- 2. All schematics and drawings shall be done on CAD. The electronic files shall be in the latest version of AutoCAD (or as noted otherwise)
- 3. Product data shall include description and complete engineering data for each control system component. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. valves, dampers, relay & switches, thermostats, temperature transmitters, pressure transmitters, air flow stations, controllers, etc.).
- 4. Since many items are interrelated and should be checked concurrently, all of the MSCC's DDC related shop drawings shall be submitted at one time. No consideration will be given to partial submittals, except valve and damper submittals on approval only. Any partial submittals must be included in the complete submittal package.

H. Project Record Documents

- 1. Submit Project Record Documents at the time of substantial completion.
- 2. Revise shop drawings to reflect actual installation and operating sequences and provide final electronic files in PDF.
- 3. PDFs shall contain the following files in the indicated format:
 - a. As-built drawings in PDF format (separate file for each system's related drawings/sheets).

- b. Sequences of operation in PDF. Provide separate files for each system's sequence of operation.
 - c. Product data and catalog specification sheets in PDF format (separate file for each product).
4. List of all BACnet IP and MSTP devices installed with their network IP addresses, BACnet Device Instance numbers and associated BACnet network numbers. MSCC shall be responsible for uploading the completed, as-built BMS Addressing Template required under section 1.9.A upon project substantial completion.
 5. All files shall be dated and shall contain the UMH project RTN number and UM AEC P100 number when applicable.
 6. Electronic copy of the field panel database/ device configuration backup for all new devices installed.

I. Operation and Maintenance Manuals

1. The MSCC shall provide the specified number of copies of complete operation and maintenance instructions for all system components furnished.
2. Include hard-copies of all Project Record Documents described above in paragraph G.
3. Indicate final set points, settings, and adjustments of all components.
4. Include project specific catalog cuts and data sheets indicating installation, operation, maintenance, repair, wiring diagrams, calibration, calibration tolerances, inspection period, cleaning methods and cleaning materials for all components.

J. Posted Operating Instructions

1. Provide panel related as-built documents in protective binder or clear plastic display envelope for each control panel. These instructions shall include such items as as-built control diagrams and sequences of operation, simplified narrative instructions and materials necessary to aid in the operation of the equipment at the local control panels.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Shipping and storage protection shall be provided by manufacturer to ensure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.11 WARRANTY

- A. The Building Management System shall be guaranteed for a period of one year after final approval has been granted by the Owner and the project Architect/Engineer. The warranty shall be provided for a completely installed system, including all components, parts and assemblies. The warranty shall cover parts, materials and labor to correct any defects in materials and workmanship.
- B. The MSCC shall initiate the warranty period by formally transmitting to the Owner commencement notification of the period for the system and devices accepted.

- C. Provide 24 hour per day emergency service during warranty period. Provide phone number(s) where warranty service can be reached at all times. Respond on-site and make corrections within 12 hours of a warranty service call.
- D. Provide and install any software or firmware revisions which are released by the DDC system manufacturer during the warranty period, at no additional cost to the Owner. Revisions that require updates at the central BMS server(s) will be coordinated with the SI at no additional cost to the Owner.
- E. The MSCC shall provide programming modifications necessary to fine tune equipment sequences during the warranty period, consistent with achieving the sequence of operation and design intent, at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 ACCEPTABLE PRODUCT MANUFACTURERS

- A. All pneumatic devices, valves, damper operators, EP relays, PE switches, low temperature detection thermostats, etc. shall be as manufactured by Honeywell, Johnson Controls or Siemens, unless noted otherwise in following sections. See "Products" for acceptable manufacturers for sensors, etc.
- B. DDC controllers and related software shall be in accordance with the pre-approved parts list as manufactured by the respective MSCC listed under Part 1- ACCEPTABLE MECHANICAL SYSTEMS CONTROLS CONTRACTORS.

