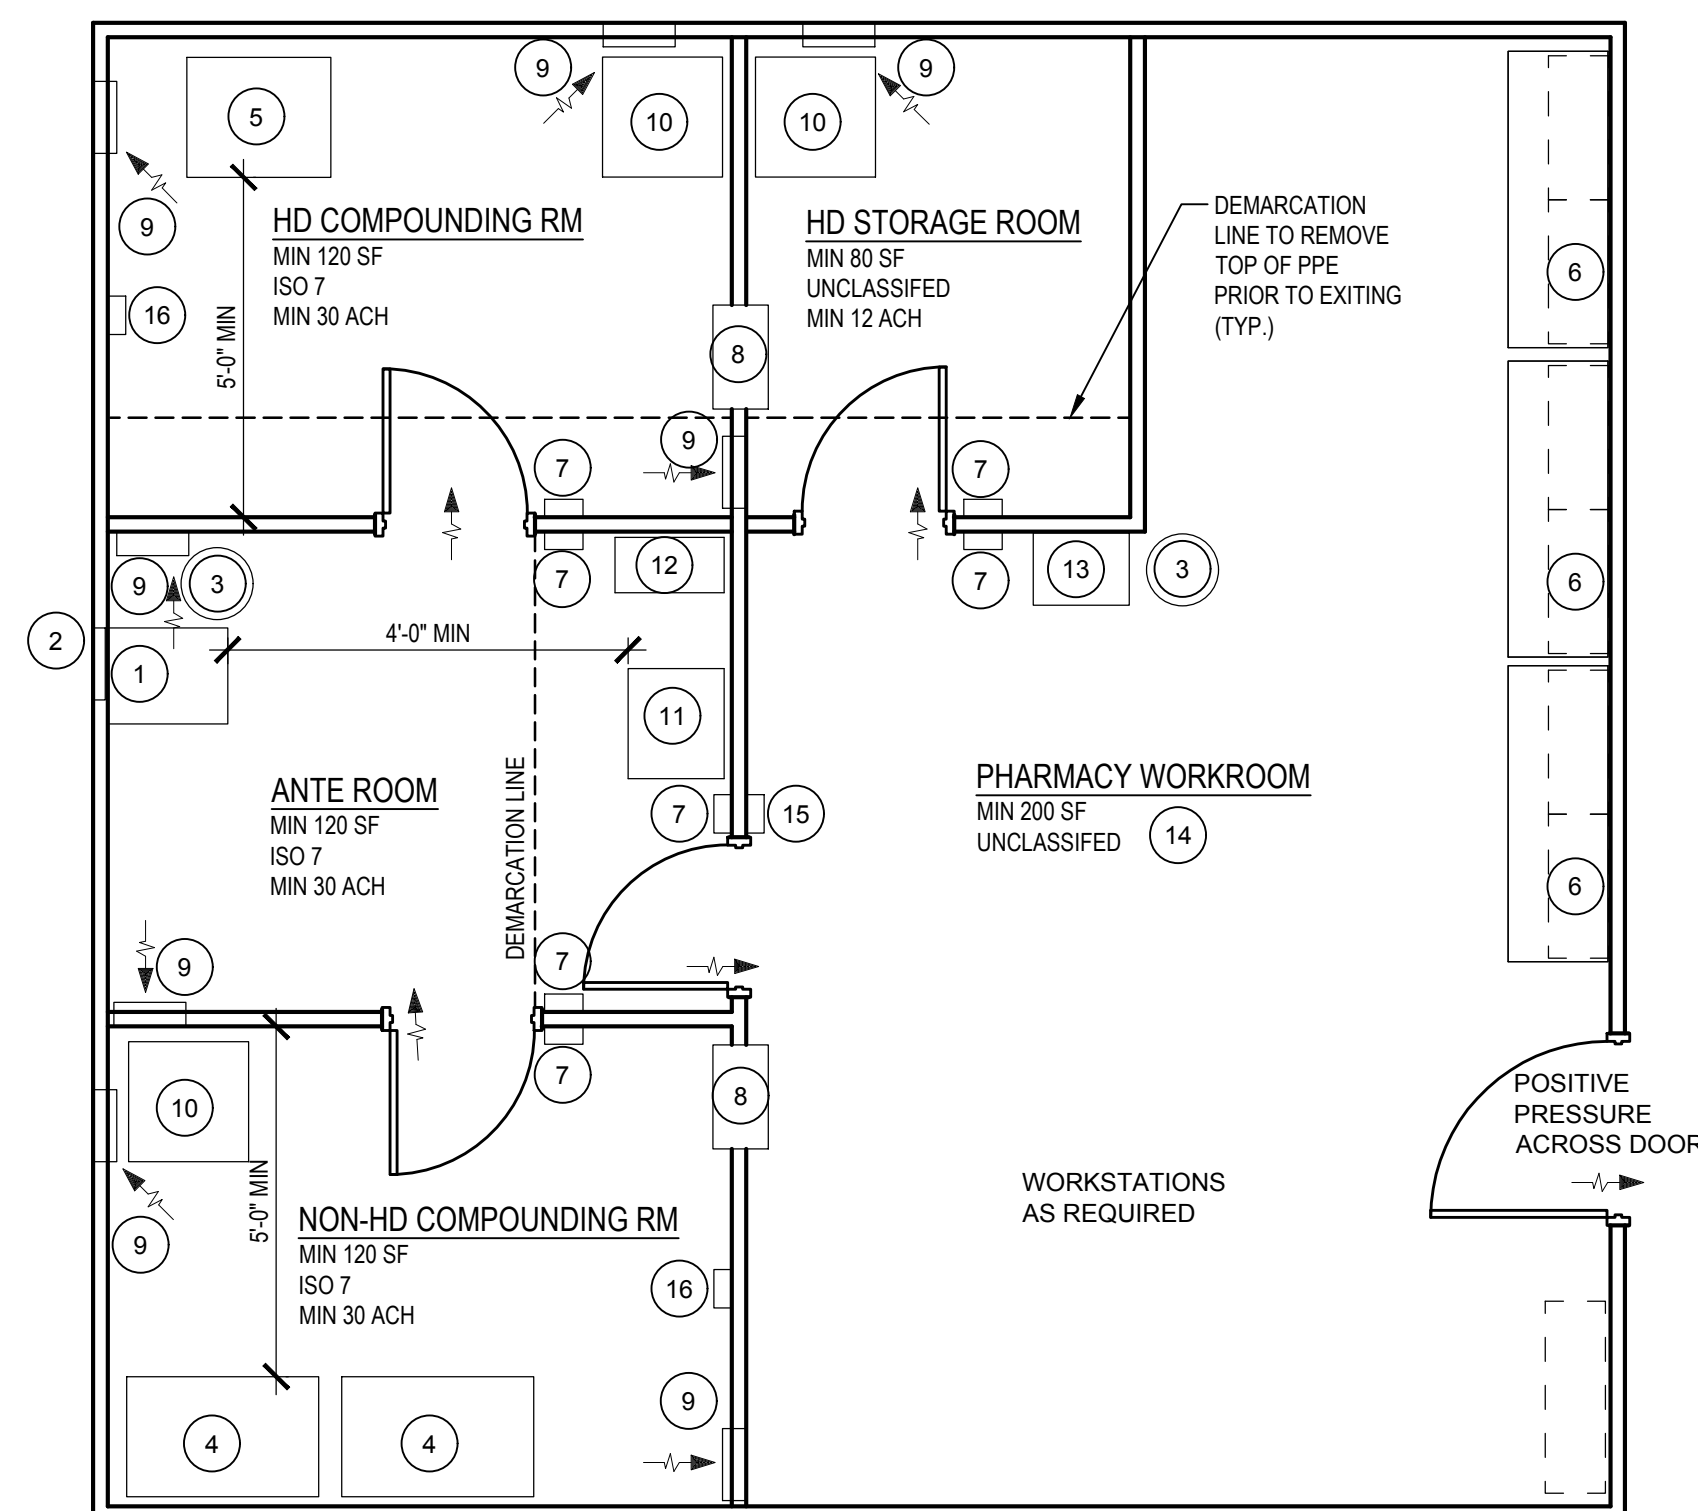

Electrical:

- Lighting Levels: 75 foot-candles for buffer and chemo rooms and 50 foot-candles in the ante room.
- Color temperature of 5000K and color rendering index of (CRI) or 90 for all LED light fixtures.
- Clean room rated light fixtures including gasketed smooth lenses and sealed around the frame to the ceiling. Fixture type: 2' x 4' or 2' x 2' LED. Mount lights in a plaster frame to allow for future maintenance.
- Emergency power for lights, receptacles, HVAC system (fan filter units, supply and exhaust fans, heating and cooling), faucet controls, door operators, monitoring controls, refrigerators and PECs.
- Loss of power can be tolerated for 30 seconds or less; therefore, UPS backup for emergency generators is not needed.
- Provide intercom system within each room (Ante Room, HD, and Non-HD Compounding Rooms, Pharmacy Work Room) to allow communication between occupants, e.g. Stentofon.
- All equipment identification labels and circuit identification labels shall utilize a high-bond adhesive and a thin poly-carbonate over laminate.
- Provide 30 amp circuit for each 6' laminar flow workstation with auxiliary receptacle. Confirm amperage requirements of each PEC/C-PEC location.
- Provide stainless steel covers for outlets and switches. Seal to wall.
- Provide key-lockable disconnect switches for 120V and 208V fan filter units, e.g. Leviton 1222-2KL.

CATEGORY 1 NON-HAZARDOUS COMPOUNDING PHARMACY

CATEGORY 2 COMPOUNDING PHARMACY

KEYNOTE LEGEND

- 1-COMPARTMENT STAINLESS STEEL SCRUB SINK WITH ELECTRONIC SENSOR FAUCET. NO AERATOR, WITH FLOW CONTROL IN THE BASE OF THE SPOUT. NON-SHEDDING WIPES. SIMILAR TO ELKAY EWSF 13026. 30" W x 26" D WITH STAINLESS STEEL SHROUD COVERING ALL PIPING AND INTEGRAL DECK MOUNTED DRENCH HOSE EYEWASH.
- MIRROR
- WASTE BASKET
- PEC: LAMINAR AIRFLOW WORK BENCH, ISO CLASS 5, ON LOCKABLE CASTERS.
- PEC: BIOLOGICAL SAFETY CABINET, ISO CLASS 5, DUCTED EXHAUST. SEAL TO WALL WITH STAINLESS STEEL ANGLE ON TOP, BOTTOM & SIDES TO PREVENT DUST ACCUMULATION. OR LOCATE PEC A MINIMUM 8" FROM THE WALL TO ALLOW CLEANING BEHIND.
- WORKSTATION, EASILY CLEANABLE
- ROOM PRESSURE MONITOR
- PASS THRU WITH INTERLOCKING DOORS
- LOW INTAKE GRILLE, HEAVY DUTY STAINLESS STEEL. LOCATE LOW RETURNS BEHIND ALL PARTICLE GENERATORS (SINK, REFRIGERATORS, PRINTERS, ETC)
- DEDICATED REFRIGERATOR WITH TEMTRACK WIRELESS MONITORING
- PPE STORAGE
- STAINLESS STEEL STOOL OR BENCH WITH OPEN (NON-ENCLOSED) LEGS AND/OR SHELF.
- SINK FOR LIQUIDS DISPOSAL
- ROOM FINISHES IN UN-CLASSIFIED WORKROOM:
 - EPOXY PAINTED WALLS
 - SHEET FLOOR W/RUBBER BASE
 - CLEANABLE CEILING TILES
- ROOM PRESSURE MONITOR DISPLAYING ENVIRONMENTAL DATA & ALARMS (TEMPERATURE, HUMIDITY, DIFFERENTIAL PRESSURE, FFU ALARMS) FOR EACH CLASSIFIED SPACE: ANTE RM, HD COMPOUNDING RM, NON-HD COMPOUNDING RM
- VISUAL INSPECTION BOX

These plans are the confidential property of the University of Michigan. These plans have been provided to you for the limited purpose of bidding and/or providing construction work at the University of Michigan. You acknowledge that these plans are the confidential property of the University of Michigan. You will keep the plans confidential and will not discuss with or provide these plans to any third party, other than those employees, subcontractors, or consultants who are essential to completing your bid and/or work. Unless your company is selected to perform a part of the work, you will destroy all copies of the plans within 90 days of the bid due date.

Pharmacy Space Environmental Monitoring Requirements

Space Type	Minimum Code Criteria			Environmental Design Criteria			Alarming (4) (5)				
	Temperature	Humidity	Room Pressurization	Temperature (1)	Humidity (2)	Room Pressurization (3)	Temperature	Humidity	Room Pressurization- Local	Room Pressurization- BMS	Other
Pharmacy Workroom	Max 72 deg F	30 to 60%RH	Positive	≤72 deg F	≤60%RH	Positive	NA	NA	NA	NA	
Segregated Compounding Area	Max 72 deg F	30 to 60%RH	Positive	≤72 deg F	≤60%RH	Positive	NA	NA	NA	NA	
Ante-Room	Max 68 deg F	30 to 60%RH	≥ +0.02"wc	≤68 deg F	≤60%RH	≥ +0.03"wc	>68 deg F	>60%RH	<+0.02"wc with 1 min delay	<+0.02"wc with 15 min delay	Fan Filter Unit (FFU) status & general alarm
Non-Hazardous Compounding	Max 68 deg F	30 to 60%RH	≥ +0.02"wc	≤68 deg F	≤60%RH	≥ +0.03"wc	>68 deg F	>60%RH	<+0.02"wc with 1 min delay	<+0.02"wc with 15 min delay	Fan Filter Unit (FFU) status & general alarm
Hazardous Compounding	Max 68 deg F	30 to 60%RH	-0.01"wc to -0.03"wc	≤68 deg F	≤60%RH	-0.02"wc	>68 deg F	>60%RH	<-0.01"wc or >-0.03"wc with 1 min delay	<-0.01"wc or >-0.03"wc with 15 min delay	Fan Filter Unit (FFU) status & general alarm
Hazardous Storage	Max 68 deg F	30 to 60%RH	-0.01"wc to -0.03"wc	≤68 deg F	≤60%RH	-0.02"wc	>68 deg F	>60%RH	<-0.01"wc or >-0.03"wc with 1 min delay	<-0.01"wc or >-0.03"wc with 15 min delay	

Notes: 1) Via wall mounted adjustable thermostat
2) Via return duct mounted sensor, accessible location
3) Via Room Pressure Monitor (RPM), adjacent to door, inside & outside of space
4) Room Pressure shall be locally alarmed at respective RPMs. All criteria also locally alarmed at RPM/HMI in Pharmacy Workroom
5) All criteria also alarmed at BMS frontend

Tunnel Division

Tunnel Access/Use Protocols and Work Rules

Table of Contents

Section 1 – Introduction.....	2
Section 2 – Background.....	2
Section 3 – Tunnel Access Requirements.....	3
Section 4 – Policy on Tunnel Access.....	4
Section 5 – Confined Space Protocol	5
Section 6 – Emergency Response Protocol	6
Section 7 – Specific Hazard Work Rules.....	8
Section 8 – Tunnel Access Orientation Acknowledgment Form	9

Section 1 – Introduction

The University of Michigan utility tunnel system is more than six miles long and has more than 200 access points. The security of the tunnel system is paramount due to its connection to numerous campus buildings. Most of the tunnel system is not considered a confined space; however certain sections of the tunnel are considered confined spaces due to excessive heat, possible entrapment conditions and lack of ventilation. Areas of the tunnel not considered confined spaces may still have hazards including heat, restrictive access, poor lighting and ENCAPSULATED asbestos containing pipe insulation in specific areas throughout.

Regarding Tunnel Security – ALL DRAWINGS AND MAPS RELATED TO THE UTILITY TUNNEL SYSTEM ARE CONSIDERED PROPRIETARY AND CONFIDENTIAL, AND ARE NOT TO BE DUPLICATED OR SHARED WITH ANYONE NOT INVOLVED WITH THE PROJECT. PRINTED AND ELECTRONIC COPIES ARE TO BE PROTECTED VIA LOCKED DRAWERS AND PASSWORD PROTECTED ELECTRONIC STORAGE, THROUGHOUT THE PROJECT; AND PROPERLY SHREDDED OR DELETED UPON PROJECT COMPLETION. E-MAIL IS CONSIDERED UN-SECURE AND SHOULD NEVER BE USED TO TRANSMIT TUNNEL DOCUMENTS.

Section 2 – Background

The Tunnel Safety Program is based on the original F&O example, provided by Keith Trombley of OSEH. The goal is to define a program that is not only safe, but also feasible and practical.

To summarize the benchmark requirements, “working” alone in the tunnels is not allowed. “Working” means actually doing work (e.g., using tools, repairing or replacing something, etc.). There is an exception for being in the tunnel alone, if you aren’t going to “work”. Examples of this would be inspecting something, going to find somebody else already in the tunnel, checking the progress of a project, etc. The goal is to not have people working alone, but not being unreasonable by requiring two people for very low risk activities

NOTE AEC Health & Safety Plan policy DOES require use of the “buddy system”, staff and support consultants are directed not to enter tunnels alone.

Other requirements of the program include tracking and accounting for workers in the tunnels. Supervisors are required to know who is in the tunnel, where they are, how to get a hold of them when necessary, and ensure they come out when they are supposed to (e.g. at the end of their shift).

Implementation of this policy helps ensure tunnels remain secure, and as a result, increases the security of the buildings connected to the tunnel system. Various means of monitoring activities in the tunnels will be used to prevent unauthorized access.

Section 3 – Tunnel Access Requirements

All persons working in the tunnels (contractor or University Personnel) must wear a University ID badge at all times. Proximity badges may also be required as part of upgrade tunnel security. Check with UPE to determine if proximity badges are needed in the areas you may be working.

1. Proper Personal Protection Equipment such as but not limited to:
 - Safety Glasses with safety shields
 - Work type boots
 - Long sleeve shirts (natural fiber or fire resistant fabric)
 - Long pants (natural fiber or fire resistant fabric)
 - Gloves-preferably of composition that would resist abrasion and heat transfer
 - Ear plugs (in high volume areas)
 - Dust mask (in high dust areas)
2. Flash light
3. Provide the location of the area you will gather at in the case of an emergency prior to entering the Tunnel System or commencement of a project. This location will be provided to the Utilities Supervisor or his representative. IF AN ESCORT HAS BEEN PROVIDED BY THE DEPARTMENT OF UTILITIES THEN THE ABOVE MENTIONED NOTE 3 WILL NOT BE REQUIRED. THE ESCORTS WILL BE RESPONSIBLE FOR THAT NOTICE.
4. Contractors will provide the following information (via email) for all projects.
 - Names of employees on site (daily) to Utilities Supervisor by email.
 - Names of employees who leave site before end of work shift.
 - Locations of employees.
 - Emergency response plan for work site.

Note: ALL EMPLOYEES SHOULD HAVE PROPER SAFETY TRAINING AND CPR, FIRST AID TRAINING PER UNIVERSITY SAFETY REQUIREMENTS AND OSHA REQUIREMENTS. THE CONTRACTOR'S PROJECT-SPECIFIC SAFETY PLAN WILL REFLECT THESE REQUIREMENTS AS A PART OF THE SPECIFICATIONS FOR THE PROJECT. YOU MAY CONTACT THE UTILITIES SUPERVISOR VIA EMAIL, TO ATTAIN SAID DOCUMENTS IF SUCH HAS NOT BEEN PROVIDED.

Section 4 – Policy on Tunnel Access

The following regulations will be strictly enforced:

- For safety considerations, valves of any size shall not be opened or closed for any reason by anyone except authorized FO-Utilities personnel. Contact DPS 1A in the event of an emergency. Contact the Tunnel Shop – Mike Rhodes (734-320-5310) or Mike Swanson (734-323-9338) or at the FO-Utilities Office – Debbie Olejniczak (734-647-2521) for questions pertaining to utility services.
- All tunnel access is limited to those persons on specific University business that require access to the tunnels.
- All personnel must have authorization from a University representative before entering the tunnels and assumes all responsibility for the safety and wellbeing of its people.
- All access to the tunnels by personnel should be scheduled 24 hours in advance; with the Tunnel Access Orientation Acknowledgement Form (see Section 8) signed and submitted prior to entry.
- The Department of Public Safety (DPS) must be notified (734-763-1131) by all contractors before ANY entry into the tunnels. Identity, work location, and expected duration of work must be provided every day that access is needed. University personnel must notify DPS whenever access is required outside normal business hours (Mon – Fri 6:00 am -4:30 pm). Once DPS is notified:
 - University personnel with tunnel access authorization may proceed to their work.
 - Others without tunnel authorization should contact the Tunnel Shop – Mike Rhodes (734-320-5310) or Mike Swanson (734-323-9338) or the FO-Utilities Office – Debbie Olejniczak (734-647-2521).
- Tunnel hatch access points must be safely barricaded to prevent accidents and unauthorized access. Safety barricades and temporary access provisions shall comply with OSHA and MiOSHA requirements.
- When workers leave the tunnel work site for any length of time and once work is completed, building doors, tunnel hatches, or other means of access must be secured.
- All persons working in the tunnels, University Personnel or Contractor’s must wear a University ID badge at all times. They will at times also be required to wear proximity card badges to be in compliance with the new tunnel security system.
- Contractors must notify DPS when leaving the tunnel site for the day.
- In addition, all persons accessing the tunnels from the power plant must sign in at the control room and state their business, how long they will be there, and if they plan to exit back into the powerhouse or somewhere else in the system. All Central Power Plant protocols shall be adhered to in full.

Section 5 – Confined Space Protocol

Signs identifying permit required confined space MAY OR MAY NOT be in place.

Be aware of tunnel sections that may contain confined spaces. Do not enter any “Permit Required Confined Space” unless authorized to do so by a University representative.

ANY PRE EXISTING CONFINED SPACE AREAS WILL BE IDENTIFIED BY SIGNAGE OR DESIGNATED PRIOR TO PROJECT COMMENCEMENT. ALL SAFETY REQUIREMENTS FOR CONFINED SPACE ACCESS SHALL BE FOLLOWED. ALL CONFINED SPACE REGULATIONS AND PROTOCOLS WILL BE ADHERED TO FOR SAID AREAS

IDENTIFIED, DESIGNATED CONFINED SPACE AREAS WHERE WORK WILL BE CONDUCTED SHALL BE INDICATED PRIOR TO PROJECT COMMENCEMENT. ALL CONFINED SPACE REGULATIONS AND PROTOCOLS WILL BE ADHERED TO FOR SAID AREAS.

Comprehensive training and proper use of equipment are necessary before any person can enter permit required confined spaces. Persons shall always follow their company policies regarding Confined Spaces. Refer to the UM Confined Space Guidelines for further information. Contact EHS to review project specifics as needed.

Section 6 – Emergency Response Protocol

Procedure to Address Emergency Notifications

In the event of an emergency in the Tunnel System, the following protocol will be initiated.

INJURED PERSONNEL:

University Personnel or Contractors may have to initiate First-Aid or CPR then establish communication to request assistance.

In the event of injury or Cardiac Arrest in the Tunnel System University Personnel or Contractor Personnel will exercise the following protocol:

- A. If able to establish Radio Communication, the University Personnel will notify Department of Public Safety (1A University Radio) and request assistance. Alert DPS to the fact that a person has suffered Personal injury or Cardiac Arrest. Begin CPR or Rescue Breathing as warranted or as directed by DPS Dispatcher. Administer First Aid as warranted or as directed by DPS Dispatcher.
- B. If contact is established by phone (911) the university or Contractor Personnel will notify 911 Dispatcher and request assistance. Alert 911 Dispatcher to the fact that a person has suffered Personal injury or Cardiac Arrest. Then begin CPR or Rescue Breathing as warranted or as directed by 911 Dispatcher. Administer First Aid as warranted or directed by 911 Dispatcher.
- C. If unable to establish Radio or Phone Communication, the University Personnel or Contractor Personnel will administer CPR, Rescue Breathing or First Aid as warranted then relocate to an area where communication can be established. After Emergency Personnel have been notified of the emergency, the Crew Member should return to the Incapacitated Personnel and resume CPR, Rescue Breathing, or First Aid As warranted.

NOTE:

CONTACT DPS (1A) FOR ALL INJURY AND/OR UTILITY BREACHES.

UTILITIES SUPERVISOR RESPONSIBILITIES:

If the emergency involves the potentially life-threatening situation (fire, smoke, chemical release, explosion, etc.) the Utilities Supervisor will notify University Personnel, and/ or Contractors, Project Managers that an emergency exist and evacuation is to begin to a safe, Predetermined Area.

University Personnel and/or Contractors will evacuate to a safe area, account for crews and notify the Utilities Supervisor of the Crew's Accountability. The names and last known location of any personnel that are unaccounted for shall be reported to the Utilities Supervisor. The University Radio Channel 8B can be utilized to contact the Utilities Supervisor. Please keep notices brief as there will be most likely be excessive radio communication required. The Utilities Supervisor can also be contacted by phone (734-320-5310). Do not consider a voice mail notice left as adequate communication. Please call until you speak to the Supervisor directly.

PROJECT MANAGERS:

If the emergency involves a potential life-threatening situation (fire, smoke, chemical release, explosion, etc.) the Project Managers will notify their personnel to evacuate to a safe Predetermined Area. The Personnel will be accounted for and will be reported to the University of Michigan Utilities Supervisor or Lead Person.

TUNNEL CREW:

The Tunnel Crew will secure a perimeter around the zone where the emergency exists and will assist Emergency Personnel with access and ventilation of areas if requested to do so. The Tunnel Crew will bring additional barricades and fans to the scene as soon as possible and will utilize them to further secure and ventilate the area if requested to do so. The Tunnel Crew will alter the Tunnel Ventilation only upon request of Emergency Personnel.

NOTICE:

No Personnel will enter the tunnel if a potentially Life Threatening Condition exists, unless requested to do so by Emergency Personnel. Personnel will not attempt a rescue in a Life-Threatening Environment, and will allow Emergency Personnel to initiate this action.

The University will provide the Ann Arbor Fire Department with names and phone numbers for Utilities Supervisor and update the lists as required. The University will also provide the Ann Arbor Fire Department with PDF files of the Tunnel Maps with hatches, PORs, streets, and buildings, and update the files as required.

The Utilities Supervisor or Lead Person will establish contact with DPS Personnel and/or Ann Arbor Emergency Personnel upon their arrival. The Utilities Supervisor will report to the On-Scene Command Post to allow interaction between Emergency Personnel, University Supervision, and The Tunnel Crew. The Utilities Supervisor will also provide Emergency Personnel with radios capable of communicating with University Personnel.

Section 7 – Specific Hazard Work Rules

HOT WORK PROTOCOL:

THE UTILITIES SUPERVISOR WILL APPROVE THAT THE CONTRACTOR IS ALLOWED TO PERFORM HOT WORK IN SPECIFIC WORK AREA(S). THE UTILITIES SUPERVISOR WILL APPROVE WORK AREAS FOR ONE WEEK MAXIMUM. THE LOCATION(S) REQUIRED FOR WORK WILL BE PRESENTED AT THE START OF EACH WORK WEEK TO THE UTILITIES SUPERVISOR FOR APPROVAL (VIA EMAIL). THIS EMAIL MAY BE SENT AT THE END OF EACH WORK WEEK BEFORE END OF THE BUSINESS DAY (3:15 PM) SO AS TO ALLOW SMOOTH TRANSITION (VIA EMAIL) BEFORE START OF WORK THE NEXT BUSINESS DAY. THE CONTRACTOR WILL BE RESPONSIBLE FOR THE COMPLETION OF THEIR DAILY HOT WORK PERMITS. THIS IS A STANDARD REQUIREMENT UNDER NFPA, FACTORY MUTUAL, AND INSURANCE COMPANIES. COPIES OF THE HOT WORK PERMITS WILL BE FORWARDED (VIA EMAIL) TO THE UTILITIES SUPERVISOR. THE UTILITIES SUPERVISOR RESERVES THE RIGHT TO STOP ALL WORK THAT IS NOT COMPLIANT WITH SAFETY REGULATIONS. THE RESULTING LOST HOURS WILL BE THE RESPONSIBILITY OF THE CONTRACTOR AND SAID CONTRACTOR WILL NOT BE REIMBURSED FOR "LOST HOURS" DUE TO NON COMPLIANCE OF SAFETY REGULATIONS.

VIOLATION OF SAFETY PROTOCOLS CAN RESULT IN REMOVAL OF VIOLATOR FROM SITE.

NOTE:

THE UTILITIES TUNNELS ENVIRONMENT TENDS TO BE HIGH HEAT HAZARD IN CERTAIN AREAS. THE AMBIENT TEMPERATURES OF AN ACTIVE TUNNEL AREA CAN BE AS HIGH AS 125+- DEGREES FAHRENHEIT. PROPER HYDRATION IS SUGGESTED. THE FOREMAN FOR THE CONTRACTOR SHOULD MONITOR HIS PERSONNEL CLOSELY FOR INDICATIONS OF HEAT STRESS RELATED DISORDERS.

Section 8 – Tunnel Access Orientation Acknowledgment Form

University of Michigan - Department of Utilities

Orientation Acknowledgement Document

The undersigned acknowledges that he/she has read the Tunnel Access/Use Protocols and Work Rules concerning:

Tunnel System Access Requirements

Policy on Tunnel Access

Confined Space Protocol

Emergency Response Protocol

Specific Hazard Work Rules

The undersigned acknowledges that he/she understands the documents as composed and will abide by the parameters set forth.

Name Printed: _____

Name Signed: _____

Contractor/Shop: _____

Project: _____

Date Signed: _____

(Submit signed form to Tunnel Supervisor, PRIOR to entering tunnels.)

DESIGN GUIDELINE 013100 **COORDINATION**

Scope

All work in ceiling spaces, mechanical rooms, reflected ceiling plans, etc. shall be coordinated to provide maximum accessibility. Consider additional drawing sections or extraordinary construction measures to assure this. Pay particular attention to this when the user and/or other design staff have consciously decided to install mechanical equipment in marginally accessible locations.

Ladders, Catwalks and Platforms

Ladders, stairs, catwalks and platforms should be provided to areas where access is required for inspection or maintenance. Access to fans, balancing and flow control dampers, steam traps, sanitary clean outs, and sensors located high above suspended ceilings are particularly important. Do not rely on walking across duct work to reach these components.

Catwalks and / or platforms should be provided in accessible shafts and plenums for inspection maintenance and/ or future modifications.

In Mechanical rooms arrange ceiling suspended fans with clearance below to allow access from a jack stand.

Drawing Requirements

The A/E must place notes on the drawings, as appropriate, directing the Contractors to coordinate all work to allow free access to mechanical and electrical equipment for servicing. Particular attention must be given to assure access to panels, doors, service entrances, etc.

The removal of other components such as light fixtures in order to service any equipment shall be discouraged. Access routes should not encourage abuse (i.e., stepping on ductwork). The specifications should require that coordination drawings be submitted by the General Contractor for major renovation and new construction projects. These drawings shall clearly show the priority by trade required to assure access to the equipment and devices in the ceiling cavity. Of particular importance is the free access to all variable volume boxes, reheat coils and their controls -- including free and easy removal of the entire box. Nothing shall be located beneath these devices. (Fire protection or other piping is to be offset around the device footprint, etc.) The A/E must witness the construction to assure that the required accessibility is achieved.

Design Professional shall mark access panel locations on plans to promote coordination.

DESIGN GUIDELINE 013639

TREE PRESERVATION

Scope

This document outlines requirements for tree preservation on the University of Michigan campus – including tree surveys, rankings, relocation, removals, replacements and protection.

Related Sections

U-M Design Guidelines

[4.4.1 Landscape](#)

U-M Master Specification Sections:

[MS 7.0 015639 Temporary Tree and Plant Protection](#)

Related Documents

[U-M Tree Preservation Policy](#)

[Vegetation Assessment](#)

Tree Surveys

Tree surveys will be completed during the pre-design phase for campus development projects. The survey will identify existing trees located within the bounds of the site as well as within any surrounding areas that may be affected by the project. The University Forester (UF) shall categorize the trees on the survey as follows:

- Memorial trees (including tree tag #) and their associated plaques
- Trees to remain and be protected (trees ranked 1, 2 or 3+/-)
- Trees that can be relocated (transplanted)
- Trees recommended for removal (trees ranked 1, 2 or 3+/-)
- Trees that are of low quality (trees ranked 4 or 5)

Tree rankings are decided by the UF based on site surveys and/or on-site analysis and the Grounds Services Tree Evaluation Methodology (Methodology). The Methodology, developed by Grounds Services (Grounds) lead staff, is based on International Society of Arboriculture evaluation standards and more than 50 years' combined experience evaluating and maintaining trees on the Ann Arbor campus. The Methodology is used to provide a condensed evaluation of tree quality for planning and construction purposes utilizing a ranking system of 1 to 5. Determining factors in the ranking of campus trees include species, form, health and condition and aesthetic value.

Grounds Tree Evaluation Methodology Ranking:

- 1 – “Significant” Tree
 - High quality species with quality form
 - Excellent health and condition
 - Provides significant aesthetic value to the space
- 2 – “Above Average” Tree
 - Quality/routine tree species
 - Above average form for the species
 - Good health and condition
 - Provides good aesthetic value to the space
- 3 – “Average” Tree
 - Routine tree species
 - Some health or condition problems
 - Average form or some deformation
 - Provides aesthetic value to the space
- 4 – “Below Average” Tree
 - Routine/low quality tree species with below average form
 - More than average health and condition issues
 - Provides little aesthetic value to the space
- 5 – “Poor” Tree
 - Low quality species with poor form
 - Serious health and condition issues
 - Detracts from the aesthetic value to the space

A tree ranked 3 requires one of the following additional categories:

- + : Indicates the tree is young, in good health, and/or provides a horticultural benefit to the site,
- - : Indicates the tree is old, of declining health, and/or is of low quality.

If the preliminary survey includes trees ranked 1, 2 or 3+ or memorial trees recommended to be relocated or removed, it shall be submitted to the Associate Vice President for Facilities and Operations (AVPFO) for approval. The survey shall be accompanied by a written summary prepared by the Campus Planner (CP) and developed in cooperation with the DM and the UF that describes the significance of the trees and the reasons for relocation and/or removal.

When a small woodlot or natural area exists, and it is more efficient for the UF to conduct a visual assessment of the site, the UF shall document the overall quality and variation of species on the site prior to tree removal. A Vegetation Assessment shall be provided by the UF to the CP and DM using an aerial photo or site plan with accompanying notes in lieu of providing a survey. The assessment needs to include the following identifying details:

- Project area, name and location
- Labeled adjacent roadways
- Names of individuals, and their department, who conducted the assessment
- Date
- North arrow
- Ranked trees
- Common and scientific tree names
- Qualitative notes/clarifying comments regarding the site or existing vegetation

The tree survey or Vegetation Assessment as approved, shall be provided to the Design Professional (DP) by the DM. The DP shall develop building and site concepts in accordance with the requirements identified on the survey. Deviation from the tree designations as shown on the tree survey will not be permitted.

Relocation and Removal

Relocation and transplantation of existing trees will be accomplished by either tree spade or by the balled-and-burlapped method. The UF along with the CP will determine the new location.

Removal includes cutting the tree down and debris disposal. The decision to remove a tree ranked 1, 2 or 3+ can only be made by the AVPFO. This includes removals requested during any phase of a project, including the initial design phase and construction operations.

Specific procedures for removal, relocation and replacement include:

- During design, the UF and DM will decide whether the removal will be completed by in-house crews or by the Contractor.
- The DM will give the UF a minimum of two weeks' notice before removals take place, unless there is a safety concern. In these cases, the DM will give the UF as much notice as possible.
- The project responsible for removing the trees will fund the cost of transplantation or permanent removal by cutting the tree down.
- If the Contractor is removing trees, instructions shall be provided that felled trees and all associated debris shall be removed from the project site within 24 hours.

Protection

Existing trees that are to be preserved shall be protected during all phases of the construction project. See MS 015639 – Temporary Tree and Plant Protection Specification.

Specific procedures for protecting trees include:

- The Contract Documents (CDs) shall identify all trees to remain and to be protected, including those outside the construction limit line.
- The protective zone around each tree shall be clearly identified. The protective zone for trees ranked 1 to 3+/- shall not encroach on the canopy dripline unless there is a compelling reason why this is not practical. In such a situation, approval for the deviation must be obtained from the UF and CP.
- For other trees, the protective zone shall extend to the tree canopy drip-line where possible.
- The CDs shall instruct the Contractor that no activity, including parking or storage of materials, will be allowed within the protective zones and that protective fences or other methods of protection will not be moved, removed or altered.
- The UF or designated Grounds representative will be allowed to periodically inspect the tree protection areas for compliance. The UF will contact the university Project Manager with concerns. If there is not sufficient resolution, the UF will pursue higher administrative action up to the AVPFO in a timely manner.

DESIGN GUIDELINE 017329

ROOFING MATERIALS CUTTING & PATCHING

Scope

Scope: Cutting and patching of roofing.

Related Sections

U-M Design Guideline Sections:

6.1 [075000 Roofing Systems and Accessories](#)

U-M Master Specification Sections:

7.2 [017329 Cutting and Patching](#)

Reference Documents:

National Roofing Contractor's Association "Roofing and Waterproofing Manual"

Design and Installation Requirements

Important considerations to remember when specifying roofing cutting and patching are:

Warranty patching work must be performed in a manner which will not void the manufacturer's warranty. Installers must be licensed by the roofing manufacturer to perform patching work. All AEC/ Construction Services improvement projects affecting newer roofs within the first 2 years of installation shall contact the original installers. They carry the 100% labor/ materials repairs. After 2 years the contractor shall be a licensed applicator for the manufacturer for the remaining years on the roof warranty. Design Manager shall provide existing roofing system manufacturer and warranty information.

For asbestos test cuts, worker must have certification for asbestos sampling. Contact OSEH for coordination and procedures.

Roofing contractor shall provide min. 2 year workmanship warranty for patching.

Include the following information in project specifications:

Quality Assurance article of the cutting and patching specification:

Installer Qualification:

Arrange for cutting and patching of roofing systems by firm experienced in similar work, and licensed by manufacturer of roofing system to perform required repair work.

Pre-Construction Conference:

Contractor to arrange, through the Construction Manager and attend a meeting with a representative of roofing firm to determine procedures for cutting and patching roofing system.

In the "Part 2 - Products" portion of cutting and patching specification, include your standard language conveying the following ideas:

Use materials for patching identical to existing materials. Use materials for patching that result in equal-or-better performance characteristics.

In the "Part 3 - Execution" portion of cutting and patching specification, include the following requirement:

Before cutting and patching roofing materials, obtain the Construction Managers approval to proceed.

DESIGN GUIDELINE 017823 **OPERATIONS, MAINTENANCE AND TRAINING**

Scope

Operations and maintenance costs are of prime concern to the University and thus the A/E shall design the systems to be both energy efficient and easily maintainable.

Where justifiable and appropriate, systems and components are to match existing. A written justification for sole-sourcing is normally required in such cases.

Systems are to be simple to operate and designed to fail in the least harmful position. Protect mechanical and electrical services from physical abuse. Provide permanent access routes as appropriate.

Show on plan and elevation drawings required clearances at equipment needed for maintenance.

Related Sections

U-M Design Guideline Section:

[Section 230000 – Basic Mechanical Requirements](#)

U-M Master Specification Sections:

[Section 017823 – Operation and Maintenance Manuals](#)

[Section 230900 – Mechanical Systems Controls](#)

Training Requirements

The A/E is responsible for meeting with the U of M Maintenance Manager (contact the Design Manger) early in the design phase of the project in order to determine the number of training sessions required, and to reflect this in the construction specification. Most training should be conducted both in a classroom and at the system/equipment location.

The need for training will vary, in part depending on the complexity of a system, its uniqueness (at the U of M), and the familiarity of the area maintenance staff with that system, material, or application.

For particular equipment, materials or components, the Contractor or supplier will normally conduct training. For complex systems such as HVAC systems, special lighting controls or communications systems, the A/E must conduct the training so that the design intent can be fully explained. It may be appropriate for systems training to be conducted jointly with a major vendor (e.g., the automatic temperature controls contractor may assist the A/E in presenting an HVAC training session).

Operating and Maintenance Instruction Manuals

Four sets of **job specific** operations and maintenance manuals shall be provided for each project. The construction specifications shall require the contractor to submit job specific O & M manuals a minimum of two (2) weeks prior to any scheduled training. The manuals shall be collected in indexed three ring binders and contain manufacturer's operating and maintenance literature for every equipment item furnished for the project. Generic wiring or piping schematics are NOT acceptable; they must be job specific, reflecting the actual furnished equipment, including all options and interfaces with other equipment or systems.

DESIGN GUIDELINE 033000 **CONCRETE**

Scope

Designing and specifying concrete work including structural, slab on grade, site work, sidewalks, etc.

Related Sections

U-M Design Guidelines:

6.4 [321000 Walks, Roads and Parking Paving: Sidewalks](#)

6.1 [093000 Ceramic Tile and Waterproofing](#)

U-M Master Specification Sections:

7.2 [033053 Miscellaneous Cast-in-Place Concrete](#)

Design and Installation Requirements

Design Requirements

Structural Elements: ACI 318, designed for calculated structural requirements. A/E's may use their own office standards for details such as chamfered vs. square edges. Include the following language in specifications:

Water shall not be added to concrete at the jobsite.

Floors, General: The University supports the use of floor flatness and levelness "F-numbers" as described in ASTM E 1155-87 and ACI 117. Flatness and levelness specified in terms of "1/8-inch in 10 feet" or similar descriptions are difficult to enforce. Job-site quality control will be provided by a testing firm engaged and paid for by the Owner, unless otherwise determined by the Design Manager.

Strength: As required, but not less than 3500 psi at 28 days.

Flat Slabs-On-Grade: Design slabs-on-grade to comply with the following requirements:

- Vapor Barriers: Usually required. Omit vapor barriers only in consultation with Design Manager. The practice of perforating vapor barriers to avoid the phenomenon of "slab curling" is not acceptable.
- Thickness: Comply with the following:
 - General: 4 inches, or greater if required by expected live load.
 - Mechanical Rooms: 5 inches, or greater if required by expected live loads.
 - Strength: As required, but not less than 3000 psi at 28 days.

Equipment Bases and Foundations:

- Minimum Compressive Strength: 4000 psi at 28 days.

Finishes:

- Chamfer exterior corners and edges of permanently exposed concrete.
- Mechanical, electrical, storage rooms etc. shall have clear sealed finish. Rooms that are typically unoccupied and have an exposed concrete floor shall be sealed for easier maintenance.
- Include moisture, alkalinity and adhesion testing in specifications to verify concrete is cured appropriately to accept finishes.

Floor and trench drains:

- Design professional shall provide details, minimum 3"=1'-0" for each type of floor or trench drain. Detail shall include termination of surface finish materials, crack isolation membranes, and waterproofing materials.

DESIGN GUIDELINE 042000 **UNIT MASONRY**

Scope

Guidelines for designing and specifying clay and concrete masonry and accessories.

Face Brick Selection

Brick Selection Process: The Design Manager will coordinate brick selection with the A/E, University Planner and University Architect. Brick selection prior to bidding is required. If cash allowances must be included, be sure to provide for special shapes. Cash allowance prices must be approved by the Director of Construction Management before bidding. Typically the selection process is as follows:

- Step 1 - Early in design phase, determine if a brick selection is required. Discuss with A/E, University Architect and University Planner to determine the criteria / objectives of the selection.
- Step 2 - The A/E shall contact several brick suppliers and formally request a submittal that will meet the criteria/objectives determined in step 1. The brick supplier's submittal shall include a thin 1' x 2' sample and a statement of unit cost along with any necessary specification data.
- Step 3 - The A/E will compile the submittal information and eliminate any submittals that clearly do not meet requirements or criteria. The remaining choices shall be reviewed at the site with the Design Manager, University Architect and University Planner.
- Step 4 - The suppliers of the acceptable samples shall be requested to build a mock-up panel 4' x 4', at the site, for final selection.
- Step 5 - Chosen samples (should seek a minimum of three) shall be included in the specification and bid as a part of the General Contractor's responsibility.
- Step 6 - The specifications shall call for the supplier of choice to build a 4' x 6' mock-up panel, at the site, that will be used for confirmation of match with mock-up panel referred to in Step 4, mortar selection, and installation workmanship. This final panel will be the panel used to measure appearance and workmanship for the project. The specifications must direct the General Contractor to construct the 4' x 6' mock-up panel to match the 4' x 4' panel and to meet certain workmanship criteria. This 4' x 6' mock-up panel must be reviewed and approved by the A/E and the owner. The General Contractor is entitled to include any of the specified brick material in his bid price. In addition, specify that the General Contractor must remove all existing mock-up panels from the site by the completion of the project.

Face Brick Specification

General: Brick complying with the ASTM C 216 face brick standard is not necessarily durable in this climate, nor suitable for installation in every season; nor does C 216 address the important issue of initial rate of absorption. Consequently, the University requests A/E's to modify ASTM C 216 as indicated below.

Modifications of ASTM C 216: Modify face brick standard as follows:

- Strength - As determined by the A/E.
- Type and Grade - Both type and grade must be clearly specified, since the ASTM C 216 default values are not acceptable:
 - Type - Suitable for architectural effect intended, but if other than FBX, coordinate with Design Manager.
 - Grade - SW, in all applications.

ASTM C 216 Table 2 "Physical Requirements" - Add the following Initial Rate of Absorption requirement:

- Initial Rate of Absorption - Not more than 22 gram/min./30 sq. in.; where cold weather installation is anticipated, not less than 6 gram/min./30 sq. in.
- If, during selection process, face brick with an IRA higher than 22 gram/min./30 sq. in is selected in order to match existing face brick, limit the average saturation coefficient to less than 0.74, or alternatively, limit absorption to 8.4 percent. Brick outside these limits has a higher potential for durability problems.

Coring - Modify Article 10 to delete frogged brick. Frogged brick is not permitted since incompletely filled cavities permit moisture to collect, possibly freezing, lifting brick and destroying mortar bond. A 3-core pattern is preferred over other patterns, whenever possible, for improved mechanical keying.

Waivered Brick: Where face brick that has been waived under ASTM C 216 is selected in order to match existing face brick, require manufacturers to submit written certification of acceptable past performance in the local climate.

Finishes Over Face Brick: Do not include painting or waterproof coatings such as silicone over clay masonry units. Specify that brick units with factory applied silicone coatings are not acceptable.

Installation: Some brick exhibits a wide range of color between those brick near the outside of the stack during firing, and those near the inside. Unless masons take care to mix these brick at the site, the resultant effect may be an unpleasant grouping of dark and light colors. Consequently, for brick susceptible to this phenomenon, require that brick be broken out of pallets and intermixed on the site before installation, to ensure pattern randomness.

Cleaning: Avoid specifying acidic cleaners for masonry in areas adjacent to stone surfaces, and where existing landscaping materials may be damaged by run-off.

Concrete Masonry Units (Block)

Standards: No special standards beyond ASTM C 90 requirements.

Mortar for Unit Masonry

Mortar: The University accepts the use of either Portland cement/lime mortar or masonry cement mortar. Calcium chloride is not permitted as an additive.

Mortar Spreading Technique: Specify that mortar be spread using the "beveling" technique described in BIA 21C-78. Beveling helps keep cavities free of mortar droppings, and assists in filling 3-hole brick cores.

Joints: Specify tooled joints in masonry exposed to weather. Avoid the use of raked, struck, or other similar joints in masonry unless units will not be exposed to weather. Require full head joints on brick masonry.

Flashing

Lead and asphalt coated lead materials are not acceptable due to the reputed incompatibility of lead and mortar, and potential toxicity issues. PVC and similar plastic flashings are not acceptable due to brittleness problems caused by stress or loss of plasticizer.

Installation: The following requirements are based on BIA and NCMA recommendations: Mechanically attach flashings to substrate for support. Adhesive attachment is not acceptable. Extend flashing over openings at least 4-inches beyond opening sides and form ends into dams. Carry flashing out of wall to ensure proper function. Because manufacturers of asphalt coated or rubberized asphalt flashings require their products to be cut off 1/2-inch behind the wall face, combination flashings consisting of rubberized asphalt sheet terminating in metal through-wall flashing pans is recommended.

Thin Brick

Installation and use of thin brick products are an option for interior applications only. Care shall be taken in pattern layout and jointing to preserve the look of full depth masonry.

Thin brick installation is not accepted in exterior applications.

Miscellaneous

Weep Holes: Construct weep holes in the head joints in exterior wythes of the first course of masonry immediately above embedded flashings and as follows:

- Form weeps by keeping head joints free and clear of mortar. Cotton wicks and plastic tubes are not acceptable.
- Space weep holes 24 inches o.c.
- The use of brick vents for weep holes is not encouraged.

Cavity Drainage Materials: - Provide free-draining mesh, made from polymer strands that will not degrade within the wall cavity.

DESIGN GUIDELINE 051000 **METALS**

Scope

Structural steel, metal deck, and metal fabrications.

Design and Installation Requirements

Structural Steel

Structural Steel Lintels and Shelf Angles - Lintels and shelf angles provided for support of masonry veneers exposed to weather must comply with the following requirements:

- Units must be hot-dip galvanized after fabrication or stainless steel.
- Leg thickness must be sized for structural loads, but not less than 3/8-inch thick.
- All exposed structural steel, not encased in fire protection, or composed of stainless steel shall be painted.

Metal Roof Deck - All metal roof deck must be hot-dip galvanized (ASTM A 525 G60 coating).

Miscellaneous Metal Fabrications

Guardrails and Handrails - Specify hot-dipped galvanized steel for all exterior locations exposed to weather. Alternatively, stainless steel, bronze, anodized aluminum and other materials may be used with the approval of the Design Manager.

Handrails in concrete paving and walks may be set in sleeves or core drilled holes. Depth of core must be not less than 4-inches deep and of a diameter not less than 1-inch wider than outside pipe diameter. Set rails in non-shrink, erosion resistant grout.

DESIGN GUIDELINE 075000 **ROOFING SYSTEMS AND ACCESSORIES**

General

In general, follow the guidelines below when designing and specifying roofing systems. Unless specifically indicated otherwise, these guidelines are not intended to restrict or replace professional judgment.

Related Sections

U-M Design Guideline Sections:

[3.2 Energy and Water Conservation](#)

[4.8 Fall Protection on Roofs](#)

[6.0 DG 051000 Metals](#)

[8.2 Architectural Preferred Manufacturer List](#)

UM Master Specifications:

[7.0 MS 075316 - Chlorosulfonate-Polyethylene \(CSPE\) Roofing](#)

[7.0 MS 075323 – Ethylene-Propylene-Diene-Monomer \(EPDM\) Roofing](#)

Reference Documents:

ANSI/SPRI VF-1 External Fire Design Standard for Vegetative Roofs

ANSI/SPRI RP-4 2008 Wind Design for ballasted Single-ply Roofing Systems

ANSI/SPRI RP-14 Wind Design Standard for Vegetative Roofing Systems

Roofing Materials

General - Specify that roofing materials for a given project are provided by a single manufacturer, and that all accessory materials be approved by that manufacturer as necessary to obtain the manufacturer's warranty.

Preferred System - Fully Adhered, Single Ply, Black, Ethylene Propylene Diene Monomer (EPDM)

Alternative systems listed below may be preferred for specific applications, such as aesthetics, condition of installation, or chemical resistance. Consult with the Design Manager for advice and consent regarding the use of other systems.

Alternative Single-Ply Systems

- EPDM, White: When considering the use of fully adhered, single ply white Ethylene Propylene Diene Monomer (EPDM) to reduce heat island effects, energy modeling shall be used to determine potential savings for white (high-albedo) vs. black roofs. Discuss results of energy modeling with the Design Manager.
- EPDM, Inverted and Ballasted (IRMA) and CPE: Not acceptable.

- Hypalon (CSPE): Consider fully adhered hypalon systems when resistance to chemical attack is paramount, such as on roofs with a substantial number of fume hood exhaust stacks or where repeated exposure to oil or coolant fluid leakage is likely. Mechanically attached systems are acceptable when desirable for condition of installation.
- Poly Vinyl Chloride (PVC) and Thermo-Plastic Olephine (TPO) Membranes: Acceptable under vegetative roof systems only, 60 mils thick minimum.
- Atactic PolyPropylene (APP) and Styrene Butylene Styrene (SBS) Modified Asphalt Membranes: Not approved for use, except for small roof areas and patching.

Alternative Roofing Types - Other types of roofing systems that may be considered include natural slate, clay tile, asphalt shingle, and standing seam sheet metal roofs. There are currently no explicit University standards for these systems. Comply with manufacturer's and industry standards, and professional judgment for materials and installation.

- Composite materials with the appearance of slate or clay tile are generally not approved for use.
- Multiple-ply built-up asphalt roofing systems are not permitted on campus areas due to objectionable odors.
- Vegetative roof systems are new to the University and are used in select applications. Close coordination with Design Manager is required for system selection and detailing.

Vapor Retarder

Use of asphaltic vapor retarders are not preferred due to objectionable odors.

Walkway Protection - For single-ply roof systems, provide walkway protection from roof access points to all roof mounted equipment requiring routine maintenance. Walkway protection should generally consist of a minimum 100-mil thick EPDM or Hypalon membrane, to match roofing material.

Provide minimum of 4 sq. ft/ of walkway pad directly adjacent to equipment access panel for toolbox and parts to be set down during routine maintenance.

Insulation - Comply with DG 3.2 requirements. Polyisocyanurate is the acceptable insulation material. Insulation products shall be 25 psi minimum. Provide insulation coverboard, 200 psi minimum.

Accessories

- Roof sumps - Specify all cast iron components.
- Roof and equipment hatches - Specify the following minimum requirements
 - Anodized aluminum hatches with insulated double wall lids and insulated double wall curb frames
 - Integral mounting flange and counter-flashing.
 - Heavy duty stainless steel hardware.

- Access ladders - Specify galvanized steel ladders fabricated from tube steel side rails with 1-3/4" tread grip rungs. Extend side rails above top rung. Paint finish optional.

Quality Assurance

Pre-Installation Conference - Require conference for all University roofing projects, including small repair or penetration work. This conference should be attended by, at least, the general contractor, the roof installer, Design Professional and University Construction Manager.

Warranty Requirements - Comply with the following requirements for warranties:

- New Membrane Roofs, Single-Ply Systems: Require a 15 year, single source warranty covering the full roofing system (including all accessories) for materials and labor.
- New Membrane Roofs, Vegetative Roof Systems: Require a 30 year, single source warranty covering the full membrane/waterproofing system (including all accessories) for material and labor.
- Repairs/Modifications: For roofs still under warranty, require that the original manufacturer's material be used and that the installer be approved by the manufacturer. Contractor should notify roofing manufacture with the warranty and University Project Manager in writing of the changes to the roof under warranty.

Design Requirements - New and re-roofing projects

General

- Provide access to all areas of roof.
- All roof work should be watertight and weatherproof, on a daily basis, before contractor leaves the project site.
- Project must comply with the requirements outlined in DG 4.8 Fall Protection on Roofs.
- Maintain minimum of 36" clear between mechanical units and adjacent structures, units, walls etc. for roofing repair and or replacement in the future.

EPDM, White Roofs (and other high albedo roofing systems) – An energy model shall be completed to determine payback and reviewed with the Design Manager. Also, ensure that the following conditions are met:

- Provide dewpoint calculations.
- Specify conductors and wiring, used to control rooftop HVAC equipment, capable to withstand reflected heat from the roof.
- Design placement of rooftop equipment to prevent ice buildup and additional risk for maintenance staff.

Flat Roof Design - Generally comply with good roofing design practices outlined in the NRCA "Handbook of Accepted Roofing Knowledge". Specifically, ensure that the following conditions are met:

- Slope roof as required by Code and not less than 1/4-inch per foot. Pitch roof by either sloping structure or by using tapered insulation.

- Slopes to drain should be unobstructed by above-roof building elements, equipment curbs, or similar objects. Where such obstructions are unavoidable, provide cants, saddles or other means to restore positive pitch to drain.
- Maximize parapet heights and run single-ply roofing materials up, over the top and down the face of parapets beneath stone coping caps and beneath metal trim. Metal coping caps are not preferred.

• Optional Roof Edge Detail **ROOF EDGE DETAIL**

- Specify that no EPDM single-ply membrane field seams be located within 5 feet of sumps (3 feet for Hypalon).
- Specify that no buck laps are permitted anywhere in single-ply roofing membranes.
- Specifically reference Factory Mutual 1-60, 1-75, or 1-90 roof requirements, as appropriate for the application.

Vegetative Roof Design - Generally comply with good roofing design practices outlined in the NRCA "Vegetative Roof Systems Manual". Specifically ensure that the following conditions are met:

- Limit slope design to a 2 to 12 pitch. A sloped structure is preferred to achieve necessary roof pitch in lieu of the use of tapered insulation.
- Provide a 6 foot minimum continuous fire break around roof edge, rooftop structures and rooftop equipment that contain combustible vertical surfaces. Non-vegetative fire breaks should consist of an ASTM E108, Class A system.
- Provide an 18 inch minimum continuous break around roof edge, rooftop structures and rooftop equipment that contain non-combustible surfaces.
- Comply with all manufacturer requirements to maintain warranties for underlayment systems.

- Provide access to at least one fire hydrant.
- Underlayment systems should consist of, at a minimum, a waterproof membrane system, membrane protection, root barrier, drainage/water retention layer, aeration/water retention layer, filter layer and soil substrate.
- Install indigenous and/or adaptive plantings only.
- Inverted insulation systems are not acceptable. Insulation must be installed below the waterproof membrane; the compressive strength must be appropriate for the expected dead and live loads of the selected system.
- Waterproofing membrane should be fully adhered to the substrate, not mechanically fastened or loose laid.
- Membrane flashings should be a minimum of 4 inches above the surface of the growth medium.
- For existing buildings, coordination with a structural engineer is required to determine the live load capacity of the existing structure.
- Structures supporting vegetative roofs should have a minimum live load capacity of 100 pounds per square foot or meet the requirements of the code, whichever is more strict.
- Vector mapping systems are recommended, but not required. For projects including vector mapping, coordinate with the Design Manager.
- Where tray systems are used over an existing conventional roof membrane, membrane protection is required.
- Water test(s) of waterproof membranes prior to installation of subsequent systems is required. Coordinate with the Design Manager.

Equipment Supports for Mechanical and Electrical Equipment and Panels. - Generally, steel support frames are preferred wherever practicable, since curbs tend to interfere with roof drainage. Coordinate the following roofing issues with mechanical engineers.

Steel Frames: Steel angle, channel or wide-flange shape frames with pipe column supports. Comply with the following requirements:

- Carry support legs down to solid structural framing (i.e. steel joists or beams, or concrete beams or deck, if analyzed and known to be structurally adequate). Do not place support legs on metal deck.
- Column supports to be round or square tubes only.
- Minimize the number of legs. For example, use 1 support centered on a gang of pipes instead of 2 wherever possible.

- Design supports for not less than 18 inches clearance above finished roofing surface. 24-inches is preferred clearance where possible and aesthetically permissible for smaller equipment units that can be reached just past center of unit from each side.
- Larger equipment shall be mounted 36"-48" above roof surface to allow for re-roofing and repair of equipment from underside.

Curb Type Supports: Construct curbs of pre-fabricated metal or site-built, preservative treated, lumber.

- For length or width dimensions greater than 48-inches, provide a saddle at the high side of the curb (against direction of slope-to-drain) to prevent water ponding behind curb.
- Generally limit the longest dimension of curb to 60 inches. Use steel support frames where a longer dimension is required.
- Do not use open-ended (two-sided) curbs. These curbs make re-roofing beneath equipment impossible.

Special Requirements - Re-roofing Projects.

Noise and Vibration - Attachment of underlayment, insulation, and other roofing materials may cause noise and vibration problems. This is especially true for applications over concrete roof structures where the structure may transmit noise throughout the building. Consult Design Manager to determine whether special requirements for evening or weekend work are necessary.

Dust Protection - Specify the provision of dust protection over occupant's equipment and furnishings where appropriate. For example, specify protection for top floor areas that are occupied (not penthouses) and that do not have suspended ceilings. Where occupant's activities may be particularly sensitive to dust, specify protection regardless of presence of suspended ceiling. Note that dust protection should be applied and removed in coordination with occupant's operations. Consult Design Manager.

Special Requirements - Construction Projects Impacting Existing Roofs.

Quality Assurance

- Standards: Require cutting and patching work in compliance with University Roofing Department and with recommendations of the National Roofing Contractors Association "Roofing and Waterproofing Manual".
- Installer qualifications: Require that cutting and patching of existing roof systems is completed by contractor licensed by manufacturer of existing roofing system.

Temporary Roof Protection

- Require protective measures for areas of existing roof used for construction access, work, or material storage. 3/4" plywood tied together over 1 1/2" ISO insulation.
- Require filter fabric over roof drains.

DESIGN GUIDELINE 078413 **FIRESTOPPING**

Scope

For University of Michigan Hospitals and Health Centers projects refer to [Design Guideline 078413-H](#).

Properly installed firestopping is critical to the successful fire performance of the building.

Specifications and details (where applicable) for firestopping should be included for both new construction and renovations, whether or not the renovation project involves new penetrations. Survey existing conditions for deficiencies in firestopping and unprotected wall openings, identifying both Code violations and other deficiencies. Present a summary to the Design Manager, who will determine the extent of remediation for each project.

Related Sections

U-M Design Guidelines:

Reference Documents:

Manual of Practice of the Firestop Contractors International Association (F.C.I.A.)

Design and Installation Requirements

Firestopping Design Standards

Include the Manual of Practice of the Firestop Contractors International Association (F.C.I.A.) in the "References" article of the specifications.

Firestopping Product Selection

Select products from recognized manufacturers which have been tested by one of the following agencies: Underwriters Laboratories (UL), or Intertek/Warnock-Hersey (WHI).

Include T and L ratings in addition to F ratings where applicable and/or where required by Code.

Floor Sleeves for Mechanical and Electrical Penetrations

Sleeves are highly recommended for floor penetrations to protect contents on the floor below the penetration from leakage or flooding caused by pipe breaks, sprinkler discharge, etc. In deciding where floor sleeves will be required, the Design Manager will evaluate the level of protection desired in the project and the likelihood of water damage.

Require coordination by the firestop contractor with mechanical and electrical trades so that the proper firestopping systems are selected.

Drawing Requirements

Design Professional to provide project specific details of each firestopping installation.

UL Design numbers shall be included on firestopping details

Inspection of Firestopping Installations

Normally, inspection of firestopping installations will be carried out by UM inspectors. If there are special circumstances, large project with multiple types of applications, which require an independent testing/inspection agency, direction will be given by the Design Manager . If a testing agency is employed, include reference to it in the specifications.

DESIGN GUIDELINE 079200 **JOINT SEALANTS**

Scope

Material and installation requirements for Joint Sealants.

VOC content of joint sealants.

Related Sections

U-M Master Specification Sections:

8.1 [079200 – Joint Sealants](#)

U-M Design Guideline Sections:

[SID 4.2 Building Envelope](#)

Reference Documents:

[South Coast Air Quality Management District \(SCAQMD\) Rule 1168, Adhesive and Sealant Applications](#), amended January 7, 2005 with an effective date of July 1, 2005.

Design and Installation Requirements

General Design Requirements

For each joint, select products with a performance rating which matches the anticipated location, use and design movement of the joint. Detail joints with appropriate backing so that sealants will perform as designed.

To ensure proper adhesion in critical joints specify pre-construction adhesion testing by a certified independent laboratory. Specify primers when necessary to attain proper adhesion to the substrate.

For joint sealants within the weatherproofing envelope specify low-VOC products complying with SCAQMD Rule 1168.

- If the project is expected to encounter extreme temperature and/or humidity conditions, verify whether low-emitting sealants will meet the project's performance requirements. When an exception to the use of low-emitting sealants is proposed, describe in writing the reasons why low-emitting products will not perform adequately.

Provide a Joint Sealant Schedule which lists products for each type of joint, in addition to backing and primers, if required.

Provide details, minimum 3"= 1'-0" scale for each type of building envelope enclosure sealant joint and condition. Termination of vapor retarders and air barriers shall be included.

Fireproofing Joint Sealants

All joints in fire rated construction shall be detailed with a UL Design Number which matches the surrounding construction and the required rating.

DESIGN GUIDELINE 081113 **HOLLOW METAL DOORS AND FRAMES**

Scope

Scope: Hollow metal doors and frames, interior and exterior applications.

Related Sections

U-M Design Guideline Sections:

[6.1 - 08 14 16 Flush Wood Doors](#)

[6.1 - 08 71 00 Door Hardware](#)

U-M Master Specification Sections:

[08 11 13 Hollow Metal Doors and Frames](#)

[08 14 16 Flush Wood Doors](#)

[08 71 00 Door Hardware](#)

Design and Installation Requirements

Exterior Doors and Frames

- Exterior doors and frames, including anchors shall be galvanized: ASTM A653/A653M, commercial quality, G90 coating designation.
- Frame min. 16 Gage
- Provide weep hole openings in bottom of exterior doors to permit moisture to escape. Seal joints in top edges of doors against water penetration.
- Exterior Doors: Provide doors fabricated with thermal-resistance value (R-Value) of not less than 4.0 deg D x h x sq.ft./Btu when tested according to ASTM C 1363.
- Exterior Doors & Frames: Reference ASHRAE Standard 90.1, 5.4.3.2. Doors and Frames labeled certified by the manufacturer. Product shall be tested by NFRC certified lab.
- Frames shall be fabricated with mitered or coped and welded face corners and seamless face joints.
- Fabricate frames as full profile welded.

Interior Frames

- Frames shall be fabricated with mitered or coped and welded face corners and seamless face joints.
- Frame min. 16 Gage
- Fabricate frames as face welded.

Doors

- Reference ANSI A250.8 and A250.4

- Heavy Duty, Model 2 (Seamless) min. 16 Gage face sheets
 - Exterior applicaton
 - Interior application, as needed based on use, potential abuse.
- Moderate Heavy Duty, Model 2 (Seamless), min. 18 Gage face sheets
 - Interior application

Door Frames metal thickness min. 16 gage.

Prepare doors and frames to receive mortised and concealed finish hardware, including cutouts, reinforcing, drilling and tapping.

Shop paint exposed surface of doors and frames units. Verify compatibility with manufacturer baked-on rust inhibitive primer.

Installation

- Apply bituminous coating to non fire rated frame interiors to receive grout fill.
- At masonry and concrete walls solidly fill space between frames and masonry/concrete with grout.
- Metal stud partitions, solidly fill space between frames and metal stud with grout
- Consider installing a conduit for future card reader within grout filled frames.

DESIGN GUIDELINE 081416

FLUSH WOOD DOORS

Scope

For University of Michigan Hospitals and Health Centers projects refer to [Design Guideline 08211-H](#).

In general, follow the guidelines below when specifying wood doors.

Related Sections

U-M Design Guideline Sections:

[6.1 – 081113 - Hollow Metal Doors and Frames](#)

[6.1 – 088000 - Glazing](#)

Design and Installation Requirements

Design Requirements for Flush Wood Doors

Design

Generally, aesthetic considerations are the prerogative of the architect. Consult with the Design Manager concerning visual effects which do not correspond to general design features stated in this guideline.

Quality Standards

Either AWI or WDMA I.S.1-A should be referenced as the quality standard in the specifications. Reference the latest edition of whichever standard is used.

Construction

In general, manufacturer's standard products are acceptable, provided they comply with the following requirements:

- The University's standard interior wood door is solid core, of flush construction, and Custom grade. Consult with Design Manager before specifying stile and rail doors or other construction grades.
- 5-ply cores shall be provided. Hot ply application for veneers are preferred. If cost considerations are paramount cold ply application will be acceptable. Lifetime warranty against delamination is required. Consult with Design Manager to determine appropriate quality level.
- Preference is for factory fitted doors.

Veneers

Do not specify exotic grades of wood with potentially long lead times and significant upcharges.

Glazing

For fire doors with lites, fire-rated safety glazing is required.

Wired glass is prohibited in door applications.

Factory glazing should always be specified for fire-rated openings and non-rated openings.

Finish

Specify factory finishing for transparent finishes. Factory finishing of adjacent wood frames is recommended to maintain a consistent appearance. Opaque finishes may be field painted but should be factory primed. Specify Medium Density Overlay in lieu of wood veneers for opaque finishes.

Fire Doors

Specify prefitting and premachining for fire doors.

Hardware

Factory machine doors for hardware that is not surface applied.

Warranty

Specify a warranty period lasting the life of the door for flush wood interior doors. Do not design doors which will void the warranty because of oversized cutouts or insufficiently sized stiles and rails.

DESIGN GUIDELINE 084113 **ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS**

Scope

This section includes aluminum entrances and storefront. Aluminum windows installed in the storefront are covered in another section.

Use curtain wall framing instead of storefront for extensive exterior applications, particularly in areas where dimensions and configuration would require reinforcement. Typically, specify curtain wall for framing exceeding 12 feet in height.

ASHRAE 90.1-2007, “Energy Standard for Buildings Except Low-Rise Residential Buildings”

AAMA/WDMA/CSA 101/I.S.2/A440-2008: NAFS – North American Fenestration Standard/Specification for Windows, Doors and Skylights

National Fenestration Rating Council (NFRC) Technical Documents

Design and Installation Requirements

Design Requirements for Aluminum Entrances

Single source responsibility - Specify that all of the storefront components, including the glazing, windows and doors, be assigned to a single contractor. In addition, the storefront, windows and doors should be provided by the same manufacturer.

Construction - In general, manufacturer's standard products (with the exception of hardware) are acceptable, provided they comply with the following requirements:

- Storefront System Construction: Thermally broken.
- Door Opening Frames: Applied stops only; blade stops are not acceptable.
- Doors: Medium stile (3-1/2 inch nominal) or wide stile (5 inches or more) doors. Medium stile is preferred. Do not specify thin or narrow stile doors. Comply with current barrier-free code for bottom rail height.

Glazing - Specify glazing per Design Guideline 08 8000 and as follows:

- Exterior storefront and doors exposed to weather: Insulating glass to match window or curtain wall systems.
- Interior storefront and doors: Single pane glazing, unless insulating glass required for acoustic properties.
- Minimum glass thickness for single panes or individual components of insulating glass used in door and storefront systems should be 1/4 inch.
- Specify factory-glazed doors where feasible.
- Carefully coordinate the selection of glazing to achieve appropriate U-value and Solar Heat Gain Coefficient (SHGC) of the assembly. Specify total assembly U-values, not center-of-glass. [SID-D](#) requires designers to investigate the payback for improved U-values and SHGC.

Finish - Typically match window or curtain wall system finish.

- For most new and replacement work, specify 2-coat 70% polyvinylidene fluoride coating. Require 3-coat systems for organic coatings applied to doors.
- For anodized finishes, specify AAMA 611 Class 1 finish, clear or color anodized, as suited to project.

Hardware - Do not use door manufacturer's "standard" hardware for aluminum entrance doors. Comply with requirements of Guideline 087100 "Door Hardware" and Preferred Manufacturer's List.

Other Considerations

Pay careful attention to specifying and detailing connections to adjacent construction, moisture control and the potential for incorporating enhanced thermal performance. Regardless of Delegated Design requirements (see below) for the storefront, the A/E is responsible for the interface between the storefront and the surrounding building (adjacent jamb, head and sill conditions). Perimeter flashing, sealants and insulation, continuity of the air barrier, anchoring and clearances must be thoroughly detailed at head, sill and jamb conditions.

In buildings with higher than typical humidity, perform a thermal analysis of the storefront assembly to ensure that condensation will be avoided on both the frame and the glazing. For buildings with typical humidity criteria it should be adequate to specify a minimum Condensation Resistance Factor (CRF) that takes into account the anticipated interior conditions. Refer to [Design Guideline Section 22 0500](#) for typical mechanical design requirements.

Delegated Design

UM recognizes that it is common practice to specify structural performance criteria for curtain walls and to delegate the actual design needed to meet these criteria to the curtain wall manufacturer. Indicate the design loads and the displacement on the drawings. The A/E should utilize the Delegated Design language in contained in AEC Masterspec Section 084113.

Testing

UM requires the storefront manufacturer to submit documentation of preconstruction testing showing that the designated system meets the performance criteria. If standard systems are being used the manufacturer is allowed to submit standard test reports for that system.

In-place field testing is also usually required for storefront installations. In special circumstances where the storefront is very limited in extent (especially if it is limited to entrance doors and framing), the requirement for in-place field testing may be waived by the Design Manager (DM). Obtain DM's approval in writing if field testing is to be waived. In most circumstances U-M will contract with a testing service for witnessing and validating testing, as well as for performing enhanced field inspections. The actual testing will normally be performed by the Contractor. In order to achieve testing of representative workmanship, samples for testing will be selected on a random basis by the A/E and the testing company (not the Contractor). At a minimum, field testing should be done twice; once fairly early in the installation process and again at the completion of the process.

Refer to language in AEC Masterspec Section 084113 ("Manufacturer Testing" in Part 1 and "Field Quality Control" in Part 3) for appropriate language regarding testing.

DESIGN GUIDELINE 084413 **GLAZED ALUMINUM CURTAIN WALLS**

Scope

This section includes exterior aluminum framing and glazing. Glazing materials and methods are specified in another section. Aluminum entrance doors and windows which may be installed in the curtain wall system are also covered in other sections.

Reference Documents:

ASHRAE 90.1-2007, “Energy Standard for Buildings Except Low-Rise Residential Buildings”

AAMA CW-DG1 “Aluminum Curtain Wall Design Guide Manual”

National Fenestration Rating Council (NFRC) Technical Documents

Design and Installation Requirements

General

Use curtain wall for all significant window wall installations, including multi-story, vertical spans of greater than twelve feet and extended horizontal lengths.

Single source responsibility - Specify that all of the curtain wall components, including the glazing, windows and doors, be assigned to a single contractor. Further, the curtain wall, windows and doors should be provided by the same manufacturer.

Curtain Wall Requirements

The curtain wall design shall incorporate the following features:

- Pressure-equalized system for managing moisture.

- Compliance with the appropriate AAMA and NFRC standards (see “Reference Standards article in AEC Masterspec Section 08 4413)

Other Considerations

Pay careful attention to specifying and detailing connections to adjacent construction, moisture control and the potential for incorporating enhanced thermal performance. Regardless of Delegated Design requirements (see below) for the curtain wall system, the A/E is responsible for the interface between the curtain wall and the surrounding building (adjacent jamb, head and sill conditions). Perimeter flashing, sealants and insulation, continuity of the air barrier, anchoring and clearances must be thoroughly detailed at head, sill and jamb conditions.

Carefully coordinate the selection of glazing to achieve appropriate U-value and Solar Heat Gain Coefficient (SHGC) of the assembly. Specify total assembly U-values, not center-of-glass. [DG 3.2](#) requires designers to investigate the payback for improved U-values and SHGC.

In buildings with higher than typical humidity, perform a thermal analysis of the curtain wall assembly to ensure that condensation will be avoided on both the frame and the glazing. For buildings with typical humidity criteria it should be adequate to specify a minimum Condensation Resistance Factor (CRF) that takes into account the anticipated interior conditions. Refer to Design Guideline section 220500 for typical mechanical design requirements.

Delegated Design

UM recognizes that it is common practice to specify structural performance criteria for curtain walls and to delegate the actual design needed to meet these criteria to the curtain wall manufacturer. Indicate the design loads and the displacement on the drawings. The A/E should utilize the Delegated Design language in contained in [AEC Masterspec Section 084413](#).

Finishes

The preferred finish for most curtain wall work is 2-coat 70% polyvinylidene fluoride paint. For metallic finishes and on doors specify a 3-coat system.

Anodized finishes may also be acceptable for some projects; review with the Design Manager. For anodized finishes specify AAMA 611 Class 1 finish, clear or color anodized, as suited to project.

Testing

UM requires the curtain wall manufacturer to submit documentation of preconstruction testing showing that the designated curtain wall system meets the performance criteria. If standard systems are being used the manufacturer is allowed to submit standard test reports for that system.

In-place field testing is also required for curtain wall installations. U-M will contract with a testing service for witnessing and validating testing, as well as for performing enhanced field inspections. The actual testing will normally be performed by the Contractor. In order to achieve testing of representative workmanship, samples for testing will be selected on a random basis by the A/E and the testing company (not the Contractor). At a minimum, field testing should be done twice; once fairly early in the installation process and again at the completion of the process.

Refer to language in [AEC Masterspec Section 084413](#) (“Manufacturer Testing” in Part 1 and “Field Quality Control” in Part 3) for appropriate language regarding testing.

DESIGN GUIDELINE 085113 **ALUMINUM WINDOWS**

Scope

Aluminum fixed and ventilating windows, including windows which are installed as part of a storefront or curtain wall system.

AAMA/WDMA/CSA 101/I.S.2/A440-2008: NAFS – North American Fenestration Standard/Specification for Windows, Doors, and Skylights

National Fenestration Rating Council (NFRC) Technical Documents

Design and Installation Requirements

General

Follow the guidelines below when specifying aluminum architectural windows and related items. Unless otherwise indicated, these guidelines are not intended to restrict or replace professional judgment.

Design Requirements

Standards

Comply with AAMA/WDMA/CSA 101.I.S.2/A440-08 specifications.

- Minimum performance class: Specify AW performance class windows for both fixed and ventilating units.

- Minimum performance grade: As required by calculated wind speed for location and exposure category.

Single Source Responsibility

Specify that windows, glazing and sealants be the sole responsibility of a single prime contractor regardless of the location within the specification. In addition, the windows should all be the provided by the same manufacturer.

Tests

Require submittal of test reports of a qualified independent laboratory indicating compliance with requirements. Review requirements for in-place field testing with Design Manager. Specify Owner's field testing for installations of more than 10 units.

Engineering

- Indicate structural loads on drawings.
- Specify delegated design submittals, signed and sealed by an engineer registered in the State of Michigan.

Supplemental Performance Requirement

In addition to the requirements in DG3.2 and AAMA class AW, specify units tested to a minimum condensation resistance factor (CRF) based upon anticipated interior temperature and humidity conditions to ensure that there will be no condensation on the window surface.

Construction

Specify thermal-break construction without exception.

Glazing

Require glass surfaces to be located in the same plane, with a tolerance of 1/8 inch.

Carefully coordinate the selection of glazing to achieve appropriate U-value and Solar Heat Gain Coefficient (SHGC) of the assembly. Specify total assembly U-values, not center-of-glass. [DG3.2](#) requires designers to investigate the payback for improved U-values and SHGC.

Refer to Design Guideline 088000 for further requirements.

Finish

Comply with the following:

- For partial renovations and replacement projects, match existing adjacent units to the greatest extent possible.

- For most new and entire building replacement work, specify a 70% polyvinylidene fluoride coating. See PML for acceptable manufacturers.
- Color: In general, specify non-metallic dark bronze. Coordinate other color selections with Design Manager.
- Specify two-coat application technique; or three-coat for applicable colors/metallics.
- Siliconized polyester and similar coatings are not acceptable.
- When an anodized finish is judged appropriate, specify AAMA 611 Class 1 finish, clear or color anodized, as suited to project.

Requirements for Ventilators

General:

- Specify ventilator units with full weather-stripping.
- Specify insect screens for Housing projects and food preparation areas only.

Office Installations: UM standard practice is to provide a minimum of one ventilating unit per office. Review project requirements with Design Manager.

Housing Installations: Specify 6" sash limiters on all residential windows. Coordinate with Design Manager.

Warranty

Require a 10-year warranty on all components of window system.

Other Considerations

Pay careful attention to specifying and detailing connections to adjacent construction, moisture control and the potential for incorporating enhanced thermal performance. Regardless of Delegated Design requirements (see below) for the windows, the A/E is responsible for the interface between the windows and the surrounding building (adjacent jamb, head and sill conditions). Perimeter flashing, sealants and insulation, continuity of the air barrier, anchoring and clearances must be thoroughly detailed at head, sill and jamb conditions.

In buildings with higher than typical humidity, perform a thermal analysis of the windows to ensure that condensation will be avoided on both the frame and the glazing. For buildings with typical humidity criteria it should be adequate to specify a minimum Condensation Resistance Factor (CRF) that takes into account the anticipated interior conditions. Refer to [Design Guideline section 22 0500](#) for typical mechanical design requirements.

Delegated Design

UM recognizes that it is common practice to specify structural performance criteria for windows and to delegate the actual design needed to meet these criteria to the manufacturer. Indicate the design loads and the displacement on the drawings. The A/E should utilize the Delegated Design language in contained in AEC Masterspec Section 085113.

Testing

UM requires the storefront manufacturer to submit documentation of preconstruction testing showing that the designated system meets the performance criteria. If standard systems are being used the manufacturer is allowed to submit standard test reports for that system.

In-place field testing is also usually required for window installations. In special circumstances where the extent of window work is very limited, the requirement for in-place field testing may be waived by the Design Manager (DM). Obtain DM's approval in writing if field testing is to be waived. In most circumstances U-M will contract with a testing service for witnessing and validating testing, as well as for performing enhanced field inspections. The actual testing will normally be performed by the Contractor. In order to achieve testing of representative workmanship, samples for testing will be selected on a random basis by the A/E and the testing company (not the Contractor). At a minimum, field testing should be done twice; once fairly early in the installation process and again at the completion of the process.

Refer to language in AEC Masterspec Section 08 5113 ("Manufacturer Testing" in Part 1 and "Field Quality Control" in Part 3) for appropriate language regarding testing.

DESIGN GUIDELINE 087100 **FINISH HARDWARE**

Scope

Requirements for finish hardware on all doors, including aluminum entrance, fire rated doors, glass doors, and coordination with card readers.

For University of Michigan Hospitals and Health Centers projects refer to [Design Guideline 08710-H](#).

[084113 Aluminum Framed Entrances and Storefronts](#)

[8.2 Architectural Preferred Manufacturer List](#)

UM Master Specifications:

[Section 087100 Door Hardware](#)

[Section 281600 Security System General Requirements](#)

[Section 281300 Access Control & Monitoring System](#)

Design Requirements

General:

- Do not use cash allowance provisions for hardware.
- Include a hardware schedule on drawings or in specifications. Note key side on door schedule.
- Egress:
 - Do not specify locks of any type on fire egress stair doors without approval from Design Manager.
 - Where required stairway door locks that restrict re-entry onto any floor without an exit discharge door will need a fail-safe electrically controlled lever that are connected to the fire panel.
 - Configure doors and select hardware to mitigate the risk of chaining doors together, thus preventing egress and emergency responder access. (e.g. same handing of

entrance door banks, flush mounted panic devices, etc...). Review approach with Design Manager.

- In areas of new construction, locate hardware in accordance with Door and Hardware Institute (DHI) "Recommended Locations for Architectural Hardware for Wood Flush Doors" and "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames." In renovated areas, obtain direction from Design Manager concerning whether to match existing hardware locations or whether to follow DHI recommendations for new construction.
- Trim Styles: Unless otherwise approved by the Design Manager, trim styles used in renovation work should match hardware currently in the building. Contact the Design Manager for information regarding existing hardware.
- Finishes: Unless otherwise approved by the Design Manager, comply with the following:
 - Specify standard uniform hardware finishes throughout the project. Obtain Design Manager approval for custom finishes.
 - For renovation work, match hardware finish of existing units.
 - For aluminum entrances, match the finish color of the door.
- Do not connect door hardware to fire alarm system unless required by code or UMHHC operating procedures.
- Where an interconnection with building fire alarm system is required, comply with the following:
 - Provide interposing interlocks using fire alarm system control modules. Program the control modules to change state only when the fire alarm system actuates.
 - Fire door hold-open devices and door operators: Provide normal (non-battery backed) power from fire alarm system. Upon a fire alarm system actuation or upon the loss of normal power to the fire alarm system, the door hold-open devices and door operators shall be de-energized. Held open doors shall close. Power operator doors shall operate by manual means only. Changes to operation described will also occur during a fire alarm 24 hour battery test. Review operational impacts with Design Manager.
 - Electrically operated access control door hardware: Provide power from access control system. When required, fire alarm system shall provide output relays or control modules to interrupt normal power to the door hold open devices upon a fire alarm system actuation. This means the status of door hardware devices shall remain unchanged during a fire alarm 24 hour battery test, but will change upon a fire alarm system actuation. The sequences of operation for door hardware devices upon fire alarm system actuation shall be defined in the design documents and executed by the

door access control system. Card access control system shall permit the card reader to function for access during a fire alarm condition. Card access control system shall have battery back up power for a minimum of 4 hours.

- Access Control: Provide operational narrative for all electrified door openings, include within hardware set in specifications.

Mechanical Hardware Requirements

Hinges:

- Interior doors (wood and hollow metal): 5 knuckle heavy duty ball bearing hinges with non-removable pins with set screw, not merely non-rising type with knurled pin. Specify steel base material unless there is an expected corrosive environment.
- Exterior doors (hollow metal): 5 knuckle heavy duty brass base metal or stainless steel ball bearing hinges with non-removable pins with set screw.
- Aluminum entrances: Heavy-duty continuous gear hinges.
- Do not specify pivot hinges.
 - Exception: pivot hinges are permitted for use on lead lined and interior all glass doors.

Closers:

- Specify surface mounted units only; concealed closers are not permitted (including aluminum entrance doors).
 - Exception: concealed closers are acceptable at interior all glass applications. Head closers are preferred.
- Door closers shall be cast iron body construction.
- Require closers to be mounted on least public room side of doors.
- Never specify hold-open function in conjunction with exterior building entrances and vestibules.
- Provide closers, adjustable to meet field conditions and barrier free requirements for opening force. Installation requirements shall require that closers be installed and adjusted to meet barrier free opening force requirements.
 - For doors that are part of the primary entrance and discharge, and are on an accessible path for which the closer force must exceed 5 pounds to allow positive latching,

consider the installation of a power assisted door operator in lieu of a pneumatic closer.

- All parallel arm closers shall be provided with manufacturer's heavy duty parallel arm bracket. Regular duty parallel arm brackets are not permitted.
- Doors that are part of the primary entrance and discharge, and are on an accessible, and are connected to the lobby, and for which the closer force must exceed 5 pounds to allow positive latching, then consider the installation of a power assisted door operator in lieu of a pneumatic closer.

<u>Typical Usage</u>	<u>CLOSERS SCHEDULE</u>		<u>LCN Catalog Number</u>	<u>Sargent - Catalog Number</u>
	<u>Maximum Size Interior Door</u>	<u>Maximum Size Exterior Door</u>		
Interior Doors: closer mounted on <u>pull</u> side of door.	Up to 54 inches	n/a	4011 REG	281 O
			4011 H (hold open)	281 H
Interior Doors: closer mounted on <u>push</u> side of door.	Up to 54 inches	n/a	4110 EDA	281 P10
			4110 H-EDA (hold open)	281 PH10
			41110 CUSH (stop arm)	281 PS
Exterior doors, or interior doors where the closer cannot be mounted on the door side of the frame. This closer mounts on the room side of the frame. It requires four inches or more clearance above the door opening.	Up to 54 Inches 60 inches	Up to 48 inches	4021 REG 4021 LONG	281 OZ 281 OZA

Exterior doors, or interior doors where the closer cannot be mounted on the door side of the frame and the mounting space on the frame is less than four inches. Design the door header to avoid this closer when possible.	Up to 54 Inches	Up to 48 inches	4021 w/ 18G plate	281 OZ w/ 281-B plate
Exterior doors and interior doors where hold open is required.	Up to 54 inches	Up to 48 inches	4111 H-CUSH	281 PSH
			4111 SH-CUSH	281 CPSH
			4111 SCUSH	281 CPS

Pulls: Through-bolt all pulls. Do not specify offset pulls on doors unless needed to match existing.

Locksets:

- Specify lever handles on each new lockset. In locations of potential abuse, specify vandal resistant free wheeling lever trim. For locksets with thumbturn locking, specify ADA compliant thumbturns.
- Specify the following standard functions by space type:
 - Offices, laboratories, small conference rooms and other non-classrooms occupied spaces: Office lockset with thumb turn inside (ANSI F04). Specify thumb turn installation that provides vertical orientation for locked / horizontal for unlocked.
 - Classrooms: All classrooms should be lockable from inside the room and provide visual indication of door status on classroom side. Review required function with Design Manager.
 - Mortise lockset type M1 (When locked, door remains locked except by key outside or thumb turn inside): Schlage L9050 with indicator: 09-611 x XL12-431.
 - Mortise lockset type M2 (When locked, door reverts to unlocked when door is opened): Schlage L9056 with indicator: 09-611 x XL12-431.
 - Gender Inclusive restrooms: Privacy lockset with "Occupied" indicator and keyed override. Schlage L9496

- Service areas: Service/store lockset (ANSI F07)
- Provide knurled handle surfaces on doors to hazardous areas. Hazardous areas include mechanical rooms, elevator machine rooms, electrical closets and substation rooms, and stairways.
- Strikes: Specify curved-lip strikes; flat (reversible) strikes are not acceptable. Require extended lip strikes where required to protect door frame from being marred by latch bolt (frequently needed at wood door frames). Specify 7/8 inch lip to center strikes for pairs of doors with an overlapping metal astragal.
- Cores: Specify 7-pin small format interchangeable cores (SFIC). Refer to "Architectural Preferred Manufacturers List" for manufacturers. In limited renovations of existing buildings, match existing core type. Review with Design Manager.
- Construction Keying: For project security, provide a construction core as determined by the Design Manager. Always include construction cores for building entrance doors with cylinders.
- Keying: Include keying and master keying. Specify that keying and master keying will be coordinated with the University Key Office. Indicate keyed side on door schedule.
- Cylinder Housings: Furnish mortise and rim cylinder housings from the same manufacturer as the locksets to be furnished for each project.

Panic Hardware: Either cross bar or push pad type crash bars are acceptable, provided the type selected will meet the requirements of the application. Dogging, where provided, should be hex-key wrench type as opposed to key cylinder type. Exit devices with concealed vertical rods are not permitted in any application. In addition, comply with the following:

- Cross bar type panic devices are only permitted for use on non-electrified applications.
- Single doors: Select rim-type panic hardware; do not specify mortise units.
- Double doors with mullions: Provide rim-type, center latching devices. Preferred locking arrangement for maximum security and minimum maintenance.
- Double doors without mullions: Provide the following exit device types for each indicated application:
 - Aluminum Entrance Doors:
 - Applications without mullions are not permitted.
 - Medium or Wide Stile doors are encouraged. If narrow stile doors are preferred, verify compatibility with required hardware.

- Typically specify a pair of surface vertical rod devices. Omit bottom rods for interior locations without security requirements. Where bottom rod is required, specify ADA compliant rod and latch guard.
- For applications where the doors are required to be both latching and securable, doors with rim and mortise type panic device applications (requiring an active lever handle), provide an exterior-side cylinder that retracts the latch bolt (but will not unlock outside trim) in conjunction with an interior-side, separately keyed cylinder, mounted in the latch head, that will unlock the outside trim.
- Specify pulls in conjunction with panic hardware, except where levers are required for fire-rated devices, or are necessary to match adjacent trim. Do not specify lever handles on public entrance doors to buildings.

Coordinators: Review locking options for pairs of doors to determine if a coordinator is required. Locking configurations that do not require a coordinator are preferred.

Removable Mullions: On double doors, where a fixed mullion is not included, provide a removable mullion. Steel key operated mullions are preferred for durability and security. Aluminum mullions are also acceptable in aluminum entrance systems where preferred for aesthetics. Where provision of a mullion is not considered feasible, provide special exit device hardware indicated above.

Thresholds: Require that aluminum thresholds be cut-in, scribed, around mullions, frame members, and stops, not simply butted to them, to provide a continuous surface across the full width of the opening from jamb to jamb.

Stabilizers: Require stabilizer sets on all aluminum entrance doors and frames.

Door surface protection: Consider kickplates on push side of all doors with closers and armor plates on doors that are in the path of cart traffic. Coordinate the armor plate height with the user's specific cart requirements. Consider providing hardware protection/ shield on doors in the path of cart traffic.

Electrified Hardware Requirements (connected to campus central access control system):

- General:
 - Do not specify magnetic locks or delayed egress devices without prior approval of the Design Manager. For BFS buildings, special locking arrangements require separate submittal to the State.
 - Where feasible, request to exit (REX) switches that are integral in hardware devices in lieu of passive infrared REX devices
- Hardware types / components:

- Electric strikes: Only specify for doors that are equipped with barrier free operators where latching is required.
- Electric mortise lockset: Specify with built-in request to exit switches.
- Electric panic device: Specify with built-in request to exit switches.
 - At all exterior door applications and interior locations where latching is not required, specify devices with motorized electrical latch retraction in lieu of devices that control the locking and unlocking of lever trim.
 - At interior and exterior applications with banks of doors that will be unlocked on a schedule via the access control system, furnish electrified devices for every door leaf in the bank.
 - Interior applications where latching is required, specify devices that control the locking and unlocking of lever trim.
- Specify devices that can be powered from lock power supply at access control panel assembly in lieu of local power supply.
- Electric power transfer (EPT): Provide heavy duty mortise type only. Electrified hinges and door cords are prohibited without prior approval of the Design Manager.
- Power Supplies: Specify power supplies for all electrified hardware to be furnished and installed by the security system integrator. Power supplies are to be located adjacent to the access control panel. **DO NOT LOCATE POWER SUPPLIES AT THE DOOR.**
- Door contacts: Specify 1" recessed door contacts where possible to be furnished and installed by the security system integrator. Coordinate with Div. 28 specifications. Generally, specify a door contact for every exterior door and every door equipped with a card reader. Specify at other locations as directed by the Design Manager.

All Glass Entry Systems

- All Glass Door systems are acceptable for select interior applications and prohibited in exterior entry applications
- Special attention is required for security applications, card readers and room schedulers. Review with security and operations Design Manager and Key office.
- Closers preferred location is at head of door.

Fully Integrated Door Systems – NOT Allowed

- Fully Integrated Door Systems are not acceptable for cross corridor and area separations.
- University of Michigan Key Shop does not support or repair Fully Integrated Doors Systems.

DESIGN GUIDELINE 088000 **GLAZING**

Scope

In general, follow the guidelines below when specifying glazing and related items. Unless otherwise indicated, these guidelines are not intended to restrict or replace professional judgment.

ASTM E2190-08 Standard Specification for Insulating Glass Unit Performance and Evaluation

ASTM E1300-09a Standard Practice for Determining Load Resistance of Glass in Buildings
Insulating Glass Certification Council (IGCC)

Design and Installation Requirements

Design Requirements for Exterior Glazing

General

Specify 1-inch thick, low-e coated, argon gas filled insulating glass in all vertical vision glass panels. Where spandrel glass is used, do not specify units with insulation board adhered to inside surface. Where metal filler panels are used, specify 1-inch thick aluminum sandwich panels with rigid insulation core.

Provide insulating glass units (IG) certified by the Insulating Glass Certification Council (IGCC) and Insulating Glass Manufacturers Alliance (IGMA).

Determine whether heat strengthened glass is required due to the effects of differential shading, tinting/coating of glass, size of units, or other conditions. Typically restrict fully tempered glass to hazardous locations.

Design shall allow option for maximum of one treatment per glazing surface, ie. low e coating and frit on different surfaces.

Tint and Appearance

Most older University buildings, including those with recently retrofitted windows, have non-reflective, bronze tint outer panes paired with clear inner panes. The current standard is insulating units with clear outer and inner panes and solar control low-e coatings which are clear in color. The goal is to maximize visible light transmittance while minimizing solar heat gain. The use of other tints and reflective coatings is discouraged. Review aesthetic, performance and budget implications of glass selection with Design Manager.

In most retrofit projects in which current ceiling heights are lower than the window head heights, use a non-vision spandrel panel composed of a 1" insulating glass unit with an outboard lite matching the tint and coating of the outboard lites in the vision panels and an inboard lite of non-tinted patterned glass. Determine whether the patterned inboard lites require heat strengthening, since patterned units tend to be weaker than clear float glass.

Where bronze tint glass is specified, include bronze anodized spacers unless "warm-edge" spacers are specified. Consider other color coated spacers where appropriate and available.

Require the glazing contractor to submit an adequate number of samples to display the color range of the glass. Because of difficulties with color variation in clear low E glazing, the following language, which is more rigorous than ASTM C 1036 and ASTM C 1376, should be included in the Quality Assurance article of the glazing specification if this type of glazing is included in the Project:

"Sealed Insulating Glass Units: In addition to other requirements in this Section, comply with ASTM D 2244- 09b Standard Practice for Calculation of Color Tolerances and Color Differences from Instrumentally Measured Color Coordinates. Obtain written acceptance by the Architect and the Owner's representative of permissible color tolerance between test specimen and reference and the procedure for calculating the color tolerance for each material and condition of use."

Thermal Performance

Vertical/Slope/Horizontal Glazing

Thermal performance characteristics for all exterior glazing types should be evaluated and selected based on the requirements of DG 3.2, including ECM's.

Since the Energy Code requires that U-value and SHGC maximums be determined for the entire fenestration assembly (not center-of-glass values), U-value and SHGC should ordinarily be specified in the accompanying Div. 8 aluminum framing sections ("Aluminum Storefront", "Glazed Aluminum Curtain Wall" and/or "Aluminum Windows") rather than in the "Glazing" section. Wherever possible, however, utilize very high performance glazing (maximum U-value of 0.3 and maximum SHGC of 0.33)

Other Performance Criteria

- Determine whether control of UV transmittance is required to minimize damage to furnishings, draperies and/or collections. Review with Design Manager.
- Determine whether controlling visual glare is a project requirement and if so, apply appropriate methods to achieve the desired performance.

Low-e Coating

For most vertical glazing apply low-e coating to the second surface of insulating glass units.

For sloped glazing applications apply low-e coating to the third surface of insulating glass units.

Fritted Glass

Use of fritted glass to improve performance and control glare, especially in skylights, sloped, and horizontal glazing, is acceptable

Fabrication and Installation

Specify pre-glazing wherever possible.

There is some evidence to suggest that wet-dry glazing systems tend to perform better over the long run than dry gasketed systems. However, not all manufacturers' products will support a wet-dry system. Verify glazing details with manufacturers. If sealants are to be used, specify pre-construction testing for sealant compatibility and adhesion.

The Drawings and Specifications should include details and requirements for each glazing condition.

Require insulating glass products to be sealed with dual seal method.

Fire Rated Glazing

Use the appropriately labeled fire-rated glazing in doors and windows requiring a fire rating.

Special Warranties

Require special project warranty on insulating glass of 10 years.

Require special project warranty on coated glass of 10 years.

Require special project warranty on laminated glass and dual glazed gel-filled fire-rated units of 5 years.

DESIGN GUIDELINE 092116 **GYPSUM BOARD ASSEMBLIES**

Scope

In general, follow the guidelines below when designing and specifying Gypsum Wallboard Assemblies and accessories.

Related Sections

U-M Design Guideline Section:

[6.1 079200 Joint Sealants](#)

[6.1 099100 Low Emitting Paint and Coating Products](#)

[6.1 093000 Ceramic Tile and Waterproofing](#)

7.2 Interior Finishes in Division 9

Application Review:

- Evaluate project application for materials cost vs. benefit.
 - Abuse resistant gypsum product is more expensive than standard gypsum board. If the standard gypsum is installed in 2 layers it is more expensive than a single layer of the abuse resistant gypsum.
 - Abuse resistant gypsum board shall be installed full height. The finish surface of abuse resistant is slightly different from standard drywall. This finish difference is noticeable in a finished partition.
 - Installing abuse resistant drywall full height, even above the ceiling, is beneficial versus having 2 different board types. It is more cost effective to install full height abuse resistant than to change to another material above the ceiling and risk the wrong product installed.

Design and Installation Requirements

Generally follow design practices outlined in manufacturer's literature and standard industry manuals.

Design non-loadbearing partitions in accordance with steel stud and drywall manufacturer's published recommendations regarding stud depth and gage for each application.

Incorporate steel or plywood sheet backing into gypsum board partitions where required to support equipment, panels, or furnishings, and as otherwise deemed necessary by the Design Manager.

Clearly mark fire-rated and smoke rated assemblies on drawings with either Underwriter' Laboratories or Gypsum Association design numbers, and with required fire rating in hours.

- Partitions shall be marked with UL designation above ceiling to prohibit unauthorized penetrations of mechanical items or conduits.

Design assemblies to provide sound control ratings established by the Project program or by the Design Manager.

Plastic trim is generally acceptable for interior applications, except specify metal trim at outside corners and other locations subject to impact damage.

Material Requirements

Gypsum General: Usually specify gypsum board for partition applications a minimum of 5/8-inch thick; and for suspended ceilings, soffits and fascias a minimum of 1/2-inch thick. Thinner units are acceptable where required for bending, compliance with UL or GA Design requirements, or other design requirements.

Abuse Resistant: Abuse Resistant materials are generally designed to withstand abrasion, which typically occurs when hard objects are dragged along or across a surface. Utilize Abuse Resistant gypsum board products in areas of expected high use and abuse. Material selection shall be evaluated based on type of abuse expected, penetration, indentation, scraping etc.

- Utilize in all high cart traffic corridors, residence floor areas and corridors.
 - Certainteed; Air Renew Extreme Abuse.
 - Georgia-Pacific Gypsum DensArmor Plus Abuse Resistant Interior Panel
 - Continental Building Products [Lafarge]; Protecta AR 100 Abuse Resistant Panels
 - National Gypsum Company; Hi-Abuse Brand XP Wallboard (XP= extra protection)
 - United States Gypsum Co.; Fiberrock Brand Abuse-Resistant Gypsum Panels.

Impact Resistance: Impact resistant materials are designed to withstand dents and punctures when directly struck with hard or heavy objects. Product resistant to surface indentation and penetration.

- Utilize in all public and common spaces, lab facilities and corridors.
 - Certainteed; "AirRenew Extreme Impact Gypsum Board"
 - Georgia-Pacific Gypsum; DensArmor Plus Impact Resistant Interior Panels.
 - Continental Building Products [Lafarge]; Protecta HIR 300 High Impact Resistant Panels.
 - National Gypsum Company' Hi-Impact Brand XP Wallboard
 - United States Gypsum Co.; Fiberrock VHI Brand Abuse-Resistant Gypsum Panels.

Glass Mat Faced: Utilize Glass Mat Faced in wet areas as wall tile backer (toilet or locker rooms with ceramic tile that do not include showers, no pool or sauna areas and not submerged in water). Product is not accepted as a finish product. Verify with each manufacturer if product can be utilized for tile backing.

- Design professional shall evaluate project specific application.
 - Certainteed; “Diamondback Tile Backer”
 - Georgia Pacific Gypsum Corp.; “Dens-Shield Tile Backer”
 - National Gypsum Company; “Gold Bond e2XP Tile Backer”
 - United States Gypsum Co.; “Fiberrock Auq-Tough Tile Backerboard”

Acoustical Gypsum Wall board: Provide gypsum wall board as part of an overall tested, certified system, including sealant, insulation and framing. Provide for specific program driven applications.

- National Gypsum Company; Soundbreak wallboard
- Certainteed; Silent FX
- Quiet Solutions; Quietrock 530

Cement Board: Utilize cement board for substrate in partitions for showers and toilet rooms directly adjacent to showers that are in high humidity areas to receive full height tile applications.

- Reference Ceramic Tile section for further information regarding cement board products, waterproofing and applications.

Flexible Gypsum Wallboard: Utilize at tight radiused applications.

- Georgia Pacific ToughRock FlexRoc Gypsum Board
- USG; Sheetrock Brand Flexible Gypsum Panels

Metal Stud Framing

Provide framing gauge as needed for partitions on a project specific basis.

- Provide studs with cut outs to accommodate conduit.
- Dimpled studs are acceptable provided they can accommodate deflection criteria established by design professional.

Metal Stud Framing Size Guidelines:

- Provide 3 5/8” minimum metal studs for interior office partitions and general spaces.
- Provide 4” minimum metal studs for interior partitions where there may be large conduit runs or as required by height requirements for partitions.
- Provide 6” minimum metal studs for interior partitions at locations with mechanical piping / plumbing located within the partitions.

DESIGN GUIDELINE 093000 **CERAMIC TILE AND WATERPROOFING**

Scope

Scope: Material selection, substrate selection, waterproofing choice, and installation.

Related Sections

U-M Design Guideline Technical Section:

6.1 [Section 092116 Gypsum Board Assemblies](#)

U-M Master Specification Sections:

7.2 [Section 092116 Gypsum Board Assemblies](#)

7.2 [Section 093000 Tiling](#)

Reference Documents:

TCNA “Tile Council of North America” for tile installation and guidelines.

Design and Installation Requirements

Material selection -

When selecting tile for installation consider the intended use, long-term installation, cleanability and application. Special attention is necessary in areas such as food service, toilet rooms, showers, and serveries. In areas with a presence of water or grease evaluate appropriate slip resistance factor.

Tile Substrate Application –

- Cementitious Backer Unit – Backing and underlayment material that can be installed in wet or dry locations. Suitable for floor, wall and ceiling applications. Cement board is recommended in high moisture (not submerged in water) areas to receive full height ceramic tile.
 - Typically installed in community toilet rooms, housing toilet rooms, and shower rooms. Cement board is more expensive and durable than gypsum based products. Although cement board is more costly than gypsum board products it provides a higher performance as a tile substrate.
- Coated Glass Mat Water-Resistant Gypsum Backer Board – Backing substrate for wet and dry applications. Suitable for floor, wall and ceiling applications.
- Fiber-Cement Underlayments – A dispersed fiber-reinforced cement backer and underlayment that can be installed in wet or dry areas. Suitable for floor, wall and ceiling applications.

- Fiber Reinforced Water Resistant Gypsum Backer Board/ Underlayment – Backer board/ underlayment conforming to ASTM C1278, can be installed in wet or dry areas. Suitable for floor, wall and ceiling applications.

Waterproof membranes- Membranes may be single or multi component liquid applied or a sheet membrane.

- ANSI A118.10 Compliant
- Liquid applied is preferred in areas with multiple corners and drains for increased coverage and ease of installation.
- Utilize under tile in toilet rooms, laundry rooms, dining facilities, shower rooms, any area that is near a water source that could flood or over flow. Install in areas that receive frequent mopping and cleaning.
- In shower areas and areas to be frequently power washed install waterproofing full height behind tile.

Crack Isolation membranes- Install crack isolation membranes in areas of existing slab on grade or concrete on metal deck. Utilize in areas with existing cracks in slabs. Refer to manufacturer recommendations for size of cracks that can be accommodated. Membrane isolates tile from in-plane substrate cracking.

- ANSI A118.12

Installation Requirements: Specify the Following

Water Testing – A water test is required to be performed at completion of waterproofing installation and again at completion of tile application. Drains shall be plugged and room flooded with minimum 2” of water for minimum 24 hours. If no leakage is evident from underside of slab or adjacent floor areas continue with next stage in construction. Note, water testing is required at every shower/ drain location.

Waterproofing installation at wall location – Waterproofing from floor application shall return up wall 6” and overlap wall waterproofing by minimum 4”.

In all cases where spillage or flooding is possible, caulk around all new and existing through-floor pipe and sleeve penetrations. Coordinate sealing requirements with mechanical engineer.

Specification Format

In specifications include a tile installation schedule to include the type of installation, tile, grout mortar and specific information for each type of tile. One source documentation that

includes everything the contractor will need to bid, purchase and install each type of tile included within a project.

When specifying ceramic tile follow format below:

3. __ Interior Tile Installation Schedule

A. Type of installation (Interior Floor Installations, Concrete Subfloor, wall installation etc.):

1. (description: wall, floor, ceiling etc.) Tile Installation (insert TCNA # if applicable):

Description

- a. Tile Type: utilize same abbreviation as shown on finish schedule
- b. Thin-Set Mortar: type of mortar
- c. Grout: Type of Grout
- d. Other specific information about tile install, i.e., pattern, membrane installation etc.

DESIGN GUIDELINE 095100 **ACOUSTICAL CEILINGS**

Scope

This section provides guidance for designing and specifying acoustical ceilings. Reference Design requirements below for oversized or specialty type panels.

For University of Michigan Hospitals and Health Centers projects refer to Design Guideline [095000-H: CEILINGS \(09510-H\)](#).

Related Sections

U-M Master Specification Sections:

[7.0 MS 220500 – Common Work Results for Mechanical](#)

Design and Installation Requirements

Submittals

For buildings subject to the jurisdiction of the State of Michigan Bureau of Fire Services (Instructional Spaces and Dormitory Spaces), include requirement for Affidavits of Compliance.

Design Requirements

In general, exposed grid suspended ceilings are preferred over concealed systems. Avoid spline and other non-accessible systems when any mechanical systems or equipment will be concealed above ceiling.

There are currently no standardized product types for acoustic panels. However, the following general guidelines apply:

- 2 foot by 2 foot panels are preferred over 2 foot by 4 foot panels.
- Rabbeted edge panels are preferred except where economy is paramount.
- All cut edges of tile shall be painted to match exposed surface color.
- 3/4 inch thick panels are preferred over 5/8 inch panels.
- If the acoustical ceiling has multiple levels, provide metal trim transitions between levels by ceiling manufacturer. Vertical application of ceiling tile is not acceptable.
- Fiberglass panels are not acceptable.
- Where possible, specify humidity-tolerant acoustical panels carrying a minimum 10 year warranty.
- Specify gypsum board or other washable panels and moisture resistant grid in food service areas. Product shall be certified for intended use, ie. USFDA for food service.
- Oversized or large format ceiling tiles and panels are allowable with caution. Due to panel size most panels in an application end up with at least one item,

diffuser, sprinkler, light etc. anchoring them down. This creates a ceiling plane that is virtually inaccessible. Large format panels are also susceptible to sagging long term. A thoroughly designed system that accounts for long term rigidity and accessibility would be accepted. Large format panel applications shall be reviewed with Design Manager.

Where ceiling-mounted items obstruct the regular spacing of hanger wires, design "trapeze" structures with additional steel supports to bridge the obstruction.

DESIGN GUIDELINE 096229

CORK FLOORING

Scope

Applications and design considerations for cork flooring in University buildings.

References

South Coast Air Quality Management District (SCAQMD) Rule #1168, corresponding to an effective date of July 1, 2005 and rule amendment date of January 7, 2005.

Applications

Cork is comfortable, reduces noise, and can have sustainable properties. As a natural wood product, it is not suitable in all locations. Do not specify for locations with any of the following characteristics:

- Chemical exposure from occupant activities or cleaning requirements
- High sun exposure - cork will fade in direct sunlight
- Building entries with high foot traffic and salt / snow
- Potential for standing water
- Locations with high point loads

Design Requirements

Wear surface density: Minimum 30 lbs per cubic foot

Thickness: Engineered material of sufficient thickness to allow product to be sanded and refinished on a 3-5 year cycle. Expectation is floor can be sanded and refinished 2 or 3 times prior to replacement being required.

Finish: Specify the following:

- Raw cork for field finishing
- Multi-component high performance polyurethane coating - 3 coats minimum. Coating shall be recommended in writing by flooring manufacturer.
- Note that installer qualifications, substrate preparation, and dry times between coatings are critical for material performance.

Sustainability requirements

VOC content – Follow the requirements of SCAQMD Rule #1168 regarding VOC content of flooring adhesives and finishes.

DESIGN GUIDELINE 096500 **RESILIENT FLOORING**

Scope

Scope: Material selection, VOC content, installation, and cleaning of resilient flooring.

For University of Michigan Hospitals and Health Centers projects refer to [Design Guideline 096500-H](#).

Related Sections

UM Master Specifications:

[7.0 MS 096500 Resilient Flooring](#)

Reference Documents:

South Coast Air Quality Management District (SCAQMD) Rule #1168, corresponding to an effective date of July 1, 2005 and rule amendment date of January 7, 2005.

Design and Installation Requirements

General - Given the wide variety of flooring materials and applications throughout the University, there are no widely applicable standards for flooring selection. Consult the Design Manager for specific types of flooring to be used.

Demolition - In the event that existing resilient flooring or adhesive contains asbestos, consult the Design Manager.

Laboratories - Several campus units require use of sheet vinyl floors with heat welded seams and integral, coved base to contain spills in laboratories. Consult the Design Manager for specific types of flooring and installation standards to be used.

VOC content – Follow the requirements of SCAQMD Rule #1168 regarding VOC content of flooring adhesives. Avoid the use of chemical welding for sheet vinyl seams unless necessary for project, since the products used for this purpose tend to have very high VOC content. For LEED projects, use products complying with the FloorScore standard unless there are special requirements which necessitate the use of a noncompliant product.

Installation - In all cases where spillage or flooding is possible, caulk around all new and existing through-floor pipe and sleeve penetrations. Coordinate sealing requirements with mechanical engineer. In general flooring shall be installed under casework.

Cleaning - Specify that the contractor clean floors of construction debris, dirt and grease as a requirement of Substantial Completion. The contractor must not wax new flooring; the University will clean, seal and wax floors as necessary after acceptance.

DESIGN GUIDELINE 099100 **LOW EMITTING PAINT AND COATING PRODUCTS**

Scope

VOC content of paints, coatings and wood finishes products.

Related Sections

U-M Master Specification Sections:

[099100 – Painting](#)

Reference Documents:

Green Seal Standard GS-11, Paints, 1st Edition, May 20, 1993

Green Seal Standard GC-03, Anti-Corrosive Paints, 2nd Edition, January 7, 1997

South Coast Air Quality Management District (SCAQMD) Rule 1113, Architectural Coatings, rules in effect on January 1, 2004

Design Requirements

Follow the guidelines below when selecting and specifying paint products. Use low-VOC products complying with the referenced standards except when circumstances conform to the stated exceptions.

- For interior paints comply with Green Seal Standard GS-11, Paints, 1st Edition, May 20, 1993.
- For anti-corrosive coatings comply with Green Seal Standard GC-03, Anti-Corrosive Paints, 2nd Edition, January 7, 1997.
- For wood coatings comply with SCAQMD Rule 1113 in effect on January 1, 2004.

White board, chalk board and idea paint types of finishes shall have clearly marked boundries to avoid damage to adjacent standard painted surfaces.

Design professional shall verify compatibility of primer and finish paint, coating etc.

Exceptions: Obtain the written permission of the Design Manager for all exceptions.

- Animal rooms.
- Areas subject to standing water or extremely high humidity.
- Exterior paints and coatings.

DESIGN GUIDELINE 101400 **SIGNAGE**

Scope

Designing and specifying signage and accessories.

For University of Michigan Hospitals and Health Centers projects refer to [Design Guideline 101400-H Signage](#).

Related Sections

U-M Design Guideline Section:

[2.4 Drawing and Construction Document Standards](#)

Reference Documents:

[Style Guide: Colors The Official University of Michigan Colors](#)

[Campus Wayfinding and Signage Guidelines](#)

[University of Michigan Emergency Preparedness](#)

Design and Installation Requirements: Exterior Building Signage

New construction is to include appropriate exterior signage in the form of free-standing UM standard blue and white building ID signs. Consult Design Manager for required quantity, locations and additional information regarding ID signs. All major renovations will also include the upgrade or replacement of existing building ID signs, as the condition of the existing sign(s) warrants. The design, wording, placement, materials, and installation details of exterior signage must be approved by the University Planner's Office.

Consult the Design Manager for information regarding permanent signs on buildings. The Planner's Office will provide policies and guidelines regarding allowable signage on exterior walls, doors and windows of buildings and the design, wording, number, placement and materials of such signage.

Each University facility shall identify its accessible building entrances with the international symbol for accessibility. Additionally, signage is required at inaccessible entrances to direct users to an accessible entrance or to a location at which they can obtain information about accessible facilities.

Design and Installation Requirements: Interior Building Signage

General

Provide signage per code requirements and as noted here. If there is a conflict between these requirements and code requirements, code requirements supersede.

For renovation projects, consult Design Manager for information regarding existing room signs and extent, type, and supplier of new room signs. Usually, where one or only a few new signs will be installed, new signs should match existing signs. However, in areas where only a few signs will be installed, designers should evaluate the feasibility of replacing old, non-compliant signs with new signs in the visibly contiguous area.

For large construction projects (major renovations, additions, and new buildings) the materials and design of new signs are to be selected to be compatible with sign standards of the college or department which will manage the proposed facility.

Signage Characteristics and Room Identification

Permanent room numbers and permanent room types are to be indicated on room signs as both tactile and raised Braille characters. Indented characters shall not be used. Braille characters may be located within an incised area on the face of a sign. Locations that include a permanent room name are limited. Coordinate extent with Design Manager.

Where International Symbol of Accessibility is required, specify raised pictogram.

Restrooms, locker rooms, shower rooms, and other rooms that have both gender specific and gender inclusive facilities require specific room names, pictograms, and text that directs occupants to other facilities in the building. See appendix A for additional graphic information. Appendix drawings are not standard details to be used with editing nor do they show every possible permutation. Edit as applicable for project detail; however, do not use room names, pictograms, or additional text that is not expressly permitted in the appendix. If specific project requirements require changes to standard language or pictograms outlined in the appendix, review specific application and proposed changes with Design Manager.

Personal room and lactation room signs shall be titled “Personal Room” or “Lactation Room” without reference to gender. Provide pictogram as shown in appendix B.

Emergency Evacuation Maps

New construction and major renovation projects are required to include emergency evacuation maps as part of interior signage package. Consult Design Manager, who shall obtain standards from the Office of Emergency Preparedness.

Building Directories

New construction projects are encouraged to include building directories as part of interior signage package. Major renovation projects are also encouraged to upgrade existing and/or install new building directories. Consult Design Manager for guidelines and standards.

Room Number Assignments

Generally include room number signs for newly created or consolidated rooms and areas. In some cases, rooms to be remodeled and rooms within new additions cannot be assigned new

numbers without renumbering rooms outside the project area. In these cases, provisions for new signage outside the project area should be included in the construction project.

Room numbers are assigned by the University's Manager for Space and Facilities Information in Architecture Engineering and Construction (AEC). Only University designated room numbers are to be indicated on construction drawings. Consult Design Manager.

Laboratory Safety Signage

University standard laboratory safety signage is required at the entryway of each main research laboratory space where hazardous materials are stored and/or used. Additionally, signage is required at special use inner rooms where hazardous materials exist, including but not limited to: environmental, procedure, tissue culture, weighing, and pilot production. Safety signage is not required for dedicated waste storage/transfer rooms within large research buildings or animal holding/containment rooms which have a separate signage system developed specifically for the animal handlers. Review required locations with Design Manager.

Construction projects should include 8.5" x 11" clear acrylic holders (portrait orientation) outside of laboratories, typically located on the latch side of the door, below the room identification sign. Safety signage inserts will be provided by the academic unit, the facility management, or UM EHS.

Some existing laboratories have 10" square safety signage. Renovation projects are required to replace old safety signage within the renovated area and are encouraged to replace old signage in the visibly contiguous area. Review with Design Manager.

DESIGN GUIDELINE 102113 **TOILET COMPARTMENTS**

Scope

Designing and specifying toilet compartments.

Related Sections

U-M Design Guideline Section:

[6.0 DG102800 Toilet Accessories](#)

[8.0 Preferred Manufacturers List](#)

Design and Installation Requirements

Generally, ceiling hung partitions are preferred for ease of cleaning. Coordinate ceiling hung units with supplemental structural steel support work. Steel support shall be designed by a structural engineer to resist rotational forces as well as weight concerns. Unbraced channels are not sufficient to stabilize panels.

Ceiling hung partitions are not recommended for ceiling heights in excess of 8'-0". Where ceiling suspended units are not feasible, provide floor supported units with headrail bracing at door openings. Wall and floor cantilevered units are generally not as stable and should be avoided.

Urinal screens shall be wall mounted to provide visual privacy and allow for ease of cleaning of floor below. Floor mounted option shall be reviewed with Design Manager.

Material Selection:

Provide Class A or Class B fire rated materials. Design Professional shall determine compliance of material required based on occupancy and use. Note Class A material is substantially higher cost and should only be specified if required by code. Otherwise provide Class B materials for cost saving and larger selection of product available.

Panel thickness shall be industry standard for material chosen.

- Painted Metal Panel: Constructed of galvanized steel with a high-grade synthetic enamel or powder coated finish.
 - Economical partition material.
- HDPE (High Density Polyethylene): Constructed from 1" thick high density polyethylene with homogenous color.
 - Preferred for housing and campus building projects
 - Mid-range partition material.
- Phenolic: Constructed of a solid phenolic core with a high-pressure decorative matte surface finish as an integral part of the core material.

- Mid-range partition material.
- Stainless Steel: Constructed of minimum 20 gauge panels.
 - Premium partition material.

Hardware and Accessories:

- Provide stainless steel hardware with tamper resistant fasteners.
- Hinges: Either surface-mounted or cutout inset type, adjustable to hold door open at any angles up to 90 degrees.
- Latch and Keeper: Provide slide latch unit, with provision for emergency access.
- Barrier Free Latch and Keeper: At each out swinging partition door, in addition to standard hinges, coat hook and other specified hardware, provide manufacturer's standard ADA-compliant latch and keeper. In addition, provide the following:
 - Handles: Provide manufacturer's standard ADA-compliant pull handles on both the interior and exterior sides of partition doors.
 - Barrier-Free Latch and Keeper shall allow user to close and secure the door with a single motion of one hand.
- Coat Hook and Bumper: Mfr's standard unit, rubber tipped.
- Purse Shelf: Stainless steel pull down purse shelves are desirable in women's toilet compartments.
- Door Pulls: Mfr's standard, exterior of standard stall doors and both sides of barrier free stall doors.
- Brackets and fittings shall be stainless steel.

DESIGN GUIDELINE 102800 **TOILET ACCESSORIES**

Scope

Designing and specifying toilet Accessories.

For University of Michigan Hospitals and Health Centers projects refer to Design Guideline 10810-H available at:

<http://www.med.umich.edu/facilities/plan/dg/06/doc/a/102800H.pdf>

Related Sections

U-M Design Guideline Section:

[6.0 DG 102113 – Toilet Compartments](#)

[5.10 Gender Inclusive Toilet/ Lockerroom](#)

Product and Installation Requirements

Provide hand towel dispensers unless hand dryers requested instead by Design Manager.

Hand Towel Dispenser

The University provides hand towel dispensers for installation by the Contractor. The standard unit which is provided is a plastic body accommodating towel rolls. Units should be provided in sufficient quantity for the number of lavatories, but not less than 1 unit for each 3 lavatories. The Project Manager will arrange for delivery of the units to the job site in coordination with the Contractor.

Note: Units are 10” or greater in depth. Units shall be placed as required by code.

Minimum of 1 unit per toilet room shall be placed to meet current ADA requirements.

- Roll Towel Dispenser Kimberly-Clark 09736
- Touch Free Dispenser Kimberly-Clark 09990 (not ADA compliant)
- Verify Specific Paper Dispenser with Design Manager.

Waste Receptacle

Avoid recessed or surface mounted stainless steel receptacles. Provide space for free-standing painted metal receptacles with vinyl bumper edge.

- Provide space for the waste receptacle near lavatories and adjacent to exit door. Locate outside of door operation clearances required by code.
- Waste receptacle is 23 gallon, 20”Long x11”Wide x30”High durable plastic.

Feminine Napkin/Tampon Dispensers

If requested by department, specify stainless steel units dispensing both products. Recessed, semi-recessed or surface mounted types are acceptable. Units to be with 25 cent coin operation. Note that dispensers are not filled and maintained by Building Services department. Review operational impact with department.

- Note a recessed model shall require a deeper partition stud depth.
- Mount so all operational and dispensing components are within required ADA reach range.

Liquid Soap Dispensers

Typically the University provides soap dispensers for installation by contractor. The standard unit which is provided is a plastic body unit with adhesive attachment. Position on wall adjacent to sink.

- If two lavatories are installed a single soap dispenser may be installed between the lavatories.
- Locate dispenser to be ADA compliant at ADA sink location.
- Verify specific soap dispenser with Design Manager.
- Soap Dispensor
 - Spartan #9756 White

Toilet Tissue Dispensers

The University provides toilet paper dispensers for installation by the Contractor. The standard unit which is provided is a plastic body unit for "jumbo" rolls. The University's Project Manager will arrange for delivery of the units to the job site in coordination with the Contractor.

- Architect of record responsible for placement of toilet tissue dispensers within ADA reach range. Preferred mounting location, above grab bar.
- Verify Specific Paper Dispenser with Design Manager.
- Toilet tissue Dispenser Units – Kimberly Clark
 - 09551 for cored tissue – preferred style of paper
 - 09608 for coreless tissue

Feminine Napkin Disposal Units

Specify stainless steel units. Surface mounted units are acceptable; through-partition units are preferred. Unit shall be mounted in compliance with ADA guidelines.

- Exception in housing facilities. Due to population swing from year to year community toilet rooms servicing dormitory residents shall have free standing feminine napkin disposal units.

Grab Bars

- Concealed mounting anchors are desirable.

- Stainless steel 18 gauge minimum
- Provide non-slip texture.
- Outside Diameter 1 1/2".

Pull Down Shelves

Stainless steel pull down purse shelves are desirable in women's toilet compartments.

- Verify with users if shelves are preferred.

General Room Shelves

Provide at least one stainless steel shelf in each toilet room if no other provision has been made for setting down possessions.

- Verify with users if shelves are preferred.

Childcare Accessories

During the programming phase, determine whether diaper-changing stations are to be provided in toilet rooms and in which toilet rooms they are to be located. Regardless of whether changing stations are required for the project, in new construction and in renovations affecting toilet rooms, provide space for mounting a diaper-changing station in each toilet room, men's, women's and gender neutral. Reinforce the wall area at the changing station location adequately to support the changing station. Note proposed location of plans. Changing stations shall be fold-down type supporting a minimum of 250 lbs. of static load when opened and shall project no farther than 4" from the wall when closed.

Shower Accessories

Individual shower compartments shall be provided with the following list of accessories:

- Stainless Steel curtain rods
- Soap Dish, Assess need with end user and confirm with Design Manager.
- Provide fold up ADA compliant bench per grouping of showers, as required by code.
- Preference is to provide a separate private dressing area directly adjacent to shower.
 - Provide minimum 2 robe hooks in dressing area.
 - Provide a built in seat in dressing area.

DESIGN GUIDELINE 104400

FIRE EXTINGUISHERS

Scope

In general, follow the guidelines below when specifying fire extinguishers and fire extinguisher cabinets.

Related Sections

U-M Design Guideline Sections:

[5.7 SBA Unit Substation Rooms](#)

[6.1 DG140000 Conveying Systems – General Requirements](#)

[6.2 DG210000 Fire Protection](#)

Requirements of Regulatory Agencies

Perform all work in accordance with applicable codes, the State of Michigan Building Code, MIOSHA General Industry Safety Standards (Part8, Portable Fire Extinguishers), the NFPA 101 Life Safety Code (where applicable), and NFPA 10 Standard for Portable Fire Extinguishers.

University of Michigan does not accept code exceptions for fire extinguisher installation. Fire extinguishers shall be installed throughout all University buildings. Any deviations from this direction shall be reviewed and approved by OSEH, University Fire Safety Services.

Extinguisher mounting height to conform to the American with Disabilities Act (ADA) Guidelines and State of Michigan Barrier Free Requirements.

General Design Requirements Fire Extinguishers

Types of fire extinguishers:

1. ABC multipurpose dry chemical
 - a. Provide UL-listed 4-A; 60-BC, 10-lb. nominal capacity, in enameled steel container.
2. BC carbon dioxide
 - a. Provide UL-listed 10-BC, 10-lb. nominal capacity, enameled metal container.
3. “Class K” wet chemical
 - a. Provide UL-listed, 6 or 9 liter capacity, stainless steel container, with wall-mounted instructional placard.
4. “Class D” dry powder
 - a. Provide FM-approved, in enameled steel container, appropriately sized for the hazard being protected.

Other types of extinguishers (water under pressure, halon agent, aqueous film forming foam, wheeled extinguishers) may be appropriate for specific hazards that are not typically found on

campus, but that could be associated with a particular project (such as electrical power generating stations, heliports, indoor solid-fuel cooking appliances, etc.) The UM Design Manager and University Fire Marshal should be consulted regarding proper extinguisher selection for unusual applications.

Design professional to determine, the appropriate applicable location for each extinguisher based on applicable codes and standards.

Specify units with the following characteristics:

Metal bodies, valve assemblies, discharge levers and carrying handles. Plastic or composite materials are not acceptable in these applications.

Rubber hoses.

Fully rechargeable.

UL-listed, bearing UL "Listing Mark" for extinguisher type, rating, and classification.

Design Requirements Fire Extinguishers Cabinets and Mounting Brackets

Fire Extinguisher Cabinets can be fully recessed, semi recessed or surface mounted depending on location and code requirements.

- Size: To suit type of unit being housed, but not less than 12 inches by 27 inches by 8 inches tub interior.
- Door and Frame Finish: Satin Stainless Steel
- Window: Approx. 2 inches by 24 inches, ¼ inch clear acrylic.
- Signage: Identify extinguisher cabinets with manufacturer's standard red lettering applied to cabinet door, spelling "FIRE EXTINGUISHER". Letter size, style and location selected by Design Professional.
- Locking fire extinguisher cabinets should not be used. If locking cabinets are desired based on an identified theft or vandalism concern, the UM Design Manager and University Fire Marshal should be consulted.

Mounting Brackets: Provide units designed to hold specified extinguishers. Mount brackets with expansion anchors to withstand a 200 pound load applied in any direction.

Signage: Identify bracket-mounted extinguishers with red letter decals with clear backgrounds, spelling "FIRE EXTINGUISHER" applied to wall surface or with three-dimensional projecting signs attached to the wall surface. Identify column-mounted extinguishers with red letter decals with white backgrounds, spelling "FIRE EXTINGUISHER" applied to the other column surface. Letter size, style and location selected by design professional.

Application

In addition to providing units in accordance with code requirements, provide a 4A:60BC, 10 pound (nominal) capacity unit in each individual laboratory. Mount units next to laboratory exit doors, in full view.

End of U-M DG 104400

DESIGN GUIDELINE 115313
LABORATORY FUMEHOODS, BSC'S, SPECIALTY HOODS
AND ACID FLAMMABLE CABINETS

Scope

Laboratory chemical fume hoods, biological safety cabinets (BSC), HEPA filtered laminar flow clean benches, hybrid hoods, acid and solvent chemical storage cabinets.

Related Sections

U-M Design Guideline Section:

6.0 DG123553 – [Laboratory Casework](#)

6.0 DG221113 – [Piping Materials and Methods](#)

6.0 DG230920 – Lab Terminal Air Flow Units and Controls

U-M Master Specification Sections:

[MS115313 – Laboratory Fume Hoods, BSC's, Specialty Hoods and Acid Flammable Cabinets](#)

[MS123553 – Laboratory Casework](#)

[MS230920 – Lab Terminal Air Flow Units and Controls](#)

Design and Installation Requirements

General

Incorporate the requirements of this section taken together with the requirements of Design Guideline 230920, Lab Terminal Air Flow Units and Controls.

Use U-M Master Specification Section 11 5313 Laboratory Fume Hoods, BSC's, Specialty Hoods and Acid Flammable Cabinets as the basis for chemical fume hood specification on all U-M projects. Specification defines fume hood types in terms of face velocity characteristics. Use these definitions when specifying fume hoods and designing fume hood exhaust systems at U-M. Specification has been customized to include many of the Design Guideline requirements. For ease of identification, requirements identified in this document by **gray highlighting** are already incorporated in the specification. Note that the specification does not include BSCs or any specialty hoods (e.g. perchloric acid, hybrid hoods, etc.).

Edit U-M Master Specification Section 115313 to make it project specific. Extensive editor's notes are included in the specification to assist the A/E. Be sure to turn on hidden text and read those notes.

Fume Hood Design Requirements

Selection and Design

Selection:

- Select hoods in close consultation with the Project Mechanical Engineer, Design Manager and the University's Department of Occupational Safety and Environmental Health (U-M OSEH).
- Complete thorough programming effort with hood users and OSEH to determine the types of work being conducted in the fume hood, the experience of the users, the materials which will be used in the hoods, and any special requirements for the hoods.
- Consider impact on mechanical requirements.
- Select hood size and type to conserve energy. Specify the narrowest width which properly accommodates user needs. When selecting a hood type evaluate hood air volume usage in conjunction with required lab air change rates.
- Evaluate hood density. Densities above three hoods per 5000 net square feet of lab shall be justified. Consider alternatives such as snorkels and chemical storage cabinets.

Performance: Comply with the requirements of ASHRAE Standard 110-95 As Manufactured, and relevant portions of NFPA 45. U-M Master Specification Section 115313 describes the specific ASHRAE 110 performance criteria required for fume hoods used at U-M.

Location: Follow the general recommendations in the National Institutes of Health publication *Methodology for Optimization of Laboratory Hood Containment*. In addition:

- Locate hoods away from excessive traffic, cross drafts and air turbulence from windows, doors, or diffusers.
- Locate hoods such that fire, explosion or toxic material escaping the hood would not cross the immediate path of room egress.
- Perform computational fluid dynamics analysis when hood proximity or density may affect the successful operation of the hoods.

Types

Hood Types: Clearly delineate the hood types required for the project, either in the hood specification or on the drawings (preferred).

- Constant Volume: Partial bypass type are appropriate in most circumstances. Full bypass type are high energy users but may be appropriate in certain applications with U-M OSEH approval.

- Variable Air Volume (VAV) Hoods: Specify VAV hoods if energy analysis proves energy savings. Always specify VAV hoods for combination sashes. For all applications utilizing VAV hoods, specify the corresponding VAV type lab terminal air flow unit control.
- Reduced Face Velocity Hoods: RFV hoods, as defined at U-M, are those that U-M has approved to operate at a reduced average face velocity, currently 70 FPM. They are used to save energy while providing equivalent capture to a conventional hood.

The following also applies to RFV hoods:

- Do not vary from the approved list of manufacturers or models.
 - Do not modify the RFV hood performance criteria.
 - Maximum hood width: 6' nominal.
 - Maximum over-all hood depth: not to exceed 36".
 - Minimum ceiling height in room: 8.5'
 - Use only "bench-top" style hoods, not floor model, perchloric acid, or radioisotope hoods.
 - Balance to provide 70 FPM average face velocity and alarm at 60 FPM face velocity. Clearly indicate air balance information in the mechanical documents.
- Bench-top hood: Designed to rest atop a counter or base cabinet, usually about 36" above the finished floor. Consider accessibility requirements when specifying height and configuration.
 - Floor model hood: Used where taller apparatus is required or equipment is to be rolled into the hood. Floor model hoods shall provide a minimum of 78" of working height.
 - Radioisotope (RI) hood: Most low-level radioisotope work can be carried out in standard fume hoods. Therefore, if radioisotopes are to be used, consult with U-M OSEH to determine which type of hood to specify.

Sash Type

Clearly delineate the hood sash type for each fume hood, either in the hood specification or on the drawings (preferred).

- Vertical rising sash: Appropriate in most circumstances.
- Combination sash: Specify when justified by the type of hood use. Constant volume hoods of any type are not safe with combination sash arrangements because correct face velocity can't be assured as the horizontal sash is adjusted. Always specify with restricted bypass VAV hoods.

Sash Stops

Specify all fume hoods with integral sash stops. Add-on stops are not acceptable.

Height for sash stops: 14" from the work surface, with a minimum clear opening height of 12" above the airfoil. For airfoils of unconventional design, adjust the location of the sash stop to maintain the 12" clear opening height.

Equip all hoods with sash alarms.

Work Surfaces

Solid Cast Epoxy Resin: Typically specify solid cast epoxy resin tops.

Stainless Steel: Specify for specialty applications only, typically RI and perchloric acid hoods.

Linings

Specify linings to meet requirements of NFPA 45, paragraph 9-1.1 (flame spread less than 25). The following are possible choices:

- Fiberglass-Reinforced Polyester Resin Panels (FRP): Typically specify FRP. Note that FRP has limited chemical and heat resistance. Stainless Steel: Provides higher heat resistance than FRP but decreased chemical resistance. Specify only in RI hoods, perchloric acid hoods and when high heat resistance is required.
- Others: Other materials are available from some manufacturers, providing increased chemical resistance. Due to minimal thickness required by application, verify that alternate materials are properly reinforced against breakage during transport and use. Review material advantages and cost/benefit ratio compared with the typical choices listed above.

Baffles

- Fixed baffles: Specify for fume hoods in teaching labs or other locations where users may be unfamiliar with fume hood operation.
- Adjustable baffles: Typically specify for research laboratories.

Controls and Alarms

Chemical fume hood controls and alarms are specified in U-M Master Specification 23 0920 Laboratory Terminal Air Flow Units and Controls. Chemical fume hood controls, including low exhaust flow and sash alarms, are to be provided and installed by the laboratory air flow controls contractor under section 230920, not the fume hood manufacturer. The fume hood manufacturer provides cut-outs for the low exhaust air flow alarm and makes provisions to allow mounting of sash sensors, sash alarm, and other devices provided by the laboratory air flow controls contractor.

Mechanical Service Fittings

Mechanical service fittings for non-specialty fluids and gases (domestic water, compressed air, natural gas, etc.) used in chemical fume hoods are specified in U-M Master Specification Section 115313 Laboratory Fume Hoods, BSC's, Specialty Hoods and Acid Flammable Cabinets. Specify factory piped units whenever possible. Piping within the fume hood shall match materials in Division 22 Mechanical Specifications.

If RO or DI water service fixtures are required, edit 115313 to include a specification for these fixtures. Specify plastic materials (PP, PVDF, etc.) and a fixture design (dead-end or re-circulating) compatible with the purity requirements of the distribution system supplying the fixture.

If other specialty fluids or gases are required (e.g. medical gases), specify compatible fixtures and fabrication techniques. The related Division 22 mechanical specification should always be referenced in such cases.

Cupsinks may be either side-mounted or mounted in the work surface (with a raised rim), depending on user needs. Coordinate location of sinks mounted in the work surface with raised rims around the perimeter of the work surface.

Electrical

Specify ground fault circuit interrupter receptacles in fume hoods and within 6 feet of fume hoods which contain sinks.

. These separate circuits must be indicated on the electrical drawings.

Additional Superstructure Components

Consider the following components where appropriate:

- [REDACTED]. However, rooms without suspended ceilings rarely benefit from enclosure panels.
- Floor Model Hoods: Specify either a stainless steel or epoxy resin floor constructed so as to retain spills, but tapered to facilitate ease of move-in for roll-in items.

Base Unit Design Requirements

Coordinate the specification of base cabinets with fume hoods for size, depth and finish match. Specify products from a single distributor to facilitate construction coordination.

Typically specify both a flammable/solvent and a corrosives storage base cabinet, each equal to half the length of the hood. Where standard cabinet lengths make this impossible, or where special storage requirements dictate additional storage capacity, locate supplemental storage units elsewhere in the laboratory. Do not locate supplemental flammable/solvent storage cabinets next to the hood superstructure. Specify either wood or metal:

Corrosives Storage Units: Specify units vented directly to the fume hood exhaust duct, not the hood exhaust chamber. Provide a detail on the architectural/lab planning and the mechanical drawings. Specify polyethylene lining with coved corners.

Flammable/Solvent Liquid Storage Units: Do not vent. If the client requests venting, review with Design Manager and U-M OSEH.

Review potential conflicts between flammable storage base cabinets and cupsinks. Not all manufacturers have resolved this conflict for their standard cupsink sizes and locations. Avoid placing cupsinks over flammable storage base cabinets. Non-standard placement or non-standard size of cupsinks may also cause problems.

Biological Safety Cabinets, Laminar Flow Clean Benches, Hybrid Hoods

Before specifying, verify with the Design Manager that they are to be included as part of the fixed construction. Select the type, size and class of these units in conjunction with the Design Manager and U-M OSEH representative.

If an exhaust connection is required to a Biological Safety Cabinets, verify with U-M OSEH the type required, direct or thimble connect. Connection are typically made via an indirect, hood mfg. provided, thimble (canopy) connection.

For BSCs, provide a minimum of 12" clearance on each side of the cabinet and between the top of cabinet and the ceiling, to allow service and testing. Provide an electrical outlet for the BSC power plug in a location that allows unplugging without moving the BSC (mount the outlet on a wall or casework to the left or right of the BSC or in the leg space below the BSC).

Performance and Testing: Fume Hoods/BSCs/Clean Benches/Hybrid Hoods

Laboratory chemical fume hoods:

- Typically specify to meet the As Manufactured (AM) ASHRAE 110 performance requirements found in U-M Master Specification 115313 Laboratory Fume Hoods, BSC's, Specialty Hoods and Acid Flammable Cabinets. Performance requirements for both standard (those operating at 100 fpm average face velocity) and RFV hoods are provided in 11 5313. These performance requirements may be inadequate for hoods which are to be used for extraordinary purposes, such as those involving highly toxic chemicals, high production volumes, or high-hazard radioactive materials. In such cases, the Design Manager and U-M OSEH shall provide direction regarding alternative AM or As Used (AU) testing.
- In some locations, additional As Installed (AI) testing may be required for a certain percentage of fume hoods. This is most likely to occur in new research buildings or areas with a high density of hoods. The Design Manager and U-M OSEH will provide direction regarding whether AI testing is required and, if so, the quantity and type to be tested. Indicate the hood quantities and types to be AI tested in the design documents.

Biological safety cabinets, laminar flow clean benches and hybrid hoods:

Provide performance criteria for within the specification sections. When a function of these devices is to provide *personnel protection*, performance requirements *for capture* should typically match U-M's 115313 performance requirements for standard chemical fume hoods.

DESIGN GUIDELINE 122000 **WINDOW TREATMENT**

Scope

Includes design and installation requirements for roller shades and horizontal venetian blinds.

Related Sections

U-M Design Guideline Section:

[8.2 Architectural Preferred Manufacturers List](#)

[3.2 Energy and Water Conservation](#)

Design and Installation Requirements

Design Requirements

General - A University-wide standard for window coverings does not exist. Window coverings are determined for each building individually, and are based on exterior and interior appearance, building use, environment, existing window coverings in adjacent areas, use and maintenance considerations.

Aesthetics - Base standards for new buildings on both exterior and interior appearance. When designing remodeling projects within an existing building, consider using the same type of window coverings as existing adjacent areas.

Environment - Consider requirements for protecting areas from the glare and heat of the sun. Also consider the environmental conditions in which the coverings will perform, such as exposure to chemicals, humidity, dirt or grease. Review flame retarding properties of window coverings for compliance with codes and condition of use.

Use – Public and student occupied areas need to withstand significant abuse.

Installations – Window treatments shall be installed in such a manor to allow full access to the window for cleaning, screen removal and window operation shall not be impaired.

Style of Window Treatments

Roller Shades – Roller shades should be considered for new construction or major renovation including new window treatments throughout the facility.

- Consult with user to establish openness factor, fabric style and color.
- Consider dual roller in meeting rooms, conference rooms or performance spaces that are on exterior of building. Dual roller option would allow for partial or full room darkening capabilities.
- Operation, consult with user to determine type of use and operation required. Determine Manual, motorized or automated with sensors.

- Manual, provide nickel plated metal bead style chain. Operation function shall stop and hold shade at any position in ascending or descending travel.
- Motorized: Motor location preferred within roller tube. Coordinate with manufacturer for maximized motor operation.
 - Connect as many shades as possible to maximize use of motor and minimize operators and cost.
 - Determine if operation is switched near motor, remote, or keyed for security purposes in student areas.
- Automated: Motorized operation monitored by solar type sensors may be considered.
 - Automated shades allow for the shades to be lowered as the solar gain increases within a space.
 - The sensors also bypass human interaction and may be more effective for managing heat gain.
 - Prior to proceeding with automated shades with sensors develop a cost analysis with a cost payback timeframe for utilities to be saved vs. the cost of the sensor system installed.
- Mounting Recessed: Recessed within a ceiling pocket permitting easy removal and replacement without damaging roller shade or adjacent surfaces and finishes.
- Mounting Surface Mounted: Surface mounted to face of partition above glazing or from ceiling or soffit area above glazing. Provide enclosure, for streamlined view and protection of roller from dirt, dust and debris.
- Direction of roll: Regular from back of roller
- Bottom Bar: metal bar or welded seaming.
- Size: Larger windows need larger shades that can be heavy. Evaluate splitting large sections of glazing into multiple shades. Larger heavy shades may be difficult to operate.

Horizontal Venetian Blinds - Typically specify heavy ladder, top slat and bottom rail construction, good quality of slat materials, and operating mechanisms that eliminate overdrive (preventing damage to worm gear or control wand). Private offices may use blinds fabricated of lighter weight material and without overdrive protection. Consult Design Manager.

- Venetian blinds may be utilized in renovation projects to match existing building standard horizontal blinds.

Maintenance –

The University Building Services Department can be requested to clean or repair blinds on a customer pay request basis. Building Services has the ability to clean standard horizontal blinds up to 10 feet in length. Preferred style for cleaning and maintenance is 1” aluminum mini blinds, preferably by Hunter Douglas..Consult with Design Manager and obtain departments' approval before specifying other types of window coverings. Select only those coverings with acceptable warranties.

Documentation-

Consider having installers visit site to assess mounting surfaces and existing conditions. A site visit can reveal potential issues as well as ensure accurate cost estimates up front.

Ensure notation for the following: Shades/ window treatments should be installed in a manner which will not inhibit operation of the window treatment or the window's function. It is the responsibility of the installer to verify function of the window as well as the window treatment as part of a standard installation.

Installation –

The University requires that a qualified dealer purchase and install blinds or shades composed of parts from the same manufacturer (single-source responsibility for both supplier and manufacturer) and labeled as to manufacturer and brand name.

End of Section.

LABORATORY CASEWORK

Scope

Includes laboratory casework, countertops, service fixtures, and related items.

Reference Documents:

SEFA 8 - Casework Recommended Practice

Design and Installation Requirements

General:

- Design overall lab layout, provide details, and select materials to facilitate cleaning and decontamination. Review specific requirements and potential 3rd party regulations with Design Manager and OSEH.
- Review laboratory casework / countertop material compatibility with planned chemical usage.
- Review anticipated shelf and casework load requirements.

Casework:

- Specify laboratory grade, SEFA tested, wood or metal casework. Both fixed and flexible systems are acceptable. Select in conjunction with the Design Manager based on the following considerations:
 - Specific user or 3rd party requirements
 - Ease of matching casework selections in future renovations
 - Materials and finishes of existing casework in other areas of existing buildings.
- Fixed casework:
 - Specify secure anchorage to substrate.
 - Specify closed toe kicks, continuous filler panels, closed back panels, and other details to eliminate openings and cavities that could harbor pests.
 - Scribe to adjacent construction for cleanable joints.
- Flexible casework: Configure casework to allow sufficient mobility for cleaning.

Hardware

Specify manufacturer's standard commercial quality, corrosion resistant, heavy duty hardware and as follows:

- Standard surface mounted pulls.
- Full extension, linear ball bearing slides rated at 100 pounds minimum that allow drawer removal without the use of tools.
- Heavy duty shelf clips. Surface mounted metal support strips and clip are not acceptable.

Finish:

- Specify SEFA certified finishes unless chemicals used in project dictate more stringent finish requirements.
- All surfaces exposed to view shall be finished.

Miscellaneous Fillers, Base and Scribes

Specify fillers at gaps between individual cabinets, and between walls and cabinets. Include removable closure panels at back surface of all knee spaces to conceal pipe spaces. Fillers and scribes should match adjacent materials and finishes.

Coordinate extent of flooring and applied base with resilient flooring specifications.

Countertops

- Specify impervious countertops with appropriate characteristics for research needs and as follows:
 - Epoxy Resin: Specify where chemical and heat resistance are needed.
 - 1 inch minimum thickness with 2" overhang from face of cabinet body.
Include drip edge
 - Chemically resistant solid phenolic: Specify where a reduced chemical resistance is acceptable and on site fabrication or reduced weight is needed. Before specifying, review impacts to future lab adaptability with Design Manager.
 - Stainless Steel: Specify where seamless surfaces are required, such as processing areas for highly radioactive materials or surgical suites.
 - Acid resistant plastic laminate: Specify only in dry labs with no sinks or chemical use. Before specifying, review impacts to future lab adaptability with Design Manager.
- Do not specify solid surface, hardwood, or other top materials unless approved by Design Manager.

Shelves and Shelf Supports

- Specify 1" minimum thickness impervious shelving materials with appropriate characteristics for research needs.
 - Epoxy Resin: Specify where chemical resistance is paramount. Epoxy shelves are heavy and not needed in most laboratories. Storage of toxic and corrosive liquids is not permitted above the benchtop.
 - Chemically resistant solid phenolic: Specify where a reduced chemical resistance is acceptable and/or there is a need for reduced weight or on site fabrication.
 - Chemically resistant plastic laminate: Specify only where limited chemical resistance and durability is acceptable and as approved by Design Manager. Provide edge banding on all edges.

- Design shelving systems to withstand expected loading and in configurations that promote safe use.
 - Do not specify laboratory shelving installed higher than 6'-6" or 30" below finished ceilings, whichever is lower.
 - Notch shelves around standards to eliminate spaces between shelves and adjacent surfaces. A 1" high raised retaining lip on rear edge may be specified in lieu of notched shelves.
- Design shelving systems to maximize flexibility within both the individual lab and the overall building. Consider the following:
 - Provide consistent shelf lengths of 30" or 36" to maximize interchangeability in the lab.
 - New buildings: Consider ability to obtain additional components for future modifications.
 - Existing buildings: Provide support systems consistent with building standards.

Accessories

Sinks

Select sink materials that match countertop materials, unless research processes are incompatible.

- Do not specify epoxy resin sinks where thermal shock from dry ice or liquid nitrogen is expected.

Mechanical Service Fittings

Show and specify mechanical service fittings such as sinks, faucets, gas, vacuum and air outlets, and similar devices as part of Section 123553, for installation by plumbing trades.

Fittings for water, gas, air, vacuum and similar services should be brass, with at least 81 percent copper content.

Water fixtures should always be specified with integral vacuum breakers in every application. Integral vacuum breakers are available for almost all types of fittings, however, in the rare case where integral vacuum breakers are not available for a required fitting, provide in-line type units.

For deionized or reverse osmosis water outlets, specify a material that matches the distribution piping material. Consider chrome plated brass with a lining material matching the distribution piping material, for outlets likely to be abused. Recirculating type faucets should normally be specified for very high purity DI applications (≥ 10 mega ohm-cm).

Electrical Service Fittings

For modular casework systems, specify electrical service fittings (outlets, switches, and similar devices) as part of Section 123553, for installation by electrical trade. Comply with associated electrical master specification sections and preferred manufacturer list. For fixed casework systems, specify electrical service fittings as part of divisions 26 and 27.

Coordinate locations of electrical/data outlets, surface raceway, lighting, and similar electrical items with casework layout. Consider the following:

- Equipment layout and impact to cord length and configuration

- Ground fault circuit interrupter receptacles, as required by code.
- Task lighting to reduce the need for artificial ambient lighting and to lessen shadows on the work-surface.
- Consider continuous dual channel raceway for future flexibility.

DESIGN GUIDELINE 132100 **CONTROLLED ENVIRONMENT ROOMS**

Scope

In general, follow the guidelines below when specifying package environmental rooms and related items. Several aspects of environmental rooms require close coordination with work of other sections. Among these are:

- Casework and shelving.
- Structural steel.
- Mechanical utilities.
- Electrical utilities.

Clearly indicate in specifications and on drawings all mechanical and electrical work which is required within the controlled environment room and which is required for connection to building utilities. Make sure that the equipment specification contains language that this work must conform to the requirements of Division 21, 22, 23 and 26 specification sections.

Include in the Specifications a requirement for submitting an Installation Manual (with the other project submittals) and an Operations and Maintenance Manual (prior to project completion).

Environmental rooms should be included in the list of equipment requiring commissioning in the project.

It is the Architect/Engineer's responsibility to obtain from the client and the Design Manager a complete understanding of how the environmental room(s) will be utilized and occupied and the required operating conditions (including special requirements such as the need for backup power and cooling). Backup power and cooling should not be provided routinely. It should be reserved for critical operations.

Related Sections

U-M Design Guideline Section:

[1. Code and Regulatory Agencies](#)

Design and Installation Requirements

General

No University-wide standards exist for interior and exterior panel materials or finishes. Most commonly, painted aluminum exteriors are specified with either painted aluminum or stainless steel interiors.

Size unit to suit user requirements and available area. Specify height requirements as well as length and width. Manufacturers have unique standard sizes, so close tolerances will need

special coordination during design. In general, avoid specifying units with less than 7.5 feet interior height (approximately 8 feet outside dimension).

Provide necessary wall reinforcement for shelving, countertops, equipment and any other wall-mounted items.

The door hardware must include a break-away type latch (with cylinder lock if needed) and inside safety release handle so that the door can be opened from the inside even if it is locked.

Provide slip-resistant flooring.

Provide adequate access, clear of any interference from other building elements, to the condensing unit and any other equipment mounted exterior to the unit. This access must incorporate a reasonable means of getting from the floor to the top of the unit (for example room for a ladder from the floor to the above-ceiling space). In most circumstances, access through a 2 x 2 ceiling grid will not be considered adequate unless portions of the grid can be easily dismantled to allow for a larger opening. Include a fluorescent light fixture, power receptacle, and switch mounted in the ceiling space to provide illumination and power for servicing at top of unit. Clearly delineate the required access on the drawings.

Consider enclosure panels around the top of units which do not meet suspended ceiling height. Panels may need to be vented and removable to accommodate roof-mounted equipment.

For environmental rooms that will be used for crystallization, provide the following special features:

- Remote mounted compressor/condenser units (not mounted on roof of environmental room).
- Self-closing and sealing doors.
- Quiet relays and switches.
- Refrigeration system piping, blower, dessicant wheel (if any) and other vibration sources mounted on vibration isolators, and not along environmental room walls.

For environmental rooms that will be used to house animals, provide quiet switches and relays.

Operating Requirements

Specifications should include information regarding at least the following project specific criteria:

- Operating temperature range.
- Control range
- Uniformity range
- Estimated door openings per hour and maximum per day
- Number of occupants (maximum at any time and average).

- Heating load in watts of operating equipment (scientific apparatus, etc.) within room. If this load cannot be determined during design, assume heat load will equal 50 percent of outlet power capacity.
- Humidity range if applicable. Do not specify range if special humidity control is not required.
- Ambient conditions of the space in which the room will sit. Identify the maximum adverse condition likely to be encountered.
- Temperature range of process chilled water, if a water-cooled condenser is being used.
- Temperature and humidity range of makeup air (see Mechanical Design Requirements below) being supplied to the environmental room.

Furnishings and Equipment

Manufacturers

Shelving is available through the suppliers of environmental rooms, and is a recommended source of shelving if no casework from another source is to be provided in the environmental room.

Some laboratory casework is available from environmental room manufacturers. Refer to suppliers use inside environmental rooms.

Materials:

- Casework: Painted metal
- Countertops: Epoxy resin
- Free standing shelving: Stainless steel wire post and shelf systems. Consider specifying the following:
 - Inlay mats to create a flat surface for small items.
 - Lateral stability clips
- Wall mounted shelving: Adjustable heights stainless steel wire shelving designed for environmental room use or standard laboratory solid phenolic shelves on adjustable brackets and standards.

Coordinate design of shelving / casework in environmental rooms with overall lab design.

Structural Steel

Structural steel support frame may be required if remote mounted condensing units are selected. For example, support frames will usually be required when mounting units on building roofs, and when condenser is to be located within the laboratory area, but not on the roof of the environmental room (occasionally necessary, due to overhead space limitations).

Mechanical Design Requirements

Coordinate utility installation, and ensure mechanical design takes into account the following:

- Makeup air to the environmental room: Provide makeup air if the room is to be occupied (rather than just used for storage of materials and samples). Follow Code requirements for ventilation. For other circumstances, the A/E must establish whether ventilation is required or advantageous. In general, if there is not a specifically identified need for ventilation, UM recommends not providing it, since makeup air may introduce unwanted humidity in environmental rooms. If makeup air is provided, exhaust or relief must also be provided. Provide ducted exhaust connections (hard pipe or thimble connection as required) to meet the requirements for both environmental room exhaust and/or dessicant dryer exhaust. Do not allow exhaust to be discharged from the environmental room into the ceiling plenum.
- Heat from condensing coil must be rejected to building exterior or a cooling loop.
- Water-cooled units should normally be specified. Do not specify air-cooled units which reject heat into occupied space or suspended ceiling plenum. Water-cooled units using city water as the primary cooling fluid are not permitted. However, if continuous operation of the environmental room is critical, consideration must be given to backup cooling which might include City water. If city water backup is required, specify an alarm to notify BAS that the unit is operating with city water cooling.
- Provide accessible filters for the evaporator coil.
- Utility piping may be factory installed and concealed in environmental room walls, or may be surface mounted in the field. Either method is acceptable, as long as appropriate coordination of factory and field work requirements is provided. Note that crystallization rooms require piping mounted on vibration isolators.
- Pipe penetrations through environmental room walls must be coordinated with room supplier. Room suppliers may, or may not, want to make the penetrations themselves. Mechanical specifications should call for coordination; leave final decision of who makes the penetration to the Contractor. Penetrations must be sleeved and sealed.
- A drain line must be shown from the evaporator unit drip pan to a safe waste (one containing an air gap). In freezer rooms, the drain line from the evaporator unit drip pan should be routed outside of the room. Coordinate location and consider installing floor drain to accommodate drain line.
- Humidification: If required, the A/E must evaluate the most cost-effective method for providing humidification for the environmental room. If house steam can be made available cost-effectively at the room location, it should be used for humidification. If a steam generator is specified, the water quality for the steam generator must be coordinated with the manufacturer's requirements. Some manufacturers may require treated water of certain resistivity. If this is not available in the building, it may be necessary to provide additional treatment as an option for the steam generator.
- Dehumidification: If required, the A/E should determine the most appropriate and economical method of dehumidification based upon the operating requirements and the type of equipment available from manufacturers. If a dessicant-type dryer is utilized, exhaust must be provided. See additional information regarding exhaust covered previously in this section.

Electrical Design Requirements

Coordinate utility installation, and ensure electrical design takes into account the following:

- Electrical panel and control panel must be provided by room manufacturer
- Electrical outlets and conduits may be factory installed and concealed in environmental room walls, or may be surface mounted in the field. Either method is acceptable (although concealed conduits are preferred), as long as appropriate coordination of factory and field work requirements is provided.
- Conduit penetrations through environmental room walls must be coordinated with room supplier. Room suppliers may, or may not, want to make the penetrations themselves. Electrical specifications should call for coordination; leave final decision of who makes the penetration to the Contractor. Penetrations must be sleeved and sealed.
- Refer to Specification Section 262000 for information regarding the electrical panel.
 1. The panel should feed not only the loads within the room, but also the evaporator unit, compressor unit, control panels and any other equipment associated with the operation of the environmental room.
 2. If possible, locate the electrical panel next to the control panel. Do not locate it on the roof, or remotely from the controlled environment room.
 3. The electrical panel may be incorporated into the control panel, if this is the standard for the manufacturer. If this is allowed, the panel buses shall be braced for the available fault current, and the breakers rated to interrupt the available fault current of the distribution system. The panel shall also be UL listed for the application.

Coordinate connection of refrigeration unit, room controls and recorder, lights and outlets that are specified in Division 26.

- Lighting should be fluorescent (except incandescent for rooms with less than 0° F.).
- Specify UL labeled, vapor-tight light fixtures equipped with two lamps. Refer to Design Guideline Section 265100, and Specification Section 265100 for information on the lamps and ballasts. Provide electronic ballasts where suitable for application.
- Refer to Master Specification Section 262726 for specification information for light switches.
- Provide a minimum of 3 receptacle circuits to the receptacle inside the unit. Refer to Specification Section 132100 and 262726 for specification information on receptacles. Provide ground fault circuit interrupter receptacles within 6 feet of sinks or other water sources. Receptacle circuits shall be 20 ampere rated, and each circuit shall serve no more than 3 duplex receptacles. Adjacent receptacles shall be fed from different circuits.
- Provide a 1" raceway path for any 'data outlet' installed inside the environmental room.
- Data outlets shall be two gang, deep, boxes unless installed in surface raceway. See also Section 272000.
- The controller should be digital and electronic. It should be programmed to maintain the environmental room within the operating criteria. Battery backup of the controller should be considered in critical applications to maintain temperature logs during

power outages or other disruptions. Controller shall be located near access door and maintained in clear view on exterior of unit.

- Recorders: Review with the Design Manager whether the manufacturer's standard chart will be adequate. Recorders for humidity-controlled rooms must include humidity as well as temperature readings.
- Alarms: Ascertain user requirements for both local and remote alarms. For remote alarms, consult with the Design Manager to determine whether alarms will be directly monitored by BAS (Building Automation System), which is typical for University Buildings, or to the Department of Public Safety (via MOSCAD) in special circumstances. At a minimum, provide the following alarms:
 - Common alarm for setpoint deviation or system trouble of temperature, humidity, etc.
 - CO₂ set point deviation alarm and automatic CO₂ safety alarm (for elevated CO₂ rooms only).

DESIGN GUIDELINE 140000 **CONVEYING SYSTEMS – GENERAL REQUIREMENTS**

Scope

This section defines general requirements for various conveying systems. Refer to individual Division 14 sections for additional requirements.

Consult with the U-M Design Manager for project specific requirements.

Related Sections

Design Guideline Sections:

5.6 [Parking Structures](#)

[DG 101400 Signage](#)

U-M Master Specification Sections:

7.0 MS142123 – [Electric Traction Passenger Elevator](#)

7.0 MS142423 – [Hydraulic Passenger Elevator](#)

7.0 MS144200 – [Wheelchair Lift](#)

7.0 MS146000 – [Hoists and Cranes](#)

Design and Installation Requirements

Preferred Manufacturers and Sub-Contractors

Refer to individual Division 14 Specification Sections.

Operation and Maintenance

On the Ann Arbor Campus, all conveying systems discussed in this section (except as noted) are operated and maintained by the Plant Operations Elevator Shop (734-647-2059) which can be contacted for specific maintenance records, for inspection information or access, and for renovation or replacement recommendations. Most general fund buildings are maintained directly by the Elevator Shop. The elevators at the U-M Hospital are covered under a maintenance contract with an outside contractor, with limited oversight by the Elevator Shop.

The Elevator Shop shall be consulted during the design of all conveying systems, and should assist with review of shop drawing submittals, and O&M manuals for conveying systems.

Inspection and Licensing Requirements

Most conveying systems in the State of Michigan discussed in this section are inspected and certified by the State of Michigan. Refer to 1. Codes and Regulatory Agencies.

Elevators -

Definition

Passenger/service elevators with horizontally sliding door typically for general use of all types, including cars, entrances, controls, safety equipment, and elevator machinery.

Freight Elevators include vertically sliding bi-parting doors with automatic power operation used for transporting food and other equipment.

Application

Passenger elevators are preferred over freight elevators in almost all cases, including "service" applications, where users expect to be moving trash, equipment and materials in the elevator on a regular basis.

Requirements of Regulatory Agencies

Perform all work in accordance with applicable codes, the State of Michigan Elevator Code, the National Electrical Code, and the American Society Mechanical Engineering Code for Elevators, ASME A-17.1 (latest edition accepted by State of Michigan). All tests shall be made in the presence of the authorized representative of such authorities and the Owner's representative.

Comply with U-M Barrier free Elevator Guidelines attached herewith.

Design and Construction Method

The delivery method for elevators specifies installation of specific non-proprietary components with which the University has a successful track record. Installation is done by a pre-qualified **elevator installation contractor**. Installation of "elevator manufacturer's standard" elevator is not acceptable. Refer to Master Specification Sections 142123 and 142423.

Non Proprietary

The non proprietary delivery method shall be evaluated by the design team. A non proprietary elevator allows for maintenance to be done by the elevator shop or an authorized elevator repairman. The components do not require specific manufacturer knowledge or tools for repair. Non proprietary elevator applications may have a higher purchase and installation cost. This higher installation cost may be offset by lower long term maintenance costs.

Proprietary

The proprietary delivery method shall be evaluated by design team. A proprietary elevator is limiting in that only the manufacturer may service the installed elevator and may require special knowledge for repair. Typically a proprietary elevator is purchased with an ongoing

maintenance plan for a specific term. Service by the Elevator Shop is limited. Consideration should be given to lifecycle cost for installation. A smaller up front purchase and installation cost may be outweighed by the long term maintenance contract requirements. Business units considering this application may consider the impact to their annual maintenance budgets versus original construction costs.

Selection of Type of Equipment

Building end use shall determine elevator type traction or hydraulic. Design Professional to evaluate and provide documentation to support decision. Choice shall be included in BOD and OPR documentation,

For Rise Up To 45 Feet: Select hydraulic or traction type elevator machine. Specify a dry pumping unit. That is, the pump, motor and valves should not be located in the hydraulic reservoir. (Note: Piston stabilizers not allowed)

For Rise Above 45 Feet: Select electric traction elevator machines.

Elevator Speed

Electric Traction Elevators Passenger/Service

- Minimum: 200 ft/min.,
- Maximum: 350 ft/min.

Electric Traction Elevator Freight

- Minimum: 200 ft/min.
- Maximum: 350 ft/min.

Hydraulic Passenger

- Minimum: 100 ft/min.
- Maximum: 150 ft/min

Roped Hydraulic

- Minimum: 100 ft/min.
- Maximum: 150 ft/min.

Hydraulic Freight

- Minimum: 100 ft/min.
- Maximum: 150 ft/min.

ElevatorControl/Controller

For both hydraulic and electric traction elevators: Specify non-proprietary microprocessor controls. Specify remote diagnostics shall be compatible with existing U-M system.

Elevator Type: Traction vs. Hydraulic

Hydraulic elevators are often less expensive than electric traction elevators, and don't require an elevator machine room above the hoistway, and are therefore often preferred by AEs.

However, there are limitations and drawbacks to their application. Traction elevators should be installed in lieu of hydraulic elevators where any of the following apply:

- Where total travel exceeds 45 feet.
- High volume applications, where speed of travel is a high priority

Elevator shaft, lobby and machine room location considerations:

Location: Coordinate with the Architect for location in the building for optimum service for the building. elevators should be near stairs

Security: Provide access control at building doors, not with card readers at the elevator landings or in the elevator cars. For security, locate the elevator within the building's access controlled area.

Access to mechanical rooms/ penthouse: Provide access to mechanical rooms/penthouse or basement via a controlled lobby with stair access and a locked keyed to mechanical room in penthouse or in the basement.

Roof access and lighting: Provide a safe access and path from roof access to the elevator machine room.

Elevators Air Lock: An air lock or transition chamber for controlling air pressure during ingress and egress from a multistory building (10) the interior of which is at an elevated air pressure.

Machine Room

Machine Rooms: Elevator machine room may be located overhead, basement or adjacent to hoistway for traditional traction or hydraulic. For machine room less (MRL) it shall be located at the top of the hoistway. The electric driving machine shall be located in a machine space within the elevator hoistway (MRL) or outside the hoistway in an elevator machine room.

Control spaces, and Control rooms: A controller shall be accessible only from a machine room, control room.

Machine/Control Room Lighting: Fluorescent lighting with guard shall be provided in the elevator machine room. Lighting shall be positioned so it does not create shadows while

service personnel are working on major equipment. Minimum of 19 foot candles measured at floor level at any point in the machine room.

Fire Extinguisher: appropriate classification shall be 15 pounds for a fire extinguisher. Mount on the wall of elevator machine room near main entrance.

Machine/Control Room Door: Appropriately fire rated labeled self closing, self locking door.

Machine Room/Control Rooms Door Hardware: Keyed to U-M BEST "ZV" key system.

Elevator Machine Room/Control Rooms Painting: Paint elevator machine room floor with light gray gloss oil based paint. Paint elevator machine room walls and ceiling with white semi-gloss latex paint.

Elevator Machine Equipment: Paint elevator machine light gray with zinc primer paint

Hoist beam: In the elevator machine room above the machine. Size shall be suitable for largest live load.

HVAC: Machine rooms for traction and hydraulic elevators require HVAC systems to maintain temperature between 50F and 95F. System must be capable of operating 24/7/365. Size system for full load (building skin and internal loads, including oil cooler for hydraulic elevators). Ductless split system is generally preferred.

Vents: Many existing, older traction machine rooms include a floor vent that communicates directly with the hoistway. Where found, remove vents and provide 2-hour rated separation in its place.

Area of vents: The area of vents shall not be less than 3.5% of the area of the hoistway nor less than 3 square feet. Control damper with heat sensing.

Pressurization: The elevator machine room serving a pressurized elevator hoistway shall be pressurized upon activation of heat or smoke detector located in the elevator machine.

Plumbing and Mechanical systems: Pipes or ducts conveying gases, vapors or liquid and not used in connection with elevator operation shall not be used in the elevator machine room or hoistway.

Elevator Machine Room Access/Machinery Space: An approved means of access shall be provided to elevator machine rooms and overhead machinery spaces. Access to machine rooms shall not be through restrooms, locker room or associated vestibules. Direct access from a public corridor is strongly encouraged.

Isolation Transformer: Provide isolation transformer per elevator controller manufacturer's recommendation.

Machine Room Less Elevators (MRL)

Control Room Location: The control room shall comply with the code and manufacturer requirements.

Communication: Two-way visual communication shall be installed between the car and the control room. Car position, movement, location and direction shall be monitored from the control room.

Other equipment: No other equipment is allowed in control room.

Signage: A permanent sign shall be placed on the door that will read "MRL ELEVATOR CONTROL ROOM". The letter size shall a minimum of 3/4 " and shall be of contrasting color with that of the background.

Main Floor Signage: A permanent sign shall be mounted on the head jamb of the main floors entrance which shall read "MRL-CONTROL ROOM LOCATED ON _ FLOOR". The letter size shall a minimum of 3/4 " and shall be of contrasting color with that of the background

Working Clearance: A working clearance of at least 3'-6" shall be maintained in front of the elevator controller at all times with the control room door closed.

Disconnect Switch: A heavy duty disconnect switch shall be installed in the control room and in the hoistway within sight of the elevator driving machine and shall be designed so that it can be locked out and tagged out in the open position. When activated, it shall cause power to be removed from the driving machine and brake. It shall also be designed to open a contact in the stop position switch circuit and render the elevator inoperative.

Other Control Room Disconnect Switch and Receptacle: See electrical requirements.

Ventilation: The control room and hoistway must be vented for control of hot smoke and gases. If ventilation is accomplished by means of a horizontal duct, the duct shall have the same rating as the hoistway. Venting may be required by the building code additional make-up air may be required. Design Professional shall evaluate.

HVAC: The control room and hoistway shall be required to maintain at neither a temperature of not less than 55 deg. F. nor more than 90 deg. F. and with manufacturers requirements either by natural air circulation or by an HVAC system.

Hydraulic Elevator Cylinder Unit

Pumping Unit: Pumping unit shall be dry and have the valve and motor located outside reservoir. The unit must be mounted on isolation pads.

Hydraulic Oil Line Access: Provide clear access for hydraulic oil line between machine room and hoistway. No underground piping.

Hydraulic Oil Lines: shall remain in conditioned space from end to end and remain within the building footprint. No buried or counseled lines are allowed.

PVC Pipe: Comply with master hydraulic elevator specs

Cylinder: Comply with master hydraulic master specs.

Cylinder Exterior: Comply with master hydraulic master specs.

Other Hydraulic Elevators

Roped: The car is supported by steel hoist ropes and sheaves, which are moved up and down by a holeless single section piston in a cylinder.

Holeless: The car is connected on each side with a single section position that moves up and down in a cylinder, which mounted on top of the pit floor.

Hoistway

Shaft Enclosures: Comply with SID-F shaft enclosures shall have a fire-resistance of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the shaft enclosure shall include any basement.

Hoistway Entrance: entrance shall consist of flush hollow metal door panels, bolted unit type frames, sills.

Sills: sills shall be of extruded aluminum or nickel silver construction with non-slip wearing surface. Supported on steel brackets and securely fastened to the floor. If cast sill is in acceptable condition re-use.

Class of Loading for Elevator: Class C1, C2 and C3 loading shall be for sill and platform for all type of elevators.

Shaft Paint: Painting shall include approximately 80% wall coverage with one coat of white paint. Painting required in Housing Building, Parking Structure and Medical School Building. Painting is not required in general fund buildings.

Shaft Lighting: single tube continuous fluorescent light fixture strip (full height of hoistway) with guard. Provide minimum one fixture per floor. Design Professional shall evaluate use of LED in lieu of fluorescent fixtures. This lighting shall be operable from a switch located in the elevator machine room, pit area and at the top floor. Shaft Lighting required in Housing Buildings, Parking Structures and Medical School Buildings. Shaft lighting is not required in general fund buildings.

Hoistway ventilation: Hoistway venting is required per code. Venting of hoistways is not required where the building is equipped throughout with an approved automatic sprinkler system.

Location of Vents: Vents shall be located below the floor at the top of the hoistway and shall open directly to the outer air or through noncombustible ducts to the outer air with back draft damper.

Piping in Hoistway: No piping, duct, electrical conduit, or other materials, etc. for non-elevator related equipment shall be allowed.

Exterior Hoistway: Provide automatically controlled heat in hoistways to provide minimum temperature of 50F, accounting for building envelope losses and infiltration at doors. Finned tube radiation is generally preferred with traps and shut-off valves shall be provided in accessible locations outside the hoistway or use listed/certified electric heaters with disconnect switch for each unit heater.

Pit Area

Construction at bottom of hoistway: Pits extending in the ground shall have noncombustible floors and be designed as to prevent entry of ground water into the pit. The pit floor of any hoistway not extending to the ground shall be of the fire resistive construction having fire-resistance rating at least equal to the required hoistway and have no habitable area under pit.

Pit Lighting: Lighting in pit area shall be a minimum of 10 ft candle measured at any point in the pit area at floor level.

Sump Pumps

- Provide sump pumps in compliance with the Michigan Elevator Code per ASME A-17.1 (latest edition accepted by State of Michigan) and Michigan Plumbing Code.
- Subsoil drains shall not be connected or discharged to elevator pits or sumps.
- Specify a simplex submersible sump pump for each hoistway with a minimum capacity of 3000 gallons per hour.
- Multiple hoistways may be served by a common sump pump sized to remove 3000 GPH per hoistway.
- Provide a union, a check valve, and an isolation valve on the pump discharge.
- Pumps \leq 1 HP should normally be 120 VAC single phase.
- Pumps $>$ 1 HP should normally be 208 VAC three phase.
- Pump voltages greater than 300 VAC are not permitted by code.
- The pump power cord shall be plugged into a non-GFCI power receptacle located in the hoistway. This arrangement shall serve as the pump disconnecting means in the hoistway. Power to this receptacle shall be controlled by the pump controller to cycle the pump on and off. The receptacle and cord cap shall be protected by a weatherproof cover.
- For *new hoistways* indicate that, at the contractors option, the sump may be either (1) cast-in-place and water-proofed with the same sealer used to water-proof the hoistway floor, or (2) a fiberglass sump. In either case, a sump cover shall be provided.
- For *existing hoistways*, the design should typically include a fiberglass sump with cover.

- Pumps shall be controlled by dual non-mercury float switches consisting of a “normal” level float switch and a “high level” float switch. “Oil Smart” or similar level controls shall not be used. The pump controller shall include a dry alarm contact for monitoring by the Owner’s Building Automation System (BAS). This contact shall energize under two conditions: any time the pump runs and any time high level is detected.
 - For elevator hoistways where ground water intrusion into the sump is expected and thus the pump is expected to run frequently, only the high level float shall alarm at BAS (Building Automated System).
- Pump power cord shall not be run in conduit. Float switch, oil level detector cords (where oil separators are used) and any other control wiring shall be run in PVC conduit properly secured to the hoistway wall and floor. Conduit shall be connected to the sump cover and the conduit's inner diameter shall be sealed with sealing putty.
- Pump control panels and oil separators shall not be installed in hoistways or elevator machine rooms.
- Pumps Serving Traction Elevators:
 - Pumps shall discharge to a sanitary drain via an indirect connection.
 - Status lights (pump running, high level) and alarm annunciators associated with pump operation **shall not** be provided. Control panel **shall not** include a pump “on-off” or “hand-off-auto” switch on the panel face.
 - Typical Sequence of Operation for Pump (modify to make project specific): The Pump shall be cycled by the "normal" float switch to maintain normal fluid level in the pit. If high fluid level is detected by the “high level” float, the pump shall start (if not already running). The pump controller shall include a common dry alarm contact (non-latching) for monitoring by the Owner’s Building Automation System. This contact shall energize whenever the pump runs and when high level is detected
- Pumps Serving Hydraulic Elevators:
 - Pumps shall discharge to an oil separator. Oil separator shall discharge to a sanitary drain via an indirect connection. Size the oil separator to contain 110% of the volume of the largest elevator hydraulic circuit.
 - Status lights (pump running, high level) and alarm annunciators *associated with pump operation* **shall not** be provided. Control panel **shall not** include a pump or oil detection system “on-off” or “hand-off-auto” switch on the panel face.
 - Specify controls to monitor “half full” and “full” oil level conditions in the oil separator. Specify an annunciator, silence button, indicator lights, and BAS contacts to provide the sequence of operation indicated below.
 - Typical Sequence of Operation for Pump (modify to make project specific):

The pump shall be cycled by the normal float switch to maintain “normal” fluid level in the pit. If high fluid level is detected by the “high level” float, the pump

shall start (if not already running). The pump controller shall include a common dry alarm contact (non-latching) for monitoring by the Owner's Building Automation System. This contact shall energize whenever the pump runs and when high level is detected.

- Typical Sequence of Operation for Oil Separator Level Alarms:

When the oil sensor detects a "half full" oil condition, it shall energize the Half Full indicator light, the common annunciator, and the Half Full BAS alarm contact. Pushing the alarm silence button shall silence the alarm but the indicator light and BAS contact shall remain energized until the oil level drops below half filled.

When the oil sensor detects a "full" oil condition, it shall energize the Full indicator light, the common annunciator (even if previously silenced), and the Full BAS alarm contact. Pushing the alarm silence button shall silence the alarm but the indicator light and BAS contact shall remain energized until the oil level drops below the full level.

Pit Painting: Paint pit floor and walls (up to sill) with two coats of light gray, gloss, and oil based paint. Paint all exposed metal in hoistway (except Guide-rails) with light gray paints two coats of rust inhibitive paint.

Electrical Receptacles: (1) GFCI duplex at 48" A.F.F., and (1) non-GFCI duplex (for sump pump) receptacle at 24" A.F.F.

Access Ladder: Galvanized steel ladder to be mounted to floor and wall shall have skid resistant rungs.

Elevator Car Enclosure:

Car Lighting: Indirect fluorescent or LED coved lighting minimum of 10 foot candle in car at floor level install fixture equally on both side of elevator cab to balance the light. Lighting shall be easy to access to replace. Downlights or drop ceiling are not acceptable.

Emergency Lighting: provide emergency lighting with a battery unit in compliance with code requirements.

Car Dimension: Based on requirements of ADA Guideline and square footage floor requirements for landing per Michigan Code and ASME A17.1 Elevator Code.

Car Door: Flush hollow stainless steel panel's with sound deadening insulation.

Car Ceiling: Canopy ceiling shall be provided, painted white. Drop ceiling systems are not acceptable.

Car Flooring: Finished floor shall be heavy duty "Rubber tile sheet type vinyl" all shall be class "A" securely connected in place "commercial grade carpeting tile" or heavy duty tile or ¼" thick (minimum) checkered aluminum with matte finish. Materials such as stone or

ceramic tile flooring add significant weight to the elevator car increasing equipment sizing and wear over time on equipment. Stone and ceramic tile flooring materials are strongly discouraged. Coordinate flooring material selection with end user and design manger.

Pads and Pad Hooks-Locks: provide pads and pad hooks with locks on walls near top 12" O.C provide educate size and storage cabinet.

Electrical Receptacle in Car: GFCI type duplex electrical receptacle in car approximately 2" above finished floor below car operating panel.

Ceiling Height in Elevator Car: Minimum of 8'-0" car heights.

Elevator Lobby

Hallway Position Indicator: LED (Light Emitting Diode) digital type and good for minimum of 5-years as part of hallway push button.

Hallway Push Button: Vandal resistant illuminated LED type hall push button shall be installed at each floor, fixture shall have up and down buttons at intermediate floors and single buttons at top and bottom floors, buttons shall be vandal resistant stainless steel with integral arrows and shall illuminate to indicate a call has been registered. Button shall remain illuminated until the call has been answered.

Hoistway Access: Hoistway Access features operable from top and bottom landings mounted on door jamb.

Lobby Lighting: 10 foot candle measured 1 foot from the sill at floor level. Feed the lighting with emergency generator power if the elevator can operate on generator power, or provide emergency egress lighting if the elevator cannot operate on generator power.

Landing System

Landing System: The landing system shall provide high speed stepping signals, one-floor-run stepping signals, leveling, and door zone signals. Shall be compatible with controller manufacturer.

Leveling: The leveling and stopping accuracy of the system shall be within 1/4 inch of the floor level and shall correct for over travel or under travel to within the same accuracy, regardless of load variations or direction of travel.

Electrical Requirements

Disconnect Switch location: Locate all disconnecting means for all elevator(s) on the inside surface of the machine room wall next to the strike jam side of the machine room door. Ensure each disconnect is within sight of the elevator equipment it controls.

Main Disconnect Switch: Provide a 3 pole fused elevator power disconnect switch. Switch shall be lockable in the open position.

Lighting Disconnect Switch: Provide a 2 pole, 240 volt, 30 amp fused elevator car lighting disconnect switch. Switch shall be lockable in the open position and contain 20 amp fuses. Feed the switch with a 20 amp emergency power circuit if generator power is available, or normal power if generator power is not available.

Car Receptacle and Fan Disconnect Switch: Provide a 2 pole, 120 volt, 30 amp fused elevator car receptacle and fan disconnect switch. Switch shall be lockable in the open position and contain 20 amp fuses. Feed the switch with a 20 amp standby power circuit if the elevator can operate on generator power, or normal power if the elevator cannot operate on generator power.

Elevator HVAC: Elevator HVAC unit shall have a dedicated branch circuit with disconnect switch inside the machine room. Feed the switch with standby power if the elevator can operate on generator power, or normal power if the elevator cannot operate on generator power.

Receptacles: Provide 120V GFCI receptacles in each machine room within 6'-0" from the governor location, elevator controller and machine. In the pit area GFCI and non GFCI shall be provided.

Machine Room Light: Machine room light fixtures shall produce a minimum of 19fc at floor level and have lamps protected by wire guards. Light switch shall be located at the point of entry on the lock-jamb side of the access door. Feed the lighting with emergency generator power if the elevator can operate on generator power, or provide emergency egress lighting if the elevator cannot operate on generator power.

Pit Lighting: Locate light with wire guard more than just below (with clearance) the fully compressed buffer. Locate light switch on wall inside the hoistway adjacent to the top of the pit ladder. Feed the lighting with emergency generator power if the elevator can operate on generator power, or provide emergency egress lighting if the elevator cannot operate on generator power.

Isolation Transformer: Individual isolation transformers and individual choke reactors for each hoist motor (controller), and filtering of harmonic distortion when Variable Voltage Variable Frequency (VVVF) AC controllers are utilized.

Electrical Ground Wiring: Ground wire shall be the same size as feeder per Controller Manufacturer requirements.

Emergency Power Operation

Emergency power: Coordinate the need of emergency power with the activity use and project architect. Emergency power is usually needed for high-rise facilities as defined by code.

Standby Power: In building or structure where standby power is required.

Emergency Power Operation: when emergency power is detected, cars shall return to the main lobby one elevator at a time, and remain there with doors open. While each car is being

returned, the other cars shall be shut down so as not to overload the emergency power generator.

One or More Cars: Once all car(s) have been returned to the lobby, one or more cars may be selected to run under emergency power, depending on the capability of the emergency power generator. Selection of the cars that run under emergency power shall be done by the group system. Or If more than one elevator is provided determine with activity input how many elevators are to operate on emergency power

Automatic Selection: the automatic selection may be overridden through manual selection. The actual number of cars allowed to run under emergency power shall be a pre-programmed value and the number of cars allowed to run shall not exceed this value

Disconnecting Means and Panel Location: Must disconnect the elevator from normal lockable power and from emergency power. Automatic transfer switch and disconnect shall be located outside the machine room. The panel for the manual selection switches for each group of elevator will be installed at a location determined by the university.

Override Switch: Manual override switch shall be provided in the main elevator lobby area(s) to override the automatic emergency power selection.

Manual transfer: Standby power shall be manually transferable to all elevators in each bank.

Mechanical Equipment: Where emergency power is connected to elevators, the elevator machine room ventilation, air conditioning equipment and hoistway ventilations shall be connected to the standby power source.

Fire Suppression

Machine Room Sprinkler: In elevator machine room's automatic sprinklers of ordinary or intermediate temperature rating shall be provided with guard. Sprinkler head shall not be installed over any elevator equipment. Provide a supervised shut-off valve with flow tamper switch in the sprinkler line supplying the pit. Locate the valve outside of and adjacent to the elevator machine room.

Pit Area Sprinkler: Sidewall sprinkler(s) with sprinkler guards in the pit area. Locate the sprinkler no more than 2'-0" above the floor. Provide a supervised shut-off valve in the sprinkler line supplying the pit. Locate the valve outside of and adjacent to the pit.

Hoistway Sprinkler: Provide a sprinkler(s) at the top of the hoistway for hydraulic elevators with cylinder or supply piping extending above second finished floor elevation. Provide a supervised shut-off valve, flow tamper switch. These items shall be located outside of and adjacent to the elevator hoistway.

Signage: Provide signage on valve outside of elevator machine room and pit area and shall read "Sprinkler Shut-off Valve for elevator ----"

Test Valve: Provide inspector test connection per code requirements.

Fire Alarms

Fire Alarms Devices: Only visible alarm notification shall be provided in elevator machine rooms.

Fireman Phone Jack: Provide a phone jack in the car as part of COP (Car Operating Panel) for fireman phone jack for high rise building phone jack is required in the elevator machine room.

Fire Alarm: A fire alarm initiating device shall be in the control space and tied in to elevator's fire emergency services.

Smoke Detectors: Stand-alone smoke detectors system shall be installed by elevator contractor

Speakers/Horns For Mass Notification: Speakers shall be mounted in car with a adjustable volume control that shall be adjustable at the elevator car top. Horns shall not be installed inside the car, hoistway or in the elevator machine room.

Hoists and Cranes - Section 146000

Definition

Manual and motor.

Application

Because of the infrequency with which these systems are installed, the University has no established guidelines for these systems. Furthermore, operation and maintenance may not be handled by the Elevator Shop. Consult Project Coordinator.

DESIGN GUIDELINE 210000 **FIRE PROTECTION**

Scope

Fire protection requirements specific to the University of Michigan including design document requirements, density requirements, special requirements for dry systems, fire and jockey pump requirements, and other miscellaneous requirements.

Related Sections

U-M Design Guideline Sections:

[104400 - Fire Extinguishers](#)

[283100 - Fire Detection and Alarm Systems](#)

U-M Master Specification Sections:

[211313 - Wet Pipe Sprinkler Systems](#)

[213113 - Fire Pumps](#)

General

All new buildings shall be protected by a hydraulically designed wet-pipe sprinkler system, designed to comply with requirements of NFPA and Factory Mutual (FM).

The University normally requires the installation of wet-pipe sprinkler systems in existing buildings undergoing major infrastructure upgrade not presently protected by fire protection systems.

In existing buildings with hydraulically designed systems, any additions, deletions and/or changes shall not compromise the integrity of the system. Water supply shall be tested and improved as required to meet requirements of NFPA , FM and City of Ann Arbor Standards. A/E shall arrange for testing by U-M Plumbing Shop through U-M Project Coordinator.

Provide standpipe system where required by code.

Design Requirements

Design drawings (plans) shall include, at a minimum, location of :

- In-coming water supply and fire department connection(s) (Siamese)
- Fire pump and controller, jockey pump, and test header
- All risers, standpipes, zone control valves, fire department valves and fire hose cabinets
- All mains four inch diameter and larger
- Inspector test /drain, service drains

- Sprinkler head locations, sprinkler zoning (with area and criteria stated)

Design shall include fire protection system riser diagram, with at minimum:

- In-coming Water supply and Siamese connections
- Fire pump and controller, jockey pump, and test header
- All risers, standpipes, zone control valves, flow switches, fire department valves and fire hose cabinets
- Inspector test /drain

Design shall include, at minimum, calculation, selection and detail of in-coming water service, fire department connection, fire and jockey pumps, test header, stand pipe/ inspector test/ zone control valves, pipe penetrations, and special systems.

Wet Suppression Systems

Sprinkler density shall be per U-M Master specification.

Discharge from test connections be piped to building exterior or indirect drain of adequate capacity.

Provide dry pendant heads for any room operating at or below 40° F (including cold rooms, environmental rooms and freezers). For areas where piping is subject to freezing, dry sprinkler heads or dry pipe systems should be used in lieu of antifreeze systems due to antifreeze flammability concerns. Whenever possible use dry sprinkler heads instead of dry pipe systems. Wet pipe sprinkler system shall normally be installed throughout including electrical rooms, substations, mechanical rooms, telephone closets, and computer rooms.

Dry Pipe Sprinkler Systems

Due to significant problems with microbiologically induced corrosion (MIC), the following requirements for dry pipe systems apply to U-M's Ann Arbor campus:

Piping for dry systems shall be specified as **Schedule 40 ASTM 53 galvanized steel in all pipe sizes**, screwed galvanized cast or malleable iron fittings through 2", grooved couplings for 2-1/2" and larger pipe sizes.

Dry pipe systems shall be specified as installed with the longitudinal weld seam located above the horizontal centerline of the pipe, and with drain valves installed at all low points regardless of trapped water volume. Require that mains and branch lines be pitched at least 1/2 in. per 10 ft in all locations, including in non-refrigerated areas (areas not subject to freezing).

Fire Pumps

Install automatically controlled fire pumps on all fire protection systems where hydraulic calculations indicate that the city water pressure is not adequate to supply the building sprinklers and/or standpipe systems. Fire pump size shall be based on the requirements of

NFPA. Water supply to fire pumps shall meet the requirements of NFPA. When a fire pump may feed multiple buildings, special approval from the University Project Coordinator is required for issues related to fire alarm system coordination; possible multiple building conflagrations; and system sectionalizing.

Jockey Pumps

Install jockey pumps on all fire protection systems where flow is detected and monitored, even if a fire pump is not required. Jockey pump head shall be adequate to maintain static pressure required at the top of the system. Size pump flow per NFPA.

Special Systems

Special fire suppression control systems should be located outside the area served. Supply cylinders should be stored in a room or location other than the protected room. A separate room is preferred.

Dry chemical extinguishing systems should be used in all kitchen and cooking locations where grease and oil are used.

Material Requirements

Pipe material per UM Master specifications.

Installation Requirements

Shop drawings shall be forwarded to FM, the Architect/ Engineer and the State of Michigan Bureau of Construction Codes and Fire Safety. Refer to U-M Master Specification.

Install sprinkler heads in center of 2'x2' ceiling tiles, and in center of 2'x2' area for 2'x4' ceiling tiles.

Pressure Testing

Pressure test fire protection systems per NFPA and FM.

Pressure testing is not required for minor relocations of sprinkler heads.

DESIGN GUIDELINE 220000 **PLUMBING DESIGN**

Scope

General plumbing design, booster pumps.

Related Sections

U-M Master Specification Sections:

[221123 Domestic Water Booster Pumps](#)

Design Requirements

New Construction

Potable hot water should be obtained from the Central Campus Power House, as delivered through existing utility tunnels. The A/E should coordinate the tie-point to the existing tunnel distribution system with the University's Utilities Engineer through the University Project Coordinator. Prior to this coordination meeting, the A/E should calculate the maximum demand and average consumption requirements of the new facility.

Physically handicapped hot water should be tempered with cold water to maintain 110°F water at the fixture. Provide check valves in both hot and cold connections to tempering valves. Pressure compensating designs shall always be used.

In all new facilities the hot water distribution system shall be of the continuous recirculation design.

Renovation

Potable hot water to meet the needs of new fixtures in renovation projects should be obtained from the existing building system.

The A/E must demonstrate to the satisfaction of the University Project Coordinator that the existing building distribution, primary heating and secondary heating systems are sufficiently large to support the new demands imposed due to the addition of fixtures in a renovation project without adversely affecting other users within the buildings. If the existing systems need to be enlarged, this determination should be made early enough for funds to be allocated within the renovation project.

Domestic Water Booster Pumps

U-M Master Specification Section 22 1123 shall be used as the basis for domestic water booster pump specifications on projects. The A/E shall edit the U-M specification to make it project specific. Turn on hidden text and read all spec. editor's notes when editing the specification.

Typically specify variable speed systems. Consider constant volume staged pump control when friction losses are low relative to fixed head (static head and residual pressure) requirements.

When using variable speed pumps, the pressure sensor(s) used to provide the controller input of distribution pressure should be located at the most hydraulically distant location, in a location accessible for maintenance. The sensor may be located in a small reservoir tank (approximately 5 gallon capacity) which will act as a capacitor to dampen out the impulsive pressure changes.

DESIGN GUIDELINE 220010 **PLUMBING SPECIALTIES**

Scope

Water hammer arrestors, back flow preventers, pressure reducing stations, city water meters, mixing valves (hand washing), floor drains, trap primers, eye washes, small RO systems to improve drinking water.

Related Sections

U-M Master Specification Sections:

[221119 Domestic Water Piping Specialties](#)

[224200 Plumbing Fixtures](#)

U-M Standard Details:

[MD 2211313 Fire Service System](#)

[MD 221119 Domestic Water Service System Detail](#)

Design and Installation Requirements

Water Hammer Arrestors

Water hammer arrestors shall be elastic chamber type in stainless steel casings certified to PDI standard WH 201, as specified in U-M Master Specification 221119.

Install ball valves for isolating water hammer arrestors for service.

Backflow Prevention

Utilize the U-M details indicated above. These details are intended to reflect both City of Ann Arbor and U-M requirements, but shall be revised as required to make project specific (e.g. to reflect parallel backflow preventers for those projects using such an arrangement). For reduced pressure zone type back flow preventers, indicate where the preventer drain is to be routed to.

Type of Back Flow Prevention Device Required:

The type of backflow prevention device *at the building entrance* must be approved by the City of Ann Arbor. The following reflects what is typically acceptable to the City, projects should therefore initially propose (with explanation) the following backflow prevention devices for City approval. *In all cases, correspondence with the City shall be made through the U-M Design Manager.*

Domestic Water At Building Entrance:

All building types except hospital and medical buildings, and high chemical hazard buildings:

Buildings without pressure booster pumps and a single feed from the city main: No back flow prevention required at entrance. Protect individual backflow hazards within the building with the type of backflow prevention device required by code, located at the hazard.

Buildings with two or more feeds from the city main, or with pressure booster pumps: Testable UL approved double check valve assembly on each feed from the city main. Protect individual backflow hazards within the building with the type of backflow prevention device required by code, located at the hazard.

Hospital or medical buildings, and high chemical hazard buildings:

Provide UL approved reduced pressure zone (RPZ) backflow preventer (BFP) type. Normally provide two RPZ assemblies each sized for 50% of the total required flow rate, piped in parallel, to allow one RPZ to be repaired while the other remains in service. Note that the City does not consider most lab buildings as high chemical hazard buildings. Protect individual backflow hazards within the building with the type of backflow prevention device required by code, located at the hazard.

Fire Service At Building Entrance, All Building Types:

Normally a testable double detector check valve assembly approved for fire service is acceptable. Protect individual backflow hazards within the building, e.g. a glycol zone at a loading dock, a small dry pipe zone chemically protected against microbiologically induced corrosion (MIC), with an RPZ BFP device located at the hazard. For buildings where extensive portions of the fire protection system are chemically treated to avoid MIC or for other purposes, provide a RPZ BFP device at the building entrance. Normally provide two RPZ assemblies each sized for 50% of the total required flow rate, piped in parallel, to allow one RPZ to be repaired while the other remains in service.

Back Flow Prevention and City Water Meters Located in Vaults:

Contact City of Ann Arbor through the U-M Design Manager for specific requirements regarding vault construction.

Individual Hazards Within Buildings:

Install backflow preventers within building as required to isolate hazards from distribution piping. Typical locations are make-up to chilled and heating water systems and cooling towers, and equipment connections, such as lab and vivarium equipment. When cost effective, aggregate such connections onto a non-potable water circuit to reduce the number of BFP assemblies, in particular RPZ type. When RPZ type BFPs protect systems that produce rapid pressure fluctuations downstream of the RPZ, provided a soft seated non-slam check valve immediately downstream of the RPZ. This prevents spitting out the RPZ drain port. Examples are systems with fast closing valves or rapidly cycling pumps (RO machines).

Pressure Reducing Valve (PRV) Stations

The A/E should separate the potable water distribution risers in high-rise buildings with only the upper floors served by booster pumps to preclude the need to add PRVs to the lower floor piping.

The PRV shall be sized for 25 percent reserve capacity at a 250 psi working pressure.

As appropriate, PRVs should be equipped with a smaller auxiliary regulator to handle low demands. The valve should include a full compliment of gauges and accessories.

Cold Water PRV set points shall be coordinated with hot water system pressure and/or hot water PRV set points, in particular when using the Campus hot water system, to prevent significant pressure imbalance between the two systems.

City Water Meters

Each building shall contain a water meter.

Provide calculations demonstrating the expected range of city water flow rate at the building entrance, for City of Ann Arbor review. For new buildings as well as major renovations in existing buildings, the size of the meter will be negotiated with the City. The City may request that existing meters be replaced. *In all cases, correspondence with the City shall be made through the U-M Design Manager.*

A separate city water meter is required for the following:

- Domestic water (building entrance)
- Cooling tower make up water
- Cooling tower blow down
- Irrigation system
- Other significant uses which do not ultimately discharge to the city sewer

Route cooling tower overflow drains through the cooling tower blow-down meter.

As indicated on U-M's Fire Service System Detail, for fire service to a building, the City will provide a FM and/or UL approved bypass meter for the testable double detector check valve assembly.

Coordinate meter installation with the University Design Manager. The meters shall be purchased by the University (include cost in project budget) from the City of Ann Arbor. Installation shall be performed by the contractor.

City magnetic flow meters require 120VAC power with a lockable disconnect located at the meter.

City meters require a remote read-out device (a small, wall mounted box) hard-wired to the City meter. This allows the City to read the meter remotely with wireless technology. The City

system has good range and typically can read the device even when mounted on a high building roof. The remote read-out device must be mounted above grade and normally should be located on an outside building wall. However, the device usually works when mounted inside the building on an outside wall, which may be preferable when the distance between the meter and an accessible outside wall location is excessively long. Devices that don't work will require relocation. Meters located outside (e.g. on a roof near a cooling tower) can have the read-out device mounted at a convenient, appropriate location near the meter. In all cases the device must be mounted at a location accessible (no ladders required) to a City meter technician; inside locations should typically be mechanical rooms.

Thermostatic Mixing Valves for Hand Washing Facilities

The Michigan Plumbing Code section 607.1 (2) (h) has been modified by local rule as follows:

An ASSE 1070 mixing valve (water temperature limiting device) is permitted to control up to 5 accessible plumbing fixtures within the same room. The ASSE 1070 mixing valve shall be certified for a minimum flow rate of 0.5 gpm or less.

Therefore accessible plumbing fixtures at U-M do not require dedicated mixing valves for the conditions stated above. This modification is incorporated into the U-M Plumbing Fixture Specification 224200.

Floor Drains

Generally, floor drains shall not be installed in laboratory areas or below emergency showers. Consult with the U-M Design Manager and building users for possible exceptions. Consider need for installing floor drains at high traffic building entrances (e.g. below walk-off mats).

Trap Primers

Trap primers are not required at the University of Michigan, regardless of Michigan Plumbing Code dictates, except for high hazard circumstances, (eg., BSL3 and BSL4 labs), and applications where a dried trap might pose an undetected IAQ problem, (eg., floor drains located inside air handling units), or where it is difficult to re-prime a trap, e.g. below walk-off mats. Therefore trap primers should not be specified for toilet room, mechanical room, safety shower, and similar low hazard floor drains. The Designer shall identify high hazard or other circumstances as mentioned above and include trap primers for such drains. For drains requiring trap primers, the use of multi-trap primers, including electrically operated types, is permitted. Multi-trap primers should conform to ASSE 1018 or ASSE 1044, but do not have to be specifically listed as conforming to those standards, provided their design incorporates an ASSE approved back flow prevention device.

Emergency Eyewashes and Showers

Freestanding eyewashes shall be designed to drench both eyes simultaneously and have a waste line connected to the building sanitary waste system.

Water supplies to eye washes and showers shall be tempered.

Small RO Systems to Improve Drinking Water

Small RO systems (often located below sinks) used to improve the quality of water for drinking, coffee brewers, etc., are to be avoided due to water waste during operation and on-going maintenance, back-flow and sanitation issues.

DESIGN GUIDELINE 220020 **HIGH PURITY WATER SYSTEMS**

General

This section describes design requirements for high purity water systems generally used to supply laboratory sinks and equipment, typically know as Reverse Osmosis/De-ionized (RO/DI) systems. This guideline also addresses RO make-up for clean steam humidification systems and soft water make-up for boilers.

Related Sections

U-M Design Guideline Sections:

[230000 – Basic Mechanical Requirements](#)

U-M Master Specification Sections:

[220514 - Variable Frequency Drives](#)

Schematic Drawings:

[MD 220020 001 High Purity Water System](#)

[MD 220020 002 RO MakeUP System Clean Steam Humid](#)

[MD 220020 003 Water Softener for Boilers](#)

System Performance Criteria

The A/E shall determine system performance based on a careful evaluation of specific program requirements. High purity water systems typically have high first and on going operational costs, therefore the A/E shall take particular care not to “over-specify” the system. The proposed system performance will be presented no later then SD phase, for approval by the U-M Design Coordinator. It shall be updated through CD phase, as the requirements for the exact equipment served becomes more precisely determined.

The A/E shall provide the following design criteria for approval:

- Make-up rate in gpm
- Daily production in gallons per 24 hour day
- Storage tank size (gallons)
- Distribution loop flow rate (gpm) and head (ft.)
- Distribution loop temperature
- Primary DI loop (to storage) product quality: Resistivity (megohm-cm), silica, total organic carbon (TOC), sodium, chloride, sulfate.

- Distribution loop water criteria: Resistivity (megohm-cm) , silica, TOC, sodium, chloride, sulfate, oxygen, boron, particulate (maximum particle size and quantity per unit volume), bacteria (viable per ml), Ph.
- Point where distribution loop water criteria is to be achieved (e.g. at point of use, leaving post filter, etc).
- Outline calculations identifying how make-up rate and distribution flow rate and head were determined

Not all the criteria listed above will apply to a project, for instance TOC limits typically apply to semi-conductor projects, but not to generic research labs. The A/E shall explicitly indicate which criteria are not applicable when providing design criteria for approval.

Water resistivity above 10 megohm-cm (CAP-1) is not typically required for general lab use, however the A/E shall determine exact resistivity requirements based on the program.

Plans and Specification Requirements

Include a clear statement of the system performance criteria within the specification.

- This statement shall include all the system performance criteria listed above.
- Obtain the most recent city water analysis and include in the specification.
- Include the minimum expected feed-water temperature.
- Indicate that system performance be guaranteed based on the stated feed-water analysis, including temperature.

Plans shall include a detailed system schematic, showing the arrangement of major system components, instruments, meters, isolation valves, gages, etc.

The system schematic shall also indicate make-up flow rate, distribution flow rate, distribution pump GPM and head, and storage tank volume.

The system schematic shall indicate piping materials for feed water, RO water, distribution supply, and distribution return.

Typical Component Arrangement and Requirements

The following sections outline the typical RO/DI system arrangement at U-M and the requirements for individual components, starting at the feed-water input. Outline level schematics for typical RO/DI, RO, and softener systems are provided for reference under the Related Documents section of this Guideline. It is not the intent of this section to dictate exact system arrangement; the A/E shall design a project specific system to meet program requirements. However, variances from this arrangement shall be called to the attention of the U-M Design Coordinator, for approval.

Feed Water

Provide back-flow prevention (BFP) at the feed water input to the system.

Provide a pressure gage up and downstream of the BFP.

Evaluate the benefit of preheating feed water to improve RO system performance (by improving RO membrane production rate, allowing reduction in RO size). Consider mixing valve or heat exchanger. Preheating shall be evaluated on large systems (make-up rates above 10 GPM), however its use typically mandates a distribution loop cooling heat exchanger be employed as well.

Feed Water Pre-Filter

Provide simplex 10 micron cartridge (disposable element) filter with bypass. Specify minimum 20" long cartridges. Provide pressure gages across filter.

Water Softener

Duplex softener arrangement, demand (flow) initiated type, common brine tank, shall be provided. Very small systems not requiring 24/7 production may utilize a simplex arrangement. For simplex arrangements, specify demand initiated/timer based regeneration type softeners interlocked to prevent RO operation during softener regeneration cycle.

Provide a hard piped bypass around the softener arrangement.

Softeners for boiler water make-up systems shall be duplex demand initiated type.

Brine tanks shall be specified large enough to hold enough salt for 1 month's soft water production. Maximum brine tank height shall be 4 feet. Indicate that the brine tank over-flow is piped to a floor drain.

For systems with make-up rates above 15 GPM or with an estimated salt use in excess of 1000 lb.s/month, bulk brine storage system shall be provided.

Provide pressure gauges across softener bank.

Carbon Filter

Provide duplex carbon filter piping arrangement. U-M utilizes a carbon bottle exchange program where a vendor replaces expired carbon bottles, therefore back-washing type carbon filters should normally not be specified and will only be considered on extremely large systems. The design should indicate all required piping for a duplex arrangement including flexible hoses for carbon filter bottle connection. Indicate carbon filters are supplied by U-M.

Provide pressure gauges across carbon filter bank.

Reverse Osmosis Prefilter

Provide simplex 1 micron cartridge (disposable element) filter without bypass. Specify minimum 10" long cartridges. Provide pressure gages across filter.

Reverse Osmosis System

Specify a skid mounted system furnished with controls providing automatic and manual operation. RO system shall include low pressure pump cut-out, relief valve, meters to monitor product and reject flow rates (typically rotometers) and isolation valves to allow pump and membrane change-out.

Provide a resettable totalizing water meter that indicates total RO product produced.

Mixed Bed De-Ionization Bottles (Make-Up Loop)

Not normally required. A pair (or multiple pair on large systems) of mixed bed resin bottles, located upstream of the storage tanks, may be required for ultra-pure/semi projects. The same piping arrangement and bottle exchange requirements described for the distribution loop mixed beds applies. See below.

Resin Trap

If mixed bed DI bottles are provided in the make-up loop, provide a resin trap downstream consisting of a basket strainer with a 1/64" mesh opening strainer element. Provide pressure gages across the strainer.

Storage Tank(s)

The A/E shall carefully evaluate storage tank size based on program requirements. Minimum tank sizes adequate to hold a 1/2 day's worth of production are typical.

Tanks shall be translucent with a bottom sloped to the outlet connection. Tank vents and overflows shall be protected by suitable filters. Provide a tank drain piped to a floor drain.

Tanks shall be equipped with clear, flexible plastic tube ("tygon") type site glasses. Provide isolation valves on site glasses. Specify external tank level sensors located in site glass piping that allows disconnecting the site glass tube to test the level controls without draining the storage tank.

Distribution Pumps

Normally provide 100% redundant distribution pumps.

Indicate isolation valves and pressure gages on the inlet and outlet of each pump, and provide a check valve on the outlet side of each pump.

Provide a means to control pump flow. Variable frequency drives (VFDs) are preferred, except for very small systems. VFDs shall comply with UM master spec section Variable Speed Drives.

Specify a low pressure cutout switch for the distribution pumps.

Due to the relatively fragile piping materials used on RO/DI systems, often at high pressures, a relief valve with discharge routed to the storage tank is recommended.

Ultraviolet Sterilizers (Upstream of Distribution Loop Mixed Bed De-Ionizers)

UV filtration upstream of the mixed beds is not typically required except in special circumstances, such as systems serving semi-conductor fab.s.

Mixed Bed De-Ionization Bottles (Distribution Loop)

U-M utilizes a mixed bed bottle exchange program where a vendor provides re-generated resin bottles as on-line bottles expire. Therefore the A/E specification should indicate that the mixed beds are provided by UM, i.e. *not* provided by the contractor. The standard bottle size utilized in this program is 3.6 cubic feet. Therefore the A/E shall design the mixed bed “farm” utilizing this bottle size. Since bottle capacity is typically 3-4 gpm/cubic foot of resin, multiple pairs of bottles are normally required. Each bottle pair shall be indicated as piped in series, with a “quality light” located between each bottle pair to indicate when the upstream bottle quality has degraded.

On extremely large systems, larger bottle sizes may be considered, not to exceed 15 cubic foot size. Larger bottle sizes must be approved by U-M Plant Engineering.

Normally Type 1 resins are utilized on U-M laboratory systems. Ultra pure systems (e.g. semi-conductor applications) may require special mixed bed resins, such as virgin semi-conductor grade. Such resin requirements shall be reviewed and approved by the U-M Design Coordinator.

Ultraviolet Sterilizers (Downstream of Distribution Loop Mixed Bed De-Ionizers)

Provide a simplex UV sterilizer downstream of the distribution loop mixed beds.

Provide a hard piped bypass around the UV sterilizer.

Post Filters, Distribution Loop

Provide simplex cartridge (disposable element) type filter with bypass, equipped with 0.2 micron absolute filter elements. Specify minimum 20” long cartridges. Provide pressure gages across filter.

Evaluate higher levels of absolute filter performance (“ultra filters”) for ultra pure or critical systems (e.g. semi-conductor applications).

Heat Exchanger, Distribution Loop

Provide when the program dictates that a maximum distribution loop temperature be maintained. Evaluate if a distribution loop heat exchanger is required due to feed-water pre-heating or other factors, to maintain loop temperatures within reasonable limits. Give

consideration of final RO/DI water use, pipe expansion concerns, etc. Plate and frame type heat exchangers are preferred.

Sample Ports

Provide sample ports at each location shown on the sample system diagram.

Component Redundancy

For critical systems, in addition to the minimum redundancy requirements specified in the above sections, provide:

- Multiple storage tanks (50/50 or similar type arrangement in lieu of a single tank)
- Redundant final filters

Redundancy for other components, though not typically recommended, may be appropriate. A/E shall evaluate with U-M user and U-M Design Coordinator.

Distribution Piping

RO/DI systems shall be designed for continuous circulation, without dead legs. Dead legs are defined as any dead-ended section of pipe more than 4 pipe diameters long that occurs when a valve is closed. Small less critical systems (total distance from point of use in the 100 foot range) may be non-circulating type

Provide a means of balancing and reading (gpm; rotometers one method) each major supply and return sub-loop, for example: on a floor by floor basis.

Hi purity water faucets with barbed terminations should be the recirculating type with integral back flow preventer, spring return handles preferred.

A back-pressure regulator is typically required on the system return main (near the connection to the storage tank).

Diaphragm or butterfly valves should be specified for supply piping downstream of the distribution loop mixed beds. However, in lower grade systems, carefully evaluate the benefit of diaphragm valves due to the high cost of this valve type. Ball valves may be used on returns and else where. Valve material should typically match associated piping material.

Provide pipe hanger details for hanging plastic pipe.

Bare polypropylene piping should not be run in plenum returns.

Piping Materials

Typical piping materials for RO/DI systems shall be as follows:

RO skid to Storage Tank:

- Sch 80 CPVC, solvent joints (all systems)

Storage Tank to inlet of Distribution Mixed Beds:

- Polypropylene (research labs, and ultra pure applications such as semi)

From Distribution Mixed Bed Outlet (and all RO/DI supply piping in building):

- Polypropylene/fused joints (research labs)
- PVDF/fused joints (ultra pure applications such as semi)

RO/DI distribution loop return piping:

- Polypropylene/fused joints (research labs and ultra pure applications such as semi)

The A/E shall carefully evaluate piping materials, considering specific project performance requirements. PVC/CPVC piping may be considered for low grade high purity applications.

For RO systems serving clean steam generators, piping may be Sch 80 CPVC/solvent joints. Specify stainless steel piping near clean steam generator connection point due to high temperatures in the vicinity of the generator. Provide a check valve in the make-up line near the connection to the generator.

Controls

Specify a complete, central control panel with the following features:

- Distribution loop supply water resistivity and alarm
- Total RO water produced
- Tank level control
- Distribution pump low pressure alarm light
- Distribution pumps off alarm light (activated only if both distribution pumps are stasured" off")
- High storage tank level alarm light (latching, requiring manual reset).
- Low storage tank level alarm light (latching, requiring manual reset).
- Common alarm dry contact, for DDC monitoring. To activate upon any alarm condition above, or any alarm condition occurring on the RO skid.
- Panel on/off switch

Though typically not required, the A/E shall consider if other monitoring and alarm features are appropriate, based on the planned use for the system. Small low grade high purity applications may not require all the control features outlined above.

The RO skid shall utilize a PLC based controller. Specify that the vendor shall provide U-M all software, pass codes, etc. to allow U-M full access to the controller programming and settings, as well as a back-up copy of the project specific program.

Electrical

Do not specify a single point power connection for the system. Instead, indicate power connections to the individual components: Softener, RO Skid, control panel, distribution pumps, etc.

The RO vendor shall be designated as providing combination starters for the RO skid pumps, and VFDs (or combination starters) for the distribution pumps.

Start-up/Certification

The entire distribution loop piping system (supply and return) shall be sanitized (with sodium hypochlorite, similar to sanitizing domestic water systems) prior to putting the system into operation. Mixed beds shall not be connected to the distribution piping during sanitization.

The RO/DI system supplier shall provide technicians specifically trained on RO/DI system start-up, for system start-up.

During start-up, the vendor shall, in the presence of U-M, delete the PLC program and demonstrate reloading the back-up copy of the software program.

All systems shall have performance certified by an independent 3rd party, including the taking of samples. On large systems, multiple samples shall be taken, e.g. one per floor. The first sample shall be taken by dumping the system make-up rate for 24 hours, and then taking a sample at a point of use location designated by the owner. The system shall then be run 1 week, and additional sample(s) shall be taken at point of use locations designated by the owner. Specify that a certified performance report shall be provided to the owner.

DESIGN GUIDELINE 220513

MOTORS

Scope

This sections covers requirements for most motors 200 HP and less. This section does not apply to fire pumps, elevators and sealed refrigeration motors, nor does it apply to small motors with stepped down voltage below 115V.

Related Sections

U-M Master Specification Sections:
[220513 - Motors](#)

General

U-M Master Specification Section 220513 Motors shall be used as the basis for the motor specification on all projects. The A/E shall edit (append) the U-M motor specification to make it project specific; however do not generally modify the fundamental motor attributes described in the specification. Turn on hidden text and read all spec. editor's notes when editing the specification.

Phase and Voltage

Motors 1/2 HP and larger should be three phase.

Single phase motors may be rated for 115V, 200V, depending on the application, and building power.

Three phase motors should be rated for 460V wherever possible. Where building power does not include 480V distribution, review options with Project Coordinator and consider adding a step-up transformer, and using 460V motors. The long term objective in most buildings is to have three phase distribution at 480V.

Power distribution system serving large motors (100HP and larger) should be examined to ensure across the line motor starting will not adversely impact the system. Consult Project Coordinator and other appropriate University personnel in these applications.

Three Phase Motor General Requirements

For most applications, including air handlers, motor enclosures for fans and pumps should be Open Drip Proof (ODP) type. For cooling towers and other harsh environments, use Totally Enclosed Fan Cooled (TEFC) motors.

Multiple Speed Motors

With the increased viability of variable speed drives, applications for multiple speed motors are few and far between. Where three phase motors require multiple speeds, there shall be a separate winding for each speed. Coordinate electrical requirements carefully with electrical designer.

Motors for Variable Frequency Drives

Review and verify with both the drive and motor manufactureres the maximum cable length for each drive. Also consider other reuirements such as RFI that may affect the cable length.

Consult manufacture guidelines and provide proper grounding.

For all hospital funded projects, provide AEGIS SGR (Shaft Grounding Ring) for all VFD motors. In addition for motors 100 HP or above, also prove an insulated ceramic bearing assembly on the non-drive end of the motor.

DESIGN GUIDELINE 220514 **VARIABLE SPEED DRIVES**

Related Sections

U-M Design Guideline Sections:

[220513 Motors](#)

[220514-H Supplemental Variable Speed Drive Guideline for UMHHC Facilities](#)

U-M Master Specification Sections:

[220513 Motors](#)

[220514 Variable Speed Drives](#)

Variable Frequency Drive Specifications

U-M Master Specification Section 220514 Variable Speed Drives shall be used as the VFD specification on all projects. Edit U-M VFD spec. 15960 to make it project specific. Turn on hidden text and read all spec. editors notes when editing the specification.

Pay special attention to the following when revising the spec. to make it project specific:

- VFDs used in U-M Hospital and Health Care Facilities may need to be 18 pulse type. Refer to the UMHHC Design Guideline 220514-H, and modify the specification to indicate 18 pulse VFDs when required for UMHHC facilities. See additional discussion on VFD pulse requirements, below.
- Additional editing is not typically required. Do not strike features required by the specification without the consent of the U-M Design Manager. Features listed are typically required for all VFDs, even if not immediately utilized by the subject project.

Pulse, THD, Disconnect, Early Break Contact, and Motor Requirements

U-M's master specification for VFDs requires minimum 6 pulse PWM type VFDs. With the exception of some UMHHC locations, 12 or 18 pulse VFDs are not required provided the VFD complies with all other aspects of the U-M master spec. Therefore do not indiscriminately specify higher pulse VFDs.

The U-M VFD master spec. limits the maximum current total harmonic distortion (THD) to not more than 100% of the VFD input current waveform at any VFD operating speed from 20% to 100%, and requires the manufacturer to provide minimum 3 percent AC line reactors and/or minimum 5 percent DC link reactors. It additionally specifies that if the maximum THD is exceeded, the manufacture shall provide additional line reactors to reduce the THD to within specified limits. *Therefore the AE must include the requirement that each VFD's current and voltage THD be measured in the electrical testing section of Division 16.*

Avoid installing VFDs on the same bus as capacitors or harmonic sensitive equipment.

The U-M VFD spec. 220514 requires all VFDs to include a disconnect switch that is pad-lockable in the open position.

For VFDs that are in sight from the motor, no separate disconnect is required between the VFD and the motor.

For VFDs that are not in sight from the motor, provide a separate disconnect between the VFD and the motor that is in sight of the motor.

Exception for VFDs serving air handlers:

If the VFD is in sight of the door that accesses the air handler section containing the motor, a disconnect is not required between the VFD and the motor. If the VFD is not in sight of that door, provide a disconnect adjacent to the door.

When a common VFD serves multiple direct-drive fan array motors, each motor shall be equipped with a separate disconnect switch. These disconnects shall be located at the door. Alternatively, they can be located in the VFD if in sight of the door, after verifying with the VFD manufacturers that it's practical given project conditions. In all cases maintain proper NEC clearances.

“In sight from the motor” is defined by the National Electrical Code as being visible from and not more than 50 feet from.

When a separate motor disconnect switch is provided, the disconnect shall include automatic “early break” auxiliary contacts that deactivate the VFD whenever the motor disconnect switch is opened. The wiring associated with the early break contacts may be run in the same conduit as the power wiring to the disconnect. Assure the electrical drawings indicate the required early break contact wiring. When a common VFD serves multiple direct-drive fan array motors, early break auxiliary contacts are not required.

U-M requires motors driven by VFDs be inverter duty rated per NEMA MG-1 Part 31.

For insulated motor bearings or shaft grounding brushes, see Design Guideline 220513 Motors for requirements.

Redundancy and VFD Bypass Devices

VFDs serving non-redundant equipment shall be scheduled with a bypass device. Examples:

- A variable volume air handler with a single supply and a single return fan: A bypass device is required on both VFDs.
- A variable volume air handler consisting of (2) supply fans and (2) return fans, each of which is sized to handle 50% of the peak load: A bypass device is required on all (4) VFDs.
- A pump set consists of (3) pumps each sized to handle 50% of the peak load, therefore a fully redundant pump has been included. None of the pump VFDs should be scheduled with a bypass device.

The electrical and mechanical systems associated with the VFD shall be sized and braced to allow the driven system to safely start and operate when the VFD is placed in bypass mode. Provide over pressure protection or similar devices that prevent damage to the driven mechanical equipment and associated components such as duct and pipe, when the motor is operated (full speed) across-the-line via the bypass device.

Although rarely required, evaluate the need to provide an automatic bypass feature that automatically connects the motor directly across the line if the VFD faults or fails. When an automatic bypass is provided, motor overload protection, run permissive, and safety circuits shall remain active with the VFD in automatic bypass.

General Design and Design Document Requirements

When a piece of equipment or a system includes multiple motors (e.g. an AHU with a supply and a return fan), provide a VFD for each motor. Controlling multiple motors with the same VFD is discouraged; exceptions may be made when a common VFD serves multiple direct-drive fan array motors. Consult with the U-M Design Manager.

The AE shall schedule the VFDs on the mechanical drawings. The following minimum information shall be indicated in the schedule: Equipment Served, Horsepower, Voltage, Short Circuit Current Rating, Input Signal (typically 4-20 mA), Bypass Device Y/N, Emergency Power Y/N.

U-M's normal convention is to have the mechanical trade furnish the VFD and the electrical trade install the VFD.

VFDs should be located indoors and as close to the driven motor as practical.

VFDs are considered motor controllers by the NEC. Do not locate piping or ductwork directly above the VFD. Maintain proper NEC clearances in front of the VFD panel, typically 42" deep.

VFDs may be mounted on walls or may be free standing. Free standing units shall be designated as mounted on a Unistrut style rack. VFDs shall not be mounted on the housings of mechanical equipment.

DESIGN GUIDELINE 220519 **THERMOMETERS AND PRESSURE GAUGES**

Scope

Requirements for thermometers and pressure gauges.

Related Sections

U-M Master Specification:

[220519 - Thermometers, Pressure Gauges, and Accessories](#)

Standard Details:

[15130001 - Thermometer Installation Detail](#)

[15130002 - Pressure Gauge Detail](#)

Design and Application Requirements

U-M Master Specification Section 22 0519 shall be used as the basis for thermometer and pressure gauge specifications on projects, with the exception of fire protection. This specification contains the minimum requirements for thermometers and pressure gauges at U-M. Project specific requirements may dictate devices with additional features, higher pressure/temperature ratings, etc. The A/E shall therefore edit the U-M specification to make it project specific. Turn on hidden text and read all spec. editor's notes when editing the specification.

Mercury thermometers are not to be used.

Single pressure gauges should be used across pumps and strainers, piped so that suction/discharge- upstream/downstream pressures can be read separately.

Installation Requirements

The A/E shall show on the drawings or details the locations of all thermometers and gauges.

DESIGN GUIDELINE 220523

VALVES

Scope

Valves for fire protection, plumbing, steam and hydronic service.

Related Sections

U-M Master Specification Sections:

[220523 Valves](#)

Design and Application Requirements

General

U-M Master Specification Section 22 0523 shall be used as the basis for valve specifications on projects, with the exception of valves for fire protection. This specification contains the minimum requirements for valves at U-M. Project specific requirements may dictate valves with additional features, higher pressure/temperature ratings, etc. The A/E shall therefore edit the U-M valve specification to make it project specific. While many valve service types are covered in the specification, not all are included. Add to the specification , service types not included, as required for the project. Turn on hidden text and read all spec. editor's notes when editing the specification.

Valves shall be specified with seats, stem seals and disc materials compatible for intended fluid, temperature, pressure and service. Valve pressure and temperature ratings shall be specified to meet or exceed those of the system in which they are installed.

Strainer blow-down valves shall be quarter turn ball valves.

Fire Protection

Valves for use in fire protection systems shall be FM approved.

Potable Water Systems

Valves in city water mains exterior to the building shall comply with City of Ann Arbor requirements.

DESIGN GUIDELINE 220553 **MECHANICAL IDENTIFICATION AND PAINTING**

Scope

Requirements for identification and painting of mechanical piping, ductwork and equipment, underground pipe identification, valve tags, and labeling architectural access panels; including corresponding labeling requirements on design drawings.

Related Sections

U-M Design Guideline Sections:

U-M Master Specification Sections:

[220553 Mechanical Identification](#)

U-M Standard Details:

Reference Documents:

General

U-M Master Specification 220553 shall be used as the basis for the specification covering the identification requirements of piping, ductwork and equipment. The master specification reflects U-M's basic requirements for mechanical identification. It includes the required label size, nomenclature, color, mounting interval, etc. Revise the master specification only as required to make it project specific, e.g. to add a new pipe system type as opposed to revising the label nomenclature already indicated.

Pipe and duct on drawings should be labeled to match the respective drawing identification nomenclature indicated in the U-M master specification.

The U-M master spec. also includes U-M's requirements for underground pipe identification, valve tags, and labeling architectural access panels.

Editor's notes are included in the specification to assist the A/E. Be sure to turn on hidden text and read those notes.

Equipment Identification

During design phase, A/E shall assign equipment numbers to be used in the construction documents, in conjunction with the Project Coordinator.

Numbers for major mechanical equipment such as air handlers, chillers and pumps should be unique within a building and continue the sequence established by existing equipment. As an example, if air handlers AC-1, AC-2 and AC-3 already exist, then a new air handler should be named AC-4 (not AC-1 or AHU-4 or ACU-4). Although many equipment designators are

presently used throughout the University, the A/E shall use the designators listed in the equipment marker section of the U-M master specification whenever possible. Where the first equipment item on a project is not named "-1", the equipment schedule should note that all the equipment with names preceding it are existing.

All small equipment intended to appear on test and balance reports, including VAV boxes, shall be identified on design drawings with a unique number. Field labeling may not be required for small equipment not listed in U-M Master Specification 220553. Consult with the U-M Design Manager.

Valve Identification

Generally all valves and regulators on all systems, except those located directly at the equipment served, shall be provided with 1-1/2 inch diameter brass tags with stamped numbers and letters. Exact valve tag requirements are described in the U-M master specification *except the A/E must edit the specification to identify which systems are to be tagged.*

Special use valves shall be numbered on the design drawings, e.g. control valves.

The contractor shall develop a directory of valve tags, to be wall mounted and included in the O&M manual, as described in the U-M master specification.

Painting

Interior pipes and ducts are not typically painted, unless required in certain locations for aesthetic reasons, as confirmed by the U-M Design Manager. Exceptions include:

- Fire protection piping in exposed locations shall be painted red
- Pipes in the Central Power Plant. Consult with the U-M Design Manager for specifics.

Exterior uninsulated pipe and ductwork shall be painted the same color as the background building, or a complementary color as directed by the U-M Design Manager. Insulated pipe and ductwork normally does not require painting, provided the insulation material does not require paint for protection. However, review the visibility of insulated pipe and duct with the U-M Design Manager to determine if painting for aesthetic reasons is appropriate.

DESIGN GUIDELINE 220719 **MECHANICAL INSULATION**

General

Insulation of pipe and duct systems to avoid condensation or to provide personnel protection is required. Cost-benefit analysis and ASHRAE 90A should be used to determine which additional systems should be insulated and the appropriate insulation thickness. A continuous vapor barrier jacket must be provided when condensation is possible. This normally means that hangers and riser clamps may not be in contact with the piping. Insulation of the complete system, including air separators, suction diffusers, chilled water pump casings, shot feeder, airflow measuring stations, etc., is required when condensation is possible.

For normal maintenance and inspection activities, insulation should be segmented for removal without damage to adjacent insulation.

Insulation exposed to outside shall be a weather resistant system, with durable, UV stable, waterproof finish.

Insulation exposed to high physical abuse, such as piping near the floors which is regularly walked over, shall be adequately protected with pre-molded, heavy gage, PVC covers, reinforcing shields, catwalks etc., to ensure the long-term integrity of the insulation system.