2.2 GENERAL DDC CONTROL ARCHITECTURE

- A. IP DDC controllers and routers shall provide IP routing capabilities to allow communication over UMH HITS's network (layer 3 IP) and between controllers. BACnet objects shall be routed from the new MCS installation to the existing central BMS server(s) that reside on the HITS network. The SI will utilize these BACnet objects to generate system graphics at the existing BMS server(s).
- B. All devices communicating across the UMH HITS layer 3 IP network shall be capable of supporting a minimum network speed of 100 MBPS.
- C. The complete Mechanical Control System (MCS) shall consist of the following:
 - 1. Data integration to UMH's existing BACnet AWS servers and operator work stations.
 - 2. Peer-to-peer DDC controllers communicating with other controllers (where IP capable) and UMH's existing BACnet AWS over the HITS layer 3 IP network.
 - 3. Peer-to-peer B-AAC, B-ASC, B-SS, B-SA and B-OD's communicating with each other over a MS/TP FLN provided by the MSCC.
 - 4. Sensors, transducers, thermostats, actuators, wiring, etc. directly wired to their respective DDC controller for a complete and operational MCS.
 - 5. Networks that are not peer-to-peer are not allowed.

- D. BACnet Broadcast Management shall be facilitated by one B-BC per IP Subnet and incorporate a BACnet Distribution Table. B-BC's that handle BBMD's and I/O functionality shall be properly sized to handle memory & processing requirements.
- E. Terminal units (VAV, FCU, etc) that do not need the global command functionality that a B-BC could provide are allowed to be integrated to the Desigo B-AWS via the use of a BACnet IP Router. Router shall convert BACnet MS/TP to BACnet IP and function as a BBMD.
- F. The system shall be modular in nature and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, Building Controllers, Advanced Application Specific Controllers, Application Specific Controllers, expansion modules and operator devices. The system shall be configured to correspond with the modular configuration of the site and to enable the progressive expansion of the site in this same modular manner.
- G. Minimize onsite integration time by performing software programming and testing offline before integration onto the live system. Software development will not be permitted online at the project site.
- H. MSCC shall develop the communications network architecture and overall system performance to have a maximum latency of 2 seconds from a state or value change at the controller to where the change is reflected on the BMS graphic screen.
- I. System architectural design shall eliminate dependence upon any single device for control execution and alarm reporting. Each DDC controller shall operate independently by performing its own specified control, alarm management, operator I/O and data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies, reporting or alarm and trending function at other operational devices. Data collection that requires a single mechanism for user notification or viewing is strictly prohibited.
- J. All controllers within a building shall be able to access any data from, or send control commands directly to, any other DDC controller or combination of controllers in the same building without dependence upon a central processing device (peer-to-peer).
- K. UMH's HITS Layer 3 Network is the preferred primary network communication means and will be required for communication between all Building Controllers (B-BC), IP capable B-AAC's and the BMS B-AWS, via BACnet IP. The use of MS/TP communications for interconnecting the said IP capable devices is strictly prohibited. HITS shall provide and install the primary network, based on coordination with the MSCC.
- L. The secondary FLN shall utilize the Master-Slave/Token-Passing (MS/TP) protocol, as acknowledged by the ANSI/ASHRAE 135 standard. This secondary network shall be provided and installed by the MSCC. Proprietary RS-485 or equivalent links will not be considered unless otherwise noted. The MS/TP link shall operate at a 38.4 Kbps minimum, and utilize no more than 2 repeaters in any instance. Multi-channel repeaters will not be permitted.

- M. All BACnet IP routers connected to the HITS network, whether integral to a controller or not, must support BACnet Broadcast Management Device (BBMD) service. Multi-casting or global broadcasting will not be permitted without the use of a BBMD.
- N. FLN data communications media shall be provided by a shielded twisted pair conductor.
- O. The FLN shall allow shared point and control information between BACnet DDC controllers. All required MS/TP repeaters, hubs, active links, gateways, etc. and associated power supplies shall be provided as required to provide shared point and control information between DDC controllers. Ethernet IP network devices and path shall be provided by UMH's HITS.
- P. Failure of any individual FLN installed BACnet controllers shall not cause the loss of communications between peer controllers.
- Q. All data transmitted must be positively acknowledged as received or negatively acknowledged as not received. Negative acknowledgments shall cause a retransmission of the data. Network connected devices must send a "Heartbeat" message at a configurable time interval. Lack of a "Heartbeat" message after successive retries shall constitute a device failure and shall be recognized as such by the network and be reported as a network alarm at the BMS B-AWS.
- R. Error recovery and communication initialization routines shall be resident in each network connected device.
- S. UL864 controllers and devices installed for equipment utilized in a smoke control sequence shall not be on the same MS/TP network segment as non-UL864 controllers and devices. These devices shall be on their own MS/TP network segment.
- T. The MSCC shall provide an IP connected DDC controller in the same room as the equipment it serves, unless the contract documents explicitly direct otherwise. Designs that situate controllers in different rooms or on other floors than the equipment being served (ie remote I/O) shall not be allowed without special permission by FPD Engineer. IP connectivity to every DDC controller is preferred, however in an instance where multiple pieces of equipment are within a common room, a MS/TP bus of up to 5 MS/TP controllers shall be allowed.
 - 1. Exceptions to this are the use of MS/TP connected DDC controllers for equipment that functions as a system, ie chiller plants utilizing chillers and cooling towers shall utilize an IP connected controller in the chiller plant and a MSTP subnetwork to a secondary controller serving the cooling towers on the roof. MS/TP controllers are preferred to remote I/O modules for these types of applications. Use of remote I/O shall not be allowed without special permission by FPD engineer.