Insulation materials should meet applicable requirements of NFPA 90A, and MICA/ NIAC “National Commercial and Industrial Insulation Standards”.

U-M Master Specification Sections:

[Section 220553 - Mechanical Identification](#)

[Section 221113 - Piping Materials and Methods](#)

Piping Insulation Materials Requirements

General

Fiberglass pipe insulation shall be rigid, pre-molded to size of piping on which it is used.

Indoor Piping

For “hot piping” carrying fluids at 110F and above: Insulate pipe and fittings (excluding unions and valves) using fiberglass insulation with ASJ (all service jacket, with integral vapor

barrier). Closed cell expanded foam insulation (similar to Armaflex) may be used on domestic hot water piping.

For “cold piping” carrying fluids below 70F: Insulate pipe, fitting, valves, unions, flanges and all cold surfaces using fiberglass (with ASJ), or closed cell expanded foam. Ensure all cold surfaces are insulated, and that continuity of vapor barrier is maintained.

Piping carrying fluids between 70F and 110F does not require insulation. Condenser water piping should be considered “cold piping” if used for free cooling.

Indoor pipe insulation can be presized rigid board fiberglass with paintable jacket. Exposed insulation in finished areas should be painted as described in Section 220553.

Tunnel Piping

Piping insulation in tunnels shall include dimpled aluminum jacketing.

Outdoor Piping

For outdoor piping, use insulating materials similar to those stated for indoor use, but add aluminum jacket for fiberglass insulation and premium quality weather resistant coating for expanded foam insulation.

Outdoor compressed air piping should be heat traced and insulated if piping is in service during the winter and if the pressure dew-point is above minus 20F.

Underground Piping

For hot piping (carrying fluid above 110F), a carrier pipe inside a steel or fiberglass jacket pipe, with foam insulation between, is preferred.

Chilled water piping is typically run as uninsulated ductile iron pipe. If ductile iron pipe is not used, consider a carrier pipe inside a PVC jacket with expanded urethane insulation between.

Refer to Section 221113 for pipe material requirements.

Ductwork Insulation Material Requirements

General

Acoustic duct lining should not be used unless part of a double wall duct system with a mylar barrier between the inner duct wall and liner face.

Indoor Ductwork

Indoor ductwork in concealed areas (above ceilings and in closed shafts), may be insulated with blanket type fiberglass insulation with jacket.

Indoor ductwork in exposed areas (such as mechanical rooms, labs with exposed ceilings etc.) should be insulated using rigid board fiberglass with paintable jacket. See Section 220553 for painting requirements.

Particular attention shall be paid to “cold ductwork” to ensure duct supports will not cause condensation.

Exhaust duct shall not be insulated.

Need for insulation on return air ductwork should be evaluated based on air stream and ambient conditions. Typically, air conditioned return duct in unconditioned mechanical rooms should be insulated.

Outdoor Ductwork

Outdoor duct insulation should be high density foam plastic, or rigid fiberglass, mastic sealed and painted with weather resistant finish.

Underground Ductwork

Requirements should be reviewed on a case by case basis with Project Coordinator

Equipment Insulation

Insulate all cold equipment to prevent condensation for the following:

- Chilled water pumps
- Chiller shells and water boxes

Insulate hot equipment as required for personnel protection and on the following equipment:

- Domestic hot water storage tanks
- Large condensate receivers

Installation Requirements

Insulation at joints should not be applied until after pipe, duct and equipment have been final installed, tested, cleaned, and inspected.

All exposed edges of insulation shall be sealed.

DESIGN GUIDELINE 221113 **BASIC PIPING MATERIALS AND METHODS**

General

In general, follow the guidelines below when designing and specifying pipe, pipe fittings, and accessories. Unless specifically indicated otherwise, these guidelines are not intended to restrict or replace professional judgment. Piping materials shall be compatible with systems served.

Related Sections

[232300 - Refrigerant Piping](#)

Ductile Iron Pressure Pipe Inside Buildings

In all cases, ductile iron pressure pipe running inside buildings shall be equipped with restrained joints. This includes new construction and renovation work.

Ductile iron pressure pipe should normally not be run inside buildings. A typical case when this is unavoidable is underground domestic, fire protection, or chilled water ductile iron pipe connecting to the associated building piping system. The transition between the underground ductile iron pressure pipe and the building pipe shall be accomplished with a flange located inside the building.

- For new installations, specify that the termination of the ductile iron pipe (and any ductile iron joint inside the building) be factory threaded and equipped with a screw-on, machine tightened, ductile iron flange that complies with ANSI/AWWA C110 and C115, similar to that available from American Ductile Iron Pipe, US Pipe, and others.

For existing buildings with unrestrained plain end or mechanical joint ductile iron piping, replace with restrained flange adapters with actuating screws that break off when tightened to

the proper torque, such as EBAA Iron Incorporated MEGAFLANGE Series 2100. Do not specify restrained flange adapters that do not incorporate break-off actuating screws.

General Material Requirements

Refer to U-M Master Specification for piping and accessory materials and installation requirements, including: Drainage and Vent Piping, Pressurized Plumbing Piping, Hydronic and Steam Piping, Eccentric Fittings, Tees in Welded Pipe, Solder in Copper Piping Joints, Dielectric Protection, Flanges, and Unions – previously addressed in this section. In all cases, pipe materials and accessories must be compatible with systems served (pressure, temperature, corrosion resistance). Master specifications contain extensive hidden text for the specification editor to guide decision making process. Where U-M Master Specifications are used, edit and customize on a project specific basis. Note that only the more typical piping applications are covered in the U-M master specification; assure every pipe application specific to the project is specified. Additional clarification is included in paragraphs that follow.

Mechanical Piping Material Requirements

Refer to U-M Master Specification Sections for details of piping material requirements. Clarifications and exceptions are noted below.

Domestic Cold Water and Hot Water

Domestic Hot Water piping installed in the central campus tunnel system shall use exclusively Victaulic grooved copper pipe and fittings.

Storm and Sanitary Waste and Vent Piping

Vent piping shall be the same as waste piping.

Master specification includes both cast iron and PVC piping. Use cast iron unless specifically instructed by U-M Design Manager to use PVC. While PVC may have some appropriate applications in small projects, there can be smoke/fire related problems with using PVC.

Laboratory Waste and Vent Piping

For most chemistry and biology labs, dumping of acids and other corrosive chemicals is prohibited. As such the waste stream is generally dilute, within Ph limits suitable for discharge to city sanitary sewers. Therefore, in most cases, neutralization pits are not required. Confirm design philosophy on lab waste system with U-M Design Manager.

For general lab applications, above ground lab waste piping is typically specified as corrosion resistant polypropylene, Schedule 40. Joints may be mechanical type or fuse-sealed, depending on application. For new lab buildings, or renovations with extensive new drainage networks, fused joints should normally be specified. Consult U-M Design Manager. Fused joints are generally less prone to developing leaks, but may be more expensive. All sink P-traps shall be of the same material as the waste pipe, and include mechanical fittings for ease of maintenance.

Underground piping shall be polypropylene, Schedule 80. Joints shall be fused type. Consult U-M Design Manager. Double walled underground piping is not generally required.

Alternate piping material shall be considered on a case-by-case basis where high temperature waste or other factors may be present. High silicon cast iron may be considered if the application warrants the added expense. Glass piping may be considered where high temperature waste is present.

High Purity Water Piping

Design piping system to meet project specific requirements. Some applications can use PVC piping (humidifiers), while others require polypropylene (most labs). Consult U-M Design Guideline 220020 – High Purity Water Systems for detailed requirements.

Vacuum Piping

Provide a plugged cross at all turns greater than 45 degrees, slope in the direction of flow and provide hose end drain valves at all low points for cleaning the system.

Chilled Water Piping

Large underground piping should generally be uninsulated ductile iron (Class 52 with Polyethylene wrap). For small piping, consider alternate materials and need for insulation.

Hot Water Heating Piping

Underground piping shall be installed using a preinsulated piping system. Carrier pipe shall match above ground piping. Jacket pipe shall be minimum 10 gauge steel, with butt welded fittings, and a fiberglass reinforced urethane elastomeric coating. Refer to section 220719 for insulation requirements.

(Steam) Condensate Piping

Underground condensate (from steam) piping shall be schedule 80 black steel with extra heavy fittings in a preinsulated system as described for underground hot water heating piping. Condensate piping shall not be run in common jacket pipe with other carrier pipes, unless specifically approved by U-M Design Manager and Utilities Department. Generally, two underground condensate lines are installed – one spare for future use.

Condenser Water Piping

U-M is presently considering non-ferrous (stainless steel, fiberglass, ABS) piping alternatives for improved water quality. Preliminary analysis indicates that non-ferrous piping may be justifiable, especially in applications where the cooling tower is drained seasonally, and where piping is not heat traced and insulated. Schedule 10 stainless steel condenser water piping has been used on some projects. Consult U-M Design Manager.

Underground condenser water piping shall be ductile iron.

Steam Piping

Underground steam piping up to 125 psig shall be Schedule 40 black steel with butt welded fittings, in a pre-insulated system as described for underground hot water heating piping.

Civil Pipe Material Requirements

Generally, underground piping 5 feet or more from building exterior walls is considered to be “Civil Piping”. The following piping materials apply to Civil piping only, and may indicate that a change in pipe material takes place at this point. Refer to Tab 2 - Sitework for additional requirements.

Storm Sewer

Shall be reinforced concrete pipe (RCP), ASTM C-76, Class IV, with rubber gasketed joints, ASTM C-443, or High Density Polyethylene with rubber gasketed joints. For small projects with piping limited to 6” and 8”, Schedule 80 PVC pipe may be used.

Sanitary Sewer

Shall be extra strength vitrified clay pipe (VCP) with O-ring joints. Sewers 15” and larger shall be reinforced concrete pipe (RCP), ASTM C-76, Class IV, with rubber gasketed joints, ASTM C-443

City Water Mains (for domestic water and fire protection)

Shall be Ductile Iron Class 52 with Polyethylene wrap.

Under Drainage Tubing

Shall be corrugated polyethylene tubing (AASHTO M 252) or corrugated polyvinylchloride tubing (ASTM F 800, with holes conforming to (AASHTO M 252)

Lawn Sprinkler Piping

Coordinate irrigation system design (including sizing water main, backflow preventer, and water meter) and installation with the University Landscape Architects Office and the U-M Plumbing shop, via the U-M Design Manager.

Pipe Hangers and Supports

Refer to U-M Standard Details, U-M Master Specification 230000 for additional hanger and support requirements previously addressed in Design Guideline Section 221113. Refer to Design Guideline Section 230000 for building attachment requirements previously included in this section.

Prior to beginning design, A/E shall review building design and construction and design suitable building attachment and pipe support and anchoring system, verifying that the existing building structure can support new piping loads.

The A/E shall include the following in piping designs:

- Pipe hanger details, including components, hanger spacing.
- Pipe hanger systems that accounts for thermal expansion of piping.
- Details of building attachments, including clarifying when support of piping from concrete slab using expansion anchors is acceptable. "C" type clamp hangers are acceptable for fire protection piping and all piping 2" and smaller when retaining clips are used.
- For large piping or where the design otherwise impacts the integrity of the building structure, indicate locations of all pipe hangers.
- For existing buildings with concrete floors, determine the extent to which vertical drill-in or similar type inserts can be used, and delineate any limitations regarding their use in the specifications. Many older buildings may not have sufficient floor thickness or integrity to allow the use of such inserts.
- Indicate locations and details of pipe anchors, guides and expansion joints or bends.

A/E shall include the following in the Project OPR/BOD document:

- Pipe expansion and stress calculations for hot pipes (120°F and above), 6" and larger. Show compliance with ANSI piping codes.

Large piping and equipment shall be independently supported from building structure, not from roof decks, etc. All piping shall be directly supported from the building, not from other piping, ductwork or equipment.

Dissimilar metal-to-metal contact between pipe and hanger is prohibited. Specify isolators, such as plastic coated hangers for copper pipe, to avoid dissimilar metal-to-metal contact between pipe and hanger.

Hangers for piping that lacks rigidity, such as polypropylene pipe, shall be spaced, as a minimum, as recommended by the manufacturer or preferably, with a continuous support. Since the spacing is typically much closer than for other piping materials, the designer must pay close attention to the implications on the design.

For cold piping systems, design piping hangers to retain integrity of vapor barriers. Specify cal-sil or similar pre-formed inserts and insulation shields for all piping 4" to 12" requiring a vapor barrier (wood blocking is not acceptable). Insulation shields are acceptable for piping 3" and below.

Design for Thermal Expansion:

Account for thermal expansion when designing pipe hangers and supports. Where space allows, expansion bends fabricated from standard piping are preferred over expansion joints.

For Expansion Design Requirements for steam in tunnels, see U-M Design Guideline SBA-H.

For steam tunnels, on low pressure steam (LPS), externally pressurized bellows type expansion joint shall be used. For low pressure condensate (LPC), use externally pressurized bellows type expansion joint or equal expansion bellows type expansion joint. For domestic hot water

(DHW), use equal expansion type bellows joints with all Stainless steel construction (no carbon steel on wetted parts). Refer to U-M Master Specification 220516 – Pipe Expansion Joints.

Pipe Hanger Submittals

A/E shall require that the Contractor submit the following for A/E review and approval:

- Type and model for all manufactured pipe support components, including building attachments, hangers, insulation saddles and shields, expansion joints, anchors.
- Locations of anchors, expansion bends and joints.
- Locations of building attachments where deemed necessary by A/E.
- Details and supporting calculation of additional supports.

A/E shall review contractor's hanger support shop drawings and details to verify that unacceptable pipe movement during all phases of operation of the system (start-up, sudden gpm changes, or shutdown) will not occur.

Pipe Hanger Shields and Preinsulated Pipe Supports

Pipe shields and preinsulated pipe supports shall be used to protect piping insulation and vapor barrier (for cold piping) as described below.

- Horizontal Cold Piping (CHWS/R, CW) sizes 2" and less:
Provide galvanized insulation protection shields under 180 degrees of piping, between hangers and pipe insulation.
- Horizontal Cold Piping (CHWS/R, CW) sizes 2 1/2 and over:
Provide 360 degree preinsulated welded pipe shields between piping and hanger.
- For all Cold Piping Vertical Risers:
Provide preinsulated riser clamps.
- For Hot Piping:
Account for thermal expansion when designing pipe supports and shields. Where suitable install hangers directly on the pipe and bury hanger in insulation. Where necessary, install pipe saddle on pipe, preinsulated pipe shield or galvanized insulation protection shield.

Pipe Penetrations and Sleeves

Provide pipe sleeves where required, including the following locations:

- Where required by code
- Where required as part of rated penetration, to maintain fire and smoke rating
- To support vertical piping (to support riser clamps).
- Where required to maintain water seal and prevent water penetration.
- Where pipe movement is anticipated (especially due to thermal expansion) at the penetration.

Fire Protection Piping, Compressed Air and other uninsulated piping: Sleeves are generally not required, unless required to maintain integrity of rated walls.

Chilled Water and Cold Water: Sleeves are generally required for all piping 2" and larger penetrating walls and floors.

Steam, Condensate, Heating Hot Water, and other hot insulated piping: Sleeves are required for all piping in walls and floors.

For underground exterior wall penetrations, piping penetrations must be watertight. For new construction, provide cast-in-place pipe sleeve with integral water-stop, oversized for use of linkseal between piping and sleeve. In existing concrete, where concrete can be core drilled and properly sealed with a linkseal, a sleeve may not be required.

For renovation work with existing concrete floors or for new floors where cast-in-place sleeves were not installed, pipes penetrating above grade floors typically require "double core" sleeves, especially in areas where floors are likely to get wet, and where water leaks to floors below would be disruptive to operations. Piping in stairwells does not require floor sleeves.

Include appropriate, project specific penetration and sleeve details for all conditions. Refer to U-M details, and customize as required.

Pipe Pressure Testing Requirements

Include pressure testing requirements in the project specifications or on the project drawings. U-M Standard Detail 221113 – Basic Piping Materials and Methods indicates typical pressure testing requirements and may be used provided it is revised to reflect project specific requirements.

For each system pressure tested, require that a test report be provided using owner furnished forms, certifying that the system was satisfactorily tested and passed.

Flushing and Cleaning of Piping Systems

At minimum, the A/E shall include the flushing and cleaning requirements found in Part 3 of U-M Master Specification 221113 – Basic Piping Materials and Methods. Refer to the spec. editors notes in U-M Master Specification 221113 for additional information.

Dye Testing Requirements for Storm and Sanitary Piping

Dye testing is required on most new connections to new and existing storm and sanitary waste piping. Refer to Master Specification Section 221113 (including hidden notes) and OSEH Dye Testing Guidelines for Storm Water & Sanitary Systems.

Where practical, dye testing of underground piping should be done during design phase to validate that the design is in compliance with effluent discharge codes and regulatory requirements. Special attention should be paid to mechanical room floor drains and cooling

tower overflow drains, both of which are now required to be routed to sanitary waste. Testing may also require services of the U-M Plumbing Shop. Coordinate with U-M Design Manager.

Require construction phase dye testing by the contractor, after final connection is made, and before system is put into service. See the U-M Master Specification Section 221113 for additional guidance. To facilitate efficient and effective testing, indicate location of appropriate validation points on plans. This is typically the first manhole outside the building.

DESIGN GUIDELINE 230000 **BASIC MECHANICAL REQUIREMENTS**

General

Within the scope defined by the Program Documents, perform the project mechanical design work and produce the project mechanical construction documents in accordance with these Design Guidelines.

Related Sections

[Codes and Regulatory Agencies](#)

Design Requirements - Codes and Standards

In addition to the **Codes** listed in section "Codes and Regulatory Agencies", the following **Standards** apply to mechanical projects. Use most current update. Where these **Standards** conflict with related **Codes**, **Code** shall take precedence.

- State of Michigan Fire Marshal Division, "Fire Damper Clarification".
- NFPA 101, "Safety to Life from Fire in Buildings and Structures".
- NFPA 90A, Installation of Air Conditioning and Ventilating Systems.
- SMACNA HVAC Duct Construction Standards - Metal and Flexible.
- Factory Mutual loss prevention data sheets.
- NFPA 13 "Installation of Sprinkler Systems".
- ANSI/ASHRAE/IES 90A Energy Standard.
- ANSI/ASHRAE/IES 100.5 Energy Standard.
- AABC National Standards for Total System Balance.
- ACGIH Industrial Ventilation.
- ASHRAE Handbook - Fundamentals, Equipment, HVAC Systems and Applications, Refrigeration.
- ASHRAE 62 Ventilation for Acceptable Indoor Air Quality.
- SMACNA - HVAC Testing, Adjusting and Balancing.
- NEBB - Procedural Standard for Testing, Adjusting and Balancing of Environmental Systems.
- AWS D 9.1 - Welding of Sheet Metal.
- AMCA - Standards, Definitions, Terms and Test Codes for Louvers, Dampers and Shutters.
- NFPA 14 - Standpipe and Hose Systems.
- Michigan Occupational Safety and Health Act.

The enforcing authority is the University of Michigan.

Design Requirements - Future Growth, Spare Capacity, Existing Conditions

When designing new installations, consider providing spare capacity for future growth. When designing renovations to existing installations, verify the existence of spare capacity before utilizing it for the new loads. Also field verify existing conditions - do not assume that existing design drawings are complete or accurate.

Design Requirements - Maintenance Accessibility

Locate equipment requiring maintenance so that it is easily accessible. Avoid installations that require the use of lifts or scaffolding, or the removal of other equipment for routine maintenance. Provide access doors to all maintainable equipment located behind walls or above permanent ceilings.

Preferred Manufacturers List

The University (Facilities Planning and Design) maintains a "Mechanical Trades Preferred Manufacturers List" (PML). This list is updated regularly, generally in February and August. The A/E shall use this list in developing construction document specifications. Obtain a current copy from the University Project Coordinator. This list is also available through this website.

Where specific manufacturers are specified in U-M AEC specifications other manufacturers listed in the PML may be added provided a model with similar quality exists, subject to the approval of the U-M Design Manager.

Demolition Requirements

To maximum extent feasible, remove abandoned branch piping and ductwork back to risers/mains. Remove abandoned conduit and equipment.

The A/E must caution the Contractor that all shutdowns of systems serving occupied spaces outside the area of this project shall be absolutely minimized. This will require that, for example, branch duct runs shall be capped and sealed at the time of partial duct removal to allow use of the remaining duct system until the new ducts are installed. Temporarily rebalance if pressure relationships are critical. Ducts cannot be left open unless the entire system can be taken out of service throughout the full construction period.

Other systems which are presently operating that are to be abandoned, as well as those previously abandoned should be removed.

Operating and Maintenance Instruction Manuals

Four sets of **job specific** operating and maintenance (O&M) manuals shall be provided for each project. These manuals shall be collected in indexed three ring binders and contain manufacturer's operating and maintenance literature for every equipment item furnished for

the project. Typical wiring or piping schematics are NOT acceptable; they must reflect the actual furnished equipment, including all options and interfaces with other equipment or systems. O&M manuals shall include a steam trap inventory with individual trap identification, service, manufacturer and model.

A single copy of each **job specific** O&M manual shall be submitted immediately after all shop drawings have been approved. This copy will be reviewed by the A/E and University personnel, then sent back to the contractor for corrections. All four corrected copies must be received by the University two weeks prior to any scheduled training.

Drawing Requirements

The amount of outdoor air for each air handling system must be shown on the equipment schedules.

Prepare the following mechanical drawings (as applicable to the project) for use during construction:

- Demolition plans and details
- Plumbing plans, including underground (within 5 feet of the building)
- Piping plans and details, including all utility meter locations
- HVAC plans and details
- Mechanical room layouts showing free space required for maintenance
- Plumbing, piping (including specialty gases) and HVAC (SA, RA, EA) risers

The drawing shall be of high quality in accordance with the Construction Documents Section of the Special Instructions to Designers.

Shop Drawings and Air/Water Test and Balance Reports

The University will retain three copies of all such submittals and the A/E will retain one copy. Therefore, the Contractor will be required to submit four copies of all such submittals plus however many copies he wishes to retain.

Access for Maintenance Operations

Add access hatches as required to service valves, dampers, coils, VAV boxes and mechanical equipment.

Structural Supports

All supports for piping and equipment shall be selected so that deflection caused by the load does not exceed 1/240th of the span.

Dust Protection

All mechanical and electrical equipment shall be protected from construction dust. Before start-up, motors must be covered or enclosed in a dust free manner. After start-up the surrounding area must be kept as dust free as possible by regular and frequent cleaning, dust control compound etc.

DESIGN GUIDELINE 230010 **HVAC DESIGN**

Scope

General requirements for HVAC design including zoning, design weather data, temperature and humidity, acoustics, and ventilation.

Related Sections

U-M Design Guideline Sections:

[SID 2.1 - Owner's Project Requirements and Basis of Design Documents](#)

Definitions

Zone: A group of one or more spaces having a single thermostatic control.

HVAC Zoning

Normal zoning for offices and office like spaces at the University of Michigan shall be:

- Exterior Spaces: Two spaces per thermostatic control zone.
- Interior Spaces: Four spaces per thermostatic control zone.

However, zoning for these as well as all other space types shall be configured to assure that the required temperature and humidity control ranges are attained.

Conference rooms and spaces on corner building exposures should be on a separate zone.

When establishing zones the following shall be considered:

- Similarity of sensible and latent loads
- Occupancy
- Occupant transiency
- Space type, e.g. lab, open office, class room, etc.
- Exterior exposure location/number of exterior exposures
- Allowable temperature and humidity range
- Impact of zoning on potential energy conservation opportunities
- Energy code requirements
- LEED credits

This is not a comprehensive list. The A/E shall determine the considerations specific to the project and design the zoning accordingly.

Mechanical System Design Criteria

Determine project specific temperature, humidity, air change rate, cleanliness, acoustic, and other design criteria for each space by consulting with the User and the U-M Design Manager. Indoor and outdoor design criteria shall be stated in the Owner's Project Requirements/Basis of Design Documents (OPR/BOD). When no OPR/BOD is planned, indicate this information on the drawings (first sheet of the applicable section).

Outdoor Air Design Conditions (Summer: ASHRAE Detroit Willow Run airport data)

HVAC Winter: Negative 10F & 0% RH

HVAC Summer: 87.9F DB / 72.7F WB (ASHRAE 1%) for lab/research areas
84.5F DB / 70.9F WB (ASHRAE 2.0%) for office/classrooms

Cooling Towers: 95F DB / 78F WB

Dehumidification (critical spaces): Select 0.4% or 1% ASHRAE dehumidification data in consultation with the U-M Design Manager.

Typical Indoor Design Conditions - Acoustics

Class/Meeting rooms:	NC/RC	30
Offices/Labs:	NC/RC	40
Labs with Fume Hoods:	NC/RC	50

Indoor Air Temperature and Humidity

Design projects to produce acceptable indoor comfort. Consider the design application, all HVAC loads, as well as initial and operating costs of various alternatives. To minimize cold drafts, provide new and existing buildings with perimeter radiation heat unless this requirement is specifically waived by the University Design Manager. At the same time, consider optimization of building skin to allow perimeter heat to be eliminated without compromising comfort.

Humidification is generally required, except where specifically waived by the University Design Manager. Criteria must be carefully selected to balance human comfort with building skin integrity. General winter humidification criteria: 30% RH. Central power plant steam contains amines; when used for direct injection humidification this may be objectionable in some cases. For office and other areas with relatively low outside air requirements a "clean steam" humidification system may be appropriate. Clean steam typically consists of a steam to steam heat exchanger with RO make-up water. In lab areas and other high outside air environments, direct steam is often acceptable. Consult with the User and the University Design Manager early in the design phase to clarify project specific humidification requirements.

Typical Space Design Criteria

(These are the minimum performance levels the HVAC system shall be designed to achieve when the User or the U-M Design Manager is unable to provide specific requirements):

Office/Classrooms/Labs

Summer: 75F maximum dbt, 60% maximum RH

Winter: 72F minimum dbt, 30 % minimum RH

Typical Space Set Points

The following set points shall be indicated on the project control drawings when the User or the U-M Design Manager is unable to provide specific requirements for a space:

Office/ Classrooms/Labs:

Heating Setpoint: 71°F

Cooling Setpoint: 76°F

Throttling Range (DDC controls): minus 1°F heating, +1°F cooling.

Dead Band (minimum): 5°F

Ventilation

Provide designs that comply with the Michigan Mechanical Code (MMC) and with the latest edition of ASHRAE 62.1 Ventilation for Acceptable Indoor Air Quality. However, the natural ventilation requirements of the MMC shall govern over the requirements found in ASHRAE 62.1. The natural ventilation approach shall typically be limited to dormitories.

For any air handling system exceeding 5000 CFM that has multiple recirculation paths, use the Appendix A approach of ASHRAE 62.1 to optimize the System Ventilation Efficiency to adjust the required system outdoor air rate to the point which provides the lowest over-all energy cost. This is most easily accomplished using energy modeling software such as Carrier Hourly Analysis Program.

DESIGN GUIDELINE 230011 **FANS AND ACCESSORIES**

Scope

Fans and accessories. Fan arrays.

Related Sections

U-M Design Guideline Sections:

[220514 Variable Speed Drives](#)

[230013 Air Handling Units](#)

U-M Master Specification Sections:

[233400 - Fans](#)

General

U-M Master Specification Section 233400 - Fans shall be used as the basis for fan specifications on all projects. The A/E shall edit the U-M fan specification to make it project specific. While many fan types are covered by this specification, not all fan types are included. Turn on hidden text and read all spec. editor's notes when editing the specification.

Direct drive fans are preferred for fans driven by variable frequency drives.

Limit belt driven fan speeds to approximately 1400 RPM.

Limit direct drive fan speeds to approximately 2700 RPM. However, it is strongly preferred that fan speeds not exceed 1800 RPM.

Forward curved fans shall not be specified except when air foil or backward inclined fans are unavailable, or when a forward curved fan provides significant performance advantages. Modular air handlers are often available with either forward curved or backward inclined/air foil fans. If backward/air foil type are available specify that type, except as qualified above.

For plenum fans, the impacts on fan performance from any inlet mounted back draft dampers shall be compensated for when selecting such fans. Backdraft dampers should be actuator driven.

Extended lube lines shall be specified where bearings are difficult to access or for units providing service to areas that might be compromised by opening an access door for bearing lubrication, e.g. clean room units, lab units with stringent temperature, pressure, or humidity controls, etc.

Fan Arrays

Fan arrays are not preferred except when space or redundancy requirements demand them. Each fan in an array requires a separate motor overload, and each fan should typically have a separate electrical disconnect. Refer to Design Guideline 220514 for additional requirements related to variable frequency drives. Typically additional air flow stations and controls are required. This all adds to complexity, cost, and maintenance. Fan arrays of more than 4 fans in particular are not preferred since they typically use more fan energy and do not save space when maintenance clearance requirements are considered. Therefore the A/E shall provide an analysis comparing the energy use, space savings, and any other benefit that results from various fan quantities, for any fan array system proposed to use more than 2 fans. This analysis shall include the impact of fan and motor efficiency differences between the various alternatives, as well as the cost for additional disconnects, fan motor overloads, air flow stations, controls, etc. .

Fan speeds in fan arrays should be limited to the range indicated for direct drive fans, above.

Each fan in a fan array should be equipped with its own variable frequency drive. Controlling multiple fans off the same VFD is discouraged and shall be approved by the U-M Design Manager. If multiple fans are controlled by a common VFD, provide a separate electrical disconnect for each fan. In such cases, early break contacts may be omitted from the individual fan disconnects.

Equipment Room Exhaust Fans

A single fan in the exhaust duct is preferred, provided the negative static pressure at the equipment room remains within reason. For rooms deep in the building, both supply and exhaust fans will be required.

DESIGN GUIDELINE 230012

AIR FILTERS

Scope

This Design Guideline covers air filters for general HVAC use. It does not pertain to clean rooms or other spaces requiring High Efficiency Particulate Air Filters, or filters in laboratory equipment such as bio-safety cabinets. It does not cover specialty filter requirements that may be required for a specific project.

Related Sections

U-M Design Guideline Sections:

[230013 - Air Handling Units](#)

U-M Master Specification Sections:

[234000 - HVAC Air Cleaning Devices](#)

General

Filters shall be specified using U-M master specification 234000 - HVAC Air Cleaning Devices. Edit this specification section to make it project specific. Turn on hidden text and read all spec. editor's notes when editing specifications.

Air filters shall be scheduled on the design drawings. Minimum schedule data shall include:

- Service
- Location
- Filter type (bag, pleated, etc.)
- MERV (Minimum Efficiency Rating Value)
- Dust spot efficiency
- Filter dimensions including depth
- Clean filter pressure drop
- Dirty filter pressure drop (1" w.g. typical)

For the typical air handler, specify filters and frames capable of a dirty filter pressure drop of 1" w.g. In all cases, size air handling (and exhaust) systems so that design air volumes can be delivered at the dirty filter pressure drop condition, not at some intermediate filter drop condition.

For filter efficiencies above 30%, bag filters shall be specified. Due to problems with disposal, box style filters shall not be used except in unusual circumstances, when approved by the Design Manager.

Roll type filters shall not be used.

Washable filters shall not be used.

Filters shall be designated as face mounted with the filter seals sealing against the upstream side of the filter frame. *Side slide filters shall only be used in unusual circumstances.*

For air handling equipment above 5000 CFM, always provide a prefilter and a secondary filter, located upstream of the first coil in the unit. This includes units equipped with final filters at or in their discharge.

Design filters so that the maximum air flow velocity across the filter does not exceed 500 FPM.

In all cases the AE's design must provide adequate access to allow changing filters. It shall not be necessary to remove fixed items, including ceiling grid, to change filters.

Filters and filter rack design should be based on the use of 24"x24" filters whenever possible. The use of 12"x24" filters to complete rack configurations is acceptable. If 24"x24" and 12"x24" modules are not possible, use industry standard filter sizes.

Filter Efficiency Guidelines

The below are guidelines only. Specific project requirements may mandate higher efficiency ratings.

Very small or non-critical air systems serving spaces less susceptible to dirt, e.g. mechanical rooms, may be designed with prefilters only.

Pre-filters shall be 2" deep, 30% efficient, MERV 8, pleated panel type. Provide pre-filters in front of any filter with a dust spot efficiency of 65% or greater.

Secondary filters for air handlers with a significant return air component shall be 65% dust spot efficient, MERV 11, bag type.

Secondary filters for continuous 100% outside air units shall be 95% efficient MERV 14, bag type.

Vivarium animal room filters used to protect exhaust Laboratory Terminal Airflow Units shall be ring panel type filters. These shall normally be mounted in the duct as opposed to on an exhaust grille face, and shall be equipped with a Magnahelic gauge.

Provide the manufacture's standard efficiency filters for packaged terminal air conditioners, fan coils, and similar small equipment. However, when this equipment exceeds 1000 CFM, specify 2" deep 30% efficient MERV 8 filters whenever possible.

DESIGN GUIDELINE 230013 **AIR HANDLING UNITS**

General

This section describes design requirements, types, and arrangements of air handlers required, sizing considerations, and minimum air handler construction features. Testing, temporary use, and training are also covered.

Related Sections

U-M Design Guideline Sections:

[230000 – Basic Mechanical Requirements](#)

[230011 – Fans and Accessories](#)

[230012 – Air Filters](#)

U-M Master Specification Sections:

[230900 – Mechanical Systems Controls](#)

[233400 – Fans](#)

[234000 – HVAC Air Cleaning Devices](#)

[237323 – Custom Air Handling Units](#)

[237324 – Semi-Custom Air Handling Units](#)

[238216 – Coils and Drain Pans](#)

Design Requirements

Air handlers shall be specified using the U-M master specifications: 237323 - Custom Air Handling Units, or 237324 – Semi-Custom Air Handling Units. Edit these specification sections to make them project specific. Note that when using these specifications the U-M related master specifications for fans (233400), filters (234000) and coils (238216) must be included since these components are not specified within the air handler specifications. Turn on hidden text and read all spec. editor's notes when editing specifications.

For all air handling equipment greater than 2000 CFM, the engineer shall provide a scaled elevation of the unit on the design drawings. This elevation shall indicate component arrangement and identify each unit component: dampers, access sections, doors (including door size), door windows, access panels, pre and final filter, coils, humidifiers, fans, blenders, eliminators, diffuser plates, lights, drain pans, flex connectors, and all significant accessories. Maximum height, width, and depth, as well as base rail height, shall also be indicated.

For all air handling equipment, the plan view drawings shall indicate the arrangement of each component, overall unit size, coil pull space, and access door swings. The plan views shall also indicate the unit's designation and the maximum unit CFM.

Units shall be labeled with sequential alpha-numeric designators. For retrofit designs, do not repeat the numerical designator of existing units; coordinate with U-M Utilities and Plant Engineering via the U-M Design Coordinator to determine the appropriate designator.

Designate adequate roof curb or housekeeping pad height to allow proper trapping of cooling coil drain pans. Provide a detail that indicates the trap height dimensions for every coil trap.

To avoid snow entrainment, limit air velocity through intake louvers to 300 FPM through the louver free area at outside air volumes that occur at 35°F or less (for example, this volume is the maximum supply air volume for 100% outside air units; for units with return, it is half the maximum supply air volume assuming 75°F return air and 35°F outside air being mixed to 55°F), and limit intake plenum velocities to 500 FPM in all directions. Slope the bottom of plenum/duct connections to the louver so that water drains out the louver.

Air Handling Unit Types

For the purposes of this guideline, semi-custom units are defined as air handlers for light to medium duty use, consisting of manufacturer's pre-engineered standard modules, with limited selections in terms of quality, features, and arrangement.

Semi-Custom units should normally be specified for applications such as offices, class rooms, and light duty lab applications (e.g. dry labs with very few or no fume hoods) where operation is generally limited to 5 days per week, 8-12 hrs/day. However for units greater than 20,000 CFM, the design should normally be based on custom units.

Custom units should normally be specified for large wet labs and dry labs, 100% outside air applications (except mechanical or electrical room ventilation), vivaria, clean rooms, 24/7 applications, and other medium to heavy duty applications.

Contact the U-M Design Coordinator early in the SD phase to establish custom versus semi-custom AHU locations.

Roof top units are not preferred and shall not be used except when approved by the U-M Design Coordinator.

Arrangement

Fan Arrangement: Draw through units are normally preferred, except for exterior units.

Returns fan configurations shall be used. Configurations using exhaust/relief fans or no return fan should be avoided and shall be used only when dictated by unusual circumstances.

Units shall be arranged to allow proper access for routine maintenance of all components. At minimum, access shall be provided for the replacement of the following components: Filters, coils, fan shafts, bearings; without unit disassembly or partial demolition of the unit or adjacencies.

Sizing

For applications where load growth is likely to occur over the life of the unit, e.g. lab buildings, size all air handler components (fans, coils, filters, etc.) with additional capacity for future use. Determine the appropriate additional capacity in consultation with the U-M Design Coordinator.

When sizing units, assume 5% duct leakage and 1°F temperature heat gain in supply ducts.

Fans shall be sized assuming dirty filter pressure drops, which are typically 1" w.g. static pressure drop across the pre filters and 1" w.g. static pressure drop across the final filters.

Construction

Unit Casing

Solid inner walls are preferred whenever possible. Perforated walls should only be utilized when external sound attenuators or other means are found to be ineffective in meeting the required noise criteria.

The minimum wall thickness for semi-custom units shall be 2". The minimum wall thickness for custom units with fiberglass insulation shall be 4", except 2" foam insulated panels are permitted if such panels match the performance of 4" thick fiberglass insulated panels. See the U-M Master Specification section 15854 for more details.

For roof top mounted units, consult the Architect and the U-M Design Manager to determine if a custom paint color or screening is required.

For units above 10,000 CFM, each access section shall be illuminated. See the U-M Master Specifications for details.

Drain Pans

Drain pans shall be designated as above floor type. Avoid floor recessed drain pans whenever possible due to the difficulty of replacement.

Drain pans shall be stainless steel. Plastic drain pans are acceptable in units of less than 2000 CFM.

Access Sections

Access sections shall be provided to allow up and down stream access to every unit component. For example, an access module shall be provided between each heating coil and cooling coil section; both the air entering and air leaving side of each coil shall be visible for inspection. The designer must accommodate these access sections when fitting units into the available space.

For large custom and semi-custom units (> 20,000 CFM), in particular those with a large outside air component, consider (with the U-M Design Coordinator) providing an access section between the pre and final filters of adequate size to allow the final filters to be replaced from the upstream side without removing the pre-filters. As an alternative to the above, a hinged pre-filter section may be specified. For hinged pre-filter configurations, also specify a gap between the pre-filter and final filter frames to allow a static pressure tap to be installed so that a separate pressure drop reading may be taken across the pre and final filter banks.

Access Doors

Hinged access doors are required in each access section.

Minimum door widths are specified in the U-M AHU Master Specifications. For semi-custom units, doors shall be a minimum 18" wide, but 24" width is strongly preferred. Widths narrower than 18" should be avoided and are unacceptable for sections requiring personnel (vs. inspection/arm reach only) access. For custom units, minimum door width shall be 24". In all cases, provide doors that are the full height of the unit, maximum 6' high.

Windows shall be provided in all access doors on units greater than 5000 CFM, and for all air handlers providing service to areas that might be compromised by opening an access door for inspection, e.g. clean room units, lab units with stringent temperature, pressure, or humidity control, etc.

Mixing Box Section/Air Blenders

The use of air blenders is strongly discouraged since U-M's experience is that such devices are ineffective in preventing stratification problems, leading to frequent nuisance freeze stat trips or more severe problems. Instead, arrange outside air and return ducts so that after combining, at least two directional changes occur prior to entering the air handler proper, or utilize blow through or other fan arrangements that completely eliminate such stratification problems. Use air blending devices only as a last resort and only with the permission of the U-M Design Manager.

When used, air blending units should be factory fabricated and should consist of fixed blades capable of providing a mixed air temperature within 6°F of the theoretical mixed air temperature. In a variable air volume AHU, this 6°F maximum deviation should apply throughout the CFM range specified. The devices should be sized to provide a maximum pressure drop of 0.15 inches water, with a stratification range not exceeding +/- 6° from the mean temperature. The A/E should lay out the AHU to provide a plenum sized for a minimum of 1/2 blender diameter upstream between return air duct and blender, and 3 blender diameters downstream between the blender and the first air flow obstruction (filter, coil, etc.).

Coils and Face/Bypass Modules

The maximum face velocity for cooling coils in both custom and semi-custom units shall be limited to 450 FPM. This face velocity shall be based on the actual coil face area sans any safing around the coil.

Maximum face velocities shall be based on any future capacity allowance for the AHU.

For units 10,000 CFM or greater, coil tracks and individual coil access panels shall be specified. See the U-M AHU Master Specifications for further details.

Coils shall have a maximum of six rows, and maximum fin spacing of 10 FPI. When these criteria can not be met, provide two coils piped in a series arrangement.

When multiple coils are stacked vertically, each coil in the stack shall be equipped with a balancing valve (circuit setter).

For 100% outside air units, or units with a large outside air component, “run-around” pumped hot water heating coils are preferred in lieu of steam coils (include redundant pumps for critical applications), for preheating applications. If preheat steam coils are used, multiple staged on/off steam coils shall be used, or a face/bypass arrangement may be used. For face/bypass arrangements, internal bypass or “Wing” coils shall not be utilized, rather an external coil bypass shall be utilized. The external bypass shall be routed to the downstream side of all unit coils (i.e. downstream of both the preheat coil and the cooling coil) and shall be sized to exert the same relative pressure drop on the fan as flow through the coils would exert.

Dampers

Damper construction is designated in U-M Master Specification 230900 - Mechanical Systems Controls. The U-M AHU Master Specifications also reference 230900 for damper construction. All air handler specifications shall utilize this damper specification for dampers provided by air handler manufacturers. This includes smoke and combination fire and smoke dampers that are provided by air handler manufacturers.

Filters

Units shall include pre-filters and final filters, except that very small, non-critical units or units serving spaces less susceptible to dirt, e.g. mechanical rooms, may include prefilters only.

Units serving substation rooms shall always be equipped with pre and final filters.

Pre-filters shall be 2” depth, 30% efficient, pleated panel type; final filters shall be bag type. Roll type filters shall not be used.

Filters shall be designated as face mounted with the filter seals sealing against the upstream side of the filter frame. Side slide filters shall only be used in unusual circumstances

Fans

Limit fans speeds to 1200-1400 RPM.

Forward curved fans shall not be specified except when air foil or backward inclined fans are not available, or when a forward curved fan provides significant performance advantages. semi-custom units are often available with either forward curved or backward inclined/air foil fans. Determine if backward/air foil type are available and always provide a design based on same when available, except as qualified above.

When plenum fans are utilized, specify a “guard cage” around the fan for safety. The impacts on fan performance of such cages as well as impacts from any inlet mounted back draft dampers shall be evaluated when selecting such fans. Assure proper up and downstream and side-to-side (relative to plenum walls and any adjacent fan(s) in the same plenum) clearances are maintained around plenum fans to prevent system effect problems or poor air distribution across upstream components.

Extended lube lines shall be specified where bearings are difficult to access or for air handlers providing service to areas that might be compromised by opening an access door for bearing lubrication, e.g. clean room units, lab units with stringent temperature, pressure, or humidity controls, etc.

Testing, Temporary Use, Training

Factory Testing

Custom units should normally be factory tested for air volume, pressure, leakage, and sound performance. Such factory testing is normally not required for semi-custom units, however it should be considered for air handlers that are not arranged in simple horizontal or vertical configurations, e.g. a fan section stacked on top of the coil sections. See the U-M AHU Master Specifications for further details.

Temporary Use/Field Testing

The U-M AHU Master Specifications contain specific criteria regarding the temporary use and field testing of air handling units.

Training

Training is not typically required on air handlers and should not be specified unless directed to do so by the U-M Design Coordinator. Consider need for training if units include direct expansion cooling.

DESIGN GUIDELINE 230014
PACKAGED ROOF TOP AIR CONDITIONING UNITS

Roof top air conditioning equipment (RTUs) is not preferred and shall be used only when absolutely necessary. Specify high quality roof top air conditioning units only. Refer to list of preferred manufacturers. Where necessary, use a continuous, sound attenuating curb when no access is required to the bottom of the equipment or support the equipment 24" above the roof (18" minimum) so that roof maintenance can be performed. Provide a catwalk for service access to routinely serviced components (such as control cabinets) that will be out of reach.

Typically, rooftop units controls should be U-M standard DDC. Direct expansion compressor and refrigeration controls may be manufacturer's standard.

Generally, units with return fans are preferred to units with exhaust fans.

DESIGN GUIDELINE 230015 **FAN COIL UNITS AND BLOWER COIL UNITS**

General

This section describes definitions, applications and design requirements for fan coil units and blower coil units.

For purposes of this section:

- Fan coil units (FCUs) refer to a variety of relatively small, unducted, floor or ceiling mounted units, used for cooling and/or heating the room in which they are located.
- Blower coil units (BCUs) refer to small to moderate-sized, ducted, floor or ceiling mounted units, used for cooling and/or heating the room in which they are located, and/or adjacent areas.

Fan coil units are one of the least preferred methods of providing air conditioning at the University. Blower coil units are generally preferred over FCUs, but less preferred than central HVAC systems.

Related Sections

U-M Master Specification Sections:

[230900 - Mechanical Systems Controls](#)

[238219 - Floor Mounted Fan Coil Units \(Un-ducted\)](#)

[238220 - Horizontal Fan Coil Units](#)

[238221 - Blower Coil Units](#)

Design Requirements

The U-M specifications listed above are typically recommended for use as the starting basis for fan coil and blower coil specifications on U-M projects. The A/E shall edit the specifications to make them project specific, in particular in the area of controls. The specification for floor mounted fan coils (238219) includes controls often used on U-M Housing projects, which may not be the appropriate choice for other projects. Turn on hidden text and read all spec. editor's notes when editing specifications.

For FCUs and BCUs, pay close attention to acoustic requirements of space served. FCUs and BCUs are generally not acceptable in classrooms, conference rooms.

Consider possible requirements for future additional capacity, and redundancy.

All FCUs and BCUs shall be individually scheduled and identified on the drawings.

Consider seasonal requirements and capabilities of chilled water, steam, and heating hot water.

Indicate maintenance requirements on drawings, for filter access. Account for access to all components requiring regular maintenance, including all valves.

For FCUs:

- Provide IAQ drain pan and code compliant method of over-flow protection
- Insulate cold piping inside and outside housing.
- Provide removable, replaceable filter.
- Provide multi-speed direct drive fans.
- Generally install floor mounted, non-recessed type. Low profile units are not acceptable due to difficulty in maintaining.
- Do not provide with integral outside air connection. Provide separate minimum ventilation air where required.

For BCUs:

- Provide IAQ drain pan, and code compliant method of over-flow protection
- Insulate cold piping inside and outside housing.
- Provide removable, replaceable filter: 2" pleated, minimum 30% efficiency.
- Provide belt drive fans with adjustable sheaves.
- Floor mounted, non-recessed type or ceiling mounted is acceptable, depending on project requirements, provided maintenance access requirements are met.
- Do not provide with integral outside air connection. Provide separate minimum ventilation air where required. If required, outside air for minimum ventilation load may be ducted to BCU return duct, provided outside air is filtered and includes an integral damper interlocked to BCU operation. BCUs should not be used for 100% economizer cooling.
- Use of BCUs should be limited to systems below 3,000 to 5,000 cfm, and should not be used in conjunction with VAV boxes.
- The generally preferred location of ceiling mounted BCUs is above corridors to allow service without disrupting the occupied space.

For FCU and BCU controls:

- See specification 230900 for control valve and actuator options.
- Do not provide factory-mounted, manufacturer DDC controls. Pneumatic or electronic thermostats, and manually controlled FCU fan speed are generally acceptable where there is little energy savings associated with reset controls. If networking or more complex control strategies are justifiable, provide U-M DDC controls.

Installation Requirements

Specify on the construction documents that the units must be installed to allow for maintenance of all serviceable components within the unit through without removing ducts, piping or other adjacent systems such as light fixtures.

Unions and isolation valves should be installed at all water service points to facilitate unit removal without disruption of service to the remainder of the building.

DESIGN GUIDELINE 230016 **COMPUTER ROOM AIR CONDITIONING**

General

This section addresses air conditioning requirements for computer rooms (including server rooms), and requirements for computer room units.

Related Sections

U-M Design Guideline Sections:

[230000 – Basic Mechanical Requirements](#)

U-M Master Specification Sections:

[230900 – Mechanical Systems Controls](#)

Design Requirements

Cooling Loads

Cooling loads vary widely in “computer rooms” throughout campus. The A/E shall work closely with the U-M Design Manager and end user to determine actual peak diversified load based on actual equipment. Consider future growth, redundancy requirements (see additional comments below in “Computer Room Unit Selection”), and seasonal changes, including seasonal limitations on the chilled water system, if used to provide primary source cooling. Clearly define all load and system design assumptions to U-M Design Manager, in a OPR/BOD document.

Temperature and Humidity Criteria

Clarify and document acceptable temperature and humidity criteria (summer and winter, including allowable range) with users and U-M Design Manager. The ASHRAE “recommended” temperature and humidity ranges found in the ASHRAE publication “*Thermal Guidelines for Data Processing Environments*” (most recent edition) should be the design criteria typically utilized for computer rooms. More stringent requirements shall be challenged and validated by the requesting parties because of the higher energy use that will result.

U-M generally discourages humidification for dedicated computer room systems. While humidification criteria is rarely as high as it had been in years past, extremely low RH (below 15%) may not be acceptable. Carefully analyze psychrometrics and alternatives (such as discharge air reset) before including computer room humidification. If humidification is required, steam generator-type humidifiers are preferred.

Source of Cooling

Outside air (air handler economizer cycles), in particular for larger computer rooms, is the preferred source of cooling when the application and infrastructure conditions permit. For critical applications, chilled water is the preferred source of cooling. Where chilled water is not available year-round, or where the chilled water system is prone to unscheduled shut-downs (including loss of chilled water during transition from free cooling to absorption cooling), combinations of chilled water primary and mechanical cooling secondary are recommended. For these applications, the refrigeration circuit may be air-cooled (equipped with low ambient refrigerant side controls) or glycol-cooled (with remote dry cooler).

The use of potable cold water for condenser cooling is not acceptable, except for very short-term temporary or emergency applications. These rare applications should be made only with the approval of the U-M Utilities Group through the U-M Design Manager.

Computer Room Unit Redundancy

While some computer rooms require full “n-1” redundancy (systems that can meet all loads with loss of the single largest component), most do not require this level of redundant capacity. Conversely, most systems will require some level of back-up cooling. For rooms with loads over 5 tons, multiple units should be installed, to offer some cooling capacity in the event of unit failure.

Controls and Alarms

Units that include mechanical cooling may include manufacturer’s standard electronic controls. Units with chilled water cooling only should be DDC controlled, integrated into U-M standard DDC system. In either case, unit failure and high temperature alarms should be integrated into U-M DDC BAS system.

Where chilled water is less reliable, where system does not provide full redundancy, and other select applications, consider using high temperature warning at 5F above setpoint to implement a graceful shut-down of non-essential equipment. In this way, users can improve reliability of essential systems. This strategy is not fully adopted by all computer room users.

For units located above a raised floor and other locations where deemed necessary, install a water sensor to detect an overflowing drain pan. Connect alarm to U-M DDC BAS system.

Emergency Power Impact

Computer rooms are not typically fed from emergency power, although many will have UPS systems. In the event that they are fed from emergency power, consider need to put computer room units and all required controls on emergency power. Central chilled water systems are not typically fed from emergency power.

Additional Computer Room Unit Features

A filter should be installed at the air-return opening.

The unit should be supplied with the optional integral fused disconnect switch, and all necessary controls to provide a completely functional unit.

Installation Requirements

At a minimum, chilled water coils should be piped with a 2-way control valve, isolation valves, and individually sized balancing valve (manual or automatic).

The unit should be supported from the concrete sub-floor slab with properly rated supports. Mounting units directly on raised floors is not be acceptable.

DESIGN GUIDELINE 230017 **WINDOW AIR CONDITIONING UNITS**

General

Window units are acceptable only if specifically approved by the University Project Coordinator.

Design Requirements

The A/E is responsible for field verifying the adequacy of the existing electrical service within the space to assure that the addition of this electrical load will not overload the circuit when all other existing equipment is operating at design capacity. If a new feed is required, it should be a part of this renovation project.

Equipment Requirements

Units which will be used to supply year-round ventilation should be equipped with an electric heating coil.

Units should be furnished with a window sleeve, approved by maintenance personnel.

Installation Requirements

Units should be mounted in the upper section of windows but not through-the-wall above the window (with ductwork to the occupied spaces).

Units should normally be mounted flush with the building exterior, projecting into the room. Deviations require approval by the Exterior Elements Design Review Committee.

DESIGN GUIDELINE 230020 **DUCT SYSTEM DESIGN**

Related Sections

U-M Design Guideline Sections:

[230030 - Laboratory Ventilation Design](#)

U-M Master Specification Sections:

[233100 - HVAC Ducts & Casings](#)

[233300 - Air Duct Accessories & RGDs](#)

General

A/E duct designs shall, at minimum, be in general compliance with SMACNA standards.

The A/E's duct specification shall state that duct construction shall, at minimum, meet SMACNA duct construction standards. The A/E's duct specification shall state that the Contractor shall provide their duct construction standards as their first shop drawing submittal so that the A/E can verify compliance with SMACNA standards.

Although typically SMACNA's HVAC Duct Construction Standards, Metal and Flexible, will apply, the A/E's spec. should also reference other standards if appropriate, e.g. SMACNA industrial duct standards.

The A/E shall provide a table that identifies the duct construction requirements for the project. At minimum the table shall include the following:

- Service/Location and/or System
e.g. Fume hood exhaust upstream of laboratory terminal units
- Duct Material
e.g. Stainless Steel (SS), Galvanized, Galvanized Plastic Coated Duct (PCD), etc.
- Pressure Classification
e.g. -2.0" w.g.

Design

Future Capacity: The amount of future air flow capacity the duct system shall be capable of handling, if any, shall be determined in consultation with the U-M Design Manager.

For duct pressure classifications greater than +/- 2" w.g., duct velocities shall not exceed 2500 FPM without the specific permission of the U-M Design Manager.

The amount of diversity assumed in the duct design shall be stated in the Design Intent Document.

Duct aspect ratios should be limited to a maximum of 4:1.

Round duct elbows constructed with centerline radius equal to or greater than 1-1/2 duct diameter shall be specified. Gored elbows are not permitted.

For rectangular duct, the AE shall design radiused rectangular elbows with r/W ratios of 1.00 or above, to the greatest extent possible. Squared elbows with turning vanes should be indicated when radiused elbows are impractical to fit .

Transition slopes should generally be 1/3 or less.

Indicate access panels on plans wherever ducts contain devices requiring maintenance or calibration, such as air flow stations, humidifiers, fire and smoke dampers, reheat coils, etc.

Indicate maintenance access by “dashing out” no-fly-zones in front of DDC terminal equipment controllers, laboratory air flow unit controllers, filters, and at other major duct mounted components.

Flexible duct shall be properly supported and shall not exceed 8' in length. The A/E should consider specifying flexible elbow duct supports (sample: www.flexflowelbow.com). Provide a detail demonstrating proper flex duct support.

Flexible duct connected to the inlet of terminal units shall be separated with a 24” long section of rigid metal duct located between the flex and the unit inlet. Provide a detail indicating this requirement.

Duct sound liner that is directly exposed to the air stream shall not to be used, except in exceptional circumstances and only with the permission of the U-M Design Manager. Utilize other duct design methods such as low velocities, directional changes, etc. for noise control. Double wall perforated duct with sound liner behind is permitted, provided a Tedlar or Mylar wrap is located between the sound liner and the perforated metal is specified. Sound attenuators shall be similarly specified or shall be packless type.

Materials/Construction

Galvanized duct shall be specified as G-90.

Fibrous glass duct shall not be used. Exception: This material may be used for “return boots” or short transfer ducts, i.e. for short segments of duct that are not hard connected to the duct system, used for the purpose of sound attenuation.

The A/Es specification shall define seal class as corresponding to the definitions found in SMACNA's HVAC Duct Construction Standards, Metal and Flexible. Specify the following seal classes:

- Ductwork rated for pressure of 2" w.c. or less: Class C (seal transverse joints only.)
- All other ductwork: Class A (seal all transverse joints, longitudinal seams, and duct wall penetrations).

Duct Sealant shall be specified as asbestos free.

Exhaust Duct

The A/E shall research the specific effluent being exhausted and shall specify duct materials and duct joining systems that will cost effectively provide long life and safe operation. Determine if a dedicated exhaust system is required or if multiple effluent sources can be safely exhausted through common exhaust ducts.

For the typical general research laboratory exhausting highly dilute, low corrosivity effluent, the following materials are often selected:

- Fume Hood Exhaust to Main Lateral: PCD
- Room General Exhaust (exhausting room only, to maintain required air change rates, *not* exhausting specific point sources): Galvanized Duct
- Autoclaves, Glass Washer/Glass Dryers, and similar moderately steam laden exhaust, from source to Main Lateral: stainless steel, welded longitudinal joints, duct sealant at transverse joints and duct wall penetrations, sloped down and back toward source to promote condensate drainage.
- Exhaust Mains/Laterals Above Lay-In/Accessible Ceilings, conveying fume hood, autoclave, or similar exhaust that is heavily diluted with room general exhaust: Galvanized duct.
- Exhaust Mains/Laterals/Risers in Shafts: PCD
- Exhaust Mains/Laterals/Risers exposed in penthouses and machine rooms: Galvanized Duct

The A/E' specification shall indicate that duct accessories and fasteners shall match the specified duct material, e.g. SS fasteners in SS duct, plastic coated components in PCD.

Tie rods shall not be permitted in exhaust duct running in shafts.

Exhaust with a heavy steam component, e.g. vivarium cage/rack washers, shall be specified as stainless steel duct with all seams, joints, and duct wall penetrations seal welded.

For positively pressurized sections of hazardous exhaust located inside buildings, including penthouses and machine rooms, specify that all duct seams, joints, and duct wall penetrations shall be seal welded. Locating positively pressurized hazardous exhaust in such locations is poor design practice. Obtain U-M Design Manager's permission first.

See U-M Design Guideline 230030 - Laboratory Ventilation for additional information on laboratory exhaust.

Installation

Duct leakage testing is required on all but very small U-M projects, and shall be specified as follows:

Leakage testing shall occur before duct is insulated or otherwise concealed.

Testing pressure shall match the duct's construction pressure class.

All ductwork with a pressure classification greater than 2" w.g. (positive and negative) or that is specified as "seal welded" shall be leak tested.

Ducts shall be leak tested per the procedures in SMACNA's HVAC Air Duct Leakage Test Manual.

Prior to testing, isolate any components that might be damaged by leak testing.

Duct leakage shall not exceed SMACNA Leakage Class 3.

Duct specified as seal welded shall demonstrate zero leakage.

Reseal and retest as required to achieve the specified leakage class.

Duct shall also pass an audible and touch test (2" from duct), conducted by the owner's representative, regardless of pressure class. All gross leaks and audible noise shall be eliminated.

DESIGN GUIDELINE 230021 **TERMINAL AIRFLOW UNITS**

Scope

Variable and constant volume non-fan powered terminal airflow units for general HVAC.

Related Sections

U-M Design Guideline Technical Sections:

[230030 Laboratory Ventilation Design](#)

U-M Master Specification:

[233600 - Air Terminal Units](#)

U-M Standard Details:

[15896001 – Supply Air TAU Clearance Detail](#)

General

This guideline covers conventional VAV/CAV terminal airflow units (TAU). It does not cover fan powered boxes. U-M master specification 233600 – Air Terminal Units shall be used as the basis for the VAV/CAV box specification on all projects. The A/E shall edit the U-M specification to make it project specific. Turn on hidden text and read all spec. editors notes when editing the specification.

Commercial grade VAV/CAV boxes shall not be used in laboratories, vivariums, or other spaces requiring accurate room pressurization control. See design guideline 230030 - Laboratory Ventilation Design for the terminal units required for those areas.

Specification Requirements

VAV & CAV Boxes

Lining: dual density thermal/acoustic insulation with a cleanable foil liner is standard at U-M, and is specified in the U-M master specification 233600.

Access panel: Access panels to allow up or downstream access to the reheat coil are not required.

Controls: VAV and CAV box control shall normally be by direct digital control (DDC) with electronic actuators.

For a standard DDC VAV/CAV boxes:

The box manufacturer shall provide the flow sensor and the damper.

The controls contractor shall furnish the following (all specified in U-M's master control specification 230900):

- Electronic damper motor actuator
- Electronic reheat coil valve actuator (if applicable)
- DDC controller enclosure (dust cover)

The box DDC controller, known as the "TEC" (terminal equipment controller) and the room temperature sensor, or "RTS" (thermostat), are provided by U-M to the controls contractor.

For atypical boxes (pressure/tracking control, etc.), carefully review the TEC section of U-M's master control specification 230900 for information about which trade provides specific components related to controls.

The controls contractor *may* elect to ship the controller, cover, and actuator(s) to the box manufacturer for mounting (or may choose to field mount the components), however this construction coordination issue does not need to be covered in the AE's specification provided U-M's master control specification 230900 is utilized on the project.

For the rare instances when a pneumatic controller is required, the *box manufacturer* shall provide a Krueter CSC-3011 controller, a controller dust cover, and a normally open damper with a damper operator. This information is specified in the U-M master specification 233600 - Air Terminal Units.

Design

On the plan views, for each terminal airflow unit, indicate the minimum and maximum CFM setting.

DDC controlled boxes require a minimum of 3' clearance in front of and the width of the DDC controller. DDC boxes shall be labeled with a unique identifier. Use U-M's terminal airflow unit clearance detail, 15896001 – Supply Air TAU Clearance Detail, which identifies clearance and labeling requirements. It is preferred the AE assign the unique identifier (per the detail's nomenclature system) for each box and indicate it on the design drawings.

Boxes should be located in corridors directly above suspended ceilings whenever possible, with unobstructed access for maintenance and removal.

Do not oversize boxes by more than 20%.

Attention shall be given to the take-off size and construction technique at the branch duct to assure sufficient supply air is available at actual branch duct static pressure. The A/E shall provide a take-off detail on the design drawings.

DESIGN GUIDELINE 230022

GRILLS, REGISTERS, DIFFUSERS AND AIR BALANCING ACCESSORIES

Design Requirements

Specify a 24 inches x 24 inches ceiling module whenever possible.

Size diffusers, registers and grills for a maximum space noise criteria of 30 in class and meeting rooms, and 40 elsewhere.

In VAV systems consider sizing to 80 percent design flow to prevent dumping at low flow.

Installation Requirements

All sub-main connections to main duct shall contain opposed blade balancing dampers. Branch connections serving individual outlets may not require dampers. However, volume control devices in or directly above diffusers should not be the primary means for system balancing.

Duct extractors and air flow equalizers should be specified as necessary to assure adequate flow and uniform air distribution.

Specify 2-way throw for corner installations and corridors. Specify 3-way throw at walls.

In rooms where heavier than air gases may be present locate one return air sidewall grill near floor level.

Locate supply diffusers and return/exhaust grills sufficiently distant to prevent short cycling. Distance between devices to be approximately 1 1/2 times the T-50 isovel throw. When this separation cannot be maintained, specify throw-reducing devices or specify a 3-way diffuser.

DESIGN GUIDELINE 230030

LABORATORY VENTILATION

Information for mechanical design engineers as well as architects/lab planners regarding laboratory ventilation design at U-M, including but not limited to the following:

- Equipment information (chemical fume hoods, chemical storage cabinets, BSCs, specialty hoods, and environmental rooms).
- Computational Fluid Dynamic and exhaust stack dispersion modeling requirements.
- Lab HVAC and exhaust design: guidance regarding lab minimum air change rates, duct materials, exhaust fan selection, system diversity, future capacity, etc.
- Vivarium requirements.
- Type and control of terminal airflow units for laboratories.
- Lab energy conservation.

Lab Equipment Parameters

Chemical Fume Hoods

General:

U-M Master Specification Section 115313 Laboratory Chemical Fume Hoods shall be used as the basis for chemical fume hood specification on all projects. 115313 must be edited to make it project specific.

U-M Master Specification Section 115313 describes fume hood types in terms of face velocity characteristics in a "Definitions" article. These definitions shall be used when specifying fume hoods and when designing fume hood exhaust systems at the University of Michigan. Fume hood air volume requirements depend upon the particular hood type being used, therefore the mechanical designer should carefully review the hood definitions section of 115313. 115313 also describes performance requirements for Reduced Face Velocity (RFV) hoods. Extensive spec editors notes are included in 11610 to assist the A/E. Be sure to turn on hidden text and read those notes.

Multiple fume hood types may be included on a given project. Clearly delineate on the mechanical drawings the air balance and fume hood monitor alarm settings for each hood type. See "Type and Control of Terminal Airflow Units for Labs", below.

The required exhaust flow (CFM), static pressure, and hood opening area (sq. ft.) vary by fume hood manufacturer. Refer to manufacturer's data and then size duct, terminal airflow units (TAU), and fans to accommodate the manufacturer with the worst case (highest air flow and pressure drop) requirements. Provide the hood basis of design (manufacturer and model) on the mechanical design documents.

For vertical opening sashes, U-M requires sash stops be provided to restrict normal sash operation to no higher than 14" above the work surface, NOT the typical 18". Note that some Reduced Face Velocity fume hoods incorporate an air foil mounted above the hood's working surface. U-M spec section 115313 requires that the sash stop location be adjusted proportionally upward to account for air foils mounted more than 2" above the hood's working surface. The resulting higher sash stop location will result in a somewhat larger fume hood air volume requirement. This should be accounted for in the mechanical design.

Assure the TAB specification requires that the air balancer adjust the TAUs to the air volume required for the particular manufacturer's hood that is installed. U-M's TAB specification 15990 includes this requirement.

U-M projects use standard chemical fume hoods that operate at an average face velocity of 100 FPM, and Reduced Face Velocity (RFV) fume hoods that operate at an average face velocity of 70 FPM. Refer to the "Design Fundamentals" section of this design guideline for exhaust system sizing requirements for the various hood types.

Constant volume hoods of any type are not safe with combination sash arrangements because correct face velocity can't be assured as the horizontal sash is adjusted. If combination sashes are required, Restricted Bypass VAV hoods shall be used with the corresponding VAV type lab terminal air flow unit control.

Requirements for Floor Mounted Hoods:

- Due to the wide variation of sash configurations available on these type hoods, floor mounted hoods shall be Restricted Bypass VAV hoods.
- Sash stops shall be supplied for every section of vertical sash, set to stop the sash at 14" above the sash's closed position

Fume Hood Monitor:

Fume hood monitors are provided by the lab air flow controls contractor, NOT the hood manufacturer. U-M specification 230900, 230910 and 230920 include specifications for fume hood monitors.

Fume Hoods in Explosion Proof Rooms

Since typical VAV controls are not explosion proof, constant volume hoods are recommended in explosion proof rooms.

Mount fume hood controls and alarm monitors outside of explosion proof rooms. Mount an explosion proof audible and visual low exhaust flow alarm indicator inside the room, triggered by the fume hood alarm monitor.

Laboratory Fume Hoods for use with Radioactive Materials (Isotope Hoods)

Although a special fume hood is generally required for use with radioactive materials, verify the need for special filtration, or a direct exhaust duct route to the outside, with U-M OSEH. Filtration and direct exhaust are not typically required.

In all cases, delineate space for a future filter box directly above radioisotope hoods.

Flammable Liquid and Corrosive Storage Cabinets

Chemicals shall not be stored within fume hoods. Where a storage space for chemicals is required, a storage cabinet below the fume hood may be provided.

Corrosive storage cabinets shall be ventilated at a rate of approximately 2 CFM exhaust per square foot of cabinet footprint. Do not duct into the fume hood bench top. Instead run a separate exhaust from the cabinet up to the exhaust duct. Connect cabinet exhausts to constant volume (CV) venturi style TAUs. This could be a CV venturi style TAU serving a CV hood,

other nearby CV venturi style TAUs (serving snorkels, for example), or, gang multiple cabinet exhausts on to a dedicated CV venturi style TAU. Normally exhaust connections for cabinets should consist of a 2 inch polypropylene vent pipe equipped with a non-corrosive ball valve for balancing.

Flammable liquid storage cabinets shall not normally be ventilated. If the lab occupant requests flammable liquid storage cabinets be ventilated, obtain approval from U-M OSEH before doing so.

Biological Safety Cabinets (BSC) and Other Specialty Cabinets and Hybrid Hoods

Selection of the type, size, class, and manufacturers of BSCs and special “hybrid” hoods shall be made by the researcher and the U-M OSEH representative, in coordination with the Architect/Lab Planner/Mechanical Engineer.

If exhaust connection is required to a BSC, do not assume a direct connection is required since more often the BSC type will allow an indirect, hood mfg. provided, thimble (canopy) connection. Verify the BSC type and the corresponding exhaust connection required, direct or thimble connect, with U-M OSEH.

Many specialty cabinets and hybrid hoods (which often filter downflow supply air) require higher than typical exhaust flow rates (i.e. rates higher than would be suggested based on hood face area) or have high static pressure drop. Always consult the manufacturer’s product manuals and design accordingly.

Environmental (Cold) Rooms

Ventilation air is required in all environmental rooms where work with volatile chemicals, compressed gasses, or continuous work activity is planned. Ventilate at 6 air changes per hour or as required by code, whichever is higher.

Ventilated environmental rooms typically require desiccant dryers to avoid excess defrost cycle times. Thus, in addition to a ventilation supply and exhaust air connection to the room, the mechanical engineer will need to provide an exhaust connection for the removal of hot, moist air rejected from the desiccant unit.

Where multiple environmental rooms are located in close proximity to one another, consider ganging the rooms on common CV TAUs, to provide the required supply and exhaust air.

Perchloric Acid Fume Hood Systems

Refer to Appendix B of this Design Guideline.

Lab Room Airflow Modeling

Computational Fluid Dynamic (CFD) studies are typically required when multiple hoods are located near each other and within the same room, unless this requirement is waived by the U-M Design Manager.

New lab buildings with “typical” fume hood alcoves or lab modules shall have CFD modeling done for each module type. CFDs shall demonstrate hood capture effectiveness, optimize air-change-rates (ACH), and evaluate supply outlet and exhaust inlet locations.

CFD Studies shall be considered for other unique air flow arrangements where proper ventilation, air conditioning, or exhaust are considered critical.

HVAC and Exhaust Systems Design

Exhaust Dispersion Assessments

Dispersion studies ensure proper, safe, dilution of exhaust emissions. Dispersion studies shall be done by qualified firms that have a minimum of 5 years of experience performing such studies.

All new lab buildings shall have a comprehensive dispersion study performed.

All critical exhaust sources shall have a dispersion study.

Renovation projects with exhaust fan volumes ≥ 5000 cfm capacity shall have a dispersion study.

Dispersion studies shall be *considered* for all other renovation projects. For example, a project installing a new outdoor air intake on a lab building likely would justify a study.

Since the results of dispersion studies often require the A/E’s initial design to be modified, they should be started as early as possible in the design process.

Design Fundamentals

General:

The specific standards that apply to a particular project should be determined during programming. The following are typical requirements:

Research labs: NFPA 45 Standard for Fire Protection for Laboratories Using Chemicals.

Hospital: All hospital projects governed by the Michigan Department of Health, Health Facilities Evaluation Section, shall comply with the Minimum Design Standards for Health Care Facilities in Michigan, and NFPA 99 Standard for Health Care Facilities.

The guidelines expressed herein are meant to supplement, not supersede, code requirements. Where conflicts exist, the AE shall review with the U-M Design Manager.

Designs may also need to comply with various U.S. Government standards or guidelines (e.g. National Institute of Health, Department of Agriculture, etc.); establish which apply during project programming phase.

Laboratory supply and exhaust air shall be dedicated to lab areas within the building and shall not be part of HVAC systems serving other building areas (offices, toilet rooms, vivariums, etc.).

Because U-M specifications and details specifically address laboratory spaces, it is critical that the A/E clearly delineate on the project drawings which spaces are laboratories.

Lab general and fume hood exhaust shall be manifolded whenever possible, as permitted by code, to reduce first cost and improve energy efficiency and maintainability.

Supply air shall be “once through” (100% outside air); it shall not be recirculated outside a laboratory room. Air may be recirculated within the laboratory room itself, e.g. local fan coils. Some very low hazard level labs may use recirculated air when approved by U-M OSEH.

The use of non-DX type fan coils or chilled beams for sensible loads is encouraged to reduce the amount of outside air required for lab cooling. For labs affecting patient care in hospital facilities, the Minimum Design Standards for Health Care Facilities in Michigan precludes the use of recirculating fan coil units in labs unless outfitted with a HEPA filter.

Rooms and all TAUs serving laboratories shall be scheduled. Provide all of the information contained on the U-M sample schedule Laboratory Terminal Air Flow Unit Sample Schedule.

HVAC systems serving laboratories, including rooms with chemical fume hoods, shall be designed for variable air volume (VAV) using tracking supply, general exhaust and fume hood TAUs. While this means supply and general exhaust shall be variable flow, it does not necessarily mean fume hoods are to be variable flow:

For purposes of initial program budget, the use of VAV fume hoods/controls should be assumed. As the program is further developed, evaluate and justify VAV vs CV fume hoods. When analyzing the potential benefit of VAV type fume hoods, evaluate with and without automatic sash lowering devices.

- Evaluate if the LMVR (see LMVR discussion below) for the room precludes the use of VAV hoods because general exhaust would increase to maintain the LMVR as the hood sash was closed.
- Assume fume hood sashes with automatic devices will result in an average hood air flow reduction of 30%,
- Assume fume hood sashes without automatic devices will result in an average hood air flow reduction of 10%.

- Hood with combination sashes must be equipped with VAV TAUs/controls.

Do not diversify fume hood loads relative to exhaust fan/system sizing; assume all hoods are at 14" sash position at all times .

Size supply and exhaust systems with additional capacity for future use. Determine the appropriate additional capacity in consultation with the U-M Design Manager. Minimum additional capacity: 10%.

Size fume hood TAUs and the associated TAU branch duct as follows:

- Full Bypass Constant Volume Type: For the air volume required to attain 100 FPM at full open sash position.
- Partial Bypass Constant Volume Type: For the air volume required to attain 100 FPM with sash at sash stop position.
- Restricted Bypass VAV Type: For the air volume required to attain 60 FPM at full open sash position, 100 FPM with sash at sash stop position.
 - Combination Sashes: 100 FPM must be achieved with the sashes in the position that creates the maximum free area opening. Example: If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed).
- Full Bypass Constant Volume **RFV** Type: For the air volume required to attain 70 FPM at full open sash position.
- Partial Bypass Constant Volume **RFV** Type: For the air volume required to attain 70 FPM with sash at sash stop position.
- Restricted Bypass VAV **RFV** Type: For the air volume required to attain 60 FPM at full open sash position, 70 FPM with sash at sash stop position.
 - Combination Sashes: 70 FPM must be achieved with the sashes in the position that creates the maximum free area opening. Example: If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed).
- Exhaust Valves for Floor Mounted Hoods: Must use VAV type TAU/controls. The exhaust air valve shall be sized so that the required face velocity can be achieved with one sash fully open. Example: If sash is 28" high and can be opened to create a free area opening 28" high, the exhaust air valve must have enough capacity to achieve the required face velocity (e.g. 100 FPM) at 28".

LMVR: Lab Minimum Ventilation Rate

Each lab room shall be ventilated at a minimum Lab Minimum Ventilation Rate. The LMVR shall be established in consultation with U-M OSEH, and shall be in compliance with codes and the Minimum Design Standards for Health Care Facilities in Michigan (when applicable). Typical LMVRs, room pressurization, and air flow control requirements can be found in Appendix A of this Design Guideline.

Snorkels and Similar Local Exhaust Terminations

To obtain U-M OSEH certification, designs shall provide a 100 FPM capture velocity 4” from the centerline of the plane of the device opening. Obtaining 100 FPM may require very high flows in the upstream connection to the device opening, resulting in high pressure drop and noise. Therefore these devices should be carefully selected and specified, and performance capability reviewed and approved by U-M OSEH.

Negative or Positive Pressure

Pressurization in and out of rooms shall be indicated on plans with directional arrows and airflow quantities (CFM).

Sealing of all room penetrations and joints shall be specified to maintain space pressurization.

If a local means of adjusting space pressurization is requested (typically accomplished with a potentiometer), specify that the adjustment device be clearly labeled to identify which direction produces positive or negative pressurization adjustment. Specify a locking enclosure for the adjustment device. Local means of adjusting pressure is discouraged.

Laboratory Pressurization Gauge

All laboratory rooms including animal rooms of all types shall be provided with a room differential pressure indicator so that room occupants can locally verify the direction of room pressurization. Provide room pressurization gauges outside and above the laboratory entrance expected to be most frequently used, in the corridor wall at the lab room. (Provide *inside*, outside, and above all BSL-3 lab doors). Analog gauges shall be used and are specified in U-M master specification 230900 and 230910. The location of the pressurization gauges shall be indicated on the lab HVAC floor plan drawings.

Emergency Operation

Provide emergency power for laboratory systems where a power failure endangers life safety.

Exhaust fans and corresponding supply fans shall automatically restart when power is restored after a power failure.

Fire detection and alarm systems shall not be interlocked to automatically shut down chemical fume hood exhaust. Exhaust fans shall continue to operate in the event of a failure or alarm condition of the supply air system. For example, if the supply air handler trips on freeze stat or smoke detector, the associated lab exhaust fan(s) shall not shut down. Proper door operation for egress shall be maintained when the supply system shuts down and the lab exhaust system continues to operate, creating a pressure differential. Some large systems may require a design that automatically reduces exhaust fan volumes, to prevent excess negative pressure at egress doors.

Indicate in the Design Intent Document, exhaust system operation under all emergency conditions (loss of power, fire, supply air failure, etc.).

Vivariums:

Vivariums require dedicated, fully redundant air handlers. Vivarium air handlers, animal room exhaust systems, terminal units, and controls shall be fed from the emergency power system.

The TAUs serving animal holding rooms shall be selected such that air flow to those rooms can be increased an additional 10% minimum, future. Size the vivarium air handler with sufficient capacity to accommodate this additional air flow capability.

Reheat coils shall utilize normally closed (N.C.) control valves to prevent over-heating animals upon a valve failure.

Each animal room exhaust shall be equipped with a duct mounted filter rack. Exhaust grille style filter frames are not preferred but may be used with the permission of the U-M Design Manager.

Laboratory Exhaust Duct

Materials

The below descriptions are considered normative for U-M lab projects; however the A/E shall give consideration to the nature of materials being exhausted and shall specify appropriate duct materials, construction methods (e.g. gasket and sealant types, etc.), and duct coatings.

Lab General Exhaust: G-90 galvanized where accessible. Specify plastic coated duct (PCD) in concealed spaces, including shafts.

Chemical Fume Hood Exhaust: PCD from hood to main lateral. If there is insignificant general exhaust flowing through the main lateral, specify PCD for the entire exhaust duct run.

Cage and rack washers, sterilizer and glass washer hoods, and any ductwork carrying moist air: “seal” welded (water leakage tight) 316 stainless steel, from hood to main lateral. Duct shall slope back toward the hood so that any condensate formed in the duct drains away from the main lateral duct. Hoods shall have drain lips, piped to a local floor drain.

Acid Exhaust: Teflon lined stainless steel duct shall be consider in lieu of FRP duct. Note: Obtain concurrence from U-M OSEH that exhaust acidity justifies these specialized materials.

Cage and rack washers shall be exhausted via a dedicated exhaust fan. Therefore the associated duct shall be stainless steel all the way to the exhaust fan, routed as directly as possible, avoiding horizontal runs. TAUs shall not be used.

Construction

Prohibit tie-rod re-enforcement methods for PCD. Prohibit tie-rods in any duct carrying corrosive exhaust.

Exhaust ducts running on the building exterior will typically require insulation to prevent condensation formation inside the duct during cold outside air conditions. Evaluate the need for drains on exterior horizontal exhaust duct work; see “Fan Construction” for additional considerations regarding such drains.

For exhaust duct connected to animal rooms, specify riveted duct upstream of filters.

Fire and/or Smoke Dampers

Not allowed in laboratory exhaust ductwork per NFPA 45.

Exhaust Fans

Fan Capacity

Specify at least 10% additional design flow at the required system static pressure for all lab exhaust fans.

Fan Selection/Number of Fans

For lab exhaust systems over 10,000 CFM capacity, provide 100% redundant standby fans.

For systems 10,000 CFM or less, consider two fans at 50% capacity each.

For all critical exhaust systems, e.g. Biosafety Level 3 labs, provide 100% redundant standby fans.

Cage and rack washers shall be exhausted via a dedicated exhaust fan.

Fan Types

Centrifugal fan systems are preferred, provided it can be shown they safely disperse the effluent. Provide direct drive fans when available.

Direct-drive, high-plume exhaust fans shall be provided on systems above 5000 CFM when no fan redundancy is provided, or when found to be required by dispersion studies.

Location and Design

Exhaust fans shall be located on a roof so that all duct in the building is negatively pressurized. If a roof location is impossible and the fan(s) must be located in a mechanical penthouse or room, design an air tight enclosure around the fan(s) and specify that the discharge duct from

the fan be seal welded. Contact the U-M HVAC/Controls Mech Tech team for additional info on air tight enclosures. Provide windows in enclosures to facilitate maintenance.

The fan stack velocity shall be maintained through the use of normally-closed bleed-in dampers or other means. VFDs on lab exhaust fans to maintain stack velocity or for other reasons are generally not used and if proposed require the review and approval of the U-M HVAC Mech Tech Team.

Orient the fan discharge duct (stack) vertically from the fan outlet. Extend stacks a minimum of 10 feet above the highest local roof. Design the stack to provide a minimum stack discharge exit velocity of 3000 FPM unless a dispersion study demonstrates a lower tip velocity achieves the required dilution target. Stack tips shall be designed to discharge exhaust straight vertically upward without obstruction. Provide designs similar to those recommended by the American Conference of Governmental Industrial Hygienists handbook "Industrial Ventilation - A Manual of Recommended Practice for Design". Rain caps, including those with deflectors, shall not be used.

Fan stacks shall be self-supporting. Guy wires shall not be used without the permission of the U-M Design Manager.

Fan Construction

Fan housings (centrifugal fans) shall be welded construction with a cleanout door.

Typically fans, fan blades, fan plenums, plenum access doors, and fan back-draft dampers should have a Heresite anti-corrosion coating. Specific applications may require different anti-corrosion coatings. It is the A/E/Lab Planners' responsibility to select appropriate coatings. Also specify a heavy-duty coating for the exterior surfaces that prevents corrosion.

Provide a scroll drain for centrifugal fans (drain valve with hose connection). Fans located in enclosures shall have scroll drains piped to the enclosure exterior, with the drain valve and hose bib on the outside, and the drain labeled as a hazard.

Similar to scroll drains, provide drains in exhaust plenums located outside (drain valve/hose connection/cap). Depending on the relative humidity of the space being exhausted, some exterior plenums will require drains that continuously remove routine condensation formation occurring in winter months. Such drains should be routed to termination points inside the building, and be properly trapped. Provide trap primers. Portions of such drains located outside must be heat traced. Similarly, evaluate the need for drains on exterior horizontal exhaust duct work.

Flexible Connectors

On positively pressurized duct work, flexible connectors are prohibited indoors, except for exhaust fans mounted inside enclosures. Fabric flexible connectors shall never be used. One

piece flexible rubber/elastomeric connectors may be used in some low risk applications, with the approval of the U-M Design Manager

Dampers

Motorized control dampers shall be used to prevent back drafting of exhaust fans. Such dampers shall be designed to fail to the “open” position on loss of power. These same dampers shall close when the fan is turned off by normal means.

Motorized bleed-in dampers shall fail to “closed” position.

Damper actuators shall be located outside of the exhaust air stream.

A method of preventing excess negative duct/plenum pressure shall be provided.

Damper construction shall meet or exceed ductwork construction (i.e. protective coating, stainless steel, etc.)

Exhaust Filters

The installation and type of filter in the laboratory exhaust system (if any) shall be determined by the U-M department of Occupational Safety and Environmental Health (OEH), and for health care facilities in compliance with requirements stated in Minimum Design Standards for Health Care Facilities in Michigan.

Radioactive hoods typically do not require filters.

All exhaust filters shall be provided with a differential pressure gauge to indicate pressure drop across filter.

Exhaust systems with filters that require a specific stack velocity to achieve required dilution targets must include provisions to maintain stack velocities as filters load up.

Exhaust System Fan Control

Exhaust fans shall be controlled by the owners Building Automation/DDC System. See U-M Design Guideline 15975 Mechanical Systems Controls.

Type and Control of Terminal Airflow Units for Labs

In August of 2016 U-M revised its long standing practice of requiring venturi style valves for all laboratory spaces, to only requiring them for labs with VAV or combination sash hoods:

For laboratory spaces which **do not contain VAV hoods or hoods with combination sashes**, (including animal rooms) use conventional terminal air flow units for supply and general room exhaust and venturi style terminal airflow units for constant volume fume hoods and any other constant volume exhaust point. Conventional supply and exhaust TAUs as well as the constant

volume venturi valves are specified in U-M Master Specification Section 233600 Air Terminal Units. The laboratory controls for these rooms, including constant volume fume hood monitors and room differential pressure gauges, are specified in U-M Master Specification 230900 Mechanical Systems Controls. *Note that constant volume venturi style TAUs used to serve such rooms must be labeled “CVV Terminal Airflow Units” on the design drawing to match the designation in U-M Master Spec 233600.*

For laboratory spaces which **do contain VAV hoods or hoods with combination sashes** (including animal rooms - rare) use venturi style terminal air flow units for supply, general room exhaust and for variable volume and combination sash fume hoods. Venturi style valves must be used because of the speed of response required for labs with VAV or combination sash hoods. Venturi style valves along with associated controls, fume hood monitors and room differential pressure gauges are specified in U-M Master Specification Section 230910 VAV/Combination Sash Fume Hood Laboratory Controls-DDC. *Note that if constant volume venturi valves are also required to serve spaces with VAV and/or combination sash hoods, U-M Master Specification 230910 requires the contractor responsible for 230910 to supply them.*

Further note that:

- U-M Master Specification **230910** covers **digitally controlled** lab terminal air flow unit controls and is typically used for all new buildings and major renovations.
- U-M Master Specification **230920** covers **analog electronic** lab terminal air flow unit controls and is typically used for smaller renovations where analog electronic air flow controls already exist and it makes sense to reuse them. Generally however projects in such spaces should be upgraded to digitally controlled TAUs. Early in design, consult the U-M Design Manager to establish which type lab controls are to be used for such projects.

Because these U-M specifications specifically address laboratory spaces, it is critical that the A/E clearly delineate on the project drawings which spaces are laboratories.

Sizing fume hood TAUs: See “HVAC and Exhaust Systems Design”, above.

Vivarium TAU Sizing: The air valves serving animal holding rooms shall be selected such that air flow to those rooms can be increased an additional 10% minimum, future.

Hood Type: Designate hood type served by each TAU on the architectural/lab plan as well as the mechanical design drawings.

Sash Type: For VAV TAUs, designate if sash is vertical rising or combination type on the design drawings. Combination sashes shall not be used on constant volume hoods.

Sash Alarms: Are to be provided for all hoods. U-M Master Specifications 230900 and 230910 (see discussion above) include fume hood monitor specifications that include the sash alarm features required by U-M.

Air Balancing: Indicate on drawings that the TAU air volume is to be balanced to achieve 100 FPM average face velocity with sash at sash stop position for standard hoods, 70 FPM average face velocity with sash at sash stop position for RFV hoods.

Fume Hood Exhaust Monitor Alarm Setting: Indicate settings on drawings as 80 FPM for standard hoods, 60 FPM for RFV hoods.

Fail Mode: Generally, supply TAUs shall be indicated to fail closed and exhaust TAUs shall be indicated to fail open.

Coatings: Specify Heresite coating (minimum) for TAUs serving chemical fume hoods. Specify other protective coating types, as application dictates.

Balancing Damper: Provide a stainless steel balance damper downstream of all TAUs serving chemical fume hoods, for testing purposes.

Clearances: Utilize U-M Standard Details “Supply Air TAU Clearance Detail” and “Supply Air LTAU Clearance Detail” to indicate required clearances. “Dash out” required clearances at each TAU on the plan views. Require that TAUs be mounted no higher than 2’ above the ceiling grid.

Power Requirements for TAUs: Designate circuits in receptacle panels on each floor for TAU power supplies. Work with TAU suppliers to determine the number of 20 amp circuits required. Do not exceed 50 TAUs per 20 amp circuit.

Power Requirements for Fume Hood Exhaust Monitors: Designate circuits in receptacle panels on each floor for Fume Hood Monitors. Work with TAU suppliers to determine the number of 20 amp circuits required. Do not exceed 10 Fume Hood Exhaust Monitors per 20 amp circuit.

TAUs are Prohibited: On exhaust connected to cage and rack washers, due to severe corrosion problems U-M has experienced even when coated TAUs have been provided. A dedicated exhaust fan is required to serve cage and rack washers.

Laboratory Supply Air Diffusers and Registers

Terminal Velocity

Terminal velocity of supply air near fume hoods, bio-safety cabinets, etc., is as important as hood velocity and should preferably be no more than 1/2 the hood or cabinet face velocity (near the hood). Therefore terminal throw velocities in areas with hoods or cabinets should be far less than typical for general lab air supply locations.

Optimize design and layout of supply air devices in consideration of all lab requirements, including velocity, throw and low flow performance.

Perforated Diffusers

To avoid cross draft problems, when supply diffusers must be located near fume hoods or other sensitive cabinets, consider perforated diffuser technology (similar to Titus RadiaTec, VersaTec ,or TriTec) that diffuses supply air at high volumes and low velocity. When RFV hoods are used, Titus VersaTec diffusers shall be specified for the immediate ceiling vicinity near the RFV hood.

Wall Registers

If wall registers are used in labs with hoods or cabinets, they should have double deflection louvers and shall be set for maximum deflection position away from the hood.

First Cost Optimization/Energy Conservation

Comply with U-M Design Guideline SID-D.

Provide fan coils/chilled beams or other strategies to reduce the quantity of “once-through” outside air required for cooling.

In spaces with high once through air requirements (> 6 ACH), evaluate strategies to reduce reheat coil pressure drops, such as larger face area reheat coils or radiant heating panels or floors in lieu of duct reheat coils.

At each phase, the A/E/Lab Planner shall calculate the following and indicate the result in the Design Intent Document:

- Fume hood density per 5000 gsf of building
- Fume hood density per 5000 nsf of lab

Densities above 3 hoods per 5000 gsf shall be justified. Consider alternatives such as snorkels and chemical storage cabinets.

Evaluate the following technologies (also see “HVAC and Exhaust Systems Design”, above, for required analysis parameters):

- Variable volume hoods
- Automatic sash closure systems
- Controls to reduce the minimum room air change rate when the lab is unoccupied.

Note: By ruling of U-M OSEH, devices to reduce hood face velocity when users are not standing in front of the hoods, e.g. “zone presence sensors” or other means, SHALL NOT be used.

Evaluate Reduced Face Velocity hoods.

Improve ventilation air flow efficiency by reducing the pressure drop of air system components. The following targets (maximums at full design flow) shall be met for all once through air handlers that will run continuously:

- Air Handler Component Face Velocity: 400 FPM
- Total supply and exhaust duct pressure drop: 2.25 in. w.g.
- Noise Control (silencers) 0.25 in. w.g.

For manifolded exhaust systems, evaluate the energy benefit gained from additional fan staging (i.e., from smaller staging increments), by increasing the number of fans drawing air from common exhaust plenums.

Exhaust Air Heat Recovery: Evaluate heat recovery (enthalpy) wheels, flat plate air-to-air heat exchangers, heat pipes (including pumped type), and run-around coils. Include impact of additional pressure drop through each device type.

Avoid tight temperature and humidity requirements. Normal lab setpoints are:

Summer: 76 dbt minimum, humidity floating but no greater than 60% RH

Winter: 71 dbt maximum, humidity floating but no less than 25% RH.

Setpoints outside these ranges shall be justified in the Owner's Project Requirement/Basis of Design (aka Design Intent) Document.

Measure comparable U-M laboratories to establish HVAC plug/equipment loads during early SD phase, and base the lab design on this measured data. For each comparable laboratory space, obtain 7 days of continuous power metering at the branch circuit panel level of all lab equipment, including plug loads and hard wired equipment, while the spaces are fully occupied. Continuous metering data shall include:

- Apparent instantaneous power
- Real instantaneous power
- Real power averaged over 15 minute intervals

The design heat load criteria shall be based on the 15 minute time averaged Real power draw of the comparable space, unless the lab user group can validate higher heat load requirements. U-M will provide the labor to take the measurements, however the A/E/Lab Planner in conjunction with the U-M Design Manager will identify comparable laboratories and analyze the collected data.

Laboratory luminance levels shall not exceed IESNA Handbook (most recent edition) foot candle levels.

Appendix A

Laboratory Minimum Ventilation Rates (LMVR)

Each lab **room** shall be assigned a Lab Minimum Ventilation Rate (LMVR). The LMVR assigns the minimum air change rates to each lab room based upon an assessment of the potential airborne hazards. This minimum air change rate is the amount of 100% outside air that must be delivered to the space, expressed in air changes per hour (ACH)¹.

The LMVR shall be assigned by U-M OSEH Research, Health, and Safety. The assessment involves a review of potential airborne hazardous materials present, quantities, operations, engineering controls and facility history. Table 1 provides the typical LMVR and other requirements by lab room type, for use prior to U-M OSEH approval. The minimum amount of 100% outside air to be delivered to the lab room shall be the higher of the LMVR or any code (e.g. ASHRAE 62.1) or governing standard's requirement.

There are five LMVR classes ranging from the least hazardous (LMVR 0) to the most potentially hazardous (LMVR 4). Air change rates are provided for both occupied and unoccupied conditions. Where an unoccupied ACH is allowed and implemented, automated methods must be provided to notify lab occupants when the room is in unoccupied mode, and to return the room to the occupied mode air change rate. One method acceptable in many lower risk labs is to set back to unoccupied LMVR based upon occupancy sensors which simultaneously turn lab general lighting off. When the lab is re-occupied, the lights automatically switch back on and the occupied LMVR is reestablished. Local indication, such as by a blinking pilot light near the lab door(s), may be required for higher risk labs. The automatic set back method and occupied/unoccupied indication for each lab room shall be approved by U-M OSEH. Flow rates through fume hoods and similar hazardous exhaust capture devices shall remain the same in both the occupied and unoccupied lab modes.

LMVR 0: No Laboratory Hazards (4 ACH occupied, 1 ACH Unoccupied)

Laboratories in this category have no significant airborne hazards or materials. LMVR 0 typically includes dry research labs, laser labs without gases, electronics labs, machine shops, and fabrication labs, with appropriate engineering controls at low hazard emission sources.

LMVR 1: Low Hazard (6 ACH occupied, 4 ACH Unoccupied)

Laboratories typically in this category are open wet research labs, microbiology, genomics, or proteomics labs with minimal quantities of hazardous chemicals,. Hazardous air emissions may exist but are well controlled with standardized equipment and procedures. Includes standard biomedical research involving CDC Risk Group 1 or 2 agents. Only low hazard compressed gases in small quantities are allowed. A risk assessment of actual conditions of use may dictate a higher LMVR depending on bulk quantities and dispensing methods.

¹Air exhausted from the space to meet the LMVR must not be recirculated. Supplemental, recirculated, and cooling air does not apply toward ACH.

LMVR 2: Constant Hazard – Constant flow required (6 ACH occupied, 6 ACH Unoccupied)

LMVR 2 labs are relatively low hazard labs. Typical chemical work involves small volumes of solvents, acids and toxic chemicals. Hazardous materials are used with good engineering controls as necessary. Only low-hazard gases are used like CO2 and N2. Well managed clinical labs working with solvent, formaldehyde, and tissue preparation procedures with good engineering controls are included in LMVR 2. Flammable liquid storage rooms are LMVR 2.

LMVR 3: Moderate Hazard (8 ACH occupied, 4 ACH Unoccupied)

Labs working with non-production volumes of many toxic and flammable chemicals and volatile solvents. Use of carcinogens, pyrophorics, acutely toxic materials, sensitizers, and reproductive toxins is in small quantities. Chemistry or pharmacy teaching labs are in this group.

LMVR 4: High Hazard (10 ACH occupied, 6 ACH Unoccupied)

LMVR4 has the highest potential severity of hazards present. LMVR 4 labs typically work with large or production volumes of solvent or corrosives, and/or large quantities of particularly hazardous materials (nanomaterials, chemotherapy agents, highly toxic compounds). Labs working with gas cylinders of toxic, pyrophoric, or flammable gases are included in this rank. Synthetic chemistry and CDC Risk Group 3 biological agents or Select Agents are typically included in LMVR 4. Unique use of hazardous materials, lab equipment, or research fabricated equipment with the potential for air emissions may also be classified into LMVR4.

Table 1: Lab Minimum Ventilation Rate, Pressurization, and Air Flow Control

Room Type	LMVR	Air-Flow Control	Pressurization	Comments
Dry Research Labs	0	V	N	
Laser Labs	0	V	N	Without gases
Open Wet Research	1	V	N	Includes both research and teaching type
Microbiology Labs	1	V	N	
Genomics Labs	1	V	N	Including DNA processing type
Proteomics Labs	1	V	N	
Analytical Labs	1	V	N	
Tissue Culture Rooms	1	V	N	Pressure relationship is dependent on project, typically negative.

Linear Equipment Corridors	1	V	N	And similar equipment rooms
Equipment Rooms with Freezers	1	V	N	
Lab Storage Rooms	1	V	N	Including similar lab support spaces
Autoclave and Dishwashing Rooms	1	V	N	
Flammable Liquid Storage Rooms	2	C	N	
MRI and NMR Rooms	2	V		
Cryogenic Liquid Storage or Dispensing Rooms	2	V		
Animal Holding Rooms: Ventilated Racks	2	C		Pressure relationship is dependent on project. If ventilated racks with rack mounted fan packs are utilized, room air change rates must be as listed for static rack rooms.
Animal Procedure Rooms	2	C		Pressure relationship is dependent on project.
Animal Holding Rooms: Static Racks		C		ACH typically 10 occupied, 10 unoccupied. Pressure relationship is dependent on project.
Chemistry Teaching Labs	3	V	N	
Pharmacy Teaching Labs	3	V	N	
Synthetic Chemistry Labs	4	V	N	
Nano-Labs	4	V	N	
Chemotherapy Labs	4	V	N	
CDC Risk Group 3 Biological Agents or Select Agents	4	V	N	
Laboratories affecting Patient Care in U-M Hospital & Health Center Facilities				See "Minimum Design Standards for Health Care Facilities in Michigan."

Table Key: LMVR: Lab minimum ventilation rate **C:** Constant Volume **V:** Variable Volume **N:** Negative **A:** Adjustable **P:** Positive

Table Notes:

Table 1 indicates the LMVR, method of air flow control, and room pressurization relative to adjacent spaces, for typical laboratory and vivarium spaces at U-M. The above table is a guide only; requirements must always be validated for the specific project. Air flow control refers

to typical control of supply air to the space and is a generalization; the project must determine the appropriate air flow control for the space.

For variable volume systems, the minimum setting of terminal units (TAUs) shall provide the room air changes per hour (ACH) value indicated by the LMVR designator, or as required by code (ASHRAE 62.1) or governing standard, whichever is higher. Indicate this minimum (CFM) setting on the drawings. The maximum settings, which shall also be indicated on the drawings, shall be as required to account for sensible and latent loads, and for exhaust make-up. Where a unoccupied ACH is permitted by the LMVR designation, such spaces shall, if meeting a 8 year simple payback criteria (SID-D), be provided with methods (e.g. occupancy sensors, etc.) to allow un-occupied setback to the minimum ACH. See the LMVR narrative, above, for additional requirements.

All rooms where bio-hazardous research is conducted shall be designed to provide negative pressure relative to adjacent spaces, and shall include visual pressure indication. Bio-hazardous research is defined as:

- A. Recombinant research at BSL 2, 2+, or 3, as classified by the NIH office of Recombinant DNA Activities.
- B. Infectious disease research at BSL 2 or 3, as classified by CDC/NIH Biosafety Guideline. Offices contained within lab areas shall operate as positive with respect to the lab.

Appendix B

Perchloric Acid Fume Hood Systems

Perchloric acid fume hood designs shall be reviewed and approved by U-M Occupational Safety and Environmental Health Department (OSEH). The following are general guidelines. The designer should also adhere to the perchloric hood requirements found in NFPA 45.

Exhaust System:

Provide a dedicated exhaust system for perchloric exhaust. Do not manifold with other exhaust systems (e.g. toilet exhaust, particulate exhaust, etc.).

Terminate vertical stacks no less than 100 feet from an air intake.

Equip the ventilation system with a built-in water wash-down system. Automatic wash-down systems are normally recommended and should be reviewed with the U-M Design Manager and U-M OSEH. Ensure that the system will adequately spray all interior surfaces of the duct, plenum, fan, fan stack, and hood. Additionally, perchloric acid fume hoods shall be provided with wash down nozzles for rinsing the area behind the baffle. Service fitting controls for internal outlets and for the wash-down system shall be external to the hood. Drain(s) shall be provided to catch the wash-down water. The point of drain discharge shall be approved by U-M OSEH. Drain material shall be polypropylene. A backflow preventer shall be provided on the cold water supply to the wash-down system. Provide a frost proof hydrant near the fan/fan stack to allow manual wash-down.

Duct:

Route via the shortest and straightest route possible to the outside, with no offsets or horizontal runs. Provide positive drain back to the hood. Indicate clearly on the design drawings that the contractor may not modify the duct design without written approval from the engineer.

Duct material: acid resistant, non-reactive materials selected for the specific chemical use in the hood; typically shall be all welded 316 stainless steel. For final connections where welded joints are not possible, specify gaskets and sealants that are non-reactive and resistant to perchloric acid. Require 316 stainless steel fasteners or fasteners with corrosion resistance equivalent to the selected duct material. Specify that all duct shall be watertight.

Flexible connections shall not be used.

Provide access to permit visual inspection of duct internals.

Labeling:

Require duct, fans and stacks to be marked as follows:

EXPLOSION HAZARD

Do no service work or inspection on this duct without prior approval from U-M Occupational Safety and Environmental Health Department.

Locate markers near points where ductwork originates or continues into shafts, floors or walls, and at maximum 5' intervals along duct runs.

Fans:

Eductor type fans systems shall normally be used in lieu of conventional fan arrangements.

Specify acid resistant, non-reactive fan materials selected for the specific chemical use in the hood. Teflon or PVC coated blades can typically be used.

Specify Type A spark proof fans.

Specify fan types with fan motors located outside the duct work. Drive belts shall be non-spark conductive type and shall not be located within the ductwork.

Appendix C

Definitions

For definitions of various laboratory chemical fume hood types, refer to U-M Master Specification 115313 Laboratory Chemical Fume Hoods.

Capture Velocity

The air velocity at the hood face or capture device necessary to overcome opposing air currents, and to contain contaminated air within that device.

Face Velocity

Speed of air moving into fume hood entrance or working access opening, usually expressed in feet per minute (FPM).

Hood - Laboratory Chemical Fume

A ventilated, enclosed work space intended to capture, contain and exhaust fumes, vapors and particulate matter generated inside the enclosure. Biological Safety Cabinets are not fume hoods and the two are not interchangeable.

Hood - Auxiliary Air Chemical Fume

A fume hood typically using “raw” outside air for make-up air; should not be used at U-M except by special permission from the U-M Design Manager.

Main (duct) Lateral

Large duct main running on a lab floor with multiple fume hood and general exhaust duct connections such that the large proportion of general exhaust connections is expected to result in a very dilute exhaust air stream.

Make-Up Air (Once-Through Air)

The supply of outdoor air to a building replacing air removed by exhaust ventilation systems.

Seal Welded Duct Joints

Both the longitudinal and transverse duct joints are continuously welded to form a 100% air and water tight seal.

Vivarium

A cluster of animal housing areas and support facilities. Fume hood and other exhaust accessories are often included as part of the design for these facilities, and therefore require special system design considerations.

DESIGN GUIDELINE 230040 **HYDRONIC SYSTEMS AND SPECIALTIES**

General

This section covers requirements for hydronics systems, including chilled water, hot water heating, and condenser water systems.

Related Sections

U-M Design Guideline Sections:

[221113 – Basic Piping Materials and Methods](#)

U-M Master Specification Sections:

[221113 – Basic Piping Materials and Methods](#)

[232116 – Hydronic Piping Specialties](#)

Design Requirements

Compression/Expansion Tanks

Provide compression tanks on all closed loop hydronics systems. Tanks shall be diaphragm/bladder type, constructed for appropriate design pressure. The tanks should be welded steel, stamped with ASME code Section VIII for appropriate psi design. Indicate system volume, and expansion tank fill and operating pressures on design drawings.

Air Separators

Install air separators to aid removal of air from hot water heating systems and as required for chilled water systems. Separators shall be a tangential type, designed and installed per manufacturers instructions

System Fill and Pressure Relief Valves

The design shall include system fill valve and pressure relief valve with a field adjustable pressure setting.

Balancing and Measuring Devices

All hydronic systems shall have a means of measuring and balancing flow at each piece of equipment and terminal device. Balancing valves shall be sized so they are not closed more than 60% for the flow and pressure expected. Do not base sizing on pipe size alone. If numerous devices are in the project, include a schedule on the drawings.

Automatic Flow Balancing Valves

Installation of automatic flow balancing valves is permitted for terminal devices (coils, finned tube radiation etc.), in lieu of installing manual balancing valves at these locations. Suitability of each application should be carefully considered by the A/E, especially in variable volume systems, and systems where design flow is likely to change and in existing systems.

Strainers and Dielectric Separation

Refer to U-M Master Specification 221113

Glycol Systems

Use of glycol in hydronic systems is generally discouraged due to environmental concerns. Glycol should only be used where other means of freeze protection are impractical. Use only concentrations required to meet design requirements. 30% ethylene glycol is typically acceptable for freeze protection on pumped hydronics systems subject to full winter conditions. Lower concentrations may be acceptable for burst protection or higher design temperature.

Do not provide an automatic cold-water makeup for glycol filled systems. Provide packaged, glycol fill system consisting of polyethylene fill tank (to hold approximately 30 gallons of pre-mixed solution) with hinged cover, fill pump and electric controls. Fill pump is to be energized to maintain system pressure as sensed by pressure switch mounted near compression tank. Provide a two stage low water alarm in the fill tank. The first stage alarms the campus BAS system (or, if BAS is not available, energizes an audible device). The second stage shuts off the pumps and requires a manual reset. Pipe relief valve back to the glycol fill tank.

Make provisions for filling glycol filled systems that ensure reasonable convenience, such that large drums will not need to be lifted up stairs.

Pre-mixed glycol is generally preferred.

Review need for containment with U-M Project Coordinator and U-M OSEH department. At minimum, include a spill pallet below the glycol fill station.

Cooling Tower Water (Condenser Water) Systems:

Tower Water systems generally require installation of side-stream aggregate filters, or possibly centrifugal separators. Consult U-M Project Coordinator. Refer to U-M details for chemical treatment and filters.

Installation Requirements

Expansion tanks and air separators shall be supported independently from piping.

Install air vents at all high points in all hydronic systems. Generally, automatic vents should be installed only in mechanical equipment rooms. All other locations will contain manual vents. Where practical, pipe outlet from automatic air vents to floor drains. Refer to Master specification and standard details.

Flow meters shall be installed with unrestricted lengths of straight pipes as required by the manufacturer.

Install unions, isolation valves and bypass lines on devices requiring removal for maintenance.

Generally, install strainers ahead of all hydronic system control valves, flow measuring devices and pumps.

DESIGN GUIDELINE 230041

PUMPS

Scope

Pump selection. Requirements for the following pump types:

- Domestic boosters
- Storm and sanitary sump pumps
- In-line circulators
- Base mounted end and double suction pumps
- Vacuum pumps
- Steam condensate pumps

Related Sections

Design Guideline Sections:

[220000 – Plumbing Design](#)

[230040 – Hydronic Systems and Specialties](#)

[230050 – Chilled Water Systems](#)

U-M Master Specification Sections:

[220523 – Valves](#)

[221113 – Piping Materials and Methods](#)

[221123 – Domestic Water Booster Pumps](#)

[221333 – Packaged Submersible Storm And Sanitary Pumps](#)

[230593 – Testing, Adjusting, and Balancing](#)

[232123 – Plumbing and Hydronic Pumps](#)

General:

U-M Master Specification Section 221123 shall be used as the basis for domestic water booster pump specifications on projects.

U-M Master Specification 221333 shall be used as the basis for packaged submersible storm and sanitary pump specifications on projects.

U-M Master Specification 232123 shall be used as the basis for plumbing recirculating pumps and hydronic pump specifications on projects.

The A/E shall edit the U-M specification to make it project specific. Turn on hidden text and read all spec. editor's notes when editing the specification.

A/E shall schedule all pump data on the drawings (not within project specifications).

Select pumps and motors to be non-overloading (not into the service factor), at pump run-out (right end of published curve).

Pump efficiency at design conditions should be close to, or left of, peak pump efficiency.

Mechanical seals shall be used on all pumps except fire pumps, where stuffing boxes shall be used.

In general, specify pumps with 1800 rpm motors, unless design condition necessitates alternate motor speed.

Where remote start-stop, or status monitoring is required, use combination magnetic starter or variable speed drive (not manual starter).

Sump Pumps

In general, design sump pumps based on a submersible, duplex pumping system. Include slide rail on all sanitary pumps and on storm water pumps with motors larger than 5 HP, or sumps deeper than 4 feet. Include lifting lugs on pumps, automatic pump alternator and non-mercury float switches. Specify one-point common alarm (indicating high level, pump failure, or seal failure), and connect to Building Automation System.

Base Mounted End Suction Circulating Pumps

Base mounted end suction circulating pumps shall be of the centrifugal single stage type, with back pull-out design. Pump and motor shall be connected through a flexible drive coupling, with safety guard.

Pump and motor shall be properly mounted and aligned on a common, welded, rigid structural steel or cast iron base, with an enclosed perimeter with opening for grouting in place. Base shall be grouted in place.

Base Mounted Double Suction Circulating Pumps

Base mounted double suction circulating pumps, shall be centrifugal, single-stage type with horizontal split case design for servicing the impeller without disruption of the piping. Vertical split case design is also acceptable, where floor space is at a premium.

Provide rigid steel grout base and grout as described for End Suction Pumps section above.

For pumps larger than 30HP, consider need for trimming impeller for improved energy efficiency, following initial testing and balancing. Consult U-M Design Manager.

In-Line Circulating Pumps

In-line circulating pumps shall be single stage; with cast iron body and bronze trim construction, unless special fluid handling dictates otherwise.

Vacuum Pump (Lab and Medical)

Vacuum pumps shall be bronze fitted, or all stainless steel, 1750 RPM and have mechanical seals. Vacuum pump package shall include tank with access hatch and all related controls and piping.

Coordinate equipment selection (rotary vane versus liquid ring) with U-M Design Manager.

System Application Requirements

Consider potential future expansion of pumped systems. Extent of expansion will be determined on a case-by-case basis. Consult with the U-M Design Manager for specific direction.

Domestic Water

Provide all bronze lead free construction or stainless steel construction for all domestic water pump applications.

Storm and Sanitary

Use submersible sump pumps as described in Sump Pumps, above.

Hydronic Systems (Chilled Water, Condenser Water, Hot Water Heating)

Use end suction, double suction or in-line pumps as described in Equipment Requirements above. Typically, use base mounted pumps for all applications over 10HP.

Install fully redundant (N-1) stand-by pumps for heating systems.

For chiller and cooling tower installations, refer to Design Guideline Section 230050.

Steam Condensate Pumps

Typically, use electric condensate pumps for steam condensate. Consider use of air operated condensate pumps (only with U-M Design Manager approval) in steam tunnels, or other spaces with high condensate temperatures.

Design of condensate pumping system must consider receiver size, location, NPSH, flash area, and receiver and flash tank venting (properly sized, routed to outside).

Installation Requirements

Install pumps and accessories in strict accordance with the manufacturer's requirements for maintaining satisfactory hydraulic performance.

Provide the following accessories for each pump (except sump pumps):

- Flexible connector, rated 2 times normal operating pressure, in suction and discharge lines. Refer to U-M Master Specification Section 221113. Flexible connectors are not

typically required on in-line pumps (allowing pumps to be supported from adjacent piping).

- Isolation valving on both sides of the pumps. Not applicable for sump pumps. For condensate pumps, suction valve must comply with U-M Master Specification Section 220523.
- On pump discharge:
 - Triple duty valve and an isolation valve, or
 - Non-slam check valve, throttling valve, means of measuring flow, and isolation valve. Install flow measuring devices in strict accordance with manufacturer requirements to ensure proper performance. Throttling valve shall be eliminated on variable flow (VSD) pumping applications.
- Pressure gauges on suction (prior to and after strainer) and discharge. For small, in-line pumps, pressure-temperature plugs may be used in lieu of gauges. Typically, these three points should use manifolded ½” piping, with isolation ball valves and a single, common gauge.

Provide the following accessories for each sump pump:

- Flexible connectors are not typically required on sump pumps, except where vibration necessitates.
- Pressure gauge, check valve and isolation valve on pump discharge. Separate throttling valve is not typically required.

Provide vibration isolation as necessary to prevent excessive noise and vibration. In general, install large pumps located above grade on concrete inertia base with spring vibration isolators. Where an inertia base is used, support piping near pumps with spring hangers. Support suction diffusers and piping directly in contact with pump from inertia base.

Suction inlet pipe for all pumps should be a straight section of pipe of not less than 10 pipe diameters in direction of flow. Where space conditions will not permit suction inlet pipe of required length, provide a suction diffuser.

Base mounted pumps shall be laser aligned. Typically, this should be specified as part of factory service technician start-up services.

For vibration testing requirements, refer to U-M Master Specification Section 230593.

DESIGN GUIDELINE 230050

CHILLED WATER SYSTEMS

Scope

Chilled water systems including system configuration, chiller sizing and redundancy, chillers, cooling towers, refrigerant monitoring, control requirements, and utility metering.

Future: Tertiary Control Diagram

General Requirements

This guideline describes typical requirements which may not be appropriate for all sizes and types of chilled water systems. After reviewing this guideline, the Designer shall consult with

the U-M Design Manager and propose the chilled water system type and configuration for approval.

Normally projects shall utilize the U-M master specifications and master details listed under Related Sections since they express U-M requirements. The A/E shall edit the specifications and details to make them project specific, being careful not to remove U-M requirements. Turn on hidden text and read all editor's notes when editing specifications.

System Configuration

Chiller Plant Chilled Water Arrangement: Design new CHW systems with Variable Primary chilled water pumping with a controlled bypass to maintain minimum chilled water flow at the chiller evaporator. Normally a magnetic type flow meter shall be provided to measure primary flow for minimum flow control. Avoid over-sizing the bypass control valve and carefully select to provide stable control. Multiple chillers shall be used in any installation of greater than ~ 400 tons.

Chiller Plant Condenser Water Arrangement: Provide constant volume condenser water pumping and variable speed cooling tower fans.

Arrange pumps to directly pump to a chiller. Pump discharge header arrangements using auto-flow balance valves or similar methods to maintain the required flow rate through the chiller condenser shall not be used. This is due to reliability problems experienced with such designs at U-M.

For large plants (~ > 500 tons) analyze the energy savings benefit of variable flow condenser water.

Chiller Plant Pumps: In all cases provide a single redundant condenser water pump and a single redundant chilled water pump that can be manually valved into service for the other pumps of the same service.

- Example 1: System Peak Diversified Load = 1000 tons. It is determined a fully redundant chiller **is not** required. 500 ton chillers are determined to be the best chiller selection. Provide (2) 500 ton chillers, (3) primary chilled water pumps, and (3) condenser water pumps.
- Example 2: System Peak Diversified Load = 1000 tons. It is determined a fully redundant chiller **is** required. 500 ton chillers are determined to be the best chiller selection. Provide (3) 500 ton chillers, (4) primary chilled water pumps, and (4) condenser water pumps.

Provide selector switches at the pumps to allow the operator to select which pump operates with a chiller. See “System Controls” section for more information.

Chiller Plant Delta T: For chilled water plants that serve new buildings, design for a distribution temperature differential (“delta T”) of at least 14° F (e.g. 44F CHWS/ 58F CHWR). For plants serving existing buildings, the existing coil performance must be considered when establishing system temperatures and delta T.

Pumps in Buildings Connected to the Chiller Plant: When connecting to chilled water plants serving multiple buildings, the building served should normally be arranged as a decoupled pumping arrangement (bridge) with a modulating valve in the secondary return leg, controlled to maintain the building loop CHWS temperature at +1°F above the distribution temperature.

The building pumping system shall include pump redundancy appropriate to the mission of the connected building. Provide no less than two identical capacity units, sized for somewhere between 50% and 100% of required building load.

Control Valves in Buildings Connected to the Chiller Plant : When connecting chiller plants to existing buildings, convert the building to variable flow by replacing existing 3-way chilled water control valves with 2-way control valves.

System Sizing and Chiller Redundancy

Calculations, criteria and assumptions regarding rationale for chiller sizing must be clearly defined in the Owner Project Requirements and Basis of Design. Indicate in the Basis of Design document the connected load and the peak diversified load (PDL) and any accommodation provided for future capacity needs.

Typically the chillers should consist of a minimum of two identical capacity units, each sized for somewhere between 50% and 100% (see rationale below) of the peak diversified load (adjusted to account for heat recovery and future capacity as described below). The engineer of record is responsible for determining PDL.

Calculate the connected load (total of scheduled load at design condition) and peak diversified load (anticipated or measured actual peak load within a building or system that reflects diversity between loads). Base system sizing on PDL, adjusted for future capacity and heat recovery. PDL is defined as the maximum load expected on a diversified cooling system on a design cooling day. Sanity check the PDL against the connected load.

Determine minimum load and verify that the chillers are capable of stable control at this load.

For existing systems, PDL shall be derived by consulting measured loads from the BAS system data historian. If unavailable, use computerized building energy simulation modeling.

For new systems PDL shall be established using a computerized building energy simulation model (Trane Trace, Carrier E20-II HAP, etc.) that complies with the requirements for simulation programs in ASHRAE 90.1 Appendix G.

To avoid oversizing central cooling equipment the model shall credit energy recovery systems. When determining the energy recovery system *credit*, if there is a significant chance of energy recovery failure, assume the largest discrete energy recovery system is not operational.

- Example: The building has two air handlers with energy recovery wheels. One unit can recover 100 tons on a design day, the other can recover 50 tons on a design day. The load should be reduced by 50 tons (because the 100 ton heat recovery system should be assumed to have failed).
- Example: A glycol run-around energy recovery system with redundant pumps and serving multiple coils: Such a system may be deemed to have very low probability of any failure, allowing full credit to be assumed for energy recovery.

Finally, in consultation with the U-M Design Manager, determine the need for future capacity and add it to the PDL to determine the required CHW system capacity. Normally assume no additional capacity. In cases where there is a significant potential for incremental increases in loads due to future renovations, a modest allowance of +/-10% future growth may be included. In some cases allowing space for future *additional* or *larger replacement* chillers may be appropriate.

After CHW system capacity is determined, consider the implications of losing one chiller. (Redundant pumping shall be considered normal for all installations.) If the loss of up to 50% of the CHW system capacity in an emergency is manageable through load shedding or shifting to other cooling sources, chillers may be sized for as little as 50% of the required CHW system capacity, though careful analysis may imply sizing at 60-70% to be more appropriate. Examples of these *non-critical CHW applications*:

- Buildings where ventilation air can be temporarily reduced.
- Buildings where outside air can be reduced in an emergency by temporarily limiting use of non-critical exhaust systems.
- Buildings or portions of buildings where space temperature can be compromised above normal set-points in an emergency.

When sizing chillers and considering the above load reduction strategies, it shall not be assumed that ventilation air can be reduced by more than 50% or that space temperature can rise above 78°F.

Non-critical CHW applications

- Typically would include offices, classrooms, outpatient facilities, buildings with return air systems, child care facilities, and housing. For single building chiller plants, the design shall provide at least sufficient redundancy for the critical portion of the facility.

Critical CHW applications

- Typically would include in-patient care facilities, animal vivaria, ambulatory outpatient surgical facilities, data centers and 100% outdoor air wet lab buildings. A system is considered to be a critical CHW application if loss of any cooling capacity is intolerable for the application due to stringent criteria and operational constraints. In this case capacity should be 100% of the required CHW system capacity for each of two units or three units at 50% , etc. For critical applications, the need for emergency power to provide un-interrupted chilled water capacity shall be evaluated. For building areas

such as vivaria, data centers or certain hospital areas requiring cooling operation during a power outage, consider providing a smaller chiller connected to emergency power along with its ancillary equipment.

- Also refer to U-M Design Guideline 230010-H Supplemental HVAC Design for in-patient and ambulatory facilities. UMHHC has rigorous requirements for N+1 chiller plant requirements; consult Hospital Facilities Planning & Design for direction.

Chillers

Obtain approval of the U-M Project Design Manager before making decisions on chiller type. The following are general criteria:

- Air cooled screw or scroll chillers: 100 tons or less
- Water cooled scroll chillers: 100 to 200 tons
- Water cooled screw chillers: 150 to 250 tons.
- Centrifugal chillers: 250 tons and larger.

The type of chiller refrigerant as of the date of this Design Guideline has not been resolved. Therefore a review of refrigerant options will be required for each project.

Multiple chillers shall be used in any installation greater than ~ 400 tons. Chillers shall be sized to operate efficiently over the full range of system load profile. Special caution shall be exercised to avoid sizing that results in short cycling in low load ranges. Multiple/additional chillers shall be used if the load profile indicates that short cycling will occur.

For chillers above 100 tons, develop a pre-purchase or bid package with bid alternates that allows the AE and the University to evaluate the chiller bids from a total (life cycle) cost perspective. Provide a life cycle cost analysis to evaluate chiller options for the base design and for bid alternates. Contact the Project Design Manager for maintenance and utilities costs. Determine the project specific system load profile and require per specification that the manufacturer provide as a part of their bid the annual energy usage based upon the load profile.

Investigate and document energy-saving opportunities where additional initial investment produces an acceptable simple or life cycle payback in accordance with U-M Design Guideline 3.2 Energy and Water Conservation. Analyze high efficiency chillers with magnetic bearings or variable speed drives (VSDs) where the load profile exhibits an opportunity for acceptable payback. For air cooled chillers with significant winter loads, analyze chillers with water-side economizers. Chillers exposed to the outside air shall be designed with 30% ethylene glycol. To avoid glycol inefficiency and glycol makeup systems, consider providing an indoor chiller with remote condenser or dry-cooler in lieu of roof top chillers.

Where there is a significant winter chilled water load, analyze the benefit of making winter chilled water utilizing a cooling tower and a plate-frame (P/F) heat exchanger, typically referred to as free cooling.

- When possible, arrange piping so that the cooling tower water entering the P/F heat exchanger is connected **from** the tower cold water supply piping located upstream of the warm-up bypass pipe, instead of from piping located downstream of the warm-up bypass. This allows the P/F exchanger to continue to receive the coldest tower water during transitions to pay (chiller) cooling.
- Pipe the P/F heat exchanger counter flow with the entering condenser water connected to the bottom of the heat exchanger so that solids deposit in the heat exchanger bottom region. For large plants, provide tees and valves to allow P/F heat exchanger back-flushing.

In buildings connected to central plants with free cooling, the sizing and/or type of “year round” terminal equipment connected to the chilled water system must consider the elevated chilled water temperature provided by the central plant in winter. Options include additional coil rows/fins, heat pumps, and DX with water cooled condensers. If the building has separate chilled beam and/or process cooling loops (operating at higher supply temp.s) and chilled water pump loops (operating at lower ~ 45°F supply temp.), such terminal equipment should be connected to the higher temperature loop to allow the chilled water pump loop to be shut down during winter free cooling.

For centrifugal and screw machines, marine water boxes shall be specified for both condenser and evaporator (both ends), at minimum for the condenser if not available on the evaporator. Marine water box end plates shall be hinged type when available; when not available provide a means of suspending the end plates when removed such as (when available from the chiller mfr.) gantry crane mounting plates and a removable gantry crane, or structural steel above for a chain-fall. Where marine boxes are not feasible, design shall indicate removable spool pieces between isolation valves and chiller heads, at both the evaporator and condenser, which when removed allow tubes to be pulled or cleaned.

Design piping and chiller placement so that complete chiller overhaul, including motor replacement, may be performed without the removal of permanent piping or electrical conduit.

- Provide permanent steel rail (beam) hoistways located over the centerline of centrifugal chillers and extending a minimum of 5 feet beyond the end of the chiller for removal of the motor and compressor. Provide a rail hoistway design that is capable of suspending the heaviest chiller component. Require the beam to be labeled with its maximum weight capacity. For large chillers or where the beam will be high above the chiller, provide a permanent hoist on the beam.
- On the design drawings, indicate “no-fly” zones above and at the ends of the chiller where pipe, electrical conduit, etc. shall not trespass, to allow unobstructed service work on the chiller including removal of motors, compressors, evaporator and condenser heads, and pipe spool pieces.
- Require spool pieces/flanges on refrigerant relief piping where its removal is necessary to permit removal of the chiller motor, compressor or other components.

Provide adequate maintenance aisles and room door widths or removable panels to allow chiller tube and chiller replacement. For chillers located in penthouses or other high locations,

provide means for future replacement with a crane if other routes are not available. Dash-out/indicate equipment clearances and access pathways on the drawings

Cooling Towers

Due to lower energy consumption and ease of maintenance, cross-flow induced draft towers shall normally be used, not forced-draft type. If a project requires a forced draft tower, provide adequate space for fan shaft removal.

Cooling tower fans shall be driven by a variable speed drive with bypass.

Account for de-rating factors associated with screen walls and re-entrainment.

Evaluate the need for low sound fans and/or tower sound attenuators.

Fan drive should be through a drive shaft and gear reducer, with motor mounted outside of the air stream. Include external oil lines and dip stick. The University discourages the use of V-belt drive cooling towers. If V-Belt drives are used, provide non-ferrous sheaves.

Cooling towers located on roofs shall be supported on galvanized steel frame-work with a minimum of 5 feet clearance between the bottom of the steel and the roof, to enable roof maintenance and replacement. Provide vibration isolators on cooling towers located on the roofs of normally occupied buildings. Provide galvanized or aluminum platforms, platform handrails and ladders for large multi cell installations, designed to permit access to all interior and exterior components requiring routine maintenance. Provide sufficient ladders to tower tops to allow safe access to motors and to all hot water basins for inspection. Provide galvanized or aluminum tower top handrails where hot water basin access requires walking on the top of the tower cells. Internal walkways shall be provided when access to cold water basins requires passing through adjacent cells.

Provide switched exterior lighting for the cooling tower to allow safe night-time access. Illuminate the top area of the tower including basins, fans, and motors; and the bottom area of the tower, e.g. access platforms, steps, and ladders. Avoid over-lighting.

Provide mechanical floats for tower make-up as opposed to electronic level controls.

Do not use flume boxes to equalize the water level in cold water basins across cells. Rather, provide an equalizer pipe, with shut-off valves to allow isolation of each tower basin.

Where cooling towers are used for winter operation with wet outdoor sumps, provide electric basin heaters. Heat trace for freeze protection all outdoor piping that remains filled with water when the tower is not operating in winter, such as make-up water, equalizer, tower drain from isolation valve to tower connection, etc. Heat-trace systems shall be DDC controlled and monitored; separate programmable controllers are not permitted.

Pipe cooling tower overflow and drain piping to the condenser water system blowdown magmeter, and then to sanitary waste. Do not discharge to roof or storm drains. Assure that the sanitary drain size is capable of handling a failed open fill valve overflow situation.

Provide blind flanges at both ends of cooling tower hot and cold manifold pipes and on equalizer lines. Equip the blind flanges with a 2-1/2" threaded nipple and cap centered on the blind flange bottom to allow fire hoses to be connected for flushing and draining purposes. Refer to the UM standard cooling tower detail for more information.

Whenever possible, butterfly valves shall be mounted in vertical pipe sections. This reduces the deposition of solids at the disc seat, making tight closure more likely. In horizontal pipe sections, butterfly valves shall be mounted with the stem horizontal and the disc seating against the flow direction at the bottom of the disc seat.

Strainers, Filtration and Air Removal

Condenser Side: Provide floor mounted basket strainers for all condenser water pumps. In addition, provide a coalescing type solids separator upstream of the chiller for single chiller systems or on the common condenser water return piping on multiple chiller systems.

CHW Side: Provide combination coalescing solids separator/air separators. A side stream separator and pump shall be considered for larger chilled water systems, sized nominally for 20% of system flow.

Water Treatment

Refer to U-M master specification and details under Related Sections. For hospital projects a shot feeder may not be required, consult with the U-M Design Manager.

Condenser Water Piping

To eliminate corrosion resulting from drained empty pipe, require non-ferrous piping (stainless steel schedule 10 or other) where the condenser water piping is intended to be drained during off-season. Strategically locate drain valves to keep indoor ferrous piping full of water year round.

For critical plants, or where replacing piping in the future would be extremely difficult, or where there is minimal interior piping, consider specifying non-ferrous pipe for all condenser water piping.

Cooling Tower and Chiller Room Noise and Vibration

Acoustic testing and analysis is typically required for cooling tower installations. Consult the U-M Design Manager and U-M Design Guideline 230060 Mechanical Sound and Vibration Control.

Consider noise and vibration criteria in chiller mechanical rooms and adjacent areas. Specify machine noise and vibration limits, and specify testing procedures. Evaluate the need for noise and vibration abatement to achieve acceptable noise levels.

Refrigeration Monitoring and Ventilation

For refrigeration systems located indoors, determine if a refrigerant monitoring system is required per the calculation methods detailed in the Michigan Mechanical code and ASHRAE Standard 15. If so, provide a refrigerant monitoring and ventilation system in accordance with the most current edition of the code and standard.

Utilize the U-M Standard Detail for the refrigerant monitor control requirements and comply with the designer notes included with that detail.

The U-M refrigerant detection and alarm master specification and detail reflect U-M's basic requirements for refrigerant monitoring of low toxicity, low flammability refrigerants (ASHRAE Standard 34 safety group A1 and B1). They do not express requirements for higher toxicity/higher flammability refrigerants such as ammonia systems. In the rare circumstances such systems are being considered, notify the U-M Design Manager and meet with U-M EHS and other U-M parties to determine specific requirements.

Provide a system of fans and dampers to sweep the room with fresh air and exhaust to clear the room of refrigerant. Typical designs shall include one exhaust fan (and possibly one supply fan) powered with a variable frequency drive to provide normal mechanical room ventilation at one speed and emergency refrigerant evacuation at another speed. The supply and exhaust fans and related dampers of the refrigerant ventilation system shall be activated through hard wiring from the refrigerant monitor control panel, not through DDC controls, unless it results in complicated multi-relay controls.

If possible, locate the refrigerant monitor control panel outside the mechanical room in a location not normally accessible to the general public, preferably a vestibule requiring a mechanical room key for access. As an alternative, in consultation with the U-M Design Manager, include a remote external display of the refrigerant level outside of the mechanical room, depending on the situation. Where mounted inside the machine room, mount the monitor as close as possible to the primary room entrance. Installation of self-contained breathing apparatus is not required since U-M has a 24/7 emergency response team with trained personnel properly fitted for SCBA.

System Controls

Use of U-M standard control diagrams and sequences when available. The description below is an overview of features required by U-M and as such does not list all the controls required for a chiller plant.

Chiller sequencing shall be via a combination of calculated load and CHW supply temperature.

Chiller start/stop functions, sequencing, cooling tower operation etc. shall be controlled by the U-M Building Automation System (BAS). Use of proprietary chiller or pump control packages is not permitted.

U-M BAS shall start and stop chillers and monitor chiller status, refrigerant head (for condenser water reset, see below) and a common chiller trouble alarm, via analog and digital DDC points (not BacNet or similar communications) connected to the chiller's control panel.

In addition, for Hospital projects only, provide the chiller with a BACnet integration card, integrated into the BMS front-end, to allow additional monitoring.

For systems with no backup/redundant pumps, the primary chilled water pumps and condenser water pumps are to be started and stopped by hard wiring to the associated chiller control panel (as opposed to the U-M BAS starting and stopping the pumps).

When redundant condenser and chilled water pumps are used, the U-M BAS system shall start the pumps. Provide a multi-contact selector switch for each pump to allow field selection of the assignment of each pump to a chiller. Label the switch similar to the following:

Chiller 1, Chiller 2, Chiller X...., Off Line

with a BAS digital input connected to each chiller selection contact. In this manner the selector switch position will signal the BAS to operate, for example, primary CHWP-3 with Chiller 1.

Provide a sequence of operation for the pump selector switches that generates a warning alarm whenever pump assignments are conflicting, i.e. when selector switches assign the same pump to multiple chillers. (Note: Typically manual valves shall be used to route pump flow through the appropriate chiller.)

Similarly, provide a multi-contact selector switch for each chiller to allow field selection of the chiller lead and lag sequence. Label the switch similar to: Lead, Lag, Off Line.

Include a temperature transmitter in the cooling tower cold water basin alarmed on temperature, for freeze protection.

Cooling tower vibration switches shall be hard wired to the tower's variable speed drive (or motor starter) safety circuit, not indirectly connected through BAS.

Cooling tower filter or separator blow down valves shall be controlled as the first stage of tower blowdown via the water treatment control panel. Refer to the U-M standard detail.

Condenser water temperature reset shall be included for centrifugal chiller plants and for plants with other chiller types that will use less energy if condenser water reset is implemented. The BAS will reset the condenser water setpoint, indexed against outside air wet bulb temperature. The chiller control panel shall generate a 4-20ma output signal to BAS to limit the amount of condenser water setpoint reset to safe reductions. Generally absorption chiller systems shall provide a fixed condenser water temperature setpoint.

Water cooled chiller plants shall have a motorized two-way condenser water bypass valve arranged to allow more rapid condenser water warm-up when the plant/towers are started "cold". For combination absorption and centrifugal chiller plants, separate bypasses shall be designed to provide a higher fixed temperature to the absorption chillers and re-settable lower temperature to the centrifugal chillers.

Utility Metering

Metering Required:

- Cooling tower make-up water and cooling tower blow-down, metered separate from the building water service. Refer to design guideline 220010 Plumbing Specialties for details.
- For a central chilled water plant serving multiple buildings, all utilities involved in the generation of chilled water (i.e. water, electric, steam (absorbers)) shall be metered separately from the building in which it resides.
- Each separate building connected to a central chilled water plant shall include chilled water BTU load metering consisting of a magnetic flow meter, high precision temperature transmitters on supply and return, and a BTU meter/computer. These devices are described in U-M Master Specification section 230900 - Mechanical Systems Controls.
 - The high precision temperature transmitters must be labeled as such on the control drawings.
 - The high precision temperature transmitters and magnetic flow meter must be shown connected to the BTU meter and to a DDC panel.
 - The BTU meter must be shown connected to a Utility Data Acquisition Panel.
 - The Utility Data Acquisition Panel must be shown with an Ethernet connection to the nearest data closet.

END DG

DESIGN GUIDELINE 230060 **MECHANICAL SOUND AND VIBRATION CONTROL**

General

Sound and vibration shall be carefully evaluated on all projects, for both interior and exterior impacts.

Related Sections

U-M Design Guideline Sections:

[230010 – HVAC Design](#)

U-M Master Specification Sections:

[220548 – Vibration Control](#)

[230593 – Testing, Adjusting and Balancing](#)

Sound Design Requirements

Interior Sound Impacts

Typical space noise criteria levels are listed in Design Guideline 230010. For NC/RC levels not listed in that section, levels shall not exceed those listed in Chapter 46 of the ASHRAE HVAC Applications Handbook (most current addition).

NC/RC levels are a general design criteria only. Spaces where sound is of a special concern, such as large lecture halls, theaters, etc., shall be evaluated using more rigorous criteria based on recognized guidelines. Criteria should be reflected in Design Intent Document and/or in Construction Documents.

For new buildings or major renovations, a study by an acoustical consultant should normally be performed. This study should determine expected sound levels for major space types and, where expected levels exceed established criteria, provide project specific alternative solutions. All significant sound impacts shall be evaluated, not just from mechanical and electrical equipment sources; for example, the impact of a large number of people walking on a hard surface that is located over a more sound sensitive space. For renovation projects, the study should include sample testing of existing areas.

For sound control, low cost solutions are the preference in lieu of more conservative solutions, in particular for spaces without special sound concerns. For instance, the use of acoustical flex duct (not to exceed 5') is preferred over equipping all VAV/CAV boxes with sound attenuators. Noise generating equipment should be located outside of more sensitive areas, i.e. over corridors, when possible, etc.

Duct sound liner shall not be used unless protected by a solid or perforated metal liner. Sound liner protected by perforated metal shall in addition be wrapped with an approved flexible liner. Unprotected duct liner may only be used for short transfer duct applications.

Schedules shall indicate the maximum NC levels (sound power) for terminal boxes, diffusers, lab air valves, and similar equipment. Fan and sound attenuator schedules shall indicate the sound power and attenuation levels required in each octave band. Some levels may be listed for small fans in lieu of octave band levels.

For new buildings or very large renovations, sample sound readings (NC and dBA) for typical spaces should be taken on a post construction basis, to verify if NC levels were achieved. This testing can typically be done by the Test and Balance contractor. More extensive post construction evaluation tests should normally be performed for areas with very special sound concerns, eg. theaters, auditoriums. Further, if these special spaces were renovated, pre-construction sound readings should be taken for comparison to post construction sound levels.

Floating floors should be considered for major mechanical rooms located over sound sensitive areas.

Exterior Sound Impacts

All new construction shall be assessed for exterior sound impacts on surrounding neighborhoods. The normal UM policy is that buildings are not to contribute a perceptible increase to the ambient noise environment. In terms of human perception, a 3 dB change (or less) would typically be considered imperceptible. However the specific characteristics of exterior sound sources shall also be considered, i.e. frequency and reverberant effects, time of day cycling, etc. In no event shall City of Ann Arbor noise guidelines be exceeded. For new buildings or improvements to existing buildings involving the addition of significant sound generating mechanical or electrical equipment to the building exterior, a study by an acoustical consultant should normally be performed. Such studies shall assess sound impacts and, where required to meet the above criteria, provide alternative project specific solutions. Such a study would typically require pre-construction field measurements of existing ambient noise levels to set baselines.

Vibration Design Requirements

Vibration impact and control shall be evaluated for specialized fixed equipment, such as MRIs, as well as building mechanical and electrical equipment.

Vibration Criteria

The maximum allowable vibration levels in the horizontal, vertical, and axial planes for building equipment shall be specified as follows:

Pumps	0.13 in/s RMS
Centrifugal Compressors	0.13 in/s RMS

Fans (all types)	0.09 in/s RMS
Chillers	mfg. recommendation.

Specify that all equipment over ½ HP be field vibration tested. Specify that equipment found to exceed the allowable vibration levels be repaired and retested until within allowable limits, at no cost to the owner.

Vibration Isolation

The minimum vibration isolation required for mechanical and electrical equipment shall conform to the Selection Guide for Vibration Isolation, ASHRAE HVAC Applications Handbook (most current addition).

For spaces with special vibration concerns, eg. clean rooms, theaters, certain medical or research equipment rooms, etc., an acoustical/vibration consultant should be utilized to assess impacts and recommend solutions. During project programming, ambient vibration levels should be recorded if vibration sensitive equipment is planned for buildings adjacent to significant vibration sources, i.e. heavily traveled roads. The results of these tests may dictate that special isolation be provided to accommodate sensitive equipment.

Unless specifically waived by the U-M design coordinator, large pumps and fans installed above grade shall be specified with inertia bases.

Avoid the blanket specification of expensive spring type vibration hangers for piping and duct. Typically when flexible connectors are employed at duct/pipe connections to equipment and the equipment base is properly isolated, spring hangers are only recommended for the first two hangers.

DESIGN GUIDELINE 230593 **TESTING, ADJUSTING, AND BALANCING**

General

This design guideline describes use of U-M's Test Adjust and Balance (TAB) specification, TAB design considerations, minimum TAB data to be shown on design documents, and the contracting of TAB work.

Related Sections

U-M Design Guideline Sections:

[230030 Laboratory Ventilation Design](#)

U-M Master Specification Sections:

[230593 Testing, Adjusting, and Balancing](#)

[230910 Lab Air Flow Controls-DDC](#)

[230920 Lab Terminal Air Flow Units & Controls](#)

TAB Specifications

U-M Master Specification Section 230593 Testing, Adjusting, and Balancing shall be used as the TAB specification on all projects. The A/E shall edit U-M TAB spec. 230593 to make it project specific. Turn on hidden text and read all spec. editors notes when editing the specification.

Pay special attention to the following when revising the spec. to make it project specific:

- **Scope of Work Section:** Remember to include systems such as domestic hot water return, RO/DI, and process cooling water systems, if TAB work is required on such systems.
- **Acoustical Testing Section:** Describe the requirements for any needed special acoustical testing. This section also requires sound readings be taken in 6 rooms designated by the AE. It is recommended this requirement always be left in the spec. in case any noise trouble shooting is needed after construction is complete.
- **Performance Testing Section:** If required, include specific details regarding the tests required.

Review and edit as appropriate, the balancing procedures included in the specification, and add any additional procedures required for unique or complex systems (e.g. BSL3 labs, clean rooms, etc.). If requested by the construction team, participate in the pre-balance conferences described in the spec. to explain the design intent and answer questions about the appropriate TAB procedures.

Be aware that the U-M TAB spec requires submittals relative to the TAB work, including proof of TAB technician qualifications, TAB instrument type and calibration, and proposed reporting forms. The AE must approve these submittals prior to any TAB work commencing.

The U-M TAB spec. requires equipment vibration testing for all rotating equipment ½ HP and larger. If a project is limited to one or two pieces of small horsepower equipment in low risk areas such testing becomes cost prohibitive and the AE should strike it from the spec. Vibration testing should always be included on projects with large equipment or significant rotating equipment quantities.

Note that the U-M TAB spec does not cover ASHRAE 110 fume hood testing.

Note that the U-M TAB spec requires that progress TAB reports be submitted within 3 days and final TAB reports within 1 week of the completion of TAB field work.

Pre-Construction TAB Work

When appropriate, require the TAB trade to perform pre-construction and post-construction TAB work, in particular when spaces are renovated, to measure representative flows, pressures, and/or temperatures of other areas served by common systems. In some cases it may be appropriate to issue a separate contract for pre-construction TAB work.

TAB Design Documents

All required TAB data shall be clearly indicated on the design documents, including the following:

- Code minimum outside air CFM for each air handler
- Air handler supply fan/ return fan/exhaust fan CFM offset (as it relates to building pressurization)
- Dirty filter pressure drops
- Fume hood face velocity alarm point
- Room pressure offsets for rooms designed with CFM offset. Indicate the amount of offset (in CFM) with an arrow pointing in the appropriate direction, across each of the room's doors. Note that the U-M TAB spec. requires smoke-stick tests to validate the offset direction at these room types
- Room pressure offsets for rooms controlled to a setpoint (e.g., to an inches w.c. setpoint) (list on control drawings).

The scope of the TAB work shall be clearly delineated in the design documents. As appropriate, require that the entire system in a renovation project be rebalanced, in particular to assure un-renovated areas are not adversely affected by new work. Include the TAB data for both the new and unaltered portions of the system.

Note that proper architectural patching of room penetrations will be required for any room with pressure offset. The mechanical engineer is advised to assure the project documents thoroughly cover this requirement.

TAB Contracting

The University of Michigan limits TAB work to pre-approved contractors. These contractors are listed in the U-M spec. The AE shall not add or delete from the contractors listed in the spec. unless directed otherwise by U-M.

The preferred and best practice is for the TAB trade to be under contract direct to the Owner rather than as a sub-contractor to another trade. Discuss the TAB contracting arrangement with the U-M Project Manager and prepare bid documents as directed.

Air and water balance should always be done by the same TAB contractor, and is a requirement of the U-M TAB spec. If a project is so large that multiple TAB contracts are required, the scope of work split should be by building area, with one contractor doing all air and water balance for a specific area, and for all systems that serve that area. Splitting all air to one TAB contractor and all water to another TAB contractor significantly dilutes the efficacy of the TAB procedures and is never advisable.

DESIGN GUIDELINE 230900 **MECHANICAL SYSTEMS CONTROLS**

Related Sections

U-M Design Guideline Sections:

SBA 5.11 - Fire Command Center
DG230030 - Laboratory Ventilation Design
DG230930 - Refrigerant Monitoring Systems

MS230920 - Lab Terminal Air Flow Units & Controls

U-M Standard Details:

15635001 - Refrigerant Monitor Control Diagram
15975001 - Differential Pressure Transmitter Installation Detail (Liquid)
15975002 - Typical DDC Panel Assembly

General

This Design Guideline does not apply to laboratory and fume hood air flow controls; see Design Guideline 230030 for these systems.

Direct digital controls (DDC) are the standard for control at U-M. Pneumatic or other non-DDC controls are limited to very small systems and shall only be specified with the Design Manager's permission.

U-M Master Specification Section 230900 Mechanical Systems Controls shall be used as the controls specification on all projects. The A/E shall edit U-M Master Specification 230900 to make it project specific. Turn on hidden text and read all spec. editor's notes when editing the specification.

Note that generally the U-M controls specification should only have items *added to it* to make it project specific (e.g. a meter which is peculiar to the project and not already covered in the spec.), otherwise it is recommended that the A/E *not* delete materials or devices from the specification.

Exception: If the typical work scope split described below under "U-M vs Contractor Work Scope" is *not* to occur, the A/E will need to edit Part 1 and 3 of the specification to make the work scope split specific to the project. While rare, such editing may be required for certain non General Fund auxiliary unit projects such as for Athletics. Consult the U-M Design Manager.

U-M has an extensive Building Automation System (BAS) that networks to localized DDC controls. This system utilizes propriety Siemens components as well as non proprietary generic controls. UM has negotiated pricing for the proprietary components and purchases these direct from Siemens for projects. U-M also self performs a portion of the DDC control work. Project budgets must (also) include the cost of the proprietary components and U-M's self performed work. During budget planning, the U-M Design Manager will provide information regarding how these costs are to be accounted for in the budget.

U-M vs Contractor Work Scope

The A/E should consult the first few pages of U-M Master Specification 230900 for detailed information regarding the split of control work, university versus contractor. By utilizing U-M's control specification, proper work scope split occurs automatically and is essentially transparent to the A/E design effort. Note that non General Fund auxiliary units may handle controls differently; always consult the Design Manager. In general, the split is as follows:

University of Michigan: Provides proprietary DDC panels, terminates inside these panels, and programs and starts-up the DDC panels. Provides application specific terminal equipment controllers (TECs) for contractor installation (e.g. DDC VAV box controllers) and room sensors for TECs.

Contractor: Supplies and installs: all field devices (transmitters, actuators, control valves, control dampers, transducers, etc.), all control wiring and tubing, all auxiliary control panels, and prepares a complete controls submittal. Mounts U-M supplied DDC panels. Installs TECs and TEC room sensors.

The detail "Typical DDC Panel Assembly" provides a graphical representation of the work split.

Using U-M Master Specification 230900

The A/E shall use U-M Master Specification 230900 as the basis for the control specification and edit it to make it project specific.

When editing this spec, assure hidden text is tuned "on" and carefully review all spec editor's notes.

Special attention should be paid to the following articles:

- Article 1.3: Edit the list of acceptable controls contractors in consultation with and as approved by the Design Manager.
- Article 2.2: Obtain approval for the type of steam condensate meter to be used, and then edit the spec accordingly.
- Article 2.3: U-M supplies application specific TECs for DDC terminal (VAV, CAV, etc.) boxes. The controls contractor is responsible for mounting these TECs on the boxes. The A/E must edit his specification for such boxes to assure the box manufacturer only supplies the components listed in article 2.3 (e.g. pneumatic damper operator and air flow arrays), NOT DDC controllers. *On the rare occasion pneumatic*

VAV box controllers are used, specify that the box manufacturer provide a Krueter model CSC-3011 controller, a normally open damper, and a damper operator.

- Article 2.6: If electrical actuators are used, power for these actuators must be accounted for on drawings. Read the spec editor's note in this article for further direction.

The U-M master specification includes specifications for most types of control components. In some cases the A/E will need to add supplemental specifications for atypical components.

Control or automatic dampers (actuated dampers) are specified in Master Specification 230900. The A/E's specification should include no other control damper specifications, and specification sections requiring factory provided control dampers, e.g. air handler specifications, shall reference Master Specification 230900 for the control damper spec.

Control Drawings

The required scope of a project's controls shall be indicated by the use of control drawings. Each control drawing shall include a detailed sequence of operation.

Control drawings and sequences shall appear on the mechanical drawings; they shall not appear in project specifications.

Control drawings shall utilized U-M's standard controls symbology. Normally, U-M will provide sample control drawings in electronic format for A/E use, which will include sequences of operation. Revise these drawings to make them project specific. Revise sequences of operation to include strategies specific to the project (example: change-over to free cooling). Include all project specific setpoints and alarm values. Provide similar control drawings for systems not available from U-M's samples.

Wiring diagrams shall be provided on the control drawings that indicate the method of starting fans, pumps, and other equipment, safety interlocks, interface to manufacturer's provided controls, etc. These diagrams may be schematic in nature but shall indicate fundamentally how electrical control is accomplished.

“Point Lists” are not required and shall not be used.

DDC Panel Locations, Clearances, and Communication Wiring

The control drawings shall include system architecture diagrams specific to the project. These diagrams indicate the location and quantity of DDC and auxiliary panels. U-M will normally provide this information to the A/E, for inclusion on the project drawings.

The controls contractor will run all communication wiring between DDC panels and TECs. Communication wiring is to be indicated on the system architecture diagram, including wiring back to a telephone closet.

Each DDC panel will have one or more auxiliary panels. See “Typical DDC Panel Assembly”. The A/E shall indicate the location of these panels on the plan views. For a typical assembly allow 7' of wall space; note that some panel assemblies require more space, consult with U-M.

Locate panels to provide a minimum of 36" clearance in front of each panel, and designate this clearance on the drawings.

Power for Controls

DDC Panel Assemblies: Each assembly (not each panel in an assembly) shall be provided with (2) 20 amp dedicated circuits (separate circuit breakers). Indicate these circuits on the electrical drawings, home-runned to the panel assembly location.

TEC Power (DDC VAV box controllers, etc.): Designate circuits in receptacle panels on each floor for TEC transformers. Provide one 20 amp circuit for every (50) Terminal Equipment Controllers.

Actuator Power: See Master Specification 230900, Article 2.6.

Power for meters and other control accessories that are provided by the controls contractor: This is provided through a fused disconnect located in the DDC auxiliary panel and is part of the controls contractor's scope of work per U-M Master Specification 230900. Therefore the A/E does not need to typically indicate power for such items on the design drawings. See U-M Master Specification 230900, article 2.5.

Life Safety Control

U-M's DDC system is not listed for life safety use and therefore shall not be used for initiating or alarming life safety applications. Two common examples are as follows:

Stair Pressurization Control: The building fire alarm system will initiate operation of the stair pressurization fans. Any controls required for stair pressurization shall be stand-alone from (and independent of) the DDC system.

Atrium Smoke Purge: The building fire alarm system will initiate atrium smoke purge. Any controls required for smoke purge shall be stand-alone from (and independent of) the DDC system.

However, the controls contractor will provide the stand alone components (dampers, end-switches, pressure transmitters, etc.) and therefore these components shall be indicated on the control drawings and include complete sequences of operation.

Fire Command Centers

The building code requires status indicators and controls for air distribution systems in Fire Command Centers (FCC). These devices shall be provided as a separate DDC control panel in the FCC. The DDC system (as opposed to the fire alarm control system) shall output status to the panel and provide air distribution system control from the panel. Refer to Design Guideline SBA 5.11 Fire Command Center for additional information.

Manufacturer Provided (Packaged) Controls

Chillers and boilers shall be equipped with manufacturer provided controls. Manufacturer provided controls shall typically be limited to control of the chiller (boiler) itself. Control of the chiller (boiler) plant (chiller (boiler) sequencing, etc.) shall be by U-M's DDC system.

Packaged controls should also be specified for equipment normally equipped that way, such as storm/sanitary pumps, RO/DI systems, vacuum pumps, air compressors, pollution control (air and water treatment) systems, refrigerant leak detection, fuel oil systems, DX systems, condensate pumps, etc. See the respective design guideline for these systems for any specific requirements for the packaged controls.

Packaged controls shall not be specified for air handlers, unless specific permission is given by the U-M Design Manager.

Control Air

For central campus projects, 90 PSIG compressed air is available from the campus steam tunnel system at minus (-) 50 °F dewpoint. This air shall be utilized for control air use, dryers for control air are not required.

For other campus locations, a control air compressor will normally be required. U-M Master Specification 230900 specifies control air compressors and accessories (PRV stations, refrigerated air dryers, etc.).

In either case, A/E drawings shall indicate the source of control air.

Electric vs. Pneumatic Actuators

Damper actuators and large control valves shall be pneumatically actuated, except for special conditions as approved by the U-M Design Manager. Small dampers and valves controlled by TECs shall utilize electric actuators, as indicated in U-M Master Specification 230900.

Smoke and combination fire/smoke dampers shall be pneumatically actuated.

Typical Alarms to be Monitored by DDC

In addition to the typical status alarms associated with DDC control, the DDC shall be indicated as monitoring the following equipment. Equipment should be specified with a common alarm contact for DDC monitoring, not separate alarm contacts for each alarm condition, except as noted:

- Sanitary and Storm Pumps (common alarm: high level, seal failure, etc)
- Cold/Warm/Environmental Rooms
- Walk-in Freezers
- Heat Trace
- Emergency Generator (generator running, generator trouble)

- Automatic Transfer Switch Transferred to Generator Power (Connect in series each “on generator power” auxiliary contact in each ATS to a single point in a DDC panel to notify BAS if any ATS transfers to generator power.)
- Critical Unitary A/C units (for example, computer rooms)
- RO/DI Systems
- Pollution Control Systems
- Fuel Oil Systems
- Refrigerant Leak Detection Systems
- Chiller Relief Valve Status
- Domestic Water Booster Pump Systems
- Glycol Make-up Systems (separate low pressure and low level alarms)
- Substation Room Temperature

The above list is not exhaustive. The design team shall carefully consider and include alarm monitoring appropriate for the project. *The A/E shall indicate any special alarm setpoints on the control drawings* (e.g. critical humidity limits in a clean room or museum).

Miscellaneous

DDC controlled heating hot water heat exchangers shall include back-up pneumatic control.

DDC controlled cooling towers shall include a pneumatic controller to provide back-up control of the tower condenser water bypass valve arrangement .

Exterior lighting associated with new buildings shall be controlled by DDC. DDC shall turn the lights on and off, and status the lighting contactor (via a current sensing relay). The contract drawings shall indicate a contactor for exterior lighting control by DDC.

U-M utilizes a central weather station that transmits outside temperature and humidity conditions across the BAS network. Therefore local outside temperature and humidity transmitters should normally not be indicated.

Fan systems capable of developing static pressures in excess of the duct system’s (air handler casing, plenums, ducts) static pressure rating (positive or negative) shall be equipped with static pressure safeties to turn off the fans prior to damage occurring from excessive pressure. The AE should not indiscriminately specify these devices but shall include them based on an evaluation of the maximum pressure the fan can develop, the pressure class of the duct system, damper pressure ratings, and the degree of risk.

In general, for air handlers, heating coils shall be designated as fail open, and cooling coils shall be designated as fail closed.

For reheat coils in zones serving animal rooms, reheat coil control valves shall be **normally closed** type. This avoids a wild coil condition from severely over-heating the animal room.

Include U-M's "Differential Pressure Transmitter Installation Detail (Liquid)" on any project utilizing liquid DP transmitters.

For all air and liquid flow measuring devices, the AE shall indicate their location on the plan views as well as on the control drawings. Design the duct or piping at the meter location to provide the manufacturer's required up and downstream straight and unobstructed lengths, and indicate these requirements on the drawings. When in doubt as to specific manufacturer's requirements, provide 10 straight diameters upstream and 5 straight diameters downstream.

For information regarding controls related to refrigerant leakage monitoring, see DG230930 Refrigerant Monitoring Systems and the standard detail 15635001 Refrigerant Monitor Control Diagram.

DESIGN GUIDELINE 232216 **STEAM SPECIALTIES**

General

Consult with Project Coordinator whenever the quality of the steam is an issue to the A/E. See University Provided Utilities in the SID Section for steam pressures available.

Design Requirements

Where medium pressure steam (60 psig) is available, a pressure reducing station shall be provided to meet the total low pressure (5 psig) load during major breakdowns or planned maintenance.

Where intermediate steam pressure is required (e.g. 15 psig) a jet compressor should be provided to supplement the low pressure steam.

The pressure reducing valve or jet compressor should be insulated and covered with sound attenuation wrapping.

Equipment Requirements

Traps, Strainers and Meters

Float and thermostatic traps - F & T traps should have heavy cast iron bodies. The float valve mechanism should be of heavy brass and should have a variable level action to ensure quick and full opening.

The thermostatic bellows member for venting air should have not less than 10 corrugations and should be protected against damage from water hammer by a brass shield cup.

Inverted Bucket Traps - IB traps should have high-strength cast iron bodies. Bucket should be of brass and the level mechanism should be of heat treated stainless steel operating on knife edges. Removable seats and plungers should be heat treated stainless steel. Steam tight seal between seats and covers should be provided using an automotive type copper gasket.

A vertical tube should be threaded into the inlet opening and capped with a baffle to prevent condensate from impinging on the bucket.

Strainers - Strainers should be of the 'Y' type having heavy cast iron bodies with blow-off tappings in screen covers.

Sizes 1/2 inch through 1-1/2 inches should have a screen of 20 mesh Monel.

Sizes 2 inches and over should be .016 inch thick perforated stainless steel, with 324 holes 1 per square inch, each .033 inch diameter.

Steam and Condensate Meters - Where possible all steam shall be metered by gravity type condensate meters as manufactured by CADILLAC METER CO., or as approved by the University Utilities Engineer through the University Project Coordinator. Flashtanks shall be provided before the meters.

Medium pressure steam that will not be returned as condensate shall be metered directly with an orifice plate and a calibratable, differential pressure cell and transmitter with pressure compensation. "Shunt flow" or by-pass type steam meters are not acceptable.

Meters should be complete with a low voltage pulse totalizer output and a 4-20 mA output proportional to flow where appropriate for external interface with a building management system.

Steam Humidifiers

Humidification should be normally provided for each project. If required, primary humidification at the central AHU's will be provided after evaluating problems that may be caused by condensation on the perimeter glazing.

When a specific zone requires a higher humidity level than adjoining areas, the A/E should provide for the prevention of moisture migration from this high humidity zone. This will require that doors remain closed except for individual ingress/egress for Rh differentials approaching 20 percent and non-permeable floor/wall/ceiling treatment for greater differentials.

All steam humidifiers connected to the building steam supply, whether primary or secondary, should contain insulated dispersion tubes.

Installation Requirements

Size traps for twice the condensate rating unless the coil or vessel manufacturer recommends otherwise. Install multiple traps where one trap will not handle the condensate rating.

The run-out from unit being trapped should be the same size as the drain tapping.

The discharge line downstream of the pressure reducing valve or jet compressor shall be fitted with a pressure relief vented to atmosphere (outside the building) to prevent overpressurization of equipment and components.

Install strainers ahead of all controlled devices. Install a valved blow-down line for each strainer. Screens should be removable without disturbing the pipes.

Install inverted bucket traps on all steam equipment drains and all steam line condensate drains except for steam using equipment served by modulating steam control valves. For this equipment, install float and thermostatic traps.

Humidifiers to be located to assure absorption into the airstream rather than wetting of parts such as fans, turning vanes, etc. The preferred location is in the supply ductwork, with 10-12 feet of straight duct downstream. Internal lining should not be used downstream within 10 feet of humidifier.

DESIGN GUIDELINE 235000

HOT WATER HEATING SYSTEMS

Scope

Hot water heating systems, including low pressure steam-to-water shell and tube heat exchangers and hot water heating boilers.

Requirements Common to Steam Heat Exchanger and Boiler Systems

The central (heat exchanger (HX) or boiler) heating system type and configuration shall take into account the attributes of the building's distribution network, terminal units, and terminal unit controls. Examples include whether terminal units utilize 2 or 3 way valves and assuring that terminal unit water temperature requirements permit the hot water supply temperature to be reset low enough and frequently enough to produce a significant number of hours when boilers can operate in condensing mode.

Quantity and Sizing

Typically the central heating equipment (HX or boilers) should consist of a minimum of two identical capacity units, each sized for somewhere between 50% and 100% (see rationale below) of the *Peak Diversified Load* (PDL). PDL is defined as the maximum load expected

on a diversified heating plant on a design heating day. The engineer of record is responsible for determining PDL.

For existing systems, PDL shall be derived by consulting measured loads from the BAS system data historian. If unavailable, use computerized building energy simulation modeling.

For new systems PDL shall be established using a computerized building energy simulation model (Trane Trace, Carrier E20-II HAP, etc.) that complies with the requirements for simulation programs in ASHRAE 90.1 Appendix G.

To avoid oversizing central heating equipment the model shall account for diversity factors at each terminal load (e.g. terminal reheat, which typically has a high diversity) and shall credit heat recovery systems. When determining the heat recovery system credit, if there is a significant chance of heat recovery failure, assume the largest heat recovery system is not operational.

- Example: The building has two air handlers with heat recovery wheels. One unit can recover 2000 MBTU on a design day, the other can recover 1000 MBTU on a design day. The PDL should be reduced by 1000 MBTU.
- Example: A glycol run-around heat recovery system with redundant pumps and serving multiple coils: Such a system may be deemed to have very low probability of any failure, allowing full credit to be assumed for heat recovery.

Finally, in consultation with the U-M Design Manager, determine the need for future capacity and add it to the PDL. Normally assume no additional capacity. In cases where there is a significant potential for incremental increases in loads due to future renovations, a modest allowance of +/-10% future growth may be included. In some cases allowing space for future *additional* or *larger replacement* central heating unit(s) may be appropriate. Indicate in the Basis of Design document the PDL and any accommodation provided for future capacity needs.

After PDL is determined, consider the implications of losing one unit. If the loss of up to 50% of the PDL in an emergency is manageable through load shedding or shifting to other heating sources, units may be sized for as little as 50% of PDL, though careful analysis may imply sizing at 60-70% of PDL to be more appropriate. Examples of these ***non-critical HWH applications***:

- Buildings where ventilation air can be temporarily reduced.
- Buildings where outside air can be reduced in an emergency by temporarily limiting use of *non-critical* exhaust systems.
- Buildings or portions of buildings where space temperature can be compromised below normal set-points in an emergency.

When sizing heat sources and considering the above load reduction strategies, it shall not be assumed that ventilation air can be reduced by more than 50% or that space temperature can fall below 65°F.

Non-critical HWH applications typically would include offices, classrooms, outpatient facilities, buildings with return air systems, child care facilities, and housing.

A system is considered to be a *critical HWH application* if loss of any heating capacity below the PDL is intolerable for the application due to stringent criteria and operational constraints. In this case capacity should be 100% of PDL for each of two units (or three units at 50% capacity, etc.).

Critical HWH applications typically would include in-patient care facilities, animal vivariums, ambulatory outpatient surgical facilities, and 100% outdoor air wet lab buildings.

In rare cases, a small off-peak unit may be required, but only if the turndown of the primary system is incapable of meeting required summer loads without excessive temperature swings. Determine minimum load and verify that the heating units are capable of stable control at this load. Consider all components such as boiler size, pump size, steam control valve size, low flow time delay to control sensors, etc.

Calculations, criteria and assumptions regarding rationale for HX (or boiler) sizing must be clearly defined in the Owner Project Requirements and Basis of Design. Clarify added design capacity for future PDL, if any, as well.

Also refer to U-M Design Guideline 230010-H Supplemental HVAC Design for in-patient and ambulatory facilities.

Emergency Power

Normally pumps and heat sources (boilers) for both critical and non-critical applications should be on emergency standby power. If this requirement pushes the standby power source into the next size increment, consider if it makes sense for one or more heating components to remain on normal power, in particular for non-critical applications. Include all components necessary for the heating unit such as control panels, steam condensate pump units, etc. For critical applications, include domestic water booster pumps if needed for make-up water; for non-critical applications, include booster pumps if it does not impact generator size.

Pump Selection

Pump quantity and flow capacity should generally be selected in a manner similar to heat generating units (considering implications of lost flow). E.G. if two HX at 60% capacity each are provided, two pumps at 60% capacity would be provided. If three HX at 50% capacity each are provided, three pumps at 50% capacity each would be provided.

Piping Considerations

The piping arrangement of the pumps relative to the heat sources should normally be as expressed on the following U-M standard details:

MD 235716 001 - Critical Steam to Water Heat Exchanger P & ID
MD 235716 002 - Non-Critical Steam to Water Heat Exchanger P & ID
MD 235716 003 - Steam to Water Heat Exchanger Piping Detail
MD 235716 XXX – Boiler P & ID (future)

In particular for boiler plants, pipe for reverse return, equal pressure drop flow paths across each heat generating unit.

Maintainability

Design the placement of piping, ductwork and equipment so that full access is provided for maintenance, including primary heat exchanger replacement, without the removal of permanent piping or ductwork. Ensure equipment top access recommendations are met.

Provide adequate maintenance aisles and room door widths or removable panels to allow replacement of the largest heat generating unit or component. For units located in penthouses or other high locations, provide means for future replacement with a crane if other routes are not available. Dash-out/indicate equipment clearances and access pathways on the drawings.

Air Removal and Miscellaneous Accessories

A coalescing combination air/dirt separator shall be installed at the location in the system with the warmest temperature and lowest pressure. When practical considerations preclude both, select the location with the warmest temperature. Refer to U-M Standard Detail 15515011– Coalescing Separator and Floor Mounted Expansion Tank for requirements.

HWH systems shall include a shot feeder and corrosion coupon rack, as well as automatic city water make-up . Refer to U-M Standard Detail 15189001 Closed System Shot Feeder and 1518903 Closed System Make-Up for requirements. For hospital projects a shot feeder may not be required, consult with the U-M Design Manager.

Heat Transfer Fluid and Water Treatment

Water (chemically treated for corrosion resistance) is always the preferred heat transfer medium in HWH systems. Glycol should only be considered when freeze protection cannot be practically provided in any other way. For example, U-M normally prefers pumped heating coils on 100% outside air units, not glycol.

Use the U-M master specification and standard details for water treatment. Refer to U-M Design Guideline X.X Water Chemical Treatment (FUTURE) for further information. Coordinate water treatment with the heat generating unit manufacturer and revise the specification and details, if required, after consultation with the U-M Design Manager.

Design Criteria - Operating Temperatures and Pressures

New HWH systems shall be designed with a maximum HWHS temperature of 140°F, to allow efficient addition of other sustainable equipment such as condensing boilers, ground

source or heat recovery heat pumps or solar thermal heat in the future. HWHS/R delta T should be a minimum of 20°F, but preferably as high as 40°F to minimize pumping energy.

For HWH systems serving existing facilities, the goal is to achieve the criteria stated for new systems, above, if possible. Since most older systems were installed with a HWHS of 180°F, or even as high as 200°F, conversion to lower temperature HWH requires careful analysis and may require modifications or additions to terminal equipment and/or building envelop to allow the system to be operated successfully at lower temperatures and/or flows.

HWH systems shall be designed for fill and operating pressures that allow filling without additional booster pumps, provide effective venting and that minimize the use of equipment or piping rated for more than 150 psig. The documents shall include a piping schematic of the hot water heating system. Include expansion tank cold fill pressure (make-up water) and operating pressure on the drawings. Taking into consideration the heating pump pressure boost above the expansion tank operating pressure, verify relief valves and other equipment are selected to meet the operating pressure. Include relief valve pressures settings on the drawings.

Control Strategies and Considerations

Use the following U-M standard details for as the starting basis for general control strategies and configuration:

MD 235716 001 - Critical Steam to Water Heat Exchanger P & ID

MD 235716 002 - Non-Critical Steam to Water Heat Exchanger P & ID

MD 235716 XXX – Boiler P & ID (future)

As the U-M standard details referenced above indicate, for heat exchangers automated isolation valves are typically not required on inactive heat generating units. In most cases, the system can function with water flowing through the inactive units.

The controls strategies outlined below shall be described in detail in the control drawing sequence of operation.

Always include a supply water temperature reset schedule (based on outside air temperature) in the sequence of operation. While an aggressive reset schedule may result in excessive pumping energy, an appropriately selected reset schedule can reduce standby losses from piping and equipment, reduce cooling load during summer conditions, and improve controllability. A proper reset schedule must be provided for condensing boilers to assure condensing mode occurs over the maximum number of operating hours. See the boiler design section below for more information.

For critical systems, consider the need for monitoring system pressure (at the point of expansion tank connection) through BAS/DDC.

For variable flow systems, the HWHS/R differential pressure set point shall be reset based upon worst case valve position, i.e. reset downward until one valve is nearly open.

Based on discussions with manufacturers listed in the referenced U-M master specifications, shell and tube heat exchangers and high efficiency high mass condensing boilers can be modulated down to very low/laminar flow. Pumps however shall be operated at no lower than the pump/motor manufacturer's minimum flow rate. Obtain this flow rate from the pump mfr. and include in the sequence of operation. To assure the minimum flow rate is always attainable, provide a minimum flow by-pass either near the pump or in the longest piping run of the system, as appropriate for the building. Unless it is critical that the system provide rapid building warm-up, the preferred bypass location is near the pump.

Additional Heat Exchanger Design and Installation Requirements

Actual Steam Pressure at the HX

The steam pressure available for use in heat exchangers varies depending on the steam plant serving the facility and the location of the heat exchanger on the steam distribution network. See U-M DG 4.6 Utilities for University Buildings for the minimum steam pressure guaranteed at the building entrance. For buildings supplied with CPP steam, the minimum pressure guaranteed is 6 psig. For CPP supplied steam, the pressure at most building entrances is higher, but typically not higher than 12 psig. Assess the location of the building entrance relative to the steam plant and select steam control valves to provide stable control over the entire minimum and maximum steam pressure range that will actually occur at the control valve inlet. Account for expected distribution losses from the building entrance to the control valve inlet. Normally at least two steam control valves are required for stable turndown capacity control and three or more may be required for high turndown systems. Provided the C_v for each control valve on the control drawings.

Built-Up Versus Packaged HX Systems

U-M generally does not prefer factory assembled heat exchanger packages. Where used, the specification must require that all components comply with related specification sections (which in turn must comply with U-M Design Guidelines), e.g. valves supplied as part of the HX package. Packages must be specified to meet code clearances and require that all components are serviceable without excessive disassembly or total system shut-down.

HX Installation Requirements

Ensure condensate from heat exchangers includes an adequate drip leg to minimize back-up of condensate into the HX. Although at least 15" drip leg is required, the drip leg should be as high as possible for the installation location. Use swing check valves, not spring loaded check valves, at steam traps due to high pressure drop and tendency to cause water hammer in steam condensate piping.

Additional Boiler Design and Installation Requirements

Forced draft, direct vent, high mass fire-tube condensing boilers with minimum 316 grade stainless steel heat exchangers shall normally be specified. Utilize U-M Master Specification 235239 Fire Tube Boilers (Hot Water) (FUTURE) as the basis for the specification for HWH Boilers as it reflects the desired boiler package features, performance requirements and remote monitoring interface capabilities. Extensive editor's notes are included in the specification to assist the A/E. Be sure to turn on hidden text and read those notes.

Provide zero side clearance boilers whenever possible.

Optimizing Condensing Boiler Efficiency

Design the boiler plant for maximum turndown, incorporating Outdoor Air Temperature (OAT) Reset and reduced distribution flow to drive HWHR temperatures down, and increase supply/return delta T, as often and as low as possible, to maximize the number of hours and extent that boiler condensing operation is achieved, while minimizing boiler on/off cycling.

Select heating terminal units/heat emitters that allow relatively low HWHS/R temperatures and high water-side delta T, evaluating any increased cost for emitters against improved boiler efficiency/lower boiler operating cost.

Analyze and provide a project specific OAT reset schedule. The highest HWH supply temperature set point of the reset schedule shall reflect the water temperature required to heat the building a -10°F OAT. The lowest set point of the reset schedule shall reflect the water temperature required at the warmest OAT requiring heating. The lowest set point shall also be limited by non-envelope influenced heat emitters such as reheat coils on VAV boxes serving internal spaces. In some cases increasing the coil size of such emitters may be justified to provide lower boiler operating cost.

Boiler Piping Considerations

In general, design systems with variable volume primary heating hot water distribution, based on two-way valve controls on heating coils and other terminal units. Avoid dedicated boiler circulation pumps or creating a primary boiler loop, as the preferred fire-tube boiler manufacturers require little or no minimum flow, and have very low (50°F) minimum heating hot water return (boiler inlet) water temperature requirements. Do not provide designs utilizing low mass water tube boilers with flow switches and the need for boiler pumps; which increase construction and operating costs, unless special circumstances require them.

Boiler Controls

U-M Master Specification 235239 Fire Tube Boilers (Hot Water) contains the University's control requirements for boilers and boiler staging. The specification includes all instruments, shipped-loose devices (including the common HWH supply water temperature

transmitter and the outdoor air temperature transmitter), and boiler/boiler plant controller programming required to operate the plant as described below.

Controls shall be provided by the boiler manufacturer to stage the boilers in the combination that continuously produces the best plant efficiency while meeting building load. Generally, operating more boilers at reduced flow and lower part load per unit provides best efficiency. Assure the plant arrangement permits the best plant efficiency to be realized.

Boiler control and boiler staging shall operate independently and stand-alone from the Owner's BAS/DDC system. Therefore the boiler specification includes the common HWH supply water temperature and outdoor air temperature transmitters. The A/E must indicate the mounting location of these devices on the design documents. Control by the Owner's BAS/DDC system shall be limited to control and monitoring of the distribution system (pumps, etc.) and monitoring a common boiler plant alarm generated by the boiler controller. See U-M Standard Detail MD 23XXXX – HWH Boiler P & ID (FUTURE) for additional information.

DESIGN GUIDELINE 260500 **COMMON WORK RESULTS FOR ELECTRICAL**

Scope

Prepare the project's electrical design and associated contract documents in accordance with these Design Guidelines, in accordance with the scope of work defined in the Program Documents, and within the construction budget.

Related Sections

U-M Design Guideline Sections:

[DG 2.0 - Project Procedures](#)

[DG 4.0 - Special Instructions to Designers](#)

U-M Standard Details:

[260000 Series - Electrical Standard Details](#)

Reference Documents:

NFPA 70 - National Electrical Code (NEC)

NFPA 70E – Standard for Electrical Safety in the Workplace

IEEE Standard 141 - Recommended Practice for Electric Pwr. Dist. for Industrial Plants

IEEE Standard 1584 - IEEE Guide for Performing Arc-Flash Hazard Calculations

Design Requirements

Submit the documents specified in the Design Deliverables list for approval. Submit them at the end of the Schematic Design, Design Development and Construction Documents phases.

Provide flexibility for future changes in the use of the space, and provide spare capacity for future load growth. Provide 20 percent spare capacity for load growth unless 20 percent spare capacity would require a significant power distribution system upgrade. In those special cases, provide as much spare capacity as the existing system can supply.

Field verify the existing installation and/or site. Do not rely solely on the existing drawings and/or site surveys. As a minimum, field verify the quantities, sizes, ages, conditions and spare capacities of the following:

- Power ducts, manholes, services to the building and unit substations.
- Panels, circuit breakers, disconnect switches, motor controls, raceways and wiring.
- Interior and exterior lighting, switches and receptacles.
- Grounding.
- Telecommunications ducts, manholes, rooms and services to the building.
- Fire alarm, security, card access control, audio/visual and other special systems.

Coordinate with the Design Manager to obtain recent historical information from the following U-M departments:

- Key plans and electrical risers from AEC. UMHS projects to contact Facility Planning and Development (FPD) for risers and panel location drawings.
- Electrical usage, primary system and unit substation information from the Plant Utilities and Plant Engineering (UPE) Department.
- Existing condition information from the Facility Condition Assessment Program, the Facility's Manager and the Plant Region maintenance personnel.
- Card access control system information from the Plant Key Office.

Show all known below grade, below floor and in-floor utilities that will be impacted by the project's work.

Use existing spare circuit breakers or existing spaces whenever possible. If necessary, combine existing lightly loaded circuits to free existing circuit breakers for the new loads. Combining circuits requires matching phase conductor colors and relabeling references to circuit used in field, including junction boxes and end of circuit labeling. Tap buses only with the approval of the Plant UPE Department. Coordinate with the Design Manager before adding a new unit substation.

Number electrical panels and devices in accordance with U-M Standard Detail 260500001. Match the existing installation whenever possible and practical.

Locate equipment requiring routine maintenance so it is easily accessible.

- Installations shall not require the use of a lift or scaffolding, or the removal of other infrastructure, for routine maintenance.
- For rooftop equipment with control panels, motor starters, disconnects or motors mounted over 6 feet above roof level and requiring routine maintenance, arrange for the Architect to provide a permanent galvanized steel work platform and ladder.

Provide access panels (24 inches square minimum to access equipment out of arm's reach) for maintaining electrical equipment located behind walls or above permanent ceilings.

Ensure that no piping or ductwork is routed in the NEC-required dedicated spaces above or working spaces around electrical equipment. Provide drip pans for existing piping routed over electrical equipment.

Correct code violations and safety hazards to the greatest extent possible within the project boundary. If existing code violations or safety hazards are discovered that are not addressed in the Program Documents, notify the Project Manager.

Short Circuit, Protective Device Coordination and Arc Flash Hazard (SPA) Studies

Short Circuit and Protective Coordination Device studies shall be prepared in accordance with IEEE Standard 141. Arc Flash Hazard studies shall be prepared in accordance with IEEE Standard 1584 and NFPA 70E.

SPA studies shall be signed and sealed by a Registered Professional Engineer, in the State of Michigan. Architect/Engineer shall be directly responsible for SPA's. If the SPA study is sub-contracted out, the Architect/Engineer shall review and approve the study. The Electrical Contractor shall not perform or arrange for these studies.

Perform SPA studies for projects that include new installations, total replacements or partial replacements of power distribution systems. Studies are required to establish proper electrical equipment ratings and settings of electrical distribution equipment and powered mechanical equipment including, but not limited to, unit substations, switchboards, panelboards, motor control centers, transformers, transfer switches, UPS's, generators, motor starters, disconnect switches, variable frequency drives and control panels. SPA studies shall also be performed for projects that include modifications to existing electrical utility service, major feeder conductors and motor quantities.

SPA studies shall begin at the point of utility service for the facility down through the 480V and 208V distribution systems. Include in the studies the project scope plus existing upstream electrical infrastructure and any other directly affected existing electrical distribution equipment. U-M standard practice is to de-energize electrical equipment prior to any work being performed. This standard practice should not be used as a basis for determining the scope for Arc-Flash Hazard analysis.

Complete a 'design basis' SPA study during the design phase of the project. For review the study shall be submitted to the Design Manager, Commissioning Authority and UPE Primary System Engineer.

Complete a 'final' SPA study during the construction phase of the project prior to energizing electrical equipment. Base calculations on actual field installation data. The final study shall incorporate shop drawing information, protective device coordination time-current curves from the electrical equipment manufacturers, and actual cable sizes and lengths from the Electrical Contractor. The final SPA study may be submitted in two parts to accommodate the construction schedule. The first part shall contain the short circuit and protective device coordination (completed shortly after shop drawing approvals) and the second part shall contain the arc flash hazard analysis (completed prior to equipment energization). For review the study shall be submitted to the Design Manager, Commissioning Authority and UPE Primary System Engineer.

Information on the primary distribution system and on the primary system fault capability is available from UPE Primary System Engineer.

Derive settings for new protective devices in consideration of existing upstream protective device settings, and optimize system coordination in light of this constraint. The utility upstream protective device feeding the facility shall be maintained as the upper limit for coordination. Where the upstream device characteristics do not allow reasonable coordination with new equipment, identify the problem and the recommended resolution in a letter to the Design Manager prior to submitting the coordination study

Design power distribution systems to limit the arc flash incident energy to a magnitude requiring Personal Protective Equipment (PPE) of Category 4 or less at unit substations and switchboards, and Category 2 or less at panelboards and similar equipment rated 600 amps or less.

All circuit breakers shall be fully rated for the available short circuit current, series ratings shall not be applied.

Do not to rely upon AIC ratings of existing equipment. Do short circuit studies to affirm the proper AIC for each location.

When the power distribution system includes an interactive power source such as an engine-generator with closed transition automatic transfer switches, solar photovoltaic system, wind generator or fuel cells, only perform the short circuit study based on the combined fault contributions from the incoming utility power system and interactive source if the two power sources are paralleled for more than 100ms.

Verify electrical equipment supplied by others such as equipment control panels and variable speed drives are adequately rated for the available short circuit current.

Contractor shall furnish all field data as required by the SPA studies. Furnish the Contractor with a listing of required data.

SPA Study and Report Requirements

SPA studies shall be performed using computer software from SKM Power Tools.

SPA studies shall include an executive summary. Incorporate description, purpose, basis and scope of the study. Also include pertinent data and the rationale employed in developing the study calculations.

'Design Basis' SPA studies are not required to include all system components. The studies shall include sufficient detail to verify the following:

- Maximum available fault current at each level of the distribution system.
- Protective device coordination for the most restrictive scenarios.
- Arc-flash hazard levels at unit substations.

All other formatting and information requirements shall apply.

Short Circuit reports shall include, but not limited to, the following:

- Input data, case descriptions and definition of terms.
- One-line diagram showing calculated short circuit currents at each node, bus identification numbers, voltages, protective devices with associated ampere ratings, cable sizes and lengths, transformer kVA sizes with voltage ratings and impedances, motor horse powers, generator kVA ratings with subtransient reactance, ATS's, switchboards and panelboards.
- Include fault contribution of motors, with motors < 50hp grouped together.
- Results of short-circuit calculations shall be presented in tabular form and include:
 - Bus identifications
 - Device identifications
 - Device ratings
 - Operating voltages
 - 3-phase short circuit currents (asymmetrical and symmetrical).
 - Phase-to-ground short circuit currents.

Protective Device Coordination reports shall include, but not limited to, the following:

- Tabulations of protective relay settings, adjustable circuit breaker trip unit settings, fixed circuit breaker ratings and fuse types/ratings.
- Automatic transfer switch voltage, current, time and control settings.
- Coordination curves prepared in log-log format to illustrate adequate clearing times between protective devices.
- Specific time-current characteristics of each protective device plotted in such a manner that all upstream devices will be clearly depicted on one sheet.
- Multi-color curve sheets for improved clarity.
- Curve sheets shall include the following:
 - Device identifications and associated settings/sizes/ratings
 - Voltage at which curves are plotted
 - Current multiplier
 - Curves labeled with applicable curve number
 - Relay CT ratios, tap, time dial, and instantaneous pickup
 - Circuit breaker sensor rating, long-time, short time, instantaneous and ground fault settings, time bands and delays
 - Melting and clearing fuse curves
 - Maximum short-circuit cutoff point
 - Cable ANSI insulation damage curves
 - Transformer ANSI damage curve and inrush point
 - Motor starting profiles (200hp and above)
 - Single-line for the portion of the system

Arc-Flash Hazard analysis reports shall include, but not limited to, the following:

- Arc-Flash Incident Energy (AFIE) levels and flash protection boundary distances at all locations in the electrical distribution system where work could be performed on energized parts.
- Analysis performed under worst-case Arc-Flash conditions.

- Results of arc-flash hazard analysis shall be presented in tabular form and include:
 - Bus identifications
 - 3-phase short circuit currents
 - Arcing fault current levels
 - Flash protection boundary distances
 - AFIE levels
 - Personal protective equipment (PPE) hazard risk category

SPA Study and Report Deliverables

Analyze the short circuit calculations, and highlight any equipment (new or existing) that is determined to be underrated as specified or that does not coordinate with upstream equipment. Propose approaches to effectively protect the underrated equipment.

Submit the report to the Electrical Contractor for their use in providing fuses and adjusting electrical equipment settings prior to equipment testing and energization. The independent electrical testing agency and Commissioning Authority will verify proper fuse sizes and protective device settings.

Submit the final SPA report (pdf format), including the associated SKM Power Tools data files, on a CD or DVD to UPE Primary System Engineer and to the contractor for inclusion in the O&M Manuals.

Arc Flash Hazard Warning Labels

The Electrical Contractor shall provide generic arc flash hazard warning labels on equipment. This equipment includes but is not limited to automatic transfer switches, switchboards, panelboards, meter socket enclosures, transformers, storage batteries, battery chargers, inverters, control panels, variable speed drives, motor controllers, circuit breakers and disconnect switches.

Although portions may be energized early to provide temporary power for construction, the power distribution system will not be declared Substantially Complete and will not be accepted by the University until the study and labeling tasks have been completed.

Design Drawings

Prepare the following electrical drawings and specifications in accordance with the Design Deliverables list and as applicable to the project, for use during construction:

- Demolition plans and details.
- Underground duct bank and manhole plans, elevations, profiles and details.
- Primary and secondary feeder conduit routing drawings.
- Normal and emergency power plans, one-lines, risers and details.
- Schematic and wiring diagrams.
- Lighting plans and details.
- Telecommunications, fire alarm, clock, card access control, security, CCTV, nurse call, audio/visual, sound reinforcement and other special systems plans, risers, schematics, and wiring diagrams.

- Grounding and lightning protection plans, risers and details.
- Substation, switchboard, panelboard, MCC and other applicable equipment schedules with connected load summaries.
- Systems and equipment sequences of operation.
- Indicate NEC required working clearances on plan views for electrical equipment and dedicated electrical space on equipment elevations. Space allotted for future equipment should be noted on plan view drawings including any associated working clearances.

For new electrical drawings, use the symbols and abbreviations established by the applicable nationally recognized trade association. When revising existing drawings, use the existing symbols and name equipment using the existing convention. Provide a complete symbols legend.

When revising existing drawings, identify revisions. Circle and label revisions, or draw the revisions using a heavier line weight than used for the existing and background.

When a building feature, cable tray, conduit, or circuit continues on to another drawing, reference the continuation drawing at the point of continuation. Show reference column and row numbers for clarity.

Indicate room names/numbers and include furniture layouts on all plan view drawings. Identify all offices intended to be occupied by more than one person.

Coordinate designs with reflected ceiling plans noting locations of soffits, beam pockets, skylights, etc.

On new building, building addition and total renovation projects, evaluate the use of aluminum cables in lieu of copper for feeder circuits No. 1 AWG and larger only. On partial renovation projects, match the existing cable type. Note that chiller manufacturers will not allow the use of aluminum cables to feed chiller VSDs or starters.

- Provide two cable and conduit sizing charts on the drawings, one for copper cables and one for aluminum cables.
- Include the aluminum cable technical and installation requirements contained in Master Specification 260513. Include Standard Detail 16120013 on the drawings.
- After completion of construction, verify the as-built drawings identify where aluminum conductor cables were installed.

Show the wire and conduit sizes for every feeder circuit on the riser and one-line diagrams.

Show wire and conduit sizes on the plan drawings for any circuit other than 20 amperes, single phase. Show multi-wire feeder and branch circuits requiring separate or oversized neutrals. A general note is adequate to define wire and conduit sizes for 20-ampere single phase circuits and to specify shared neutrals.

Show bus amperes, number of phases and wires, breaker/starter/fused switch/fuse sizes, and AIC ratings for all unit substations, switchboards, panels, MCC's, etc.

Specify the mounting heights of electrical devices. Indicate if the devices are flush or surface mounted. Indicate if raceways are exposed or concealed. Show 4" high minimum concrete housekeeping pads for floor-mounted equipment.

Show Contractor furnished electrical equipment and control wiring on the plan drawings. Include equipment required by the NEC such as motor disconnect switches if not provided by others, and include control wiring required for equipment operation if not provided by others. Do not rely solely on specification statements or general drawing notes to identify Contractor scope. Provide sufficient information so that quantities can be determined easily.

Specifications

Number specification sections in accordance with the CSI specification numbering system.

Use the U-M Master Specification sections applicable to the project. Turn on hidden text, follow the hidden text editor's notes and edit the sections to make them project specific.

Eliminate from general specifications the requirements that do not apply to the project.

Shop Drawing Review

Review Contractor submitted shop drawings and product literature. Approve submittals that comply with the contract documents, and mark up or reject submittals that do not comply. Approved submittals shall include adequate information to prove that the proposed products comply fully with the contract documents. Each submittal shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked shall be rejected.

Testing

Specify testing in accordance with Design Guideline 260800, Electrical Acceptance Tests. Request approval before specifying testing beyond what is listed in Design Guideline 260800.

Commissioning

Edit and insert Commissioning Master Specification 019100 or 019110 into the project specifications (unless an edited version will be provided by the U-M Commissioning Authority during CD design). Refer to this specification section rather than specifying commissioning requirements in the other specification sections.

Operation and Maintenance Manuals

Edit and insert Master Specification 017823 into the project specifications. Refer to this specification section rather than specifying O&M manual requirements in the other specification sections.

Review and approve Contractor submitted operation and maintenance manuals. These manuals shall be marked to indicate the specific models, sizes, types and options of the systems and equipment that was to be provided. Manuals not so marked shall be rejected.

Training

Refer to Specification 019100 or 019110 when specifying Owner training requirements. Training shall not take place until the Owner's Personnel have been given 2 weeks to review the approved Operation and Maintenance Manuals. The Contractor shall notify the Project Manager 3 working days in advance of training sessions.

Record Drawings

Review and approve Contractor submitted as-built information and provide the information to the University in accordance with Design Guideline 2.4. The drawings shall show the locations of equipment, light fixtures, switches, receptacles and junction boxes, riser information, the sizes of conduits and conductors, circuit numbers, and deviations from the design. Buried, embedded and concealed primary and feeder conduits shall be dimensioned from permanent building features.

Products

Specify products that conform to the applicable standards of the American National Standards Institute (ANSI), the Institute of Electrical and Electronic Engineers (IEEE), the National Electrical Manufacturers Association (NEMA) and the National Fire Protection Association (NFPA).

Specify that products be listed or labeled by a Nationally Recognized Testing Laboratory. When components are combined to form a major assembly, the entire assembly shall be listed or labeled.

Specify multiple manufacturers from the Electrical Trades Preferred Manufacturers List when multiple manufacturers produce products meeting the project requirements.

Do not use the term "Or Equal" or any similar language to specify products or services.

Specify products that are known to have been used with success elsewhere. Do not specify newly developed or unproven products.

When designing new electrical systems, specify major power distribution equipment shall be from one manufacturer. When designing renovations, match the existing equipment where practical.

Specify that equipment and materials shall be provided from the manufacturers specified. Substitutions for specified products shall be acceptable only if proposed and approved in writing before the project is awarded.

During Contractor shop drawing submittal review, approve only those submittals which comply with the project specifications.

Execution

Ensure the following additional Contractor actions are specified in the contract documents.

Temporary Services

Temporary lighting and power shall be provided as specified in the project's Supplemental General Conditions. Project design shall include investigation of proposed power sources, available capacities, and impact on end users. For UMHS projects, contractors shall coordinate temporary power sources with FPD.

Permanent electrical systems or equipment used during construction shall be replaced or cleaned and fully refurbished prior to acceptance by the University.

Lamp and Ballast Recycling

The Contractor shall recycle lamps and ballasts. Insert verbatim into the project specifications the recycling requirements contained in Master Specification 260500.

Quality Assurance

Specify the Contractor shall contact the Owner's Code Inspection Department at (734) 764-2457 before the start of the project to arrange for periodic inspections. Do not specify code inspections by the city of Ann Arbor or any other jurisdiction prior to coordination with Owner's Code Inspection Department.

Specify that electrical systems, equipment and materials shall be tested by an independent testing agency prior to final acceptance of the work. Acceptance tests shall be performed in accordance with applicable codes, standards and manufacturers' instructions. The contractor shall provide written test reports, signed and dated, for all tests prior to acceptance of the electrical equipment by the Owner.

Warranty

Specify that electrical work shall be guaranteed for a period of one year from the date of acceptance of the project by the University. A manufacturer's warranty beginning upon equipment receipt or startup shall be extended to one year from final project acceptance. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.

MEDIUM, LOW AND CONTROL VOLTAGE CABLES

Related Sections

U-M Design Guideline Sections:
[260800 - Electrical Acceptance Tests](#)

Products

Medium Voltage Primary Cables

Primary power distribution cable shall be single conductor stranded copper, with ethylene propylene rubber (EPR) insulation rated 15kV, 90 degrees C, 133 percent insulation level, having a 5 mil thick minimum tape shield with 12-1/2 percent minimum overlap, and polyvinyl chloride (PVC) jacket. Cable shall be suitable for use on a 13.2 kV, 3 phase, 3 wire, ungrounded system. Cable shall be suitable for use in cable trays.

Medium voltage service cables of voltages other than 13.2-kV (2.4kV, 4.8-kV) shall be of the type noted immediately above. The cable and terminations will be provided, and installed, to allow possible, future, conversion of the service to 13.2-kV.

Medium voltage cables serving loads directly at voltages below 13.2-kV (2.4-kV, 4.16-kV, 4.8-kV) shall be single conductor stranded copper, with ethylene propylene rubber (EPR) insulation rated 5kV, 90 degrees C, 133 percent insulation level, and polyvinyl chloride (PVC) jacket. Cable shall be suitable for use on a 5 kV, 3 phase, 3 wire, ungrounded system. Cable shall be suitable for use in cable trays.

Wires and Cables (600 Volts and Below)

Power distribution and lighting wire for indoor use shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type THHN, or THHN/THWN-2 insulation rated 90 degrees C, 600 volts.

Power distribution and lighting wire for outdoor use, for use in parking structures and tunnels, and for underground use in conduits shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type XHHW insulation rated 90 degrees C in dry locations and 75 degrees C in wet locations, 600 volts.

Insulated power cable for use as fire pump supply cables shall be able to pass the two hour fire rated test under UL 2196 test (and shall be so labeled), be NEC Type MI rated 600-volts, and shall be one of the following types:

1. Mineral insulated, single conductor, solid copper conductor, using compressed magnesium oxide insulation, and shall have a liquid and gas tight seamless copper sheath. The cable is NEC Type MI. This cable is Factory Mutual (FM) approved, and

may be used without need for a 'clearance from FM... Install and support as required by manufacturer and Code.

2. Ceramfied silicone insulated (Lifeline), single conductor, stranded copper conductor, cermafied silicone rubber insulated. The cable to be NEC Type RHH. This cable is not FM approved. FM must review each application before giving an approval for that project. Install cable in EMT, and install and support as required by manufacturer and Code

Control wire shall be single conductor stranded copper, No. 14 AWG minimum, with NEC Type THHN, or THHN/THWN-2 insulation rated 90 degrees C, 600 volts.

Instrumentation and special systems wire shall be in accordance with manufacturer's recommendations, but shall not be less than No. 20 AWG.

Execution

Medium Voltage Primary Cables

Cables shall be pulled in lengths not exceeding 500 feet.

Cables shall be pulled using generous amounts of compatible cable pulling lubricant.

AE shall make calculations to insure maximum cable pulling tensions, sidewall pressures and cable bend radii do not exceed manufacturer's instructions.

Cables passing through manholes shall be trained neatly in the same relative position as in the duct bank, without crossing each other, and shall be supported by porcelain or fiberglass insulators attached to manhole cable racks.

Cables shall be identified by numbered tags. Identification numbers and tagging requirements shall be coordinated with the Plant Electric Shop through the Owner's Representative.

Wires and Cables (600 Volts and Below)

All wiring, including low voltage control, telecommunications, and power limited wiring shall be installed in raceways. (Raceways include conduits, ducts, trays, surface raceways, and wireways.) The only exceptions include:

1. NEC Type MI cable.
2. Control wiring at VAV boxes, serving sensors and actuators associated with that VAV box.
3. Type MC Cable serving light fixtures.
4. Type MC cable run in hollow wall cavities

5. Manufacture prepared wiring systems associated with lighting fixtures. An example of this would be, Lithonia 'RELOC'. Said systems shall have a corrugated metal cover.

Wiring of different voltage levels shall be segregated. Wiring of different voltage levels shall not share raceways (except wiring to rooftop receptacles, rooftop motor controls and motor disconnect early break auxiliary contacts may share raceways with motor feeders).

Six hundred (600)-volt power feeder wiring shall be spliced with solderless compression butt splices or ring lugs and terminated with solderless compression ring lugs.

Branch circuit wiring, lighting wiring, and control and instrumentation wiring shall be spliced with wire nut connectors.

Control and instrumentation wiring shall be terminated with solderless compression ring or spade lugs.

NEC Type MI cable shall be supported and protected in accordance with its manufacturer's instructions to maintain its UL fire resistive listing, and shall be spliced and terminated with special fittings from the same manufacturer as the cable.

Home runs of 20 amp branch circuits that exceed 150 feet in length shall be No. 10 AWG wire.

Home runs of 480 volt or 208 volt, 20 amp or 30 amp, single phase branch circuits that feed special receptacles shall be installed using 5 wires. Terminate the spare wires to ground at both ends.

Cables and wires terminated in panels shall be uniquely identified by permanent tags.

The shields of shielded instrumentation and control cables shall be grounded at one end only. The shields at the other end shall be insulated from ground.

Color Coding

All wiring shall be color coded, continuous color coded, or tape color coded at each termination and at each intervening 'box/point. 'If no color coding system exists, Campus circuits shall be color coded as follows:

1. Three Phase Power Over 600 Volts:
 - Phase X(A): Black
 - Phase Y(B): Red
 - Phase Z(C): Blue

2. Three Phase Power 480/277 Volts:
 - Phase X(A): Brown
 - Phase Y(B): Orange
 - Phase Z(C): Yellow
 - Neutral: Gray
 - Ground: Green
3. Three Phase Power 208/120 Volts:
 - Phase X(A): Black
 - Phase Y(B): Red
 - Phase Z(C): Blue
 - Neutral: White
 - Ground: Green
4. Single Phase Power 240/120 Volts:
 - Phase X(A): Black
 - Phase Y(B): Red
 - Neutral: White
 - Ground: Green
5. Fire Alarm Wiring (Being updated and expanded for easier identification):
 - Addressable Device: #18 Shielded Twisted Pair (STP) Red with Black Stripe
 - Horn, Horn/Strobe or ZAM Positive (+) 24 VDC: #14 Red
 - Horn, Horn/Strobe or ZAM Negative (-) 24 VDC: #14 Black
 - Speakers: #18 STP Solid Red
 - Strobe Light Positive (+): #14 Solid Yellow
 - Strobe Light Negative (-): #14 Solid Blue
 - Panel Communications: #18 STP Red with Black Stripe
 - Fireman's Telephone: #18 STP Red with Yellow Stripe
6. Synchronized Clock Wiring:
 - Line: Black
 - Neutral: White
 - Clock Correction: Red
7. Less Than 120 Volts: Use Industry Standard Methods

Site lighting wire insulation shall be in solid colors to match the circuit voltage and phase color code.

All UMHS owned facilities, unless noted otherwise, (University Hospital, THC, etc.) circuits shall be color coded as follows:

1. Three Phase Power Over 600 Volts:
 - Phase X(A): Black
 - Phase Y(B): Red
 - Phase Z(C): Blue

2. Three Phase Power 480/277 Volts:
 - Phase X(A): Red
 - Phase Y(B): Blue
 - Phase Z(C): Black
 - Neutral: Gray
 - Ground: Green

3. Three Phase Power 208/120 Volts:
 - Phase X(A): Yellow
 - Phase Y(B): Orange
 - Phase Z(C): Brown
 - Neutral: White
 - Ground: Green

4. Less Than 120 Volts: Use Industry Standard Methods

GROUNDING AND BONDING FOR ELECTRICAL

Scope

Provide grounding in accordance with the requirements of the NEC, these guidelines, and University Inspection Authorities.

The resistance of the completed ground system for standard installations shall not exceed 5 ohms. If any special equipment being installed requires a lower ground system resistance, that equipment manufacturer's maximum ground resistance shall apply.

The incoming power to the building shall always be considered the building's 'Service' (as defined by NEC Article 230), even if power is from another University facility. Size the bonding conductor in accordance with Article 230.

If equipment being installed requires a special or an isolated ground system, the equipment manufacturer's requirements shall be considered. Single point radial (star) ground systems are acceptable. Avoid providing an isolated ground system unless absolutely necessary to meet a manufacturer's warranty requirements.

When installing a new substation, either in an existing building or in an addition, connect the ground mats of the substations together. Also connect the new substation to building steel, the associated incoming duct bank (when a new duct bank entrance is installed), and to all water services.

Material Requirements

Grounding system conductors making up the grounding mat and associated ground risers, and/or for encasement in concrete shall be No. 4/0 AWG bare, stranded copper.

Ground conductors for all power distribution equipment, end-use equipment and all branch circuits, shall be insulated stranded copper conductors, color coded green or (a continuous) green color with 1 or more yellow stripes. The size shall be in accordance with NEC, except that none shall be smaller than No. 12 AWG.

Underground and concrete encased ground connections, all connections to and a-part-of the main substation grounding bar, and all ground connections to structural steel, shall be made using Cadweld exothermic weld-type connectors, or "Burndy Hyground" connectors.

Exposed ground connections to power generation and distribution equipment shall be made using copper compression ground fittings or compression lugs bolted to the equipment.

Splices and taps of ground conductors No. 8 AWG and larger shall be of the Cadweld exothermic weld type. Tape or coat all exposed splices and taps.

Design Requirements

Extend ground conductors from the ground system to all switchgear, transformers, unit substations, motor controllers, panelboards, control panel ground buses, and ground bars. Equipment rated above 480 volts, or 600 amperes shall be grounded by two independent grounding conductors.

The enclosures of all switchgear, transformers, unit substations, motor controls and panelboards shall be grounded by a separate grounding conductor to the ground system.

Motors rated 460 volts and below shall be securely bonded to the ground system either by means of a stranded copper ground conductor connected to building steel, or by a motor feeder ground conductor. Motors rated above 460 volts shall be bonded by 2 independent ground conductors.

A separate grounding conductor shall be used for all new feeders and branch circuits. Ground underground duct banks for primary or secondary power cables with a No. 4/0 AWG bare stranded copper ground wire that is run within the duct banks and is grounded at both ends.

Conduit shall not be used as the ground conductor.

Ground each manhole with 4 - 3/4 inch diameter by 10 feet long ground rods, one driven inside or outside of the manhole at each corner. Connect the ground rods with a No. 4/0 AWG bare, stranded copper ground wire loop. Pigtails from the ground wire loop shall be used to ground the manhole cover frame, ladder, concrete inserts or cable racks, duct ground wires, and the shields of any primary cables that are spliced in the manhole.

Ground the lightning protection system to separate ground rods. The main ground system shall not be used. Connect the lightning protection ground system, to the main grounding system, after the lightning protection system is completed and tested

Ground instrumentation and electronic devices in accordance with the NEC or the manufacturer's recommendations, whichever is stricter.

Conduits, cable trays and all other raceways shall be grounded/bonded in accordance with the NEC.

The shields of medium-voltage shielded power cables shall be grounded at both ends. The shields of shielded power cables spliced in a manhole shall also be grounded in the manhole.

The shields of shielded instrumentation cables shall have their drain wires grounded at one end only. The shield at the other end of the cables shall be isolated from ground.

Provide protection for ground conductors subject to physical damage or abuse. Where metallic conduit is used for physical protection of a ground conductor, the conductor shall be bonded to the conduit at both ends.

Installation Requirements

Instruct the Contractor to test the grounding in accordance with Section 16950, and to provide the University Project Coordinator with test reports

ELECTRICAL MATERIALS AND METHODS

Scope

Provide raceways for all wiring. All exposed and concealed wiring (including low voltage control, telecommunications, and power limited wiring) shall be installed in raceways.

Provide spare raceways for future use.

- From recessed lighting and receptacle panels, to the above ceiling spaces for future circuits.
- In parking structures for future CCTV cameras and entrance controls.
- In animal rooms, and at environmental rooms, for future environmental monitoring.
- Telecommunications conduits on laboratory benches for future data connections.
- Power and data conduits in wet laboratories for clusters of high-powered computers.

Related Sections

Design Guideline Sections:

[260543 - Underground Services for Electrical Systems](#)

U-M Standard Details:

[260000 Series - Electrical Standard Details](#)

Conduits

Specify 1/2 inch through 4 inch diameter electrical metallic tubing (EMT) for indoor concealed, and exposed installations, not encased in concrete.

Specify galvanized rigid steel conduit or intermediate metal conduit (IMC) for:

- Indoor installations over 4 inches in diameter.
- Indoor installations embedded in concrete.
- Indoor installations of primary power cables and fire pump supply cables. Also encase these conduits in 2 inches (minimum cover) of concrete where they are routed through the building. As an alternative, NEC Type MI cable may be used without raceways for fire pump supply cables, but only with special permission.
- Outdoor installations above ground.

Specify Schedule 40 PVC conduit for installations embedded in concrete, except as noted in Section 16110.

Specify standard wall, fiberglass reinforced epoxy, conduit for installations in parking structures, tunnels and on cooling towers.

Specify flexible metallic conduit for final connections to recessed lighting fixtures. As an alternative, manufactured wiring systems or Type MC cable may be used above accessible ceilings. Manufactured wiring systems or Type MC cable shall not be used above permanent ceilings or in walls.

Specify liquid tight flexible metallic conduit for final connections to transformers, motors and other equipment subject to vibration or removal for maintenance. Final connections to transformers in electrical rooms only may be non-liquid tight flexible metallic conduit.

Connections to recessed power receptacles, and light switches, in areas with accessible ceilings:

- A. In new 'metal stud and gypsum board partitions (walls)', the final connections may be made with type MC cable. This MC cable, shall:
 1. Be run to a box immediately above the accessible ceiling, and the box size shall not exceed 4-11/16" square.
 2. Conduit shall be used for the entire run, from this junction box, to the power source, load (lights), etc.
 3. No more than three circuits may be run through any given junction box.
 4. Individual conductors making up the MC cable shall be stranded copper, with separate grounding conductor, and steel corrugated armor. Individual conductors shall be color coded as required in section 16120.
 5. The MC cable is terminated using UL listed hardware intended for the cable and boxes being used, (and rated for commercial and industrial environments).
 6. The MC cable shall be secured in the wall cavity as required by NEC
 7. The MC cable shall be as short as it is necessary to serve the need and meet the Code
- B. In existing 'metal stud and gypsum board partitions (walls)', where the wall is not being otherwise opened up, the final connections to new devices may be made flexible conduit and standard (separate) conductors. This flexible conduit shall:
 1. Be increased in size as necessary to maintain the proper fill for the wiring to be installed.
 2. Shall be installed and secured as required by NEC.
 3. Shall be as short as it is necessary to serve the need and meet the NEC.
- C. In all other wall types and conditions use standard conduit, of the type appropriate for the wall construction.

Connections to other recessed devices, (including communication outlet boxes, junction or pull boxes, etc) shall be with standard conduit of the type appropriate for the wall construction
Cable Trays

Specify ladder-type cable trays for:

- Telecommunications cables in telecommunication rooms, in laboratories, and corridors with open or accessible ceilings, and under computer room raised floors.
- Avoid installing cable trays in air plenum spaces.
- Overhead primary cables within substation rooms.

- Provide rollouts or vertical drops for routing the cables into the substation's primary switches.

Avoid specifying center spline cable trays, except where obstructions or support restrictions make installation of ladder cable tray impractical.

Surface Raceways

Where conduits cannot be concealed, specify metallic or plastic surface raceways for indoor exposed installations in finished areas to feed surface mounted outlets.

Boxes

Specify sheet steel switch and outlet boxes for use with EMT, and cast or malleable iron boxes for use with galvanized rigid steel conduit and IMC.

Specify PVC boxes for use with PVC and fiberglass reinforced epoxy conduit.

Specify compatible boxes, from the same manufacturer and of the same product line, for use with surface raceway installations.

Products

Conduits

Electrical metallic tubing shall be thin wall steel tubing, electro-galvanized or hot dipped galvanized inside and outside. Fittings and bushings shall be galvanized steel setscrew type connectors. Conduits 2" and larger will have fittings and bushings with two screw connectors.

Galvanized rigid steel conduit and intermediate metal conduit shall be hot dipped galvanized inside and outside, in 10' lengths and threaded on both ends. Fittings and bushings shall be threaded, cast or malleable iron, and hot dipped galvanized inside and outside.

PVC conduit and fittings shall be Schedule 40 and UL Labeled for 90 degrees C cables. Fittings shall be Schedule 40, solvent type, and from the same manufacturer as the conduit.

Fiberglass reinforced epoxy (FRE type) conduit shall be standard wall thickness, iron pipe size, sunlight resistant, and gray or black color. Fittings shall typically be push-fit on straight sections and solvent type at fittings and boxes. Connections of FRE conduit to PVC boxes shall be made with solvent type threaded fittings. Fittings shall be from the same manufacturer as the conduit.

Flexible metallic conduit shall be galvanized steel or aluminum. Fittings shall be of steel with cadmium or galvanized finish. Fittings shall be machine screw clamp type, single or two-piece. Self-locking, twist-in type fittings are not acceptable.

Liquid tight flexible metallic conduit shall consist of a flexible, galvanized steel core, a continuous copper ground strip and a polyvinyl chloride jacket. Fittings shall be steel liquid tight grounding type and from the same manufacturer as the conduit.

Cable Trays

Ladder type cable trays shall be aluminum with a 4-inch (minimum) rail height, and 9 inch maximum rung spacing. Rungs shall provide a flat surface for cable support of at least 5/8". The tray with a 10' span shall be capable of sustaining a working load of 75pounds per lineal foot (50 pounds of cable per foot, plus a 250 pound person sitting at mid-span), with a load deflection of 1.0 inch maximum when tested in accordance with NEMA VE1-3.01. 'Fittings' shall be from the same manufacturer and product line as the tray, and shall also have a 9-inch maximum rung spacing, and a 12-inch minimum bend radius. The side rail (or equivalent) shall be continuous through the 'fittings'. Preferred, but not required, are pre-drilled mounting holes on the upper surface of the side rails - will facilitate conduit terminations at the tray

Center spline cable tray (when allowed) shall be aluminum with top mounted rungs, 3 inch (minimum) load depth, 3/4" inch minimum (flat) rung width, and 9 inch maximum rung spacing. The tray with a 10' span shall be capable of sustaining a working load of 75 pounds per lineal foot (50 pounds of cable per foot, plus a 250 pound person sitting at mid-span), with a load deflection of 1.0 inch maximum when tested in accordance with NEMA VE1-3.01. Fittings shall be from the same manufacturer and product line as the tray, and shall have a 3/4" inch minimum rung width, a 9 inch maximum rung spacing, and a 12 inch minimum bend radius.

Tray fasteners shall be galvanized or zinc plated steel; and shall be configured and installed so no sharp, or threaded surfaces, protrude in the 'cable space'.

Surface Raceways

Surface raceways shall consist of a base and cover of .040-inch thick minimum zinc plated or galvanized steel, or PVC, sized for the number of conductors contained within. Complete the installation with all connectors, fittings, bushings, boxes, covers and mounting hardware from the same manufacturer. All materials for a given location shall be of same color; with the color specified being one of the manufacturer's standard finishes.

Provide barriers to separate conductors of different voltages, or services.

Surface raceways shall be sized so that the installed wiring does not exceed NEC specified fills, and the minimum bend radius of the installed wiring is not violated - even at outlet box locations. [The telecommunication wiring will be Category 5E (4 pair), Category 6 (4 pair cable) and/or fiber strands, all to be installed without violating their minimum bend radius.]

Owner Installed Telecommunication Wiring

When calculating raceway fills, for telecommunication raceways assume 3, 4-pair, cables to each telecommunication outlet. This is the standard currently being used by the University

Boxes

Fixture, switch, outlet, splice and wire pulling boxes shall be cast or formed from carbon steel sheets of commercial grade steel not less than 14 gauge. Boxes shall be of one-piece construction, zinc or cadmium plated. Boxes shall be tapped for installing covers and plates as required.

Steel pull and junction boxes shall be rated NEMA 1 indoors, or NEMA 3R minimum outdoors, fabricated from galvanized or painted code gauge cold rolled carbon steel sheets. Boxes shall be of welded construction with flat, removable covers. Box covers shall be fastened in place by machine screws or hinges and latches. Self-tapping or sheet metal screws are not acceptable.

PVC pull and junction boxes shall be rated NEMA 3R minimum, molded in one piece, with integral mounting feet and flat, gasketed, removable covers. Box covers shall be fastened in place by machine screws. Self-tapping or sheet metal screws are not acceptable.

Supports

Hangers and brackets shall be made of steel pipe, channel iron, angle iron or prefabricated steel channel, and shall be galvanized or painted.

Hangers shall be of sufficient strength, and spaced, such that their deflection at any point does not exceed 1/240 of the hanger span length after the supported equipment, conduits, cable tray and cables are installed.

Anchors for heavy and large loads, mounted to gypsum board, hollow tile, block, or similar surfaces, shall be toggle bolt type. Install metal backer plates as needed for concentrated, or extra heavy, loads to be mounted to gypsum board walls. For heavy or large loads mounted to solid surfaces, use metal expansion, or epoxy anchors. Use lead shield anchors, or plastic expansion anchors, for supporting smaller loads. Powder-driven anchors shall not be used.

Execution

Raceways

Minimum power and control conduit size shall be 1/2 inch. Minimum telecommunications conduit size shall be 1 inch.

All medium (primary) voltage raceways, and any other raceways above 4", shall be rigid.

FRE raceways and PVC boxes shall be used in parking structures, tunnels, cooling tower enclosures, and all other areas with high humidity and/or corrosive environments. Tunnel sections passing through building mechanical rooms (and other related areas) are not exempted from these requirements even if non-FRE conduits are currently present.

Conduits in finished areas shall be concealed wherever possible and practical. When conduits cannot be concealed in finished areas, surface raceways shall be used.

Concealed and exposed raceways shall be installed parallel to or at right angles to building lines. Surface raceways shall be installed as close to room corners or trim features as possible to make the surface raceways less obvious. Use the surface raceway to route the wiring to a junction box above the finished ceiling whenever possible.

In renovation areas, with existing gypsum board walls, flexible conduit may be used from the new outlet box in the wall, to a junction box mounted on the wall immediately above the accessible ceiling. Size flex raceway to maintain equivalent cross-sectional area.

Raceways and other electrical equipment shall be separated from steam pipes, hot water pipes, and other hot surfaces by a minimum of 4 inch horizontally or 12 inch vertically.

Raceways and other electrical equipment shall be separated from ductwork and pipes so that they do not come into contact with each other.

Low voltage signal circuits shall be separated, or shielded, from power circuits to prevent the induction of noise into the signal circuits.

Raceway fittings and bends shall have bend radii greater than the minimum bend radii of the cables enclosed.

Metal raceways, fittings, boxes and enclosures shall be mechanically joined together to form a continuous electrical conductor providing effective electrical grounding continuity. This requirement, does not, however, negate the Guideline requirement for separate grounding conductors for all power circuits (as defined in Guideline Section 16450)

Raceway expansion fittings shall be provided at the intervals specified by the manufacturer, and all building expansion joints.

Directional changes in primary conduits above ground shall be made with 3' minimum radius sweeps and long radius elbows. Those underground shall be with 20' minimum radius bends.

Conduits entering panels located outdoors, in parking structures, in steam tunnels and on cooling towers shall enter from the sides, back, or bottom. Conduits shall not enter from the top.

Weep holes shall be drilled in the bottom of all switch and outlet boxes installed in parking structures and tunnels.

Mounting Heights

Equipment and devices shall be installed at the following heights:

- Receptacles (Wall): 18" A.F.F. to center
- Receptacles (Above Counter): 48" A.F.F. to center
- Receptacles (Unfinished Area): 48" A.F.F. to center
- Surface Raceway Receptacle Strips: 42" A.F.F. to bottom (unless noted otherwise)
- Light Switches: 48" A.F.F. to center
- Telephone Outlets (Wall Phone): 54" A.F.F. to center

- Telephone/Data Outlets: 18" A.F.F. to center
- Clock Outlets: 88" A.F.F. to center
- Fire Alarm Pull Stations: 48" A.F.F. to center
- Fire Alarm Horn/Strobes: 80" A.F.F. to bottom or 6" below ceiling (whichever is lower)
- Card Readers: 48" A.F.F. to card slot
- Security System Controls: 48" A.F.F. to center
- Thermostats/HVAC Controls: 48" A.F.F. to center
- Electrical Panels: 72" A.F.F. to top
- Safety Switches/Motor Starters: 72" A.F.F. to top (except top of handle shall not exceed 78" A.F.F.)
- Motor Control Switches/Pushbuttons: 60" A.F.F. to center

Supports

Electrical equipment and raceways shall be supported independently of supports provided by other trades.

Equipment (other than conduit) to be surface mounted to masonry or concrete walls shall first be secured to steel channels that in turn are mounted to the wall. Do not mount the equipment directly to masonry or concrete.

Equipment to be surface mounted on other wall surfaces may be directly mounted to the wall, unless the equipment's load exceeds the strength of the wall material. Where weight exceed wall capability, in finished areas, install steel backer plate in the wall. In unfinished areas install steel channels as noted above to spread the load.

Floor mounted equipment shall be secured to 4 inch thick concrete housekeeping pads. Pads to be sized 4 to 6 inches longer, than equipments length and width. Bevel edge of pads, and reinforce as appropriate.

Conduits and boxes shall be supported using steel conduit straps or 1/4-inch minimum diameter threaded rod hangers. Conduits shall be supported at intervals not exceeding 10 feet. Suspended ceiling hangers or hanger wire shall not be used (except to support manufactured wiring system cables and Type MC cables).

Cable trays shall be supported with support brackets or 3/8-inch diameter minimum threaded rod hangers at intervals not exceeding 8 feet for straight runs. Additional supports shall be provided at tray fittings.

Flexible metallic conduit to motors and similar equipment shall not exceed 3 feet in length, and shall have adequate slack to absorb the maximum vibration.

Flexible metallic conduit to lighting fixtures shall not exceed 6 feet in length. Place box and flex conduit so the light fixture can be lifted out of accessible ceilings when required, and/or long enough to place fixture in adjacent 'tile' location

Flexible metallic conduits, and manufactured wiring system cables, shall be routed parallel to or perpendicular to building lines, in a neat and workmanlike manner. Any excess cable shall be coiled and supported independently of the ceiling grid system at intervals not exceeding 3 feet. Said cables shall not lie on the ceiling tiles. These same requirements shall apply to cables placed below raised floors.

Penetrations, Sleeves and Seals

Scanning for electrical conduits shall be performed prior to core drilling concrete floors.

- Use a Hilti Ferrosan or similar impulse induction type scanner capable of detecting both metallic conduits and copper wires in PVC conduits. Tracers that scan for energized cables or that scan for injected high frequency signals are not acceptable.
- Notify the Owner's Inspection Department prior to all tests.
- Prior to core drilling, arrange for the Owner's Representative to notify building occupants of the potential for an unscheduled power outage.
- Conduits damaged during core drilling shall be restored immediately at the Contractor's expense.
- Penetrations shall be cut neatly and to the minimum size required for installation of the equipment and raceways.

Galvanized steel pipe sleeves shall be provided for conduits penetrating floors, exterior walls and roofs. As an alternative in floors, a Hilti CP680 Cast-In Firestop Device may be used.

- Extend floor sleeves above the floor a minimum of 2 inches.
- Embed sleeves in new concrete or step-core concrete and grout sleeves into existing concrete with epoxy grout.
- Seal floor sleeves using fire-sealing systems approved by a Nationally Recognized Testing Laboratory.
- Seal exterior wall and roof penetrations water tight.

Conduit penetrations in walls shall be patched on both sides to seal against the passage of air, sound, smoke, and fire.

- Seal conduit penetrations in fire rated walls using fire-sealing systems approved by a Nationally Recognized Testing Laboratory.
- Seal conduit penetrations in non-rated walls using masonry materials that match the wall construction.

Cable tray penetrations in fire rated walls shall be sealed using fire sealant bag or brick systems approved by a Nationally Recognized Testing Laboratory.

Recessed outlet boxes, located less than 24 inches apart, on opposite sides of a fire rated wall, with box openings over 16 square inches, shall both be fire sealed.

Identification

Systems and equipment shall be provided with nameplates indicating their name or number, and power source. Nameplates shall be engraved 1/8-inch thick plastic with black letters on a white background, and letters at least 1/4 inch high. Nameplates shall be attached with a minimum of two mechanical fasteners such as sheet metal screws or bolts and nuts. Embossed plastic tape labels are not acceptable.

Receptacle and switch plates shall be labeled to indicated panel and circuit serving the device. Also mark the same circuit information, inside the outlet box, using indelible ink. "Black on clear Dymo", tape markers, are acceptable for this requirement

Junction boxes and box covers of special circuits shall be color coded as follows:

- Emergency power and Fire Alarm Circuits: Red Paint
- Temperature Control Circuits: Blue Paint
- Clock Circuits: Orange Paint

Junction box covers shall be marked in indelible ink, with the panel name, and breaker numbers of the circuits contained within.

Conduits and cables in the University tunnel system shall be banded at major changes in direction, junctions, entrances to buildings and every 25 ft on straight runs. Banding shall be tape similar to Scotch #33 electrical tape, which is suitable for high temperatures.

- Electrical Power: Red
- Clock System: Red with Purple
- Radio System: Red with Silver
- Computer System: Red with Yellow
- High Voltage: Red

DESIGN GUIDELINE 260543 **UNDERGROUND SERVICES FOR ELECTRICAL SYSTEMS**

Scope

This guideline defines the requirements and standards for design of underground electrical and telecommunication pathway systems.

The guideline covers concrete encased duct banks and manholes for primary (medium voltage) power distribution cables and telecommunications cables.

Also included are direct buried ducts for secondary power cables, site lighting cables, and dedicated telecommunications circuits.

Related Sections

U-M Design Guideline Sections:

- [6.3 DG 260526 - Grounding and Bonding for Electrical](#)
- [6.3 DG 260533 – Electrical Materials and Methods](#)
- [6.3 DG 260533 – Medium Voltage Electrical Distribution](#)
- [6.3 DG 265600 - Exterior Lighting](#)

U-M Master Specification Sections:

- [7.1 MS 033053 - Miscellaneous Cast-in-Place Concrete](#)

U-M Standard Details:

- [260000 Series - Electrical Standard Details](#)

Design Requirements

Use U-M Master Specification 260543, “Underground Services for Electrical Systems” as basis for design and specifying underground electrical and telecommunication pathway systems. Edit the specification and details to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

Underground Ducts

Slope duct banks downward, toward manholes, and away from buildings and tunnels, a minimum of 6 inches per 100 feet. Duct banks shall not route water from manholes into buildings or tunnels, or contain traps between manholes where water may accumulate.

Horizontal directional changes and sloping vertical changes in duct banks shall be made with 20’-0” minimum radius bends. Where this radius cannot be accommodated, perform detailed pulling tension and sidewall pressure calculations, to ensure compliance with cable manufacturer’s recommendations. Vertical directional changes in duct banks up into buildings shall have a minimum 6’-0 radius.

Duct banks and direct buried ducts shall be supported on undisturbed soil or on piers extending down to undisturbed soil.

Where power and telecommunications duct banks run in parallel, they shall be separated by a minimum of 12 inches of soil or concrete - vertically and/or horizontally. If the services need to be placed one upon the other the (vertically stacked), the power ducts shall be above the telecommunications ducts. Where UM duct banks are located within the Right of Way, a minimum separation of 36" from other utilities may be required. Verify with city of Ann Arbor requirements.

Ground primary power duct banks with a No. 4/0 AWG bare stranded copper ground wire that is run within the duct bank and is grounded at both ends. Direct buried ducts shall be grounded by insulated, stranded copper ground wires installed in each duct. Telecommunications duct banks do not require grounding.

Place marker tape approximately 12 inches above duct banks or direct buried ducts for the entire length of the duct run. Marker tape shall be plastic, vinyl, or Mylar, 6 inches wide, red for electrical power and orange for telecommunications, and labeled to indicate the type of circuit buried below.

Contractor shall cleanout ducts, using a solid mandrel and a stiff bristled brush, prior to cable pulling (3-1/4" mandrel for 4" ducts and 4" mandrel for 5" ducts). Leave a pulling string in the duct when cleanout is complete. This will serve as the duct identification on both ends of the run.

Concrete Encased Ducts

Specify Type DB PVC conduit for concrete encased duct banks.

PVC conduit for concrete encasement shall be Type DB, 4-inch diameter minimum, UL Labeled for 90 degrees C cables. Fittings shall be Type DB, solvent type, and from the same manufacturer as the conduit.

Primary power duct banks shall include No. 4 steel reinforcing bars. Telecommunications duct banks do not require steel reinforcing.

Prior to concrete encasement, ducts, reinforcing steel and ground wires shall be secured with nonmetallic straps or cable ties to nonmetallic duct spacers at intervals not exceeding 8 feet. Duct spacers shall be sized for the ducts being held, and shall provide the minimum spacing between ducts required for concrete flow and by the NEC. Duct spacers shall be anchored to the ground using nonmetallic bands and stakes.

Duct banks shall have a minimum of 3 inches of concrete cover on all sides.

Concrete shall have a minimum strength of 3,000 psi at 28 days.

Always provide spare ducts in concrete encased duct banks.

Direct Buried Ducts

Specify Schedule 40 PVC conduit for direct buried ducts, except where galvanized rigid steel conduit is required for strength or due to inadequate cover.

PVC conduit for direct burial shall be Schedule 40, UL Labeled for 90 degrees C cables. Fittings shall be Schedule 40, solvent type, and from the same manufacturer as the conduit.

Direct buried ducts and fittings shall have bend radii greater than the minimum bend radii of the cables enclosed, and shall not be smaller than the radii of standard manufactured elbows.

Route direct buried ducts at right angles to building lines and site features, and as close to curbs and sidewalks as possible to avoid interferences with future landscaping.

Where direct buried PVC ducts cannot be buried deep enough to meet the NEC minimum cover requirements, rigid steel conduits shall be installed instead, or a concrete cover shall be poured over the ducts.

When installing direct buried ducts under sidewalks, walkways and other paved areas, install a least one additional 6" PVC sleeve for installation of future ducts without the need to re-open the paved area.

Sleeves

Under roadways, driveways, parking lots and sidewalks, and all other paved areas, specify Schedule 40 PVC conduit sleeves to enclose direct buried ducts.

Sleeves shall be Schedule 40 PVC conduit, 6-inch diameter, UL Labeled for 90 degrees C cables. Couplings shall be Schedule 40, solvent type, and from the same manufacturer as the conduit.

Sleeves shall be buried at a minimum depth of 24" to their top. Sleeves shall extend a minimum of 12" beyond the paved areas they pass under.

Spare sleeves shall be taped closed at both ends with duct tape.

Ends of spare sleeves shall be marked with steel stakes, pipes or conduits that are 3' long minimum, driven vertically down at the sleeve ends to a depth of 6" below grade to their top.

A marker tape shall be buried in the backfill approximately 12 inches above the sleeves for the entire length of the sleeves.