SPEC WRITER NOTES: INCLUDE THE FOLLOWING PARAGRAPH "R" FOR ALL INPATIENT I-2 FACILITIES AND ANY OTHER CRITICAL FACILITIES (IE DATA CENTERS, ETC). OTHERWISE DELETE PARAGRAPH "R" BELOW.

- U. In general, the MSCC shall provide a fault tolerant BMS architecture such that the loss of a single DDC controller does not inhibit the continued, automatic operation of that utility service (ie chilled water, heating hot water, airflow, etc). BMS architecture does not need to be fully redundant, but rather be capable of continuing to provide a partial capacity of the utility being produced. For example, do not control the entire facility chilled water plant (multiple chillers, pumps and towers) off a single DDC controller. Provide multiple (minimum of two) DDC controllers for all critical, major mechanical systems, including but not limited to:
 1. Minimum of two (2) DDC controllers per chilled water plant (chillers, pumps, cooling towers, etc).
 2. Minimum of two (2) DDC controllers per heating hot water plant (boilers, heat exchangers, pumps, etc).
 3. A maximum of two (2) air handling units (AHU) on a single DDC controller. AHU's sharing a DDC controller shall not be designed as backup for one another, i.e. thru a header system or common SA or RA ductwork.
 4. Air handling units (AHU) serving operating rooms (OR's) are required to utilize a dedicated DDC controller per AHU.
- V. BMS designs utilizing DDC controllers that only manage centralized functions (ie alarming/ trending, scheduling, static pressure reset, supervisory control, etc) shall not be allowed. All programming identified as part of a systems sequence of operation shall reside within that systems DDC controller (ie static pressure reset for an air handling unit shall reside within the appropriate air handling unit's DDC controller).

2.3 GENERAL DDC CONTROLLER REQUIREMENTS

- A. Stand-alone microprocessor board with ROM and fully custom programmable RAM, EPROM, and/or EEPROM memory, integral interface equipment and power surge protection. DDC controllers shall be connected directly to sensors, controlled devices and the communication network.
- B. All DDC controllers shall use the latest version of ANSI/ASHRAE Standard 135 BACnet standard for communications, have passed BTL certification as available and be listed as compliant with UL916 Standard for Energy Management Equipment. DDC controllers used in smoke control applications must also be listed as compliant with UL864 Standard for Control Units and Accessories for Fire Alarm Systems.
- C. Controllers shall be listed by BACnet Testing Laboratories (BTL) as conforming to the required standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
- D. The "Present_Value" property of all analog output and binary output objects shall be writable so that UMH Systems Monitoring personnel have the capability to override all system outputs from the central BMS server(s).
- E. Each DDC controller shall support firmware upgrades without the need to change hardware.

- F. Each DDC controller shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The DDC controller shall provide both local and remote annunciation of any detected component failures, low battery conditions or repeated failure to establish communication for any system.
- G. DDC controller types shall be one of three types, a BACnet Building Controller (B-BC), a BACnet Advanced Application Specific Controller (B-AAC) or a BACnet Application Specific Controllers (B-ASC).
 - 1. Building Controllers (B-BC) shall be used for all major mechanical equipment and/or systems (i.e. chilled water, heating hot water, large AHU's, etc.).
 - 2. Advanced Application Specific Controllers (B-AAC) shall be used, as an extension of a B-BC's performance & capacity, for control of all medium and small mechanical systems and/or terminal equipment. In addition, all room types listed under section 3.4.A shall be provided with a B-AAC (or B-BC) controller; B-ASC controllers are not allowed to serve these room types.
 - 3. Application Specific Controllers (B-ASC) shall only be allowed to be used on terminal equipment including VAV boxes, FCU's, etc, with the exception as noted above.
- H. See Table 1 under section 3.13 at the end of this specification, which compares integration functionality of the Desigo B-AWS to the various MSCC BACnet controllers. MSCC shall be responsible for ensuring minimum BIBB performance per Table 1.
- I. Provide and install the latest firmware on all controllers. This is defined as the latest version of firmware, as tested and recommended by the manufacturer, prior to project completion.
- J. Alarm Management
 - 1. Alarm management shall be provided within the controller software to monitor and direct alarm information to operator devices.
 - 2. Each Building Controller shall perform distributed, independent alarm analysis, minimize network traffic, and prevent alarms from being lost. At no time shall the Building Controllers ability to report alarms be affected by either operator or activity at a PC workstation, local I/O device or communications with other panels on the network.
 - 3. Conditional alarming shall allow generation of alarms based upon user defined multiple criteria.
 - 4. Binary Alarms. Each binary alarm object shall be set to alarm based on the operator-specified state. Provide the capability to automatically and manually disable alarming.
 - 5. Analog Alarms. Each analog alarm object shall have both high and low alarm limits. Alarming must be able to be automatically and manually disabled.
 - 6. All alarm shall include the point's user-defined language description and the time and date of occurrence.
 - 7. Alarm reports and messages shall be routed to user-defined list of operator workstations, or other devices based on time and other conditions. An alarm shall be able to start programs, print reports, be logged in the event log, generate custom messages, and display graphics.

8. The user shall be able to add a 200-character alarm message to each alarm point to more fully describe the alarm condition or direct operator response. Each Building Controller shall be capable of storing a library of at least 50 alarm messages. Each message may be assigned to any number of points in the Controller.
9. Operator-selected alarms shall be capable of initiating a trigger to an advanced annunciation, such as text, email, etc.
10. An alarm history log shall report the start of the alarm condition, acknowledgement by a user and return of the alarm to normal condition.
11. Controllers shall have enhanced alarming capabilities thru BACnet Event Enrollment Objects to allow BACnet integration of complex alarming and alarm management with the BMS frontend. Examples include:
 - a. Alarms based on a deviation from setpoint
 - b. Alarms based on a sustained condition over time (ie time delay)
 - c. Alarm management that allows the capability for time delays or maintenance mode to allow alarms to be delayed during maintenance overrides.

K. Data Collection

1. A variety of historical data collection utilities shall be provided to manually or automatically sample, store, and display system data for all points.
2. Building Controllers shall store point history data for selected analog and digital inputs and outputs.
3. Any point, physical or calculated may be designated for trending. Any point, regardless of physical location in the network, may be collected and stored in each Building Controllers point group.
4. Two methods of collection shall be allowed: either by up to four pre-defined time intervals or upon a pre-defined change of value. Sample intervals of 1 minute to 7 days shall be provided.
5. Each Building Controller shall have a dedicated RAM-based buffer for trend data and shall be capable of storing a minimum of 10,000 data samples.
6. Trend data shall be stored at the Building Controllers and uploaded to the workstation when retrieval is desired. Uploads shall occur based upon either user-defined interval, manual command or when the trend buffers are full. All trend data shall be available for use in third-party personal computer applications.

SPECIFICATION EDITOR: UMH REQUIRES ALL BACNET BUILDING CONTROLLERS (B-BC) TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL B-BC LOCATIONS TO FACILITATE BACNET IP INTEGRATION TO FRONT END.

L. BACnet Building Controller (B-BC):

1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Building Controller (B-BC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.