Manholes and Pull Boxes

Specify reinforced concrete manholes where required for the following:

1. Satisfy cable routing needs, to control pulling tensions, and for cable splicing.

2. Keep duct lengths to 400 feet or less on straight runs. Longer runs are acceptable only when calculations are completed showing that pulling tensions and sidewall pressures are not exceeded in the longer pull.
3. Keep the maximum amount of bends between manholes to no more than 180 degrees.
 - a. When bends are present, the maximum length of the duct must be appropriately reduced so the limiting (maximum) pulling tension and maximum sidewall pressures of the cables are not exceeded.
 - b. Designer shall do sufficient calculations to ensure that the two, above noted, limiting factors are not violated.

Specify pre-cast polymer pull boxes, only in owner-approved locations, where adequate space does not exist for the installation of manholes.

Manholes and pull boxes shall be accessible on at least three sides by trucks, cable reel trailers, and other cable pulling equipment.

Manholes - General

Manholes shall be precast, or cast in place, and shall be steel reinforced as needed, to achieve an MDOT highway loading of H-20.

Provide a cast iron frame with cover, a galvanized steel ladder, and galvanized pulling eyes embedded in the concrete opposite each duct entrance and in the floor beneath the cover.

Provide a sealed depression in the floor offset slightly from the center, for installation of a portable sump pump. Drains shall not be installed in floors.

Manholes placed in 'green-belts' and like areas shall have manhole covers with a lighter duty rating (the manholes themselves and the 'ring', however, are the same as required for the MDOT, H-20 rating)

All duct entries into manholes shall include provisions for bell end fittings and a means to securing the duct bank(s) to the manhole wall

1. Precast, or cast-in-place, manholes shall be delivered (or constructed) with the ducts openings cast in place.
2. Provisions for known future ducts shall have knockouts installed, with the bell end fittings included.
3. When installing multiple new ducts into manholes without proper knockouts, cut an opening in the manhole wall, rework steel reinforcing, and install ducts, all in accordance with the associated U of M standard detail.
4. Alternately, when installing multiple new ducts into manholes without proper knockouts, the duct openings may be core drilled at the proper locations. The diameter of the corings, however, shall be 2" to 4" larger than the duct being installed. This larger opening will allow proper grouting of the ducts and bell ends into the manhole wall.

Provide bell end fittings on ducts where the ducts enter manholes. Note that the use of a coupling on the end of a length of PVC pipe, is not the equivalent of a bell end fitting - only true 'bell end fittings' shall be used to meet this requirement. The duct(s) and associated bell end fittings shall be securely grouted into the wall of the manhole.

Where duct banks enter manholes or buildings, they shall be constructed as an integral part of the wall. (Do not core-drill the wall and then install end bell fittings to the edge of core-drilled hole without prior written approval from the U-M Primary Systems Engineer.) Duct bank shall extend to the inside surfaces of the walls, and the duct bank reinforcing shall be integrated with the wall reinforcing.

Ducts shall enter telecommunications manholes on the short sides only. Ducts may enter primary manholes on any side, but should be positioned to permit installation of additional ducts in the future. Ducts should enter as perpendicular to the wall surface as possible.

Ground splices and connections at manholes and pull boxes, where required, shall be exothermic welds, or copper (or bronze) compression ground fittings, or bolted compression ground fittings.

Concrete shall have a minimum strength of 3,000 psi at 28 days.

Electrical Power Manholes

Electric power manholes shall have inside dimensions of 10 feet long by 10 feet wide by 7 feet high. Duct entry points shall be offset from the center of the wall to allow easier training of the cables along the walls of the manhole.

Provide a grounding system for each manhole and connect this to grounds run with power duct banks. Make all grounding system connections using exothermic welds, or copper (or bronze) fittings as manufactured by Burndy Hyground System.

The frame and 36" cover for electrical power manholes shall be East Jordan Iron Works 1580C with lettering, "UM ELEC".

Electric power manholes shall be equipped with 3 Aickenstrut (non-metallic) stanchions per wall, each bolted to the wall with stainless steel Rawl bolts. Each stanchion shall be fitted with one Aickenstrut (non-metallic) cable support arm.

The typical medium voltage feeder being installed is composed of 3-1/C, 350 kcmil copper, 15kV (ungrounded) cables, with tape shields, and EPR insulation rated for 133% of the 15kV nominal rating.

Ground electric power manholes with four, ¾ inch diameter by 10 foot long, ground rods, one driven inside of the manhole at each corner. Connect the ground rods and any duct bank ground conductors together with a No. 4/0 AWG bare, stranded copper ground wire loop. A No. 2 AWG bare stranded copper pigtail from the ground wire loop shall be used to ground the manhole cover frame, ladder support bracket, any metallic concrete inserts and metallic cable racks, and the shields of any cables that are spliced are to be grounded in the manhole.

Telecommunication Manholes

Telecommunications manholes shall have inside dimensions of 12 feet long by 6 feet wide by 7 feet high. Duct entry points shall be offset from the center of the wall to allow easier training of the cables along the walls of the manhole. Ducts shall only enter on the shorter end walls, not on the long walls. The frame and 27" cover for telecommunications manholes shall be East Jordan Iron Works 1805 with the lettering, "UM TELECOM".

Telecommunications manholes shall contain seven full height vertical concrete inserts in each long wall, and two in each short wall. Inserts shall be 1-5/8 inch hot dipped galvanized Unistrut type channel or Aickenstrut nonmetallic channel of equal size and strength. Corner inserts shall be equipped with 12 inch corner brackets and side inserts shall be equipped with 3 inch side brackets to support full height perforated cable support racks. Each long wall shall also be equipped with 2 copper ground bus bars, 6 inches long by 2 inches wide by 1/4 inch thick, on 2 inch metal stand-offs bolted to the concrete.

Pull boxes

Pull boxes and covers shall be precast polymer concrete or polymer foam, heavy-duty rated, bottomless, with a single piece cover. Pull boxes shall be one size larger than required to loop cables out of the opening and back in again without exceeding the minimum bend radii of the cables. Covers shall be engraved "UM ELECTRIC", "UM TELEPHONE", or "UM OUTSIDE LIGHTING" as applicable, and attached with pentahead stainless steel bolts.

Pull boxes shall be located in mulched areas wherever possible and shall be level with the existing grade.

Provide barriers in pull boxes containing circuits of two different voltages, or containing both power and telecommunications circuits.

Excavation and Backfill

Miss Dig shall be contacted at (800) 482-7171 before performing any excavation work.

Manholes shall be installed on a base of pea gravel or MDOT Class II sand at least 12 inches deep. Pull boxes shall be installed on a base of pea gravel or MDOT Class II sand at least 6 inches deep.

Provide barricades around open holes and trenches, temporary bridges over trenches cut through major sidewalk routes. Major sidewalk routes shall not be closed to pedestrian traffic.

Trees, shrubs and plantings in the area of excavation shall be removed by the Plant Grounds Department in advance. Provide barriers to protect landscaping adjacent to the excavation area.

Remove rocks, concrete, or other debris encountered during excavation.

Where sidewalk sections must be removed for installation of underground ducts, remove the sidewalk sections (flags) completely from joint to joint.

Cut asphalt to be removed for installation of underground ducts, in two, straight, parallel lines.

Backfill excavations in 6 inch layers and mechanically compact to 98 percent compaction. Excavated materials may be used as backfill only if the backfill is sand or clean dirt that is free of rocks and debris over 3/4 inches in diameter. Dispose of clay, rocks, concrete and other debris, and replace with MDOT Class II sand.

In landscaped areas, backfill and mechanically compact to a depth of 6 inches below grade. Backfill the last 6 inches with clean topsoil, and reseed affected lawn areas.

Restore concrete sidewalks and asphalt in accordance with University Guidelines.

Quality Assurance

U-M Code Inspection Department (EHS) shall be contacted before pouring concrete and before backfilling excavations.

ELECTRICAL ACCEPTANCE TESTS

Scope

This guideline defines the standard tests that all electrical systems and equipment must pass prior to final acceptance by the University. These tests are in addition to acceptance tests specified by equipment manufacturers or defined in the other Design Guidelines sections. Obtain permission through the Design Manager before specifying tests less than or in excess of these tests.

References

ANSI/NETA ATS, “Standard for Acceptance Testing Specifications”
NFPA 70, “National Electrical Code”
NFPA 72, “National Fire Alarm Code”

General

Acceptance tests shall be performed in accordance with the current version of ANSI/NETA ATS and by an independent testing agency. Specify only the independent testing agencies listed in the latest Electrical Trades Preferred Manufacturers List.

Tests shall be performed in accordance with applicable codes, standards, and equipment manufacturers' instructions.

The Contractor shall provide all test equipment, materials and labor necessary to perform the tests, and shall coordinate with the other trades for necessary services, such as scaffolding and the uncoupling of motors.

Tests shall consist of visual inspections, manual operations, and electrical testing under all normal and expected abnormal operating conditions.

The Owner shall be notified at least 3 working days in advance of all tests.

Tests shall be witnessed by the Owner unless such witnessing is waived in writing.

The Owner shall be provided with a written test report, signed and dated, for all tests.

Testing Criteria

High potential tests shall be performed at the AC or DC voltage listed in ASNI/NETA ATS unless specified otherwise herein. Do not perform more than one high potential test on any item without authorization from the Owner.

Dielectric absorption tests shall be performed with a 2,500 volt DC megger.

Megger tests shall be performed at a DC voltage of 1,000 volts for 600 volt rated equipment, and at a DC voltage of 500 volts for 120-300 volt rated equipment.

Continuity checks shall be performed with a low voltage DC meter, light or bell.

The resistance to ground shall be measured using either the three point method or the fall-of-potential method.

Test instruments shall be calibrated to national standards to insure the accuracy of tests. These calibration reports shall be made available to the Owner when requested. Depending upon frequency of use, the instruments shall be calibrated at least every 12 months.

Visual Inspections

Prior to manual operation and electrical testing, verify the following:

- The equipment complies with the contract documents and the shop drawing submittals.
- The equipment is completely and properly installed according to the contract documents and the manufacturer's instructions.
- Adequate working space exists around the equipment to fully open doors and access panels, and to access all components that require maintenance.
- The equipment is free from damage and defects.
- Shipping blocks and restraints have been removed.
- The equipment has been aligned.
- The equipment has been lubricated.
- The ventilation louvers are open and unobstructed.
- Electrical connections have been tightened.
- Voltages, phases, and rotation have been identified.
- Terminations have been identified.
- Equipment labels have been installed.
- The equipment has been calibrated.
- The equipment is ready to be electrically tested.

Manual Operations

Prior to electrical testing, verify the following:

- Mechanical components operate smoothly and freely.

- Mechanical stops, limit switches, etc., are properly adjusted.

Electrical Acceptance Tests

Duct Banks

A stiff bristled brush shall be pulled through each duct to clean out dirt and debris.

A solid mandrel rated for the inside diameter of the ducts and at least 5 inches long shall be pulled through each duct to verify the absence of kinks, flat spots, and other obstructions. The Owner may require the use of the Owner's mandrel.

Medium Voltage Primary Cables

A continuity test, a 2,500 volt DC megger test, a DC high potential test, and a second 2,500 volt DC megger test shall be performed on 15 kV primary cables after the cables have been spliced or terminated. The high potential test shall be performed at 45kV on new cable installations and at 30kV on existing installations or when new cable has been spliced to existing cable.

600 Volt Power Cables

A continuity check and a 1,000 volt DC megger test shall be performed on 600 volt power cables No. 4 AWG and larger. The megger test shall be performed between each pair of conductors and from each conductor to ground. Each test shall be performed for 15 seconds or until the insulation resistance value stabilizes.

The insulation resistance between conductors, and from each conductor to ground, shall be 100 megohms minimum in one minute or less. In addition, the lowest insulation resistance value shall not differ from the highest value by more than 20 percent. If all megger readings for a given circuit are above 1000-megohms, the 20 percent balance requirement may be waived.

Control Cables

A continuity check shall be performed on control and instrumentation wiring.

Substation Primary Switches

A continuity check, a 2,500 volt DC megger test, and a 37 kV DC high potential test shall be performed on primary switches.

Substation Transformers

A DC megger test and a turns ratio test shall be performed on unit substation transformers. The DC megger test shall be performed at 2,500 volts on coils rated over 600 volts, and at 1,000 volts on coils rated 600 volts and below. A turns ratio test shall be performed on each tap.

Verify proper setting and operation of the fan control panel to insure it and the fans are operable and functional. Temperature test the probes in each winding.

Substation Secondary Switchgear

A continuity check and a 1,000 volt DC megger test shall be performed on the buses and on the main, tie, and feeder breakers.

A ducter (contact resistance) test shall be performed on main, tie, and feeder breakers in unit-substations. Maximum readings shall not exceed manufacturer limits.

The overcurrent devices of substation breakers with electronic trip units shall be tested using the primary current injection method. Secondary current injection shall not be used.

Molded case circuit breakers with thermal/magnet trips shall not be primary current injection tested.

A 1,000 volt DC megger test and a turns ratio test shall be performed on CT's and PT's.

The metering shall be calibrated.

Engine-Generators and Automatic Transfer Switches

A continuity check and 1,000 volt DC megger test shall be performed on the generator windings, generator circuit breaker, power circuit portions of the automatic transfer switches, and the interconnecting power circuit wiring.

A continuity check shall be performed on the control wiring.

The metering and time delay relays shall be calibrated and tested.

The manufacturer's recommended normal start-up testing shall be performed.

A load bank test shall be performed on the generator with a load bank rated at 100 percent of full generator output for a period of at least 120 minutes.

If the engine is natural gas fueled and Compliant Capable rather than Certified as defined in EPA 2009 NSPS emissions standards, an EPA Initial Performance Test shall be performed. This test shall consist of three separate 1 hour runs at close to full load. It shall be performed in accordance with EPA test requirements, and the measured emissions shall be within EPA limits.

Normal power shall be shut off to each automatic transfer switch, one at a time. Each time the engine-generator shall start and the automatic transfer switches shall function according to the design intent.

Normal power shall be returned to the automatic transfer switches. The automatic transfer switches shall return to normal power and the engine-generator shall shut down according to the design intent.

Normal power shall be shut off to the entire building. The engine-generator shall start and the automatic transfer switches shall function according to the design intent. Normal power shall be returned. The automatic transfer switches shall return to normal power and the engine-generator shall shut down according to the design intent.

The generator shall be tested for voltage and frequency stability. The automatic transfer switches shall be used to apply load to the generator according to the worst case step loading sequence defined in the generator specification. The generator voltage and frequency shall remain within the values listed in the generator specification.

The ATS maintenance bypass switches shall be inspected for proper labeling and tested for proper operation in all modes.

The generator and automatic transfer switch controls, gauges, status indicators, and alarms, including remote annunciators and devices in the Fire Command Center, shall be tested for proper operation.

Alarm outputs to the fire alarm and BAS systems shall be verified.

Transformers, Reactors, Switchboards, Panelboards, and Motor Control Equipment

A continuity check and a 1,000 volt DC megger test shall be performed on distribution and isolation transformers, and on line reactors.

A 1,000 volt DC megger test shall be performed on buses, motor starters, circuit breakers, and disconnect switches. This test may be combined with the power cable megger test by testing the devices and terminated cables together.

A continuity check shall be performed on motor control circuits and control panel internal wiring.

An operational test shall be performed on the motor controls.

Motor heater sizes shall be checked for proper size.

Motors

A 1,000 volt megger test shall be performed on 460 volt motors. A 500 volt megger test shall be performed on 200 volt and 120 volt motors.

Motors shall be “bumped” to verify proper direction of rotation.

Motors shall be run to verify proper ampere draw and to verify vibration and heating are within required limits.

The Electrical Contractor shall assist the Temperature Control Contractor and the Mechanical Contractor and insure proper operation of safeties, interlocks and motor controls.

Capacitors

Capacitors shall be inspected for proper fuses before testing. A 1,000 volt DC megger test shall be performed on 460 volt capacitors, and a 500 volt megger test shall be performed on 200/240 volt capacitors. After each megger test, proper discharge shall be checked.

Grounding

The resistance to ground of each ground rod in a ground mat shall be measured before connection to the other ground rods. The resistance shall not exceed 10 ohms. If the reading exceeds 10 ohms, add one extension and drive it another 10 feet. Further testing of that rod is not needed.

The resistance to ground of the total ground system shall be measured with all connections completed. The resistance shall not exceed 2 ohms for switching stations or utility (DTE) feed point services; and shall not exceed 5 ohms for building service substations.

Ground rods for manholes and light poles need not be tested.

A continuity check shall be performed from equipment ground bus bars and ground lugs to the ground system.

Lighting Fixtures

Lighting fixtures shall be checked for proper assembly, proper louvers or lenses, proper lamps, proper ballasts, straight row alignment, proper aiming, and the absence of light leaks.

Battery-backed emergency lighting fixtures shall be checked for continuous operation for a minimum of 90 minutes.

Lighting Circuits

Lighting circuits shall be checked for proper switching, for proper circuiting according to the design documents, and for circuiting that matches the lighting panel schedules.

Lighting Controls and Dimming Systems

Lighting controls and dimming systems shall be tested to verify that they have the specified features and programmability, and that all controls are properly labeled.

Lighting controls and dimming systems shall be tested to verify that the control sequences noted in the contract documents and manufacturer's instructions are present and operable, that control and dimming are smooth and free of flicker, and that fading is properly timed.

Lighting controls and dimming systems shall be tested to verify that the emergency lights function upon a loss of normal power.

Fire Alarm Systems

Fire alarm systems shall be tested in accordance with NFPA 72.

Controls that interface with the fire alarm system shall be tested in cooperation with the Temperature Controls Contractor to insure proper operation of interfaced mechanical devices.

Alarm, supervisory, and trouble outputs to the MOSCAD and BAS systems shall be tested to insure that the signals are received by Public Safety or at Plant Operations.

Special Systems

Security systems, card access control systems, sound reinforcement systems, and other special systems shall be tested in accordance with test plans submitted by their manufacturers and approved by the Owner. These test plans shall verify compliance with specifications and proper operation including all inputs, outputs, alarms, and accessories under all modes of operation.

Heat Tracing Cables and Mats

A continuity check, a 500 volt DC megger test, and an operational test shall be performed on heat tracing circuits prior to insulation of the pipe or tank. Verify proper current draw and heating of the heat tracing.

The 500 volt DC megger test shall be repeated after the insulation is completely installed.

An operational test shall be performed on the controls and alarms.

Lighting Dimming Controls

A. Dimmer and other Light Control Systems

1. The systems shall be placed, labeled, and configured to be 'user friendly and intuitive.
2. Dimming systems shall not be 'shared' among multiple rooms, unless those rooms are separated by a movable partition.
3. When the room size is above 400 square feet, the dimming system shall have its own 'software' to schedule the lighting, or otherwise save lighting energy when the space is un-occupied. Alternately, it may be connected into the building lighting control system when one is available
4. Whenever possible, install new systems to be similar in operation and function to other systems already in the building for easier understanding and operation on 'users'.
5. In rooms with an installed A/V system, the dimming controls shall be coordinated with and integrated into the user control panel (screen) of that A/V system so all controls can be centralized for the instructor (user of the space).

B. Lighting control systems

1. Lighting control systems installed to only save energy (scheduling, and/or otherwise saving lighting energy), may serve multiple rooms.
2. All rooms larger than 400 square feet shall be connected to the lighting control system of the building, and/or have its individual controls.
3. Lighting control systems shall be integrated into the overall building control system, and the installed dimming systems
4. In rooms with more than one door, provide a full set of controls at the most frequently used door. At the remaining doors provide controls for at least portion of the lights.
5. When an energy analysis determines that room ventilation can be reduced when the room is unoccupied or fume hood flow can be reduced when nobody is standing at the hood, connect one dry contact of the occupancy sensor to the lighting system and provide a second dry contact for use by the building DDC system.

C. Owner Training

Specify that the installing contractor train the occupants of the space on how to operate the system, and that University Maintenance and Operations be instructed in the proper setting, adjusting, and maintaining the equipment

DESIGN GUIDELINE 261000

MEDIUM VOLTAGE ELECTRICAL DISTRIBUTION

Scope

This guideline defines the requirements and standards for design of expansions and modifications to the University medium voltage electrical distribution system. The guideline covers basic requirements for system design, services, load estimating, cables and raceways, unit substation configurations and testing.

Design Requirements

Use U-M Master Specification 260513, "Medium, Low and Control Voltage Cables" as basis for design and specifying medium voltage power distribution cables. Use U-M Master Specification 261100, "Unit Substations" as basis for design and specifying medium voltage switches and unit substations. Edit the specification and details to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

Proposed designs associated with the University medium voltage distribution system shall be coordinated with the U-M Primary Systems Engineer (UMPSE). Contact the UMPSE through the University Design Manager.

University Medium Voltage Distribution Systems

The University medium voltage distribution systems serve three major campuses, Central Campus, North Campus and Michigan Medicine.

The Central Campus primary distribution systems consist of a 13.2 kV looped system and a 2.4 kV radial system. The 2.4 kV system is slowly being eliminated and upgraded for incorporation into the 13.2 kV distribution system. The 13.2kV distribution system is comprised of numerous loop style feeders served from U-M Switching Stations. The loop feeders serve multiple buildings each with one or more unit substations.

The North Campus primary distribution systems consist of a 4.8 kV looped system and a 13.2 kV looped system. The 4.8 kV system will eventually be upgraded to a 13.2 kV system. The distribution systems are comprised of numerous loop style feeders served from U-M Switching Stations. The loop feeders serve multiple buildings each with one or more unit substations.

The Michigan Medicine primary distribution system, in general, consists of a 13.8-kV dual radial system served from a single U-M Switching Station. Additional Michigan Medicine buildings are fed from a 13.2-kV looped system, as noted above, served from a single U-M Switching Station. Each building fed from the 13.2kV looped system is served by a dedicated loop to provide dual primary sources as required for inpatient facilities. Additional information on the primary distribution systems and on the primary system fault capability is available from the UMPSE.

Electrical Service Requirements

Coordinate with the UMPSE on the design of electrical services for new buildings or accommodations required for increased loads on existing building electrical services.

New buildings located within the coverage area of the University medium voltage distribution systems shall be served by the 13.2kV system and designed to comply with the standards and requirements noted in this guideline. Coordinate with the UMPSE for incorporation of new building electrical services into existing distribution systems. Avoid adding new loads to the 2.4kV or 4.8kV systems.

The transformer secondary main breaker of unit substations shall be regarded as the building's service disconnect and shall be suitable for use as service entrance equipment.

New 'off site' buildings, (buildings located outside of the coverage area of the University medium voltage distribution systems), shall be served by the local electrical utility and designed to comply with their standards and requirements. The design for off-site buildings may require space for two future 15kV loop switches and one 15kV fused transformer feeder switch, verify with the UMPSE. Transformers and secondary switchgear shall comply with U-M design guidelines and specifications.

If the building design includes an emergency generator, service for an electrically driven fire pump shall be served from both the line side of the unit substation secondary main breaker and from the emergency power distribution system. For building designs that do not include an emergency generator, coordinate with the Design Manager and the UMPSE on the design for

the fire pump power source(s). Request data from the UMPSE or local utility (off site projects) to verify compliance with NFPA 20 requirements for 'reliable power'. The reliability study shall encompass the prior five years in lieu of one year as required by NFPA 20.

Load Estimate Requirements

During the Schematic Design Phase, estimate the additional kW demand load associated with proposed project scope. 'Square foot' load estimates based on building types are acceptable at this stage of design. Design Development Phase deliverables shall include a kW demand estimate based on load lists. Drawings submitted for Owner review during the Construction Document Phase shall include finalized kW demand load calculations.

For large chillers (750 Tons and above) perform an economic evaluation for serving the chiller(s) at 4160V or 4800V versus at 480V. The evaluation shall include cost savings that may be obtained by incorporation of a VFD at 480V. Perform this evaluation during the Schematic Design Phase.

Phasing

In general, phase rotation shall be A-B-C. The phasing of new installations shall be A-B-C (X-Y-Z) from left to right, top to bottom and front to back, when viewed from the front. Match the phasing of renovations to the existing installations.

Medium Voltage Cable and Raceway Requirements

University medium voltage distribution cables are primarily routed underground.

Design raceway systems in such a way that cable pulls do not exceed 500 feet. Provide calculations showing that the required cable pulls do not exceed the manufacturers' recommendations for pulling tensions, sidewall pressures, and cable-bending radius.

For buildings served from the University medium voltage distribution system, the U-M Primary Systems Electrical Shop will furnish and install the medium voltage cables, splices, and terminations. Medium voltage cabling will be installed and terminated to each loop switch. The contractor shall be responsible to furnish and install all manholes, raceways, cable trays, and supports. Coordinate installation through the UMPSE. Medium voltage feeder cables for chillers shall be furnished and installed by the contractor.

Unit Substations

Unit substations, fed from looped style distribution systems, shall consist of two 15kV non-fused sectionalizing loop switches, one 15kV fused transformer disconnect switch, transformer with 480V or 208V secondary, and secondary switchgear with main circuit breaker.

Unit substations, fed from radial style distribution systems, shall consist of one 15kV fused transformer disconnect switch, transformer with 480V or 208V secondary and secondary switchgear with main circuit breaker.

Distribution systems designed to serve laboratory research or inpatient facilities shall include double-ended unit substations and may include a main-tie-tie-main arrangement to assist with

maintenance. Distribution systems for all other facilities shall include single ended unit substations unless otherwise required for reliability or limiting shutdowns for maintenance.

Testing

Instruct the Contractor to perform testing in accordance with Design Guideline 260800 and to provide the University Project Manager and the UMPSE with test reports. Testing associated with medium voltage distribution systems shall be coordinated and performed in conjunction with the U-M Primary Systems Electrical Shop.

ELECTRICAL POWER SYSTEMS

Scope

The various Codes applicable to the University's electrical power system are mainly based upon a model of a single utility service, connected to a single premise. The University's electrical system, however, consists of multiple utility services, a cogeneration facility, and a comprehensive primary distribution network connected to hundreds of premises. Thus applying the codes to the University's electrical system is not straightforward as it would be in other locations.

To meet the level of safety intended by the Codes, the design the University's electrical distribution systems is as described herein.

Electrical System Description

Utility Services

The Detroit Edison Company DTE provides the following primary and secondary services to the University:

1. Three 13.2 kV primary services, from DTE's University Substation, to the Central Power Plant (CPP) on Central Campus.
2. Two 13.8 kV primary services, from DTE's Academy Substation, to the University of Michigan Hospitals (UMH) main distribution substation in University Hospital. (A possible conversion to 13.2 kV is being investigated.)
3. Two 13.2 kV and two 4.8 kV primary services, from DTE's Campus Substation, to the North Campus Switching Station.
4. Eleven 13.2 kV and 4.8 kV primary services to individual buildings having service patterns where the primary demand rate is cost effective.
5. Over 250 secondary services of various voltages to individual buildings.

Cogeneration Facility

The University produces steam, and generates electricity, at the Central Power Plant, a cogeneration facility that contains the following:

1. Three steam turbine-driven 13.2 kV generators with a total capacity of 37.5 megawatts.
2. Two gas turbine-driven 13.2 kV generators with a total capacity of 7 megawatts.

Primary Distribution Network

The University distributes power to most of the buildings connected to its medium voltage distribution system through the following types of circuits and service points:

1. 13.2 kV and 2.4 kV primary feeders from the Central Power Plant to most buildings on the Central Campus and Athletic Campus.
2. 13.8 kV primary feeders from the University Hospital's Substation to most of the UMH buildings on the Medical Campus. (A possible conversion to 13.2 kV is being investigated.)
3. One 13.2kV emergency feeder from the Central Power Plant, through a 13.2-13.8-kV autotransformer, to select UMH loads. (May be eliminated if 13.8 to 13.2 conversion is warranted.)
4. 13.2 kV and 4.8 kV primary feeders from the North Campus Switching Station to most North Campus buildings.

Application of the Codes

General

1. New electrical systems shall comply with the NEC and other noted codes on the U of M web page.
2. Existing electrical systems under addition or renovation shall be upgraded to comply with the current codes.
3. Existing electrical systems serving an area, undergoing non-electrical renovation, in general, are not required to be upgraded to comply with the current codes. However:
 - a. No work of any discipline shall degrade the existing electrical distribution system in any way.
 - b. Upgrade the electrical distribution systems wherever possible and practical.
4. The University's electrical system is considered "reliable" as defined in NFPA 20 Appendix A.
5. As described in NEC Section 695-3(2), the Central Power Plant could be considered an "on-site power production facility" The University, however, prefers an on-site, natural-gas-fired generator to supply the emergency power loads in a facility.

Application of NFPA 70, the National Electrical Code

1. The service points at which the Detroit Edison utility services end and the University premises wiring begin, are defined as the connections of the secondary buses or terminals at the Detroit Edison owned step-down transformers, fused cut-out switches, or service drop conductors, to the University owned cables.
2. The "source ends" (Central Power Plant or switching station ends) of the University's primary distribution cables are feeders and shall comply with NEC Article 220, "Feeders".
3. The "load ends" (building ends) of the University primary distribution cables, however, shall be treated as the utility services to the building. Install service disconnecting means and comply with all of the requirements of NEC Article 230, "Services".

4. In a like manner, a secondary-voltage feeder (or feeders) from one building to another building shall be treated as the utility's service to the building. Install service disconnecting means and comply with all of the requirements of NEC Article 230, "Services".
5. This service entrance shall fully comply with NEC Article 230, and all other applicable sections. These requirements include, but are not limited to the following:
 - a. Conductors shall be maintained outside of the building or shall be enclosed in two inches of concrete until they enter the room containing the building service disconnecting means.
 - b. Primary disconnect switches, unit substation transformers and pad-mount transformers shall be treated as utility owned equipment.
 - Access shall be restricted to qualified personnel only.
 - The transformer primary switches shall not be used as the building service disconnecting means.
 - c. The line side terminals of the secondary main disconnecting device(s) shall be treated as the building service point.

Application of the National Electrical Safety Code

In addition to complying with the NEC, the Central Power Plant, switching stations, substation rooms, manholes and other areas containing primary equipment, main service switchgear, or cables shall comply with the National Electrical Safety Code.

Application of the International Building Code

1. In low-rise buildings, provide emergency power for egress lighting, emergency signs, and the fire alarm system.
 - a. Provide a natural gas fueled engine-generator set whenever possible because the savings in maintenance costs will offset the higher initial cost. Connect the generator using one or more automatic transfer switches. These transfer switches shall be 'close-transition', soft-start, with full, isolated maintenance bypass systems included
 - b. As an alternative to an engine-generator set, consider providing a fuel cell system.
 - c. Provide a central battery/inverter system with the battery system being of the flooded-wet-cell, Plante-lead-alimony, type. Provide sufficient 'installation and working' clearances around the overall system, and installed needed ventilation. (Sealed valve regulated battery systems shall be used due to their high maintenance replacement costs.)
 - d. When an engine-generator set cannot be provided, provide individual battery packs.
 - e. Because the normal power source is sufficiently reliable, do not connect low-rise building fire pumps, elevators, or similar equipment to the engine-generator set.
2. In high rise buildings; provide emergency power for egress lighting, emergency signs, and the fire alarm system. Provide standby power for fire pumps, elevator(s), smoke exhaust systems, stairwell pressurization systems, and other standby systems as required by codes.

- a. Provide a single natural gas fueled engine-generator set with one or multiple automatic transfer switches. These transfer switches shall be 'close-transition', soft-start, with full, isolated maintenance bypass systems included
 - Provide the fire pump automatic transfer switch as an integral part of the fire pump controller.
 - Provide the elevator system automatic transfer switches as part of the building's power distribution system, not integral to the elevator controllers.
 - b. Consider supplying more than one building from a single engine-generator set.
 - c. Consider installing the engine-generator set in an adjacent parking structure or lot to minimize noise and vibration.
3. Only as a temporary measure when an engine-generator set cannot be provided at the time of initial construction, provide two separate services to the building and provide multiple transfer switches.
- a. Obtain one service from the University electrical system and the other from Detroit Edison.
 - b. Do not obtain both services from the University electrical system because both services will be connected together at times for system maintenance or load balance.
 - c. Do not obtain either service from a 4.8kV or 2.4kV primary circuit because these circuits are being phased out.
 - d. Do not obtain both services from Detroit Edison unless they originate at different Detroit Edison switching stations.
 - e. The University's long-range goal is to provide emergency and standby power to every high-rise building from engine-generator sets. Design the electrical distribution system so that an engine-generator set can be connected in the future.
4. In low rise and high rise buildings with special needs, special power may be required by codes or may be requested by the Owner for hazardous labs, animal rooms, freezer farms, radio transmitters, telecom switching stations or other critical loads.
- a. When possible, provide the special power from the same natural gas fueled engine-generator set that supplies the emergency and standby power. Use a separate automatic transfer switch to feed the special loads.
 - b. If no engine-generator set exists and special power is required within minutes of a loss of normal power, provide a dedicated natural gas fueled engine-generator set.
 - c. If no engine-generator set exists and special power is required within a few hours of a loss of normal power, provide a University standard generator connection box for connecting a portable generator.

Electrical System Requirements

Distribution Network

The University's long-range goal is to convert the entire primary distribution network to 13.2kV.

1. Connect new unit substations to 13.2kV primary circuits, not to 4.8kV or 2.4kV circuits.
2. Coordinate with the Utilities and Plant Engineering Department to establish the specific circuits and connection points.

Unit Substations

Provide indoor unit substations consisting of primary load break switches, dry type transformers, and secondary switchgear distribution sections.

1. Provide double-ended substations with two main and one tie secondary circuit breakers
Double-ended substations are typically only used for health care, and research buildings.
2. Provide single-ended substations with main secondary circuit breaker
Single-ended substations are used for classroom, library, housing facility, and similar buildings. With single-ended substations provide a generator connection box on an exterior portion of building accessible to trucks. Also provide raceway and conductors from the generator connection box, to a separate circuit breaker in the substation dedicated for this generator connection.
3. Substations with a secondary voltage rating of 480/277-volts, three phase, 4-wire, are preferred.
4. Size substations only for the anticipated peak load plus spare capacity for future growth. Do not oversize the substations and thus increase initial costs and transformer losses.

DESIGN GUIDELINE 261100 **UNIT SUBSTATIONS**

Scope

This guideline defines the requirements and standards for design of unit substations. The guideline covers basic requirements for design, system ratings, designated spaces, primary switches, transformers, secondary switchgear and testing. Unit substation assemblies shall be configured as single-ended or double-ended and consisting of primary sections, transformer sections, and secondary voltage distribution sections.

Design Requirements

Use U-M Master Specification 261100, “Unit Substations”, as basis for design and specifying unit substations. For the required configuration of University substations see Standard Electrical Detail 26110001 for single-ended substations and Standard Electrical Detail 26110002 for double-ended substations. Edit the specification and details to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

Rating Requirements

Unit substations shall be 500 kVA minimum and 2000 kVA maximum unless approved otherwise by the University.

System fault contribution of 750 mVA with an X/R ratio of 15 shall be used when determining the required interrupting rating for unit substation equipment.

Provide a short circuit, protective device coordination and arc flash hazard study per DG 260500, "Common Work Results for Electrical".

Base calculations to determine the degree of arc flash hazard on actual field installation data and coordinate with UM Primary System Engineer. Design distribution systems to limit the arc flash incident energy to a magnitude requiring PPE of Level 4 or below.

Size single ended unit substations so that the transformer's AA rating equals roughly 150 percent of the projected peak demand. Size double ended unit substations so that each transformer's AA rating equals roughly 115 percent of the projected peak demand for the entire double ended unit substation.

Loop style feeders of the University medium voltage distribution system are considered service entrance conductors. The transformer secondary main breaker of unit substations shall be regarded as the service disconnect and shall be suitable for use as service entrance equipment.

Space Requirements

See DG 5.7 for associated architectural, mechanical and electrical space requirements.

The substation shall be a front-aligned structure. Any variations in section depth shall be reflected on the rear side of the substation. Label front of substations on plan view drawings.

Provide working clearances as required by MEC and indicate them on plan view drawings. Provide required dedicated work space above the unit substation and delineate them on drawings with an elevation view. Space and room requirements for unit substations shall be determined and accounted for during the Schematic Design Phase.

Provide rear access to all unit substations. Working space for rear access shall be based upon clearances required for working on energized parts at the system voltage. Where applicable, include clearance allowances for wall mounted ground bars.

Incoming Line Section Requirements

Provide 15kV incoming line sections with two loop switches for the two incoming lines, and a fused load interrupter transformer primary switch.

The transformer primary switch shall be key-interlocked with its associated secondary main breaker so that the secondary main breaker closes after and must be opened before the transformer primary switch.

UM Primary Systems Engineer and Engineer-of-Record shall agree on rating of the primary fuses or work with manufacturer to propose an alternate rating after review of the coordination study..

Specify installation of warning labels on loop switches with the following verbiage; 'Danger – Contacts on either side of this device may be energized by backfeed'.

Transformer Requirements

Provide only dry type transformers, unless an alternate for a given project is specifically approved by the University.

Unit substation transformer coils shall be copper.

Transformers shall have five full capacity, 2.5 percent taps on the primary winding, two below and two above the nominal voltage.

Transformers shall be equipped with forced air cooling fans and controls. The transformers FA ratings shall equal 133 percent of their AA ratings.

Transformers shall be equipped with temperature monitoring systems that start the fans on high AA temperature, alarms on high FA temperature and initiates a second alarm and closes a breaker 'trip' contact on high-high FA temperature.

The temperature monitor shall include LED's indicating "power on" and "fans running".

The temperature monitor shall include an RS485 data port for future connection to a remote monitor.

Secondary Switchgear Section Requirements

Provide secondary main breakers in all unit substations.

Bonding of the transformer secondary neutral conductor to the grounding electrode shall be performed within the secondary switchgear enclosure.

Secondary mains and tie breakers shall be electrically operated (electrically charged). Each electrically operated breaker shall be powered by a dedicated, charging motor.

Feeder breakers shall be manually 'charged' unless noted otherwise. Frame sizes of feeder breakers shall be 800-ampere minimum.

Tie breakers shall be identical to the main breakers and shall be capable of being exchanged with either main breaker.

If required, provide a fire pump breaker vertical section between the transformer section and secondary main breaker section. The fire pump section shall be completely barriered from the transformer and secondary sections. The section shall comply with all requirements of NEC

Articles 230 and 695. The breaker shall not trip (only alarm) on ground fault and the trip button shall be disabled so it cannot be inadvertently pushed. The cubical door shall be painted red.

For double-ended substations, provide main and tie circuit breaker controls with auto-manual selector switch to automatically or manually transfer one or both secondary main buses to the opposite power source. When transferring or retransferring an energized bus to the opposite power source, the transfer shall be closed-transition.

On a project-by-project basis, the designer shall discuss with the UM Primary System Engineer, the consideration of a 'main-tie-tie-main' arrangement in lieu of a 'main-tie-main' arrangement. If an M-T-T-M arrangement is approved, modify the spec section accordingly.

Vertical bus ratings for feeder breaker sections shall be based on breaker cell frame size ratings including spares and spaces.

Blank compartments are not permitted. Spaces shall be fully bused, fitted with neutral current sensors rated to match the breaker frame sizes, and ready to accept future circuit breakers.

An Ethernet connection shall be provided for each revenue meter and a secondary Ethernet connection shall be provided to monitor circuit breakers (a single point of connection shall be provided for monitoring circuit breakers). Connections and wiring shall be shown on drawings.

UM Primary System Engineer may opt to extend UM's Distribution Management System from the watt-hour meter by connecting some or all of the points listed below:

- Open-Close status contacts of loop switches and transformer primary fused switch.
- Alarm contacts on transformer temperature monitoring system.
- Status contacts of main and tie circuit breakers in unit substations.

Secondary main, tie, and feeder breakers shall be as noted below:

- Individually mounted, draw out, metal-clad, stored energy type, quick-make and quick-break air circuit breakers.
- Breakers shall be rated for 100 percent continuous duty, with frame, sensor and rating plug ratings shown on the drawings. Sensor and rating plug ratings shall match the breaker frame size.
- Breakers shall be capable of being manually racked into three positions; "connected", "test" and "disconnected". The breaker frames shall be grounded in all positions.
- The compartment front doors shall be closable in all breaker positions and shall permit breaker operation with door open or closed. The doors shall be capable of being opened without tripping breakers in the "connected" position.
- Each breaker shall be equipped with three-phase current sensors and a microprocessor-based RMS sensing trip unit.
- A Kirk Key interlock shall be provided to prevent the operation of the fused primary switch unless the main breaker is open. Kirk Key interlock shall also be provided on double ended substations (if designed without automatic transfer controls) to prevent the operation of the tie breaker unless one of the mains is open.

Breaker RMS sensing trip units shall be as noted below:

- Solid-state trip units shall be true RMS sensing. The trip units shall be magnitude and time adjustable, and shall include a local indication of the cause of a trip. The trip unit settings shall be indicated on the drawings.
- The trip units shall coordinate with the primary fuses, main breaker and largest downstream feeder breakers. UM Primary System Engineer and Project Engineer-of-Record shall specify secondary main breaker settings to limit arc flash incident energy exposure.
- The trip units shall allow adjustment without breaker trips and routine testing without removing the breakers from service.
- Trip units shall be provided with long time, short time, instantaneous and ground fault functions as a minimum. Instantaneous trip function on main and tie breakers shall be defeatable.
- The main and tie breaker trip units shall include technology to reduce arc flash incident energy during maintenance activities.
- Power for ancillary functions of the solid state trip unit shall be obtained from within the circuit breaker assembly itself, or it shall be provided by a separate control power circuit connected to the secondary bus ahead of the main breaker. Solid state trip units shall have non-volatile memory to maintain all settings, trip indications and fault data during a power outage. Batteries to maintain the memory are not acceptable.
- Trip units shall be provided with integral metering functions including an integral keypad and display.
- Trip units shall be equipped to provide alarms. Alarms shall have separate adjustable pick-up and delay settings.
- Trip units shall have open protocol communication capabilities (Modbus TCP/IP).

Design the overcurrent protective system so it can be set in a 'selective' manner, to minimize the disruption from any given fault, to as small an area as possible. Prepare the settings for the overcurrent protective system to insure proper selectivity and coordination.

Require contractor to provide test reports showing that the overcurrent system has been set and tested, before the system is commissioned. All breakers (new and existing) shall be tested via primary current injection.

Adjacent to secondary main circuit breakers, in a separate cubicle, provide an analog voltmeter with selector switch, an analog ammeter with selector switch and a revenue kilowatt-hour meter. Selector switches shall have an off position.

Sub-metering components (metering of feeders) shall be located in the associated secondary switchgear section or, due to space limitations, provide separate wall mounted metering enclosures located within the substation room. Coordinate with UM Primary System Engineer for locating sub-meters.

Testing

Instruct the Contractor to perform testing in accordance with manufacturer instructions and Design Guideline 260800, and to provide the University Project Manager and UM Primary System Engineer with test reports.

Manufacturer's start up responsibilities shall include point-to-point testing of metering CT circuits.

LOW VOLTAGE ELECTRICAL DISTRIBUTION

Scope

New distribution systems shall be 480/277 volts AC, and/or 208/120 volts AC, three-phase, four-wire (w/ground), unless otherwise directed by University Design Manager (UDM).

The A/E shall perform a fault and coordination study to the depth needed to insure that the specified devices will properly and safely interrupt faults and overloads, and that the system can be coordinated properly.

All breakers, fuses and electrical distribution equipment shall have interrupting ratings of at least 1.2 times the available fault current as determined by a fault current analysis performed by an engineer.

All relays, breakers, fuses, and other overcurrent protective devices shall be coordinated in order to protect electrical equipment from damage and to isolate the fault to the smallest possible portion of the distribution system..

All fault current and coordination studies (not performed by the A/E) shall be approved by the A/E before equipment energization. The approved fault current and coordination studies shall be provided to the University Project Manager (UPM) before commissioning of the distribution system can proceed.

Switchboard and Panelboard Requirements

All switchboards and panelboard breakers shall have the appropriate short circuit interrupting rating as determined by the fault current analysis. All switchboards and panelboards shall be of the safety dead front type and ruggedly constructed of sheet steel. All switchboard and panelboard doors shall have latches in addition to locks and shall be master keyed alike. All switchboards and panelboards shall have an identity designation and shall include its source identification and location. All loads shall be identified by number and load (where applicable) and a typewritten load schedule shall be protected by clear plastic and placed in a frame mounted to the inside of the door.

All breakers requiring settings such as long time pick-up, instantaneous pick up, etc. shall be set according to a coordination study performed by an engineer. The coordination study shall be submitted and approved by the project A/E before any equipment energization. The approved settings shall be placed on the breakers and records of the approved settings and coordination study shall be provided to the UPM before job closeout/ commissioning.

At job closeout, all switchboards, and panelboards, shall have a minimum of 25 percent spare capacity - split equally between breakers spares and breaker spaces.

All current carrying parts shall be 98 percent conductivity copper and the phase buses shall be 100% rated throughout. Where a neutral bus is required (4-wire systems), it shall be 100% rated and isolated (unless it is required by the NEC to be bonded to ground, such as in the case of service equipment). The equipment ground bus shall be rated at a minimum of 50% of the phase bus capacity. Both the neutral and ground buses shall have sufficient terminals to accommodate the number of poles or devices that can be installed.

The main and feeder protective devices shall typically be bolted to the bus. Square-D, I-Line panels are an exception.

Indoor panelboards, switchboards, and safety switches, are to be NEMA 1. In areas where water spray or high humidity will be present (like a room needing occasional wash downs) use NEMA 4. Typical outdoor applications shall be NEMA 3R. In cooling towers, parking structures, or areas where water spray and/or high humidity will be present, use stainless steel NEMA 4. For other special locations, provide equipment that has NEMA type enclosures as required by the NEC.

Panelboards

Panelboards with mains (circuit breaker or fused switch) shall have these devices installed at the top or bottom of the bus. They shall not be mounted on the side like a feeder device.

In cases where significant neutral currents may be present due to non-linear loads, the panelboard shall be provided with a 200% rated neutral bus bar; the panelboard feeder neutral shall be sized at 200% and the source transformer shall be rated appropriately to serve non-linear loads (high harmonics) with a minimum K-rating of 4

For special systems, provide bus bars meeting those special system requirements.

Panelboards shall have wire gutters sized to accommodate the bending radius of all wires when fully equipped and shall not be less than 4 inches wide.

In general, panelboards in finished areas shall be flush mounted. Panelboards in electrical, mechanical and other service rooms and spaces may be surface mounted.

"Loadcenter" type panelboards are not acceptable unless specifically approved by the UDM for the specific and/or unusual application.

Switchboards

Wherever space permits, switchboards shall be of the fused switch type and equipped with peak current limiting fuses, (unless engineering requirements dictate other fuse types) so that fault current can be minimized. Where space is not available for the larger enclosures of fused switches, circuit breaker switchboards may be utilized.

Mount switchboards, whenever possible, in areas accessible only to qualified electricians. In those locations the switchboards do not need to have a door. In areas accessible to other than qualified electricians, provide a door.

In general, switchboards in finished areas' areas shall be flush mounted, in electrical, mechanical and other service rooms and spaces they may be surface mounted.

Safety Switches

Safety switches shall be fused or unfused as needed. Handles shall have provision for padlocking. In addition, safety switches shall include a maintenance bypass (open door while hot) provision.

Provide ground connection point in all safety switches. Provide neutral bar where circuit is 4-wire.

Safety switches on load side of Variable Speed Drives shall have auxiliary contacts to de-energize VSD before opening safety switch (Form C). Certain applications may require more than one auxiliary contact.

All safety switches shall be "Heavy Duty" rated.

Distribution Transformers

Generally, building distribution transformers shall be of the 480-208Y/120 volt type. Transformers shall be of the dry type, with a 220 degrees C insulation system, and designed for a maximum temperature rise at full load of 115 degrees C above a 40 degrees C ambient.

Provide terminals compatible with copper terminations and having holes drilled to accept NEMA 2 or 4-hole terminals as is appropriate for the size of the transformer. Provide a ground connection bar (or device) to accommodate at least 4-NEMA 2-hole terminals.

Transformers shall have a sound rating 3 dB below NEMA standard (42 dB for 10-50 kVA, 47 dB for 51-150 kVA, 52 dB for 151-300 kVA and 57 dB for 301-500 kVA rated transformers). As a first preference, transformers should have 6 adjustment taps, two 2 ½ percent above and four 2 ½ percent below nominal voltage. If this setup is not readily available, four adjustment taps, two 2-1/2 percent above and two 2-1/2 percent below nominal shall be acceptable.

Where substantial non-linear loads are to be served, the appropriate K-rated (K-4 minimum) transformer shall be used.

Provide vibration pads for the transformer supports.

Distribution System Requirements

Substation secondary distribution breaker frame size shall be 800 A. The minimum sensor rating shall be 800 A, which can be set to 50 percent to produce a minimum 400 A breaker rating. Exemptions to these ratings will be permitted for feeds to emergency systems.

The first tier of distribution panels downstream of the substation shall be of the fused switch type and equipped with peak current limiting fuses, (unless engineering requirements dictate other fuse types) so that fault current can be minimized.

Provide required working space according to the NEC article 110 for motor disconnects and all other electrical equipment.

All outdoor disconnects and associated electrical equipment for cooling towers shall be stainless steel and NEMA 4 rated.

Provide NEMA Type 6-20R 250 volt, 2 pole, 3 wire, 20 amp receptacle outlets on a 208 volt, single phase circuit where required for large freezers or other large appliances. All wiring for these receptacles shall be No. 10 AWG minimum so that the circuits can be upgraded later to 30 amps if required.

Provide 120 volt duplex receptacle outlets on both side walls of corridors and hallways at intervals not exceeding 20 feet.

Provide a 120 volt duplex receptacle outlet at each stairwell floor landing.

Provide a minimum of one 120 volt duplex receptacle outlet per each 100 square feet, or any fraction thereof, in each mechanical, electrical and janitorial closet.

Provide ground fault circuit interrupter (GFCI) protection for all 120 volt receptacle outlets located outdoors, in toilet areas and within 6 feet of water sources. No receptacles shall be rendered GFCI by being fed from the load side of a GFCI. Water coolers do not require GFCI and shall be fed from a simplex receptacle.

Installation Requirements

The Contractor shall provide at least five working days notice and shall coordinate service interruptions with the University Project Manager. The University must approve each service interruption in writing.

Before closeout/commissioning the contractor shall:

- Comply with all applicable codes and standards.
- Install all wiring in approved raceway.
- Install a separate equipment grounding conductor with the phase conductors in the raceway.
- Provide exothermic welded connections or *Burndy High Ground* compression connection between the Grounding Electrode Conductor and any Grounding Electrode.
- Install all distribution equipment at a height that will not place the top unit operating handle more than 6 feet and 6 inches above the finished floor.
- Identify all receptacles with circuit number and source panel.
- Identify all installed switchboards and separately mounted circuit breakers, panelboards, motor starters, disconnect switches, relays, and all other equipment used

for the operation and control of electrical equipment by means of engraved laminated plastic (or equivalent) plates permanently affixed to the equipment. The information provided shall contain the identification number/label of the equipment and its power source identification and location.

- Identify all panelboard circuit breakers with permanently fixed numbers and a typewritten directory identifying the breaker loads mounted in a frame affixed to the interior of the door and protected by clear plastic.
- Perform testing in accordance with Section 16950 and provide the UPM with acceptable test reports.
- Provide all engineered coordination and short circuit studies to the UPM.
- Provide all one-lines, riser and as-built drawings to the UPM.

Wiring Devices

Scope

All wiring devices shall be UL -extra-heavy duty. See Preferred Manufacturer's List for specific information on acceptable products.

Devices shall have a minimum rating of 20-amperes.

Wiring devices connected to 'normal power' shall be supplied in the manufacturer's standard color closest to 'Ivory', unless noted otherwise. If Ivory is not available, in special application devices, use the manufacturer's standard brown.

Wiring devices connected to 'emergency power' shall be supplied in the manufacturer's standard color closest to 'Red', unless noted otherwise. If red is not available in special application devices use the manufacturer's standard ivory or brown. Exception: 'Special Power' receptacles installed in the Medical School shall be gray.

When multiple circuits serve a series of receptacles the circuits shall be alternated so adjacent receptacles are not on the same circuit.

Receptacles shall be installed so the ground terminal is below, or to the left of the neutral terminal. If the building standard is other than this, follow the existing building standard

All receptacles and switches shall be labeled to note the source of power.

Receptacles within 6-feet of a water source shall be GFCI type. Receptacles dedicated to sump pumps and water fountains are excluded.

GFCI receptacles shall not be wired to protect downstream standard receptacles. Each GFCI, when it operates shall only interrupt 'its own' receptacles

Coverplates shall be 'high-quality', Type 302, stainless steel unless noted otherwise.

'Futura' class devices shall not be used, unless the needed device is only available in that style, or otherwise noted.

Lighting Controls

A. General

Toggle switches shall be rated 120/277 volts, 20-amperes, single-pole, double-pole, 3-way, or 4-way as required

Dimmer switches shall be rated 1000 watts minimum, specification grade, heavy duty, with radio noise filter - UL listed for 'heavy duty' use.

Lighting control switches, serving areas 'not visible' at the switch location shall have a pilot light function.

B. Occupancy Sensors

1. Wall mounted occupancy sensors shall be rated 600 watts minimum, 180 degrees coverage, 300 sq. ft. minimum coverage, infrared type
2. Ceiling mounted occupancy sensors shall be rated 1000 watts minimum, 180 degrees coverage, 1000 sq. ft. minimum coverage, infrared type,
3. All sensors shall have adjustable range or sensitivity, and adjustable time delay.
4. Ceiling mounted sensors (especially) shall utilize low voltage control circuits and be interlocked with the switch circuit for local auto/off control.
5. Dual technology occupancy sensors shall be used in applications where false operations must be minimized. These dual technology devices shall have a power ratings of at least 1000 watts load rating, shall cover at least 180 +/- degrees (from device), 1000 sq. ft. +/- coverage, and combination ultrasonic/infrared type. The ultrasonic component shall be of a frequency compatible with hearing aids.
6. Occupancy sensors shall be of a type that does not make any noise when the sensors switch from the on state, to the off state.
7. NOTE: Some ultrasonic occupancy sensors operate at frequencies that interfere with proper hearing aid operation. Any ultrasonic sensors shall therefore be specified to operate beyond the interference frequencies with hearing aids.

C. Light Dimming Control Systems

1. The wiring devices, as applicable for the dimming system, shall be in accordance with the above requirements.
2. Such systems shall be placed, labeled, and configured to be 'user friendly and intuitive. See Section 16550 for more information.

D. Lighting control systems

1. The wiring devices, as applicable for the lighting control system, shall be in accordance with the above requirements.
2. Such systems shall be placed, labeled, and configured to be 'user friendly and intuitive. See section 16550 for more information.

Receptacles

Duplex and single (simplex) receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire, NEMA Type 5-20R.

GFCI duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire straight blade type with nylon or Lexan bodies. GFCI receptacles shall trip when ground currents exceed 5-mA, shall trip in 25-milliseconds maximum, and shall have an interrupting rating of 2000 amperes.

TVSS receptacles shall clamp at 330 volts or less, and shall have visual indication of the failure of their protective circuitry.

Child resistant receptacles shall require the simultaneous insertion of both line and neutral plug blades before power is applied to the receptacle contacts.

'Special receptacles' shall be of the voltage, amperage, number of poles, number of wires, configuration, and NEMA Type required by the (to be) supplied load.

Ceiling mounted and/or critical application receptacles shall be 'twist-lock' type with the NEMA configuration required for the (to be) supplied load.

'Receptacle Strips'

Commercially available surface mounted receptacle strips shall not be used unless the receptacles meet the above noted minimum requirements. Alternately, use surface raceway with receptacles separately installed. The receptacles shall be spaced as required for the application.

Power Poles

Power poles shall be painted steel unless shown otherwise, with an internal barrier to separate power wiring from telecommunications wiring. If power outlets are installed they shall meet the minimum requirements noted above. A green ground wire shall connect all receptacles. The pole shall not be used as the ground conductor.

The poles shall be firmly affixed at the top and bottom. The power and/or telecommunications wiring shall exit the poles through separate flex conduits connected to ceiling mounted junction boxes

Floor Boxes

In general, floor boxes shall be avoided. When there is no good alternative, however, the boxes shall be of the 'Flush-Poke-Thru' type, with multi-service capability, and be UL listed for 2-hour fire resistance.

Boxes shall have a minimum capacity of 30 cubic inches, split into 2 or 3 compartments of equal capacity by removable partitions

These 'Flush Poke-Thru' type floor boxes shall meet ADA and Accessibility Guidelines and be UL listed for scrub water exclusion.

Multi-service devices shall have the necessary channels in the insert body to provide complete separation of power & communication services.

Pin And Sleeve Connectors

Pin and sleeve connectors shall comply with IEC Standard 309. They shall consist of nylon housings with integral locking rings and cord grips that are color coded by voltage. Pins and sleeves shall be sized, arranged, and keyed to prevent incorrect assembly.

Timers

A. General

1. Acceptable manufacturers are noted in the Preferred Manufacturers List.
2. All devices shall be UL listed and labeled for the application
3. Inside mounted devices shall have a NEMA 1 enclosure. Outdoor applications shall have a NEMA 3R enclosure. In either case, the cover shall be lockable.
4. Controls shall be easy to understand, and adjust.
5. Power control contacts shall be provided, capable of switching 20-ampere, 120 or 277-volt circuits. These contacts shall be capable of controlling incandescent, fluorescent, or HID lighting.

B. 24-Hour and 7- Day Timers.

1. Where BAS control panels are not available, or too expensive to upgrade, install timers.
2. Timers shall be electronic type, with battery back up and appropriate charging circuits to keep the battery charged. The battery shall supply only the internal date, and time circuitry.
3. Timers for control of indoor lighting applications shall include automatic switching to accommodate daylight savings time changes, standard holidays, and special other specific dates.
4. Timers for control of outdoor lighting applications shall include astronomical type of controls to automatically adjust on and off times to accommodate time of year.
5. Two or more power control contacts shall be provided, as noted above.
6. Provide at least one, Form C, control contact rated for 120-volts.

C. Spring Wound Timers

1. Where an application requires a timer, to allow an erratically scheduled 'On Times' of a specific length, use manually, spring wound, timers.
2. Timer shall allow 3-way switching of lights, i.e. control of tunnel lighting from either end of the tunnel segment.
3. The construction of the timer shall be appropriate for the environment where it is to be used, i.e., hot and high humidity environments in tunnels.

Installation Requirements

- D. Provide No. 10 AWG wire to NEMA Type 6-20R receptacles serving freezers, window air conditioners, or other large appliances.
- E. Where circuits are supplying a high portion of non-linear load, provide a separate neutral conductor for each single-phase branch circuit. The neutrals of these single-phase circuits shall not be shared or daisy-chained.

- F. Provide ground fault circuit interrupter (GFCI) receptacles for new and existing 120 volt duplex receptacles located outdoors, in toilet rooms and within 6 feet of water sources including sinks, cup sinks, fume hood sinks, faucets, hose bibs and water coolers. Standard receptacles protected by an upstream GFCI receptacle or a GFCI circuit breaker is not acceptable.
- G. Provide waterproof enclosures for duplex receptacles located outdoors. Enclosures shall remain watertight even while in use.
- H. Provide a label on the cover plate of new, or existing, light switches and receptacles in the project area. Identify the panel and circuit number feeding the device. Embossed plastic tape labels are not acceptable.
- I. Color code junction boxes and box covers of emergency circuits with red paint.
- J. Mark lighting and power junction box covers in indelible ink with the panel and breaker numbers of the circuits contained within.

MOTOR CONTROLS

Scope

In general, motors larger than 1/3 horsepower shall be 460 volts or 208 volts, 3 phase. Motors 1/3 horsepower and smaller shall be 115 volts, single phase. Motors 200 horsepower and larger may be rated for medium voltage 2,400-volts, 4,160-volts, or 4,800-volts.

When both 480/277-volts and 208/120-volts are available in a given building, connect and run all 3-phase motors at 480/277-volts.

Especially when only 208/120-volts is available in a building, carefully evaluate the degree and frequency of motor-starting voltage-drops, on the other systems in the building. Where the 'flicker limits' noted in utility system (DTE's) rate/rule books (or good engineering practice) would be violated, install 'soft starters', variable frequency drives, or other means for reducing the voltage-drop during motor-starts.

Provide a motor control center (MCC) to control motors clustered in a given area or zone of the building. Provide local (individual) combination motor starters to control one, or a small number, of motors in a given area or zone.

Avoid feeding 3 phase motors from lighting or receptacle panels. Use 'power panels', available in the building, whenever possible.

Design motor feeder circuits to limit the motor starting and running voltage drops to values within the requirements of the NEC.

Motors 50 HP and larger shall be provided with power factor correcting capacitors.

- If a VFD is the motor controller, evaluate whether or not a capacitor should be installed given the distorted waveforms often present with VFD's.
- If only 208/120-volts is available in the building, and all 3-phase motors are therefore 208-volt, evaluate and then address the affects of the non-linear loads connected to the system (computers, UPS systems, etc.)

A duplex work receptacle shall be in close proximity to all motors and motor controllers.

Distribution systems and motor feeders to 'duplex' systems shall be sized to operate both motors simultaneously - even if current plan is only operate one at a time.

Motor Controllers

Provide electrically operated, motor controllers to provide short circuit and motor overload protection, and motor disconnecting means, for all three-phase motors.

Single phase motors may be controlled by manual motor starters.

Starters shall be lockable in the open (preferably in open and closed) positions.

Combination motor starters, with fused switches, are preferred whenever possible (for their visible break).

Variable Frequency Drives, and Reduced Voltage Starters

When variable frequency drives (VFD) are specified (these are normally specified by mechanical engineer), the drive should be supplied with a disconnecting means. If none is supplied (specified), a separate disconnection means shall be provided - at the VFD. If VFD is not in line of sight of motor, or is not lockable in the open position, install a non-fused disconnect switch at the motor. That disconnect shall have 'pre-break' contacts. If the VFD controller needs this pre-break contact, wire this contact to the VFD. These control wires for the pre-break, may be run in the same conduit as the motor feeder.

Provide reduced voltage or soft motor starters when full voltage motor starting may affect voltage sensitive equipment on the same bus.

Disconnecting Means Needed in Line of Sight of Motor

If motor control (starter) disconnecting means is not in line of sight of motor, or is not lockable, provide a lockable, non-fused safety switch at the motor. (This requirement applies to all types of motor control equipment.)

For critical motor loads such as many fume hoods, provide motor single-phasing-protection. Single phasing protection shall be accomplished by the use of a 'single phase detector' on a fused disconnect, or by the use of a molded case circuit breaker.

Control Circuit Requirements

In general, provide 'Hand-Off-Auto' (HOA) control switches for motors 1/2 horsepower and larger (including those controlled by variable speed drives). In the "hand" position, the motor shall run independently of most automatic start/stop controls. Only the safety and modulating controls shall remain active. In the "auto" position, all start/stop controls shall be active. Wherever possible, control circuits shall be wired so that motors automatically restart after a power disruption. Provide time delays to allow large fans and pumps to coast down before restarting after a momentary power disruption, and to prevent all of the large motors from restarting simultaneously.

High temperature detectors (firestats), smoke detectors, low temperature detectors (freezestats), flow switches and all other safety controls shall be energized and operational whenever the equipment they protect is operating.

When required, provide limit switches on dampers to prevent the associated fans from starting until the dampers are fully open.

Duct smoke Detectors

Duct smoke detectors required by code.

- Duct Smoke detector shall be supplied by, installed, and wired by the fire alarm system supplier. This detector shall be compatible with that fire alarm system.
- When fire alarm system is 'intelligent', do not directly control motor from smoke detector. See detail 16720006 noted below.
- Wire those duct smoke detector to the 'Duct Smoke Detector Interface Box' as shown on details 16720008 (for buildings without fire alarm systems, 1672007 (for buildings with 'hard-wired' fire alarm systems), or 16720006 (for buildings with addressable fire alarm systems). These interface boxes allow quicker isolation of equipment failures to either the temperature control system or the fire alarm system. Interface boxes are available from Owner.
- Fire alarm contractor and temperature control contractor will wire to these interface boxes, and test them for proper operation.
- The interface box(es) should be close to the temperature control panels.

Equipment Requirements

Medium voltage motor starters shall be of the vacuum breaker type. Coordinate the selection of medium voltage motor starters with the University Utilities Department through the University Project Coordinator.

Each MCC motor starter or combination motor starter shall consist of a fused disconnect switch or molded case circuit breaker, a magnetic motor starter with 1 overload relay per phase, and a control power transformer. Fuses shall be of the dual element, time delay, rejection type. Fused disconnects are preferred since they provide a 'visible break'.

Provide drip shields for motor control equipment installed in areas with fire protection sprinkler systems.

Installation Requirements

Instruct the Contractor to perform testing in accordance with Section 16950, and to provide the University Project Coordinator with test reports.

VARIABLE FREQUENCY DRIVES

Scope

For the purposes of these guidelines, the terms variable speed drive and VSD, can, and may be used interchangeably with the terms variable frequency drives and VFD

This electrical guideline, in large part, deals with the installation of VSD. For information dealing with the drives themselves refer to the mechanical guidelines, Section 15960.

Safety disconnect switches are not required at the motor, when the line disconnect of the VSD is lockable, and within sight of the motor. When the VSD line disconnect is not lockable, or is not in line-of-sight, a separate safety disconnect shall be installed at the motor location. All safety disconnect switches shall have pre-break (auxiliary) control contacts, (even if they are not specifically required by the VSD supplier). The wires for this control contact shall be run in the same raceway as the power conductors.

All wiring and grounding shall be in accordance with the associated electrical sections dealing with these requirements.

Harmonic Distortion Considerations

Before adding a VFD, determine the total harmonics generating load on the unit substation transformer. The new harmonic generating load shall not exceed 10 percent of the transformer base rating without approval from the University Utilities Department through the University Project Coordinator. Harmonic generating loads, as defined here, include electronic ballasts, computers and their peripherals, solid state power supplies, UPS systems, VSD drives, etc.

If the total load on the transformer, after the additions of the current project, exceed 75% of its rating; and/or if the total harmonic generating load on a substation will exceeds 50%; the A/E shall prepare a study for review by the University showing that the transformer can safely carry those loads. If the study shows the transformer inadequate, the project shall either increase the transformer size, or add additional transformers. Before adding a VSD, evaluate the possible effects of the VSD on power factor correcting capacitors or harmonic sensitive equipment on the same bus. Avoid installing a VSD on the same bus with capacitors or 'sensitive' equipment. Sensitive equipment, as defined here, are loads adversely affected by harmonic voltage distortions. These include, high sensitivity laboratory equipment, patient monitoring or treatment equipment, computers, etc.

Provide calculations per IEEE Standard 519 showing the current and voltage total harmonic distortion (THD) that will be reflected into the existing University power system, for any load exceeding 10% of the rating of the transformer serving it. Contact the University Utilities Department through the University Project Coordinator for the required power system data. The VSD shall limit the THD to the values noted below when operating at any load from zero to 100 percent.

- VSD input voltage waveform: less than 3 percent THD
- VSD input current waveform: less than 100 percent THD

After startup of the VSD, the mechanical contractor shall provide, and the electrical contractor shall install, at no additional cost to the University any additional reactors or filters required to reduce the actual THD to the calculated THD.

Maintenance Bypasses

All VSD's for motors larger than 5 HP, and/or on systems serving critical loads (as defined in program statement, shall include full maintenance bypass systems. These bypasses shall be configured to allow operation of the motor; 'across the line' mode while the drive is being repaired. Also, the bypass equipment shall be electrically isolated from the VSD drive equipment so that maintenance may be safely done with the motor running 'across the line' in through the bypass.

The electrical system serving a VSD, and the mechanical system being served by the VSD, shall be sized and braced to allow that motor (and associated mechanical system) to start and operate properly and safely when in the bypass mode - across the line. Special attention needs to be given to the affects of the voltage drops during start and the ability of the upstream overcurrent devices to carry the locked rotor current during the startup.

HEATING CABLES AND MATS

Scope

Provide heating cables and mats to protect outdoor piping and tanks from damage due to cold weather. When required, provide heating cables and mats to prevent ice buildup on and damage to concrete slabs, roofs, gutters, and downspouts.

Provide self-regulating heat tracing products manufactured by Raychem Corporation, Process Division, Menlo Park, California or Thermon Corp, 100 Thermon Dr., P.O. Box 609, San Marcos, TX, 78667-0609.

Equipment Requirements

Provide Raychem model "Autosense M-Wire" or comparable Thermon model for protection of critical water lines (such as exposed chilled water pipes serving a computer room A/C unit).

Provide Raychem model "BTV" or comparable Thermon model for protection of non-critical hot and cold water lines (such as exposed chilled water lines to a local air conditioning unit serving a general occupied zone).

Provide Raychem model "XTV" or comparable Thermon model for steam service.

Provide Raychem model "ElectroMelt" or comparable Thermon model for concrete snow-melting and de-icing applications.

Provide Raychem model "IceStop" or comparable Thermon model for roof and gutter snow-melting and de-icing applications.

Get written approval from University Project Manager if the necessary product cannot be provided by Raychem or Thermon.

Sizing Requirements

Use the Raychem application software such as "TraceCalc" etc. or comparable Thermon application software to size and determine the heating cable wattage density and trace ratio (wraps per linear foot). For applications not covered by software, use the approved method as outlined in Raychem's or Thermon's applicable design guide publication.

Monitoring and Control Requirements

When available, the Building Automation/Direct Digital Control (BAS/DDC) System shall provide all control and monitoring functions. If BAS/DDC is not available, get direction from the University Project Manager. Contact University Project Manager to determine if heat trace system monitoring is necessary or desirable. Monitoring functions shall be accomplished

through current sensing switches (CSS) that monitor each electrical feed phase. When providing systems with an integral monitoring conductor, contact University Project Manager for monitoring conductor connections.

Installation Requirements

Heating cables and mats shall be installed according to the manufacturer's instructions. All installations shall comply with the NEC and particularly articles 426 and 427 of the 1999 and 2002 NEC, which apply to this equipment. Per article 426-28 and 427-22, the system shall be protected by a 30mA trip ground fault protection of equipment device.

The contractor shall test the heating cables and mats in accordance with this Design Guideline, DG Section 16950 and manufacturer's recommendations before energizing or installing any insulation or covering. Contractor shall provide the University Project Manager with test reports before job closeout

Insulation Resistance (Megohmmeter) Testing for Heat Trace Cables

- A. Refer to manufacturer's Design, Installation, and Maintenance Guide.
- B. Perform megohmmeter test at 2500v dc.
 - i. Measure the resistance between the heating cable bus wires and the grounding braid.
 - ii. If the heating cable is installed on a metal/conductive surface, apply megohmmeter between the grounding braid and the surface.
 - iii. Apply the voltage for one full minute.
 - iv. All insulation resistance values should be greater than 1000 megohms.
 - v. Resistance reading should stabilize.
 - vi. If any of the above conditions cannot be met contact the Project Manager.
- C. Perform megohmmeter testing prior to installation and after installation of heating cables, but prior to power connections.

DESIGN GUIDELINE 263000

ENGINE-GENERATOR SYSTEM AND ROOM

Scope:

This guideline defines the requirements and standards for design of engine-generators and associated system components. The guideline covers basic requirements for design, system components, controls, natural gas fuel systems, exhaust systems, automatic transfer switches (ATSSs), room construction, outdoor enclosures and installation.

[7.2MS 231123 – Natural Gas Systems](#)

[7.3MS 263000 – Engine-Generator System](#)

U-M Standard Details

[26000000 - Series Details](#)

Reference Documents

- Environmental Protection Agency (EPA) emissions standards for stationary internal combustion engines.
- NFPA 37, "Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines"
- NFPA-110, "Standard for Emergency and Standby Power Systems"
- UL 1008, "Standard for Automatic Transfer Switches"
- UL 2200, "Standard for Stationary Engine Generator Assemblies"
- International Fuel Gas Code
- Ann Arbor City Code, Chapter 119 Noise Control

Design Requirements:

Use U-M Master Specification 263000 Engine-Generator System as basis for design and specifying Emergency Power Supply Systems (EPSS) comprised of engine-generator units (Emergency Power Supply - EPS), ATSSs and associated accessories. Edit the specifications to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

Locating EPSs outdoors, on grade level in an accessible location is preferred (see UMHS Design Guideline 263000-H for healthcare related projects). Evaluate and compare locating the EPS in a room versus locating it in an outdoor enclosure.

- Consider initial cost, ease of maintenance, load bank testing, ease of major component replacement, fuel and exhaust piping routes, fuel tank placement, heat rejection, feeder cable lengths, sound, vibration, exhaust re-entrainment, etc.
- For non-Regental projects, obtain Exterior Elements Design Review Committee (EEDR) approval before locating a unit or exhaust stack outdoors where visible to the public.

Provide studies to determine how the EPS's sound, vibration and exhaust re-entrainment will impact the building and surrounding buildings. Perform these studies in the schematic design phase to avoid last minute design changes. See Design Guideline 230060 for applicable sound and vibration limits.

During the schematic design phase, contact the U-M OSEH Air Quality Specialist regarding Michigan Department of Environmental Quality regulations, EPA air permit requirements and estimated EPS kW rating. At completion of EPS submittal reviews, provide the OSEH Air Quality Specialist finalized EPS kW rating. Also notify the OSEH Air Quality Specialist when EPSs are relocated or removed from service.

System Requirements:

Provide a stationary natural gas fueled EPS with ATSS, load testing means, and associated accessories in compliance with NFPA 110, Level 1, EPSS requirements. The University considers the probability of a simultaneous failure of both the natural gas utility delivery system and power from the Ann Arbor campus outside electrical utility to be low. Provide a diesel engine-generator system only when on site fuel storage is required or the EPS performance requirements cannot be met using a natural gas fueled system. Off Campus installations will require analysis and coordination with the local authority having jurisdiction for determination if a natural gas utility delivery system will be acceptable.

Provide generator main circuit breakers located in the unit mounted generator connection panel. Provide circuit breakers for emergency power, standby power, fire pump and load bank circuits. Provide barriers between emergency, standby and load bank circuit breakers. Load bank circuit breaker shall be rated for 100 percent of EPS capacity.

When the EPSS includes multiple accessories requiring power, provide a 208Y/120 volt, three phase load center panel to feed lube oil pumps, electric fuel pumps, cooling water pumps, electric motorized dampers, exhaust fans, lights, and receptacles. Feed the panel with emergency power.

Provide emergency power to the controls associated with combustion air, ventilation air and other systems that must operate when the engine-generator is operating.

Edit the specifications to include the EPS's maximum physical size, maximum allowable sound levels (including the load bank) and maximum allowable vibration levels. Sound and vibration requirements shall be based upon sound and vibration studies.

When multiple units are operated in parallel, the units shall be the same manufacturer and model, have the same kVA ratings, the engines shall utilize the same fuel type and the generators shall be wound with a 2/3 pitch. The loads served by multiple units operated in parallel shall be divided into multiple blocks, prioritized (emergency, legally required standby, optional standby) and controlled so the highest priority blocks receive power even if one unit fails. Emergency loads shall not be shed.

EPA Certification

Engine shall be factory EPA Certified and meet the current EPA exhaust emissions standards for engine-generators operated no more than 500 hours per year and no more than 100 hours per year in a maintenance/test mode. When a factory EPA Certified engine is not available, the engine shall be EPA Compliant Capable and the supplier shall provide the first field certification of EPA emissions compliance as part of the field start-up and performance testing.

EPS Sizing

Design of EPS sets shall be based upon the unit's code defined standby rating.

Size the unit using generator sizing software from one of the specified manufacturers and submit report to Design Manager. Provide sufficient capacity to start the unit's largest block of load while all other loads are running, without exceeding the specified maximum voltage or frequency drop.

Specify minimum required starting KVA, corresponding voltage dip percentage and temperature rise of alternators.

Provide 25 percent spare capacity above the peak projected load to feed future growth.

Automatic Transfer Switches

Specify ATSS to be provided as part of the EPS package and supplied by the EPS vendor. Do not specify them separately. ATSS shall be approved by the EPS manufacturer. ATSS shall be from the same manufacturer.

Provide 3 pole ATSS rather than 4 pole except where the generator neutral is grounded, the generator feeds multiple buildings, or 4 pole ATSS are required by code.

Provide open transition ATSS to feed loads which can withstand interruptions and will restart automatically after transfer to and retransfer from the EPS. Provide closed transition ATSS to feed loads, including elevators, which cannot withstand interruptions and will not restart automatically after transfer to and retransfer from the EPS.

Verify ATSS are adequately rated for the available fault current either from the EPSS or normal power system, whichever is greater. Closed transition ATSS shall be rated for the combined fault current contributions from the EPSS and the normal power system if the two power sources are paralleled for more than 100ms.

ATSS shall include full maintenance bypass and transfer switch isolation sections.

ATSs shall include a microprocessor based control panel. One ATS shall include a programmable generator exerciser time clock.

EPS Load Banks

EPS unit load testing shall be performed using a resistive load bank.

For EPS units located in an accessible location on grade (indoor or outside), provide a means to connect a portable load bank. Load bank staging locations shall be within 80'-0 of the EPS connection point.

For EPS units not located in an accessible location, provide a permanent, 100 percent rated, resistive load bank with integral control panel. Load bank design shall include the following:

- Master load on-off switch and load on-off step switches.
- Load dump circuit and associated components to immediately disconnect the load bank if a loss of normal power occurs during a load test. Show the control wiring on the drawings.
- Digital monitoring system with memory to display and log generator volts, amps, kW and frequency.
- Indicate the direction of heat discharge on the drawings.

Controls and Monitoring

Provide an NFPA 110 compliant control panel mounted on the EPS no more than 78 inches above the finished floor to the top of the panel, including the concrete housekeeping pad and vibration isolators.

Provide a guarded, remote manual stop station in accordance with NFPA 110. Locate it on the outside of the generator room or enclosure. Label it with a laminated plastic nameplate, white letters on a red background.

Provide a remote generator annunciator panel in the fire command center. For buildings without a fire command center, provide a remote annunciator panel in a location where it will be readily visible to maintenance personnel. The remote annunciator panel shall mirror all status indicators and alarms contained on the EPS control panel. Coordinate remote annunciator panel locations with U-M Division of Public Safety & Security, Facilities Maintenance and Utilities & Plant Engineering Department (UPE).

In fire command centers provide a generator remote “Auto-Run” switch and ATS status indicators in accordance with Design Guideline DG 5.11.

In addition to connections to remote annunciator panels, connect auxiliary “generator running” and “generator trouble” output contacts to separate points in the Building Automation System (BAS) DDC panel.

Connect an “on generator power” auxiliary contact in each ATS to a single point in a DDC panel for notification if any ATS transfers to generator power. Show these DDC points on the temperature control drawings.

Do not connect any EPS or ATS output contacts to MOSCAD or to the fire alarm system.

EPS control panel contacts shall be used for control of mechanical equipment required for EPS operation. Do not use ATS auxiliary contacts to control mechanical systems because false mechanical system operation can occur during ATS testing and maintenance.

Natural Gas Fuel System

Coordinate with DTEEnergy to ascertain the range of natural gas pressure available at the outlet of the DTEEnergy regulator and development of an engineered solution. Submit a Service Request form to UPE for new NG service arrangements. Edit Specification 263000 to specify this gas pressure range and update the basis of design with this information.

Obtain the approximate dimensions of the DTEEnergy gas meter train (often 12 feet or more in length) and locate the meter train where it won't detract from the building's appearance (include meter train in any EEDR efforts). Provide protection against vehicle impact where appropriate, such as concrete-filled steel pipe bollards with yellow PVC jackets.

Provide gas piping in accordance with NFPA 37, a second gas regulator at the engine in compliance with the EPS manufacturer's recommendations, and a gas pressure gauge downstream of the second gas regulator.

A frequent cause of EPS problems is low gas pressure caused by undersized gas piping resulting in excessive pressure drop. Size the gas piping system based on maximum gas flow of the EPS and other connected loads.

Engine Exhaust System

Design the exhaust system in accordance with the results of the exhaust re-entrainment study and in accordance with EPS manufacturers' instructions.

Calculate the exhaust system's expansion and contraction with temperature, and provide supports, slides and restraints as required.

Exhaust system piping in direct contact with the earth shall be stainless steel or otherwise protected from corrosion.

Direct the exhaust upward rather than horizontal, and away from buildings, trees, plants and anything else that is combustible.

Exhaust system design shall include the following:

- Flexible section to isolate the exhaust system from engine vibration.
- Hinged 90 degree, flapper style rain cap at the top of the exhaust stack. Do not provide a stack termination that deflects exhaust horizontally, including an inverted cone style cap.
- Manual blowdown valve in a pipe tapped into the lowest point of the exhaust system, and piped down to 24" above the floor for discharge into a bucket in an accessible location.

Provide a silencer with 35 dBA minimum attenuation when the EPS is located in or near an occupied building. Provide a silencer with 25 dBA minimum attenuation when the EPS is located

remote from occupied buildings. Provide a higher attenuation silencer when required by the results of the sound study. Refer to Design Guideline 230060 for additional sound control requirements.

A natural gas unit will require a 3-way catalytic converter. A diesel unit may require a catalytic converter or at least a particulate filter. Provide access for maintenance of the catalyst or filter.

EPS Room Requirements:

Architectural

Space and room requirements for EPSs shall be determined and accounted for during the Schematic Design Phase. Locating the room above the lowest level of the building is preferred.

Separate the generator room from occupied areas or provide sound-proofing and vibration isolation so the EPS will have minimal impact on surrounding areas. Generator room designs should maintain the sound criteria of the surrounding areas.

Per NFPA 110, generator rooms shall have a minimum two hour fire rating including rated walls and doors. Extend the walls from the floor to the deck above. CMU block walls are recommended for noise mitigation and safety. Obtain permission through the Design Manager before providing stud and wallboard construction. Expanded metal mesh, woven wire mesh or chain link fence are not acceptable for EPS rooms unless used to segregate spaces within the room.

Exit doors shall swing outward from the room.

- Exit doors shall be equipped with listed fire exit devices. Door locks shall be keyed with Best "BDM" cores.
- Provide an opening large enough for the passage of the largest shipping section of the EPS. Typically, this means a minimum 8 foot tall by 7 foot wide double door with a removable mullion.
- Personnel doors should be a minimum 36 inches wide.

Provide a 4 inch minimum housekeeping pad under each piece of floor-mounted equipment.

- Pads shall be smooth and level.
- Pads shall conform to the footprint of the equipment and shall be the full width and depth of the equipment, but shall not extend beyond the equipment by more than 4 inches. Pad edges shall be chamfered.
- The EPS housekeeping pad shall be steel reinforced in accordance with the EPS manufacturer's instructions.

Provide 2 coats of water-borne epoxy paint over a compatible primer on the concrete floor. Provide paint on the walls and ceiling.

Provide a 10 pound Type ABC fire extinguisher at each exit door.

Provide an unobstructed route to the building exterior to permit replacement of the largest shipping section of the EPS. Entire equipment access pathway, including egress route exterior door, and all intervening doors shall have free and clear area that complies with

requirements for EPS room listed above. Interior intervening doors/frames and other secondary systems constructed to be easily removable are an acceptable alternative. Design the floor of the entire route for the weight of the EPS. Provide a route and means to move drums of oil and other large maintenance items to the EPS (i.e. roof mounted units).

Mechanical

Avoid installing ductwork, piping, clean-outs, and other mechanical system components in the room unless they serve the room or EPSS. When there is no alternative to installing foreign ductwork or piping in the room, they should be installed over aisle ways and not over footprint of EPSS equipment.

Provide dry horizontal sidewall fire protection sprinklers. Sidewall sprinklers shall be supplied by the building wet sprinkler system from adjacent heated spaces. See Design Guideline 210000, for additional requirements.

- Do not locate the sprinkler heads over the EPSS equipment.
- Provide wire guards on the sprinkler heads.

When the EPS room will be located on the lowest level of the building and/or below-grade evaluate the risk from flooding and the resulting associated water damage to the EPSS equipment. Based on the risk analysis, determine if a floor drain with a backwater check valve should be installed. If required the backwater check valve shall be located outside of the room.

Provide sound attenuation at intake and exhaust dampers when required by the results of the sound study.

Provide motorized dampers, fed by emergency power, for combustion and cooling air in accordance with EPS manufacturer's instructions. Provide louvers exterior to the dampers when the dampers are visible to the public. Louvers shall be sized to avoid rain and snow intrusion and so as not to reduce design air flow rates of associated duct work and dampers.

Provide ventilation to remove equipment heat (in addition to EPS unit mounted radiator fan) and maintain equipment within their ambient temperature ratings under all weather and electrical load conditions.

Provide heat to maintain room temperature above 45 degrees F when the unit isn't running.

Electrical

Unless part of the EPSS, do not locate electrical equipment in the EPS room, including lighting and receptacle panels, central UPS systems, Building Automation System DDC panels, fire alarm control panels, security panels, or MOSCAD panels.

Provide manually-switched LED lighting in front of each EPS control panel, along either side of each EPS, in front of ATs and in front of other electrical equipment. Connect this lighting to emergency power. Provide a battery-backed lighting fixture or an emergency lighting battery pack in front of each EPS control panel, ATS and paralleling switchgear if provided.

Provide exit signs above the exit doors.

Provide two quad receptacles, each on a dedicated circuit, and connect them to emergency power. Receptacles shall be located on opposite sides of the room.

To protect EPSS equipment from water damage by activation of the fire protection sprinkler system, provide fire alarm system, multi-sensor, smoke/heat detectors to give an early warning of a possible fire. Also provide minimum of one combination audible/visual appliance. Fire alarm system devices shall be installed in accordance with Design Guideline 283100.

Indicate EPSS equipment working clearances on plan view drawings.

Provide full size copies of the building's EPSS One Line Diagrams and Riser Diagrams on the wall in front of the EPS. Drawings shall be minimum 24"x36", installed in wooden frames and protected by glass.

Outdoor Enclosure Requirements:

Provide the EPS manufacturer's standard weather-protective, non-walk-in outdoor enclosure for most projects. When recommended by the results of the sound study or when the EPS is adjacent to occupied buildings, provide an appropriately rated sound-attenuating enclosure.

- Provide a floor unless the enclosure will be fastened down to a level concrete pad. Enclosures that are open on the bottom to air or grating are not acceptable.
- Provide clearance above the radiator cap to permit viewing down into the radiator without using a mirror, and to permit adding coolant without using a pump.
- Provide access and clearance around the engine and generator for routine maintenance.

Back Feed Tap Box:

Evaluate the need for a back feed tap box for connection of a temporary portable EPS to a unit substation feeder breaker. Temporary portable EPSs are used during unit substation maintenance, generator maintenance and for support of designated loads during a prolonged power shutdown (i.e.: freezers, general building HVAC, etc.).

A generator back feed tap box may be required for buildings under the following scenarios:

- A permanently installed EPS is not required by code.
- To satisfy special program load requirements.
- For buildings with an EPS sized only for small emergency and legally required standby loads.

Design the tap box in accordance with Standard Detail 26110004. The tap box shall also include a phase rotation monitor with indicating light to signal correct phase sequence. Install phase rotation monitor label reading 'LIGHT INDICATES CORRECT PHASE ROTATION. IF NO LIGHT REVERSE ANY TWO LEADS'. Locate the tap box at the loading dock or where a portable generator can be parked adjacent to it.

Installation Requirements

The EPS, automatic transfer switches, load bank, accessories and supporting systems shall be installed, adjusted and tested in accordance with Specification 263000 and the other Division 23 and 26 specifications.

LIGHTNING PROTECTION

General

Early in the design of a new building, if the building will be taller than surrounding buildings and structures, provide a Lightning Risk Analysis in accordance with Appendix L of NFPA 780. The Project Team will review the Risk Analysis and determine if a lightning protection system should be provided.

Lightning Protection System Requirements

If it is determined that a lightning protection system should be provided, provide a traditional type of system in accordance with the appropriate chapter of NFPA 780. Do not provide an early streamer emission system or a charge dissipation system.

Provide UL listed or labeled lightning protection components and cables. Provide copper or bronze components and cables. Aluminum components and cables are not acceptable.

Ground the lightning protection system using separate copper-clad ground rods in accordance with Design Guideline 16450. The building ground system rods shall not be used. Do not provide chemically enhanced ground rods or ground test wells.

Obtain an electrical inspection of the underground components before burying them.

Test the lightning protection system in accordance with Design Guideline 16950. After both the lightning protection system and the building ground system have been completed and tested, bond the two systems together. Obtain a final electrical inspection.

The lightning protection system shall be installed by an Underwriters Laboratories Master Label Installer in accordance with UL 96A. After the system is completed and tested, the Installer shall provide a UL Master Label suitable for mounting in the building’s unit substation room.

- USGBC, LEED Reference Guide for Green Building Design and Construction

Design Requirements

Use U-M Master Specification 265100 "Interior Lighting" as basis for design and specifying interior lighting on all projects. Use the appropriate U-M 260000 Series Standard Details. Edit the specification and details to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

Design light levels in accordance with the IES Lighting Handbook. Design for the full range of occupant ages, the tasks being performed and the associated need for contrast.

Show the target design footcandle (fc) levels for each space in Design Development review documents.

The project's interior lighting power allowance shall not exceed the interior lighting power allowances listed in ASHRAE 90.1. When required by Design Guideline 3.2, the project's interior lighting power allowances should contribute toward a building's total annual energy cost savings goal below ASHRAE 90.1 baseline building. Design documents shall include a tabulation of rooms with design lighting power densities (LPD) and associated ASHRAE allowable LPD's.

Where applicable during the Schematic Design phase identify LEED credits that will be pursued associated with the design of the lighting and lighting controls for the project.

Promote the use of skylights, clerestory windows, light shelves and other architectural features to channel non-glaring natural daylight into the building and minimize the use of electrical lighting.

Promote the use of light colored finishes on ceilings, walls, and floors to increase light reflectivity and reduce the need for artificial ambient light.

Minimum ambient lighting levels should be coupled with task lighting as needed. Promote the use of under-shelf and table lamp task lights on laboratory benches, office desks, study tables, and other work surfaces to further reduce the need for artificial ambient light.

Provide lighting calculations on a 2 foot by 2 foot grid to show normal power lighting levels and to demonstrate compliance with code requirements for egress and emergency lighting.

Normal Lighting:

Corridors and toilet rooms shall be designed for a lighting level of 10 fc average minimum, at floor level.

Design lighting so the ratio of light levels between adjacent spaces does not exceed 10:1.

Provide linear fluorescent and/or light emitting diode (LED) lighting for most applications. Avoid incandescent, HID and compact fluorescent lighting.

Provide vertical illumination across the full length and height of chalk and marker boards, library shelves, wall-mounted art, signage, and other vertical surfaces requiring illumination.

Consider indirect lighting to minimize glare. Avoid locating downlights above shiny floors and stairs where reflected glare may cause falls.

Locate fixtures, remote ballasts and/or remote LED drivers so they are accessible for maintenance by the use of a 10'-0 step ladder only, or provide fixtures equipped with a lowering device. Obtain Design Manager's approval before locating fixtures, remote ballasts, and/or remote LED drivers where a lift, scaffolding or bosun chair is required for maintenance.

Locate wall fixtures sufficiently below ceilings and provide cove fixtures with adequate access openings so lamps and ballasts can be replaced without removing fixtures or cutting coves. Coves with lighting shall comply with the maintenance accessibility requirements noted above.

Locate recessed mounted fixtures so their lenses can be removed and their components can be replaced without removing adjacent architectural, mechanical, or electrical equipment

Egress Lighting

Along the building-code-defined means of egress (including the exit discharge) provide a lighting level (at floor level) of 1 fc minimum at all times. Means of egress shall include designated aisles, corridors, passageways, stairs, ramps, escalators and landings leading from all occupied spaces to an exit or public way. Private offices and space within an individual's work cubicle need not be included in the means of egress (for lighting purposes), but aisles serving these spaces are. Because aisles could be relocated in open offices with movable furniture and/or furniture-based partitions, the above-noted minimum egress lighting level shall be provided throughout these open office spaces. Egress lighting for open office spaces with fixed partitions is only required along designated aisles.

Egress lighting fixtures required to satisfy minimum fc levels that also serve as emergency lighting shall be continuously illuminated or controlled by occupancy sensors (OS) via UL924 control units. Egress lighting shall not be controlled by manual switches. Lighting in stairways and for elevator landings may be partially controlled by OS but lighting levels shall not be reduced at any time below code-mandated minimum fc levels. Spaces that require egress lighting and incorporate dimming controls shall be designed to prevent reduction of lighting levels below required minimum egress lighting levels or include an interface with the fire alarm system for lighting control similar to requirements for an assembly occupancy.

Egress lighting systems in buildings or portions of buildings under State Bureau of Fire Safety jurisdiction shall also comply with NFPA 101 requirements associated with utilizing OS for control, including interface with the fire alarm system (when fire alarm system is capable of controlling lights). Compliance with these NFPA requirements is applicable only for portions of the egress lighting system located within egress paths defined in NFPA 101.

Emergency Lighting:

Provide an emergency lighting level (at floor level) along the means of egress (including the exit discharge) of 1 fc average and 0.1 fc minimum. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.

Connect an appropriate number of lighting fixtures to generator-backed emergency lighting circuits whenever generator emergency power is available. If generator emergency power is not available, provide emergency lighting battery pack units.

- Do not locate emergency lighting battery pack units outdoors or in unheated spaces.
- In finished spaces, backing up normal lighting fixtures with battery pack units is preferred to providing sealed beam LED wall pack emergency lighting units.

- Emergency battery pack units shall not contain audible alarms.
- Battery-inverter systems for single room applications may be used with Design Manager's approval. Central battery-inverter systems shall not be used.

Provide sealed beam LED wall pack emergency lighting units in the following rooms even when generator-backed emergency lighting is provided:

- Unit substation and emergency generator rooms.
- Elevator machine rooms, elevator control rooms, and on Machine-Room-Less (MRL) elevator machines.
- Mechanical rooms containing boilers, chillers, fans, pumps or compressors.

Lighting in Elevator-Related Spaces:

Provide elevator space lighting in accordance with the Michigan Elevator Code. Strict compliance is mandatory to obtain an elevator permit.

- Elevator lobbies: 10 fc minimum at elevator door sills at floor level with the elevator doors closed.
- Elevator machine rooms and control rooms: 19 fc minimum at floor level everywhere.
- Spaces containing elevator machinery (MRL elevator machines, remote sheaves, etc.): 19 fc minimum on the equipment.
- Elevator pits: 10 fc minimum at floor level everywhere.
- When the elevators are capable of operating on generator standby power, connect all elevator space lighting to generator emergency power.
- When the elevators are not capable of operating on generator standby power, connect elevator space lighting to generator emergency power anyway if emergency power is available. If generator emergency power is not available, provide 1 fc average and 0.1 fc minimum of battery-backed emergency lighting in elevator spaces.
- Several U-M departments (typically - Healthcare, Housing, Engineering, Parking) require and will pay separately for vertical-mounted, metal guarded, fluorescent strip lights the full height of each elevator shaft. Coordinate with the Design Manager to determine if elevator shaft lighting is required. If required, control the shaft lighting from 3 locations including the machine or control room, the top landing and the elevator pit.

Control Systems:

Designs for control systems shall be represented on project specific drawings. Proposed locations of all system equipment, components and devices shall be shown. A submission package for lighting control systems that consist of manufacturers cut sheets alone is not acceptable. Include wiring diagrams, sequence of operation and programming instructions at Design Development phase.

Lighting System Components

Lighting Fixtures:

Lighting fixtures shall be listed and labeled by Underwriters Laboratories (UL) or other approved Nationally Recognized Testing Laboratory (NRTL). Provide fixture types known to have been used with success elsewhere. Do not specify newly developed or unproven fixtures.

Specify manufacturers listed in the Electrical Preferred Manufacturers List (PML). When necessary to meet special architectural or photometric requirements, request Design Manager approval before specifying fixtures from other manufacturers. Demonstrate to the Design Manager that the proposed fixtures are available from a local supplier known by U-M for good quality products and service. Demonstrate that replacement parts are readily available.

To obtain competitive pricing, specify a minimum of three manufacturers for each fixture type. To reduce pricing, specify fixtures from local suppliers who can package multiple fixture types. After the Design Development phase, the lighting designer shall send a copy of the lighting fixture schedule to each of the lighting representatives listed in the Electrical PML Section 265100 to request comments and recommended equivalents. The lighting designer shall evaluate the proposed recommendations to ensure design compliance and then incorporate equivalents into the lighting fixture schedule. The proposed lighting equivalents shall meet or exceed the design requirements as well as any other requirements in the U of M Design Guidelines. Refer to Electrical PML for local supplier information.

Provide lighting fixtures rated for operation at 277 volts wherever possible. Fixtures rated for operation at 120 volts may be required for Housing facilities, renovation projects, track lighting and for specialty applications.

Lighting fixtures in Housing facilities shall be high abuse / impact resistant, especially in student rooms and corridors.

Specify top covers for pendant bowl and wall sconce fixtures to keep debris, dust and bugs out.

Lighting fixtures installed adjacent to, or in direct contact with, insulation shall be IC rated.

Lamps:

In general, linear fluorescent lamps shall be 4' maximum, T8, with a color temperature of 3500 degrees K, Color Rendering Index (CRI) of 85 minimum and average rated life of 24,000 hours, minimum.

High output T5 fluorescent lamps matching the T8 lamps in color temperature and CRI may be used only when necessary to meet special fixture or photometric requirements. U-tube and normal output T5 fluorescent lamps shall not be used.

LED sources shall have a color temperature of 3500 degrees K, a CRI of 80 minimum, and a lumen maintenance L70 rating of 50,000 hours minimum.

Halogen MR type lamps are prohibited. LED MR type lamps may be used.

Request Design Manager's approval before specifying lamp technologies other than those listed above. Demonstrate to the Design Manager that the proposed lamp technologies provide unique advantages to the project.

Ballasts and Drivers:

Ballasts for T8 and high output T5 fluorescent lamps shall be NEMA Premium Ballast (NPB) program compliant, electronic type, programmed start, series circuited, and rated

for a minimum start temperature of 0 degrees Fahrenheit. Ballasts shall be of the single, two, three, or four-lamp type as appropriate for the switching scheme, and shall only serve one fixture.

LED drivers shall be electronic-type, labeled as compliant with radio frequency interference (RFI) requirements of FCC Title 47 Part 15, and comply with NEMA SSL 1 "Electronic Drivers for LED Devices, Arrays, or Systems". LED drivers shall have a sound rating of "A", have a minimum efficiency of 85 percent, and be rated for a THD of less than 20 percent at all input voltages.

Dimmable ballasts/drivers with 0-10V controls are preferred. When separate control wiring is required clearly show this on the plan drawings. Route it in the same conduit as the power wiring when allowed by code and the manufacturer.

Ballasts and drivers shall be rated for the extremes of ambient temperature in which they are located. Specify ballasts and drivers rated for reliable starting to minus 20 degrees F for fixtures mounted in unheated spaces. Specify high ambient temperature ballasts and drivers for fixtures mounted indoors in direct sunlight or in high ambient temperature spaces.

Exit Signs:

Provide exit signs to meet code egress requirements, in rooms where code requires two or more exit doors, and in rooms designed for 50 occupants or more. In addition, provide exit signs in unit substation rooms, engine-generator rooms and large mechanical rooms.

Exit signs shall be on at all times and shall be LED illuminated. Radioactive, self-luminous and photoluminescent exit signs of any type shall not be used.

Exit signs shall have stencil faces, red letters and red directional arrows. Provide green letters and arrows only in buildings where existing exit signs have green faces.

Provide abuse resistant exit signs in University Housing facilities and parking structures.

Lighting Control Requirements

Design lighting controls with an understanding of the user's operational requirements and functional needs for the building and the spaces within it. Requirements of the controls shall be defined at the schematic design phase of the project. Basis of Design shall be updated with this information.

Lighting controls shall be a straightforward, cost effective means of reducing energy consumption and maintenance costs. The systems shall be placed, labeled, and configured to be 'user friendly' and intuitive.

Lighting controls for all building spaces shall comply with the applicable version of ASHRAE 90.1.

Sensors and any interfaced lighting control components shall fail to the 'ON' position so that lights are not disabled by a failed occupancy sensor or ancillary interface device.

Control each room and each block of open office space separately. Lights shall not be controlled from panel circuit breakers.

Do not provide proprietary control systems that inhibit competition and are difficult to maintain by the users.

Do not provide device-addressable lighting controls or a BACNet interface between the lighting controls and the HVAC controls at this time. These technologies are not sufficiently developed yet, and their additional installation, programming, and maintenance costs far exceed their energy cost savings.

Provide lighting control for the following typical spaces as noted below:

- Corridors and Lobbies – Occupancy sensors
- Offices, Workrooms, Breakrooms, Storage Rooms – Vacancy sensors.
- Open Offices – Dimming controls and vacancy sensors.
- Small Conference Rooms - Dimming controls and vacancy sensors.
- Small Classrooms - Dimming controls and vacancy sensors.
- Large Conference Rooms – Multi-zone controls with dimming and vacancy sensors.
- Large Classrooms – Multi-zone controls with dimming and vacancy sensors.
- Restrooms and Locker Rooms - Occupancy sensors.

Vacancy / Occupancy Sensors:

Specify vacancy / occupancy sensors in most rooms and spaces to control the lighting. Define proposed sensor types and technologies in Basis of Design.

Show sensor locations on the reflected ceiling or lighting plan drawings. Do not make the Contractor responsible for determining sensor locations. Follow manufacturer's spacing instructions to achieve total space coverage. Indicate the manufacturer's recommended separation from supply air diffusers and other building features which can affect proper sensor operation. Include interferences from furniture, partitions, soffits, ceiling height variations, etc.

Sensors may be passive infrared or dual technology (infrared/microphonic or infrared/ultrasonic). Infrared/microphonic sensors are preferred to infrared/ultrasonic OSs which are susceptible to nuisance activations from ventilation air currents.

- Supplemental power pack units shall be located above the ceiling (accessible) adjacent to the associated light switch/occupancy sensor location.
- Infrared/ultrasonic sensors shall operate at 40 kHz minimum to avoid interfering with hearing aids. See DG 5.2 for restrictions in animal facilities.
- Sensors shall operate without producing an audible clicking noise during switching.
- Sensors shall be powered by the lighting circuit. Battery powered sensors shall not be used.

Provide a schedule showing the required sensor settings for each area type. Include "manual on", "auto on", "auto off" and the "time delay" in seconds.

Provide manual switches in lieu of sensors in unit substation, electrical, mechanical and telecommunications rooms and in spaces where an unexpected shut-off of the lights could pose a safety risk.

Provide multi-contact sensors to control both the lighting and the ventilation.

- Use the lighting sensors to reduce the room ventilation, turn the ventilation off or widen the thermostat dead band during unoccupied periods.
- When an area has multiple ventilation zones, provide separate sensors for each ventilation zone to control both the lighting and the ventilation in that zone.

Location of occupancy sensors shall be coordinated with furniture layout, ceiling mounted fixtures and devices, and other features that may impede its operation.

Photocell Sensors:

Specify photocell sensors in areas where daylight harvesting is required per ASHRAE 90.1.

Depending on the area, in response to photocell daylight readings, lighting control schemes can consist of bulk switching, staged switching, or dimming. Areas where a particular illumination level is required, such as an office, should use dimming. Areas such as atriums, gyms or public spaces should consider bulk or staged switching.

In rooms with large windows, orient fixtures in rows parallel to the windows. Provide daylighting controls to switch off or dim the fixtures near windows when the incoming daylight is high.

Photocell sensors shall be equipped with adjustable cloud or shadowing delay and adjustable set point functions. Provide a schedule showing the required photocell settings for each area type.

Dimming Systems:

Dimming systems shall not be 'shared' among multiple rooms, unless those rooms are separated by a movable partition.

Whenever possible, install new systems to be similar in operation and function to other systems already in the building for easier understanding and operation by 'Users'.

In rooms with an A/V system, dimming system controls shall be interfaced with the A/V system User controls.

Master Automated Lighting Control System:

Prior to specifying a master lighting control system perform a cost-benefit analysis (at the schematic design phase) to justify this method and complexity of controls.

Lamp and Ballast Recycling

Lamps, ballasts and drivers being demolished or replaced shall be recycled in accordance with the University recycling policy contained in Specification 260500.

DESIGN GUIDELINE 265600 **EXTERIOR LIGHTING**

Scope

The overall goal of exterior lighting (street, parking lot, pedestrian and building-mounted lighting) is to improve and enhance the sense of safety and security in an efficient and sensitive manner. The lighting design shall take into consideration horizontal and vertical luminance and the uniformity of light distribution while minimizing glare, light pollution and light trespass. In addition, the lighting design should impart a sense of order, contribute to the overall campus aesthetic and ambience, enhance wayfinding, and strengthen U-M identity.

Design Process

This Design Guideline standardizes U-M exterior lighting equipment and installation requirements to strengthen U-M identity and to enhance lighting reliability and maintainability. However, it is not intended to limit creativity or innovation. Newer technologies and improved products will be considered, but must be approved by the Design Manager before being used. Significant deviations from this Design Guideline may require External Elements Design Review (EEDR) Committee or Regental approval.

At the end of Schematic Design, submit a preliminary exterior lighting plan showing the proposed lighting locations and general equipment types.

At the end of Design Development, submit the following electronic files for U-M mock-up and approval:

- Lighting plans showing dimensioned lighting equipment locations and types.
- Lighting simulations showing calculated results, including:
 - Name and version of simulation software used.
 - List of assumptions including Lamp Lumen Depreciation (LLD), surface reflectance values, and other pertinent modeling inputs.
 - Summary results for each area (maximum, minimum, average, avg./max., avg./min.).
 - Average maintained horizontal illuminance on grade, shown in a grid pattern, in footcandles or lux.
 - Average maintained vertical illuminance at 5 feet-6 inches above grade in at least two directions of main travel, in footcandles or lux.
 - Lighting power density.
- Lighting equipment specifications and manufacturer cut sheets, including:
 - Fixture types, descriptions, dimensions, optics, materials, finishes, light distribution types and IESNA-formatted photometric data files.
 - Lamp type for each fixture, and lamp wattage, color temperature, color rendering index and related life.
 - Pole and/or mounting support descriptions, dimensions, materials and finishes.

Design Requirements

Use the referenced U-M Master Specification Sections and Standard Details to specify exterior lighting equipment and installation requirements. Make these documents project specific, but do not deviate from the requirements without Design Manager approval. Turn on hidden text and follow the purple Spec Editor notes when editing specification sections.

Facilitate facial recognition through vertical illumination and careful selection of the color temperature and color rendering of the light sources.

Control light distribution to prevent direct glare to motorists, pedestrians and occupants of adjacent buildings, light pollution, and light intrusion onto adjacent private property.

Compensate for existing or planned light obstacles such as buildings, fully leafed trees, accumulations of fallen leaves and piles of snow.

Locate lighting to emphasize specific building components and site features (i.e. building entrances, fenestration patterns, columns, pedestrian/vehicular nodes or gateways). Locate lighting symmetrically at building entrances. Alternate lighting on both sides of long, straight sidewalks.

Locate lighting to frame important campus views and to avoid competing with existing illuminated and non-illuminated campus elements.

Locate lighting on U-M property. Do not locate lighting in City right-of-way or on private property. Obtain University Planner and City approval before installing University lighting in City right-of-way.

Provide lighting to illuminate emergency telephone kiosks and bus shelters within the project boundary if they are not currently illuminated.

Coordinate pole base locations with existing and planned underground obstructions including tunnels, duct banks, pipes and electrical cables. Provide custom pole base designs to attach poles to the tops of walls, bridges, parking decks, tunnels and similar structures.

Locate lighting outside the drip lines or root zones of significant (in size or age) vegetation. Request that U-M clear any significant vegetation if required.

Avoid lighting sporting and picnicking areas near Housing facilities because this encourages their use late at night.

Locate building-mounted lighting 12 feet minimum above grade. Lighted bollards, hand rail fixtures, in-wall fixtures, step lights, under-bench fixtures and in-ground fixtures are strongly discouraged because they are unreliable. Underwater pool and fountain fixtures are prohibited. Fixtures capable of being stepped on or touched shall not exceed 120 degrees F to the touch.

Provide code-required emergency lighting at building exit discharges. Exit discharges include landings, porches, stairs, ramps, and infrequently sidewalks, up to the point where they qualify as the public way. Feed this emergency lighting with generator-backed emergency lighting circuits when available, or with an indoor-located lighting inverter when a generator is not available. Do not specify local battery packs for exterior emergency fixtures.

The University is transitioning from fluorescent and metal halide to LED exterior lighting. Provide LED fixtures for new installations. Request Design Manager approval before matching non-LED fixtures when replacing or adding fixtures within an existing group.

Specify a lighting color temperature of 4000 - 4100 degrees K. Request Design Manager approval before matching a different color temperature when replacing or adding fixtures within an existing group.

Specify LED fixtures by stating manufacturer's standard lumen output. Do not specify LED fixtures by stating wattage which may change as technology advances.

Comply with Design Guideline SID-D requirements related to energy conservation.

- U-M exterior lighting is governed by life safety regulations which provide security to pedestrians at all hours of the night. Therefore it is exempt from ASHRAE 90.1 requirements for dimming or shutoff during nighttime hours.
- Exterior lighting power densities shall not exceed the power allowances in ASHRAE 90.1. Support U-M energy conservation efforts and provide power densities as low as reasonable within the overall lighting design goals.

On a project pursuing LEED certification, investigate earning the “Light Pollution Reduction” LEED point.

Provide maintained (not initial) exterior light levels in accordance with IESNA recommendations which are summarized for most applications in the following table. Base light level calculations on an ambient air temperature of 50 degrees F.

AREA DESIGNATION	CRITERIA	ATTRIBUTE	TARGET
Pedestrian ways distant from roadways	Horizontal illuminance	Average maintained illuminance on pavement	0.5 footcandle
		Average-to-minimum uniformity	5:1*
	Vertical illuminance	Average maintained illuminance at 5-feet/6-inches above grade in at least two directions (in direction of main travel)	0.5 footcandle
		Average-to-minimum uniformity	5:1*
Pedestrian ways adjacent to roadways	Horizontal illuminance	Average maintained illuminance on pavement	0.5 footcandle
		Average-to-minimum uniformity	5:1*
	Vertical illuminance	Average maintained illuminance at 5-feet/6-inches above grade in at least two directions (in direction of main travel)	1.0 footcandle
		Average-to-minimum uniformity	5:1*
Parking lots	Horizontal illuminance	Minimum maintained illuminance on pavement	0.6 footcandle
		Average-to-minimum uniformity	4:1
Roadways	Horizontal illuminance	Average maintained illuminance on pavement	0.9 footcandle
		Average-to-minimum uniformity	4:1
*Raise light levels at brightly lit building entrances when necessary to meet this uniformity.			

Feed street, parking lot and pedestrian lighting at 277 volts from 480Y/277 volt, 3 phase, 4 wire circuits. Feed them with four No. 4 AWG conductors plus a No. 8 AWG ground conductor in a 1-1/4 inch, Schedule 40 PVC or HDPE conduit. Alternate feeder circuit phases for each successive light so that a single phase failure will not leave large areas in total darkness. Balance the load across all three phases and limit the total load to 29 kVA. Before adding lighting to an existing circuit, request that U-M provide the existing load on the circuit.

Feed building-mounted lighting at 277 volts single phase. Feed them with No. 10 AWG conductors plus a No. 10 AWG ground conductor.

Provide dedicated circuits for emergency telephone kiosks, illuminated signs, parking lot electric gates and Parkmasters. Feed them at 120 volts single phase except when the equipment requires 277 volts single phase. Feed them with No. 10 AWG conductors plus a No. 10 AWG ground conductor in a 1 inch, Schedule 40 PVC or HDPE conduit. Coordinate the underground power conduits with the underground IT conduits.

Control street, parking lot, pedestrian, and building-mounted lighting with lighting contactors. See the applicable Standard Details. Lighting contactors shall be switched by a Building Automation System (BAS) Direct Digital Control (DDC) panel contact. Provide photocell control of the contactors only if DDC control is not available. Do not provide time switch control or individual photocells in the fixtures. Wire the control circuits so they are fail safe and the lighting will be energized in the event of a BAS System or photocell failure.

Products

Street and Parking Lot Lighting

In general, provide the U-M standard low profile, full cutoff, black aluminum LED fixtures on 30 foot, round, tapered, black aluminum poles. Pole height may be reduced when necessary to minimize light trespass on surrounding areas. On the top deck of parking structures, the poles shall be hinged at the base so fixtures can be maintained without requiring a bucket truck.

Pedestrian Lighting

Provide the U-M standard 16 inch, round globe LED fixtures with 6 spoke, black globe baskets, mounted singly, in doubles, or in fives on round, tapered, black aluminum poles. Specify single globe fixtures as 6020 lumens each, double globe fixtures and five globe fixtures as 4090 lumens each globe, and all fixtures with Type V distribution. As an alternative to mounting the fixtures on poles, mount them on column tops or with wall brackets. Specify pole lengths and mounting brackets to locate the horizontal center bands of the single globe fixtures at 12 feet, 0 inches above grade. Double globe and five globe fixtures can be taller.

Building-Mounted Lighting

In general, provide black aluminum LED downlight, hanging or wall sconce fixtures at building entrances to compliment the building's architecture. Floodlighting or highlighting of building facades is generally discouraged. Provide black aluminum LED wall packs at loading docks and similar service areas. Select and aim wall packs to minimize glare.

Lighting Contactors

Lighting contactors for street, parking lot and pedestrian lighting shall be NEMA 1, 3-pole, 4-wire, 480 volt, 100 amp, combination fused switch contactors with 50 amp fuses. They shall be electrically held and include a hand-off-auto switch and a 300VA, 277-120V control power transformer. These lighting contactors will be furnished by the U-M Utilities Power and Lighting Shop (734 647-7049) for installation by the contractor. Place the appropriate Standard Detail on the lighting drawings.