2. Controllers shall support Internet Protocol (IP) for communications to other BC's and the BMS front-end and MS/TP communication to B-AAC's and B-ASC's.
3. Controllers shall have a 32 bit processor with an EEPROM, flash driven operating system. They shall be multi-tasking, multi-user, real-time digital control processors and permit I/O expansion for control / monitoring of up to 48 I/O. Controller size shall be sufficient to fully meet the requirements of this specification. Controllers shall be fully programmable while supporting standard energy management functions, including but not limited to:
 - a. Alarm detection and reporting
 - b. Automatic Daylight Saving Time switchover
 - c. Calendar-based scheduling
 - d. Closed loop PID control
 - e. Duty cycling
 - f. Economizer control
 - g. Equipment scheduling, optimization and sequencing
 - h. Event scheduling
 - i. Historical trend collection
 - j. Holiday scheduling
 - k. Logical programming
 - l. Reset schedules
 - m. Night setback control
 - n. Peak Demand Limiting (PDL)
 - o. Start-Stop Time Optimization (SSTO)
 - p. Temperature-compensated duty cycling
 - q. Temporary schedule override
4. Provide controller with integral power switch. If an integral switch is not provided by the manufacturer, the MSCC shall provide a separate dedicated transformer and switch within each enclosure for each controller present.
5. The operator shall have the ability to manually override automatic or centrally executed commands at the Building Controller via local, point discrete, hand/off/auto operator override switches for digital control type points and gradual switches for analog control type points. These override switches shall be operable whether the panel processor is operational or not.
6. Controllers shall provide local LED status indication for power, communications, status and each digital output for constant, up-to-date verification of all point conditions without the need for an operator I/O device.
7. All points associated with a given mechanical system (i.e., an air handling unit) will be controlled from a single Building Controller or point expansion panel(s) from the respective master. All expansion modules shall be located in the building controller enclosure or an attached enclosure. No points from a given mechanical system may be distributed among multiple panels - points must be run back to a single Building Controller dedicated to that mechanical system. Multiple mechanical systems shall be allowed on a single controller Closed-loop control must never depend upon network communications. All inputs, program sequences, and outputs for any single DDC control loop shall reside in the same Building Controller.
8. A variety of historical data collection utilities shall be provided for manual or automatic sampling, storing and displaying system point data.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 21

- a. Building Controllers shall store point history data for selected analog and digital inputs and outputs:
 - 9. Building Controllers shall also provide high resolution sampling capability for verification of control loop performance. Operator-initiated automatic and manual loop tuning algorithms shall be provided for operator-selected PID control. Provide capability to view or print trend and tuning reports.
 - 1) Loop tuning shall be capable of being initiated either locally at the Building Controller or from a network workstation. For all loop tuning functions, access shall be limited to authorized personnel through password protection.
 - 10. Provide controllers that, upon full system power recovery, all clocks shall be automatically synchronized, and all controlled equipment shall be automatically re-started based on correct clock time and sequence of operation.
 - 11. Provide additional controllers or I/O modules if necessary in each DDC panel so that each panel has at least 20% spare universal I/O capacity for connection of future points. Provide all processors, power supplies, and communication controllers so that the implementation of adding a point to the spare point location only requires the addition of the appropriate expansion modules, sensors/actuators and/or field wiring/tubing.
 - 12. Controllers shall provide at least one data communication port for operation of operator I/O devices such as portable laptop operator's terminals. Controllers shall allow temporary use of portable devices without interrupting the normal operation of permanently connected printers or terminals. A USB port shall alternatively be available to support local HMI tools connection.
 - 13. Field bus adaptors may be used, as an extension of the B-BC, to facilitate communication between the B-BC and remote field devices (sensors, actuators). Adaptors shall be microprocessor based and utilize advanced diagnostics and configuration. Adaptor shall be housed in panel or junction box enclosure.
- M. BACnet Advanced Application Specific Controller (B-AAC):
- 1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Advanced Application Specific Controller (B-AAC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
 - 2. Controllers shall support MS/TP communication to B-BC's and other B-AAC's and B-ASC's. Also acceptable are B-AAC controllers that support Internet Protocol (IP) for communications to other BC's/ AAC's and the BMS front-end and MS/TP communication to B-AAC's/ ASC's.
 - 3. Controller shall be a microprocessor-based, 32 bit, multi-tasking, real-time digital control processor capable of stand-alone operation for medium sized mechanical systems and/ or control of roof-top units, VAV terminal units, CAV terminal units, dual-duct terminal units, fan-coil units, heat pump units.
 - a. If the hardware point requirements of any medium-sized system should exceed the I/O configuration of available B-AAC offerings then a B-BC must be used. Control of one piece of mechanical equipment may not be performed by more than one controller.

4. Controllers shall be peer-to-peer devices with hand/off/auto switches for each digital output. Switch position shall be supervised in order to inform the system that automatic control has been overridden. Switches will only be required for non-terminal applications (not required for VAVs, CAV's and other above terminal devices). All inputs and outputs shall be of the universal type, allowing for additional system flexibility
5. Each controller shall support its own real-time operating system. Controllers without real-time clock functionality will only be permitted for use on terminal or unitary equipment such as VAV boxes, fan coil units and auxiliary monitoring and control.
6. Provide each controller with sufficient memory to accommodate point databases and operating programs. All databases and programs shall be stored in non-volatile EEPROM. The controllers shall be able to return to full normal operation without user intervention after a power failure of unlimited duration.
7. Controllers must be fully programmable. All programs shall be field-customized to meet the user's exact control strategy requirements. Controllers utilizing pre-packaged or canned programs shall not be acceptable.
8. All points used for a single mechanical system shall be connected to the same B-AAC. Points used for control loop reset based on outside air, or space/zone temperature, or extremely remote differential pressure sensors on slow acting control loops are exempt from this requirement.
9. Provide spare additional I/O such that future use of spare capacity shall require providing only the field device, field wiring, point database definition and operational sequence programming changes as required. Additional point modules may be required to implement use of these spare points.
 - a. Provide at least one (1) spare universal input and one (1) spare universal output or 15% spare I/O of the total capacity of each B-AAC whichever is greater.
 - b. If B-AAC I/O is not universal then provide at least one (1) spare analog input, one (1) spare digital input, one (1) spare analog output and one (1) spare digital output or 15% spare I/O of the total capacity for each point type of each B-AAC whichever is greater.

N. BACnet Application Specific Controller (B-ASC):

1. Provide controllers conforming to the latest version of ANSI/ASHRAE 135 BACnet Application Specific Controller (B-ASC) standard device profile and support all of the minimum required BACnet Interoperability Building Blocks (BIBBs) associated with this device profile.
2. Controllers shall support MS/TP communication to B-BC's, B-AAC's and other B-ASC's.
3. Controller shall be a microprocessor-based, 32 bit, multi-tasking, real-time digital control processor capable of stand-alone operation for control of mechanical terminal units, ie VAV terminal units, CAV terminal units, air terminal units, dual-duct terminal units, fan-coil units, heat pump units and rooftop units.
4. Each controller shall be capable of sharing point information with other B-BC, B-AAC, or B-ASC on a peer-to-peer basis via the BACnet network.

5. Controllers shall include all point inputs and outputs necessary to perform the specified control sequences. All inputs and outputs shall be of the universal type (outputs may be utilized either as modulating or two-state). Analog outputs shall be industry standard signals such as 24V floating control and 0-10VDC allowing for interface to a variety of modulating actuators.
 6. Provide each controller with sufficient memory to accommodate point databases and operating and application programs. All databases and programs shall be stored in non-volatile EEPROM. The controllers shall be able to return to full normal operation without user intervention after a power failure of unlimited duration.
 7. Each controller shall perform its primary control function independent of other DDC controller communications, or if communication is interrupted. Reversion to a fail-safe mode of operation during network interruption is not acceptable. Controller shall receive its real-time data from the Building Controller time clock to ensure network continuity.
 8. Each controller shall include algorithms incorporating proportional, integral and derivative (PID) values for all applications. All PID values and biases shall be field-adjustable by the user via operator terminals. Controllers that incorporate proportional and integral (PI) control algorithms only, without derivative (D) control algorithms, shall not be acceptable.
 9. Controllers shall provide diagnostic LEDs for power, communications and processor status. The controller shall continually check the status of its processor and memory circuits
 10. All points used for a single mechanical terminal unit shall be connected to a dedicated B-ASC. Points used for control loop reset based on outside air, or space/zone temperature, or extremely remote differential pressure sensors on slow acting control loops are exempt from this requirement.
 11. Controllers shall perform and manage historical data collection. Minimum sampling time shall be configurable with a minimum sample rate of once per second. Controller shall store point history files for all analog & binary I/O's.
- O. Controllers used for air terminal units (VAV's, CAV's, dual-duct mixing boxes):
1. Provide electronic damper operators compatible with the controller and the air terminal units provided. Actuator shall utilize a brushless DC operator, min 35 in-lbs of torque, floating control (unless noted otherwise).
 2. Controllers shall have an internal differential pressure transducer(s) capable of utilizing the total and static pressure signals from the air terminal unit's velocity sensor. The differential pressure transmitter shall be capable of 5% accuracy, not to exceed a velocity pressure error of 0.023" w.c., for the flow range 0-5600 fpm. Associated velocity sensor shall be furnished by air terminal unit manufacturer.
 3. Each controller shall have electronic outputs compatible with the electronically operated air terminal unit tempering coil control valve and perimeter radiation control valve where applicable.