Lighting contactors for building-mounted lighting shall be NEMA 1, 3-pole, 4-wire, 480 volt, 30 amp, combination fused switch contactors with 20 amp fuses. They shall be electrically held and include a hand-off-auto switch and a 300VA, 277-120V control power transformer. These lighting contactors shall be provided by the contractor. Place the appropriate Standard Detail on the lighting drawings.

Junction Boxes

In-ground junction boxes shall be precast polymer/fiberglass, nominally 13 inches by 24 inches by 15 inches high, bottomless, with a single piece removable cover engraved "UM OUTSIDE LIGHTING".

Execution

Pole Bases and Underground Work

Direct the contractor to contact Miss Dig (800 482-7171 or 811) before performing excavation work.

When existing lighting is being demolished, specify the following:

- Power shall be maintained to lighting on the same circuits but outside of the work area.
- Demolished lighting fixtures and poles shall be turned over to the U-M Utilities Power and Lighting Shop.
- Existing pole bases and wiring shall be removed completely. Underground conduits may be abandoned in place. Holes left by the pole bases shall be backfilled. Pavement shall be restored to match existing and lawn areas shall be leveled and prepared with fresh top soil for re-seeding by the University.
- Temporary lighting shall be provided at the same lighting levels as the demolished lighting until the demolished lighting is replaced. As an alternative, construction fencing shall be provided to prevent public access to the area until the demolished lighting is replaced.

Locate pole bases in accordance with the appropriate Master Specification Sections and Standard Details. Bases should not be located in sidewalks. They should be located to minimize impact on snow removal and lawn mowing, and where they will not be damaged by maintenance equipment.

Show on the plan drawings a spare 1-1/4 inch conduit stubbed out from every fourth or fifth pole base, especially at corners and intersections, for expansion of the lighting circuit in the future. Select pole bases with one or two active conduits. Do not exceed three conduits per pole base. Stub out the spare conduits 3 feet and aim them toward open lawn areas.

Provide a 5/8 inch diameter x 8 foot long copper clad ground rod for each light pole base, and connect it to the pole ground lug. See the Standard Details.

Specify Schedule 40 PVC or HDPE conduits to feed in-wall, step and in-ground lighting. Develop a detail requiring conduits to enter fixtures only from below.

Design underground conduit runs parallel to parking lot edges, sidewalks, and driveways, and adjacent to the pavement edges, to avoid interfering with future landscaping or other excavations.

Provide in-ground junction boxes at key locations to enable expansion of the lighting in the future. Avoid locating in-ground junction boxes in sidewalks or driveways. Hide them in landscaping whenever possible.

When streets, parking lots, or sidewalks are cut for the installation of any underground utilities, provide a 6 inch sleeve for future exterior lighting circuits. See the Standard Details.

Lighting Control

Locate lighting contactors indoors, preferably on the inside of an exterior wall. When feeding street, parking lot and pedestrian lighting, penetrate the exterior wall below grade with Schedule 40 PVC conduits. Seal the penetrations per Specification Section 260533. Extend the conduits to in-ground junction boxes located 5 feet from the building wall.

Quality Assurance

Specify that the Contractor contact the U-M Code Inspection Department (734 764-2457) before pouring concrete, backfilling excavations, and energizing circuits.

Record Drawings

Specify that electronic files of record drawings or scanned mark-ups of construction drawings be provided at Substantial Completion for forwarding to the U-M Utilities Power and Lighting Shop. Record drawings shall show the dimensioned locations of lighting poles, stubbed-out spare conduits, in-ground junction boxes, underground sleeves, the circuit numbers for all circuits, and deviations from the design. Dimensions shall be from permanent building or landscape features.

Reference Documents:

ANSI/TIA/EIA-568-B, "Commercial Building Telecommunications Cabling Standard"

ANSI/TIA/EIA-569-A, "Commercial Building Standard for Telecommunication Pathways and Spaces"

ANSI/TIA/EIA-607, "Grounding and Bonding Requirements for Telecommunications in Commercial Buildings"

Design Requirements

Provide Building Entrance (BE) rooms, Telecommunication Rooms (TRs), telecommunication cable pathways, Work Area Outlets and incidentals as described below and in accordance with the Program Documents. Coordinate the telecommunications system design with the Design Manager. Copy the related Master Specification Sections and appropriate Standard Details into the design documents, and edit them to make them project specific.

Telecommunications systems in most U-M Ann Arbor Campus buildings are operated and maintained by the U-M ITSComm Department. In addition, ITSComm is usually involved with the telecommunications systems in U-M Health System buildings, on the U-M Dearborn and Flint Campuses, and at off-campus and leased facilities. This Guideline provides requirements for most University owned or operated buildings, even if the “serving utility” is not ITSComm.

System Description

The BE room is the main termination point in a building. TRs are distribution and termination rooms located on each floor of a building and serve Work Area Outlets within 293 cable feet (including 6 feet of slack at the TR room and 3 feet at the Work Area Outlet). If cable lengths will exceed 293 feet, provide additional TRs. The BE may also be the TR for that floor. Stack the BE and TRs wherever possible. The BE is connected to TRs via backbone cables in conduits. The BE is connected to equipment external to the building via service entrance cables in duct banks and outside plant cables in direct buried conduits. See Design Guideline SBA-C for additional architectural, mechanical and electrical requirements related to the BE and TRs.

ITSComm generally provides the network equipment, cabling and terminations from their network backbone to the Work Area Outlets, including the faceplates and telephone instruments at the outlets. Provide ITSComm with AutoCAD files of the completed CD phase telecommunication plan drawings. ITSComm will add numbers to the Work Area Outlets and cabling information to the drawings for their use in providing the cabling and terminations.

The current cable plant provides multiple 4-pair cables of copper conductors from each Work Area Outlet to the nearest BE or TR. These cables are used for all voice, telephone set power, and data services, including point-to-point and local area networking. Separate RG-6 coaxial cables are installed to locations noted for closed circuit TV and/or cable TV.

All Work Area Outlet (station) wiring will be home run from the Work Area Outlet to the nearest TR. For transmission integrity, no intermediate splices or terminals will be allowed. During renovations, if the existing cables will be too short, modify the existing cable pathways as necessary so new cables can be installed.

Telecommunication Service Entrance and Outside Plant Cabling

Consult with the Design Manager and ITSComm prior to proceeding with the telecommunication service entrance design.

Duct Banks, Manholes, Hand Holes and Underground Conduits

Provide a minimum of four 4-inch service entrance conduits in a concrete-encased duct bank extending from a location specified by ITSComm (typically a telecommunication manhole) to the building. Slope duct banks downward toward manholes and away from the building a minimum of 6 inches per 100 feet. Duct banks shall not route water from manholes into the building or contain traps between manholes where water may accumulate.

Encase service entrance conduits in concrete except where they terminate at poles. When terminating at a pole, clamp the conduits rigidly to the pole at a 90-degree separation from power conduits clamped to the pole.

Provide 12 foot by 6 foot by 7 foot high (inside dimensions) telecommunication manholes unless smaller manholes are approved by ITSComm.

Provide 1-1/2 inch minimum direct-buried conduits for outside plant cables serving emergency telephone kiosks, digital signs, parking controls and similar outdoor equipment.

Underground conduits shall not include more than 180 degrees of total bends or exceed 400 feet in length between pull points (manholes or hand holes), and shall have a bending radius of at least 10 times the conduit diameter. Provide manholes or hand holes in straight sections of conduit runs when necessary to meet these requirements. Hand holes shall not be used in place of conduit sweeps for directional changes in underground conduits. Conduit bodies, specifically LB fittings, are not allowed anywhere. Provide a nylon pull string in each conduit.

Provide a 6 inch wide red marker strip in the trench 1 foot above the duct bank or direct buried conduit.

In multi-utility trenches, the minimum spaces between telecommunication conduits or cabling and other facilities are: 3 inches where separated by concrete, 4 inches where separated by masonry, and 12 inches where separated by well-tamped earth.

Where conduits enter a building, extend the conduits 6 inches beyond the interior wall or floor. Plug spare conduits with water-tight mechanical seals.

If the termination point (typically the BE) of the building service entrance or outside plant cables is more than 50 feet inside the building, or if the cables run through plenum spaces, install the cables in galvanized steel rigid metal conduits. As an alternative and only when approved by ITSComm, provide a 4 foot by 4 foot minimum backboard where the cables entering the building can be spliced to cables rated for indoor use. Provide the NEC-required working space in front of the backboard. Piping and ductwork shall not be routed above the backboard.

Direct Buried Service Entrance Cables

Direct-buried service entrance cables are typically allowed only at off-campus and leased facilities, and only when specifically noted in the Program Documents. Consult with ITSComm prior to proceeding with direct-buried service entrance designs.

Inside Plant Cabling

Telecommunication Cable Pathways

Provide a continuous cable pathway between each Work Area Outlet and the nearest TR to support and protect the station cables. Acceptable cable pathways in order of preference are conduits, cable trays, J-hooks, wireways and underfloor duct systems. Cable pathways shall be continuous and unobstructed, accessible for maintenance and installation of additional cables with minimal disruption to building occupants, and located at a safe working height. Cable pathways serving multiple outlets shall include spare capacity for future use.

Conduits

Provide a conduit from each Work Area Outlet to the nearest TR or cable tray, or as a minimum to above the ceiling. Size conduits for a maximum of 40 percent fill. Minimum conduit size to an outlet box shall be 1 inch, except conduits to wall telephone outlet boxes may be 3/4 inch minimum. Alternate larger conduit sizes will be noted in the Program Documents.

Daisy chaining of outlet boxes is unacceptable, but up to three outlet boxes may be served from one NEC-sized junction box. Size the conduit feeding the junction box as follows:

- 1-1/4 inches for serving two outlet boxes.
- 1-1/2 inches for serving three outlet boxes.

Provide a 1-1/4 inch conduit for serving up to three 1-gang outlets in a surface raceway. Provide multiple 1-1/4 inch conduits to surface raceways containing high outlet densities.

Design conduit runs for minimal bends and as short a path as possible. Provide pull boxes sized in accordance with the NEC in straight sections of conduit every 100 feet or 180 degrees of total bends. For conduits over 2 inches in diameter, consult ITSComm on pull box size. Bends in conduits over 2 inches shall be long sweeps, and no conduit shall have a bend radius less than 10 times the conduit diameter. Conduit bodies, specifically LB fittings, are not allowed.

Conduits shall not be routed within 12 inches above or 4 inches horizontal from hot equipment and pipes, including boilers, water heaters, incinerators, hot water heating lines and steam lines, or through areas in which flammable or other hazardous material may be stored.

Terminate horizontal conduits entering a BE or TR 6 inches inside the room. Extend conduit floor sleeves 6 inches minimum above the floor. Terminate conduits with nylon insulated grounding bushings. Provide a nylon pull string in each conduit.

Fire seal between recessed outlet boxes located on opposite sides of a fire rated wall if the boxes are less than 24 inches apart.

After cables are installed, seal floor sleeves and wall penetrations in fire-rated walls using listed fire-sealing systems.

Cable Trays

Telecommunication cable trays shall be of the aluminum ladder type, or galvanized or zinc electroplated steel wire basket type. Aluminum center spline cable trays may be used only where approved by ITSComm, and only when supported so rigidly they do not tilt if unevenly loaded.

Size cable trays based upon the square footage of the area being served, the number of Work Area Outlets planned for the space, and the diameter of the cables as follows:

- If Work Area Outlet locations are not yet known, assume a minimum of one outlet for every 100 square feet of useable floor space served by the cable tray.

- Standard Work Area Outlets are served with three 4-pair cables with an average cable diameter of 0.165 inch each.
- Provide a minimum of 50 percent spare cable capacity for future use.
- The maximum allowable cable tray fill shall not exceed 50 percent of the tray cross-sectional area.

Design cable tray installations as follows:

- Provide 12 inches minimum access above and 18 inches minimum access on one side of cable trays for ease of cable pulling.
- Locate cable trays so they can be accessed safely from a ladder, taking into consideration access restrictions including ducts, pipes, conduits, light fixtures and ceiling grids.
- Ducts, pipes, conduits, light fixtures, ceiling grid support wires or other mechanical or electrical items shall not be attached to, pass through, or located within the cross-sectional area of cable trays.
- Cable trays shall not be used in place of conduit runs specified for computer room tie cables or other riser type cable installation.

Terminate cable trays entering a BE or TR 6 inches inside the room. Provide barriers in cable trays when necessary to separate circuits of different low voltage levels.

J-Hooks

Telecommunication cables may be installed in J-hooks above accessible ceilings in rooms, but J-hooks shall not be installed in corridors. Provide conduits or cable trays in corridors because the high quantity of cables will result in cable damage if the cables are installed in J-hooks.

Cables may be installed in J-hooks in unfinished open ceiling areas, but only if a minimum of 10 feet AFF, only if the cables will be protected from damage, and only if the cables are completely accessible for replacement. Cables shall not be installed in J-hooks in finished open ceiling areas or above inaccessible ceilings.

If cables in J-hooks penetrate a corridor wall from a room, and the distance from the wall to the cable tray is more than 18 inches, provide conduit stubs from the wall to the cable tray.

J-hooks for telecommunication cables shall be zinc electroplated steel or plastic, color coded silver or gray, listed for use in plenum spaces, with a minimum of 1 inch-wide cable support area, and rated for use with Category 6A UTP and similar cables. J-hooks shall be spaced a maximum of 5 feet apart. J-hooks installed to support telecommunication cables shall not be used to support any other types of cables.

Wireways and Underfloor Duct Systems

Power poles and surface raceways are generally not preferred, but power poles may be used to serve furniture systems in renovations. Surface raceways may be used to serve multiple outlet locations in renovations, at laboratory and computer benches, or for surface mount cable routing where conduit is inappropriate. Underfloor duct systems may be used to serve furniture not located against a wall, but only if cables can be easily replaced. Provide 20 percent spare cable capacity for future use. Provide dividers between power and telecommunication wiring.

Conduit connections to power poles and multi-outlet surface-mounted raceways shall be a minimum of 1 1/4 inches. Provide 6 inch x 6 inch x 4 inch junction boxes when necessary to transition to the top of power poles. Provide conduits to both ends of surface-mounted raceways containing high outlet densities. Maintain the cable minimum bend radius at all times.

Wireways may be built into furniture systems including wall partitions, auditorium seating, desks and laboratory benches, but only if the cable minimum bend radius is maintained at all times and the cables can be easily replaced.

Floor surface and under-carpet cable covers are strongly discouraged and may be used only where approved by ITSComm.

Work Area Outlets

Provide sufficient Work Area Outlets to meet current and anticipated future needs. Coordinate with the Design Manager and ITSComm to determine User needs. Consider the following:

- Most outdoor areas and parking structure floors require at least one emergency telephone.
- Laboratory suites and Housing facility lobbies typically require a campus telephone.
- Animal housing facilities typically require data connections to animal room monitoring panels.
- Housing facility student rooms require one data outlet per pillow, one voice outlet per room, and one RG-6 coaxial cable TV outlet per room.
- Medical facility patient waiting rooms typically require an RG-6 coaxial cable TV outlet.
- Housing facility laundry rooms require one data outlet per clothes washer, one per clothes dryer, and one for the Blue Bucks control panel.
- Offices typically require two outlets, one on each wall perpendicular to the door wall.
- Elevator controllers, unit substation watt-hour meters, building energy and water meters and sub-meters, and the building's main temperature control DDC system head end control panel typically require data connections.
- Parking attendant booths, cash registers in cafes and shops, Blue Bucks control panels and vending machines typically require data connections.
- Audio/visual racks and devices, classroom and conference room scheduling panels, and many lighting control panels and control devices require data connections.
- Buildings with U-M Wireless Network service require outlets for Wireless Access Point (WAP) devices. Request ITSComm to identify WAP outlet locations.

Outlet boxes shall be 4-11/16 inch sheet metal outlet boxes a minimum of 2-1/8 inches deep, with a double-gang plaster ring, except wall telephone outlet boxes shall have a single-gang plaster ring. ITSComm will provide the outlet box faceplates.

Provide floor boxes and poke-throughs sized to accommodate all power, data and audio/visual receptacles and jacks required for the project. Provide spare capacity for future use, dividers between power and telecommunication wiring, and cable training space to maintain cable minimum bend radii. Covers shall be flush, captive, and shall not pop open when rolled on by cart wheels or when stepped on with high heel shoes. Floor boxes and poke-throughs shall be approved by ITSComm.

Grounding, Bonding and Electrical Protection Requirements

Provide a 1/4 inch x 1 inch x 12 inch copper ground bus bar in each BE and TR, and connect each to the ground bus bar in the nearest electrical panel on the same floor with a No. 6 AWG, green insulated, stranded copper ground wire. See Design Guideline SBA-C.

Provide a No. 6 AWG, green insulated, continuous stranded copper ground wire from each TR ground bus bar to the BE room ground bus bar, and from the BE room ground bus bar to the main building ground bus bar (usually located in the unit substation room). The resistance to building ground shall be 1 ohm maximum.

Provide protection for ground wires subject to physical damage or abuse. Non-metallic conduit is preferred. Where metallic conduit is used, bond the conductor to the conduit at both ends.

Bond telecommunication conduits to cable trays using listed grounding bushings and ground straps or using listed conduit grounding clamps. Bond conduits, cable trays, metallic wireways and metallic underfloor duct systems to the nearest BE or TR ground bus bar with No. 12 AWG, green insulated, stranded copper ground wire.

Bond telecommunication cable shields on one end to the nearest BE or TR ground bus bar.

DESIGN GUIDELINE 273523 **EMERGENCY RESPONDER RADIO COVERAGE**

Scope

Provide two-way Emergency Responder Radio Coverage (ERRC) in new buildings and in high rise major renovations to enable communication between emergency responders at the exterior perimeter of the building and emergency responders within the building. All areas of the building shall have code compliant radio coverage. New buildings which will achieve radio coverage without amplification are exempt.

MBC, “Michigan Building Code”

Michigan Public Safety Communications System, <http://michigan.gov/mpscs>.

NFPA-72, “National Fire Alarm and Signaling Code Handbook” (Handbook includes the code plus non-binding but informative Annexes and Supplements)

Design Requirements

1. U-M emergency responders include but are not limited to the following:
 - U-M Division of Public Safety and Security (DPSS).
 - U-M Hospitals and Health Care Security and Housing Security.
 - U-M OSEH and Plant Operations Departments.
 - City of Ann Arbor Fire and Police Departments.
 - Washtenaw County Sheriff and Michigan State Police Departments.
 - Huron Valley Ambulance.

2. Provide plan drawings showing equipment locations. Provide a performance-based specification. The detailed technical design of the ERRC should be by the Contractor.
3. Provide ERRC utilizing a bidirectional amplifier (BDA) “leaky” cable system, an amplified distributed antenna system (DAS), or other proven signal amplification technology capable of achieving the required radio coverage.
4. ERRC shall provide coverage on the 800 MHz band.
5. ERRC shall permit the simultaneous use and interoperability of analog and digital modulation radios.
6. ERRC shall be neutral host and nonproprietary.
7. ERRC shall not infringe on or be overrun by adjacent building communication systems or cellular telephone service provider systems.
8. ERRC shall be designed to maintain full system operation during a normal power outage. It shall transfer to and from an Uninterruptible Power Supply (UPS) without interruption.
9. ERRC shall comply with the requirements of and obtain licensee consent from the Michigan Public Safety Communications System.
10. When required by the program documents, add cellular telephone signal enhancement to the ERRC. Coordinate with ITSComm for connections to cellular telephone service provider headend equipment.
11. Do not combine the ERRC with other radio systems such as:
 - Wi-Fi systems.
 - Pager systems.
 - Medical telemetry systems.
12. Provide ERRC expandability to permit future additions and changes to the emergency responder radio frequencies.
13. Design the ERRC to provide signal amplification on every floor of the building. During installation, install infrastructure (equipment space, electrical power and cable pathways) throughout the building. However, install amplification only on floors that fail to pass the Contractor’s pre-installation and acceptance tests.
14. ERRC headend including all common equipment shall be located in a room on the main floor or one floor below grade. Locate the headend equipment in the telecommunications Building Entrance (BE) room whenever possible. See Design Guideline SBA-C.
15. Locate the EERC node equipment in Telecommunications Rooms (TRs).

16. Provide a UPS sized to provide emergency power to ERRC headend and node equipment for a minimum of 24 hours. Connect the UPS to a generator-backed emergency power circuit if available.
 - UPS shall be enclosed in a NEMA Type 4 enclosure.
 - UPS batteries shall be of the sealed maintenance-free type.
 - Provide battery ventilation in accordance with code.
17. Provide the ERRC headend room and the TRs containing ERRC equipment with continuous air conditioning to alleviate heat build-up within the rooms. Connect the air conditioning system to normal building power circuits. The ERRC equipment can operate at an elevated temperature during a power outage.
18. Determine whether code requires rooms housing ERRC equipment to be separated from the remainder of the building by rated fire barriers.
19. Provide pathway (circuit) survivability in accordance with NFPA 72.
20. Provide a risk analysis in accordance with NFPA 72 to determine:
 - Whether the pathway (circuit) survivability level shall be Level 2 or Level 3.
 - Whether the antenna cables shall be plenum rated and/or Circuit Integrity (CI) type cables.
21. Provide supervision of the ERRC antennas, signal boosters, power supplies and UPS.
 - Provide supervisory and trouble alarm output contacts indicating an impairment. Connect the supervisory and trouble alarm contacts to the building fire alarm system.
 - Program the fire alarm system to relay ERRC supervisory and trouble alarm signals to the appropriate supervising station (DPSS, UMHHC Security, etc.). Instruct supervising station personnel to notify the Ann Arbor Fire and Police Departments of an impairment.
22. If outdoor antennas are required, obtain U-M approval of antenna locations. Provide access for maintenance and code-required fall protection.
23. Identify all required outside plant fiber optic cables required to connect ERRC to remote antennas, other services and other buildings. These cables will be provided by others.

Specification Requirements

1. Include the following in the ERRC performance specification.
 - ERRC equipment shall be FCC certified.
 - The Contractor shall be FCC licensed as required by code.
 - The Contractor shall submit detailed shop drawings for approval.
 - Components shall be industry standard and readily available to U-M.
 - Performance specifications for major components.
 - Requirements for a stock of spare parts.
 - ERRC headend and node equipment shall be securely attached to racks or backboards.
 - Antennas shall be securely attached independently from the work of other trades.

- Required separation distances between ERRC equipment and other mechanical, electrical and telecommunications equipment.
 - Required separation distances between ERRC antennas and antennas of other radio systems.
 - Cables shall be installed hidden from view except in open ceiling areas. Antennas may be installed exposed on the underside of ceilings.
 - Components shall be labeled with unique part or address numbers which correspond to numbers shown on the Contractor drawings.
 - Label the ERRC headend room door to identify the presence of headend equipment.
2. Plant Radio Shop personnel will operate and maintain the ERRC. Specify the following to support operation and maintenance activities:
 - Four paper copies of operation and maintenance manuals.
 - An electronic file storage device (USB drive, SD card, etc.) containing the final system software including the master program generic to the system, the software associated with each programmable piece of equipment, and the software licenses and passwords required by the Plant Radio Shop to perform programming changes.
 - A minimum of 8 hours of Owner training on operation and maintenance.
 - One year of customer service from the date of acceptance by U-M.
 - A parts and labor warranty for 1 year from date of acceptance by U-M.
 - The first code-required annual operational test at the end of 1 year.
 3. Code requires one set of ERRC technical information and documentation to be filed in the Fire Command Center (if one exists) or in the ERRC headend room. Specify one set of the following:
 - ERRC bid specifications and drawings.
 - ERRC as-built drawings.
 - Summary of ERRC frequencies utilized.
 - Summary drawing showing locations of ERRC headend and node equipment, and antenna sites.
 - Table of effective radiated power at antenna sites.

Bidding Requirements

1. Before bidding, forecast which floors will likely require amplification.
2. To bid the work, request a base bid price for the EERC headend and for amplification on just the floors forecast to require amplification. Request an add price for adding amplification on each additional floor and a deduct price for deleting amplification from each floor.
3. As an alternative bidding method, request a base bid price for just the ERRC headend. Request an add price for adding amplification on each floor.

Testing Requirements

1. The Contractor shall perform pre-installation testing for percent coverage and signal strength in accordance with code. Testing shall not be performed until after the building is fully enclosed (roof, exterior skin, doors and windows are installed), and interior ceilings and walls are in place.
 - Measure the percent coverage and signal strength in both the critical and general areas on each floor. Measure the signal strength receivable within the building and the signal strength received when transmitting from within the building.
 - Install amplification only on the floors which fail to have the required percent coverage and signal strength.
 - Provide spare capacity to install amplification later on floors that pass pre-installation testing but may drop below the required percent coverage or signal strength when construction and furniture move-in are completed.

2. The Contractor shall perform acceptance testing for percent coverage and signal strength in accordance with code. Testing shall be performed after furniture move-in. OSEH personnel, U-M Plant Radio Shop personnel and the project's Commissioning Authority will witness the testing.
 - Demonstrate full compliance with IFC and NFPA 72 requirements.
 - Demonstrate full compliance with specification requirements.
 - Modify or add equipment, cables and antennas as required to achieve the code-required performance. Resolve specification deviations.

CLOCK SYSTEMS

Scope

Provide clocks and clock accessories to the extent required by the Owner's Project Requirements (OPR) document.

Related Sections

U-M Master Specification Sections:
[275313 –Clock Systems](#)

Design Requirements

For new buildings, building additions and major renovation projects, provide GPS wireless clocks. Submit a request to the U-M Fire Protection Shop (through the Design Manager) to perform an analysis of the GPS signal strength in the project area. Provide a GPS signal transmitter if necessary to assure adequate GPS signal strength.

For smaller renovation projects, match the building's current clock system if the current clock system is working adequately. If the current clock system is not working adequately, provide GPS wireless clocks.

Use U-M Master Specification 16730 to specify GPS wireless clocks and signal transmitters. When matching the building's current clock system, contact the U-M Fire Protection Shop for their recommendations on specification requirements.

Equipment Requirements

In general, provide 120 volt powered, GPS signal synchronized, wireless, single face wall mounted or double face edge mounted, analog clocks. Battery powered GPS wireless clocks may be used only when approved by the Users and only when the Users acknowledge they must periodically replace the batteries.

In general, clocks shall be 12.5 inch nominal diameter with white faces, polycarbonate frames (color by the A/E), polycarbonate lenses, black standard numerals and sweep second hands.

When a GPS signal transmitter is required, coordinate with the clock manufacturer and specify the appropriate 1 watt output model. Locate the transmitter in accordance with the manufacturer's instructions.

Installation Requirements

Clocks in classrooms should be located on side walls so they are visible to both the professor and the students.

Provide a simplex NEMA 5-20R receptacle in a flush-mounted single gang outlet box to power each 120 volt clock and GPS signal transmitter.

Provide the clock manufacturer's standard lock-type hanger which requires a sequence of movements to install and remove the clock.

SECURITY SYSTEMS

Scope

Provide a security system when required by the Program Documents.

Provide a security system that connects to a Larse Class A remote transmitting unit in each building for notification at the Church Street Security Office. The system shall have proprietary Class B circuits.

Design Requirements

Locate sensors so that they are accessible for maintenance by the use of a ladder only. No lifts or scaffolding shall be required for maintenance.

Locate the security system control panel in a clean, dry, heated and ventilated closet or electrical room near a building entrance. Locate the panel in the same closet or room as the fire alarm system control panel or Larse panel if possible. The panel shall not be located in a building corridor, loading dock area or other high traffic area.

Equipment Requirements

The security system shall be resistant to damage from power system surges, spikes and voltage dips. The system shall be emergency battery backed.

The security system shall be field programmable. When a special device is required to perform field programming, 1 programmer shall be provided as part of the system unless the University already owns an appropriate programmer.

All wiring for the security system shall be in conduit or surface raceways. Use concealed conduit whenever possible and practical. When concealed conduit cannot be used in finished areas, provide surface raceways.

Route security system wiring in separate conduits or surface raceways from the other building wiring.

Installation Requirements

Instruct the Contractor to wire the sensors in each zone in numerical order beginning with the detector closest to the control panel, and progressing away from the control panel.

Instruct the Contractor to provide a typed list identifying all zones and sensors, including the sensor types and locations.

Instruct the Contractor to perform testing in accordance with Section 16950, and to provide the University Project Coordinator with test reports.

DESIGN GUIDELINE 283100 **FIRE DETECTION AND ALARM**

Scope:

This guideline defines the requirements and standards for design of a new fire alarm system or the expansion of an existing system. The guideline covers basic requirements for system design, fire alarm control panels, initiating devices, notification appliances, wiring, and central station monitoring.

Related Sections

[28000000 - Series Details](#)

Reference Documents:

- Michigan Building Code (MBC)
- Michigan Electrical Code (MEC)
- Michigan Elevator Code
- NFPA 101 - Life Safety Code

Design Requirements:

Use U-M Master Specification 283100, “Fire Detection and Alarm Security”, as Basis for Design (BOD) and specifying fire detection and alarm systems. Edit the specification and details to make them project specific. When editing the specification, turn on hidden text and follow the Spec Editor notes.

The U-M Fire Marshal Office reviews fire alarm system designs and inspects installations for all applicable U-M projects. U-M Electrical Inspectors along with U-M Fire Alarm Electricians will witness fire alarm system testing on all applicable U-M projects.

Michigan Bureau of Fire Services (BFS) reviews fire alarm system designs and inspects installations for health care, instructional, dormitory, and child care spaces.

Fire alarm systems and accessories shall be UL listed and FM Global approved.

For new buildings, that by code, are not required to have a fire alarm system installed, perform a risk analysis in coordination with NFPA 550 and U-M Risk Management Department, and submit to the Design Manager. Through this analysis and in conjunction with approval from Executive Director of AEC, determine if a fire alarm system should be installed even though it is not required by code. Include risk analysis report in the BOD.

If an existing building is not protected by a sprinkler system or area smoke detectors, or is only partially sprinkled or partially protected by area smoke detectors, follow the new building risk analysis guidelines above for renovation and expansion projects.

New fire alarm systems shall have one or more fire alarm control panels (FACP's) as required by the size of the project area. In addition, new fire alarm systems shall be installed with 25% (additional) spare capacity in all initiating circuits, notification appliance circuits, power supplies, amplifiers, batteries, and related components of the overall system.

Whenever possible, expand and/or extend the existing system unless otherwise directed by the Design Manager. Existing fire alarm systems shall always maintain 5% spare capacity in all power supplies, amplifiers, batteries, and related components of the overall system. If a system's capacity is found to be below this requirement notify the Design Manager.

The fire alarm system shall also include provisions for connection to the University MOSCAD system which is monitored by U-M Division of Public Safety & Security (DPSS).

See Design Guideline 5.2, 'Animal Facilities' for the specific fire alarm sound and strobe requirements in animal housing areas.

Project plan view drawings for fire alarm systems shall include room names and furniture layouts. Coordinate design with reflected ceiling plans noting locations of soffits, beam pockets, skylights, etc.

FACP's and Remote Annunciators:

FACP's shall incorporate the following:

- Modular design with solid state, microprocessor based electronics, power-limited design.
- Programs stored in a non-volatile flash EPROM memory within the FACP. Loss of primary and secondary power shall not erase the program stored in memory.
- Capable of being programmed by the Owner on site to accommodate expansion or sequence of operation changes.
- Display only those primary controls and displays essential to operation during a fire alarm condition.
- Audible signals that sound during alarm, supervisory, or trouble conditions.
- Battery capacity (secondary power) to operate the entire system (except door hold-open and door control devices) upon the loss of primary power for a period of 24 hours in a normal supervisory mode followed by 5 minutes of evacuation alarm operation or 15 minutes of voice/alarm operation as applicable.

The system shall be capable of being walk tested by one person.

Locate FACP and remote annunciator panels in the fire command center, building lobby or in a secure, clean, dry, heated, and ventilated closet or electrical room near the building entrance. The panels shall not be located in a vestibule, loading dock area, or other high traffic area. One panel should be located in an accessible location visible and adjacent to the building entrance selected for emergency response. Coordinate locations with Design Manager, DPSS, and Fire Safety Service.

Remote annunciators shall duplicate the display, programmable function keys, alarm functions/controls, and alarm audible signals of fire alarm control panels.

Microphones shall be included with remote annunciators when the fire alarm system includes emergency voice/alarm communications or a mass notification system, along with the same pushbuttons as the FACP for selecting pre-recorded voice messages, and the same controls to choose total building or selected areas communications.

Provide an empty 1" conduit from FACP to Building Entrance (BE) telecommunications room.

Initiating Devices:

Initiating devices shall be addressable. In general, provide Class B initiating device circuits except where an applicable code requires a different circuit class.

Locate area smoke detectors, duct smoke detectors, and heat detectors so that they are readily accessible for maintenance. Provide accommodations for accessing all devices; no lifts or scaffolding shall be required for maintenance. Those devices in restricted areas such as elevator shafts shall be easily accessible, from a non-restricted area, via access doors. Avoid locating detectors above sloped auditorium floors or above steps.

Initiating devices shall be listed for the environment they are to be installed. These areas include but are not limited to locations with temperatures below 32F, wet/damp locations, and areas where the room will be occasionally hosed down.

Manual Pull Stations

Manual pull stations shall be located at all exit doors.

Pull stations in Residential buildings, areas where children are present, and as noted in BOD shall have protective covers with audible alarm (when cover is lifted).

Smoke Detectors

Smoke detectors are required above FACP's, remote annunciator panels, and NAC panels.

Michigan Elevator Code requires smoke detectors be located in elevator machine rooms, above machine room-less elevator equipment, elevator lobbies, and at the top of sprinklered elevator hoist ways to initiate an elevator recall. These smoke detectors shall be provided with the building fire alarm system and be connected to the FACP.

When the need for door hold-open devices (and associated door release service devices) is defined during schematic design, the associated devices shall be powered by a normal power

120V branch circuit. The associated smoke detectors shall report to the fire alarm system, and the normal power door hold open circuits are then opened by the fire alarm system via control modules. Carefully coordinate associated fire system components and door hardware specified in the architectural section.

Provide smoke detectors in the following locations:

- Substation rooms
- Telecommunication/data rooms
- Electrical power rooms
- Mechanical rooms
- Recycling and trash rooms

Smoke detectors in resident areas of residence halls and as noted in BOD shall have wire screen covers that are UL listed for the fire alarm system being installed.

Do not locate smoke detectors at the top of atriums or skylights. In these applications use beam or aspirated type detectors where applicable. Avoid locating smoke detectors where direct sunlight, high humidity, stagnant air, or turbulent air will cause maintenance problems.

Smoke detectors when not in plain view and more than 10 feet above the floor, provide smoke detector remote alarm indicators and test switches mounted in plain view at 44 inches above the floor.

Duct Smoke Detectors

Locate duct smoke detectors at locations defined by manufacturer and/or by the mechanical contractor to have a laminar flow across the detector. Do not locate duct smoke detectors downstream of humidity injection points or in outside air intake plenums.

Duct smoke detectors shall be visible and accessible to responding personnel, requiring no more than the use of an 8'-0" step ladder to access. If the duct detector must be located where it is concealed and/or in accessible, provide a remote indicator light and test pushbutton in a nearby accessible location.

Duct smoke detectors shall report to the FACP, and the FACP shall operate a control module to stop the associated fan and close associated dampers.

All duct smoke detector installations shall include a 'duct detector interface box' as shown in Standard Details 28310006, 28310007, or 28310008. The Temperature Control Contractor shall provide the interface box. Locate the duct detector interface box so that a ladder is not needed for access. Typically the boxes are located near the associated temperature control panel.

If the fire alarm system is connected to a MOSCAD panel for transmission of alarm, supervisory, and trouble signals to DPSS, program the duct detectors as supervisory rather than alarm devices. Duct detectors shall only alarm the building if the fire alarm system is not connected to MOSCAD.

Duct smoke detectors shall be installed in the return and supply ducts of air handling units of more than 2000 cfm. NFPA 101 references NFPA 90A - Standard for the Installation of Air

Conditioning and Ventilation Systems, which requires duct smoke detectors to be installed in the supply duct. MBC references the Michigan Mechanical Code which requires duct smoke detectors to be installed in the return duct.

Duct smoke detectors shall be mounted to the outside wall of the duct with a rigidly mounted sampling tube protruding into the duct. Installing area smoke detectors inside the duct work in lieu of duct smoke detectors with sampling tubes is not acceptable.

Sampling tubes of duct smoke detectors shall not be installed in the ducts until after the ducts have been cleaned and the air handling unit filters have been changed.

Heat Detectors

Careful consideration shall be given to providing heat detectors, rather than smoke detectors, in high humidity locations such as bathrooms with showers and laundry areas, and/or in areas with occasional smoke present such as kitchens.

Notification Appliances:

In general, provide Class B notification appliance circuits except where an applicable code requires a different circuit class.

Combine horns or speakers with strobes when both are required at the same location.

Audible Notification Appliances

Audible notification appliances shall produce a three-pulse temporal pattern evacuation tone. If an emergency voice/alarm communication system is provided, the audible evacuation alarm signal shall produce three-pulse temporal pattern evacuation tone followed by a pre-selected voice evacuation message. The alarm tones and voice evacuation messages shall alternate until they are silenced.

Specify speakers and horns with multiple adjustable taps. Audible notification appliances shall be capable of being adjusted to increase the sound level if needed based on final inspection and testing. Spare system and circuit capacities requirements shall be maintained.

The sound level in sleeping rooms shall be not less than 75 dBA measured 3'-0" from the most remote wall with a square wave low level frequency of 520 Hz.

Do not provide horns or speakers in elevator machine rooms or in elevator cars.

Do not provide horns or speakers in exit stair enclosures unless the building is equipped with an emergency voice/alarm communication system or a mass notification system. Emergency voice/alarm communication system exit stair enclosure speakers shall be on a separate paging zone.

High Rise buildings, Educational Group E buildings, and Assembly Group A buildings having more than 1000 occupants and/or other buildings as noted in the BOD, shall have emergency voice/alarm communication systems throughout the building.

Provide a speaker in each sleeping room and a sounder base in each sleeping room smoke detector. The speaker shall provide the general alarm and the sounder base shall alarm upon

smoke within the room.

In rodent rooms, the sound shall be a three-pulse temporal pattern with a peak frequency below 500 Hz.

Note the following issues when designing audible notification systems:

- Assume that all interior doors will be closed.
- Office system furniture with sound dampening partitions may be installed.
- The ambient sound level in each space, the distance from the nearest notification appliance to each space, and the sound attenuation of the intervening walls and doors.
- Many laboratories and mechanical rooms have high average ambient sound levels.
- Alarm sound level measurements will be taken during fire alarm system testing, and audible appliances may have to be added if the alarm sound levels do not meet Code.

Visual Notification Appliances

Provide visual notification appliances in all common and public spaces as required by the applicable codes. Common and public spaces are defined as corridors, toilet rooms, auditoriums, classrooms, single or multi-person offices 200 square feet or larger*, conference rooms, and laboratories. Also provide visual notification appliances in the following locations:

- Elevator machine rooms
- Mechanical rooms and other areas that have an average ambient noise level exceeding 95 dBA
- Sleeping rooms and in living spaces of suites or apartments

Do not provide visual notification appliances in the following locations:

- Exit stair enclosures
- Elevator cars
- Single or multi-person offices less than 200 square feet*
- Closets and coat rooms
- Electrical closets
- Mechanical pipe chases
- Crawl spaces
- Small bathrooms within classrooms
- Janitor closets
- Storage rooms less than 200 square feet
- Unoccupied spaces
- Animal rooms

** For UM Hospital and Health Center facilities, verify with design manager*

Specify strobes with multiple adjustable taps. Visual notification appliances shall be capable of being adjusted to increase the candela level if needed based on final inspection and testing. Spare system and circuit capacities requirements shall be maintained.

Size and locate visible notification appliances in strict accordance with the "Visible Characteristics, Public Mode" Section of NFPA 72. Select the strobe candela outputs in accordance with the spacing tables, and indicate their outputs on the plan drawings for all strobes. Locate strobes at the halfway distance on the longest walls as shown in the NFPA 72 figures and

appendices. Do not install strobes near room corners without increasing their candela ratings appropriately.

On all buildings on the Ann Arbor Campuses, install a NEMA 3R, 110 candela strobe and speaker outside above the location of the 'Siamese' (fire hose) fire department connection.

Monitor and Control Modules:

Provide individually addressable monitor and control modules for interface with other building life safety systems. Monitor and control modules shall use Class B circuits. Control modules shall be within 3'-0 of the associated device.

Provide FACP modules and individual modules for control of other systems and equipment. These systems and functions include but are not limited to the following:

- Shut down of ventilation systems via normally closed control module contacts after an alarm report from associated duct smoke detectors.
- Control module output contacts (minimum of three) for each elevator to control elevator recall (designated and alternate floors) and in-cab warning signaling. See Standard Details 28310010, 28310011, & 28310012.
- Control, via normally closed control module contacts, electrified door locking hardware, magnetic door locks, door hold-opens, and to disable electrically operated door proximity sensors.
- Interfacing with MOSCAD system for relaying status of supervisory signals of Emergency Responder Radio Systems (ERRC).

Provide FACP modules and individual modules for monitoring the status of other systems and equipment. These systems and functions include but are not limited to the following:

- Fire protection system (see additional requirements below) and other safety protection systems.
- Fire Pumps - Supervisory signals; Pump running, Loss of ac power, Phase reversal, Controller connected to alternate source, Selector switch not in auto, Control panel trouble.
- ERRC - Supervisory signals; Antenna malfunction, Signal booster failure, Loss of normal ac power, Failure of battery charger, Low-battery capacity.
- Pre-action fire protection systems - Monitor each zone of the pre-action system in addition to general system alarm, supervisory, and trouble signals.

In a building with a sprinkler system, provide water flow switches to detect sprinkler activation and valve tamper switches at all shut off valves (inside and outside the building and also including elevator machine room sprinkler shut off valves). FACP descriptors shall specifically note sprinkler system coverage area of the associated water flows, and the locations of the tamper switches.

Emergency Responder Radio Coverage (ERRC):

Refer to Design Guideline DG 273523 for ERRC design and installation requirements.

A hard wired fire department communication system shall not be specified in lieu of, or in addition to an ERRC system.

Mass Notification System:

If noted in the Owner's Project Requirements, provide necessary equipment, initiating devices, notification appliances, conduit, wiring, programming, and appurtenances to the base fire alarm system scope of work to incorporate building-wide mass notification into the fire alarm system. The system shall be specified as an Add Alternate so associated additional costs can be quantified.

Provide speakers for audible notification appliances in lieu of horns if the base fire alarm system scope of work specifies horns. Provide sufficient speakers to meet NFPA 72 voice intelligibility requirements.

In the main fire alarm control panel and in each remote fire alarm annunciator panel provide a minimum of 8 pushbuttons to initiate the alert strobe lights and the building-wide evacuation or alert tone followed by a unique pre-recorded voice message.

Provide a Local Operating Console (LOC) cabinet with microphone for use by Facility Manager. Locate the LOC in a secure location acceptable to DPSS.

Alarm and supervisory signals shall be sent through MOSCAD (or other supervised system acceptable to AHJ) to DPSS.

Provide system interconnecting raceways, wiring, and routing in compliance with the system "survivability" requirements contained in NFPA 72.

MOSCAD (Central Station Monitoring):

DPSS remotely monitors essentially all of the fire alarm systems on the Ann Arbor campuses. The connection from the building to DPSS is by the University MOSCAD (Motorola SCADA) system. This system performs the functions of a Central Station Monitoring facility and the DPSS office is considered to be a constantly attended location.

In offsite locations and/or when noted in the BOD, the fire alarm system shall be connected by digital dialer to a listed Central Station Monitoring facility which in an emergency will notify the authorities and appropriate emergency personnel in that jurisdiction.

The FACP and fire pump controller shall have output contacts that will interconnect with the MOSCAD remote transmitting unit (RTU). These contacts, in their normal state, shall be closed, and in the 'alarm' state they shall open. Provide form "C" contacts, plus needed conduit and wiring to the MOSCAD alarm junction box (also referred to as interface junction box) for signal inputs. Signal inputs shall include, but are not limited to, the following:

- FACP - Alarm
- FACP - Supervisory
- FACP - Supervisory Maintenance Alert
- FACP - Trouble
- Fire Pump - Pump Running
- Fire Pump - Supervisory
- ERRC - Signal booster supervisory, Power supply supervisory

The MOSCAD RTU, RTU box, alarm junction box, and antenna equipment will be furnished by

the University. All wiring in the RTU, between the RTU and alarm junction box, as well as all of the programming and work needed at DPSS will be by the University. Wiring to the antenna shall be furnished by the University and installed by the contractor. *(Note to U of M Design Manager, include \$8,000 in the project budget to pay for these U of M provided equipment and services).* Contractor shall furnish and install all conduits and install RTU box and alarm junction box furnished by the University. Include Detail 28160015 for installation details.

Note that the MOSCAD system is connected by radio to DPSS on Kipke Drive on south campus. The MOSCAD system is often used to transmit other alarm messages to that central security office. These other alarms might include security, and/or monitoring points of critical systems.

Installation and Testing:

Fire alarm system shall be connected, programmed, tested, and certified, by NICET, Level 2 (minimum) certified fire alarm persons.

Fire alarm system wiring shall be segregated from other system wiring. Wiring shall be installed in raceways, cable trays, or in J-hooks. In mechanical rooms, unfinished spaces and other areas wiring may be subject to physical damage wiring below 10'-0 shall be installed in conduit.

Fire alarm system control panels, equipment, and other components shall not be painted. Conduit and/or couplings, junction boxes, and covers, however, shall be painted red.

Require the contractor to fully test the system prior to arranging witness testing by the University. Witness testing shall include the contractor, U-M Fire Marshal, U-M Electrical Inspector, U-M Fire Protection Shop, and Commissioning Authority. On classroom, in-patient medical, and Housing projects, the contractor shall also be required to support a system test by the Inspector from the Michigan Bureau of Fire Services. Provide the University Project Manager and Commissioning Authority with test reports.

Training on fire alarm system operation and programming shall be provided as part of the system. The training shall consist of two training programs. One program shall be for the U-M Fire Protection and Radio Shop personnel and the second shall be for the Building Facility Management, FSS, and DPSS.

The fire alarm contractor shall provide the University, on CD, a complete 'Windows System' compatible copy of the operational and application programs. This electronic documentation shall reflect the system as configured after the certification testing is completed and accepted.

Design Requirements

All work within City of Ann Arbor street right-of ways shall be in accordance with the City of Ann Arbor's standards and requirements. Permanent construction within City of Ann Arbor right-of-ways requires licensing by the City. Permanent construction on land not owned by the University may require an easement. Early in design, notify the University Design Manager of any such construction so that discussions with the City and/or other affected property owners can be initiated. Coordinate communications with the City through the University Design Manager.

All water main and sewer connections to City of Ann Arbor facilities shall be in accordance with the City of Ann Arbor's Standards and Requirements. Coordinate communication with the City Engineer regarding interpretation of these Standards and Requirements through the University Design Manager.

All materials, equipment and construction for bituminous and concrete pavements shall be in accordance with the latest version of the Michigan Department of Transportation Standard Specifications for Construction.

Granular materials shall be a minimum of MDOT Class II, compacted to 98% of an ASTM 1557 value.

All concrete shall be 4,000 pounds per square inch minimum compressive strength at 28 days, and consist of air entrained Portland cement with a total air content of not less than 4 percent, but not more than 7 percent. Cement content shall be a minimum of 6 sacks per cubic yard. The slump shall be not more than 4 inches, nor less than 1-1/2 inches as determined by the slump cone test, ASTM C-143. All flatwork concrete shall be reinforced with polypropylene fibrillated fibers at a volume of 1.5 pounds per cubic yard.

Backfill for all utility trenches that run under, or within 3 feet of, existing and proposed concrete or asphalt surfaces shall be granular material as specified in (4) above.

All regular sidewalks should be 8 feet wide, and all steps and stairs eliminated if at all possible to facilitate barrier free access, cleaning and snow removal.

Paved areas at building entrances should be adequate to accommodate refuse containers.

The potential for installing an automatic lawn irrigation system should be discussed with U-M Grounds Services, coordinated through the University Design Manager, early in the project, so that plumbing for the meter, back-flow equipment and a supply line to the outside of the building can be included in Mechanical work. See [Design Guideline 328400 Irrigation](#) for additional information.

Wall hydrants to receive a 1-inch hose should be included in the Mechanical work even if an automatic lawn irrigation system is planned for the project.

Storm water management strategies should be included early in the design process. The A/E should consult with the University Design Manager and Campus Planning to determine the appropriate measures to reduce the amount of runoff. All projects are encouraged to do as much as possible to minimize impacts from storm water runoff. At a minimum, all projects with earth disturbance >1 acres are required to meet the [storm water management post-construction requirements](#). Refer to the [storm water management procedure](#) for complete information.

Site Elements

The A/E shall identify on the existing conditions site plan and on the demolition plan all site elements that will be impacted by construction, to include but not limited to:

- Free-standing building ID signs
- Plaques on the grounds or on the building
- Public art works and artifacts
- Kiosks used for posting flyers
- SORC posting boards (triangular boards used for posters)
- Memorial benches
- Memorial trees

The A/E and the University Design Manager will work with Campus Planning to determine the appropriate disposition of these site elements. It will be the responsibility of the project to relocate, replace, or restore the elements per the instructions of Campus Planning. The A/E will stipulate in the design documents the approved disposition/relocation/restoration of all relevant site elements. Refer to [Campus Planning Site Furnishings Standards Manual](#) for more information.

Refuse Removal

The A/E shall stipulate in the Design Documents that the Contractor shall remove all building materials and debris from the job site, and sub-grade the landscape areas to 4 inches below finish grade. Refuse removal during the construction phase shall be as frequent as necessary to prevent windblown debris. Unsightly pileup is also prohibited.

The construction site and valuable landscape plants shall be fenced to control Contractor parking and material storage.

Existing trees and other landscape plant materials within and outside the contract limits must be protected from soil compaction and breakage. See [Design Guideline 013639 Tree Preservation](#).

Landscape plants and materials to be removed must be approved by the University Design Manager.

DESIGN GUIDELINE 312500 **EROSION AND SEDIMENTATION CONTROL**

Scope

In general, follow the guidelines below when designing and specifying soil erosion and sedimentation control. Unless specifically indicated otherwise, these guidelines are not intended to restrict or replace professional judgment.

LEED Reference Guide for Green Building Design and Construction

[Southeast Michigan Council of Governments Low Impact Development Manual](#)

[University of Michigan Soil Erosion & Sedimentation Control Procedures](#)

Summary

Soil erosion and sedimentation control (SESC) procedures are activities which are regulated by the State of Michigan on all U-M project sites that implement an earth change activity.

All earth changes of one acre or more or within 500 feet of [Waters of the State](#) require a plan that is in compliance with the Soil Erosion and Sedimentation Control Part 91 of Natural Resources and Environmental Protection Act Public Acts 451 of 1994, as amended. All other projects must provide a site plan and a description of the methods being employed to control run off and the resulting sedimentation which would otherwise enter the existing storm water system.

During the design phase of the Project, the U-M Design Manager, with the assistance of the A/E, will submit to U-M Department of Environment, Health and Safety (EHS) a [Project Notification Form](#).

Definition

“[Waters of the State](#)” includes the Great Lakes and their connecting waters, lakes, ponds, rivers and streams, which may or may not be serving as a county drain as defined by the drain code; or

any other body of water that has definite banks, a bed and visible evidence of a continued flow or continued occurrence of water and wetlands regulated under Part 303 of Public Acts 451 of 1994.

Design Requirements

The A/E shall prepare the soil erosion and sedimentation control plans and specifications. Implementation of the soil erosion and sedimentation control plan including required maintenance during construction and final removal as directed in the plans is the responsibility of the Contractor.

U-M EHS is designated as an "Authorized Public Agency" and is responsible for administration of Part 91 of Act 451. The proposed plans for soil erosion and sedimentation control must be submitted for review and approval to the U-M EHS and Campus Planning, prior to the beginning of any site work. Coordinate with the Design Manager.

Developing and Implementing the Plan

Governing Principles for All UM Sites Involving an Earth Change Activity

The following principles should be considered before construction, when developing a soil erosion and sedimentation control plan:

- Integrate the overall construction design and activities to fit the existing physical and vegetative features of the site.
- Specify the staging of construction and stabilization activities to minimize the area and duration of disturbance. This can be done by limiting the areas of heavy equipment access and staging/storage of materials; protecting high quality and environmentally sensitive areas; and avoiding excessive and unnecessary clearing and stockpiling of topsoil.
- Protect natural/intermittent streams and swales and maintain as a natural habitat/campus amenity by identifying and mapping natural drainage features and directing surface drainage to the natural features.
- Reduce impervious surfaces by minimizing the dimension or area required for roads, drives, walks and parking.
- Specify control measures that will minimize erosion as a first line of defense, such as: seeding & mulching, preserving vegetative buffers, surface roughening, grade stabilization structures, check dams and controlling wind erosion by covering stockpiles or wetting exposed soils.
- Include perimeter protection controls that will prevent off-site sedimentation. Ex: perimeter barriers (silt fence), vegetative filter strips, anti-tracking pads, storm drain inlet protection, and sediment basins. Sedimentation control should not be used as a substitute for erosion control, but rather in conjunction with erosion control.

- Specify that a sweeper shall be employed to remove sediment tracked onto the pavement at least on a daily basis. Include a requirement that sweepers must be used more frequently, as needed, based on site conditions.
- Require the Contractor to establish an inspection and maintenance schedule.

Include as a minimum the following information for sites one acre or more in size or within 500 feet of Waters of the State:

- A map or maps at a scale of not more than 200 feet = 1 inch. Map shall include a legal description and site location, sketch that includes the proximity of any proposed earth change to lakes, streams or both; predominant land features including lakes, streams and wetlands; and contour intervals or slope information.
- A soils survey or a written description of the soil types of the exposed land area contemplated for the earth change.
- Description and location of physical limits of each proposed earth change.
- Description and location of existing and proposed on-site drainage and dewatering facilities.
- Timing and sequence of each proposed earth change.
- Description and location of all temporary and permanent erosion and sedimentation control measures, including timing on installation and removal of temporary measures.
- Program and schedule for maintaining all control measures.

A [design and review checklist](#) containing these required plan items is available

Recommended control measures for all U-M sites involving earth change activity:

The following SESC measures need to be included in all plans. Other measures may also be required based on specific site conditions and projects.

- Provide inlet protection on all adjacent and down gradient storm water inlets, catch basins, and manholes. This may be accomplished using filter fabric, regular or high flow silt sacks, or other control measures.
- Install an entrance anti-tracking pad with a minimum of 50 feet in length. A geotextile filter fabric should be placed under 6 inches of limestone aggregate.
- Install perimeter barriers adjacent to and down gradient of the disturbed area.
- Place stockpiles and other spoil piles away from the drainage system to minimize sediment transport. Keep as few stockpiles as possible during the course of the project. If the stockpile and/or spoil pile must remain onsite overnight, or if the weather conditions indicate the chance for precipitation protect the pile from erosion.
- Provide dust control.
- Provide sweeping to remove any track-out.

- Specify biodegradeable products for erosion control blankets.

Construction sequence for all U-M sites involving earth change activity:

Include a construction sequence in the plans and/or specifications. The following construction sequence is recommended:

- Install all temporary and permanent erosion and sediment control measures in accordance with the approved plan and special permit conditions.
- U-M EHS will inspect all projects at least weekly and after every significant storm events to evaluate the effectiveness of the control measures.
- Per plan and per U-M EHS maintain all temporary and permanent control measures daily and as needed based on the site inspections.
- Complete permanent soil erosion control measures for all slopes, channels, ditches, or any disturbed land area within 5 calendar days after final grading or the final earth change has been completed.
- Remove all temporary control measures after permanent soil erosion control measures are in place and the area is stabilized.
- Notify the Project Manager for a final inspection when the project is completed.

DESIGN GUIDELINE 321000 **WALKS, ROADS AND PARKING PAVING**

Scope

Scope: Paving for walks, roads and parking.

Related Sections

U-M Design Guidelines

LEED Reference Guide for Green Building Design and Construction

Design Requirements

All work within City of Ann Arbor street right-of ways shall be in accordance with the current version of the City's standards and requirements. During design, the A/E shall submit plans and specifications to the City for review and approval. This process should be completed prior to the issuance of 100% CD's.

All materials, equipment and construction for bituminous and concrete pavements shall be in accordance with the current version of the Michigan Department of Transportation Standard Specifications for Construction. No welded wire fabric shall be used in sidewalk construction.

In order to promote infiltration and an even distribution of storm water flow, impervious surfaces should be minimized. The A/E should evaluate the site for potential pervious pavement/infiltration opportunities early in the design process. Consult with the U-M Design Manager and Campus Planning to determine the appropriate paving materials for each project.

Pervious Pavement Installation Requirements

Pervious pavement should not be located on top of recent fill or compacted areas, unless adequate under drainage is provided. Traffic type, pavement use, and type of loading should be considered in design, for example, dumpsters should not be located on porous pavement due to concentrated point load while emptying the dumpster.

Properly sized infiltration beds and under drains in locations with poorly drained soils should be incorporated. All porous paving installations should include an overflow system. This could consist of bleed-out pipes connected to sumps or outfalls into an unconventional or conventional storm water system.

Utilize perforated pipes along the bottom of the filter bed to evenly distribute runoff. Infiltration areas should be located within the immediate project areas in order to control runoff at its source. Install compatible plantings adjacent to the pervious pavement that do not block the porosity.

Soil type (infiltration rate) and amount of water stored will determine the depth of the pervious pavement system. Frost depth should also be considered and the minimum filtration bed depth should increase accordingly.

“Vacuuming” the pavement should occur annually in order to keep the porous system operating at its potential.

Systems

- **Porous concrete:** Pervious pavement should be underlaid with a stone sub-base. Installation methods and outcomes should be carefully observed where grading requirements are stringent.
- **Porous asphalt:** Pervious asphalt should be placed directly on the stone sub-base in a single layer and rolled into a finished surface. This system is best used for parking lots, walkways, and in natural areas.
- **Porous concrete unit pavers/paver blocks:** This system is best used in high-visibility areas such as courtyards and plazas, as well as sites containing heavy loads, such as parking lots, service areas and low-speed drives. Accessible ramps within porous paver areas should use standard concrete to achieve and maintain the required grade.

Impervious Concrete Installation Requirements

Concrete shall consist of air entrained Portland Cement with a total air content of not less than 4 percent but not more than 7 percent. Cement content shall be a minimum of 6 sacks per cubic yard. Concrete shall contain polypropylene fibrillated fibers at a volume of 1.5 pounds per cubic yard

All regular sidewalks shall be 8 feet wide and 8 inches thick, and all steps and stairs eliminated if at all possible to facilitate cleaning and snow removal.

Paved areas at building entrances shall be adequate to accommodate refuse containers.

Where possible, impervious surface drainage should be directed to water receiving landscape areas such as lawns and planted areas.

Quality Acceptance Test

Minimum concrete 28 day compressive strength shall be 4000 psi.

Slump shall be not more than 4 inches, or less than 1 1/2 inches, as determined by the slump cone test specified in ASTM C-143.

Cleanup Requirements

Concrete and asphalt work (including cutting, grinding, drilling, and hyro-demolition) washout cannot be discharged into storm drains, catch basins or to the sanitary sewer system. Direct the Contractor to utilize proper disposal and washout practices and to perform washing of concrete trucks in designated areas or offsite.

DESIGN GUIDELINE 328400

IRRIGATION

Scope

Designing and specifying irrigation.

[Maintenance Priority System Campus Map](#)

[Southeast Michigan Council of Governments Low Impact Development Manual](#)

Summary

Careful consideration should be given to the selection of plant materials that require less water to sustain their life. The designer should also consider context when preparing landscape plans and work with Campus Planning to ensure an investment in an irrigation system is warranted. For example, a landscape within an area of high-visibility and high pedestrian traffic may be more richly planted, which would warrant irrigation. U-M Grounds Services (Grounds) has developed a maintenance priority system and corresponding campus maps that can serve as a guide for where irrigation (or intensity thereof) may be appropriate.

When irrigation is warranted, U-M is committed to installing water-efficient irrigation systems with metering equipment and other high-efficiency irrigation technologies to reduce potable water consumption.

Design Requirements

Design teams shall coordinate during Schematic Design with Grounds to identify system

requirements, including components to be pre-purchased and provided by Grounds due to central control irrigation system requirements. Grounds/Owner-provided items are a project cost.

In addition to irrigation design, the Design Professional (DP) should provide plumbing, mechanical systems, electrical and irrigation system/coverage design for associated irrigation components within the building envelope and exterior to the building. Consult with Grounds to evaluate adequate capacity and flow when tying into an existing irrigation system.

The DP shall design the connection of power to the controller and pump, building penetrations and note sequencing to avoid waterproofing warranty violation.

Separate meters for irrigation measurement should also be included—coordination with the City/authority having jurisdiction through the U-M Design Manager is required. Design Professionals are not authorized to contact jurisdictional agencies outside the university without U-M permission. See the standard details Irrigation Controller / Time Clock Installation Detail as well as the Schematic Irrigation System Detail.

Contractor's plumbing/mechanical, electrical and site trades will provide (except for identified Grounds/Owner-provided items) and install (including Grounds/Owner-provided items) all irrigation components associated with the irrigation system. Owner-provided material and Contractor material and installation, which comprise a full working irrigation system, are project costs.

DESIGN GUIDELINE 331000

WATER SUPPLY SYSTEMS

General

The City of Ann Arbor's local plumbing codes supplement the State and National codes. Consult the City Engineer through the University Design Manager for specific interpretation.

The purchase of the water meter is the responsibility of the University; however, installation will be by the City. The Contractor is responsible for obtaining all necessary permits. The water use and sewer use fees for the water meter will be the responsibility of the University.

Related Sections

[6.0 DG 230000 - Basic Mechanical Requirements](#)

[6.0 DG 221113 – Basic Piping Materials and Methods](#)

Material Requirements

Materials from the City main to the entrance into the building shall meet City of Ann Arbor requirements.

Piping inside the building downstream of the City water meter should be copper. Brass nipple and/or dielectric flanges shall be used between dissimilar metals. Dielectric unions are not acceptable.

Installation Requirements

An approved backflow preventer shall be installed at the point of entry in new buildings, and at the point of take-off of new piping in renovation projects whenever the water is to be used for non potable purposes. See Section DG220010. Backflow preventers shall be tested and certified upon installation of unit.

All fixtures connected to purified water systems shall contain approved vacuum breakers.

The A/E shall consult with the University Design Manager to determine if the existing building distribution system is sufficiently large to support the new demands.

All water pipes should be pitched to facilitate complete drainage.

Water hammer arresters should be installed at all fixture groups.

Newly installed pipes should be cleaned and chlorinated. The method used should be as set forth in AWWA Standard Specifications, latest edition, including all amendments thereto. The treatment should consist of a solution of not less than 50 ppm of available chlorine (liquid chlorine or sodium

hypo chloride). After sterilization the system should be flushed with clean water until the chlorine residual is not greater than 0.2 ppm.

The high oxygen content of Ann Arbor water should be compensated for. One acceptable method is treating with sodium silicate prior to occupancy.

System must pass inspection by City of Ann Arbor.

7.0 MASTER SPECIFICATIONS

This section of the U-M Design Guidelines Website contains guide Master Specifications for the design and construction of facilities at the University of Michigan. The U-M Master Specifications were developed by Architecture and Engineering, for projects designed by our in-house design staff. They are maintained by roughly the same group that maintains the Design Guidelines Technical Sections. At this time we allow A/Es to use their own master specification, but strongly encourage them to use our Master Specification as a guide. Certain Design Guideline Technical Sections require that a related U-M Master Specification section be used as the basis for the A/Es project specific specification. In all cases when U-M Master Specifications are used they must be edited as required to be made project specific. The Master Specifications include extensive hidden notes to the designer, which should be deleted prior to issuing for bid. The Master Specification is divided by CSI Division. Most sections are available in both Acrobat (pdf) and Word (doc) format.

DIVISION 01 GENERAL REQUIREMENTS
SECTION 011000 - SUMMARY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The Drawings and the general provisions of the Contract, including the current edition of the University of Michigan Standard General Conditions apply to each section of this Project's specifications.

1.2 PROJECT DESCRIPTION

EDIT BELOW TO SUIT PROJECT

- A. The Project: Remodel approximately *insert* sq. ft. of existing *insert next or modify* laboratory and office space in rooms *insert room numbers* in the *insert name* Building on the University of Michigan's *insert next or modify* Medical Central North South (athletic) Campus in Ann Arbor, Michigan. Major aspects of the work include, but are not limited to:

PLEASE TAKE TIME TO EDIT BELOW TO SUIT PROJECT. THIS LIST SHOULD NOT BE A CONSIDERED A "SCOPE" ARTICLE. IT IS INTENDED TO HELP THE CONTRACTOR GET ORIENTED TO THE PROJECT.

1. Demolition of existing structures as required for new construction.
2. Removal, abatement, and proper disposal of existing asbestos containing materials, lead containing materials, PCB containing materials, and regulated building materials.
3. Construction of new masonry and drywall/metal stud walls and partitions.
4. Interior and exterior doors and hardware.
5. Architectural finishes
6. Laboratory furniture and pre-packaged controlled environmental room.
7. Revision of existing HVAC system, including new fume-hood exhaust system.
8. New plumbing work, including natural gas, vacuum, domestic hot and cold water, purified water piping, and drainage, waste and vent plumbing.
9. Fire protection piping.
10. Electrical lighting and power.
11. Alarm and telecommunications systems.

INCLUDE BELOW ONLY FOR PROJECTS IN BUILDINGS UNDER THE JURISDICTION OF THE STATE OF MICHIGAN BUREAU OF FIRE SERVICES (BFS). FOR A COMPLETE LISTING, REFER TO DESIGN GUIDELINE 1.0 CODES AND REGULATORY AGENCIES.

- B. The building in which the project is located is under the jurisdiction of the State of Michigan Bureau of Fire Services (BFS).

INCLUDE BELOW ONLY FOR PROJECTS IN BUILDINGS WITH A BFS COMPARTMENT BUT ARE OUTSIDE OF THAT COMPARTMENT. FOR A COMPLETE

LISTING, REFER TO DESIGN GUIDELINE 1.0 CODES AND REGULATORY AGENCIES

- C. The compartment of the building in which the project is located is not under the jurisdiction of the State of Michigan Bureau of Fire Services (BFS). There are compartments in the building that are under the jurisdiction of the State of Michigan Bureau of Fire Services (BFS). Submit fire alarm and fire suppression work to the State of Michigan and request related inspections.

INCLUDE AND EDIT BELOW FOR PHASED CONSTRUCTION

1.3 WORK SEQUENCE

- A. Work Sequence (Phasing): Conduct the Project in phases to provide the least possible interference to activities of the Owner's personnel, and to permit the orderly transfer of personnel and equipment to the new facilities.

THE FOLLOWING IS AN EXAMPLE OF PHASING LANGUAGE. MODIFY TO SUIT PROJECT

- 1. Achieve Substantial Completion (ready for Owner's occupancy) in room 10 before beginning work in room 20; achieve Substantial Completion in room 20 before beginning work in room 30.
- B. Notify Owner's Representative 7 calendar days prior to scheduled date of Substantial Completion of each phase of the Project. Before beginning successive phases of Work, comply with the following requirements:
 - 1. Obtain Architect's Certificate of Substantial Completion for the completed phase of Work.
 - 2. Allow 7 calendar days before beginning next phase, to permit Owner to prepare space for use.

INCLUDE BELOW IF WORK UNDER OTHER CONTRACTS WILL BE OCCURRING DURING CONTRACT TIME. INCLUDE INFORMATION ON DRAWINGS RELATED TO OTHER CONTRACT WORK (I.E. SHARED STAGING, ACCESS AND DUMPSTER SPACE.)

1.4 WORK UNDER OTHER CONTRACTS

- A. During the Contract Time, additional construction work under separate contract will be taking place. Major aspects of work under other contracts are indicated on Drawings. Coordinate construction operations and cooperate with Owner and other contractors to minimize possible conflicts. Contact The University of Michigan Construction Management Department (734) 764-2457 for further information.

1.5 WORK BY OWNER

ALWAYS RETAIN BELOW.

- A. Shut-down and restoration of utilities, including plumbing, fire protection (and Owner's implementation of Red Tag Permit system), HVAC, electrical, fire alarm, or other services that require temporary discontinuation and later restoration shall be conducted by Owner's Maintenance personnel. Contractors are not authorized to impair any services. Contact the Maintenance Department through the Owner's Representative.

DELETE BELOW IF NO OTHER CONSTRUCTION WORK BY OWNER.

- B. During the Contract Time, additional construction work performed by Owner will be taking place. Major aspects of work under other contracts are indicated on drawings. Coordinate construction operations and cooperate with Owner to minimize possible conflicts.

INCLUDE BELOW WHERE ASBESTOS ABATEMENT WORK IS BEING DONE BY OWNER OR OWNER'S SUB-CONTRACTOR

- C. During the Contract Time, Asbestos Abatement Work will be performed by Owner. The Contractor shall coordinate the Work performed by the Owner and Owner's Asbestos Abatement Sub-contractor, if any. Refer to Division 02 Section for information on Abatement Work to be performed by Owner.

INCLUDE BELOW FOR PRE-ORDERED EQUIPMENT

1.6 PRODUCTS ORDERED IN ADVANCE

EDIT SAMPLE LANGUAGE BELOW FOR PRE-ORDERED EQUIPMENT THAT WILL BE INSTALLED BY THE CONTRACTOR.

CONTRACTORS ARE REQUIRED TO PAY USE TAX ON EQUIPMENT PRE-PURCHASED BY THE UNIVERSITY AND INSTALLED BY THE CONTRACTOR. FORM OF PROPOSAL SHOULD NOTE THAT THE PROJECT INCLUDES USE TAX. ALWAYS INCLUDE EQUIPMENT COST BELOW UNLESS IT IS INCLUDED ON THE FORM OF PROPOSAL. THE BIDDERS WILL NEED THIS TO CALCULATE THE 6% USE TAX. COORDINATE WITH AEC PROJECT CONTROLS.

- A. Owner has pre-ordered and paid for the products indicated below. Work of this Contract includes unloading, handling, storing, setting, installing and making building service connections. Contractor responsible for payment of State of Michigan use tax on equipment cost listed below.

LIST EQUIPMENT OR MATERIALS AND APPROXIMATE DELIVERY DATES. WHEN PRE-ORDERING MATERIALS, INCLUDE CLEAR DESCRIPTION OF SCOPE OF MATERIALS INCLUDED.

1. Unit substation:
 - a. Approximate delivery date:
 - b. Equipment Cost:
- B. Coordinate exact time and date of delivery with equipment manufacturer.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 011000

SECTION 011400 - WORK RESTRICTIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. Types of special construction requirements include the following:

EDIT THE LIST BELOW TO SUIT PROJECT. ADDITIONAL POSSIBILITIES INCLUDE CENTRAL SYSTEM DISABLEMENT, SEASON-SPECIFIC CONSTRUCTION, AND DURATION-LIMITED CONSTRUCTION.

1. Use of premises.
2. Security.
3. Parking on U-M property.
4. Scheduling of work.
5. Refrigerant handling.
6. Tunnel projects.
7. Medical School facilities.
8. Noise and vibration control.
9. Animal rooms.
10. Student housing.
11. Fume hood ductwork demolition.
12. Protections when using epoxy coatings.

ALWAYS INCLUDE TWO PARAS BELOW.

- B. This Section contains requirements that apply to Divisions 01 through 14 and Divisions 21, 22, 23, 26, 27, 28, 31, 32 and 33 of the specifications.
- C. Related Work of other Sections:
1. Division 01 Section "Summary" for general restrictions on site use.
 2. Division 01 sections "Temporary Facilities and Controls" and "Temporary Tree and Plant Protection"

EDIT BELOW IN CONJUNCTION WITH FACILITY MANAGER AND PROJECT MANAGER. NOTE THAT SOME AREAS THAT MAY HAVE NON-STANDARD WORKING HOURS INCLUDING HOUSING, ANIMAL ROOMS.

1.2 DEFINITIONS:

- A. Work Hours: 7:00 AM through 5:00 PM, Monday through Friday.
- B. Business Hours: 8:30 AM through 5:00 PM, Monday through Friday.
- C. Off-Hours: Hours outside of Work Hours defined above.
- D. Early morning Hours: 7:00 AM through 8:30 AM, Monday through Friday.

ALWAYS EDIT AND INCLUDE USE OF PREMISES ARTICLE BELOW. ARTICLE IS PRE-EDITED FOR SMALLER SCALE RENOVATION PROJECTS.

1.3 USE OF PREMISES

- A. Coordinate use of premises under direction of the Owner's Representative.

EDIT THE FOLLOWING TO SUIT PROJECT

1. The building in which Project is located will be continuously occupied during construction. Coordinate construction efforts with Owner to minimize interference with Owner's operations.
2. Provide and maintain access of Owner's personnel to toilets, telephone closets and janitor closets on Owner-occupied floors throughout Contract Time.
3. Maintain emergency egress routes for Owner's personnel as directed by Owner's Representative.

RETAIN 1 OF THE 2 OPTIONS BELOW. ALLOWING USE OF BUILDING TOILETS IS COMMON PRACTICE.

4. Existing toilets designated by Owner may be used by Contractor's personnel for personal use only during construction. Do not use toilet facilities to conduct construction operations without written permission of Owner's Representative.
 - a. If use of toilets for construction activities is permitted by Owner's Representative, clean toilet facilities daily.
5. Contractor's personnel are prohibited from using toilets facilities during construction. Provide temporary toilet facilities for construction personnel. Coordinate location with Owner's representative.

INCLUDE THE FOLLOWING WHERE APPLICABLE

6. Contractor's staging area is strictly limited to areas indicated on the drawings. Where no staging area is indicated, Contractor's use of site is limited to areas within the Contract bounds, or as reasonably required to complete the Work. Strictly comply with Owner's Representative's directions establishing staging and operation areas, through-building routes, and locations for material delivery and disposal.

ALWAYS INCLUDE BELOW.

7. Smoking is prohibited in all University of Michigan buildings and grounds, including, Project site, mechanical rooms, utility spaces, and roof tops.

ALWAYS INCLUDE BELOW.

1.4 SECURITY

- A. Purchase University-provided photographic identity badges for each person engaged in on-site work and ensure that workers wear badges at all times on University property. Purchase cost per badge is \$4.00. Coordinate through Owner's Representative.

EDIT AND INCLUDE PARKING ARTICLE BELOW FOR ALL PROJECTS THAT DO NOT HAVE SPECIAL CONDITIONS. PROJECTS THAT USE SPECIAL CONDITIONS MAY INCLUDE PARKING REQUIREMENTS IN THE SPECIAL CONDITIONS. COORDINATE WITH CONSTRUCTION MANAGEMENT.

COORDINATE PARKING LOT DESIGNATION WITH CONSTRUCTION MANAGEMENT AND SVEN SAWIN (UPO). INCLUDE PRINTOUT OF THIS SECTION WITH BRR PAPERWORK.

TYPICAL

LOCATIONS:

SC7 -- NORTHEAST CORNER OF STADIUM BLVD AND KIPKE DR.

NC37 -- GREEN ROAD COMMUTER LOT. NOTE THAT THIS LOT IS SERVED BY AAATA BUSES NOT UM BUSES. SELECT LANGUAGE AS APPROPRIATE BELOW.

1.5 PARKING ON U-M PROPERTY

- A. Arrange parking for Contractor's personnel in accordance with Article 1.6 of the University of Michigan Standard General Conditions.

INCLUDE THE FOLLOWING 3 ITEMS FOR SC7 LOT OR OTHER ORANGE LOTS, SERVED BY UM BUS SYSTEM. DO NOT USE FO NC37

- B. The Owner has designated the use of U-M parking lot **insert**, located **insert location** for the Contractor's use on this project. This lot requires each vehicle to display a U-M orange parking permit and is the only U-M parking that will be made available to the Contractor for this project.

1. The cost and arrangement for purchase of permits for U-M parking shall be the Contractor's responsibility. The Owner will not repay the Contractor for parking for this project. Information regarding current rates and annual price adjustments (traditionally on July 1 each year) for parking permits may be obtained from the U-M Parking Customer Services office located at 523 South Division Street, Ann Arbor, Michigan 48104. Phone 734-764-8291.
2. The Owner will allow use of standard U-M bus services for contractor personnel between the above designated lot and the jobsite at no cost to the Contractor. The U-M bus follows an existing schedule and route that may not go directly to, nor stop directly in front of the jobsite. The U-M bus frequency and bus routes can be obtained from the U-M Parking Customer Services office or the LPT website (<http://ltp.umich.edu/transit/routes.php>).

INCLUDE THE FOLLOWING 3 ITEMS FOR NC37 (GREEN ROAD COMMUTER LOT) ONLY

- C. The Owner has designated the use of U-M parking lot NC37 (Green Road commuter lot), located on Green Road, near Baxter Road for the Contractor's use on this project. This lot does not require permits.
1. The Owner has designated the use of U-M parking lot NC37, located on Green Road, near Baxter Road for the Contractor's use on this project. This lot does not require permits.
 2. The AAATA bus systems serves NC37. Bus frequency and bus routes can be obtained from the AAATA website (<http://www.theride.org>).

INCLUDE ON ALL PROJECTS.

- D. The Contractor shall not transport materials or tools on UM or AAATA busses.

ALWAYS EDIT AND INCLUDE SCHEDULING ARTICLE BELOW. COORDINATE WITH AEC CONSTRUCTION MANAGEMENT.

1.6 SCHEDULING OF WORK

A. Schedule work with Owner to fit Owner's operations, to facilitate completion of this work, to coordinate with and expedite new construction work on project, and as follows:

- 1. Schedule with Owner work that interferes with facility operation, including shut-off of mechanical and electrical services and encumbrance of Owner's ingress and egress routes and normal operation. Provide the following notice of planned interruption of services:

10 DAYS IS MINIMUM FOR ALL PROJECTS

- a. Provide not less than 10 working days notice before interruption, with final confirmation not less than 72 hours before interruption.
- 2. When permitted by Owner's Representative to deliver items of equipment to Owner's loading dock facilities, schedule such deliveries in advance with Owner. Provide minimum 1 business day notice prior to planned delivery time of equipment.
 - a. Dock hours: < >
 - b. Permitted delivery hours: < >

IN OCCUPIED BUILDINGS, WORK HOURS SHOULD BE DISCUSSED WITH THE AEC CONSTRUCTION MANAGEMENT AND BUILDING FACILITY MANAGER AND MODIFIED ACCORDINGLY. NOTE THAT WORK IN RESIDENCE HALLS HAS DIFFERENT TIME RESTRICTIONS. COORDINATE WITH "STUDENT HOUSING" ARTICLE BELOW.

- 3. Schedule work during Work Hours unless otherwise approved by Owner.

INCLUDE THE FOLLOWING ONLY WHERE A SPECIFIC TIME PERIOD OR DEADLINE DATE IS REQUIRED. IF REQUIRED, DATE WILL BE LISTED IN FRONT END DOCUMENTS PRODUCED BY PROJECT CONTROLS.

- 4. Schedule and coordinate construction operations to achieve Substantial Completion, ready for Owner's occupancy, by the date listed in the form of proposal.

B. Start of Operations: Do not commence work before insurance and bonds have been submitted to Owner.

INCLUDE REFRIGERANT HANDLING REQUIREMENTS BELOW IN CONSULTATION WITH MECHANICAL ENGINEER, BUT ALWAYS WHEN DEMOLITION WILL INCLUDE REMOVAL OF A/C EQUIPMENT OR PIPING, AND WHENEVER NEW A/C EQUIPMENT WILL BE INCLUDED IN THE PROJECT.

1.7 REFRIGERANT HANDLING

A. Refrigerant Installation and Disposal: Perform all work related to refrigerant contained in chillers, cooling coils, air conditioners, and similar equipment, including related piping, in strict accordance with the following requirements:

- 1. ASHRAE Standard 15 and Related Revisions: Safety Code for Mechanical Refrigeration.
- 2. ASHRAE Standard 34 and Related Revisions: Number Designation and Safety Classification of Refrigerants.

3. United States Environmental Protection Agency (US EPA) requirements of Section 808 (Prohibition of Venting and Regulation of CFC) and applicable State and local regulations of authorities having jurisdiction.

B. Comply with Owner's tracking procedure for CFC and HCFC refrigerants. When new refrigeration equipment is installed, or when refrigerant is disposed of, complete the "Refrigerant Disposal Form". Copies of the form are available from Owner's Facilities and Operations Air Conditioning Shop. Contact (734) 647-2041. Submit completed forms to the Owner's Representative and Air Conditioning Shop.

1. For new refrigeration equipment, the following information is required: Unit location, area served, make, model and serial number of unit, refrigerant type and quantity.

2. For removed refrigeration equipment, the following information is required: Unit location, area served, make, model and serial number of unit, refrigerant type and quantity. Removed refrigerant shall become the property of the Contractor.

INCLUDE BELOW FOR TUNNEL PROJECTS. DELETE IF TUNNEL WORK NOT INCLUDED IN PROJECT

1.8 TUNNEL PROJECTS

A. Tunnel Access: As shown on drawings.

B. Construction Energy: Use of electric arc welders is permitted at the discretion of the Owner, subject to verification of adequacy of power source.

1. Notify the Owner of the expected electrical consumption per welding rig and the number of rigs proposed for use.

2. The Owner will identify sources of limited amounts of both 120 VAC, single phase, electric power, and compressed air, from existing distribution systems.

3. Tie into the identified sources for power and compressed air only in the presence of Owner's personnel.

C. Safety Requirements: Perform work within tunnels in strict compliance with the published requirements of Owner's Environment, Health and Safety (EHS) department. Copies of requirements are available from the Safety Division of Owner's EHS department.

D. Contractor shall notify Department of Public Safety Dispatch at 734-763-1131 prior to entering and after exiting the tunnel system.

EDIT AND INCLUDE BELOW FOR MEDICAL SCHOOL PROJECTS. CAN BE EDITED FOR OTHER SCHOOLS AND COLLEGES. NOTE THAT WORK SUSPENSION AND RIGOROUS CLEANING REQUIREMENTS ADD COST.

1.9 MEDICAL SCHOOL FACILITIES

A. Scheduled Suspended-Work Periods: The University's Medical School conducts noise sensitive research and regularly scheduled academic examinations throughout the year. Certain construction operations are expected to result in noise, vibration, utility shut-offs, and other nuisances that will negatively affect the examination environment.

1. Upon request of the Owner's Representative, suspend activities conducted within the indicated areas that produce noise, vibration, and other nuisances, or that otherwise have, in the opinion of the Owner, the potential to disturb Medical School research and examinations:

a. The precise dates, times, and durations of the work suspension periods are unknown. The Owner's Representative will provide full details of each required work suspension not less than 7 calendar days prior the beginning of the suspension.

REVIEW QUANTITY BELOW WITH MEDICAL SCHOOL FACILITIES PRIOR TO INCLUDING. WORK IN MEDICAL SCIENCE UNIT II SECOND AND THIRD FLOORS TEND TO IMPACT STUDENTS & EXAMS MOST FREQUENTLY.

b. Include in the construction schedule 20 working days, of eight hours each, of suspended work time within the areas indicated.

USUALLY INCLUDE BELOW FOR ALL MEDICAL SCHOOL PROJECTS.

B. Daily Cleaning Program: In public areas, including lobbies, corridors, elevator cabs, and similar areas used for construction traffic, but outside the limit of the Project, comply with the following:

- 1. Either at the end of each working day or before 7:30 AM each working day, broom clean floors using commercial cleaning compound. Wet mop floors after broom cleaning to completely remove dirt, dust, and scuff.
2. Storage of construction related materials and equipment, including temporary storage of all types, is prohibited outside the Project limits.

THE FOLLOWING CAN HAVE SIGNIFICANT COST IMPLICATIONS. DISCUSS THE FOLLOWING REQUIREMENTS WITH MEDICAL SCHOOL REPRESENTATIVE BEFORE INCLUSION.

C. Nuisance Control Program: Schedule dust, noise, vibration, and fume generating activities during Off Hours. Applicable nuisance-generating activities include:

- 1. Demolition work, including cutting, coring, asbestos abatement, and debris removal operations.
2. Use of gasoline or diesel-powered vehicles or equipment.
3. Utility shut-downs and tie-ins.
4. Fume/odor generating construction activities, including application of non-water-based paints, epoxy coatings, resinous flooring and similar materials that release significant quantities of volatile organic compounds during application and cure.

5. Construction activities in public areas (including corridors, lobbies and stairs) outside the immediate Project limits.
6. Delivery of materials to site and trucking of debris from site.
7. Transportation of construction materials and debris through public areas (including corridors, lobbies and stairs) to and from immediate Project limits.

INCLUDE BELOW FOR NOISE AND VIBRATION CONTROL EXCEPT IN MEDICAL SCHOOL.

DELETE BELOW FOR MEDICAL SCHOOL PROJECTS AND USE "SPECIAL REQUIREMENTS FOR MEDICAL SCHOOL PROJECTS" ARTICLE.

1.10 NOISE AND VIBRATION CONTROL

- A. Noise-Vibration Restrictions: Noise- and vibration-sensitive research will be conducted for the duration of the Project.

THE OPTIONS BELOW ARE GIVEN AS A GUIDE TO CREATING YOUR OWN PROJECT-SPECIFIC SPECIAL REQUIREMENTS - READ AND EDIT THE FOLLOWING CAREFULLY. TYPICALLY NOT ALL WILL APPLY.

1. Demolition operations are restricted to Off-Hours.
2. Terminate disruptive work during the times and dates listed below:

PROVIDE SPECIFIC TIMES AND DATES DURING WHICH DIRUPTIVE WORK SHOULD NOT OCCUR (E.G.: EXAM SCHEDULE IN ADJACENT CLASSROOM)

- a. <>
3. Arrange a system of notification with Owner's Representative that will provide building occupants not less than 24 hours warning of performance of construction operations that will cause noise and vibration.
4. Conduct demolition work in a single, continuous operation. Complete demolition work within 7 calendar days from start of demolition operations.
5. Plan, schedule and perform work during evenings and weekends, at no additional cost to Owner, as required to achieve completion of floor slab demolition within indicated time.

INCLUDE BELOW FOR WORK INSIDE ANIMAL ROOMS IN ANY UNIVERSITY UNIT.

1.11 ANIMAL ROOMS

THE FOLLOWING REQUIREMENTS MAY NOT BE REQUIRED IN EVERY CASE. DISCUSS WITH ULAM REPRESENTATIVE BEFORE INCLUSION.

- A. For work conducted in animal rooms, comply with the following special scheduling requirements:
1. Schedule work in designated Animal Rooms during Work Hours.
 2. Unless other arrangements have been agreed to by Owner in writing, Contractor's personnel shall not enter designated Animal Rooms until each of the following conditions are met:

REVISE BELOW TO SUIT DEPARTMENT AND REPRESENTATIVE FOR EACH PROJECT.

- a. Contractor has coordinated work with Medical School Facilities Management and Planning. Contact the Medical School Facilities Department, located in room 1590 of Medical Science Research Building (MSRB) II, at (734) 747-2788.
- b. Owner has removed animals from each room in which work is to be performed.
- c. Owner's personnel have cleaned each room in which work is to be performed and notified Contractor that each room is ready.
- d. Contractor's personnel are properly attired in clothing provided by Owner. Attire is required for the protection of the sterile environment provided for research animals. Contractor's personnel should not expect to encounter substances or contaminants hazardous to humans, unless otherwise informed by Owner.

INCLUDE BELOW FOR PROJECTS IN HOUSING DEPARTMENT BUILDINGS.

1.12 STUDENT HOUSING

- A. The building will be occupied and used as a residence throughout the construction period.
- B. Comply with the following special safety and security requirements for work conducted within student occupied buildings and areas:

MODIFY TIMES BELOW IN COOPERATION WITH HOUSING DEPARTMENT REPRESENTATIVE

- 1. Schedule Work during the Work Hours, with the following restrictions:
 - a. Occupied Buildings: Do not begin work that will generate noise or vibration before 9:00 AM.

MODIFY OR DELETE THE FOLLOWING SUBPARA TO SUIT PROJECT CONDITIONS. COORDINATE WITH HOUSING DEPARTMENT REPRESENTATIVE.

- b. Study and Exam Days: No work will be permitted during officially designated study and exam days. Study and exam days include:

LIST ALL APPLICABLE DATES BELOW.

- 1) <>
- 2. Building Access: During Business Hours, notify Owner's Representative for access to Project site.
 - a. Individual areas can be opened as often as once each day by the Owner's building facilities manager. When more frequent daily access is required, or when access is required for more than 5 working days, obtain keys from the Housing Security Department, or from the University Key Office. Use keys to obtain access to areas in strict compliance with approved construction schedule issued to Housing Security. When working in more than one area, check with the building facilities manager to ensure no scheduling conflicts exist.

- b. Building access outside of Business Hours is available only with the written approval of the Owner's Representative. Coordinate access with the Owner's Representative and the Owner's Public Safety Department.
- 3. Personal Conduct Restrictions: Employees of the Contractor and subcontractors shall comply with the following restrictions regarding personal conduct while on University of Michigan property:
 - a. Harassment: Conduct considered by the Owner as harassing is strictly prohibited, including the use of profanity; or the use of derogatory or demeaning gender- or race-related comments or actions. The Owner reserves the right to require the Contractor, at no additional cost to the Owner, to remove from the Project all personnel who violate this policy.

INCLUDE BELOW IN PROJECTS WITH FUME HOOD DUCTWORK MODIFICATION OR DEMOLITION.

1.13 FUME HOOD DUCTWORK DEMOLITION AND MODIFICATION

- A. Existing fume hood ductwork may have been corroded by exposure to a variety of chemicals during its use.
- B. Ensure that all personnel engaged in demolition or modification of fume hood ductwork wear indicated personnel protective equipment (PPE).
- C. PPE is prudent and precautionary only; it does not suggest an inherent health hazard from the ductwork.
- D. In addition to standard OSHA and MIOSHA safety gear (such as hard hats, steel-toed footwear and similar items), PPE includes the following:
 - 1. Leather gloves for dry conditions; rubber over-gloves for wet conditions.
 - 2. Safety eye wear to prevent dust or debris from falling into the eyes.
 - 3. Protective outerwear to protect against dust or debris contact with skin.

INCLUDE BELOW IN PROJECTS WHERE THE BUILDING WILL BE OCCUPIED DURING CONSTRUCTION AND SOLVENT-BORNE OR HIGH BUILD EPOXY BLOCK FILLERS, PAINTS, OR FLOOR COATINGS. CONSIDER LOW VOC PRODUCTS WHERE POSSIBLE.

1.14 PROTECTIONS WHEN USING EPOXY COATINGS

- A. The building will be occupied during construction.
- B. Comply with the following requirements for Work involving the application of solvent-borne epoxy coatings or high-build epoxy products:

1. Protect the work area where the epoxy coatings are applied. Provide temporary barrier enclosures around the work area consisting of 8 mil polyethylene sheeting supported by wood or metal studs. The joints in the sheeting and the perimeter of the barriers must be sealed.
2. Provide temporary equipment to ensure that the work area is under negative pressure relative to the rest of the building. Ventilation must be sufficient to prevent a build-up of excessive vapors inside the enclosure during the application and curing of epoxy. The ventilation must be operational 24 hrs/day until completion of epoxy application and curing.
3. Provide seven days' notice prior to the beginning of epoxy application. The Owner's Representative shall schedule a meeting to coordinate activities required to achieve the protection requirements indicated above and to determine whether air quality monitoring will be performed during epoxy application. Attendees at the meeting shall include the General Contractor, the Subcontractor for the epoxy application, the Owner's Representative and a representative of the University of Michigan's Environment, Health and Safety Department (EHS).
4. Provide waste disposal plans to Owner's Representative for review and approval by UM EHS. Waste materials that have been in contact with products containing solvents must be disposed as hazardous waste.

TREE PROTECTION REMOVED FROM THIS SECTION. UTILIZE SECTION 015639 "TEMPORARY TREE AND PLANT PROTECTION" FOR PROJECT IMPACTING TREES AND PLANT.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 011400

SECTION 012100 - ALLOWANCES

*GENERALLY ASK FOR ASSISTANCE WHEN PREPARING THIS SECTION.
PREVIOUS EXPERIENCE HAS SHOWN THIS TO BE A PROBLEM SECTION FOR
MANY PROJECTS.*

PART 1 - GENERAL

1.1 SUMMARY

- A. Selected materials are shown and specified in the Contract Documents by allowances. Allowances have been established in lieu of additional requirements and to defer selection of actual materials to a later date. Additional requirements, if necessary, will be issued by Change Order.

*THE FOLLOWING TYPE OF CASH ALLOWANCE INCLUDES MATERIAL ONLY, NOT
LABOR - THIS TYPE IS COMMON FOR BRICK AND CARPET*

- 1. Cash Allowances: Contractor's costs for unloading and handling on the site, labor, installation costs, overhead, profit and other expenses contemplated for the allowance shall be included in the Contract Sum and not in the allowance.
- B. Type of allowance is "Lump-sum" cash allowance.
- C. General information concerning cash allowances and procedures for submitting and handling Change Orders are included in "Standard General Conditions".

1.2 SELECTION AND PURCHASE

- A. At the earliest feasible date after Contract award, advise the Owner of the date when the final selection and purchase of product described by allowance must be completed in order to avoid delay in performance of the Work.
 - 1. When requested by the Owner, obtain proposals for each allowance for use in making final selections; include recommendations that are relevant to performance of the work.

1.3 SUBMITTALS

- A. Submit proposals for purchase of products or systems included in allowance, in the form specified for Change Orders.
- B. Submit invoices or delivery slips to indicate actual quantities of materials delivered to the site for use in fulfillment of allowance.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 SCHEDULE OF CASH ALLOWANCES

MODIFY THE FOLLOWING TO SUIT PROJECT. PAY SPECIAL ATTENTION TO DOLLAR VALUES - BELOW ARE EXAMPLES ONLY

- A. Cash Allowance: Include a lump sum material cost of \$35.00 per square yard for purchase of carpeting as indicated on drawings and specifications.
- B. Cash Allowance: Include a lump sum material cost of \$425.00 per thousand units for purchase of face brick as indicated on drawings and specifications.

END OF SECTION 012100

SECTION 012200 - UNIT PRICES

*GENERALLY, EDITING THIS SECTION REQUIRES CAREFUL ATTENTION TO
DETAIL AND STRONG KNOWLEDGE OF THE STANDARD GENERAL CONDITIONS
- ASK FOR ASSISTANCE IF REQUIRED.*

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes administrative and procedural requirements for unit prices.

1.2 DEFINITION

- A. Unit price: A unit price is an amount proposed by Bidders and stated on the Bid Form as a price per unit of measurement for materials or services that will be added to or deducted from the Contract Sum by Change Order if estimated quantities of Work required by the Contract Documents are increased or decreased

1.3 PROCEDURES

- A. Unit prices include necessary material, overhead, profit and applicable taxes.
- B. Refer to individual Sections
 - 1. For demolition or construction activities requiring establishment of unit prices.
 - 2. For requirements for materials and methods described under each unit price.
- C. Owner reserves the right to reject the Contractor's measurement of Work-in-place that involves the use of established unit prices, and to have this Work measured by an independent surveyor acceptable to the Contractor at the Owner's expense.

*RETAIN ONLY ONE OF THE FOLLOWING 2 OPTIONS. STANDARD UNIT PRICES
SHOULD BE LISTED ONLY IN FOP. NON-STANDARD UNIT PRICES SHOULD
BE DETAILED BELOW WITH SHORTER DESCRIPTION IN FOP.*

- D. List of Unit Prices: A schedule of unit prices is included in the Form of Proposal.
- E. List of Unit Prices: A schedule of unit prices is included in Part 3.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

USE FRAMEWORK BELOW FOR NON-STANDARD UNIT PRICES.

- A. SCHEDULE OF UNIT PRICE ITEMS Unit Price No. 1: <Brief Description - match FOP>

1. <Detailed description>
2. Unit of Measure: < >
3. Quantity: < >

END OF SECTION 012200

SECTION 012300 - ALTERNATES

PART 1 - GENERAL

1.1 SUMMARY

- A. Notification: Immediately following award of Contract, prepare and distribute to each party involved notification of the status of each alternate. Indicate whether alternates have been accepted, rejected or deferred for consideration at a later date. Include a complete description of negotiated modifications to alternates, if any.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 SCHEDULE OF ALTERNATES

BELOW ARE 3 EXAMPLES OF ALLOWABLE ALTERNATE TYPES. COORDINATE DESCRIPTION IN THIS SECTION WITH AECION / FORM OF PROPOSAL (FOP). FOP DESCRIPTION ARE LIMITED TO 1 SENTENCE. SCOPE DESCRIPTION IN THIS SECTION SHOULD CONTAIN IDENTICAL KEY PHASE. ADDITIONAL DETAIL CAN BE PROVIDED FOLLOWING THE KEY PHRASE IF NEEDED.

- A. Alternate No. 1: Provide the ADD price for <describe the additional work to be added to the base bid scope of work>
- B. Alternate No. 2: Provide the DEDUCT price for <describe the work to be deleted from the base bid scope of work>
- C. Alternate No. 3: Provide the ADD or DEDUCT price for providing_<description> in lieu of <description>.

END OF SECTION 012300

SECTION 013100 - PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.1 RELATED SECTIONS

- A. Additional project coordination, phasing, and scheduling requirements are included in Division 01 Sections "Summary" and "Work Restrictions"

1.2 COORDINATION

- A. Project Meetings: Attend regular meetings with Owner and subcontractors as directed by Owner. Location of meetings will be determined by Owner.
- B. Coordinate inspections and testing of concealed Work to occur prior to concealing that Work.
- C. Coordinate sequencing of Work to occur during conditions of temperature, humidity, exposure, forecast weather, and status of Project completion, which will ensure best possible results for each unit of Work. Isolate each unit of Work from non-compatible Work, as required to prevent deterioration.
- D. Coordinate work between trades for the most efficient sequence of installation, to prevent space conflicts, and to provide clearances required by code, Drawings, and the manufacturer.
 - 1. Minor dimension changes (including the need to adjust finish dimensions), difficult installations and/or the addition of off-set fittings will not be considered changes to the Contract.
 - 2. Obtain approval of the Owner's Representative prior to any changes or alternate configurations.

1.3 COORDINATION DRAWINGS

- A. General: For all Work in areas indicated under scope, prepare coordination drawings with space conflicts resolved, and showing clearances required by code, Drawings, and the manufacturer.

EDIT BELOW TO BE PROJECT SPECIFIC

- B. Scope: Provide coordination drawings for the following project areas:

EDIT TO BE PROJECT SPECIFIC. ON SMALLER PROJECTS, CONSIDER LIMITING TO CRITICAL AREAS TO MINIMIZE COST AND TIME IMPLICATIONS.

- 1. Open ceiling areas above 7-feet.
- 2. Ceiling and above ceiling space.
- 3. Slab Edge and Embedded Items.
- 4. Mechanical rooms.
- 5. Mezzanines and interstitial spaces.
- 6. Electrical rooms.
- 7. Shafts.
- 8. Tunnels.

9. Other spaces where the contractor determines limited space availability necessitates coordination.

EDIT BELOW TO BE PROJECT SPECIFIC

- C. Content: Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts.
 1. General: Show the following on all drawings:
 - a. Functional and spatial relationships of components.
 - b. Space / access requirements as indicated by code, on Drawings, and per manufacturer requirements.
 - c. Column center lines, interior partition locations and heights, ceiling heights, and fire rated construction locations.
 - d. Dimensions.
 2. Drawing types:
 - a. Floor Plans
 - b. Reflected Ceiling Plans
 - c. Plenum Plans: Locate all components within ceiling plenum to accommodate layout of light fixtures and other ceiling mounted items indicated on Drawings.
 - d. Section drawings: As needed to adequately represent the Work.
 - e. Elevations: Locate all equipment, panels, controls, and other wall mounted items in mechanical and electrical rooms.
 3. Architectural and structural: Show the following:
 - a. Relationships between ceilings mounted devices and the acoustical ceiling grid.
 - b. Sub-framing for support of ceiling, soffit, and wall systems
 - c. Structural penetrations and openings for all disciplines.
 - d. Location and size of access doors.
 - e. Slab edge locations and sizes and locations of embedded items for metal fabrications, sleeves, anchor bolts, bearing plates, angles, door floor closers, slab depressions for floor finishes, curbs and housekeeping pads, and similar items.
 4. Equipment:
 - a. Indicate equipment that projects into the above ceiling coordination space.
 5. Mechanical and Plumbing Work: Show the following:
 - a. Sizes, bottom, and top elevations of ductwork, piping, and conduit runs, including insulation, bracing, flanges, and support systems.
 - b. Dimensions of major components, such as dampers, valves, diffusers, access doors, and cleanouts.
 - c. Fire-rated enclosures around ductwork.
 - d. Location of DDC control panels and major control devices (e.g. flow meters, control dampers, control valves greater than 2")
 - e. Location and pitch for steam, condensate, sanitary, storm, and all other pitched services.
 - f. Space for tube pulls, coil pulls, filter removal, etc.
 6. Electrical Work: Show the following:
 - a. Runs of vertical and horizontal conduit 1-1/4 inches in diameter and larger.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

013100 - 2

- b. Light fixture, exit light, emergency battery pack, smoke detector, and other fire-alarm device locations.
 - c. Panelboard, switchboard, switchgear, substation transformer, busway, generator, and motor control center locations.
 - d. Location of pull boxes and junction boxes, dimensioned from column center lines.
 - e. Cable trays.
7. Fire-Protection System: Show the following:
- a. Locations of standpipes, mains piping, branch lines, pipe drops, and sprinkler heads.

D. Process requirements:

- 1. Base drawings: Architect will furnish Contractor one set of digital data files of Drawings for use in preparing coordination digital data files.
 - a. Architect makes no representations as to the accuracy or completeness of digital data files as they relate to Drawings or to existing conditions.
- 2. Meetings:
 - a. Kick-off meeting: Introduce and define process. Establish drawing format, zoning, sequencing, and milestones schedule dates.
 - b. Progress meetings as needed to complete the work but not less than every 2 weeks during coordination.
 - c. Require each trade contractor's coordination representative to physically attend the meetings.
 - d. Invite Architect, Engineer, and Owner's Representative to each meeting.
 - e. Provide meeting minutes within 5 business day of each meeting.
- 3. Sequencing: Coordinate the addition of information from each trade in a sequence that best provides for coordination of the information and resolution of conflicts between installed components before submitting for review.
- 4. Conflict resolution: Resolve drawing conflicts between meetings. Review major conflicts at the meeting with the Architect / Engineer for resolution. Provide the Architect / Engineer with necessary information to review.
- 5. Field Coordination: Use approved coordination drawing during installation. When new conflicts are determined, review with coordination team, Architect / Engineer, and Owner's Representative for resolution.

E. Submittal requirements

- 1. Submit the following:
 - a. Coordination drawings that the contractor has signed-off as being complete. Drawings shall be at a legible scale and include:
 - 1) Composite view of all systems.
 - 2) Isolated view of each individual system.
 - b. Record drawings showing actual built conditions and service configurations.

2. Review: Architect will review coordination drawings to confirm that the Work is being coordinated, but not for the details of the coordination, which are Contractor's responsibility. If Architect determines that coordination drawings are not being prepared in sufficient scope or detail, or are otherwise deficient, Architect will so inform Contractor, who shall make changes as directed and resubmit.
3. Coordination Drawing Prints: Prepare coordination drawing prints according to requirements in Section 013300 "Submittal Procedures."

ELECTRONIC 2-D FILES LISTED BELOW.

4. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:
 - a. File Preparation Format: DWG, DXF, or DGN.
 - b. File Submittal Format: Submit or post coordination drawing files using format same as file preparation format and Portable Data File (PDF) format.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 013100

SECTION 013200 - CONSTRUCTION PROGRESS DOCUMENTATION

THIS SECTION SPECIFIES REQUIREMENTS FOR CONSTRUCTION SCHEDULE AND SHOP DRAWING LOG. MODIFY AS REQUIRED FOR PROJECT.

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes administrative and procedural requirements for documenting the progress of construction during performance of the Work, including the following:

ADJUST LIST BELOW TO SUIT PROJECT.

1. Contractor's Construction Schedule.
2. Submittals Schedule.

1.2 SUBMITTALS

- A. Submittals Schedule: Submit one copy of schedule. Arrange the following information in a tabular format in chronological order:

REVISE LIST BELOW TO SUIT PROJECT. ADD INFORMATION, SUCH AS SCHEDULED DATES FOR PURCHASING AND INSTALLATION AND THE ACTIVITY OR EVENT NUMBER, IF A CPM CONSTRUCTION SCHEDULE IS USED.

1. Scheduled date for first submittal.
2. Specification Section number and title.
3. Submittal category (action or informational).
4. Name of subcontractor.
5. Description of the Work covered.
6. Scheduled date for Architect's final release or approval.

- B. Contractor's Construction Schedule: Submit one printed copy of initial schedule, large enough to show entire schedule for entire construction period.

1.3 COORDINATION

- A. Coordinate preparation and processing of schedules and reports with performance of construction activities and with scheduling and reporting of separate contractors.

- B. Coordinate Contractor's Construction Schedule with the Schedule of Values, list of subcontracts, Submittals Schedule, progress reports, payment requests, and other required schedules and reports.

1. Secure time commitments for performing critical elements of the Work from parties involved.
2. Coordinate each construction activity in the network with other activities and schedule them in proper sequence.

PART 2 - PRODUCTS

2.1 SUBMITTALS SCHEDULE

- A. Submit concurrently with the first complete submittal of Contractor's Construction Schedule. Comply with requirements of individual specification sections.
- B. Coordinate Submittals Schedule with list of subcontracts, the Schedule of Values, and Contractor's Construction Schedule.

2.2 CONTRACTOR'S CONSTRUCTION SCHEDULE, GENERAL

- A. Time Frame: Extend schedule from date established for the Notice of Award to date of Substantial Completion.
 - 1. Contract completion date shall not be changed by submission of a schedule that shows an early completion date, unless specifically authorized by Change Order.
- B. Activities: Treat each story or separate area as a separate numbered activity for each principal element of the Work. Comply with the following:
 - 1. Procurement Activities: Include procurement process activities for long lead items and major items, requiring a cycle of more than 60 days, as separate activities in schedule. Procurement cycle activities include, but are not limited to, submittals, approvals, purchasing, fabrication, and delivery.
 - a. **INSERT LIST OF MAJOR ITEMS OR PIECES OF EQUIPMENT**
 - 2. Submittal Review Time: Include review and re-submittal times indicated in Division 01 Section "Submittal Procedures" in schedule. Coordinate submittal review times in Contractor's Construction Schedule with Submittals Schedule.
 - 3. Startup and Testing Time: Include not less than **INSERT NUMBER** business days for startup and testing.
 - 4. Substantial Completion: Indicate completion in advance of date established for Substantial Completion, and allow time for Architect's administrative procedures necessary for certification of Substantial Completion.
- C. Constraints: Include constraints and work restrictions indicated in the Contract Documents and as follows in schedule, and show how the sequence of the Work is affected.

DELETE SUBPARAGRAPHS BELOW NOT APPLICABLE.

- 1. Phasing: Arrange list of activities on schedule by phase.
- 2. Work Restrictions: Show the effect on the schedule of the following:

REVISE LIST BELOW TO SUIT PROJECT.

- a. Limitations of continued occupancies.
 - b. Uninterruptible services.
 - c. Use of premises restrictions.
- D. Milestones: Include milestones indicated in the Contract Documents in schedule, including, but not limited to the following:

EDIT BELOW TO BE PROJECT SPECIFIC. INCLUDE ITEM 2 AND SUB-ITEMS BELOW FOR ALL PROJECT SUBMITTED TO BFS. SUB-ITEMS A, B, & D CAN BE DELETED FROM PROJECTS THAT DO NOT HAVE FIRE ALARM OR FIRE SUPPRESSION WORK. REFER TO DESIGN GUIDELINE 1.0 CODES AND REGULATORY AGENCIES FOR A LISTING OF BFS BUILDINGS.

1. Notice to Proceed.
2. State of Michigan Bureau of Fire Services (BFS) milestones:
 - a. Submission of "Application for Fire Safety Plan Examination" and associated fee for fire alarm and fire suppression work.
 - b. Submission of OFS 12A and associated fee.
 - c. BFS 50% inspection.
 - d. Final fire alarm test.
 - e. BFS final inspection.
3. Delivery of major equipment.
4. Substantial Completion.
5. Final Completion.

2.3 CONTRACTOR'S CONSTRUCTION SCHEDULE (GANTT CHART)

GANTT-CHART SCHEDULE IN THIS ARTICLE IS ADEQUATE FOR MANY PROJECTS.

- A. Gantt-Chart Schedule: Submit a comprehensive, fully developed, horizontal Gantt-chart-type, Contractor's Construction Schedule within 30 days of date established for the Notice of Award. Base schedule on the Preliminary Construction Schedule and whatever updating and feedback was received since the start of Project.
- B. Preparation: Indicate each significant construction activity separately. Identify first workday of each week with a continuous vertical line.

PART 3 - EXECUTION

3.1 CONTRACTOR'S CONSTRUCTION SCHEDULE

- A. Contractor's Construction Schedule Updating: At monthly intervals, update schedule to reflect actual construction progress and activities
 1. As the Work progresses, indicate Actual Completion percentage for each activity.
- B. Distribution: Distribute copies of approved schedule to Owner and other parties identified by Contractor with a need-to-know schedule responsibility.
 1. Post copies in Project meeting rooms and temporary field offices.
 2. When revisions are made, distribute updated schedules to the same parties and post in the same locations. Delete parties from distribution when they have completed their assigned portion of the Work and are no longer involved in performance of construction activities.

END OF SECTION 013200

SECTION 013300 - SUBMITTAL PROCEDURES

9/20/11 SECTION REWRITTEN TO INCORPORATE ELECTRONIC SUBMITTAL PROCEDURE. NOTE THAT ONLY HARD COPIES INCLUDED IN SECTION REQUIREMENTS ARE SAMPLES.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related sections:

EDIT BELOW TO BE PROJECT SPECIFIC

- 1. Division 01 Section "Construction Progress Documentation" for submitting submittal and construction schedules.
- 2. Division 01 Section "Special Procedures for Fire Marshal Review and Inspection" for submittal requirements for Fire Marshal review.
- 3. Division 01 Section "Project Commissioning" for commissioning submittals.
- 4. Division 01 Section "Operation and Maintenance Manuals" for submitting operation and maintenance manuals.

1.2 SUMMARY

- A. Section includes requirements for the submittal schedule and administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals.

1.3 DEFINITIONS

- A. Facilities Information Center (FIC): Owner's department responsible for tracking and archiving submittals.
- B. ProjectDox: Communications software utilized by Owner that enables members to upload and download electronic files via web based graphical interface. Owner will establish project specific site with project specific members.
- C. Portable Document Format (PDF): An open standard file format licensed by Adobe Systems used for representing documents in a device-independent and display resolution-independent fixed-layout document format.

1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

- A. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
 - 1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.

2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.

RETAIN SUBPARAGRAPH BELOW IF ONE SUBMITTAL HAS AN IMPACT ON ANOTHER SUBMITTAL. SUBMITTALS THAT REQUIRE CONCURRENT REVIEW SHOULD BE SO INDICATED IN THOSE SECTIONS.

3. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
 - a. Architect reserves the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.
- B. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
 1. Initial Review: Allow 10 business days for initial review of each submittal. Allow additional time if coordination with subsequent submittals is required. Architect will advise Contractor when a submittal being processed must be delayed for coordination.
 2. Resubmittal Review: Allow 10 business days for review of each resubmittal.
- C. Electronic Submittals: Identify and incorporate information in each electronic submittal file as follows:
 1. Assemble complete submittal package into a single indexed file incorporating submittal requirements of a single Specification Section and transmittal form.
 2. Name file with submittal number or other unique identifier, including revision identifier.
 - a. File name shall use project identifier (UM project number) and Specification Section number followed by a brief description. Resubmittals shall include a decimal point, followed by a sequential number Example file names:
 - 1) PXXXX 081700 Door hardware schedule.pdf; PXXXX 081700 Door hardware schedule.2.pdf
 - 2) PXXXX 238236 Finned Tube Cover product data.pdf
 - b. Coordinate project specific file naming with Architect prior to first submittal.
 3. Transmittal Form for Electronic Submittals: Use electronic form, containing the following information:
 - a. Project name and Owner's Project Number.
 - b. Date.
 - c. Architect name and address.
 - d. Contractor name, address and telephone number.
 - e. Name of firm or entity that prepared submittal.
 - f. Names of subcontractor, manufacturer, and supplier.
 - g. Specification Section number and title or Drawing sheet number.
 - h. Description of items included:
 - 1) Brief written description of each item.
 - 2) Indication of full or partial submittal.

P00000000 0000 Issued for: BID

013300 - 2

- 3) Action requested (eg. "for review", "for information only", or other notation).
 - 4) Location(s) where product is to be installed, as appropriate.
- D. Options: Identify options requiring selection by Architect.
- E. Deviations and Additional Information: Clearly note on submittals all deviations from Contract Documents. Do not proceed with work related to the submittal, regardless of Architect/Engineer's action marking, without the Architect/Engineer's specific, written approval of such deviation. Refer to Standard General Conditions for additional requirements and obligations related shop drawings.
- F. Resubmittals: Resubmit in same form as initial submittal.
1. Note date and content of previous submittal.
 2. Note date and content of revision in label or title block and clearly indicate extent of revision.
 3. Resubmit submittals until they are marked with approval notation from Architect's action stamp.
- G. Distribution: Furnish copies of final submittals to manufacturers, subcontractors, suppliers, fabricators, installers, authorities having jurisdiction, commissioning agent, Owner and others as necessary for performance of construction activities. Show distribution on transmittal forms.
- H. Use for Construction: Retain complete copies of submittals on Project site. Use only final action submittals that are marked with approval notation from Architect's action stamp.