4. Provide a discharge air sensor, mounted on the discharge of the terminal box reheat coil and/ or the outlet of dual duct mixing boxes, interfaced with the controller.
 5. DDC terminal controllers used in pressurized room applications shall not be permitted to modulate the terminal unit damper as part of a regular calibration cycle.
MSCC shall provide alternate controllers, proportional actuators and/or auxiliary devices (ie an 'auto-zero' auxiliary device(s) which functions to temporarily disengaging the transducer from the air velocity sensor so that a 0 cfm air volume reading is forced without changing the damper position) when serving these spaces to prevent negatively affecting room pressurization.
 6. If coordinated with mechanical contractor, controllers shall be furnished to the unit manufacturer for factory mounting; otherwise, controls shall be field installed.
 7. MSCC shall provide controllers with metal enclosure, complete with conduit knockouts.
- P. Provide wall-mounted space sensors for each controller performing space temperature control. Sensor shall be thermistor, 55°F-85°F range, +/-0.18°F resolution and capable of being field calibrated. Provide sensor with auxiliary communications port to allow remote connection to VAV controller(s) with a laptop computer, to facilitate configuration and commissioning of controllers.
1. Space Sensors in private spaces (i.e. office, exam, patient room, etc.):
 - a. Provide with digital temperature display
 - b. High accuracy set point adjustment
 - c. Flush mounted override button (only on systems where this function exists)
 2. Space Sensors in public areas (i.e. corridors, waiting rooms, dining areas, etc.):
 - a. Provide without digital LCD temperature display, no adjustment or override button.
 3. Space Sensors where occupant safety is a concern (i.e. psych. patient areas):
 - a. Install wall-mounted, blank-faced, stainless-steel temperature sensors with tamper-proof screws.
 4. Space Sensors in areas subject to abuse (i.e. utility corridors, central sterile, OR's/ Procedure Rooms, etc.):
 - a. Provide appropriate sensor per above with 2-piece crash guard, consisting of heavy gauge, bent stainless sheet steel securely anchored to wall on either side of sensor, consistent with guards used thru ought medical campus.
 5. Zone Sensors shall not be located on perimeter walls. Where explicitly indicated on drawings to do so and/or in locations near exterior walls and/or subject to drafts, sensors shall have insulated mounting bases to prevent false room temperature readings.
- Q. BACnet IP Routers:
1. BACnet router between MS/TP and B/IP (BACnet over IP) as well as a BBMD (BACnet Broadcast Management Device) for transportation of BACnet broadcasts over an IP network with several subnets.

2. Router shall comply with latest version of ASHRAE Standard 135 for communications.
3. Routers shall be UL864 listed when connected to BACnet MS/TP network segments that contain UL864 listed devices being used in a smoke control application.
4. Device shall be capable of routing BACnet packets over layer 3 IP network and shall support both the router and BACnet Broadcast Management Device (BBMD) networking options. BBMD shall support registrations by Foreign Devices.
5. 24 VAC power supply required for router(s) shall be provided by the MSCC. Supply from UPS source at DDC controller panel.
6. Device shall be password protected with customizable password and security settings.
7. Acceptable Manufacturers: Loytec, Cimetrics.