PART 2 - PRODUCTS

2.1 SUBMITTAL PROCEDURES

- A. General Submittal Procedure Requirements: Prepare and submit submittals required by individual Specification Sections. Types of submittals are indicated in individual Specification Sections.
1. Upload electronic submittals as PDF electronic files directly to "To be Reviewed" folder on ProjectDox website specifically established for Project.
 2. Notify all website members using ProjectDox automated message system. Include the file name for each submittal uploaded.
 3. Architect uploads annotated file to the "Reviewed" folder on ProjectDox website.
 4. Architect notifies all website members using ProjectDox automated message system. Message will include file name for each submittal reviewed and uploaded.
 5. Notify Architect, Owner's Representative and FIC that reviewed files have been retrieved.
- B. Certificates and Certifications Submittals: Provide a statement that includes signature of entity responsible for preparing certification. Certificates and certifications shall be signed by an officer or other individual authorized to sign documents on behalf of that entity.

- C. Product Data: Collect information into a single submittal for each element of construction and type of product or equipment.
1. If information must be specially prepared for submittal because standard published data are not suitable for use, submit as Shop Drawings, not as Product Data.
 2. Mark each copy of each submittal to show which products and options are applicable.
 3. Include the following information, as applicable:
 - a. Manufacturer's catalog cuts.
 - b. Manufacturer's product specifications.
 - c. Standard color charts.
 - d. Statement of compliance with specified referenced standards.
 - e. Testing by recognized testing agency.
 - f. Application of testing agency labels and seals.
 - g. Notation of coordination requirements.
 - h. Availability and delivery time information.
 4. For equipment, include the following in addition to the above, as applicable:
 - a. Wiring diagrams showing factory-installed wiring.
 - b. Printed performance curves.
 - c. Operational range diagrams.
 - d. Clearances required to other construction, if not indicated on accompanying Shop Drawings.
 5. Submit Product Data before or concurrent with Samples.
- D. Shop Drawings: Prepare Project-specific information, drawn accurately to scale. Do not base Shop Drawings on reproductions of the Contract Documents or standard printed data.
1. Preparation: Fully illustrate requirements in the Contract Documents. Include the following information, as applicable:
 - a. Identification of products.
 - b. Schedules.
 - c. Compliance with specified standards.
 - d. Notation of coordination requirements.
 - e. Notation of dimensions established by field measurement.
 - f. Relationship and attachment to adjoining construction clearly indicated.

DELETE BELOW IF PROJECT DOES NOT INCLUDE DELEGATED DESIGN.

- g. Seal and signature of professional engineer if specified.

REVISE SPECIFIC SHEET SIZE INDICATED BELOW IF NEEDED FOR PROJECT.

2. Sheet Size: Except for templates, patterns, and similar full-size drawings, submit Shop Drawings in electronic files formatted for printing to scale on sheets at least 8-1/2 by 11 inches, but no larger than 30 by 42 inches.

- E. Samples: Submit Samples for review of kind, color, pattern, and texture for a check of these characteristics with other elements and for a comparison of these characteristics between submittal and actual component as delivered and installed.

1. Transmit Samples that contain multiple, related components such as accessories together in one submittal package.
2. Identification: Attach label on unexposed side of Samples that includes the following:

- a. Generic description of Sample.
 - b. Product name and name of manufacturer.
 - c. Sample source.
 - d. Number and title of applicable Specification Section.
 - e. Specification paragraph number and generic name of each item.
- 3. Provide corresponding electronic submittal of Sample transmittal, digital image file illustrating Sample characteristics, and identification information for record.
 - 4. Disposition: Maintain sets of approved Samples at Project site, available for quality-control comparisons throughout the course of construction activity. Sample sets may be used to determine final acceptance of construction associated with each set.

RETAIN FIRST SUBPARAGRAPH BELOW IF REQUIRED.

- a. Samples that may be incorporated into the Work are indicated in individual Specification Sections. Such Samples must be in an undamaged condition at time of use.
- b. Samples not incorporated into the Work, or otherwise designated as Owner's property, are the property of Contractor.

RETAIN BELOW IF APPLICABLE.

- 5. Samples for Initial Selection: Submit manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available.
 - a. Number of Samples: Submit one full set of available choices where color, pattern, texture, or similar characteristics are required to be selected from manufacturer's product line. Architect will return submittal with options selected.
- 6. Samples for Verification: Submit full-size units or Samples of size indicated, prepared from same material to be used for the Work, cured and finished in manner specified, and physically identical with material or product proposed for use, and that show full range of color and texture variations expected.
 - a. Number of Samples: Comply with requirement of individual specification. Unless noted otherwise, submit three sets of Samples. Architect will retain **one** Sample set; FIC will retain one sample set; remainder will be returned.
 - 1) Submit a single Sample where assembly details, workmanship, fabrication techniques, connections, operation, and other similar characteristics are to be demonstrated.
 - 2) If variation in color, pattern, texture, or other characteristic is inherent in material or product represented by a Sample, submit at least three sets of paired units that show approximate limits of variations.

F. Product Schedule: As required in individual Specification Sections, prepare a written summary indicating types of products required for the Work and their intended location. Include the following information in tabular form:

1. Type of product. Include unique identifier for each product indicated in the Contract Documents or assigned by Contractor if none is indicated.
 2. Manufacturer and product name, and model number if applicable.
 3. Number and name of room or space.
 4. Location within room or space.
- G. Qualification Data: Prepare written information that demonstrates capabilities and experience of firm or person. Include lists of completed projects with project names and addresses, contact information of architects and owners, and other information specified.
- H. Welding Certificates: Prepare written certification that welding procedures and personnel comply with requirements in the Contract Documents. Submit record of Welding Procedure Specification and Procedure Qualification Record on AWS forms. Include names of firms and personnel certified.
- I. Installer Certificates: Submit written statements on manufacturer's letterhead certifying that Installer complies with requirements in the Contract Documents and, where required, is authorized by manufacturer for this specific Project.
- J. Manufacturer Certificates: Submit written statements on manufacturer's letterhead certifying that manufacturer complies with requirements in the Contract Documents. Include evidence of manufacturing experience where required.
- K. Product / Material Certificates: Submit written statements on manufacturer's letterhead certifying that product / material complies with requirements in the Contract Documents.
- L. Material Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting test results of material for compliance with requirements in the Contract Documents.
- M. Product Test Reports: Submit written reports indicating that current product produced by manufacturer complies with requirements in the Contract Documents. Base reports on evaluation of tests performed by manufacturer and witnessed by a qualified testing agency, or on comprehensive tests performed by a qualified testing agency.
- N. Preconstruction Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of tests performed before installation of product, for compliance with performance requirements in the Contract Documents.
- O. Compatibility Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of compatibility tests performed before installation of product. Include written recommendations for primers and substrate preparation needed for adhesion.

**RETAIN BELOW IF PROJECT INCLUDES DELEGATED DESIGN SERVICES.
TYPICALLY DELETE.**

2.2 DELEGATED-DESIGN SERVICES

- A. Performance and Design Criteria: Where professional design services or certifications by a design professional are specifically required of Contractor by the Contract Documents, provide products and systems complying with specific performance and design criteria indicated.
 - 1. If criteria indicated are not sufficient to perform services or certification required, submit a written request for additional information to Architect.
- B. Delegated-Design Services Certification: In addition to Shop Drawings, Product Data, and other required submittals, submit digitally signed PDF electronic file, signed and sealed by the responsible design professional, for each product and system specifically assigned to Contractor to be designed or certified by a design professional.
 - 1. Indicate that products and systems comply with performance and design criteria in the Contract Documents. Include list of codes, loads, and other factors used in performing these services.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

- A. Submittals: Review each submittal and check for coordination with other Work of the Contract and for compliance with the Contract Documents. Note corrections and field dimensions. Mark with approval stamp before submitting to Architect.
- B. Project Closeout and Maintenance Material Submittals: See requirements in Division 01 Section "Closeout Procedures"
- C. Approval Stamp: Stamp each submittal with a uniform, approval stamp. Include Project name and location, submittal number, Specification Section title and number, name of reviewer, date of Contractor's approval, and statement certifying that submittal has been reviewed, checked, and approved for compliance with the Contract Documents.

3.2 DELIVERY OF SAMPLES

- A. Hand deliver all required physical submittals / samples to AEC offices or project site. Location to be coordinated with Owner's Representative at pre-construction meeting.

AEC
Facilities Services Building A
326 E. Hoover, Mail Stop B
University of Michigan
Ann Arbor, Michigan 48109

LANGUAGE BELOW MATCHES STANDARD SUBMITTAL STAMPS USED BY AEC, A&E. OTHER A/E SHOULD EDIT TO MATCH LANGUAGE USED ON THE STAMP THAT WILL BE USED FOR THE PROJECT.

3.3 ARCHITECT'S ACTION

- A. Architect's/Engineer's Action: Where action and return is required or requested, Architect/Engineer will review each submittal, mark with "Action", and whenever possible return within 2 weeks of receipt.
 - 1. Final Unrestricted Release: Work may proceed, provided it complies with contract documents.
 - a. Marking: "Approved"
 - 2. Final But Restricted Release: Work may proceed, provided it complies with notations and corrections on submittals and with contract documents.
 - a. Marking: "Approved as Noted, Resubmission Not Required"
 - 3. Partial Release: Work may proceed on the indicated portions of the submitted item(s), provided it complies with contract documents. Do not proceed with work on items noted to be resubmitted.
 - a. Marking: "Partial Approval, Resubmit as Noted."
 - 4. Returned for Re-submittal: Do not proceed with work. Revise submittal in accordance with notations and resubmit without delay to obtain a different action marking.
 - a. Marking: "Not Approved, Revise and Resubmit"
 - 5. Returning sample or information: Submittals which were for information only and require no action.
 - a. Marking: "Returning Samples / Information"
 - 6. Submittals Not Requiring Action: Submittals which require no action, such as cleaning and maintenance information; or submittals not required and not reviewed, will be acknowledged as follows:
 - a. Marking: "Action Not Required"
- B. Incomplete submittals are unacceptable, will be considered nonresponsive, and will be returned for resubmittal without review.
- C. Submittals not required by the Contract Documents may be returned by the Architect without action.

END OF SECTION 013300

SECTION 013500 - SPECIAL PROCEDURES FOR FIRE MARSHAL REVIEW AND INSPECTION

*INCLUDE THIS SECTION FOR ALL PROJECTS - BOTH BFS AND NON-BFS.
(CHANGED 4/11/13).*

EDIT ONLY AS NOTED

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes special procedures for Fire Marshal review and inspection for construction projects in University of Michigan buildings under the following jurisdiction:

SELECT ONE OR TWO OF THE FOLLOWING AS APPLICABLE TO PROJECT A LIST OF BFS JURISDICTION BUILDINGS IS AVAILABLE IN 1.0 CODES AND REGULATORY AGENCIES AT THE FOLLOWING LINK:

[HTTP://WWW.UMAEC.UMICH.EDU/DESGUIDE/1.0-CODES/DG1.0.PDF](http://www.umaec.umich.edu/desguide/1.0-codes/dg1.0.pdf)

1. State of Michigan Bureau of Fire Services (BFS).
2. University of Michigan Health Environment Health and Safety department, Fire Safety division.
3. State of Michigan Bureau of Fire Services (BFS) for fire alarm and fire suppression work only.

1.2 RELATED DOCUMENTS

RETAIN BELOW FOR BFS PROJECTS.

- A. Schedule milestones for BFS project are included in Division 01 section "Construction Progress Documentation".

1.3 SUBMITTALS

INCLUDE ITEM A. BELOW FOR BFS PROJECTS CONTAINING FIRE ALARM OR FIRE SUPPRESSION WORK. ITEMS B AND C APPLY TO ALL PROJECTS.

- A. Projects including fire alarm and fire suppression work require submission of the following documents to the State of Michigan BFS. Copies shall be submitted to UM concurrent with submission to BFS:
1. "Application for Fire Safety Plan Examination" for fire alarm and fire suppression work with all supporting documentation and copy of associated fee payment.
 2. Signed OFS 12 A with copy of fee payment.
- B. Copies of all inspection reports.
- C. Final inspection manual as detailed in article 2.1:
1. Draft copy: Submit draft copy to UM Owner's Representative for review concurrent with request for inspection, typically at least four weeks prior to final inspection.
 2. Inspection copy: Provide one copy to the Fire Marshal at the final inspection.

3. Final copy: Submit two copies to UM Owner's Representative after final inspection is complete.

1.4 COORDINATION

- A. Coordinate scheduling and timing of required administrative procedures, system testing, and inspections with other construction activities to avoid conflicts and to ensure orderly progress of work and inspections.

PART 2 - PRODUCTS

2.1 FINAL INSPECTION MANUAL

- A. General: The final inspection manual shall provide the Fire Marshal with information needed to conduct a final inspection.
- B. Contents:

RETAIN BRACKETED TEXT FOR BFS PROJECTS

1. Contents of the inspection manual are specific to each project [and include those items noted on the BFS "Plan Review Report"].
2. Typical contents include but are not limited to the following:
 - a. Details for each through-penetration firestop system from a qualified testing and inspecting agency.
 - b. Notarized affidavits of Compliance for all non-labeled interior finish materials attesting to compliance with the specified flame spread and smoke developed ratings. Affidavits shall state:
 - 1) Name of product.
 - 2) Indication that product has been tested by a nationally recognized independent testing laboratory.
 - 3) Name of testing laboratory.
 - 4) Laboratory project or test number.
 - 5) Date of test.
 - 6) Test results.
 - 7) Statement that product was installed as tested.
 - c. Construction inspection approval certificates for mechanical and electrical construction.
 - d. Light level calculations for required emergency lighting.
 - e. Final fire alarm approval certificate.
- C. Format:
 1. Manuals shall be three hole punched and bound.
 2. Provide heavy paper dividers with plastic tabs to divide the Manual into sections.
 3. Provide a Table of Contents at the front of the Manual. List each tabbed section of the Manual.

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 013500

SECTION 014200 - REFERENCES

PART 1 - GENERAL

GENERALLY, EDITING OF THIS SECTION IS NOT REQUIRED

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 DEFINITIONS

- A. General: Basic Contract definitions are included in the Conditions of the Contract.
- B. "Approved": When used to convey Architect's action on Contractor's submittals, applications, and requests, "approved" is limited to Architect's duties and responsibilities as stated in the Conditions of the Contract.
- C. "Directed": A command or instruction by Architect. Other terms including "requested," "authorized," "selected," "required," and "permitted" have the same meaning as "directed." No such implied meaning will be interpreted to extend Architect/Engineer's responsibility into Contractor's area of construction supervision.
- D. "Indicated": Requirements expressed by graphic representations or in written form on Drawings, in Specifications, and in other Contract Documents. Other terms including "shown," "noted," "scheduled," and "specified" have the same meaning as "indicated."
- E. "Regulations": Laws, ordinances, statutes, and lawful orders issued by authorities having jurisdiction, and rules, conventions, and agreements within the construction industry that control performance of the Work.
- F. "Furnish": Supply and deliver to Project site, ready for unloading, unpacking, assembly, installation, and similar operations.
- G. "Install": Unload, temporarily store, unpack, assemble, erect, place, anchor, apply, work to dimension, finish, cure, protect, clean, and similar operations at Project site.
- H. "Provide": Furnish and install, complete and ready for the intended use.
- I. "Or equal": When the phrase "or equal" is used after a single manufacturer's name, or at the end of a list of manufacturer's names, submit proposed products in strict compliance with the "Owner's Options" clauses of the Standard General Conditions.
 - 1. The Owner will consider only those Contractor-proposed substitutions submitted with the Bid in the "Owner's Options" portion of the Form of Proposal.
 - 2. In all cases, judgments of equality of products will be made solely by the Architect/Engineer.

1.3 ABBREVIATIONS AND ACRONYMS

- A. Industry Organizations: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities indicated in Gale's "Encyclopedia of Associations: National Organizations of the U.S." or in Columbia Books' "National Trade & Professional Associations of the United States" and as follows:
1. "AFF": "Above finished floor" level
 2. "Mfr"/"Mfr's": "manufacturer" / "manufacturer's"
 3. "NIC": "Not in Contract"
 4. "OFCI": "Owner furnished, Contractor installed"
 5. "w/": "with"

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 014200

SECTION 015000 - TEMPORARY FACILITIES AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes temporary plumbing and electrical services and provisions for protecting personnel and property.
- B. Related Work of other Sections:
 - 1. Division 01 Section "Temporary Tree and Plant Protection".

1.2 QUALITY ASSURANCE

- A. Standards and Regulations: Comply with applicable laws and regulations and the following:
 - 1. NFPA Code 241, "Building Construction and Demolition Operations".
 - 2. ANSI-A10 Series standards for "Safety Requirements for Construction and Demolition".
 - 3. NECA Electrical Design Library "Temporary Electrical Facilities".
- B. Conditions of Use: Keep facilities clean and neat. Operate in a safe and efficient manner. Take necessary fire prevention measures. Do not allow hazardous, dangerous or unsanitary conditions, or public nuisances to develop or persist on the site.

PART 2 - PRODUCTS

RETAIN BELOW FOR RENOVATION PROJECTS. IDENTIFY ELEVATOR(S) THAT CONTRACTOR MAY USE ON DRAWINGS.

2.1 ELEVATOR USE AND PROTECTION

- A. Existing Elevator Use: Use of designated Owner's existing elevator will be permitted, provided elevator is protected, cleaned and maintained in a condition acceptable to Owner. At Substantial Completion, restore elevator to condition existing before initial use, including replacing worn cables, guide shoes, and similar items of limited life.
 - 1. Do not exceed 25% of elevator load capacity with any one piece of material, equipment, or hand truck. Do not exceed elevator load capacity.
 - 2. Provide protective coverings, barriers, devices, signs, or other procedures to protect elevator car and entrance doors and frame. If, despite such protection, elevators become damaged, engage elevator Installer to restore damaged work so no evidence remains of correction work. Return items that cannot be refinished in field to the shop, make required repairs and refinish entire unit, or provide new units as required.
 - 3. Maintain access to the emergency phone, main car operating panel, and emergency escape hatch inside the elevator.

4. Coordinate use with Owner's Representative and provide priority to departmental use.

2.2 CONSTRUCTION FENCE

INCLUDE BELOW WHERE SECURITY IS NOT AN ISSUE

- A. Fabricate construction fence of minimum 36-inch tall factory-wired wood slat "snow fence" with water-resistant treated wood support stakes at 48-inches on center.

INCLUDE BELOW WHERE SECURITY IS AN IMPORTANT ISSUE - OR WHERE DESIRABLE TO CONCEAL CONSTRUCTION ACTIVITY FROM VIEW

- B. Fabricate construction fence of the following materials:
 1. Wire Mesh Fabric: 9 gage galvanized steel wires, woven into 2-inch diamond mesh pattern with top selvages knuckled.
 2. Posts: As required for indicated height, but not less than 2.37 outside diameter.

INCLUDE BELOW FOR FENCING INSTALLATIONS ON EXISTING PAVED SURFACES OR OTHER AREAS WHERE SURFACE MOUNTED POSTS ARE PREFERABLE TO POSTS DRIVEN INTO THE GROUND.

3. Fence post base plates: As required for indicated height.

GATES ARE NOT TYPICALLY REQUIRED

4. Gate Frames: 1.90-inch outside diameter. Fabricate gates with 7 gage diagonal tension wires for units wider than 36 inches.

RAILS NOT TYPICALLY REQUIRED, UNLESS NEEDED AS STRUCTURE FOR GATES

5. Rails: Not less than 1.66-inch outside diameter.
6. Hardware: Provide galvanized steel connectors, gate hinges and hasps as recommended by manufacturer.

INCLUDE BELOW ONLY WHERE NEEDED TO BLOCK VIEW OF SITE

7. Screening Material: 85% closed knitted polyethylene screen fabric; 5.1 oz. per sq. yd.; grommets spaced 24 inches on center along cloth perimeter for attachment to wire mesh and posts.
 - a. Product: Midwest Cover Inc., Construction 85, Color: Royal Blue.

2.3 ROOF PROTECTION

- A. Roofing Protection: Provide protective measures for areas on existing roof used for construction access, where materials are being moved or stored.
- B. Provide 1 1/2" ISO insulation with 3/4" plywood over ISO at all areas of work and foot traffic. Plywood is to be tied together.
- C. Prevent debris from entering the roof drains by placing filter fabric over the drains. When cleaning is complete remove the filter fabric and properly dispose of collected debris.

PART 3 - EXECUTION

3.1 PERFORMANCE

- A. Barriers: In general, provide barriers between active construction operations and completed areas of work, and between construction activity and Owner occupied areas. Provide barriers in locations indicated on drawings, or if not indicated, as required by Owner's Representative.

SELECT BELOW FOR GENERAL DUST BARRIER ONLY.

1. Construct barriers of metal or fire-retardant treated wood studs and 6 mil thick plastic sheet.

1 HOUR BARRIER REQUIRED BETWEEN ACTIVE CONSTRUCTION AREAS AND OCCUPIED AREAS REQUIRED IN ALL BUILDINGS. INCLUDE BELOW AND SHOW ON DRAWINGS.

2. Construct construction barriers serving as separation between active construction areas and occupied areas to provide 1-hour fire-rated assembly as defined by Underwriters Laboratory "Fire-Resistance Directory."

INCLUDE THE FOLLOWING IF DESIRED

3. Provide dust covers over Owner's equipment and furnishings. Use 6 mil thick clear plastic sheet and thoroughly tape seams to provide dust-proof cover.

3.2 TEMPORARY UTILITY INSTALLATION

- A. Electrical Service: Comply with NEMA, NECA and UL standards and regulations for temporary electrical service. Install service in compliance with National Electrical Code (NFPA 70). Provide outlets and lighting as required for operations. Comply with applicable provisions of Division-26.

1. Owner will pay for reasonable use of electricity related to the Work.

- B. Water Service: Connect to existing building services. Comply with applicable provisions of Division-22.

1. Owner will pay for reasonable use of water related to the Work.

EDIT BELOW TO SUIT PROJECT. ADD OR DELETE REQUIREMENTS AS NEEDED

3.3 PROTECTIONS

- A. Openings Between Floors: Shaft and chase spaces may terminate above occupied areas within building. Existing barriers between floors are not designed to prevent debris from falling through to bottom level. Provide appropriate barriers at all unprotected openings between floors during construction operations.

1. Protect openings between floors with appropriate materials, providing full coverage of opening in a manner which will prevent personnel, equipment, construction materials and debris, from falling through; capable of withstanding loads imposed during construction operations; and secured to prevent unintentional removal.

B. Roofing Protection: Provide protective measures for areas on existing roof and around curbed openings during installation of fans or other roof mounted units and areas where materials are being moved or stored.

DELETE BELOW IF NO "SNOW FENCE" CONSTRUCTION FENCE INCLUDED

C. Construction Fence Erection: Drive support stakes into ground not more than 48-inches on center and to sufficient depth to provide support for fencing. Wire pre-fabricated fencing material to stakes.

SELECT BETWEEN FENCING WITH BASE PLATES AND FENCING WITH DRIVEN POSTS. DELETE ALL FENCING REQUIREMENTS BELOW IF NO WIRE MESH CONSTRUCTION FENCE INCLUDED. COORDINATE WITH PM.

FENCING WITH BASE PLATES

D. Construction Fence Erection: Provide fence panels with posts and post base-plates. Do not drive posts into ground, concrete walks or pavement.

1. Fence Panels: 6'-0" high X 12'-0" long max.

INCLUDE BELOW WHERE APPLICABLE

2. Provide hasp and pad lock at each gate.
3. Secure wire mesh to outside face of posts with 9 ga. galvanized metal wire ties spaced not less than 16 inches on center. Install mesh to align with top of posts.

INCLUDE BELOW WHERE APPLICABLE

4. Secure fabric screen to outside face of construction fence using 9 gage galvanized steel wire. Fasten fabric sheets at 18-inches o.c. through grommets to top rail, each line and corner post, and at bottom to wire mesh.

FENCING WITH DRIVEN POSTS

E. Construction Fence Erection: Drive line and corner posts into ground not less than 42 inches below grade, with not less than indicated dimension exposed above grade, and spaced not more than 18 (may use 12 feet if no top rails) feet on center. Erect top rails and gates where indicated.

SELECT ONE OF THE TWO BELOW - USUALLY 8 FEET UNLESS CONSTRUCTION MANAGER REQUESTS GREATER HEIGHT

1. Height of Fence Exposed Above Grade: 8 feet.
2. Height of Fence Exposed Above Grade: 10 feet.

INCLUDE BELOW WHERE APPLICABLE

3. Provide hasp and pad lock at each gate.

4. Secure wire mesh to outside face of posts with 9 ga. galvanized metal wire ties spaced not less than 16 inches on center. Install mesh to align with top of posts.

INCLUDE BELOW WHERE APPLICABLE

5. Secure fabric screen to outside face of construction fence using 9 gage galvanized steel wire. Fasten fabric sheets at 24-inches o.c. through grommets to top rail, each line and corner post, and at bottom to wire mesh.

END OF SECTION 015000

SECTION 015639 - TEMPORARY TREE AND PLANT PROTECTION

INCLUDE SECTION FOR ALL PROJECTS WHERE TREES MIGHT BE AFFECTED BY CONSTRUCTION OPERATIONS, INCLUDING STAGING, LAY DOWN AREAS, AND CONTRACTOR PARKING (LEGAL OR ILLEGAL), EVEN IF NO ACTUAL SITE WORK IS PART OF THE PROJECT. IF THERE ARE NO TREES IN THE VICINITY OF THE PROJECT, PARAGRAPHS BELOW CAN BE DELETED.

IF THE VICINITY OF THE SITE CONTAINS TREES, IT WILL BE NECESSARY TO GET A TREE SURVEY. CAMPUS PLANNING WILL PROVIDE ASSISTANCE IN OBTAINING THE TREE SURVEY. ALL TREES IN THE VICINITY OF THE CONSTRUCTION SITE SHOULD BE NOTED ON THE PLAN. SUBMIT THE PLAN TO THE UNIVERSITY FORESTER, WHO WILL DESIGNATE "SIGNIFICANT" TREES.

THE PROTECTION ZONE FOR SIGNIFICANT TREES CANNOT ENCROACH ON THE CANOPY DRIPLINE UNLESS THERE IS A COMPELLING REASON WHY THIS CANNOT HAPPEN. DEVIATION FROM THIS REQUIREMENT MUST BE APPROVED BY THE UNIVERSITY FORESTER AND THE ASSOC. VP FOR FACILITIES & OPERATIONS.

FOR TREES OTHER THAN SIGNIFICANT TREES, THE PROTECTIVE ZONE SHOULD EXTEND TO THE CANOPY DRIPLINE WHEREVER POSSIBLE. DEVIATIONS FROM THIS STANDARD NEED TO BE APPROVED BY THE UNIVERSITY FORESTER

PART 1 - GENERAL

1.1 WORK INCLUDED

- A. Provide all equipment and materials, and do all work necessary to protect existing trees and plants from damage as a result of the Contractor's operations.

1.2 SUBMITTALS

- A. Proposed methods, materials to be employed and schedule for effecting tree and plant protection shall be submitted for approval, including tree protection fence.

1.3 SPECIAL SITE LIMITATIONS

- A. Areas around trees that could be impacted by construction activities before such activity begins are identified on the Drawings as "Protective Zones/Protected Areas". Protective zones around each tree shall be clearly identified on contract documents. The protective zone shall not encroach on the canopy dripline unless there is a compelling reason why this is not practical. In such a situation, approval for the deviation must be obtained from the Owner's Representative.

- B. Protected areas shall not be entered or used for any purpose during construction except as authorized by the University Forester (UF). Areas identified on the Drawings as "Temporary Work Zones" within the Protected Areas are zones in which construction shall be undertaken, but only after the UF has been notified of the intended operations in the Temporary Work Zone. The UF shall be notified at least 48 hours prior to work scheduled in the Temporary Work Zone. Depending on field conditions, the UF may require additional tree protection consisting of fencing and boxing to protect tree trunks and roots.
- C. Plans for all operations within Temporary Work Zones shall be reviewed fully with the UF before beginning work. Contractor shall plan operations in Temporary Work Zones to minimize the use of wheeled, motorized equipment, and to minimize root compaction and root disturbance. All excavation in Temporary Work Zones shall be initiated with root pruning trenching as specified herein. All excavation in Temporary Work Zones shall be scheduled to minimize the amount of time between excavation and completion of the construction item in the Temporary Work Zone. Schedule shall be approved by the Owner's Representative. After each work item is completed in the Temporary Work Zone, the protection fence shall be restored to its original position to reestablish the protected area.

PART 2 - PRODUCTS

2.1 TREE/LANDSCAPE PROTECTION FENCING

- A. Tree and landscape protected area fencing shall be:
 - 1. Wire Mesh Fabric: Six foot 9 gage galvanized steel wires, woven into 2-inch diamond mesh pattern with top selvages knuckled.
 - 2. Posts: As required for indicated height, but not less than 2.37 outside diameter.

RAILS NOT TYPICALLY REQUIRED UNLESS TO MEET A TEMPORARY TRAFFIC PEDESTRIAN BARRIER REQUIREMENT - VERIFY AND DELTE BELOW IF NOT NECESSARY

 - 3. Rails: Not less than 1.66-inch outside diameter. Rails are not typically required unless a bottom rail is required for areas adjacent to walks to meet accessibility requirements.
- B. Fencing other than that specified above will be subject to the approval of the UF, or as specifically noted on the plans.

2.2 BOXING

- A. Boxing shall be installed for trees that are in jeopardy of damage in the Temporary Work Zone and identified for boxing by the UF. Size of box enclosure for each tree will be determined in the field by the University Forester.
- B. Boxing shall be 4 x 4 inch wood posts spaced 8 feet on center with three, 2 x 4 inch wood rails between posts to a height of approximately 5 feet.

PART 3 - EXECUTION

3.1 PRE-INSTALLATION MEETING

- A. Contractor shall schedule a tree and plant protection pre-installation site meeting with the Owner's Representative and UF and/or qualified U-M Grounds personnel prior to the start of site construction, which includes prior to installation of construction fence and tree and plant protection.

3.2 INSTALLATION OF FENCING

- A. Prior to start of demolition work and clearing and grubbing operations, tree and planting protection fencing shall be installed in accordance with the following:
 - 1. At tree protection areas indicated on Drawings and as staked in the field.
 - 2. At locations indicated on the Drawings as "Protected Areas."
- B. The protective zone will be extended at a minimum out to the tree's dripline and is better defined as the "critical root zone" (CRZ). CRZ is determined by measuring a radius from the tree's trunk that is equal to 1 foot for each inch of tree diameter.
- C. Tree and Landscape "Protected Area" temporary fence erection: Drive line and corner posts into ground not less than 42 inches below grade, with not less than indicated dimension exposed above grade, and spaced not more than 18 feet on center (may use 12 feet if no top rails). Erect bottom rails where needed to meet ADA requirements.
 - 1. Height of Fence Exposed Above Grade: 6 feet.
 - 2. Secure wire mesh to outside face of posts with 9 gage galvanized metal wire ties spaced not less than 16 inches on center. Install mesh to align with top of posts.

3.3 ROOT PRUNING

- A. Where excavation will be in close proximity to existing trees designated to remain, roots shall be pruned by University Forester or as otherwise specified by the Owner's Representative after consulting with the University Forester. Contact Owner's Representative when roots are exposed. Root pruning shall be as indicated on the drawings and as additionally identified in the field by the Owner's Representative. Root pruning shall consist of cutting clean, straight excavation through upper root zone, 12 inches to 18 inches deep, wherein all roots shall be cut cleanly and flush with face of excavation thus causing minimum amount of disturbance to remaining roots. Use of motorized ditch-digging machine for this purpose is permitted. Use of other motorized excavation equipment, which causes excessive root movement, dislodgment, ripping, or splintering will not be permitted. In this situation, UF and/or U-M arborists may use an Air Spade (compressed air soil excavator) to clear soil from root zone to route utilities under the root system without cutting roots.

- B. Coordinate with Owner's Representative to provide aeration and slow release tree watering bags as remediation measures for trees that have been negatively impacted by construction.

3.4 REMOVAL OF PROTECTION

- A. Except as otherwise indicated or requested by Project Manager after consulting with the UF, temporary protection devices and facilities installed during course of the work shall be removed only after all work that may injure or damage trees and plants is completed.

END OF SECTION 015639

BuildingName
The Description of the Project
P00000000 0000 Issued for: BID

SECTION 015719 - CONSTRUCTION AIR QUALITY

FOR USE ON ALL PROJECTS.

THE CONTENTS OF THE FOLLOWING ARE INTENDED TO BE AN EXAMPLE ONLY AND INCLUDES TYPICAL REQUIREMENTS - MODIFY TO SUIT PROJECT. SOME PROJECTS, PARTICULARLY NEAR THE HOSPITAL MAY HAVE MORE STRINGENT REQUIREMENTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:

- 1. Division 23 Section: Custom Air Handling Units.
- 2. Division 23 Section: Semi-Custom Air Handling Units.
- 3. Division 23 Section: Air Filters.
- 4. Division 23 Section: HVAC Ducts and Casings.
- 5. Division 23 Section: Air Duct Accessories and RGD's.

1.2 SUMMARY

- 1. This Section includes requirements for construction air quality including diesel exhaust mitigation.

RETAIN BELOW FOR LEED PROJECTS

- 2. These requirements are also applicable to LEED 2009 IEQ credit 3.1 Construction Indoor Air Quality Management Plan - During Construction.

1.3 QUALITY ASSURANCE

- A. Indoor Air Quality Reports: Review periodic Indoor Air Quality Reports provided by others and promptly comply with report recommendations.
- B. Inspection and Maintenance: Periodically inspect project conditions to assure that indoor air quality measures are being implemented. Maintain indoor air quality measures to assure operational effectiveness.

PART 2 - PRODUCTS

2.1 AIR FILTRATION

- A. Provide air filters or filtration media with a Minimum Efficiency Reporting Value (MERV) of 8 or as specified, whichever is greater.

PART 3 - EXECUTION

3.1 HVAC SYSTEM PROTECTION

- A. Protect HVAC systems per Related Sections.
- B. Ductwork Contamination: Provide professional cleaning for all ductwork contaminated with construction debris and dust.

3.2 SOURCE/POLLUTION CONTROL

- A. Temporary Heat and Hazardous Exhaust: Provide temporary heaters that exhaust combustion air directly to the outside of the building, or that prevents hazardous exhaust levels within the construction area. Limit the use of exhaust producing equipment inside the construction area.
- B. Assure exhaust fumes are not drawn into new and existing air intakes.
- C. Volatile Organic Compounds (VOC) control: Limit the buildup of VOCs within the construction area by storing VOCs in tight containers, providing ventilation with outside air during installation of VOC emitting material. Locate pollutant sources in one designated area away from supply ducts, areas occupied by workers, and absorbent materials.
- D. Smoking is prohibited in all University of Michigan buildings and grounds.

3.3 PATHWAY INTERRUPTION

- A. Construction partitions: Provide air tight temporary construction partitions to separate occupied or completed areas from active construction areas.
- B. Construction area pressurization: Provide temporary fans or portions of the permanent air handling system to maintain a negative pressure in the construction areas relative to adjacent occupied or completed spaces.
- C. Provide construction entry mats at each entry to limit dirt and debris from entering the building.

3.4 HOUSEKEEPING

- A. Perform daily housekeeping to prevent the accumulation and tracking of debris, dirt, dust, and moisture within the construction area. Coordinate activities of the various trades to organize work areas to assure that routine cleaning is effective.
- B. Provide thorough cleaning of all building interior surfaces prior to HVAC filter replacement, testing and balancing, and commissioning activities.

3.5 SCHEDULING

- A. Schedule high pollution activities that utilize high VOC level products such as paints, sealants, adhesives, caulking and cleaners to take place prior to installing highly absorbent materials such as ceiling tiles, carpet, fabric furniture, acoustic panels, insulation, and gypsum board.
- B. Where practical, perform high VOC work during off-hours to minimize personnel exposure.
- C. Coordinate schedule for installation of low-VOC products with temperature requirements.
- D. Schedule delivery to minimize storage requirements of materials on the project site.
 - 1. Where air testing or building flush-out procedures are required, provide adequate time to conduct these activities prior to building occupancy.

3.6 DIESEL EXHAUST MITIGATION

- A. All diesel equipment utilized on the project site except delivery trucks shall be fueled with biodiesel B-20. In case of extreme cold weather, biodiesel B-5 is acceptable. Provide records of refueling receipts when requested by the owner.
- B. All diesel equipment utilized on the project for more than ten workdays shall utilize exhaust after-treatment devices to reduce emission from diesel engines. Exhaust after treatment devices shall be either diesel oxidation catalyst type or diesel particulate filters. The required minimum percent reduction in emissions for either device shall be, PM: 20%, HC: 40%, CO: 10%.

END OF SECTION 015719

SECTION 016000 - PRODUCT REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section specifies administrative and procedural requirements governing the product delivery, storage and handling and Contractor's selection of products for use in the Project.

1.2 QUALITY ASSURANCE

- A. Compatibility of Options: When Contractor is given the option of selecting between two or more products for use on the Project, the product selected shall be compatible with products previously selected, even if previously selected products were also options.

1.3 PRODUCT DELIVERY STORAGE AND HANDLING

- A. Deliver, store and handle products in accordance with the manufacturer's recommendations, using means and methods that will prevent damage, deterioration and loss, including theft.

MODIFY BELOW TO SUIT PROJECT

1. Schedule delivery to minimize storage time at site and to avoid overcrowding of construction area.
2. Coordinate delivery with installation time to ensure minimum holding time for items that are flammable, hazardous, easily damaged, or sensitive to deterioration, theft and other losses.
3. Deliver products to the site in the manufacturer's original sealed container or other packaging system, complete with labels and instructions for handling, storing, unpacking, protecting and installing.
4. Inspect products upon delivery to ensure that products are undamaged and properly protected.
5. Store heavy materials away from the project structure in a manner that will not endanger the supporting construction.

PART 2 - PRODUCTS

2.1 PRODUCT SELECTION

- A. General Product Requirements: Provide products that are undamaged and, unless otherwise indicated, unused at the time of installation.
 1. Provide products complete with accessories, trim, finish, safety guards and other devices and details needed for a complete installation and for the intended use and effect.

USUALLY RETAIN ALL BELOW

- B. Product Selection Procedures: No substitutions will be permitted, except those in compliance with the Contract Document provisions concerning "Owner's Options"; otherwise comply with the following:

1. Proprietary Specification Requirements: Where a single product or manufacturer is named, provide only the product indicated.
2. Semi-proprietary Specification Requirements: Where two or more products or manufacturers are named, provide one of the products indicated.
 - a. Where products or manufacturers are specified by name, accompanied by the term "or equal", or "or approved equal" comply with the Contract Document provisions concerning "Owner's Options."
3. Descriptive Specification Requirements: Where Specifications describe a product or assembly, listing exact characteristics required, with or without use of a brand or trade name, provide only a product or assembly possessing the specified characteristics and that otherwise complies with Contract requirements.
4. Performance Specification Requirements: Where Specifications require compliance with performance requirements, provide products that comply with indicated requirements, and are recommended by the manufacturer for the application indicated.
5. Compliance with Standards, Codes and Regulations: Where Specifications only require compliance with a code, standard or regulation, select a product that complies with the indicated standards, codes and regulations.
6. Visual Matching: Where Specifications require matching an established sample, the Architect's decision will be final on whether a proposed product matches satisfactorily.

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 016000

SECTION 017300 - EXECUTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes general administrative and procedural requirements governing execution of the Work including, but not limited to, the following:
 - 1. Installation of the Work.
 - 2. Protection of installed construction.
- B. Related Requirements:
 - 1. Section 011000 "Summary" and 011400 "Work Restrictions" for limits on use of Project site.
 - 2. Section 017239 "Cutting and Patching"
 - 3. Section 017700 "Closeout Procedures" for final cleaning.
 - 4. Section 019100 "Project Commissioning" for start-up.
 - 5. Section 024119 "Selective Demolition" for demolition.
 - 6. Section 078413 "Penetration Firestopping" for patching penetrations in fire-rated construction.

1.3 QUALITY ASSURANCE

- A. Manufacturer's Installation Instructions: Obtain and maintain on-site manufacturer's written recommendations and instructions for installation of products and equipment.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examination and Acceptance of Conditions: Before proceeding with each component of the Work, examine substrates, areas, and conditions, with Installer or Applicator present where indicated, for compliance with requirements for installation tolerances and other conditions affecting performance. Record observations.
 - 1. Examine rough-in for mechanical and electrical systems to verify actual locations of connections before equipment and fixture installation.
 - 2. Examine walls, floors, and roofs for suitable conditions where products and systems are to be installed.
 - 3. Verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

- B. Correct defects that would result in unacceptable performance of materials or equipment to be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions.

3.2 PREPARATION

- A. **Field Measurements:** Take field measurements as required to fit the Work properly. Recheck measurements before installing each product. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
- B. **Space Requirements:** Verify space requirements and dimensions of items shown diagrammatically on Drawings.
- C. **Review of Contract Documents and Field Conditions:** Immediately on discovery of the need for clarification of the Contract Documents caused by differing field conditions outside the control of Contractor, submit a request for information

3.3 INSTALLATION

- A. **General:** Locate the Work and components of the Work accurately, in correct alignment and elevation, as indicated.
 - 1. Make vertical work plumb and make horizontal work level.
 - 2. Where space is limited, install components to maximize space available for maintenance and ease of removal for replacement.
 - 3. Conceal pipes, ducts, and wiring in finished areas unless otherwise indicated.
 - 4. Install Work within recognized industry tolerances, if not otherwise indicated.
- B. Comply with manufacturer's written instructions and recommendations for installing products in applications indicated.
- C. Install products at the time and under conditions that will ensure the best possible results. Maintain conditions required for product performance until Substantial Completion.
- D. Conduct construction operations so no part of the Work is subjected to damaging operations or loading in excess of that expected during normal conditions of occupancy.
- E. Sequence the Work and allow adequate clearances to accommodate movement of construction items on site and placement in permanent locations.
- F. **Templates:** Obtain and distribute to the parties involved templates for work specified to be factory prepared and field installed. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing products to comply with indicated requirements.

- G. Attachment: Provide blocking and attachment plates, anchors, fasteners, and other devices of adequate size and number to securely anchor each component in place, accurately located and aligned with other portions of the Work. Where size and type of attachments are not indicated, verify size and type required for load conditions.
 - 1. Allow for building movement, including thermal expansion and contraction.
 - 2. Coordinate installation of anchorages. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
- H. Mounting Heights: Except as otherwise indicated, mount individual units of Work at industry recognized standard mounting heights for applications indicated. The Contractor shall refer questionable mounting height choices to the Architect/Engineer and the Owner for final decision. The Contractor shall comply with the Owner's and the State of Michigan's requirements for accessible mounting heights.
- I. Joints: Make joints of uniform width. Where joint locations in exposed work are not indicated, arrange joints for the best visual effect. Fit exposed connections together to form hairline joints.
- J. Adjust, clean, lubricate, restore marred finishes and protect installed Work to ensure that it will remain without damage or deterioration during the remainder of the construction period. Unless otherwise specified by the Contract Documents, all Work is to be thoroughly cleaned prior to its being turned over to the Owner. This includes dusting, window cleaning, floor cleaning and all other operations associated with the proper cleaning of the Work. Waxing or buffing floors shall be performed when required by the Contract Documents.

3.4 PROTECTION OF INSTALLED CONSTRUCTION

- A. Provide final protection and maintain conditions that ensure installed Work (completed or in progress) is without damage or deterioration at time of Substantial Completion. Comply with manufacturer's written instructions.

END OF SECTION 017300

SECTION 017329 - CUTTING AND PATCHING

1/08 - CUTTING LEAD BASED PAINT (LBP) SECTION REMOVED PER EHS DIRECTION. ALL PROJECTS THAT IMPACT LBP NEED TO INCLUDE SECTIONS 028300 OR 028333.

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of cutting and patching work is generally not specifically shown on drawings. Include cutting and patching work as indicated by provisions of this Section.
 - 1. Cut holes and openings in, or remove portions of, existing construction necessary for connection of new architectural elements, mechanical and electrical utilities and services, equipment and supports.
 - 2. Patch around mechanical and electrical penetrations.
 - 3. Patch floors, walls, and ceilings damaged by demolition operations, including removal of indicated mechanical and electrical items, and indicated wall-, floor-, and ceiling-mounted items. Patch and paint openings in walls, floors and ceilings created by demolition and removal operations.
 - 4. Patch and repair blemishes and holes in existing construction surfaces left in place, and scheduled to be exposed, that have been damaged due to construction operations.
- B. Materials removed and not indicated to be turned over to Owner or indicated for reuse, as well as rubble and debris resulting from these operations, are property of Contractor.
- C. Related requirements:
 - 1. General: Refer to other Sections for specific requirements and limitations applicable to cutting and patching individual parts of the work.
 - 2. Division 2 sections for selective demolition, regulated construction waste, asbestos, lead and PCB remediation.
 - 3. Division 21, 22, 23 and Division 26, 27 and 28 sections for other requirements and limitations applicable to cutting and patching mechanical and electrical installations.

1.2 DEFINITIONS

- A. Cutting: Removal of in-place construction necessary to permit installation or performance of other work.
- B. Patching: Fitting and repair work required to restore construction to original conditions after installation of other work.

1.3 SUBMITTALS

DELETE BELOW IF NO FINISHES PATCHING, EDIT TO BE PROJECT SPECIFIC OR DELETE IF INCLUDED IN INDIVIDUAL DIV 9 SECTIONS.

A. Product data indicating compliance with requirements for the following finish materials used in patching:

1. Acoustical tile.
2. Resilient flooring.
3. Rubber base.

DELETE BELOW IF SAMPLES NOT REQUIRED, EDIT TO BE PROJECT SPECIFIC OR DELETE IF INCLUDED IN INDIVIDUAL DIV 9 SECTIONS.

B. Samples for initial selection for the following:

1. Acoustical tile.
2. Resilient flooring.
3. Rubber base.

DELETE BELOW IF NO ROOFING REPAIR

C. Qualification data for firm engaged to perform cutting and patching of roofing system.

1.4 QUALITY ASSURANCE

A. Assignment of Cutting and Patching Responsibilities:

1. Cutting shall be the work of the individual architectural, mechanical or electrical trade requiring such cutting for access, or to permit alteration to be performed, or similar purposes.
 - a. Cutting required for inspection and to obtain test samples shall be the work of the General Contractor.
2. Patching shall be the work of the appropriate architectural trade.

DELETE SUBCATEGORIES THAT DO NOT APPLY TO PROJECT.

B. Cutting and Patching: Comply with requirements for and limitations on cutting and patching of construction elements.

1. Roofing Elements:

- a. Standards: Perform cutting and patching work in compliance with University of Michigan Facilities and Operations standards (phone 647-2059 for information on requirements), and with recommendations of the National Roofing Contractor's Association "Roofing and Waterproofing Manual".
- b. Installer Qualifications: Arrange for cutting and patching of roofing systems by firm experienced in similar work, and licensed by manufacturer of roofing system to perform required repair work.
- c. Pre-Construction Conference: Arrange and attend meeting with Owner's Representative, representative of Owner's roofing maintenance department, and representative of roofing firm to determine procedures for cutting and patching roofing system.

2. Structural Elements: When cutting and patching structural elements, notify Architect of locations and details of cutting before proceeding. Shore, brace, and support structural elements during cutting and patching. Do not cut and patch structural elements in a manner that could change their load-carrying capacity or increase deflection
3. Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that results in increased maintenance or decreased operational life or safety.
4. Other Construction Elements: Do not cut and patch other construction elements or components in a manner that could change their load-carrying capacity, that results in reducing their capacity to perform as intended, or that results in increased maintenance or decreased operational life or safety.
5. Visual Elements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch exposed construction in a manner that would, in Architect's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner.

PART 2 - PRODUCTS

2.1 MATERIALS

BELOW IS GENERAL STATEMENT. IF SPECIFIC MATERIALS ARE KNOWN, LIST ON FINISH SCHEDULE.

- A. Materials for Patching: Unless otherwise indicated, use materials for patching identical to existing materials. If identical materials are not available, or cannot be used, use materials visually matching existing adjacent surfaces to the fullest extent possible and that result in equal-or-better performance characteristics.
- B. Asphalt Patching: Provide 8-inch thick 21 AA limestone base, 2-inch No. 1300 leveling course, and 2-inch No. 1300 wearing course in accordance with MDOT 1984 Standard Specifications for Construction.

PART 3 - EXECUTION

3.1 PERFORMANCE

- A. Protect existing property, equipment, remaining surfaces, utilities and services within and adjacent to work from damage due to operations. If utilities or services are uncovered that are not indicated on drawings, advise Owner and do not work in immediate area until instructed by Owner.
 1. Shore and brace existing construction during cutting operations as required to prevent cracking, movement, or collapse of existing assemblies, surfaces and materials.

- B. Use extreme caution when cutting into shafts and chases. Shafts and chases may end above occupied areas within building. Take all necessary precautions to prevent debris from falling into shaft during cutting and patching operations. Comply with requirements of Division 01 Section "Temporary Facilities and Controls".
- C. Before cutting and patching the following building elements, obtain the Owner's Representative's approval to proceed:

EDIT THE FOLLOWING TO SUIT PROJECT.

- 1. Structural concrete.
- 2. Roofing materials.
- 3. Miscellaneous structural metals, including lintels and equipment supports.

ALWAYS RETAIN BELOW.

- D. Cutting Concrete Floors: Before core drilling, saw-cutting, or breaking up concrete floors, test for the presence of electrical conduits. Use an impulse induction type scanner, similar to Hilti Ferroskan, capable of detecting both metallic conduits and copper wires in PVC conduits. Tracers that scan for energized cables or that scan for injected high frequency signals are not acceptable. Immediately restore, at no cost to the Owner, conduits damaged during cutting operations. Comply with the following notification requirements:
 - 1. Notify the Owner's Representative not less than 72 hours in advance of each core drilling operation. Owner's Representative will arrange notification of building occupants of potential for power outage.
 - 2. Notify the Owner's Inspection Department prior to conducting each test.
- E. Patching: Match existing construction. Comply with applicable materials and workmanship requirements of individual sections of these Specifications that govern new work.
 - 1. Patch exposed-to-view surfaces with seams which are durable and as invisible as possible. Create surface finishes matching existing adjacent surfaces in color, texture, gloss and other visual characteristics.
 - 2. Patch all partition, floor, ceiling and roof assemblies to maintain original performance characteristics, including those for fire and acoustical barriers.
 - a. Patch fire-rated assemblies using safing materials between the penetrating element and fire-rated assembly. Use safing materials complying with Division 07 Section "Penetration Firestopping" and that will not reduce the fire-rating of the existing assembly.
 - b. Patch assemblies to maintain acoustical barrier performance using joint sealing materials between the penetrating element and assembly. Use latex acoustical sealants complying with Division 07 Section "Joint Sealants."
- F. Cleaning: Clean areas and spaces where cutting and patching are performed. Remove paint, mortar, oils, putty, and similar materials from adjacent finished surfaces.

END OF SECTION 017329

SECTION 017420 - CONSTRUCTION AND DEMOLITION WASTE TRACKING

FOR USE ON ALL PROJECTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. This section defines requirements for reporting the disposition of construction and demolition waste/material quantities on all University of Michigan projects.

1.3 REFERENCES

- A. Definitions
 1. Waste: Removal off-site of demolition and construction materials for deposit to a landfill or incinerator as is acceptable to authorities having jurisdiction.
 2. Recycle: Removal off-site of demolition and construction materials to a Recycling Center for processing.
 3. Salvage: Removal off-site of demolition or construction materials for subsequent sale or reuse in another application.
 4. Waste Manifest: Removal off-site of demolition and construction materials included in the UM-EHS Waste Manifest. Exclude from all calculations.
 5. Soils and Excavation: Excavated soils and land-clearing debris. Exclude from all calculations.

1.4 SUBMITTALS

- A. Waste Quantities Report: Provide information documenting all types and amounts of demolition and construction materials removed from the project site using the form provided in Part 3.
- B. Receipts: Provide records from the salvage and recycling facilities, landfills and incinerators, in as much as available, documenting quantities of materials received by each.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 IMPLEMENTATION

- A. Transmit completed Waste Quantities Report(s) and receipts to c-d-waste-tracking@umich.edu by the time of Substantial Completion.

END OF SECTION 017420

	BuildingName		
	The Description of the Project		
P00000000	0000	Issued for: BID	017420 - 2

Waste Quantities Report

Project name: _____

U-M project number: _____

Report Date: _____

Name of person completing this report: _____

Contractor - Company Name: _____

Address: _____

Phone #: _____

Waste^{1 2 3}:

Waste dumpsters: _____ Cubic yards _____ Tons
(Landfilled or incinerated)

Recycled dumpsters: _____ Cubic yards _____ Tons
(Dropped off at recycling center)

Salvaged Waste: _____ Cubic yards _____ Tons
(Sold or reused)

Totals: _____ Cubic yards _____ Tons

¹ Report shall be completed in the same unit for each category of waste.

² Hazardous Waste Manifest and soils and excavation are excluded from all calculations.

³ Provide receipts when available.

SUBMIT COMPLETED FORM TO c-d-waste-tracking@umich.edu

SECTION 017700 - CLOSEOUT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

- A. The requirements of this Section are in addition to project closeout requirements indicated in the Standard General Conditions.

1.2 SUBSTANTIAL COMPLETION

- A. Prerequisites to Substantial Completion: Complete the following:
 - 1. Submit statement showing changes to Contract Sum. Advise Owner of pending insurance change-over requirements.

1.3 DEFINITIONS

- A. Discharge to Ground: Discharge to grassy and/or soil areas capable of water infiltration. Frozen ground conditions are not capable of infiltration.
- B. Wash Water: Liquid waste generated during cleaning activities, including mixtures of water and chemicals and/or detergents. It also includes water containing residues of chemicals, detergents, or the substances being removed (i.e., paint, solvents, etc.). It does not include runoff from cleaning with only potable water that has not come into contact with chemicals or detergents.

1.4 FINAL CLEANING

- A. Final Cleaning: Immediately before turning project over to Owner, wash and clean all parts of the Work. Remove tools and equipment, construction debris, rubbish, and surplus materials.
 - 1. Clean interior and exterior surfaces of window units and glass within the limits of construction area, including the following:

SELECT PARA ABOVE OR BELOW, OR DELETE BOTH IF NO GLASS IN PROJECT.

- 2. Clean interior surfaces of window units and glass within the limits of construction area.

INCLUDE SUBPARA BELOW WITH EITHER PARA ABOVE. SELECT ONE OF THE FOLLOWING THREE OPTIONS.

- a. New window units and glass installed under Contract.
 - b. Existing window units and glass repaired under Contract.
 - c. Existing window units and glass not installed or repaired under Contract.
- B. Disposal of Wash Water from Activities Outside Buildings:
 - 1. Protect storm drains and catch basins. Do not allow runoff from cleaning activities that is discharged to ground to leave the site.

2. Utilize one of the following two procedures to handle wash water generated from detergent or chemical cleaning.
 - a. Obtain approval from the Michigan Department of Environmental Quality (MDEQ) for contractor to discharge to the ground by "authorization by notification" as a mobile power washer. Do not reference University of Michigan in application.
 - 1) Contact UM Environment, Health and Safety department (EHS) - Environmental Protection & Permitting at 734-936-1920 for information on discharge to ground.
 - b. Collect wash water and sample to determine proper disposal method.
 - 1) Contact UM EHS-HazMat at 734-763-4568.
 - 2) Allow adequate lead time for sampling, analysis and disposal coordination.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION 017700

SECTION 017823 - OPERATION AND MAINTENANCE MANUALS

PART 1 - GENERAL

SPEC EDITORS: EXCEPT AS NOTED, DO NOT EDIT THIS SPEC SECTION. INCLUDE IT ON ALL PROJECTS INVOLVING SYSTEMS, EQUIPMENT OR MATERIALS THAT REQUIRE OPERATION OR MAINTENANCE FOR SAFETY, SUCCESSFUL PERFORMANCE, LONGEVITY, OR PRESERVATION OF WARRANTIES.

1.1 SUMMARY

- A. This Section defines the Contractor's requirements for providing four approved paper copies of Operation and Maintenance (O&M) Manuals.
 - 1. Contractors installing equipment pre-purchased by the project (AHU's, chillers, substations, generators, etc.) shall provide O&M Manuals for the pre-purchased equipment assigned to them for installation.
 - 2. Contractors installing or relocating equipment furnished by the Users (lab equipment, audio/visual equipment, etc.) need not provide O&M Manuals for User-furnished equipment.

1.2 RELATED DOCUMENTS

- A. Refer to the U-M Standard General Conditions and other Division 01 Specification Sections for requirements which apply to this Section.
- B. Special operation and maintenance data requirements referenced in the other Technical Specification Sections apply to this Section.

1.3 SCHEDULE

- A. Submit a draft O&M Manual for approval soon after construction start.
- B. Submit one completed copy for approval as soon as it is completed.
- C. Provide four approved O&M Manuals for Owner use a minimum of two weeks prior to scheduled Owner training.
- D. Submission of four approved O&M Manuals is a prerequisite for Substantial Completion and final payment.

1.4 CONTENTS

- A. The O&M Manuals shall provide the Owner's maintenance personnel with the information they need to install, inspect, test, operate, clean, lubricate, maintain, adjust, repair and replace the project's systems and equipment.
- B. The O&M Manuals shall include information on the following:

ARCHITECTURAL LEAD: ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IT PROJECT SPECIFIC. ADD ARCHITECTURAL ITEMS REQUIRING MAINTENANCE USING SPECIAL CLEANERS, PRESERVATIVES, PROCEDURES, ETC.

- 1. Divisions 02 Through 14: Systems and equipment items include but are not limited to:
 - a. Power operated doors, windows, fire shutters, roof hatches, and related items.

- b. Operable partitions.
- c. Electric signs and graphics systems.
- d. Motorized projection screens and projector lifts.
- e. Fume hoods, bio-safety cabinets and snorkels.
- f. Laboratory plumbing and electrical fixtures specified as part of laboratory casework.
- g. Laboratory equipment including ventilated cages, sterilizers, glass washers, tunnel washers, cage and rack washers, bedding dispensers/disposers, water bottle fillers, and auto watering systems.
- h. Darkroom equipment.
- i. Motorized shades and blinds.
- j. Dock levelers and truck restraint systems.
- k. Trash compactors
- l. Controlled environment rooms.
- m. Elevators and barrier-free lifts.
- n. Food service equipment.

MECHANICAL LEAD ENGINEER: ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IT PROJECT SPECIFIC.

- 2. Divisions 21, 22 and 23: Systems and equipment items include but are not limited to:
 - a. Tunnel piping, valves, expansion joints, and loops.
 - b. Building piping, valves, expansion joints, and loops.
 - c. Meters and gauges.
 - d. Heat trace systems.
 - e. Motors, motor controllers, and variable frequency drives.
 - f. Water treatment systems.
 - g. Fire protection systems.
 - h. Piping and plumbing specialties.
 - i. Hot and cold domestic water systems.
 - j. Sanitary and laboratory waste systems.
 - k. Grease interceptors/separators.
 - l. Rainwater and storm sewer systems.
 - m. Irrigation systems.
 - n. Purified and RO/DI water systems.
 - o. Pumps.
 - p. Medical and specialty gas systems.
 - q. Natural gas systems.
 - r. Fuel oil storage and transfer systems.
 - s. Hot water heating systems.
 - t. Boilers.
 - u. Chilled water systems.
 - v. Chillers.
 - w. Cooling towers.
 - x. Condenser water systems.
 - y. Steam and condensate systems.
 - z. Engine-generator exhaust systems.
 - aa. Sand filters.
 - bb. Humidifiers.
 - cc. Heat exchangers.
 - dd. Terminal heating and cooling units.
 - ee. Energy recovery systems.
 - ff. Free cooling systems.
 - gg. Smoke evacuation systems.
 - hh. Stairwell pressurization systems.
 - ii. Point exhaust systems.
 - jj. Laboratory vacuum systems.

- kk. Compressed air systems.
- ll. Control air systems.
- mm. Exhaust air systems.
- nn. HVAC systems.
- oo. Air handling units.
- pp. Fans.
- qq. Pressurization control systems.
- rr. Mechanical systems controls.
- ss. Laboratory and fume hood controls.
- tt. Clean room controls.
- uu. Kitchen Hoods.
- vv. Kitchen exhaust controls.
- ww. Fan coil units.
- xx. DX systems.
- yy. Computer room HVAC systems.
- zz. Saw dust collection systems.

ELECTRICAL LEAD ENGINEER: ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IT PROJECT SPECIFIC.

- 3. Divisions 26, 27 and 28: Systems and equipment items include but are not limited to:
 - a. Primary power distribution.
 - b. Unit substations.
 - c. Secondary power distribution and metering.
 - d. Engine-generators, transfer switches and load banks.
 - e. Paralleling switchgear.
 - f. Motor starters and controls.
 - g. Wiring devices.
 - h. Grounding.
 - i. Normal and emergency lighting.
 - j. Lighting control and dimming systems.
 - k. Lighting individual controls.
 - l. Voice & data systems.
 - m. Emergency and campus telephones.
 - n. Audio/visual systems.
 - o. Room scheduler systems.
 - p. Master clocks.
 - q. Access control systems.
 - r. Security and CCTV systems.
 - s. Fire detection and alarm systems.
 - t. Emergency responder radio coverage systems.
 - u. MOSCAD (Motorola SCADA alarm transmitter to DPSS).

1.5 DOCUMENTATION REQUIREMENTS

- A. Provide complete information regarding the installation, inspection, testing, operation, cleaning, lubrication, maintenance, and adjustment of the equipment supplied, including data needed to facilitate maintenance in accordance with the warranty requirements, and data needed to order an exact replacement or the approved spare parts. Manufacturers' sales literature and similar promotional materials shall not be included.

- B. Documentation shall be project specific. Edit manufacturers' standard documentation to reflect the exact equipment supplied. Circle or draw an arrow toward information that applies. Cross out information that does not apply. Do not highlight information because highlighting cannot be photocopied. Documentation that is not properly marked will be rejected.
- C. Drawings may be reduced in size as long as they are still legible.
- D. When documentation on a system or assembly includes data from more than one manufacturer, provide complete data on each component. Assemble the data into one tabbed section of the Manual.

1.6 IDENTIFICATION

- A. In the Table of Contents and in each tabbed section, identify each system and equipment item using the same name designation used in the Contract Documents.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 PREPARATION

- A. Soon after construction starts, submit one draft O&M Manual for approval. This draft Manual shall consist of labeled binders with a Table of Contents and the divider tabs.
- B. Throughout the construction process, gather operation and maintenance documentation and enter the data into the binders. Bring the Manual to Commissioning Meetings when requested to do so.

3.2 BINDERS

- A. Bind O&M Manual in commercial quality, "D-ring", loose leaf binders with durable and cleanable plastic covers. Maximum binder ring size shall be 4 inches.
- B. Label both the front and the spine of each binder with "Operation and Maintenance Manual", the Project Name, the U-M Project Number, the Contractor's name, and the Contractor's Project Number.
- C. When multiple binders are required to assemble one Manual, label both the front and the spine of each binder with the number of the binder, the quantity of binders in the Manual (i.e. 3 of 5), and the contents of the binder (i.e. Plumbing). Provide on the inside cover of each binder a complete list of the binders (i.e. Volume 1 - Architectural, Volume 2 - Elevators, Volume 3 - Plumbing, etc.).

3.3 TABLE OF CONTENTS

- A. Provide a Table of Contents at the front of the Manual. List each tabbed section of the Manual. List the system and equipment names and numbers contained within each tabbed section.

- B. When multiple binders are required to assemble one Manual, provide a Table of Contents at the front of each binder.

3.4 CONTENTS

- A. Arrange the O&M Manual in order by specification section. Provide heavy paper dividers with plastic tabs to divide the Manual into sections with a separate section for each system. Divide a section into tabbed subsections when the section contains documentation on multiple major equipment items. Permanently mark each tab to identify the contents of the section.
- B. Three hole punch 8-1/2" x 11" to 11' x 17" documents and insert them directly into the Manual. Fold documents larger than 8-1/2" x 11" appropriately. Provide transparent plastic sleeves to enclose drawings, charts, booklets, brochures, computer software media, and other off-size documentation. Do not store any documentation in the inside pockets of the binder covers.
- C. In the front portion or first binder of the Manual, provide the following documents:
 - 1. For systems requiring Federal or State inspections such as elevators and fire alarm systems, a copy of the inspection report and approval certificate for each system.
 - 2. A copy of the valve tag schedule.
 - 3. A list of the local suppliers (with addresses and telephone numbers) for each piece of equipment.
 - 4. A list of the warranty service contacts (with addresses and telephone numbers) for each piece of equipment.
 - 5. A list of the periodic maintenance activities that must be performed to retain warranty coverage.
 - 6. For equipment with warranties in excess of one year, a copy of the extended warranty information.
 - 7. For equipment with a service agreement, a copy of the service agreement and a list of the service agreement contacts (with addresses and telephone numbers).
- D. In the middle portion of the Manual in separate tabbed sections, provide the following project-specific documents:
 - 1. Complete operation and maintenance instructions for each system and major equipment item.
 - 2. Except for minor equipment, complete manufacturer's nameplate data.
 - 3. Pump curve for each pump.
 - 4. Flow curve for each flow element (pitot tube, triple duty valve, circuit setter, etc.).
 - 5. Fan curve for each fan.
 - 6. Clean and dirty filter pressure drops for each filter.
 - 7. Short circuit analysis with overcurrent protective device settings and fuse sizes.
 - 8. Exploded assembly views with references to part numbers.
 - 9. List of manufacturers' recommended spare parts.
- E. In the back portion of the Manual, provide the following documents:
 - 1. Signed factory representatives' startup reports.

- F. In plastic sleeves in the back of the Manual, provide the following drawings for use during a building emergency:
1. Record copies of the elevator schematic wiring diagrams.
 2. Record copies of the fire protection system piping schematics.
 3. Record copies of the temperature control schematics.
 4. Record copies of the power one line and riser diagrams.
 5. Record copies of the fire alarm and security system wiring diagrams.

3.5 SUBMISSION

- A. To avoid delaying Owner training, Substantial Completion and final payment, complete the O&M Manual as early in the construction process as possible.
- B. Submit one paper copy of the Manual for Owner review and approval.
- C. Incorporate the Owner's review comments into the submitted Manual and prepare three more paper copies.
- D. Submit four approved O&M Manuals for distribution by the AEC Facilities Information Center.

END OF SECTION 017823

SECTION 019100 - PROJECT COMMISSIONING

REVISION HISTORY:

JULY 2016: REVISED TO ESTABLISH 019100 AS THE SOLE SPECIFICATION FOR CX.ING, ALLOWING 019110 "SMALL" PROJECT COMMISSIONING TO BE RETIRED.

ARCHITECT/ENGINEER: EDIT THE FOLLOWING ARTICLES TO MAKE THIS SPECIFICATION PROJECT SPECIFIC: 1.1.B, 1.2.B. REVISE 3.1.N IF NECESSARY, SEE THE EDITOR'S NOTE AT THAT LOCATION. EDIT ARTICLE 1.2.B TO LIST ALL EQUIPMENT AND SYSTEMS TO BE COMMISSIONED INCLUDING PREPURCHASED AND OWNER FURNISHED EQUIPMENT. CLARIFY WITH THE DESIGN MANAGER EXACTLY WHICH OWNER FURNISHED EQUIPMENT IS TO BE COMMISSIONED. GENERALLY OWNER FURNISHED EQUIPMENT IS NOT COMMISSIONED. IF A COMMISSIONING AUTHORITY (CXA) HAS BEEN HIRED FOR THE PROJECT, REQUEST THE CXA REVIEW YOUR EDITED VERSION OF THIS SPECIFICATION AND INCORPORATE ANY INPUT RECEIVED.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. The Drawings and the general provisions of the Contract, including the Standard General Conditions and the Supplemental General Conditions, apply to this Section.

EDIT THE BELOW SPECIFICATION SECTION NUMBERS. U-M MASTER SPECIFICATION SECTION 017823 SHALL BE USED AS THE O&M MANUAL SPECIFICATION.

- B. Refer to other Division 01 Specification Sections, including the following, for related requirements which apply to this Section.
 - 1. Division 01 Section - Project Management and Coordination.
 - 2. Division 01 Section - Submittal Procedures.
 - 3. Division 01 Section - Operation and Maintenance Manuals.
- C. Testing, balancing, commissioning, operation and maintenance manual, and Owner training requirements referenced in the other Technical Specification Sections apply to this Section.

1.2 SUMMARY

- A. Each Contractor shall perform the commissioning activities for the systems, equipment and materials they install. When the equipment and materials are part of a larger system, each Contractor shall commission their portion of the work as part of the overall system commissioning. The commissioning activities will be coordinated by the University's Commissioning Authority (CxA). Perform the commissioning activities as outlined in Part 3, "Execution" and as described in the U-M "Generic Sample Commissioning Plan" available for review at <http://www.umaec.umich.edu/wp-content/uploads/2013/08/Sample-Cx-Plan-Master.pdf>. Where terms, procedures, forms, etc. are indicated in this specification, the requirements for such items shall be as described in the U-M "Generic Sample Commissioning Plan".

B. Perform commissioning activities on the following:

ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IT PROJECT SPECIFIC.

1. Divisions 02 through 14: Systems and equipment include but are not limited to:
 - a. Power operated doors, windows, fire shutters, roof hatches, and related items.
 - b. Operable partitions.
 - c. Electric signs and graphics systems.
 - d. Motorized projection screens and projector lifts.
 - e. Fume hoods, bio-safety cabinets and snorkels.
 - f. Laboratory plumbing and electrical fixtures specified as part of laboratory casework.
 - g. Laboratory equipment including ventilated cages, sterilizers, glass washers, tunnel washers, cage and rack washers, bedding dispensers/disposers, water bottle fillers, and auto watering systems.
 - h. Darkroom equipment.
 - i. Motorized shades and blinds.
 - j. Dock levelers and truck restraint systems.
 - k. Trash compactors
 - l. Controlled environment rooms.
 - m. Elevators and barrier-free lifts.
 - n. Food service equipment.

ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IS PROJECT SPECIFIC.

2. Divisions 21, 22 and 23: Systems and equipment include but are not limited to:
 - a. Tunnel piping, valves, expansion joints, and loops.
 - b. Building piping, valves, expansion joints, and loops.
 - c. Meters and gauges.
 - d. Heat trace systems.
 - e. Motors, motor controllers, and variable frequency drives.
 - f. Water treatment systems.
 - g. Fire protection systems.
 - h. Piping and plumbing specialties.
 - i. Hot and cold domestic water systems.
 - j. Sanitary and laboratory waste systems.
 - k. Grease interceptors/separators.
 - l. Rainwater and storm sewer systems.
 - m. Irrigation systems.
 - n. Purified and RO/DI water systems.
 - o. Pumps.
 - p. Medical and specialty gas systems.
 - q. Natural gas systems.
 - r. Fuel oil storage and transfer systems.
 - s. Hot water heating systems.
 - t. Boilers.
 - u. Chilled water systems.
 - v. Chillers.
 - w. Cooling towers.
 - x. Condenser water systems.
 - y. Steam and condensate systems.
 - z. Engine-generator exhaust systems.
 - aa. Sand filters.

- mm. Exhaust air systems.
- nn. HVAC systems.
- oo. Air handling units.
- pp. Fans.
- qq. Pressurization control systems.
- rr. Mechanical systems controls.
- ss. Laboratory and fume hood controls.
- tt. Clean room controls.
- uu. Kitchen Hoods.
- vv. Kitchen exhaust controls.
- ww. Fan coil units.
- xx. DX systems.
- yy. Computer room HVAC systems.
- zz. Saw dust collection systems.

ADD TO OR DELETE FROM THE FOLLOWING LIST TO MAKE IT PROJECT SPECIFIC.

- 3. Divisions 26, 27 and 28: Systems and equipment items include but are not limited to:
 - a. Primary power distribution.
 - b. Unit substations.
 - c. Secondary power distribution and metering.
 - d. Engine-generators, transfer switches and load banks.
 - e. Paralleling switchgear.
 - f. Motor starters and controls.
 - g. Wiring devices.
 - h. Grounding.
 - i. Normal and emergency lighting.
 - j. Lighting control and dimming systems.
 - k. Lighting individual controls.
 - l. Voice & data systems.
 - m. Emergency and campus telephones.
 - n. Audio/visual systems.
 - o. Room scheduler systems.
 - p. Master clocks.
 - q. Access control systems.
 - r. Security and CCTV systems.
 - s. Fire detection and alarm systems.
 - t. Emergency responder radio coverage systems.
 - u. MOSCAD (Motorola SCADA alarm transmitter to DPSS).

1.3 SUBMITTALS

- A. Provide the Commissioning Authority with the lists, forms, drawings, plans, reports, and manuals described in Part 3, "Execution".

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 COMMISSIONING ACTIVITIES

- A. Attend regularly scheduled Commissioning Team meetings, separate from other project meetings and occurring at intervals deemed appropriate by the CxA. Typically meetings will be held one per month at the beginning, increasing to one per week for the last third of the project.
 - 1. Solely when dictated by the CxA, on some projects the Commissioning Team meetings will be held as part of regular project construction meetings.
- B. Attend additional commissioning meetings including but not limited to:
 - 1. Pre-start meetings.
 - 2. Functional test preparation meetings.
 - 3. Pre-balance conferences.
 - 4. Water treatment meetings.
- C. Maintain one all-inclusive Commissioning Plan and keep it up-to-date.

COMMISSIONING AUTHORITY: MAINTAIN A SECOND COPY OF THE COMMISSIONING PLAN.

- 1. The Commissioning Plan shall be used to store all of the documents produced during the commissioning process. Maintain the Commissioning Plan in the construction office.
- 2. An initial draft of the Commissioning Plan will be prepared and delivered to the Contractor by the CxA soon after construction starts.
- 3. Provide to the CxA a complete list of trade contractor, major manufacturer, and major supplier contact information for inclusion in the Commissioning Plan.
- 4. The CxA will develop project-specific commissioning forms for inclusion in the Cx Plan, along with other required documents. Each Contractor shall complete, sign, and insert into the Commissioning Plan the portion of each form that relates to their work. The types of documents required for this project include but are not limited to:
 - a. Commissioning meeting minutes.
 - b. Interim and final commissioning reports.
 - c. Installation Sequences.
 - d. Commissioning Status Check Sheets.
 - e. Pre-Installation Check Sheets.
 - f. Pipe Flushing and Cleaning Forms.
 - g. Duct Leak Test Reports.
 - h. Pre-Start Check Sheets.
 - i. Mfr.'s reports documenting equipment start-up.
 - j. Equipment Functional Test Check Sheets.
 - k. System Functional Test Check Sheets.
 - l. Training plans and training attendance sheets.

5. Provide one copy of the following documents to the CxA for systems or equipment being commissioned when such tests are required by other specification sections:
 - a. Manufacturers' factory test reports.
 - b. Field inspection and test reports.
 - c. Manufacturers' check-test-start reports.
 6. Provide a detailed list of every control point installed. Include, in checklist format, a detailed procedure to verify all aspects of the controls' operational sequence.
 7. Insert the original of each form or document in the Commissioning Plan and provide a copy of each to the CxA.
- D. Assist with establishing the order, timing, and duration of the commissioning activities, and add them to the Project Schedule.
- E. During the shop drawing submittal process, submit one set of shop drawings for all systems and equipment being commissioned to the CxA for review.
1. Submit the shop drawings at the same time they are submitted to the A/E for review.
 2. The CxA assists the A/E in reviewing submittals and will not return comments directly back to the contractor.
 3. After completion of the review, provide to the CxA one set of the A/E reviewed and stamped shop drawings for all systems and equipment being commissioned.
- F. At the time of shop drawing submittal, provide to the CxA installation manuals for the systems and equipment being commissioned.
- G. Soon after construction starts, submit one draft Operation and Maintenance (O&M) Manual in accordance with the related specification section.
- H. Submit duct leak testing plans and calculations prior to leak testing each section of duct. No testing shall commence until the plan and calculations are approved by the CxA.
- I. Submit pipe flushing and cleaning plans for each systems for CxA approval at least 2 weeks prior to the first flushing and cleaning activities.
- J. Submit electrical test reports for CxA approval at least 2 weeks prior to equipment energization.
- K. Provide at least 2 weeks advance notification of the following activities:
1. Coordination drawing meetings. The CxA may attend.
 2. Duct leak tests. The CxA must witness duct leak tests unless waived by the CxA.
 3. Pipe flushing and cleaning of each system or portion of each system. The CxA must witness flushings and cleanings unless waived by the CxA.
 4. Manufacturer check-test-starts. The CxA may attend.
 5. Functional tests. The Commissioning Authority must witness and approve all functional tests.
 6. Owner training sessions.
- L. Check, test, and start up each system in accordance with the Manufacturer's instructions.

1. The Pre-Start Check Sheets shall be submitted and approved prior to starting up systems and equipment. This applies both to early starts for construction use and to full startups before functional testing.
 2. Where required by the Project Specifications or by the Manufacturer, startup shall be performed by a Manufacturer's Representative. Provide a copy of the completed equipment start up form used by the Manufacturer's Representative during start up.
- M. Functionally test each piece of equipment and system to verify proper function in all modes of operation. Coordinate with other trades so all modes of operation can be demonstrated. Each Contractor shall demonstrate the portion of the work they provided.
1. Test each system component, zone, and control sequence.
 2. Test under both full and partial loads.
 3. Test under normal, abnormal, and emergency conditions.
 4. Test under design basis seasonal conditions.

FOR SMALL PROJECTS, CONSIDER IN CONSULTATION WITH THE COMMISSIONING AUTHORITY IF THE 20% RANDOM FUNCTIONAL TESTING LIMIT SPECIFIED BELOW IS ADEQUATE AND REVISE IF APPROPRIATE. IF THE COMMISSIONING AUTHORITY HAS YET TO BE HIRED, CONSULT WITH THE U-M MANAGER OF COMMISSIONING AND PLAN REVIEW THROUGH THE U-M DESIGN MANAGER. NORMALLY FOR PROJECTS WITH SMALL QUANTITIES OF TERMINAL UNITS, PLUMBING FIXTURES, ETC. THIS SECTION SHOULD BE REVISED TO SPECIFY THAT ALL UNITS BE FUNCTIONALLY TESTED.

- N. Functional testing shall include:
1. 100 percent of all major equipment
 2. 100 percent of terminal units that are controlled in any way by occupancy sensors.
 3. 100 percent of terminal units or zones that provide temperature, humidity, pressure, or similar control outside of what would be the design criteria for a typical office, e.g. those serving museum, special storage, or similar spaces.
 4. 100 percent of terminal units serving any space designated as a lab.
 5. Random functional testing of no less than 20% of fan coil units, VAV boxes, chilled beams, plumbing fixtures, lighting occupancy sensors, and similar high unit count equipment. If the quantity is 25 units or less, no less than 5 units shall be functionally tested. If significant issues are found, randomly functional test in additional increments of 10% until no significant issues are found. The CxA shall designate the specific units to be tested.
- O. When requested by the CxA, provide trend logs of the controlled variables for all central equipment, and for any zone or terminal unit serving spaces with specific temperature, humidity, or pressure setpoints. For systems or equipment determined not to be operating properly by the CxA, provide logs for any additional control points requested, for trouble-shooting purposes.
1. Trend logs shall begin once each functional test is complete, and continue until the equipment or system is accepted by the CxA.

2. The sampling interval and the required frequency of providing trend logs shall be as required by the CxA.
- P. Correct the incomplete and non-conforming items that were identified during the commissioning process.
1. Deficiencies that affect system operation must be corrected prior to functional testing.
 2. Deficiencies discovered during or after functional testing must be corrected prior to acceptance of the systems by the CxA.
- Q. At the same time they are submitted to the A/E for review, submit a copy of each Air and Water Balance Test Report to the CxA for review.
- R. Provide four reviewed and approved paper copies of O&M Manuals in accordance with the O&M Manual specification section a minimum of two weeks prior to scheduled Owner training.
- S. Arrange for and participate in Owner training sessions for the systems and equipment being commissioned.
1. Assist the CxA in developing a training plan. Submit for CxA approval a master list of all training sessions at least 30 days in advance of the proposed first training session. Include systems and equipment, area served, agenda, duration, time and location of each training session. The CxA will develop the final training plan which the contractor shall comply with. Dates and times of each session shall be as convenient for the Owner.
 - a. A training session may include several common types of similar systems or typical equipment that all Trainees have involvement with. Standard AHU's, fans, and ductwork can all be covered in one air handling systems training session. General lighting systems and typical power distribution systems can be covered in one electrical systems training session.
 - b. Keep unique, large or complex systems and equipment in their own training sessions (e.g. fume hoods, lab exhaust controls, emergency power systems, or large lab exhaust systems must be separate from a general air handling systems training session).
 2. Define each training session as either overview training or specific system/equipment training.
 - a. Overview training shall provide the design intent and general operation of each system and its equipment, including interactions with other systems and equipment. Overview training is generic in nature and at a level that is consistent with the level of Trainee's knowledge.
 - b. Specific system/equipment training shall include the overview followed by more detail. It is intended to expand the Trainee's specific knowledge of a particular system or equipment. Specific system/equipment training generally only applies when special training requirements are referenced in other Technical Specification Sections.
 3. Training sessions shall occur after the system and equipment have passed functional testing, and after final approved O&M Manuals have been provided to the Owner.
 - a. Invite Manufacturers' representatives when required by other Technical Specification Sections or when required due to the complexity of the system or equipment.

- b. Provide the appropriate design and coordination as-built drawings and O&M Manuals for each training session.
- 4. Conduct the training at the system or equipment. For specific system/equipment training, also conduct classroom training when specified or appropriate.
 - a. In conjunction with the CxA, provide overview training on the system and equipment.
 - b. Review the contents of the O&M Manual as it relates to the Training Session.
 - c. Walk down each system with the Trainees. Indicate the locations and explain the operation of basic system components such as isolation valves, drains, vents, expansion compensators, distribution piping, flow meters, electrical panels, motor controls, disconnects, lighting controls, fire alarm and security devices, roof hatch access, etc.
 - d. For specific system/equipment training, also provide the following:
 - 1) Meanings of alarms, indicators, and warning signs.
 - 2) Operating procedures under all normal, abnormal and emergency modes of operation.
 - 3) Maintenance procedures including cleaning, lubricating and adjustment procedures.
 - 4) Inspection, troubleshooting and repair procedures.
 - e. After each training session, insert a copy of the agenda and completed sign-in sheet into the Commissioning Plan.
- T. Submit the completed Commissioning Plan to the CxA for approval.

SPECIFICATION DIVISION 2

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 024119 - SELECTIVE DEMOLITION

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS
SECTION 024119 - SELECTIVE DEMOLITION

*5/6/2014 -- EDITED TO ADD DEFINITIONS SECTION AND MORE CLOSELY
ALIGN WITH STANDARD REFERENCE SPECIFICATION SECTION.*

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Work of this Section includes the following:
1. Demolition work of existing construction and building elements indicated on Drawings or by provisions of this Section.
 2. Salvage of existing items to be reused or recycled.
- B. Related work of other Sections includes the following:

*DELETE BELOW IN CONSULTATION WITH MECHANICAL ENGINEER OR IF NO
A/C EQUIPMENT OR PIPING DEMOLITION IS INCLUDED IN PROJECT.*

1. Refrigerant handling requirements are specified in Division 01 Section "Work Restrictions."

*DELETE BELOW IN CONSULTATION WITH MECHANICAL ENGINEER OR IF NO
FUME HOOD DUCTWORK DEMOLITION IS INCLUDED IN PROJECT.*

2. Fume hood ductwork demolition requirements are specified in Division 01 Section "Work Restrictions."

USUALLY RETAIN BELOW.

3. Safety barriers and temporary closures are specified in Division 01 Section "Temporary Facilities and Controls."

*RETAIN BELOW FOR REROOFING PROJECTS INVOLVING TEAROFF OF
EXISTING ROOF.*

4. Installation of new roofing system after removal of existing roof is specified in Division 07.

DELETE BELOW IF NO ASBESTOS WORK IN PROJECT.

5. Removal and disposal of asbestos-containing materials is specified in Division 02 Section "Asbestos Remediation."

DELETE BELOW IF NO SPECIAL LEAD PRODUCT REMOVAL WORK.

6. Removal and disposal of lead-containing materials is specified in Division 02 Section "Lead Products Remediation - Renovation, Repair and Painting in Child Care Facilities and Target Housing."

DELETE BELOW IF NO LIGHT FIXTURE DEMOLITION WORK IN PROJECT.

7. Removal and disposal of fluorescent lamps and ballasts is specified in Division 26 Section "Basic Electrical Requirements."

1.3 DEFINITIONS

INCLUDE TERMS THAT APPLY TO PROJECT.

- A. Remove: Detach items from existing construction and dispose of them off-site unless indicated to be salvaged or reinstalled.
- B. Remove and Salvage: Detach items from existing construction, in a manner to prevent damage, and deliver to Owner ready for reuse or store as noted on Drawings.
- C. Remove and Reinstall: Detach items from existing construction, in a manner to prevent damage, prepare for reuse, and reinstall where indicated.
- D. Existing to Remain: Leave existing items that are not to be removed and that are not otherwise indicated to be salvaged or reinstalled.
- E. Dismantle: To remove by disassembling or detaching an item from a surface, using gentle methods and equipment to prevent damage to the item and surfaces; disposing of items unless indicated to be salvaged or reinstalled.

1.4 MATERIALS OWNERSHIP

- A. Unless otherwise indicated, demolition waste becomes property of Contractor.
- B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.
 1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.5 SUBMITTALS

- A. Landfill Records: Indicate receipt and acceptance of demolished material by a landfill facility authorized to accept such material.

1.6 QUALITY ASSURANCE

- A. Notify the Michigan Department of Environmental Quality as required by law, of demolition work, including work that does not involve asbestos abatement work.

1.7 WARRANTY

RETAIN BELOW FOR WORK IMPACTING ROOFS UNDER WARRANTY. CONTACT PLANT REGIONAL ASSET MANAGER TO VERIFY IF ROOF IS UNDER

WARRANTY. MOST ROOFS LESS THAN 15 YEARS OLD ARE UNDER WARRANTY.

- A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials and using approved contractors so as not to void existing warranties. Notify warrantor before proceeding. Existing warranties include the following:
 - 1. Roof system
- B. Notify warrantor on completion of selective demolition, and obtain documentation verifying that existing system has been inspected and warranty remains in effect. Submit documentation at Project closeout.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 DEMOLITION, GENERAL

- A. Carry out all demolition work in a neat and orderly manner. Keep noise, dust, and similar nuisances to a minimum. Do not collapse walls. Do not throw or drop materials.
 - 1. Where material indicated to be removed is suspected of containing asbestos, inform Owner's Representative immediately. Do not disturb materials suspected of containing asbestos until asbestos content has been verified by Owner.

INCLUDE BELOW WHEN SHAFTS WILL BE CUT INTO FOR ARCHITECTURAL, MECHANICAL OR ELECTRICAL WORK.

- 2. Use extreme caution when cutting into shafts and chases. Shafts and chases may end above occupied areas within building. Take all necessary precautions to prevent debris from falling through openings between floors during demolition operations. Comply with requirements of Division 01 Section "Temporary Facilities and Controls".

RETAIN ARTICLES B & C AS APPLICABLE TO PROJECT

- B. Removed and Salvaged Items:
 - 1. Clean salvaged items.
 - 2. Pack or crate items after cleaning. Identify contents of containers.
 - 3. Store items in a secure area until delivery to Owner.

INCLUDE LOCATION IN BUILDING IF KNOWN OR INDICATE LOCATION IN ANOTHER BUILDING IF APPLICABLE.

- 4. Transport items to Owner's storage area location in building.
- 5. Protect items from damage during transport and storage.
- C. Removed and Reinstalled Items:

1. Clean and repair items to functional condition adequate for intended reuse.
 2. Pack or crate items after cleaning and repairing. Identify contents of containers.
 3. Protect items from damage during transport and storage.
 4. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.
- D. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Owner's Representative, items may be removed to a suitable, protected storage location off-site during selective demolition and reinstalled in their original locations after selective demolition operations are complete.

3.2 PROTECTION

- A. Temporary Protection: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent materials to remain.
1. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
 2. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.
 3. Protect existing utilities and services indicated to remain in service and protect them against damage during demolition operations.
 4. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
 5. Cover and protect furniture, furnishings, and equipment that have not been removed.
 6. Patch, repair or replace materials and items accidentally damaged during demolition operations.
- RETAIN THE PARAGRAPH BELOW FOR REROOFING PROJECTS.**
7. Re-roofing Project Demolition: Removal of existing roofing materials shall not expose more of the underlying construction than can be recovered in one day with the specified roofing system.
 8. Comply with requirements for temporary enclosures, dust control, heating, and cooling specified in Section 015000 "Temporary Facilities and Controls."
 - a. Confine dust and debris to immediate area of demolition activity to the greatest extent practicable.
- B. Temporary Shoring: Design, provide, and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.

1. Strengthen or add new supports when required during progress of selective demolition.
- C. Remove temporary barricades and protections where hazards no longer exist.

3.3 DEMOLITION OF ARCHITECTURAL FINISHES

- A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:
1. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping, to minimize disturbance of adjacent surfaces. Temporarily cover openings to remain.
 2. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
 3. Do not use cutting torches without written permission from Owner's Representative. Comply with provisions of the Standard General Conditions and Owner's rules and procedures.
 4. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loading on supporting walls, floors, or framing.
 5. Dispose of demolished items and materials promptly.
- B. Remove all loose material from partially demolished work leaving only sound and secure construction.

INCLUDE THE FOLLOWING WHEN PLASTER REPAIR MAY BE REQUIRED

1. Plaster: Remove loose plaster that will be exposed in finished construction. Loose plaster is defined as plaster material of at least 2 inches by 4 inches in size that can be moved by touch or that sounds hollow when lightly tapped with a hammer.

INCLUDE THE FOLLOWING WHEN CARPET OR RESILIENT FLOORING WILL BE REMOVED

2. Flooring: Where shown, scheduled or otherwise required for application or installation of new floor finishes or coverings, remove existing flooring tile, resilient sheet flooring as follows:
 - a. Remove all traces of existing flooring materials. Remove resilient sheet and tile flooring products in compliance with recommended methods of Resilient Floor Covering Institute "Recommended Work Practices for Removal of Resilient Floor Coverings."
 - b. Remove adhesives, except those containing asbestos. Use chemical strippers approved by manufacturer of new flooring materials, or grind concrete floor surfaces to completely remove adhesive. Obtain Owner's Representative's approval of removal method prior to beginning removal work.

- c. Do not remove vinyl composition tile or adhesives suspected of containing asbestos. Owner will verify asbestos content of questionable materials. Removal of asbestos-containing adhesives (if any) is included in Division 02 Section "Asbestos Abatement."
- d. Clean floor slabs of dust and adhesive residue.

3.4 DEMOLITION OF CONCRETE OR ASPHALT

- A. Water used during concrete and asphalt work (including sweeping and saw-cutting) must be contained and collected for proper disposal. Do not discharge water containing dust or debris from concrete or asphalt work into storm drains, catch basins or to the sanitary sewer system.

3.5 DISPOSAL OF DEMOLISHED MATERIALS

- A. Remove demolition waste materials from Project site and dispose of them in an EPA-approved construction and demolition waste landfill acceptable to authorities having jurisdiction.
 - 1. Remove and transport debris in accordance with the Standard General and Supplemental General Conditions.

INCLUDE THE PARAGRAPHS BELOW IF DEMOLISHED ACOUSTICAL PANELS AND TILE ARE TO BE RECYCLED. THIS IS A VIABLE ECONOMIC OPTION IF COST OF SEPARATING ACOUSTICAL TILE FROM THE REST OF CONSTRUCTION DEBRIS IS MINIMAL. USG, ARMSTRONG AND BPB ALL HAVE RECYCLING PROGRAMS AND WILL PICK UP PROPERLY PREPARED PANELS FREE OF CHARGE IF THE TYPE OF TILE IS RECYCLABLE. SEE ALSO COMMENTS IN SECTION 095100.

3.6 RECYCLING OF MATERIALS

- A. Acoustical ceiling panels and tile.
 - 1. Coordinate with requirements for accepting materials by acoustical ceiling manufacturer selected to supply materials under Division 09 Section "Acoustical Ceilings."
 - 2. Neatly stack large clean pieces on wooden pallets. Shrink wrap pallets or bind with straps.
 - 3. Notify manufacturer when collection and wrapping of materials is complete and ready for pickup.
 - 4. Store in a protected location accessible to manufacturer for pickup.

3.7 SELECTIVE DEMOLITION SCHEDULE

RETAIN THIS ARTICLE IF DRAWINGS DO NOT SHOW ALL SELECTIVE DEMOLITION NOTES AND LISTS. SEE "DEFINITIONS" ARTICLE FOR DEFINITION OF TERMS.

- A. Remove and Salvage:

BELOW ARE SEVERAL STANDARD ITEMS. EDIT TO BE PROJECT SPECIFIC

1. Ancillary Materials: Where mechanical or electrical devices are indicated to be demolished, legally dispose of ancillary materials.

EDIT BELOW TO SUIT PROJECT.

- a. Lubricant oils: Contact UM EHS Hazardous Materials (734-763-4568) to arrange for proper disposal of lubricant oils.
2. Remove cylinders from locksets removed during demolition operations. Turn cylinders over to Owner's Key Office.
3. **<Insert description of items to remove and salvage>.**

B. Remove and Reinstall:

BELOW IS A STANDARD ITEM. EDIT TO BE PROJECT SPECIFIC

1. Remove cylinders from locksets removed during demolition operations. Turn cylinders over to Owner's Key Office.
2. **<Insert description of items to remove and reinstall>.**

"EXISTING TO REMAIN" PARAGRAPH BELOW MAY BE USED TO INFORM CONTRACTOR OF ITEMS THAT ARE TO REMAIN, SUCH AS THOSE THAT OCCUR IN, OR ARE ADJACENT TO, CONSTRUCTION BEING DEMOLISHED, BUT ARE NOT BEING REMOVED AND REINSTALLED. RETAIN PARAGRAPH IF REQUIRED.

C. Existing to Remain:

1. **<Insert description of items to remain>.**

"DISMANTLE" PARAGRAPH BELOW MAY BE USED TO INFORM CONTRACTOR OF ITEMS ATTACHED TO VALUABLE SUBSTRATES THAT REQUIRE SPECIAL CARE IN REMOVAL. INSERT ADDITIONAL REQUIREMENTS IF ITEMS ARE TO BE SALVAGED OR REUSED; OTHERWISE ITEMS ARE TO BE DISPOSED.

D. Dismantle:

1. **<Insert description of items to be removed>.**

SECTION 028110 - REGULATED CONSTRUCTION WASTE REMEDIATION

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS

SECTION 028110 - REGULATED CONSTRUCTION WASTE REMEDIATION

SECTION ADDED 9/04

THIS SECTION DESCRIBES REQUIREMENTS FOR REMOVAL AND DISPOSAL OF REGULATED CONSTRUCTION WASTE, I.E., CONSTRUCTION WASTE THAT CANNOT BE DISPOSED OF WITH TYPICAL NON-HAZARDOUS CONSTRUCTION AND DEMOLITION DEBRIS. THIS APPLIES TO BUILDING ITEMS INCLUDING BUT NOT LIMITED TO MERCURY-CONTAINING EQUIPMENT, BATTERIES, SELF-LUMINESCENT EXIT SIGNS, FIRE EXTINGUISHERS AND BULK CLEANERS, PAINTS ETC. THAT WILL BE DISTURBED/REMOVED DURING DEMOLITION OR RENOVATION.

THE A/E MUST CONTACT OSEH EARLY IN THE DESIGN PHASE FOR A SURVEY OF REGULATED BUILDING WASTE TO BE DISTURBED/REMOVED.

1.1 SUMMARY

- A. This Section specifies requirements for the removal, staging and disposal of Regulated Waste, including but not limited to the following:

ALWAYS INCLUDE THE FOLLOWING PARAGRAPHS.

1. Mercury-containing articles and equipment, including but not limited to controls, thermometers, thermostats, switches, manometers and gauges.
2. Batteries, including but not limited to lead-, nickel- and or mercury-containing batteries from exit signs, smoke detectors and backup power sources.
3. Smoke detectors.
4. Self-luminescent exit signs.
5. Containers of paint and paint related materials, cleaners, pesticides, compressed gas cylinders and above ground and below ground fuel tanks and portable fuel cans.
6. Fire extinguishers.
7. Electronic Waste, including but not limited to TVs, computers, monitors, printers and any other electronics containing a circuit board.
8. Hazardous or Liquid Industrial Waste.

- B. Extent of regulated building waste is as follows:

SELECT FROM OPTIONS BELOW

1. As identified in the survey.
2. As identified by the Contractor during demolition or construction.

1.2 RELATED SECTIONS

DELETE PARAGRAPHS BELOW WHICH DO NOT APPLY TO THE PROJECT.

- A. Asbestos abatement is covered in Division 02 Sections "Asbestos Remediation"; "Asbestos Remediation - Floor Tile and Mastic"; and "Asbestos Remediation - Roofing Material".

- B. Removal of lead products is covered in Division 02 Sections "Lead Remediation" and "Lead Remediation - Renovation, Repair and Painting in Child Care Facilities and Target Housing".
- C. PCB disposal is covered in Division 02 Section "PCB Remediation".
- D. Selective demolition is covered in Division 02 Section "Selective Demolition".
- E. Refrigerant handling and disposal is covered in Division 01 Section "Work Restrictions".
- F. Lamp and ballast recycling is covered in Division 26 Section "Basic Electrical Requirements".

1.3 DEFINITIONS

- A. The term "Construction and Demolition Debris" refers to Non-Hazardous Waste generated during construction, renovation and demolition projects.
- B. The term "Regulated Waste" refers to building equipment or materials that will be demolished as part of a renovation or construction project, but cannot be disposed of as typical Construction and Demolition Debris
- C. The term "EHS-HMM" refers to Owner's Environment, Health and Safety Department-Hazardous Materials Management program, 1239 Kipke Drive, Ann Arbor, MI 48109-1010, phone (734) 763-4568.
- D. The term "Project Site" indicates the limits of the project site as indicated on drawings or by provisions of this specification.

1.4 QUALITY ASSURANCE

- A. Contractor personnel must be thoroughly familiar with the following information:
 - 1. Proper methods for removal and staging of regulated waste. See PART 3, 3.2, A-E of this Section for requirements.
 - 2. Proper response in case of an emergency spill or leak. See PART 3, 3.2, F of this Section for requirements.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 NOTIFICATION

- A. Contact EHS immediately if fuel tanks or laboratory chemicals are discovered. EHS-HMM program personnel will arrange for proper removal and disposal of these materials.

3.2 REMOVAL AND STAGING OF WASTE

- A. Regulated Waste must be removed and staged in an intact state in an area easily accessible by EHS-HMM program personnel (loading dock).

- B. Do not disassemble exit signs. Stage whole exit sign for pickup by EHS-HMM.
- C. Store waste containers and other staged waste in a secure area (preferably a locked room) at the project site. Labels shall remain visible and shall be legible. Waste containers shall be inspected daily for leaks, closure, labeling and container integrity. Set containers securely on a hard surface which is accessible to EHS drum carts. Do not stage containers on lawns, dirt piles, gravel drives, areas with mud or basement areas with no elevator access.
- D. Place mercury-containing articles and equipment **ONLY** in EHS provided containers. Remaining waste types do not need to be containerized, but must be staged in a neat and orderly fashion and grouped by waste type (i.e. all batteries staged together, all paint staged together, etc.) Obtain empty containers from the EHS North Campus Transfer Facility, 1655 Dean Road. Contact the EHS-HMM program at 734-763-4568 at least three working days in advance to request pick-up of pails and/or drums.
- E. Do not mix Regulated Waste with trash, and construction debris. Contractor shall be responsible for costs incurred by the Owner for disposing of foreign items mixed with Regulated Waste. **DO NOT DISPOSE OF ANY REGULATED WASTE IN THE REGULAR SOLID WASTE. DO NOT DISPOSE OF ANY LIQUIDS IN THE REGULAR SOLID WASTE.**
- F. Handle mercury-containing articles and equipment with extreme care to prevent the release of elemental mercury. Mercury-containing articles and equipment shall be cushioned to prevent breakage. Leave enough space at the top of each container for the installation of lids. Ensure that the lid is secured tightly. Use duct tape or another strong tape if necessary to secure the lid.
- G. If elemental mercury is accidentally spilled due to the breakage of a mercury-containing article or equipment, immediately evacuate the area to limit exposure and contact the EHS-HMM program at 734-763-4568 (M-F, 8AM-5PM) or after hours the University of Michigan Department of Public Safety (DPS) 734-763-1131. DPS will notify UM EHS On-Call staff to respond to the scene and clean up the mercury.
 - 1. Without walking through the spill area, close off the area and restrict access to the spill site by locking doors to the room or taping off the area. Avoid tracking the material to other areas of the site.
 - 2. Remain at the project site until EHS or DPS personnel arrive at the scene.

3.3 DISPOSAL OF WASTE

- A. Disposal of regulated construction waste shall be done in coordination with EHS.
 - 1. Contact EHS at least one week in advance to request pick-up of the containers.
 - 2. EHS will package, pickup and dispose of properly staged Regulated Waste at no cost to the contractor. Call the EHS-HMM program at 734-763-4568 to schedule a pickup immediately after regulated waste has been staged.

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 028213 - ASBESTOS REMEDIATION

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS
SECTION 028213 - ASBESTOS REMEDIATION

PART 1 - GENERAL

1.1 SUMMARY

BEFORE EDITING THIS SECTION DETERMINE WHETHER ASBESTOS ABATEMENT WORK WILL BE DONE AS PART OF THE GENERAL CONTRACT, WILL BE BID OUT SEPARATELY DIRECTLY TO ABATEMENT CONTRACTORS OR WILL BE PERFORMED BY THE OWNER. IF ABATEMENT WORK IS NOT PART OF THE GENERAL CONTRACTOR'S WORK, DO NOT INCLUDE THIS SECTION.

- A. This Section includes removal and disposal of asbestos-containing materials by full enclosure, glove bag, or entire structures methods as applicable. Demolition and debris removal of all asbestos-containing materials identified by provisions of this Section, or shown on drawings, or identified at the site, shall be executed under the provisions of this Section, and other applicable sections of these specifications.
- B. Extent of asbestos removal work is as follows:

EDIT THE FOLLOWING TO SUIT PROJECT

- 1. Indicated on drawings.
- 2. Surveyed and listed in "Schedule of Items Containing Asbestos" Article in Part 3 of this Section.

SELECT ABOVE OR BELOW FOR SURVEYED AND SCHEDULED EXTENT

- 3. Surveyed and listed in "Schedule of Items Containing Asbestos" Article in Part 3 of this Section, as specified in related sections, and as indicated on the drawings. Proceed with Work of this Section simultaneously, and in coordination with, remaining Work of the Project.
- 4. Marked at the site during the pre-bid inspection "walk through".
- 5. Limited to that required to connect new plumbing work to existing piping.

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

1.2 RELATED SECTIONS

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

- A. Unit price items are scheduled with related units of measure in Division 01 Section "Unit Prices."

INCLUDE THE FOLLOWING IF ABATEMENT WORK IS AN ALTERNATE

- B. Work of this Section that is affected by alternates is described in Division 01 Section "Alternates."
- C. Demolition and removal of items not containing asbestos as a component is included in Division 02 Section "Selective Demolition."
- D. Pipe re-insulation is included in Division 23 Section "Mechanical Insulation."

1.3 DEFINITIONS

- A. Asbestos Abatement Firm: Firm engaged to perform actual removal and disposal work, either as Contractor or subcontractor.
- B. Asbestos Containing Material: The term "asbestos containing material" is abbreviated ACM.
- C. Owner's Consultant: Firm engaged by Owner to identify and measure asbestos containing materials, or to inspect demolition operations, including monitoring of air quality.
- D. EHS: Owner's Environment, Health & Safety Department, 1239 Kipke Drive, Ann Arbor, MI 48109-1010; phone (734) 647-1143.

1.4 SUBMITTALS

- A. Initial Submittals: Submit the following documents to Owner's Representative at the pre-abatement meeting:
 - 1. License from the State of Michigan in accordance with Act 135 P.A. 1986 (Asbestos Abatement Contractors Licensing Act).
 - 2. Copy of notification sent to appropriate federal, state, and local agencies.
 - 3. Schedule of removal, specifying work locations, length and number of shifts, foreman's name, and crew size.
 - 4. Disposal Site Certification: Letter, signed by the Contractor, certifying that an approved asbestos-accepting type II landfill will be used for disposal. Include the facility name, address, and phone number.
- B. Waste Disposition Submittals: Submit to ESH signed waste shipment record stating that asbestos waste has been properly disposed. Submit the following:
 - 1. Receipts (trip tickets) from approved landfill.
 - 2. Asbestos Waste Shipment Record: As follows:
 - a. Prior to removing asbestos-containing material from the project site, provide Owner's Representative or Owner's consultant with a completed waste shipment record fully complying with Section 61.150 of the NESHAP standard, and 49 CFR Part 172.200 of the U.S. Department of Transportation, and including all required information.
 - b. Ensure that the landfill operator provides a signed copy of the waste shipment record to EHS within 35 days of the date that asbestos-containing material is removed from the project site. If waste is not transported directly from the project site to the landfill, the waste shipment record shall reflect each transfer.
 - c. The Owner will not make final payment prior to receipt of signed waste shipment record.
- C. Contract Closeout Submittals: Comply with the following additional requirements of Division 01 Section "Closeout Procedures":
 - 1. Asbestos Quantity Removal Report: Submit 3 copies of asbestos quantity removal report to Owner's Representative at least 4 weeks prior to Contractor's application for final payment. Include information in the following format:
 - a. Quantities of Asbestos Removed:

- 1) Asbestos insulation removed from _____ft. of _____ inch diameter pipes.
 - 2) _____ square feet of asbestos insulation removed from ducts, chiller surfaces, equipment, etc.
 - 3) _____ square feet of asbestos-containing debris removed from project area.
 - 4) _____ square feet of asbestos-containing floor covering.
2. Statement of Visual Inspection: Prior to application for final payment, submit to EHS a statement of visual inspection signed by the Contractor's competent person/supervisor. Include the following:
- a. Name of licensed contractor conducting work.
 - b. Name, signature, and title of on-site supervisor.
 - c. Name, location, and start and finish date of abatement work.
 - d. Current date.
 - e. Statement that the work was completed according to applicable federal, state, and local laws, and these specifications.
 - f. Statement that the Asbestos Abatement Firm's field supervisor has visually inspected the work site and has found no dust, debris, or other suspect asbestos-containing materials that were part of the scope of work.

1.5 QUALITY ASSURANCE

- A. Pre-Qualified Asbestos Abatement Firms: Engage one of the following pre-qualified firms to perform abatement of asbestos containing materials:
1. 21st Century Salvage, Inc.
 2. Adamo Demolition Company
 3. Advanced Industrial Services, LLC
 4. Asbestos Abatement, Inc.
 5. Bierlein Companies, Inc.
 6. Certified Abatement Services, Inc.
 7. Detroit Dismantling Corporation
 8. Environmental Assurance Company, Inc.
 9. Environmental Maintenance Engineers
 10. Environmental Specialty Services, Inc.
 11. Global Green Service Group
 12. Great Lakes Environmental Service, Inc.
 13. Homrich
 14. Michigan Mechanical Abatement, Inc.
 15. MIS Corporation-Michigan
 16. National Environmental Group, LLC
 17. Next Generation Environmental, Inc.
 18. North American Dismantling Corp.
 19. Pro-Tech Environmental & Construction, Inc.
 20. Professional Thermal Systems, Inc.
 21. Qualified Abatement Services, Inc.
 22. Quality Environmental Services, Inc.
 23. Rand Environmental Services
 24. Trust Thermal Abatement, Inc.
- B. Regulatory Requirements: Make all necessary notifications to the appropriate federal, state, and local agencies.

1. The National Emission Standards for Hazardous Air Pollutants (NESHAP), Asbestos regulation 40 CFR 61, Sub-Part M requires that if at least 80 lin. meters (260 lin. ft.) of friable asbestos materials, at least 15 sq. meters (160 square feet), or 1 cu. meter (35 cu. ft.) of friable asbestos materials, or other facility components are stripped or removed while renovating a facility, all the requirements of section 61.147 apply.
 2. When applicable, notify the Michigan Department of Environmental Quality (MDEQ), the Michigan Department of Licensing and Regulatory Affairs (MDLARA), and appropriate state and local regulatory agencies. No work shall be conducted without notification of authorities having jurisdiction.
- C. Pre-Abatement Meeting: Approximately 2 weeks prior to scheduled start of the abatement project, the Owner's Representative will hold a pre-abatement meeting with the individuals indicated below:
1. Contractor' representative.
 2. Asbestos Abatement Firm's representative.
 3. EHS representative.
 4. Owner's consultant.
 5. Owner's Representative.
 6. Owner's building maintenance personnel.
- D. The meeting agenda will include:
1. Review of the scope of work.
 2. Removal methods to be used.
 3. Review of Contractor's initial submittals.
 4. A walk-through survey of the site, if appropriate.
- E. For small projects, the meeting may be suspended at the discretion of the Owner's Representative. If the meeting is suspended, deliver required initial submittals to the Owner's Representative's office 2 weeks prior to the start of work.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 ASBESTOS ABATEMENT, GENERAL

- A. Conduct asbestos abatement operations in a manner that fully protects Contractor's and subcontractor's employees, the general public, and building occupants from exposure to asbestos and other safety and health hazards.
1. Asbestos abatement projects shall be directly supervised by a competent person as described in 29 CFR 1926.1101.
 2. The supervisor/competent person must complete responsibility checklists throughout all phases of the project.
- B. Protect adjacent areas, materials and surfaces from damage due to demolition operations, including but not necessarily limited to the following:
1. Water damage.

2. Dirt, dust and debris.
 3. Abrasion.
 4. Cuts and scratches.
 5. Holes from fasteners for temporary barriers.
- C. All asbestos work shall be conducted within a regulated area that complies with the following requirements:
1. Post a sufficient number of signs required by 29 CFR 1926.1101 at the asbestos abatement area and at every work area entrance, so that tenants, Owner's personnel, and other contractor's employees have an opportunity to take protective measures before exposing themselves to asbestos. Place banners if necessary to secure open areas. Include information on signs indicating location and quantity of asbestos-containing material.
 2. Allow only authorized, properly protected personnel to enter the regulated area. Immediately report unauthorized individuals entering the work area to EHS or the Owner's consultant.
- D. When required, provide employees and inspectors authorized to enter the regulated area with protective work clothing consisting of disposable Dupont "Tyvek" (or equivalent) full body coveralls, head covers, boots, and other necessary safety gear, including a hard hat and eye protection.
- E. Provide respiratory protection to employees as required by current OSHA regulations including 29CFR 1910.134 and 1926.1101.
1. Provide asbestos abatement workers with powered air purifying respirators (PAPR) with full facepiece and HEPA filters for adequate protection during asbestos material removal operations. Respiratory protection may be down-graded if negative exposure assessment indicates that less protection is required.
 2. A half-face respirator or PAPR must be worn while tearing down and setting up enclosures, while glovebagging, and during pre-cleaning and post-cleaning work.
 3. Do not allow respirators to be pulled away from faces while in the work area.
 4. Maintain an extra PAPR unit on site at all times for the duration of the abatement project.
 5. Provide full facepiece supplied-air respirators operated in pressure demand mode equipped with air auxiliary and pressure self-contained breathing apparatus or HEPA egress filters if required for measured fiber concentrations.
- F. Maintain at each job site and post the following documents:
1. Copy of MDEQ/MDLARA notification.
 2. Employee respiratory protection program.
 3. Michigan Right-To-Know poster.
 4. Material Safety Data Sheet locator.
 5. Company standard operating procedure.
 6. This specification Section.
 7. Material Safety Data Sheets for products used on job.
 8. CFR 1926.1101.
 9. CFR, Part 61 (NESHAP).

10. The foreman's or supervisor's Contractor/Supervisor Accreditation Certificate.
 11. State of Michigan Accreditation Certificates and Medical Approval for each worker.
- G. Use the following engineering controls and work practices for all asbestos abatement operations, regardless of measured exposure levels:
1. Vacuum cleaners equipped with HEPA filters to collect all asbestos-containing dust and debris.
 2. Wet methods to control exposures during asbestos removal and clean-up, except where proven to be infeasible.
 3. Prompt clean-up and disposal of asbestos-contaminated wastes and debris in leak-proof containers.
 4. Establish a decontamination area, adjacent and connected to the regulated area, if the Project requires the removal of more than 25 lin. ft., or 10 sq. ft. of thermal systems insulation or surfacing ACM.
 5. Establish an equipment area adjacent to the regulated area if the Project requires the removal of less than 25 lin. ft. or 10 sq. ft. of thermal systems insulation or surfacing ACM.
- H. Do not use any of the following equipment or work practices during asbestos abatement operations, regardless of measured exposure levels:
1. High-speed abrasive disc saws not equipped with point-of-cut HEPA ventilation or HEPA filtered exhaust air enclosures.
 2. Blowing with compressed air to remove asbestos-containing materials.
 3. Dry sweeping, shoveling, or other dry methods to clean up asbestos-containing dust and debris.
 4. Employee rotation as a means of reducing employee exposure to asbestos.

ALWAYS RETAIN FULL ARTICLE BELOW

3.2 ASBESTOS REMOVAL BY FULL ENCLOSURE METHOD

- A. Preparation of the Work Area: Complete the following preparation work prior to beginning asbestos removal operations:
1. Install critical barriers over each opening into the regulated area. The following requirements are in addition to, not in lieu of, other indicated surface and object protection requirements:
 - a. Seal each opening between the work area and adjacent areas with not less than 2 layers of 4-mil polyethylene sheeting. Use an expanding-polyurethane foam gun to seal areas with large numbers of pipes, conduits and beams. Openings include, but are not necessarily limited to, windows, skylights, doorways, elevator hoistway openings, corridor entrances, drains, ducts, grills, grates, and diffusers.
 - b. Seal intake and exhaust vents and duct seams within the regulated area with not less than 2 layers of 6-mil polyethylene sheeting.

2. HVAC System Shutdown: Owner's maintenance personnel will shut down heating, cooling, and air conditioning systems when necessary. Coordinate scheduling with Owner's personnel and provide 72 hours notice to the Owner's Representative prior to planned shut-down.
3. Protection of Surfaces and Objects: The following requirements are in addition to, not in lieu of, indicated work area sealing requirements. Cover the following surfaces and objects as follows:
 - a. Protect all surfaces beneath all removal activity. Remove moveable objects from the work area, and cover fixed objects with impermeable dropcloths or plastic sheeting with edges securely sealed with tape.
 - b. Cover open tanks with plywood or other solid material.
 - c. Provide clean, fresh air to mechanical equipment, where required to maintain proper performance of equipment.
 - d. Fully pre-clean all covered surfaces with amended water and a HEPA vacuum.
 - e. Cover walls with not less than 2 layers of 4-mil polyethylene sheeting. Construct free-standing enclosure walls of not less than 6-mil polyethylene sheeting, with supports spaced not more than 3 feet o.c.
 - f. Cover floors with not less than 2 layers of 6-mil polyethylene sheeting. Avoid seams where possible. If seams are necessary, overlap not less than 12 inches and tape joints. Extend sheeting 12 inches up the side walls leaving no seams at the wall and floor joint. Immediately repair punctures and leaks, and clean up seepage.
4. Cleaning: Do not use cleaning methods that raise dust, such as sweeping or using vacuum cleaners not equipped with HEPA filters. Do not disturb asbestos materials during pre-cleaning phases.
 - a. Treat water removed from the enclosure as asbestos contaminated waste. Fully seal floor drains.
5. Deactivate or install ground-fault circuit interrupters on each electrical circuit within the enclosure.
6. Construct a three-chambered decontamination facility that is adjacent to and connected to the regulated area, and that consists of a dirty room, a shower room, and a clean room in series. Construct decontamination facilities that are exposed to weather of lumber and exterior grade plywood. Secure the facility when not in use.
 - 1) Supply the equipment room with properly labeled, impermeable bags and containers for the containment and disposal of contaminated protective equipment.
 - 2) Construct showers that comply with the requirements of 29 CFR 1910.141 (d) (3), with the shower room adjacent to both the equipment room and the clean room. Filter water waste and shower water through a 5 micron filter, or remove water from site as asbestos waste.
 - 3) Equip the clean room with a locker or appropriate storage container for each employee.
7. Employee Decontamination Facilities: Comply with the following requirements:

- a. Access the work area only through an approved decontamination system. Lock or block other entrances. Seal emergency exits (for use during a fire or accident) with polyethylene sheeting and tape.
 - b. Seal the waste pass-out, except during the removal of asbestos waste from the enclosure.
 - c. Entrance To The Regulated Area: Employees shall enter the decontamination area through the clean room, remove and store clothing, and put on protective clothing and respiratory protection before passing through to the equipment room.
 - d. Exit From The Regulated Area: Employees shall exit the regulated area by removing gross contamination and debris from their protective clothing. The clothing shall be removed and disposed of in the equipment room into labeled impermeable bags or containers. Employees shall then shower and enter the clean room before changing into street clothes.
8. Local Exhaust Ventilation: Maintain portable air filtration units with a HEPA filter in use during asbestos abatement operations requiring enclosures. Units shall conform to OSHA Standard 1926.1101, Appendix F, and shall be designed in accordance with 40 CFR 61, Subpart M, Section 61.153.
- a. Exhaust directly to building exterior. Provide a backup portable air filtration unit at each removal enclosure. Startup ventilation units prior to initiating asbestos removal operations and run until the Owner's consultant has approved their shut-down after cleaning, sampling, visual inspection, and tear-down.
 - b. Direct air movement within the enclosure away from the employees' work area and toward the air filtration device.
 - c. Provide not less than 4 air changes per hour within the enclosure.
 - d. Within the enclosure, through the period of its use, maintain a pressure differential of not less than minus 0.02 water gage with respect to ambient conditions outside the enclosure.
9. Visually inspect the enclosure for breeches and smoke-test for leaks before work begins, and before the start of each work shift. Make all modifications to the enclosure prior to starting removal work.
- B. Asbestos Removal Operations: Comply with the following requirements for asbestos removal operations:
- 1. Immediately preceding asbestos removal, apply a fine mist of amended water (water and wetting agent) to the asbestos materials and the surrounding area. Keep surrounding areas wet by spraying periodically with amended water. Maintain a high humidity environment to assist in fiber settling.
 - 2. Remove asbestos material using two-person teams, on staging platforms, if necessary.
 - 3. Remove the wet asbestos material as intact sections or components. Carefully lower the material to the floor or place directly into container. Never drop or throw asbestos material on the floor.

4. At working heights between 15 and 50 feet above the floor, place removed asbestos materials in containers at the elevated levels and lower to floor, or place onto inclined chutes or scaffolding for subsequent collection and placement into containers. Clean all debris at the completion of each workday.
5. Once the asbestos material is at ground level, pack in labeled 6-mil polyethylene bags, wet and, if appropriate, hold in drums prior to starting the next section.
6. Use 2 sealed and labeled 6-mil thick bags for storage and transportation of asbestos waste. Standing water shall be in each bag
7. Wrap large components removed intact in two layers of 6-mil polyethylene sheeting, label, and secure with tape for transport to the landfill. Comply with all wetting requirements.
8. Treat wires, hangers, steel bands, nails, screws, metal lath, tin sheeting, and similar sharp objects removed with asbestos material as asbestos waste. Place in drums for disposal.
9. Label containerized asbestos waste in accordance with OSHA, EPA, and Department of Transportation regulations, as follows:
 - a. Label each container with OSHA label that contains the following information:

**DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST**

- b. Label each container with Owner's and Asbestos Abatement Firm's names and addresses as required by NESHAP. Owner's address is EHS, 1239 Kipke Drive, Ann Arbor, MI 48109-1010.
 - c. Label each container with Class 9 Label required by DOT and identify waste as "RQ, Asbestos NA 2212."
 10. Prepare a complete and accurate NESHAP Waste Shipment Record (special manifest). Assure all information required by the U.S. Department of Transportation regulation is included. Under "special handling instructions" provide the required DOT identification information: RQ Asbestos 9,NA 2212, PG III.
 - a. Do not remove waste from site until Owner's Representative has signed and verified the shipment record.
 11. Remove containerized asbestos waste daily from site, or store on site in a locked or secured location until ready for final disposal. Obtain approval of Owner's Representative and EHS representative of the location of disposal containers. Outdoor waste containers shall be fully enclosed and locked. Mark vehicles used to transport waste during the loading and unloading of asbestos waste with a visible sign, as required by NESHAP.
 12. Each container shall have excess water evident, or the asbestos waste shall be mixed in a slurry.
- C. Post-Removal Operation Requirements: After completion of asbestos removal and clean-up operations, comply with the following requirements:

1. The Asbestos Abatement Firm representative, in presence of Owner's consultant, shall inspect the entire work area for asbestos. Include decontamination unit, all plastic sheeting, seals over doorways, windows, and all other openings.
 - a. If any suspect asbestos is found, repeat final cleaning operation, until the visual inspection is satisfactory to the Owner's consultant and the asbestos removal firm. Asbestos not scheduled to be removed as part of the project is exempt.
2. Encapsulate all walls, floors, ceilings, other exposed surfaces, and decontamination facilities after completing the work area inspection.
 - a. Remove the inner polyethylene barrier that is not integral to maintaining negative pressure in the enclosure at this time, and post-abatement air samples will be collected by Owner's consultant. Immediately clean any asbestos-containing materials observed behind these secondary barriers.
3. When post-abatement fiber levels are greater than either 0.01 fiber/cc or background level, repeat cleanup operation until the area is below either 0.01 fibers/cc or background level.
4. When the post-abatement samples are in compliance, and the Owner's consultant or EHS has completed the visual inspection, the enclosure shall be removed.
 - a. Turn off HEPA filter exhaust units only after all barriers have been removed.
 - b. A final visual inspection will be conducted by the Owner's consultant or EHS representative before the Contractor is released from the removal site. The final inspection will include tape, polyethylene sheet, debris, and equipment.

DELETE BELOW IF NO GLOVE BAG REMOVAL TECHNIQUES ARE APPLICABLE

3.3 REMOVAL BY NEGATIVE PRESSURE GLOVE BAG SYSTEMS

- A. Equipment and Materials: Use the following equipment and materials for each glovebag procedure:
 1. Glovebags fabricated of 6-mil thick plastic without seams at the bottom.
 2. HEPA vacuum system attached to the glovebag and run continuously during operation.
 3. Protective suits and respirators.
 4. Plastic sheeting.
 5. Wetting agent.
 6. Encapsulant.
- B. Procedures: Comply with the following glovebag method requirements:
 1. Wrap loose and friable material adjacent to the removal area in 2 layers of 6-mil thick plastic, or otherwise render intact.
 2. Place plastic sheeting on the floor and equipment beneath each glovebag.
 3. Wet-wipe or HEPA vacuum dust and dirt from insulation to be removed.
 4. Install glovebags to completely cover the circumference of pipe or other structure where work is to be done.
 5. Smoke-test glovebags for leaks. Seal leaks prior to use.

6. Insert and seal equipment that penetrates the bag (spray wands, vacuum nozzles) before insulation is disturbed.
7. Wet the insulation to be removed before, during, and after the removal.
8. Provide only bags capable of withstanding constant wetting and evacuation through a HEPA filtered device.
9. During the performance of glovebag operations removing thermal systems, insulation, or surfacing materials, employ not less than 2 persons, working simultaneously, for each task.
10. Wipe insulation residue from the pipe prior to application of an encapsulant.
11. Spray the pipe and glovebag with an encapsulant before the bag is removed from the pipe.
12. Seal exposed insulation ends with a heavy grade mastic.
13. Follow glovebag manufacturer's instructions.
14. Comply with requirements for asbestos waste disposal indicated in "Removal by Full Enclosure Method" of this Section.

C. Unacceptable Conditions and Procedures and Conditions: In general, do not use the glovebag method in conditions that prevent safe completion of the removal process. The following procedures are not allowed during glovebag removal:

1. Removing severely damaged insulation.
2. Overloading glovebag.
3. Sliding or moving insulation or glovebag along pipe.
4. Squeezing bags to remove air.
5. Placing glovebags on pipes or other surfaces that exceed 150 deg. F.
6. Using a glovebag more than once.

DELETE BELOW IF NO ENTIRE STRUCTURES REMOVAL METHODS ARE APPLICABLE

3.4 REMOVAL BY ENTIRE STRUCTURES METHOD

A. The removal of entire structures without disturbing the asbestos is encouraged. An example is removal of asbestos covered pipe fittings by cutting out the entire pipe section scheduled for demolition.

1. Obtain Owner's Representative's approval of removal by entire structures method prior to starting the project.

B. Required Procedures: Comply with the following requirements applicable to removal of entire structures:

1. Properly wet all asbestos materials before starting procedure. Ensure that material stays adequately wet throughout the entire procedure by continuing application of water as needed.
2. Properly and fully wrap and label the structure before it is moved or cut out.
3. Provide the equipment necessary for asbestos debris cleaning on site during the procedure.
4. Comply with requirements for asbestos waste disposal indicated in "Removal by Enclosure Full Method" Article of this Section.

3.5 FIELD QUALITY CONTROL

- A. Pre-Notification of EHS Representative: To permit adequate time to schedule air monitoring, notify the EHS representative not less than 10 calendar days prior to planned start of all removal operations.

DELETE PARAGRAPH B. AND SUBPARAGRAPHS 1. AND 2. BELOW IF ONLY ROOFING REMOVAL IS INCLUDED.

IF BOTH ROOFING AND OTHER CATEGORIES OF REMOVAL WORK ARE INCLUDED IN PROJECT, INCLUDE HIDDEN TEXT IN PARAGRAPHS BELOW

- B. Air Monitoring: Except for roofing removal work Owner will retain a professional independent industrial hygiene consultant to collect air samples and oversee the project to insure that compliance with applicable codes, regulations, and ordinances, including 29 CFR 1926.1101, NESHAP, and P.A. 135. The consultant will collect background, contiguous, work area, personal, and post-abatement air samples. EHS will provide one copy of the report to the Contractor.
 - 1. If contiguous sampling indicates airborne fiber concentrations above 0.01 fibers/cc or background level, work will be stopped unless otherwise approved by EHS. Work may resume when the source of contamination has been corrected and the contamination has been cleaned to the satisfaction of the EHS.
 - 2. Glovebag, entire structures, and full enclosure clearance sampling will be by the aggressive PCM method when feasible. Enclosures must be fully dry before sampling.
 - 3. Roofing removal Contractors may provide their own air monitoring in compliance with roofing removal requirements of this Section.
- C. Inspection: If during the project, EHS representative or Owner's consultant determines that work practices either violate applicable rules and regulations or endanger employees, the Contractor's on-site representative shall stop operations immediately and take corrective action. Cooperate fully with EHS representative and Owner's consultant.

RETAIN BELOW FOR REMOVAL OF FLOOR TILE, FLOORING ADHESIVE, TRANSITE TOPS AND PANELS, OR ROOFING MATERIALS

3.6 REMOVAL OF NON-FRIABLE ASBESTOS-CONTAINING MATERIALS

ALWAYS RETAIN PARAGRAPHS BELOW IF "NON-FRIABLE" ARTICLE IS RETAINED

- A. Removal of Non-Friable Materials, General: For each type of non-friable asbestos-containing material indicated, comply with the following requirements:
 - 1. Comply with requirements of Article 3.1 of this Section.
 - 2. Conduct non-friable material removal operations to prevent the material from becoming friable during the removal and disposal process. No visible emissions are permitted. If the material does not remain substantially intact, comply with the requirements for friable asbestos removal specified in Articles 3.2 of this Section (except roofing removal).

3. Place impermeable dropcloths on surfaces beneath removal activity.
4. Do not conduct asbestos removal unless the Owner's Consultant is present at the site and EHS has been notified. For roofing removal projects, notify EHS prior to start of work.
5. Labeling Containerized Waste: Comply with the requirements of Article 3.2, paragraphs B.9.a. through c. of this Section.

RETAIN BELOW IF VINYL-ASBESTOS TILE REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

B. Removal of Resilient Flooring Materials:

1. Prior to removal, critical barriers shall be placed over openings to the regulated area. During removal, air in the regulated area shall be filtered through the use of air filtration device(s).
2. Removal of floor tile with an infrared heat machine eliminates the critical barrier and negative pressure requirements.
3. Prior to removal, clean floors of dirt and debris with vacuums equipped with HEPA filter, disposable dust bag, and metal floor tool (brush tools are not permitted). Control odors and fumes with engineering controls.
4. Sanding the floor or related backing is not permitted.
5. Mechanical chipping of vinyl floor tile is prohibited, except when performed in a negative pressure enclosure.
6. Thoroughly wet vinyl floor tile with amended water. Use a slip scraper or equivalent to loosen the floor tile from the floor. Remove the floor tile in an intact state. Keep the floor tile wet throughout the removal and cleanup.
 - a. Removal of floor tile using an infrared heat machine eliminates the wetting requirement.
7. Remove vinyl sheet flooring by cutting while wetting the snip-point. Wet sheet flooring during delamination. Rip-up of resilient flooring material is not permitted.
8. Clean resilient flooring of all debris using a HEPA vacuum, wet sweeping, mopping or equivalent and allow time to dry. Dry sweeping is prohibited.
9. Place the resilient flooring material and debris in an asbestos disposal bag. Seal the bag and place it in a properly labeled drum or polypun bag. Comply with the disposal and labeling requirements of this Section.

RETAIN BELOW IF VINYL TILE ADHESIVE REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

C. Asbestos Mastic Removal:

1. Clean the floor of all debris using a HEPA vacuum, wet sweeping, mopping or equivalent.
2. Remove as much mastic as possible using an EHS approved solvent. Control odors and fumes with engineering controls.
3. Perform scraping of residual adhesive and backing using wet methods.
4. After all debris is removed, thoroughly mop the floor and allow time to dry.

5. If shot blasting is used to remove mastic, comply with requirements for friable asbestos removal specified in Article 3.2 of this Section.
6. Properly dispose of all asbestos and solvent waste according to all applicable regulations, and comply with the disposal and labeling requirements of this Section.

RETAIN BELOW IF TRANSITE BOARDS OR ASBESTOS-CONTAINING LABORATORY TOPS REMOVAL IS INCLUDED IN THE PROJECT - DELETE IF NONE

D. Asbestos-Containing Siding, Transite Panels, and Laboratory Counter Tops: Remove non-friable asbestos-containing siding, shingles, transite panels, and laboratory counter tops using the following technique:

1. Cutting, abrading, or breaking material is not permitted.
2. Wet material with amended water prior to removal.
3. Carefully disassemble material such a manner as to prevent breakage.
4. Wrap and seal material in two layers 6-mil thick polyethylene, asbestos disposal bags, or equivalent. Seal bags or packages and properly label them with appropriate asbestos warning signs as indicated in "Removal of Non-Friable Materials, General" Article of this Section.
5. Immediately lower to the ground unwrapped or unbagged materials via covered, dust-tight chute, crane, or hoist; or place in an impervious waste bag or wrap in plastic sheet and lower to the ground no later than the end of the work shift.
6. Clean the floor of all debris using a HEPA vacuum, wet sweeping, mopping or equivalent and allow time to dry.
7. Dispose of asbestos waste in accordance requirements of this Section.

RETAIN BELOW IF ROOFING REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

E. Non-Friable Asbestos-Containing Roofing Materials: Non-friable asbestos-containing roofing materials may be removed in a non-friable state. This specification does not apply to removal of intact cements, coatings, or mastics. Obtain EHS review and approval of planned removal operations prior to beginning. Remove non-friable asbestos-containing roofing materials in using the following technique:

1. Each employee who is likely to disturb or handle asbestos material shall have completed an 8-hour training class, and the project shall be supervised by a competent person who has completed the appropriate contractor/supervisor course.
2. Isolate roof level heating and ventilation air intake sources within the regulated area and others that will be affected; or arrange for shut-down the affected ventilation system during removal operations. Acceptable isolation techniques include the following:
 - a. Use 20-foot or larger buffer zones.
 - b. Installation of HEPA filters over the air intakes.

- c. Erection of horizontal or vertical extensions that relocate the opening of the intake outside or above the regulated area.
 - d. Covering the intake with plastic sheeting or other appropriate barrier.
3. Personal protective equipment (PPE), including disposable coveralls and NIOSH approved appropriate high efficiency particulate absolute (HEPA) respirators, shall be worn by personnel if the asbestos containing material is not removed in an intact state.
4. Remove roofing material in an intact state.
5. Use wet methods to remove materials that are not intact, or that are rendered not intact during removal, except where wet methods will create a safety hazard or are otherwise not feasible.
6. Continuously apply a water mist to the blade of power cutting tools, unless a competent person determines that misting will substantially decrease worker safety.
7. When removing roofing felts, collect the dust generated by power roof cutters with a HEPA-filtered dust collector; or immediately vacuum using a HEPA-filtered vacuum along the cut line. For smooth surfaces only, gently sweep wet dust generated from cutting operations, and carefully and completely wipe up the still-wet dust and debris.
8. For removal and repair operations of intact roofing less than 25 sq. ft. in area, the use of wet methods or HEPA vacuuming is not required, provided manual methods do not render the material non-intact and no visible dust is created.
9. Do not drop or throw to the ground asbestos-containing roofing material that has been removed. As soon as practicable, but not later than the end of the work shift, lower debris to ground either by passing or carrying by hand, or by lowering to the ground in a covered, dust-tight chute, crane or hoist.
 - a. While on the roof, keep non-intact asbestos-containing materials wet; or seal in impermeable waste bags, or wrap in plastic sheeting.
 - b. While on the roof, intact asbestos-containing material is not required to be kept wet, bagged, or wrapped.
10. Upon being lowered to the ground, transfer unwrapped material to a closed receptacle in manner that precludes the dispersion of dust. Dispose of the material in an asbestos-accepting Type II landfill. Notify the landfill that the roofing material contains asbestos and provide waste shipment records to EHS within 35 days.
11. For removal of intact pipeline asphaltic wrap or roof flashings that contain asbestos, engage a competent person to examine the material and determine whether the material is intact and likely to remain intact during removal. Remove the material using manual methods. Sanding, grinding, or other abrading operations are not permitted. Do not throw or drop materials to the ground. Lower the material in a covered, dust-tight chute, crane, or hoist. Remove debris from the roof at the end of the work shift.

RETAIN BELOW IF EXTERIOR MISCELLANEOUS (NON ROOFING) REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

- F. Non-Friable Asbestos Containing Exterior Sealant, Caulk, Putty and Window Glazing: Remove exterior non-friable asbestos-containing sealants, caulk, putty and window glazing using the following technique:
1. Any existing loose material shall be HEPA vacuumed prior to removal.
 2. The material shall be thoroughly wetted prior to and during its removal.
 3. The material should be removed as intact as possible. Manual methods such as scraping or raking shall be used, unless power tools are used that are equipped with HEPA ventilation. If power tools are used comply with Article 3.2 (Asbestos Removal by Full Enclosure Method) of this Section.
 4. Asbestos containing materials removed, shall be immediately bagged or wrapped and kept wetted until transferred to a closed receptacle.
 5. The removal of windows and other whole building components without disturbing the asbestos is encouraged. An example of this would be removing a window with asbestos containing glazing or caulk by cutting out the entire window scheduled for demolition. Comply with Article 3.4 (Removal by Entire Structures Method) of this Section when removing entire building components containing asbestos.
 6. If the material becomes friable during the abatement process, comply with the requirements for friable asbestos removal specified in Article 3.2 (Asbestos Removal by Full Enclosure Method) of this Section.
 7. Dispose of all asbestos containing materials, including those removed by the entire structures method, per the requirements of this Section.

3.7 SCHEDULE OF ITEMS CONTAINING ASBESTOS

WHERE THE FOLLOWING PARAGRAPH IS INCLUDED, BE SURE TO REFERENCE THESE BIDDING REQUIREMENTS IN THE "INSTRUCTIONS TO BIDDERS" FRONT-END DOCUMENT

- A. Bidding Requirements: Comply with the following requirements related to bidding:
1. Survey quantities provided are approximate. Bidders are required to field investigate as necessary and assume all responsibility to verify the work required and quantities involved for complete asbestos abatement.
 2. The building is open for field inspection by all bidders during the bidding period.
 3. A "pre-bid orientation meeting" will be conducted to familiarize prospective bidders with site conditions and provide for verification of marked and scheduled quantities, as applicable.

EDIT THE FOLLOWING LIST TO SUIT PROJECT

- B. The following items have been surveyed and determined to have asbestos as a component:
1. Roofing felts and base flashing.

2. Roofing underlayment.
3. Spray applied insulation.
4. Blown-in insulation.
5. Fire proofing materials.
6. Fire doors.
7. Drywall and drywall taping compounds.
8. Acoustic and decorative plaster.
9. Vinyl asbestos floor tile.
10. Composition sheet flooring.
11. Shaft wall construction.
12. Flooring adhesives.
13. Textured paints and coatings.
14. Laboratory countertops, sinks and shelves.
15. Cabinet liners and bottoms.
16. Laboratory fume hood interior.
17. Vinyl wall coverings.
18. Cement pipes.
19. Boiler insulation.
20. Piping insulation.
21. Duct insulation.
22. Flexible fabric ductwork connections.
23. Cement composition board ducts.
24. Electrical panel partitions.
25. Electrical wiring insulation and electrical cloth.
 - a. Assignment of Responsibility: Removal of wire covered with non-friable, asbestos-containing, insulation shall be performed by the electrical (sub)contractor. Electrical (sub)contractor shall accumulate wire in containers furnished by the asbestos abatement contractor. The asbestos abatement (sub)contractor shall seal and dispose of containers as asbestos waste.
26. Underground electric ductbank insulation.

SPECIFICATION DIVISION 2

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 028214 - ASBESTOS REMEDIATION - FLOOR TILE AND MASTIC

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS

SECTION 028214 - ASBESTOS REMEDIATION - FLOOR TILE AND MASTIC

USE THIS SECTION FOR PROJECTS WHERE ASBESTOS ABATEMENT IS LIMITED TO REMOVING NON-FRIABLE VINYL ASBESTOS FLOOR TILE.

PART 1 - GENERAL

1.1 SUMMARY

BEFORE EDITING THIS SECTION DETERMINE WHETHER ASBESTOS ABATEMENT WORK WILL BE DONE AS PART OF THE GENERAL CONTRACT, WILL BE BID OUT SEPARATELY DIRECTLY TO ABATEMENT CONTRACTORS OR WILL BE PERFORMED BY THE OWNER. IF ABATEMENT WORK IS NOT PART OF THE GENERAL CONTRACTOR'S WORK, DO NOT INCLUDE THIS SECTION.

- A. This Section includes removal and disposal of asbestos-containing materials by full enclosure, glove bag, or entire structures methods as applicable. Demolition and debris removal of all asbestos-containing materials identified by provisions of this Section, or shown on drawings, or identified at the site, shall be executed under the provisions of this Section, and other applicable sections of these specifications.

- B. Extent of asbestos removal work is as follows:

EDIT THE FOLLOWING TO SUIT PROJECT

- 1. Indicated on drawings.
- 2. Surveyed and listed in "Schedule of Items Containing Asbestos" Article in Part 3 of this Section.

SELECT ABOVE OR BELOW FOR SURVEYED AND SCHEDULED EXTENT

- 3. Surveyed and listed in "Schedule of Items Containing Asbestos" Article in Part 3 of this Section, as specified in related sections, and as indicated on the drawings. Proceed with Work of this Section simultaneously, and in coordination with, remaining Work of the Project.
- 4. Marked at the site during the pre-bid inspection "walk through".
- 5. Limited to that required to connect new plumbing work to existing piping.

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

1.2 RELATED SECTIONS

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

- A. Unit price items are scheduled with related units of measure in Division 01 Section "Unit Prices."

INCLUDE THE FOLLOWING IF ABATEMENT WORK IS AN ALTERNATE

- B. Work of this Section that is affected by alternates is described in Division 01 Section "Alternates."

- C. Demolition and removal of items not containing asbestos as a component is included in Division 02 Section "Selective Demolition."
- D. Pipe re-insulation is included in Division 23 Section "Mechanical Insulation."

1.3 DEFINITIONS

- A. Asbestos Abatement Firm: Firm engaged to perform actual removal and disposal work, either as Contractor or subcontractor.
- B. Asbestos Containing Material: The term "asbestos containing material" is abbreviated ACM.
- C. Owner's Consultant: Firm engaged by Owner to identify and measure asbestos containing materials, or to inspect demolition operations, including monitoring of air quality.
- D. EHS: Owner's Environment, Health and Safety Department, 1239 Kipke Drive, Ann Arbor, MI 48109-1010; phone (734) 647-1143.

1.4 SUBMITTALS

- A. Initial Submittals: Submit the following documents to Owner's Representative at the pre-abatement meeting:
 - 1. Schedule of removal, specifying work locations, length and number of shifts, foreman's name, and crew size.
 - 2. Disposal Site Certification: Letter, signed by the Contractor, certifying that an approved asbestos-accepting type II landfill will be used for disposal. Include the facility name, address, and phone number.
- B. Waste Disposition Submittals: Submit to EHS signed waste shipment record stating that asbestos waste has been properly disposed. Submit the following:
 - 1. Receipts (trip tickets) from approved landfill.
 - 2. Asbestos Waste Shipment Record: As follows:
 - a. Prior to removing asbestos-containing material from the project site, provide Owner's Representative or Owner's consultant with a completed waste shipment record fully complying with Section 61.150 of the NESHAP standard, and 49 CFR Part 172.200 of the U.S. Department of Transportation, and including all required information.
 - b. Ensure that the landfill operator provides a signed copy of the waste shipment record to EHS within 35 days of the date that asbestos-containing material is removed from the project site. If waste is not transported directly from the project site to the landfill, the waste shipment record shall reflect each transfer.
 - c. The Owner will not make final payment prior to receipt of signed waste shipment record.
- C. Contract Closeout Submittals: Comply with the following additional requirements of Division 01 Section "Closeout Procedures":
 - 1. Asbestos Quantity Removal Report: Submit 3 copies of asbestos quantity removal report to Owner's Representative at least 4 weeks prior to Contractor's application for final payment. Include information in the following format:

- a. Quantities of Asbestos Removed:
 - 1) _____ square feet of asbestos-containing floor covering and or mastic.
2. Statement of Visual Inspection: Prior to application for final payment, submit to EHS a statement of visual inspection signed by the Contractor's competent person/supervisor. Include the following:
 - a. Name of contractor conducting work.
 - b. Name, signature, and title of on-site supervisor.
 - c. Name, location, and start and finish date of abatement work.
 - d. Current date.
 - e. Statement that the work was completed according to applicable federal, state, and local laws, and these specifications.
 - f. Statement that the Asbestos Abatement Firm's field supervisor has visually inspected the work site and has found no dust, debris, or other suspect asbestos-containing materials that were part of the scope of work.

1.5 QUALITY ASSURANCE

- A. Pre-Qualified Asbestos Abatement Firms: Engage one of the following pre-qualified firms to perform abatement of asbestos containing materials. Contact EHS for approval if a contractor is not on the list (i.e. flooring contractors trained specifically to remove floor tile).
 1. 21st Century Salvage, Inc.
 2. Adamo Demolition Company
 3. Advanced Industrial Services, LLC
 4. Asbestos Abatement, Inc.
 5. Bierlein Companies, Inc.
 6. Certified Abatement Services, Inc.
 7. Detroit Dismantling Corporation
 8. Environmental Assurance Company, Inc.
 9. Environmental Maintenance Engineers
 10. Environmental Specialty Services, Inc.
 11. Global Green Service Group
 12. Great Lakes Environmental Service, Inc.
 13. Homrich
 14. Michigan Mechanical Abatement, Inc.
 15. MIS Corporation-Michigan
 16. National Environmental Group, LLC
 17. Next Generation Environmental, Inc.
 18. North American Dismantling Corp.
 19. Pro-Tech Environmental & Construction, Inc.
 20. Professional Thermal Systems, Inc.
 21. Qualified Abatement Services, Inc.
 22. Quality Environmental Services, Inc.
 23. Rand Environmental Services
 24. Trust Thermal Abatement, Inc.
- B. Pre-Abatement Meeting: Approximately 2 weeks prior to scheduled start of the abatement project, the Owner's Representative will hold a pre-abatement meeting with the individuals indicated below:
 1. Contractor's representative.

2. Asbestos Abatement Firm's representative.
 3. EHS representative.
 4. Owner's consultant.
 5. Owner's Representative.
 6. Owner's building maintenance personnel.
- C. The meeting agenda will include:
1. Review of the scope of work.
 2. Removal methods to be used.
 3. Review of Contractor's initial submittals.
 4. A walk-through survey of the site, if appropriate.
- D. For small projects, the meeting may be suspended at the discretion of the Owner's Representative. If the meeting is suspended, deliver required initial submittals to the Owner's Representative's office 2 weeks prior to the start of work.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 ASBESTOS ABATEMENT, GENERAL

- A. Conduct asbestos abatement operations in a manner that fully protects Contractor's and subcontractor's employees, the general public, and building occupants from exposure to asbestos and other safety and health hazards.
1. Asbestos abatement projects shall be directly supervised by a competent person as described in 29 CFR 1926.1101.
 2. The supervisor/competent person must complete responsibility checklists throughout all phases of the project.
- B. Protect adjacent areas, materials and surfaces from damage due to demolition operations, including but not necessarily limited to the following:
1. Water damage.
 2. Dirt, dust and debris.
 3. Abrasion.
 4. Cuts and scratches.
 5. Holes from fasteners for temporary barriers.
- C. All asbestos work shall be conducted within a regulated area that complies with the following requirements:
1. Post a sufficient number of signs required by 29 CFR 1926.1101 at the asbestos abatement area and at every work area entrance, so that tenants, Owner's personnel, and other contractor's employees have an opportunity to take protective measures before exposing themselves to asbestos. Place banners if necessary to secure open areas. Include information on signs indicating location and quantity of asbestos-containing material.

2. Allow only authorized, properly protected personnel to enter the regulated area. Immediately report unauthorized individuals entering the work area to EHS or the Owner's consultant.
- D. When required, provide employees and inspectors authorized to enter the regulated area with protective work clothing consisting of disposable Dupont "Tyvek" (or equivalent) full body coveralls, head covers, boots, and other necessary safety gear, including a hard hat and eye protection.
- E. Provide respiratory protection to employees as required by current OSHA regulations including 29CFR 1910.134 and 1926.1101.
1. Provide asbestos abatement workers with powered air purifying respirators (PAPR) with full facepiece and HEPA filters for adequate protection during asbestos material removal operations. Respiratory protection may be down-graded if negative exposure assessment indicates that less protection is required.
 2. A half-face respirator or PAPR must be worn while tearing down and setting up enclosures, and during pre-cleaning and post-cleaning work.
 3. Do not allow respirators to be pulled away from faces while in the work area.
 4. Maintain an extra PAPR unit on site at all times for the duration of the abatement project.
 5. Provide full facepiece supplied-air respirators operated in pressure demand mode equipped with air auxiliary and pressure self-contained breathing apparatus or HEPA egress filters if required for measured fiber concentrations.
- F. Maintain at each job site and post the following documents:
1. Employee respiratory protection program.
 2. Michigan Right-To-Know poster.
 3. Material Safety Data Sheet locator.
 4. Company standard operating procedure.
 5. This specification Section.
 6. Material Safety Data Sheets for products used on job.
 7. CFR 1926.1101.
 8. CFR, Part 61 (NESHAP).
 9. Training Certificates and Medical Approval for each worker.
- G. Use the following engineering controls and work practices for all asbestos abatement operations, regardless of measured exposure levels:
1. Vacuum cleaners equipped with HEPA filters to collect all asbestos-containing dust and debris.
 2. Wet methods to control exposures during asbestos removal and clean-up, except where proven to be infeasible.
 3. Prompt clean-up and disposal of asbestos-contaminated wastes and debris in leak-proof containers.
- H. Do not use any of the following equipment or work practices during asbestos abatement operations, regardless of measured exposure levels:
1. High-speed abrasive disc saws not equipped with point-of-cut HEPA ventilation or HEPA filtered exhaust air enclosures.

2. Blowing with compressed air to remove asbestos-containing materials.
3. Dry sweeping, shoveling, or other dry methods to clean up asbestos-containing dust and debris.
4. Employee rotation as a means of reducing employee exposure to asbestos.

3.2 REMOVAL OF NON-FRIABLE ASBESTOS-CONTAINING MATERIALS

A. Removal of Non-Friable Materials, General: For each type of non-friable asbestos-containing material indicated, comply with the following requirements:

1. Comply with requirements of Article 3.1 of this Section.
2. Conduct non-friable material removal operations to prevent the material from becoming friable during the removal and disposal process. No visible emissions are permitted. If the floor tile does not remain substantially intact, cease operations and contact EHS.
3. Do not conduct asbestos removal unless the Owner's Consultant is present at the site and EHS has been notified.
4. Labeling Containerized Waste: Label containerized asbestos waste in accordance with OSHA, EPA, and Department of Transportation regulations, as follows:
 - a. Label each container with OSHA label that contains the following information:

**DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST**

- b. Label each container with Owner's and Asbestos Abatement Firm's names and addresses as required by NESHAP. Owner's address is EHS, 1239 Kipke Drive, Ann Arbor, MI 48109-1010.
 - c. Label each container with Class 9 Label required by DOT and identify waste as "RQ, Asbestos NA 2212."
5. Prepare a complete and accurate NESHAP Waste Shipment Record (special manifest). Assure all information required by the U.S. Department of Transportation regulation is included. Under "special handling instructions" provide the required DOT identification information: RQ Asbestos 9,NA 2212, PG III.
 - a. Do not remove waste from site until Owner's Representative has signed and verified the shipment record.
6. Remove containerized asbestos waste daily from site, or store on site in a locked or secured location until ready for final disposal. Obtain approval of Owner's Representative and EHS representative of the location of disposal containers. Outdoor waste containers shall be fully enclosed and locked. Mark vehicles used to transport waste during the loading and unloading of asbestos waste with a visible sign, as required by NESHAP.
7. Each container shall have excess water evident, or the asbestos waste shall be mixed in a slurry.

RETAIN BELOW IF VINYL-ASBESTOS TILE REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

B. Removal of Resilient Flooring Materials:

1. Prior to removal, critical barriers shall be placed over openings to the regulated area. During removal, air in the regulated area shall be filtered through the use of air filtration device(s).
2. Removal of floor tile with an infrared heat machine eliminates the critical barrier and negative pressure requirements.
3. Prior to removal, clean floors of dirt and debris with vacuums equipped with HEPA filter, disposable dust bag, and metal floor tool (brush tools are not permitted). Control odors and fumes with engineering controls.
4. Sanding the floor or related backing is not permitted.
5. Mechanical chipping of vinyl floor tile is prohibited, except when performed in a negative pressure enclosure.
6. Thoroughly wet vinyl floor tile with amended water. Use a slip scraper or equivalent to loosen the floor tile from the floor. Remove the floor tile in an intact state. Keep the floor tile wet throughout the removal and cleanup.
 - a. Removal of floor tile using an infrared heat machine eliminates the wetting requirement.
7. Remove vinyl sheet flooring by cutting while wetting the snip-point. Wet sheet flooring during delamination. Rip-up of resilient flooring material is not permitted.
8. Clean resilient flooring of all debris using a HEPA vacuum, wet sweeping, mopping or equivalent and allow time to dry. Dry sweeping is prohibited.
9. Place the resilient flooring material and debris in an asbestos disposal bag. Seal the bag and place it in a properly labeled drum or polyspun bag. Comply with the disposal and labeling requirements of this Section.

RETAIN BELOW IF VINYL TILE ADHESIVE REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

C. Asbestos Mastic Removal:

1. Clean the floor of all debris using a HEPA vacuum, wet sweeping, mopping or equivalent.
2. Remove as much mastic as possible using an EHS approved solvent. Control odors and fumes with engineering controls.
3. Perform scraping of residual adhesive and backing using wet methods.
4. After all debris is removed, thoroughly mop the floor and allow time to dry.
5. Shot blasting is prohibited, except when performed in a negative pressure enclosure.
6. Properly dispose of all asbestos and solvent waste according to all applicable regulations, and comply with the disposal and labeling requirements of this Section.

3.3 FIELD QUALITY CONTROL

- A. Pre-Notification of EHS Representative: To permit adequate time to schedule air monitoring, notify the EHS representative not less than 10 calendar days prior to planned start of all removal operations.
- B. Air Monitoring: Owner will retain a professional independent industrial hygiene consultant to collect air samples and oversee the project to insure that compliance with applicable codes, regulations, and ordinances, including 29 CFR 1926.1101, NESHAP, and P.A. 135. The consultant will collect background, contiguous, work area, personal, and post-abatement air samples. EHS will provide one copy of the report to the Contractor.
 - 1. If contiguous sampling indicates airborne fiber concentrations above 0.01 fibers/cc or background level, work will be stopped unless otherwise approved by EHS. Work may resume when the source of contamination has been corrected and the contamination has been cleaned to the satisfaction of the EHS.
- C. Inspection: If during the project, EHS representative or Owner's consultant determines that work practices either violate applicable rules and regulations or endanger employees, the Contractor's on-site representative shall stop operations immediately and take corrective action. Cooperate fully with EHS representative and Owner's consultant.

3.4 SCHEDULE OF ITEMS CONTAINING ASBESTOS

WHERE THE FOLLOWING PARAGRAPH IS INCLUDED, BE SURE TO REFERENCE THESE BIDDING REQUIREMENTS IN THE "INSTRUCTIONS TO BIDDERS" FRONT-END DOCUMENT

- A. Bidding Requirements: Comply with the following requirements related to bidding:
 - 1. Survey quantities provided are approximate. Bidders are required to field investigate as necessary and assume all responsibility to verify the work required and quantities involved for complete asbestos abatement.
 - 2. The building is open for field inspection by all bidders during the bidding period.
 - 3. A "pre-bid orientation meeting" will be conducted to familiarize prospective bidders with site conditions and provide for verification of marked and scheduled quantities, as applicable.

EDIT THE FOLLOWING LIST TO SUIT PROJECT

- B. The following items have been surveyed and determined to have asbestos as a component:
 - 1. Vinyl asbestos floor tile.
 - 2. Composition sheet flooring.
 - 3. Flooring adhesives.

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 028215 - ASBESTOS REMEDIATION - ROOFING MATERIAL

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS

SECTION 028215 - ASBESTOS REMEDIATION - ROOFING MATERIAL

USE THIS SECTION WHEN ASBESTOS ABATEMENT IS LIMITED TO REMOVAL OF ROOFING MATERIALS.

PART 1 - GENERAL

1.1 SUMMARY

BEFORE EDITING THIS SECTION DETERMINE WHETHER ASBESTOS ABATEMENT WORK WILL BE DONE AS PART OF THE GENERAL CONTRACT, WILL BE BID OUT SEPARATELY DIRECTLY TO ABATEMENT CONTRACTORS OR WILL BE PERFORMED BY THE OWNER. IF ABATEMENT WORK IS NOT PART OF THE GENERAL CONTRACTOR'S WORK, DO NOT INCLUDE THIS SECTION.

- A. This Section includes removal and disposal of asbestos-containing materials by full enclosure, glove bag, or entire structures methods as applicable. Demolition and debris removal of all asbestos-containing materials identified by provisions of this Section, or shown on drawings, or identified at the site, shall be executed under the provisions of this Section, and other applicable sections of these specifications.
- B. Extent of asbestos removal work is as follows:

EDIT THE FOLLOWING TO SUIT PROJECT

- 1. Indicated on drawings.
- 2. Surveyed and listed in "Schedule of Items Containing Asbestos" Article in Part 3 of this Section.

SELECT ABOVE OR BELOW FOR SURVEYED AND SCHEDULED EXTENT

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

1.2 RELATED SECTIONS

INCLUDE THE FOLLOWING IF UNIT PRICE PAYMENT METHOD IS REQUIRED

- A. Unit price items are scheduled with related units of measure in Division 01 Section "Unit Prices."

INCLUDE THE FOLLOWING IF ABATEMENT WORK IS AN ALTERNATE

- B. Work of this Section that is affected by alternates is described in Division 01 Section "Alternates."
- C. Demolition and removal of items not containing asbestos as a component is included in Division 02 Section "Selective Demolition."
- D. Pipe re-insulation is included in Division 23 Section "Mechanical Insulation."

1.3 DEFINITIONS

- A. Asbestos Abatement Firm: Firm engaged to perform actual removal and disposal work, either as Contractor or subcontractor.

- B. Asbestos Containing Material: The term "asbestos containing material" is abbreviated ACM.
- C. Owner's Consultant: Firm engaged by Owner to identify and measure asbestos containing materials, or to inspect demolition operations, including monitoring of air quality.
- D. EHS: Owner's Environment, Health and Safety Department, 1239 Kipke Drive, Ann Arbor, MI 48109-1010; phone (734) 647-1143.

1.4 SUBMITTALS

- A. Initial Submittals: Submit the following documents to Owner's Representative at the pre-abatement meeting:
 - 1. License from the State of Michigan in accordance with Act 135 P.A. 1986 (Asbestos Abatement Contractors Licensing Act) (when applicable).
 - 2. Copy of notification sent to appropriate federal, state, and local agencies (when applicable).
 - 3. Copy of 8-hour training class certificates for each employee who is likely to disturb or handle asbestos material. Contractor/supervisor course certificates are also required for the competent person.
 - 4. Schedule of removal, specifying work locations, length and number of shifts, foreman's name, and crew size.
 - 5. Disposal Site Certification: Letter, signed by the Contractor, certifying that an approved asbestos-accepting type II landfill will be used for disposal. Include the facility name, address, and phone number.
- B. Waste Disposition Submittals: Submit to EHS signed waste shipment record stating that asbestos waste has been properly disposed. Submit the following:
 - 1. Receipts (trip tickets) from approved landfill.
 - 2. Asbestos Waste Shipment Record: As follows:
 - a. Prior to removing asbestos-containing material from the project site, provide Owner's Representative or Owner's consultant with a completed waste shipment record fully complying with Section 61.150 of the NESHAP standard, and 49 CFR Part 172.200 of the U.S. Department of Transportation, and including all required information.
 - b. Ensure that the landfill operator provides a signed copy of the waste shipment record to EHS within 35 days of the date that asbestos-containing material is removed from the project site. If waste is not transported directly from the project site to the landfill, the waste shipment record shall reflect each transfer.
 - c. The Owner will not make final payment prior to receipt of signed waste shipment record.
- C. Contract Closeout Submittals: Comply with the following additional requirements of Division 01 Section "Project Closeout":
 - 1. Asbestos Quantity Removal Report: Submit 3 copies of asbestos quantity removal report to Owner's Representative at least 4 weeks prior to Contractor's application for final payment. Include information in the following format:
 - a. Quantities of Asbestos Removed:

- 1) _____ square feet of asbestos-containing roofing material removed from project area.
2. Statement of Visual Inspection: Prior to application for final payment, submit to EHS a statement of visual inspection signed by the Contractor's competent person/supervisor. Include the following:
 - a. Name of licensed contractor conducting work.
 - b. Name, signature, and title of on-site supervisor.
 - c. Name, location, and start and finish date of abatement work.
 - d. Current date.
 - e. Statement that the work was completed according to applicable federal, state, and local laws, and these specifications.
 - f. Statement that the Asbestos Abatement Firm's field supervisor has visually inspected the work site and has found no dust, debris, or other suspect asbestos-containing materials that were part of the scope of work.

1.5 QUALITY ASSURANCE

- A. Pre-Qualified Asbestos Abatement Firms: Engage one of the following pre-qualified firms to perform abatement of asbestos containing materials (when applicable):
 1. 21st Century Salvage, Inc.
 2. Adamo Demolition Company
 3. Advanced Industrial Services, LLC
 4. Asbestos Abatement, Inc.
 5. Bierlein Companies, Inc.
 6. Certified Abatement Services, Inc.
 7. Detroit Dismantling Corporation
 8. Environmental Assurance Company, Inc.
 9. Environmental Maintenance Engineers
 10. Environmental Specialty Services, Inc.
 11. Global Green Service Group
 12. Great Lakes Environmental Service, Inc.
 13. Homrich
 14. Michigan Mechanical Abatement, Inc.
 15. MIS Corporation-Michigan
 16. National Environmental Group, LLC
 17. Next Generation Environmental, Inc.
 18. North American Dismantling Corp.
 19. Pro-Tech Environmental & Construction, Inc.
 20. Professional Thermal Systems, Inc.
 21. Qualified Abatement Services, Inc.
 22. Quality Environmental Services, Inc.
 23. Rand Environmental Services
 24. Trust Thermal Abatement, Inc.
- B. Regulatory Requirements: Make all necessary notifications to the appropriate federal, state, and local agencies.

1. The National Emission Standards for Hazardous Air Pollutants (NESHAP), Asbestos regulation 40 CFR 61, Sub-Part M requires that if at least 80 lin. meters (260 lin. ft.) of friable asbestos materials, at least 15 sq. meters (160 square feet), or 1 cu. meter (35 cu. ft.) of friable asbestos materials, or other facility components are stripped or removed while renovating a facility, all the requirements of section 61.147 apply.
 2. When applicable, notify the Michigan Department of Environmental Quality (MDEQ), the Michigan Department of Licensing and Regulatory Affairs (MDLARA), and appropriate state and local regulatory agencies. No work shall be conducted without notification of authorities having jurisdiction.
- C. Pre-Abatement Meeting: Approximately 2 weeks prior to scheduled start of the abatement project, the Owner's Representative will hold a pre-abatement meeting with the individuals indicated below:
1. Contractor' representative.
 2. Asbestos Abatement Firm's representative.
 3. EHS representative.
 4. Owner's consultant.
 5. Owner's Representative.
 6. Owner's building maintenance personnel.
- D. The meeting agenda will include:
1. Review of the scope of work.
 2. Removal methods to be used.
 3. Review of Contractor's initial submittals.
 4. A walk-through survey of the site, if appropriate.
- E. For small projects, the meeting may be suspended at the discretion of the Owner's Representative. If the meeting is suspended, deliver required initial submittals to the Owner's Representative's office 2 weeks prior to the start of work.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 ASBESTOS ABATEMENT, GENERAL

- A. Conduct asbestos abatement operations in a manner that fully protects Contractor's and subcontractor's employees, the general public, and building occupants from exposure to asbestos and other safety and health hazards.
1. Asbestos abatement projects shall be directly supervised by a competent person as described in 29 CFR 1926.1101.
 2. The supervisor/competent person must complete responsibility checklists throughout all phases of the project.
- B. Protect adjacent areas, materials and surfaces from damage due to demolition operations, including but not necessarily limited to the following:
1. Water damage.

2. Dirt, dust and debris.
 3. Abrasion.
 4. Cuts and scratches.
 5. Holes from fasteners for temporary barriers.
- C. All asbestos work shall be conducted within a regulated area that complies with the following requirements:
1. Post a sufficient number of signs required by 29 CFR 1926.1101 at the asbestos abatement area and at every work area entrance, so that tenants, Owner's personnel, and other contractor's employees have an opportunity to take protective measures before exposing themselves to asbestos. Place banners if necessary to secure open areas. Include information on signs indicating location and quantity of asbestos-containing material.
 2. Allow only authorized, properly protected personnel to enter the regulated area. Immediately report unauthorized individuals entering the work area to EHS or the Owner's consultant.
- D. When required, provide employees and inspectors authorized to enter the regulated area with protective work clothing consisting of disposable Dupont "Tyvek" (or equivalent) full body coveralls, head covers, boots, and other necessary safety gear, including a hard hat and eye protection.
- E. Provide respiratory protection to employees as required by current OSHA regulations including 29CFR 1910.134 and 1926.1101.
1. Provide asbestos abatement workers with powered air purifying respirators (PAPR) with full facepiece and HEPA filters for adequate protection during asbestos material removal operations. Respiratory protection may be down-graded if negative exposure assessment indicates that less protection is required.
 2. A half-face respirator or PAPR must be worn while tearing down and setting up enclosures, while glovebagging, and during pre-cleaning and post-cleaning work.
 3. Do not allow respirators to be pulled away from faces while in the work area.
 4. Maintain an extra PAPR unit on site at all times for the duration of the abatement project.
 5. Provide full facepiece supplied-air respirators operated in pressure demand mode equipped with air auxiliary and pressure self-contained breathing apparatus or HEPA egress filters if required for measured fiber concentrations.
- F. Maintain at each job site and post the following documents:
1. Copy of MDEQ/MDLARA notification (when applicable).
 2. Employee respiratory protection program (when applicable).
 3. Michigan Right-To-Know poster.
 4. Material Safety Data Sheet locator.
 5. Company standard operating procedure.
 6. This specification Section.
 7. Material Safety Data Sheets for products used on job.
 8. CFR 1926.1101.
 9. CFR, Part 61 (NESHAP).

10. The foreman's or supervisor's Contractor/Supervisor Accreditation Certificate.
 11. State of Michigan Accreditation Certificates and Medical Approval for each worker (when applicable).
- G. Use the following engineering controls and work practices for all asbestos abatement operations, regardless of measured exposure levels:
1. Vacuum cleaners equipped with HEPA filters to collect all asbestos-containing dust and debris.
 2. Wet methods to control exposures during asbestos removal and clean-up, except where proven to be infeasible.
 3. Prompt clean-up and disposal of asbestos-contaminated wastes and debris in leak-proof containers.
 4. Establish a decontamination area, adjacent and connected to the regulated area, if the Project requires the removal of more than 25 lin. ft., or 10 sq. ft. of thermal systems insulation or surfacing ACM.
 5. Establish an equipment area adjacent to the regulated area if the Project requires the removal of less than 25 lin. ft. or 10 sq. ft. of thermal systems insulation or surfacing ACM.
- H. Do not use any of the following equipment or work practices during asbestos abatement operations, regardless of measured exposure levels:
1. High-speed abrasive disc saws not equipped with point-of-cut HEPA ventilation or HEPA filtered exhaust air enclosures.
 2. Blowing with compressed air to remove asbestos-containing materials.
 3. Dry sweeping, shoveling, or other dry methods to clean up asbestos-containing dust and debris.
 4. Employee rotation as a means of reducing employee exposure to asbestos.

ALWAYS RETAIN FULL ARTICLE BELOW

3.2 ASBESTOS REMOVAL BY FULL ENCLOSURE METHOD

- A. Preparation of the Work Area: Complete the following preparation work prior to beginning asbestos removal operations:
1. Install critical barriers over each opening into the regulated area. The following requirements are in addition to, not in lieu of, other indicated surface and object protection requirements:
 - a. Seal each opening between the work area and adjacent areas with not less than 2 layers of 4-mil polyethylene sheeting. Use an expanding-polyurethane foam gun to seal areas with large numbers of pipes, conduits and beams. Openings include, but are not necessarily limited to, windows, skylights, doorways, elevator hoistway openings, corridor entrances, drains, ducts, grills, grates, and diffusers.
 - b. Seal intake and exhaust vents and duct seams within the regulated area with not less than 2 layers of 6-mil polyethylene sheeting.

2. HVAC System Shutdown: Owner's maintenance personnel will shut down heating, cooling, and air conditioning systems when necessary. Coordinate scheduling with Owner's personnel and provide 72 hours notice to the Owner's Representative prior to planned shut-down.
3. Protection of Surfaces and Objects: The following requirements are in addition to, not in lieu of, indicated work area sealing requirements. Cover the following surfaces and objects as follows:
 - a. Protect all surfaces beneath all removal activity. Remove moveable objects from the work area, and cover fixed objects with impermeable dropcloths or plastic sheeting with edges securely sealed with tape.
 - b. Cover open tanks with plywood or other solid material.
 - c. Provide clean, fresh air to mechanical equipment, where required to maintain proper performance of equipment.
 - d. Fully pre-clean all covered surfaces with amended water and a HEPA vacuum.
 - e. Cover walls with not less than 2 layers of 4-mil polyethylene sheeting. Construct free-standing enclosure walls of not less than 6-mil polyethylene sheeting, with supports spaced not more than 3 feet o.c.
 - f. Cover floors with not less than 2 layers of 6-mil polyethylene sheeting. Avoid seams where possible. If seams are necessary, overlap not less than 12 inches and tape joints. Extend sheeting 12 inches up the side walls leaving no seams at the wall and floor joint. Immediately repair punctures and leaks, and clean up seepage.
4. Cleaning: Do not use cleaning methods that raise dust, such as sweeping or using vacuum cleaners not equipped with HEPA filters. Do not disturb asbestos materials during pre-cleaning phases.
 - a. Treat water removed from the enclosure as asbestos contaminated waste. Fully seal floor drains.
5. Deactivate or install ground-fault circuit interrupters on each electrical circuit within the enclosure.
6. Construct a three-chambered decontamination facility that is adjacent to and connected to the regulated area, and that consists of a dirty room, a shower room, and a clean room in series. Construct decontamination facilities that are exposed to weather of lumber and exterior grade plywood. Secure the facility when not in use.
 - 1) Supply the equipment room with properly labeled, impermeable bags and containers for the containment and disposal of contaminated protective equipment.
 - 2) Construct showers that comply with the requirements of 29 CFR 1910.141 (d) (3), with the shower room adjacent to both the equipment room and the clean room. Filter water waste and shower water through a 5 micron filter, or remove water from site as asbestos waste.
 - 3) Equip the clean room with a locker or appropriate storage container for each employee.
7. Employee Decontamination Facilities: Comply with the following requirements:

- a. Access the work area only through an approved decontamination system. Lock or block other entrances. Seal emergency exits (for use during a fire or accident) with polyethylene sheeting and tape.
 - b. Seal the waste pass-out, except during the removal of asbestos waste from the enclosure.
 - c. Entrance To The Regulated Area: Employees shall enter the decontamination area through the clean room, remove and store clothing, and put on protective clothing and respiratory protection before passing through to the equipment room.
 - d. Exit From The Regulated Area: Employees shall exit the regulated area by removing gross contamination and debris from their protective clothing. The clothing shall be removed and disposed of in the equipment room into labeled impermeable bags or containers. Employees shall then shower and enter the clean room before changing into street clothes.
8. Local Exhaust Ventilation: Maintain portable air filtration units with a HEPA filter in use during asbestos abatement operations requiring enclosures. Units shall conform to OSHA Standard 1926.1101, Appendix F, and shall be designed in accordance with 40 CFR 61, Subpart M, Section 61.153.
- a. Exhaust directly to building exterior. Provide a backup portable air filtration unit at each removal enclosure. Start up ventilation units prior to initiating asbestos removal operations and run until the Owner's consultant has approved their shut-down after cleaning, sampling, visual inspection, and tear-down.
 - b. Direct air movement within the enclosure away from the employees' work area and toward the air filtration device.
 - c. Provide not less than 4 air changes per hour within the enclosure.
 - d. Within the enclosure, through the period of its use, maintain a pressure differential of not less than minus 0.02 water gage with respect to ambient conditions outside the enclosure.
9. Visually inspect the enclosure for breeches and smoke-test for leaks before work begins, and before the start of each work shift. Make all modifications to the enclosure prior to starting removal work.
- B. Asbestos Removal Operations: Comply with the following requirements for asbestos removal operations:
- 1. Immediately preceding asbestos removal, apply a fine mist of amended water (water and wetting agent) to the asbestos materials and the surrounding area. Keep surrounding areas wet by spraying periodically with amended water. Maintain a high humidity environment to assist in fiber settling.
 - 2. Remove asbestos material using two-person teams, on staging platforms, if necessary.
 - 3. Remove the wet asbestos material as intact sections or components. Carefully lower the material to the floor or place directly into container. Never drop or throw asbestos material on the floor.

4. At working heights between 15 and 50 feet above the floor, place removed asbestos materials in containers at the elevated levels and lower to floor, or place onto inclined chutes or scaffolding for subsequent collection and placement into containers. Clean all debris at the completion of each workday.
5. Once the asbestos material is at ground level, pack in labeled 6-mil polyethylene bags, wet and, if appropriate, hold in drums prior to starting the next section.
6. Use 2 sealed and labeled 6-mil thick bags for storage and transportation of asbestos waste. Standing water shall be in each bag
7. Wrap large components removed intact in two layers of 6-mil polyethylene sheeting, label, and secure with tape for transport to the landfill. Comply with all wetting requirements.
8. Treat wires, hangers, steel bands, nails, screws, metal lath, tin sheeting, and similar sharp objects removed with asbestos material as asbestos waste. Place in drums for disposal.
9. Label containerized asbestos waste in accordance with OSHA, EPA, and Department of Transportation regulations, as follows:
 - a. Label each container with OSHA label that contains the following information:

**DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST**

- b. Label each container with Owner's and Asbestos Abatement Firm's names and addresses as required by NESHAP. Owner's address is EHS, 1239 Kipke Drive, Ann Arbor, MI 48109-1010.
 - c. Label each container with Class 9 Label required by DOT and identify waste as "RQ, Asbestos NA 2212."
10. Prepare a complete and accurate NESHAP Waste Shipment Record (special manifest). Assure all information required by the U.S. Department of Transportation regulation is included. Under "special handling instructions" provide the required DOT identification information: RQ Asbestos 9,NA 2212, PG III.
 - a. Do not remove waste from site until Owner's Representative has signed and verified the shipment record.
11. Remove containerized asbestos waste daily from site, or store on site in a locked or secured location until ready for final disposal. Obtain approval of Owner's Representative and EHS representative of the location of disposal containers. Outdoor waste containers shall be fully enclosed and locked. Mark vehicles used to transport waste during the loading and unloading of asbestos waste with a visible sign, as required by NESHAP.
12. Each container shall have excess water evident, or the asbestos waste shall be mixed in a slurry.

- C. Post-Removal Operation Requirements: After completion of asbestos removal and clean-up operations, comply with the following requirements:

1. The Asbestos Abatement Firm representative, in presence of Owner's consultant, shall inspect the entire work area for asbestos. Include decontamination unit, all plastic sheeting, seals over doorways, windows, and all other openings.
 - a. If any suspect asbestos is found, repeat final cleaning operation, until the visual inspection is satisfactory to the Owner's consultant and the asbestos removal firm. Asbestos not scheduled to be removed as part of the project is exempt.
2. Encapsulate all walls, floors, ceilings, other exposed surfaces, and decontamination facilities after completing the work area inspection.
 - a. Remove the inner polyethylene barrier that is not integral to maintaining negative pressure in the enclosure at this time, and post-abatement air samples will be collected by Owner's consultant. Immediately clean any asbestos-containing materials observed behind these secondary barriers.
3. When post-abatement fiber levels are greater than either 0.01 fiber/cc or background level, repeat cleanup operation until the area is below either 0.01 fibers/cc or background level.
4. When the post-abatement samples are in compliance, and the Owner's consultant or EHS has completed the visual inspection, the enclosure shall be removed.
 - a. Turn off HEPA filter exhaust units only after all barriers have been removed.
 - b. A final visual inspection will be conducted by the Owner's consultant or EHS representative before the Contractor is released from the removal site. The final inspection will include tape, polyethylene sheet, debris, and equipment.

3.3 FIELD QUALITY CONTROL

- A. Pre-Notification of EHS Representative: To permit adequate time to schedule air monitoring, notify the EHS representative not less than 10 calendar days prior to planned start of all removal operations.
 1. Roofing removal Contractors may provide their own air monitoring in compliance with roofing removal requirements of this Section.
- B. Inspection: If during the project, EHS representative or Owner's consultant determines that work practices either violate applicable rules and regulations or endanger employees, the Contractor's on-site representative shall stop operations immediately and take corrective action. Cooperate fully with EHS representative and Owner's consultant.

**RETAIN BELOW FOR REMOVAL OF FLOOR TILE, FLOORING ADHESIVE,
TRANSITE TOPS AND PANELS, OR ROOFING MATERIALS**

3.4 REMOVAL OF NON-FRIABLE ASBESTOS-CONTAINING MATERIALS

**ALWAYS RETAIN PARAGRAPHS BELOW IF "NON-FRIABLE" ARTICLE IS
RETAINED**

- A. Removal of Non-Friable Materials, General: For each type of non-friable asbestos-containing material indicated, comply with the following requirements:
1. Comply with requirements of Article 3.1 of this Section.
 2. Conduct non-friable material removal operations to prevent the material from becoming friable during the removal and disposal process. No visible emissions are permitted. If the material does not remain substantially intact, comply with the requirements for friable asbestos removal specified in Articles 3.2 of this Section (except roofing removal).
 3. Place impermeable dropcloths on surfaces beneath removal activity.
 4. Do not conduct asbestos removal unless the Owner's Consultant is present at the site and EHS has been notified. For roofing removal projects, notify EHS prior to start of work.
 5. Labeling Containerized Waste: Comply with the requirements of Article 3.2, paragraphs B.9.a. through c. of this Section.

RETAIN BELOW IF ROOFING REMOVAL IS INCLUDED IN PROJECT - DELETE IF NONE

- B. Non-Friable Asbestos-Containing Roofing Materials: Non-friable asbestos-containing roofing materials may be removed in a non-friable state. This specification does not apply to removal of intact cements, coatings, or mastics. Obtain EHS review and approval of planned removal operations prior to beginning. Remove non-friable asbestos-containing roofing materials in using the following technique:
1. Each employee who is likely to disturb or handle asbestos material shall have completed an 8-hour training class, and the project shall be supervised by a competent person who has completed the appropriate contractor/supervisor course.
 2. Isolate roof level heating and ventilation air intake sources within the regulated area and others that will be affected; or arrange for shut-down the affected ventilation system during removal operations. Acceptable isolation techniques include the following:
 - a. Use 20-foot or larger buffer zones.
 - b. Installation of HEPA filters over the air intakes.
 - c. Erection of horizontal or vertical extensions that relocate the opening of the intake outside or above the regulated area.
 - d. Covering the intake with plastic sheeting or other appropriate barrier.
 3. Personal protective equipment (PPE), including disposable coveralls and NIOSH approved appropriate high efficiency particulate absolute (HEPA) respirators, shall be worn by personnel if the asbestos containing material is not removed in an intact state.
 4. Remove roofing material in an intact state.
 5. Use wet methods to remove materials that are not intact, or that are rendered not intact during removal, except where wet methods will create a safety hazard or are otherwise not feasible.

6. Continuously apply a water mist to the blade of power cutting tools, unless a competent person determines that misting will substantially decrease worker safety.
7. When removing roofing felts, collect the dust generated by power roof cutters with a HEPA-filtered dust collector; or immediately vacuum using a HEPA-filtered vacuum along the cut line. For smooth surfaces only, gently sweep wet dust generated from cutting operations, and carefully and completely wipe up the still-wet dust and debris.
8. For removal and repair operations of intact roofing less than 25 sq. ft. in area, the use of wet methods or HEPA vacuuming is not required, provided manual methods do not render the material non-intact and no visible dust is created.
9. Do not drop or throw to the ground asbestos-containing roofing material that has been removed. As soon as practicable, but not later than the end of the work shift, lower debris to ground either by passing or carrying by hand, or by lowering to the ground in a covered, dust-tight chute, crane or hoist.
 - a. While on the roof, keep non-intact asbestos-containing materials wet; or seal in impermeable waste bags, or wrap in plastic sheeting.
 - b. While on the roof, intact asbestos-containing material is not required to be kept wet, bagged, or wrapped.
10. Upon being lowered to the ground, transfer unwrapped material to a closed receptacle in manner that precludes the dispersion of dust. Dispose of the material in an asbestos-accepting Type II landfill. Notify the landfill that the roofing material contains asbestos and provide waste shipment records to EHS within 35 days.
11. For removal of intact pipeline asphaltic wrap or roof flashings that contain asbestos, engage a competent person to examine the material and determine whether the material is intact and likely to remain intact during removal. Remove the material using manual methods. Sanding, grinding, or other abrading operations are not permitted. Do not throw or drop materials to the ground. Lower the material in a covered, dust-tight chute, crane, or hoist. Remove debris from the roof at the end of the work shift.

3.5 SCHEDULE OF ITEMS CONTAINING ASBESTOS

WHERE THE FOLLOWING PARAGRAPH IS INCLUDED, BE SURE TO REFERENCE THESE BIDDING REQUIREMENTS IN THE "INSTRUCTIONS TO BIDDERS" FRONT-END DOCUMENT

- A. Bidding Requirements: Comply with the following requirements related to bidding:
 1. Survey quantities provided are approximate. Bidders are required to field investigate as necessary and assume all responsibility to verify the work required and quantities involved for complete asbestos abatement.
 2. The building is open for field inspection by all bidders during the bidding period.

3. A "pre-bid orientation meeting" will be conducted to familiarize prospective bidders with site conditions and provide for verification of marked and scheduled quantities, as applicable.

EDIT THE FOLLOWING LIST TO SUIT PROJECT

- B. The following items have been surveyed and determined to have asbestos as a component:
 1. Roofing felts and base flashing.
 2. Roofing underlayment.

SPECIFICATION DIVISION 2

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 028300 - LEAD REMEDIATION

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS
SECTION 028300 - LEAD REMEDIATION

DO NOT USE THIS SPEC FOR RENOVATION, REPAIR AND PAINTING (RRP) WORK IN CHILD CARE FACILITIES, FAMILY HOUSING, RESIDENTIAL PROPERTIES AND HALL DIRECTOR/OTHER APARTMENTS WITHIN RESIDENCE HALLS. CONTACT OSEH DIRECTLY FOR ASSISTANCE IN DEVELOPING A CUSTOM SPEC FOR THESE FACILITIES.

THIS SECTION DESCRIBES REQUIREMENTS FOR INSTALLATION, REMOVAL AND DISPOSAL OF LEAD-CONTAINING MATERIALS (LCM) DURING DEMOLITION OR RENOVATION ACTIVITIES.

SURVEY ALL BUILDING COMPONENTS WHICH MAY CONTAIN LEAD OR BE COVERED WITH LEAD-BASED PAINT (LBP), INCLUDING WALLS, CEILING, FLOORS, AND STRUCTURAL STEEL. CONTACT OSEH EARLY DURING THE DESIGN PHASE FOR A LEAD-PAINT SURVEY TO DETERMINE EXTENT AND CONCENTRATION OF LEAD-BASED PAINT, IF ANY. BRETT GOECKE IS THE OSEH CONTACT FOR LEAD-PAINT SAMPLING.

INCLUDE OSEH IN ANY PRE-CONSTRUCTION MEETINGS FOR PROJECTS INVOLVING LBP DISTURBANCE.

FOR DRY SANDBLASTING, WELDING, BURNING, OR OTHER OPERATIONS THAT CREATE SIGNIFICANT AMOUNTS OF AIRBORNE DUST, FUME OR LIQUID WASTE, OSEH MUST REVIEW AND APPROVE THE PROPOSED METHODS OF PAINT DISTURBANCE.

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section specifies requirements for working with lead-containing materials (LCM), during any of the following operations:

DELETE OR MODIFY BELOW TO SUIT PROJECT CONDITIONS.

1. Demolition of Lead-Containing Materials (LCM): Includes razing a building or any portion of a building or piece of equipment with LCM.
2. Incidental Removal or Disturbance of Lead-Based Paint (LBP): This includes activities such as sanding and scraping for paint preparation activities.
3. Removal of Lead-Based Paint (LBP): Complete removal of LBP from substrate, typically prior to torch cutting for demolition activities.
4. Removal or installation of lead sheet products as follows:
 - a. Radiation shielding.
 - b. Soundproofing.
 - c. Flashing.
 - d. Pipe, sink traps and sinks.

- B. Extent of known LCM is as follows:

SELECT ONE OF THE FOLLOWING PARAGRAPHS REGARDING EXTENT OF WORK OR MODIFY TO REFLECT PROJECT SCOPE.

1. As shown on drawings and survey reports. Assume all paint or other coatings not identified on drawings or reports contain lead.
2. Marked at the site during the pre-bid inspection "walk through."

1.2 RELATED SECTIONS

- A. Demolition and removal of items not containing lead as a component is included in Division 02 Section "Selective Demolition."

1.3 DEFINITIONS

- A. The term "Lead-Based Paint" (LBP) is identified as paint or other surface coating such as varnish, sealer or stain containing lead in any detectable amount.
- B. The term "Incidental Removal or Disturbance of Lead-Based Paint" indicates one or more of the following operations:
 1. Scraping, hand sanding, or otherwise removing loose LBP from existing surfaces scheduled to remain in place.
- C. The term "Demolition of LCM" refers to cutting, drilling, abrading, demolishing, or otherwise disturbing building elements coated with LBP or containing lead.
- D. The term "Lead-Containing Materials" (LCM) is identified as construction debris coated with lead-based paint or other materials containing lead, such as x-ray shielding.
- E. The term "Critical Barrier" indicates the perimeter of the enclosure within which lead disruption/removal work takes place. Critical Barriers may include existing floor, wall, and ceiling structures, as well as constructed partitions, closures and seals.
- F. The term "Project Site" indicates the limits of the Project Site as indicated on drawings or by provisions of this specification.
- G. The term "Work Area" indicates the area within the Critical Barrier.
- H. The term "Action Level" means exposure to an airborne concentration of lead of 30 micrograms per cubic meter of air calculated as an 8-hour time-weighted average (TWA).
- I. The term "Exposure Assessment" means a determination of employee exposures for a given task measured by air monitoring. The Assessment must meet the criteria for objective data as outlined in the MIOSHA/OSHA Lead in Construction Standard (MIOSHA Part 603, R325.51992 and 29 CFR 1926.62).
- J. The term "OSHA PEL" stands for the Permissible Exposure Limit established by the Occupational Safety and Health Administration for lead exposure. The OSHA PEL refers to an airborne concentration of lead of 50 micrograms per cubic meter of air calculated as an 8-hour time-weighted average (TWA).
- K. The abbreviation "TCLP" stands for Toxicity Characteristic Leaching Procedure and refers to one of the tests to determine if waste is considered a Hazardous Waste or non-hazardous solid waste.

- L. The term "Hazardous Waste" refers to a listed waste or any solid or liquid waste with one or more of the following characteristics: toxic, corrosive, flammable, explosive, combustible, oxidizer, pyrophoric, unstable (reactive) or water - reactive.
- M. The term "Non-Hazardous Waste" refers to any solid or liquid waste not exhibiting characteristics of Hazardous Waste.
- N. The term "EHS-HMM" refers to Owner's Environment, Health and Safety Department - Hazardous Materials Management Program 1239 Kipke Drive, Ann Arbor, MI 48109-1010, phone (734)763-4568.

1.4 SUBMITTALS

- A. Exposure Assessment Documentation: Submit to EHS
- B. All information used to document previous employee exposure assessments, if available. If not available, conduct an initial exposure assessment at the start of the project.
- C. Written Compliance Plan: Submit to EHS a Written Compliance Plan incorporating all requirements in the MIOSHA Lead in Construction Standard. Also indicate type of containment and method of liquid waste capture to be established if water is utilized for removal.
- D. Health and Safety Requirements: Submit to EHS the following information for each employee that will conduct lead disturbance on the job site:
 - 1. Respiratory Protection Program.
 - 2. Proof of current fit test for respirator that will be worn on Project Site.
 - 3. Proof of medical surveillance for respirator usage and lead work.
 - 4. Proof of lead awareness training in accordance with section 1.5. QUALITY ASSURANCE.
- E. Prepare a written schedule for each operation expected to disturb/remove LCM, indicating the following:
 - 1. Type of work to be performed, such as cutting, demolition, paint removal, or other action.
 - 2. Location of work to be performed.
 - 3. Proposed starting date and time.
 - 4. Proposed working hours.
 - 5. Proposed duration.
- F. Waste Container Order: If necessary, submit an order for hazardous waste containers (pails, drums, or dumpsters) to EHS-HMM not less than 10 working days prior to beginning LBP disruption/removal work. Containers are not needed for demolition waste with LBP that has been TCLP tested and found to be non-hazardous Contact EHS-HMM (734)-763-4568 to order containers and labels. The following information should be submitted with the order:
 - 1. Location
 - 2. Work activities/methods
 - 3. Estimated number of pails, drums or dumpsters needed for both solid and liquid waste.
- G. All submissions must be directed to EHS.

1.5 QUALITY ASSURANCE

- A. Personnel involved in the disturbance of LCM shall be trained in accordance with the requirements of the MIOSHA Lead in Construction Standard, including:
 - 1. The content of the MIOSHA Lead in Construction Standard and its appendices;
 - 2. The specific nature of the operations which could result in exposure to lead above the action level;
 - 3. The purpose, proper selection, fitting, use, and limitations of respirators;
 - 4. The purpose and a description of the medical surveillance program, and the medical removal protection program including information concerning the adverse health effects associated with excessive exposure to lead (with particular attention to the adverse reproductive effects on both males and females and hazards to the fetus and additional precautions for employees who are pregnant);
 - 5. The engineering controls and work practices associated with the employee's job assignment including training of employees to follow relevant good work practices;
 - 6. The contents of any compliance plan in effect;
 - 7. Instructions to employees that chelating agents should not routinely be used to remove lead from their bodies and should not be used at all except under the direction of a licensed physician; and
 - 8. The employee's right of access to records under 29 CFR 1910.20.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 HEALTH AND SAFETY REQUIREMENTS

- A. General: Determine employee exposure to lead in air as required in MIOSHA Lead in Construction Standard.
- B. Exposure Assessment: If the Contractor has made a previous Exposure Assessment that is representative of the task to be performed on-site, the Contractor may rely on this data and determine the need for personal protective equipment and work practice controls based upon this data, if approved by EHS.
- C. Job requirements: When the Contractor does not have an Exposure Assessment or the Assessment is determined to be insufficient, the Contractor must conduct personal air monitoring in accordance with the MIOSHA Lead in Construction Standard and follow the requirements below which are outlined by job task until monitoring determines otherwise:
 - 1. Manual demolition, scraping, sanding, heat gun application, power tool cleaning with HEPA dust collection system, spray painting with LCM:
 - a. Use of 1/2 mask respirator with HEPA filters.
 - b. PPE.

- c. Medical surveillance.
 - d. Use of changing room.
 - e. Use of handwashing facilities.
 - f. Provision of lead awareness training.
2. Using lead mortar, lead burning, rivet busting, power tool cleaning without HEPA collection, cleaning up with dry expendable abrasives, removing or relocating enclosure:
- a. Loose fitting PAPR with HEPA or supplied air respirator.
 - b. PPE.
 - c. Medical surveillance.
 - d. Use of changing room.
 - e. Use of handwashing facilities.
 - f. Provision of lead awareness training.

THE TECHNIQUES USED IN THE PARAGRAPH BELOW SHOULD BE USED ONLY IF NO OTHER ALTERNATIVES ARE AVAILABLE AND AFTER CONSULTATION WITH OSEH. DELETE THE PARAGRAPH BELOW IF OSEH WILL NOT ALLOW THESE TECHNIQUES IN THE PROJECT.

3. Abrasive blasting, welding, using cutting torch, burning (Contact EHS for alternatives before using these methods):
- a. Supplied air respirator or SCBA.
 - b. PPE
 - c. Medical surveillance.
 - d. Use of changing room.
 - e. Use of handwashing facilities.
 - f. Provision of lead awareness training.

3.2 PREPARATION

- A. General: Prepare Work Areas in a manner that will protect Owner's personnel and property, and the visiting public, from contact with LCM. Prior to beginning work, confirm starting date and time with Owner. Do not begin work that will disturb LCM without Owner's approval.

DELETE PARAGRAPH BELOW IF NO REMOVAL WORK ON BUILDING EXTERIOR.

- B. Preparing Building Exteriors: Ensure adequate measures are in place to limit airborne lead content below the Action Level of 30 ug/m³ (micrograms per cubic meter) adjacent to the Work Area.
- 1. Erect barricades and install warning tape or signs as necessary to prevent inadvertent exposure of passersby to LCM in all forms, including, but not necessarily limited to dust, particles, and fumes.
 - 2. Completely cover grounds and vegetation with minimum 8-mil thick polyethylene sheets with joints between sheets lapped and taped; with one edge taped to adjacent building surfaces below area of work; and with free ends secured in position with stakes, tie-down lines or weights. Cover sufficient ground area to capture wind-blown chips, dust and particles.

DELETE PARA BELOW IF NO REMOVAL WORK WITHIN BUILDING.

C. Preparing Building Interiors: Ensure adequate measures are in place to protect building occupants from exposure to airborne lead dust, particles, fumes or other LCM exceeding the Action Level of 30 ug/m³ (micrograms per cubic meter) lead content in air. Adequate measures shall include, but are not necessarily limited to, construction of Critical Barriers and/or establishment of negative pressure within Work Area.

1. Seal off openings and penetrations into the Work Area. Provide temporary dust barriers consisting of at least polyethylene plastic sheet on wood studs. Lap and tape joints of plastic sheeting to prevent dust, particles, fumes, and other forms of lead debris from leaving the enclosed area.
2. Discontinue building ventilation within the Work Area and seal off ventilation supply and return or exhaust diffusers, grilles or openings.
3. Post warning signs at all entrances to the Work Area that state the following, as required in MIOSHA Lead in Construction Standard:

DANGER

LEAD WORK AREA

MAY DAMAGE FERTILITY OR THE UNBORN CHILD

CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM

DO NOT EAT, DRINK OR SMOKE IN THIS AREA

3.3 WORK PRACTICES

A. General: Perform any removal, demolition or disturbance of LCM in compliance with the following requirements:

1. Restrict access to Work Area to essential personnel.
2. Use moist-removal methods and/or HEPA vacuuming where applicable. Do not over-saturate the Work Area.
3. Any debris generated must be cleaned up immediately before it can be tracked into other areas.
4. Remove contaminated clothing and personal protective equipment before leaving the Work Area, or Work Area enclosure, as applicable.
5. If the Action Level is exceeded outside the Work Area, discontinue work and modify Critical Barrier, or perform other modifications of methods or materials as required to reduce the lead contamination below the Action Level.
6. Prohibit eating, drinking, and smoking in the Work Area.

THE PARAGRAPH BELOW COVERS BOTH LARGE AND SMALL PAINT REMOVAL PROJECTS, FOR BOTH EXTERIORS AND INTERIORS. DELETE ONLY IF NO PAINT PREP IS REQUIRED.

B. Incidental Removal of LBP: Remove paint from building surfaces by hand scraping and sanding; or through the use of fluid-applied chemical strippers designed to dry into a solid polymeric sheet and peel off with paint encapsulated. Hand-scraping and sanding must be used in conjunction with moist-removal methods using misted water. Leave moist paint dust and chips in place to air dry before collection. Contact EHS as soon as removal has begun.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 028300 - - 6

1. Wet methods (including power-washing) that use amounts of water that can drip, spill, or leak onto the ground, or onto or into other adjacent surfaces are prohibited unless approved by EHS.
2. Dry removal methods (including sand blasting, power sanding, and other methods relying on high velocity mechanical abrasion) that create airborne fine particulate waste materials are prohibited unless specifically reviewed and approved by EHS.
3. Prior to torch-cutting building elements containing LBP, remove paint within four inches of centerline of cut in accordance with requirements of this Section.

DELETE PARAGRAPH BELOW IF NO SOLID SHEET REMOVAL. BELOW ASSUMES THAT LEAD IS NOT CONTAMINATED BY RADIATION OR REGULATED CHEMICALS. IF CONTAMINATION IS POSSIBLY PRESENT, CONSULT WITH OSEH REGARDING DECONTAMINATION OR DISPOSAL AS HAZARDOUS MATERIAL.

- C. Removal of Solid Lead Sheeting: Remove and stockpile solid lead sheet materials in a manner that will not result in the contamination of Work Area or Project Site. Remove sheet products in the largest sections possible. Do not unnecessarily cut or abrade lead sheet materials. Provide minimum 8-mil thick plastic sheet covering between solid lead stockpiles and walls, floors, paving or ground as applicable.
 1. Do not separate lead sheet materials that are adhesively laminated to gypsum substrates. Remove and dispose as lead hazardous waste all gypsum board with lead laminate attached.

3.4 DISPOSAL

- A. Lead Painted Demolition Debris and Lead Paint Chips: Prior to removal of waste from the site, coordinate Toxicity Characteristic Leaching Procedure (TCLP) testing of LCM waste with EHS-HMM. Allow two weeks for testing results. If TCLP testing shows the waste to be nonhazardous, the waste can be disposed of as normal construction demolition debris. If waste is classified as Hazardous or has not been TCLP tested, comply with the following requirements:
 1. Collect and place solid and liquid waste in Owner-provided containers.
 2. Store waste containers in a secure area (preferably a locked room at the project site. Set containers securely on a hard surface which is accessible to EHS drum carts. Do not stage containers on lawns, dirt piles, gravel drives, areas with mud or basement areas with no elevator access.
 3. Ensure that soil, ground water, and drains or sewers within the storage area are protected from possible contamination. Keep containers secure and tightly closed at all times, except when adding waste.
 4. Keep lead waste segregated from other waste. Do not co-mingle waste. **DO NOT MIX LIQUID AND SOLID WASTE.**

5. Place appropriate labels on all containers. Provide all information required on the label; mark labels using indelible ink. The name of the "Waste Generator" is as follows:
 - a. "Campus Area" 1655 Dean Road, Ann Arbor, Michigan 48109.
 - b. Contact EHS at the start of the project (734-763-4568) for proper generator name and site address.
 6. Mark the side of each container with the name and phone number of Owner's Representative knowledgeable about the type of waste contained.
 7. Do not remove waste from Project Site.
- B. Disposal of hazardous lead waste shall be done in coordination with EHS-HMM.
1. Contact EHS-HMM at least one week in advance to request pick-up of the containers.
 2. EHS will pickup and dispose of properly packaged and staged hazardous lead waste at no cost to the contractor. Call the EHS-HMM Program at 734-763-4568 to schedule a pickup immediately after lead waste has been staged.
- C. Disposal of Non-Hazardous LCM from Demolition/Renovation Activities: Collect non-hazardous LCM waste in a covered dumpster and dispose of the waste at a Type II or III landfill. For projects where large amounts of hazardous waste are generated, EHS may allow for transportation and disposal of waste by a qualified contractor. If applicable, contact EHS for additional transportation and disposal requirements.

3.5 CLEAN UP

- A. Upon completion of LCM or LBP removal and disposal operations, clean all surfaces within the Work Area before it can be tracked into other areas, including, but not necessarily limited to the following:
1. Siding.
 2. Steel support structures.
 3. Floors and ground.
 4. Walls.
 5. Window sills.
 6. Trim.
 7. Ledges and projections.
- B. For projects within building interior spaces, use a HEPA filtered vacuum for removal/elimination of dust, particulates, and debris.
1. Brushing, brooming and other dry methods that generate airborne dust are prohibited.
- C. Remove and dispose of wash water and HEPA filters as Hazardous Waste.
- D. Remove and dispose of all solid waste used for protection and clean-up as Non-Hazardous Waste as indicated in Section 3.4, "Disposal of Non-Hazardous LCM from Demolition/Renovation Activities".

- E. Field Testing: Upon completion of removal, disposal, and clean-up operations, the Owner may visually inspect and/or test the Project Site for evidence of remaining lead contamination. Return to Project Site and, at no additional cost to Owner, re-clean areas found to be contaminated.

NUMBER SECTION DESCRIPTION

DIVISION 02 EXISTING CONDITIONS

SECTION 028333 - LEAD REMEDIATION - RENOVATION, REPAIR AND PAINTING IN
CHILD-OCCUPIED FACILITIES AND TARGET HOUSING

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS

SECTION 028333 - LEAD REMEDIATION - RENOVATION, REPAIR AND PAINTING IN CHILD-OCCUPIED FACILITIES AND TARGET HOUSING

DECEMBER 2011

THIS SECTION IS TO BE USED FOR REMOVAL AND DISPOSAL OF LEAD CONTAINING MATERIALS (LCM) DURING RENOVATION, REPAIR AND PAINTING (RRP) WORK IN CHILD CARE FACILITIES, FAMILY HOUSING, RESIDENTIAL PROPERTIES AND HALL DIRECTOR/OTHER APARTMENTS WITHIN RESIDENCE HALLS. LEAD WORK WITHIN RESIDENCE HALL STUDENT ROOMS AND OTHER SPACES WITHIN RESIDENCE HALLS IS COVERED BY THE CONSTRUCTION LEAD SPECIFICATION, SECTION 028300. FOR LEAD ABATEMENT WORK (NOT RRP WORK) IN CHILD CARE FACILITIES ETC. CONTACT UM OSEH-IH&S (DANIELLE SHEEN 734-647-1142) FOR PROJECT SPECIFIC LEAD ABATEMENT SPECIFICATION DEVELOPMENT.

SURVEY ALL BUILDING COMPONENTS WHICH MAY CONTAIN LEAD OR BE COVERED WITH LEAD-BASED PAINT (LBP). THE SURVEY MUST BE CONDUCTED BY A CERTIFIED LEAD RENOVATOR. CONTACT OSEH EARLY DURING THE DESIGN PHASE FOR A LEAD-PAINT SURVEY TO DETERMINE EXTENT AND CONCENTRATION OF LEAD-BASED PAINT, IF ANY. BRETT GOECKE (734-647-2306) IS THE OSEH CONTACT FOR LEAD PAINT SAMPLING. INCLUDE OSEH IN ANY PRE-CONSTRUCTION MEETINGS FOR PROJECTS INVOLVING LBP DISTURBANCE.

IF AREAS OF LEAD PAINT DISTURBANCE ARE BELOW SIX SQUARE FEET (SF) FOR INTERIOR WORK AND 20 SF FOR EXTERIOR WORK, THE EPA RULE DOES NOT APPLY. CONSULT OSEH TO DETERMINE IF THE RULE APPLIES. THIS EXCEPTION DOES NOT APPLY TO WINDOW REPLACEMENT, DEMOLITION OR ANY PROHIBITED ACTIVITIES LISTED BELOW IN THE SPECIFICATION.

PART 1 - GENERAL

1.1 SUMMARY

- A. This section specifies requirements when renovating, repairing or painting in target housing and child occupied facilities built before 1978. Activities impacting lead-based paint (LBP) that are subject to the requirements of this section include but are not limited to:
1. Remodeling and repair/maintenance.
 2. Electrical work.
 3. Plumbing repairs or improvements.
 4. Painting.
 5. Carpentry.
 6. Window replacement.
 7. Demolition of painted walls or ceilings.
 8. Re-plastering.
 9. Any other activities which disturb painted surfaces.

B. This section does not apply to lead abatement projects in housing and child occupied facilities. Lead abatement is work designed to permanently eliminate lead based paint hazards.

C. Extent of LBP is as follows:

SELECT ONE OF THE FOLLOWING THREE ITEMS REGARDING EXTENT OF WORK OR MODIFY TO REFLECT PROJECT SCOPE.

1. As shown on drawings.
2. All existing paint.
3. Marked at the site during the pre-bid inspection "walk through."

D. Prohibited Activities:

1. Prohibited activities include open flame burning/torching, using a heat gun above 1,100 degrees Fahrenheit (°F) and sanding, grinding, planing, needle gunning or blasting without a shroud and HEPA vacuum attachment.

1.2 RELATED SECTIONS

A. Demolition and removal of items not containing lead as a component are included in Division 02 Section "Selective Demolition."

1.3 DEFINITIONS

A. The term "Abatement" signifies any measure or set of measures designed to permanently eliminate lead-based paint hazards from the target housing or child-occupied facility as defined in 40 CFR part 745, subpart L. Abatement includes, but is not limited to:

1. The removal of lead-based paint and lead-contaminated dust, the permanent enclosure or encapsulation of lead-based paint, the replacement of lead-painted surfaces or fixtures, and the removal or covering of lead-contaminated soil.
2. Preparation, cleanup, disposal, and post-abatement clearance testing activities associated with such measures.

B. The term "Action Level" means an airborne concentration of lead of 30 micrograms per cubic meter of air calculated as an 8-hour time-weighted average (TWA).

C. The term "Certified Inspector or Risk Assessor" means an individual who has been trained and is certified by the Environmental Protection Agency (EPA) or the Michigan Department of Community Health to conduct lead-based paint inspections or risk assessments.

D. The term "Child-occupied Facility" means a building, or portion of a building, constructed prior to 1978, visited regularly by the same child, 6 years of age or under, on at least two different days within any week (Sunday through Saturday period), provided that each day's visit lasts at least 3 hours and the combined weekly visit lasts at least 6 hours, and the combined annual visits last at least 60 hours. Child-occupied facilities may include, but are not limited to, day-care centers, preschools and kindergarten classrooms.

- E. The term "Cleaning Verification Card" means a card developed and distributed, or otherwise approved, by the EPA for the purpose of determining, through comparison of wet and dry disposable cleaning cloths with the card, whether post-renovation cleaning has been properly completed.
- F. The term "Common Area" means a portion of a building that is generally accessible to all residents or users. Common areas include (but are not limited to) hallways, stairways, laundry rooms, recreation rooms, playgrounds, community centers and fenced areas whether interior or exterior spaces.
- G. The term "Component" means a specific design or structural element or fixture distinguished by its form, function, and location. A component can be located inside or outside the dwelling. Examples include (but are not limited to) ceilings, wall, floors, shelves, crown molding, trim, fences, handrails window sills and soffits.
- H. The term "Containment" means a process to protect workers and the environment by controlling exposures to the lead-contaminated dust and debris created during a renovation, repair or painting project.
- I. The term "Critical Barrier" indicates the perimeter of the enclosure within which lead disruption/removal work takes place. Critical Barriers may include existing floor, wall, and ceiling structures, as well as constructed partitions, closures and seals.
- J. The term "Encapsulant" means a substance that forms a barrier between lead-based paint and the environment using a liquid-applied coating (with or without reinforcement materials) or an adhesively bonded covering material.
- K. The term "Enclosure" means the use of rigid, durable construction materials that are mechanically fastened to the substrate in order to act as a barrier between lead-based paint and the environment.
- L. The term "Exposure Assessment" means a determination of employee exposure for a given task measured by air sampling. The Assessment must meet the criteria for objective data as outlined in the MIOSHA/OSHA Lead in Construction Standard (MIOSHA Part 603, R325.51992 and 29 CFR 1926.62).
- M. The term "Hazardous Waste" refers to a listed waste or any solid or liquid waste with one or more of the following characteristics: toxic, corrosive, flammable, explosive, combustible, oxidizer, pyrophoric, unstable (reactive) or water - reactive. This definition includes lead paint that has been removed from the substrate and has failed the TCLP for any reason.
- N. The term "Inspection" means a surface-by-surface investigation to determine the presence of lead-based paint and the provision of a report explaining the results of the investigation.
- O. The term "Lead-Based Paint" (LBP) is identified as paint or other surface coatings that contain lead equal to or in excess of 1.0 milligrams per square centimeter or more than 0.5 percent by weight or lesser value as defined by EPA.

- P. The term "Non-Hazardous Waste" refers to any solid or liquid waste not exhibiting characteristics of Hazardous Waste. This definition includes lead-based paint not removed from substrate and not failing TCLP for other characteristics. It also includes lead paint chips that do not fail the TCLP for any reason.
- Q. The term "EHS" refers to Owner's Environment, Health and Safety Department, 1239 Kipke Drive, Ann Arbor, MI 48109-1010, phone (734)647-1142.
- R. The term "OSHA PEL" stands for the Permissible Exposure Limit established by the Occupational Safety and Health Administration for lead exposure. The OSHA PEL refers to an airborne concentration of lead of 50 micrograms per cubic meter of air calculated as an 8-hour time-weighted average (TWA).
- S. The term "Renovation" refers to a modification of all or part of any existing structure that disturbs a painted surface, including (but not limited to) removal/modification of painted surfaces, components or structures, surface preparation activities and window replacement as defined in 40 CFR part 745, subpart E.
- T. The term "Renovator" means a person who either performs or directs workers who perform a renovation. A certified renovator is a renovator who has successfully completed a renovator course accredited by the EPA or the Michigan Department of Community Health. Note: because the term renovation is broadly defined by the EPA rule "Lead-Based Paint Renovation, Repair and Painting Program" contractors such as electricians and plumbers may be considered "renovators" under this rule.
- U. The term "Target Housing" refers to housing constructed before 1978, except for: housing for the elderly, dormitories, studio apartments, efficiencies, military barracks and rentals of individual rooms.
- V. The term "TCLP" stands for Toxicity Characteristic Leaching Procedure and refers to one of the tests to determine if waste is to be disposed as a Hazardous Waste or non-hazardous solid waste.
- W. The term "Wet Disposable Cleaning Cloth" refers to a commercially available, pre-moistened, white disposable cloth designed to be used for cleaning hard surfaces such as countertops and uncarpeted floors.

1.4 SUBMITTALS

- A. All submittals must be directed to UM EHS. Submit documents requested in paragraphs B - E before start of project.
- B. Project Information:
 1. Copy of Firm Certification from the EPA or the State of Michigan Department of Community Health.
 2. Schedule of renovation, repair and painting activities.
 3. Length and number of shifts.
 4. Certified supervisor name, crew size, length and number of shifts.

- C. Written Compliance Plan: Submit to EHS a Written Compliance Plan incorporating all requirements in the MIOSHA Lead in Construction Standard. Also indicate type of containment and disposal to be established if water is utilized for removal.
- D. Health and Safety Requirements: Information must be provided for all workers that will conduct renovation, repair and painting activities on site, including the following for each employee that will conduct lead disturbance on the job site:
 - 1. Exposure Assessment Documentation, if available.
 - 2. Respiratory Protection Program.
 - 3. Proof of current fit test for respirator that will be worn on Project Site.
 - 4. Proof of medical surveillance for respirator usage and lead work.
 - 5. Proof of certified renovator training and accreditation for each supervisor on-site.
 - 6. Proof of lead awareness training and medical approvals for all workers on-site.
- E. Renovation Work Notification
 - 1. Renovations in Housing or other Dwelling Units
 - a. Occupants of units where renovations will take place must be provided with EPA's lead pamphlet "Renovate Right-Important Lead Hazard Information for Families, Child Care Providers and Schools".
 - b. Obtain written acknowledgement from an adult occupant that the pamphlet has been received or certify in writing that the pamphlet has been delivered to the dwelling and the occupant refused to sign or was unavailable.
 - c. Obtain a certificate of mailing at least 7 days prior to the renovation.
 - d. The written certification must include the address of the unit undergoing renovation, the date and method of delivery of the pamphlet, name of person delivering the pamphlet, reason for lack of acknowledgement, the signature of a representative of the firm performing the renovation and the date of the signature.
 - 2. Renovations in Common Areas
 - a. Where renovations take place in common areas, occupants of affected units must be notified in writing. Such notification shall be accomplished by distributing the written notification to each affected unit.
 - b. The notice shall describe the general nature and locations of the planned renovations activities, the expected start and ending dates and a statement of how the occupant can obtain the EPA lead pamphlet at no cost.
 - c. Obtain a certificate of mailing at least 7 days prior to the renovation.

- d. In place of the written notification to each affected unit the renovator may, while the renovation is ongoing, post in an area likely to be seen by occupants of all the units, informational signs describing the general nature and locations of the work and anticipated completion date. Additionally post a copy of the EPA lead pamphlet or information on how to obtain a copy free of charge from the renovator.
 - e. Prepare sign and date a statement describing the steps performed to notify all occupants of the intended renovation activities and to provide the pamphlet.
 - f. If the scope, locations or expected starting and ending dates change, re-notify the occupants prior to beginning additional renovation work.
3. Renovations in Child-Occupied Facilities
- a. Child-occupied facilities where renovations will take place must be provided with the EPA's lead pamphlet "Renovate Right-Important Lead Hazard Information for Families, Child Care Providers and Schools".
 - b. Obtain written acknowledgement from an adult representative of the child-occupied facility that the pamphlet has been received or certify in writing that the pamphlet has been delivered to the child-occupied facility and the adult representative refused to sign or was unavailable.
 - c. Obtain a certificate of mailing at least 7 days prior to the renovation.
 - d. The written certification must include the address of the unit undergoing renovation, the date and method of delivery of the pamphlet, name of person delivering the pamphlet, reason for lack of acknowledgement, the signature of a representative of the firm performing the renovation and the date of the signature.
 - e. Provide the parents or guardians of children using the child-occupied facility with the pamphlet and the information describing the general nature and locations of the renovation and the anticipated completion date by mailing or hand-delivering the information. Or, while the renovation is ongoing, post in an area likely to be seen by the parents or guardians of the children frequenting the child-occupied facility, informational signs describing the general nature and locations of the work and anticipated completion date. Additionally post a copy of the pamphlet or information on how to obtain a copy free of charge from the renovator.
 - f. Prepare sign and date a statement describing the steps performed to notify all parents and guardians of the intended renovation activities and to provide the pamphlet.
 - g. Any written acknowledgements required above must include the occupant's name and acknowledgement that the pamphlet was received prior to the renovation, the address of the facility undergoing renovation and the dated signature of the occupant.

- F. Waste Drum Order: Submit order for waste drums to EHS not less than 10 working days prior to beginning LBP disruption/removal work. The following information should be submitted with the order:
 - 1. Location.
 - 2. Work activities/methods.
 - 3. Estimated number of barrels/drums needed for both solid (paint chips) and liquid waste (wash water).
- G. Prior to application for final payment, submit a renovation report prepared by a certified renovator. The report should include the following:
 - 1. Start and completion dates of project.
 - 2. The name and address of each certified person conducting the renovation and the name of each supervisor assigned to the project.
 - 3. A detailed written description of the project, including all of the following:
 - a. Renovation methods used.
 - b. Locations of rooms and components where renovation, repair and painting occurred.
 - c. Results of Visual Inspection and Cleaning Verification.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 LEAD RENOVATION, GENERAL

- A. Conduct lead renovation, repair and painting activities in accordance with all state and federal regulations and guidelines.
- B. Assign a Certified Renovator to the project who will remain on-site during all renovation, repair and painting work.
- C. Maintain at each job site and post the following documents:
 - 1. Employee Respiratory Protection Program.
 - 2. Michigan Right-To-Know poster.
 - 3. Material Safety Data Sheet locator.
 - 4. Company standard operating procedure.
 - 5. This specification section.
 - 6. Material Safety Data Sheets for products used on job.
 - 7. EPA or Michigan Department of Community Health Renovator Certificates for each supervisor (initial and the most recent refresher).
 - 8. Proof of lead awareness training and medical approvals for all workers on-site.
 - 9. For renovations in common areas and child care facilities post a written notification detailing the general nature and locations of the work and anticipated completion date.
 - 10. For renovations in common areas and child care facilities post a copy of the EPA lead pamphlet "Renovate Right-Important Lead Hazard Information for Families, Child Care Providers and Schools".

- D. Open-flame burning or torching of lead-based paint is prohibited.
- E. Machine sanding, grinding, abrasive blasting and sandblasting of lead-based paint is prohibited, unless the sanding, grinding, blasting, or sandblasting is conducted using a shrouded tool with a high-efficiency particulate air (HEPA) exhaust control that removes particles of 0.3 microns or larger from the air at an efficiency of 99.97% or more.
- F. Dry scraping of lead-based paint is permitted only in conjunction with heat guns or around electrical outlets. Operating a heat gun on lead-based paint is permitted only if the temperature generated by the heat gun is less than 1,100 °F.

3.2 HEALTH AND SAFETY REQUIREMENTS

- A. General: Determine employee exposure to lead in air as required in MIOSHA Lead in Construction Standard.
- B. Exposure Assessment: If the Contractor has made a previous Exposure Assessment that is representative of the task to be performed on-site, the Contractor may rely on this data and determine the need for personal protective equipment and work practice controls based upon this data, if approved by EHS.
- C. Personal Air Monitoring: When the Contractor does not have an Exposure Assessment or the Assessment is determined to be insufficient, the Contractor must conduct personal air sampling in accordance with the MIOSHA Lead in Construction Standard and follow all State and Federal regulations and procedures as covered in Certification Training courses.

3.3 PREPARATION

DELETE PARAGRAPH BELOW IF NO RENOVATION WORK ON THE EXTERIOR.

- A. General: Prepare Work Areas in a manner that will protect Owner's personnel and property and contain the work area so that no dust or debris leaves the work area.
- B. Preparing Building Exteriors: Ensure adequate measures are in place to prevent dust and debris from escaping the work area and to limit airborne lead content below the Action Level of 30 ug/m3 (micrograms per cubic meter) adjacent to the Work Area.
 - 1. Close all doors and windows within 20 feet of the renovation on the same floor and all doors and windows on floors below the renovation area.
 - 2. Ensure that doors within the work area that will be used while the job is being performed are covered with plastic sheeting in a manner that allows workers to pass through while confining the dust and debris.
 - 3. Erect barricades and install warning tape or signs as necessary to prevent inadvertent exposure of passersby to LBP in all forms, including, but not necessarily limited to dust, particles, and fumes.

4. Completely cover grounds and vegetation extending 10 feet beyond the perimeter or a sufficient distance to collect falling debris with minimum 8-mil thick polyethylene sheets with joints between sheets lapped and taped; with one edge taped to adjacent building surfaces below area of work; and with free ends secured in position with stakes, tie-down lines or weights. Cover sufficient ground area to capture wind-blown chips, dust and particles. Contractor is responsible for any paint debris found at project completion.

DELETE PARAGRAPH BELOW IF NO RENOVATION WORK WITHIN THE BUILDING

C. Preparing Building Interiors:

1. Discontinue building ventilation within the Work Area and seal off ventilation supply, return or exhaust diffusers, grilles or openings.
2. Remove all objects from the work area or cover with plastic sheeting with all seams and edges sealed.
3. Close windows and doors in the work area to form a Critical Barrier. Doors must be covered with plastic sheeting.
4. Cover the floor surface a minimum of six feet beyond the perimeter of the surfaces undergoing renovation or a sufficient distance to contain the dust, whichever is greater.
5. Post warning signs at all entrances to the Work Area that states the following, as required in MIOSHA Lead in Construction Standard:

**DANGER
LEAD WORK AREA
MAY DAMAGE FERTILITY OR THE UNBORN CHILD
CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM
DO NOT EAT, DRINK OR SMOKE IN THIS AREA**

3.4 WORK PRACTICES

A. General: Perform renovation of LBP coated materials in compliance with the following requirements:

1. Restrict access to Work Area to essential personnel.
2. Use moist-removal methods where applicable. Do not over-saturate the Work Area.
3. Remove contaminated clothing and personal protective equipment before leaving the Work Area, or Work Area enclosure, as applicable.
4. If dust or debris is escaping the Work Area or if the Action Level is exceeded outside Work Area, discontinue work and modify Critical Barrier, or perform other modifications of methods or materials as required to prevent dust and debris from escaping.
5. Prohibit eating, drinking, and smoking in the Work Area.
6. Collect and contain all paint chips, debris, personal protective equipment and protective sheeting, daily. Seal in heavy duty bags or drums to prepare for proper disposal.

7. Use precautions (such as tack mats, shoe covers, HEPA vacuuming and or wet wiping) to ensure that all personnel, tools, waste containers and other items are free of dust and debris when leaving the area.

3.5 POST RENOVATION CLEANING

- A. Upon completion of work, mist the plastic sheeting and fold the plastic containment sheeting dirty side inward, after misting and seal edges or dispose of plastic in sealed bags.
- B. Brushing, brooming and other dry methods that generate airborne dust are prohibited.
- C. Remove and dispose of all solid waste used for protection and clean-up as Non-Hazardous Waste as indicated in Disposal Article (2.6) below.
- D. Clean all objects and surfaces within project area, and two feet beyond, per the methods detailed below, always cleaning higher to lower.
 1. Clean walls starting at the ceiling and working down to the floor by either vacuuming with a HEPA vacuum or wiping with a damp cloth.
 2. Thoroughly vacuum all remaining surfaces and objects in the work area including furniture and fixtures, with a HEPA vacuum. The HEPA vacuum must be equipped with a beater bar when vacuuming carpets and rugs.
 3. Wipe all remaining surfaces and objects in the area, except for carpeted and upholstered surfaces with a damp cloth. Mop uncarpeted floors thoroughly, using a mopping method that keeps the wash water separate from the rinse water, such as the 2-bucket mopping method or using a wet mopping system. Properly contain all wash water for testing to determine if it is hazardous. Dispose wash water as Hazardous Waste if testing indicates that it is hazardous. If testing indicates that it is non-hazardous filter for particulates and dispose of in a sanitary drain. Do not dispose of wash water in storm drains.
- E. After cleanup is complete a Certified Renovator must perform a visual inspection to determine if dust, debris or residue is present. If dust, debris or residue is present the area must be re-cleaned and the visual inspection repeated.
- F. After the visual inspection has passed, exterior areas are considered clean. Cleanup of interior areas must be further verified. Start the post renovation cleaning verification process with windows sills and then proceed to uncarpeted floors and countertops, cleaning higher to lower as detailed below:
 1. The Certified Renovator must wipe, with a wet disposable cleaning cloth that is damp to the touch, each window sill, uncarpeted floor and countertop within the work area and compare the cleaning cloth to the cleaning verification card. If the cleaning cloth is darker than the verification card cleaning must be repeated. If it is not, then cleaning is complete.

2. Each window sill in a project area must be wiped with a separate cleaning verification cloth.
 3. Uncarpeted floors and countertops in the project areas must be less than 40 square feet (sf). If the surface is larger than 40 sf, the work area must be divided into roughly equal sections less than 40 sf.
 4. Wipe each section separately with a new wet disposable cleaning cloth.
 5. Floors must be wet wiped with an application device with a long handle and a head to which the cloth is attached.
 6. For any areas that failed, repeat cleaning, wet wipe again and compare cloth again to the verification card. If the cleaning cloth is darker than the verification card, cleaning must be repeated. If the cleaning cloth is not darker than the verification card, cleaning is complete.
 7. For any areas that have failed two wet wipes, wait until the area has dried completely or 1 hour has passed, whichever is longer. Once dry, wipe that area with a dry disposable cleaning cloth and consider the area adequately cleaned.
- G. Contractor is responsible for re-cleaning any areas that do not pass applicable cleaning verification standards. The Owner or Owners Consultant may dictate the method of cleaning to reach clearance.
- H. The Owner reserves the right to perform dust clearance sampling to determine if a renovated area is free of lead hazards.
- I. Remove all warning signs and tape after proper cleaning has been verified.

3.6 DISPOSAL

- A. Disposal of Non-Hazardous Lead-Based Paint or Lead-Based Paint Components: Collect Non-hazardous LBP waste in a covered dumpster and dispose of the waste at a landfill.
- B. Project Waste (LBP paint and wash water only): Coordinate testing, collection, and removal of waste from the Project Site with EHS. Where testing of waste indicates waste is Non-Hazardous, dispose as in Paragraph above, "Disposal of Non-Hazardous LBP or LBP Components. If waste is classified as Hazardous, comply with the following requirements:
1. Keep lead waste segregated from other waste and from other Projects. Do not co-mingle waste. Collect and place solid and liquid waste in Owner-provided drums. DO NOT MIX LIQUID AND SOLID WASTE.
 2. Store containers in the Work Area within the Project Site, protected from physical damage, weather, fire hazard and vandalism. Ensure that soil, ground water, and drains or sewers within the storage area are protected from possible contamination. Keep containers secure and tightly closed at all times, except when adding waste.
 3. Place appropriate labels on all containers. Provide all information required on the label; mark labels using indelible ink. The name of the "Waste Generator" is as follows: "Building Name" 1655 Dean Road, Ann Arbor, Michigan 48109.

4. Mark the side of each drum with the name and phone number of Owner's Representative knowledgeable about the type of waste contained.
 5. Prepare a complete and accurate State of Michigan Hazardous Waste Manifest. Obtain approval from Owner's Representative (EHS) to assure correct Generator Name and US EPA Identification Number.
- C. Disposal of LBP waste shall be done in coordination with EHS-Hazardous Materials Management (HMM).
1. Contact EHS-HMM at least one week in advance to request pick-up of the containers.
 2. EHS-HMM will pickup and dispose of properly packaged and staged LBP waste at no cost to the contractor. Call the EHS-HMM Program at 734-763-4568 to schedule a pickup immediately after LBP waste has been staged.

DIVISION 02 EXISTING CONDITIONS

SECTION 028400 - PCB REMEDIATION

END OF CONTENTS TABLE

DIVISION 02 EXISTING CONDITIONS
SECTION 028400 - PCB REMEDIATION

THIS SECTION DESCRIBES REQUIREMENTS FOR DEMOLITION AND DISPOSAL OF BUILDING MATERIALS SUSPECTED OF CONTAINING PCB'S. THIS APPLIES TO ALL SUSPECT PCB CONTAINING BUILDING MATERIALS TO BE DISTURBED DURING DEMOLITION OR RENOVATION. AEC MUST CONTACT OSEH EARLY IN THE DESIGN PHASE FOR A PCB SURVEY OF SUSPECT MATERIALS TO BE DISTURBED. OSEH WILL CONDUCT SAMPLING TO DETERMINE THE PRESENCE AND QUANTITY OF PCBs IN THE MATERIAL.

PART 1 - GENERAL

1.1 SUMMARY

- A. This section specifies requirements for the demolition and disposal of PCB Bulk Product Waste (BPW). The requirements of this section apply to demolition or renovation of the following:
 - 1. Material (paint, caulk and sealants etc.) previously determined or assumed to contain greater than 50 parts per million (ppm) PCBs.
 - 2. Substrate contaminated (>50 ppm) by PCB paints, caulks and/or sealants etc., if removed at the same time as PCB BPW.
- B. Extent of PCB-containing materials is as follows:

INSERT SURVEY INFORMATION HERE.

1.

1.2 DEFINITIONS

- A. The abbreviation "PCB" stands for Polychlorinated Biphenyl.
- B. The term "PCB bulk product waste" refers to waste derived from manufactured products containing PCBs in a non-liquid state, where the concentration at time of disposal is greater than or equal to 50 parts per million (ppm). This includes caulks, applied dried paints, varnishes, waxes, or other similar coatings or sealants.
- C. The term "Project Site" indicates the limits of the project site as indicated on drawings or by provisions of this specification.
- D. The term "work area" indicates the area within the critical barrier.
- E. The term "critical barrier" indicates the perimeter of the enclosure within which PCB disruption/removal work takes place. Critical barriers may include existing floor, wall, and ceiling structures, as well as constructed partitions, closures and seals.
- F. The term "EHS" refers to Owner's Environment, Health and Safety Department, 1239 Kipke Drive, Ann Arbor, MI 48109-1010, phone (734)747-1142.

1.3 RELATED SECTIONS

- A. Demolition and removal of items not containing PCB as a component is included in Division 02 Section "Selective Demolition."

PART 2 - (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 PCB BULK PRODUCT WASTE REMOVAL, GENERAL

- A. Conduct PCB removal operations in a manner that fully protects Contractor's and subcontractor's employees, the general public, and building occupants from exposure to PCB's.
- B. Protect adjacent areas, materials and surfaces from damage due to demolition operations, including but not necessarily limited to the following:
 - 1. Water damage.
 - 2. Dirt, dust and debris.
 - 3. Abrasion.
 - 4. Cuts and scratches.
 - 5. Holes from fasteners for temporary barriers.
- C. All removal shall be conducted within a regulated area that complies with the following requirements:
 - 1. Establish a regulated area with caution tape and signage to keep unauthorized personnel out of the area.
 - 2. Allow only authorized, properly protected personnel to enter the regulated area. Immediately report unauthorized individuals entering the work area to EHS or the Owner's consultant.
- D. Provide respiratory protection to employees as required by current MiOSHA regulations including Part 451 Respiratory Protection and MiOSHA part 301 Air Contaminants.