R. Human Machine Interface (HMI) panel:

SPECIFICATION EDITOR: UMH DESIRES TO UTILIZE A LOCAL INTERFACE TO SIMPLY DISPLAY CRITICAL INFRASTRUCTURE POINTS (IE AHU DISCHARGE AIR TEMPERATURES, DIFFERENTIAL PRESSURE, SUPPLY & RETURN WATER TEMPERATURES, ETC) AT THE TEMPERATURE CONTROL PANEL TO PROVIDE A QUICK VISUAL ON THE STATUS OF A SYSTEM. OLDER INSTALLATIONS HAVE USED LOOP POWER INDICATORS IN COMBINATION WITH RTD SENSORS (SPECIFIED ELSEWHERE IN THIS SPEC). NEW INSTALLATIONS SHALL UTILIZE HUMAN MACHINE INTERFACE PANELS AS SPECIFIED BELOW.

1. The MSCC shall install a 15" TFT LCD industrial color touchscreen in the cover of the DDC control panel. The HMI shall be custom configured by the MSCC to display controller status and DDC point values (i.e., AHU discharge temperature, differential pressure, supply & return temperatures, etc) relevant to the equipment the DDC controller is controlling. Standard default view shall be a read only display.
2. HMI shall utilize BACnet MS/TP direct to DDC controller as well as IP thru the HITs network for management and configuration of the device.
3. HMI shall at a minimum satisfy BACnet Operator Device (OD) functionality as a local MS/TP device.
4. HMI shall be suitable for operation in un-conditioned equipment room (32°F-122°F, 30%-90%RH).
5. Mount the HMI through the Auxiliary (Aux.) temperature control panel face, utilizing mounting bolts, with its center-line a nominal 60" A.F.F. Provide an additional Aux. panel for the HMI when insufficient room exists in the main Aux. panel.
6. Approved Manufacturers:
 - a. Loytec LVIS-3ME15-G2 with mounting frame

S. Room Pressure Monitor (RPM)

1. RPM shall be capable of measuring the differential pressure between two adjacent spaces at all locations shown on the prints. Each room shall have its own controller capable of stand-alone operation. Each monitor shall be capable of both visual and audible alarms.
2. Room pressurization monitoring system shall consist of a differential pressure transducer, wall-mounted display, DDC controller, wall/ ceiling-pickups with stainless steel trim kits and tubing.

3. Supply voltage shall be 24V AC. Monitors shall be capable of wipe down cleaning.
4. Each monitor shall support up to four (4) individual screens.
5. Each monitor shall have the ability to zero and set up the transducer as well as configure the alarm delay from the local interface.
6. When used on rooms with anterooms, monitor shall be capable of monitoring up to (2) two separate rooms (i.e. Patient Room and Anteroom) with separate room pressure readings for each.
7. Provide a monitor with a full color TFT/ QVGA touchscreen interface, min. size of 7" corner to corner. Monitors with color touchscreen displays shall be flush mounted and user programmable. Home screen graphics shall indicate one of five (5) configurable room modes. Each mode will allow for customized color, verbiage and graphic. Monitor shall display relevant room values (pressure, temperature, humidity, airflow, status, etc) as indicated on Contract Documents. Display shall provide a change of color for visual indication of alarm status: green for normal, orange for warning alarm (with notice on monitor to close door) and red for alarm. Monitor settings shall be accessed via password protected touch screen.
8. When used serving an Isolation Room or Protective Environment Room:
 - a. Monitor mode (i.e. Normal Patient Room or Isolation/ Protective Environment Room) shall be set by the user (clinician) thru touchscreen password access.
 - b. Shall be provided with a separate remote mounted monitor panel, located at the respective nurse's station- see drawings. Remote panel shall be flush mounted LCD screen, set to monitor and alarm (visual only) multiple RPM's. Panel shall be capable of indicating respective room's status (isolation/protective vs. normal patient room) and alarm.
9. Provide monitor with integrated room DDC controller, panel or valve mounted. Controller shall:
 - a. Be non-proprietary and be fully configurable and commissionable thru the monitor touchscreen.
 - b. Be native BACnet (MS/TP or IP), BTL listed high speed microprocessor based and integrated into the BMS.
 - c. Comply with Part 1- "Quality Assurance".
 - d. Be capable of direct connection to up to four (4) RPM's.
 - e. NOT serve as the control for the space. All control shall reside within the MSCC's BMS. RPM DDC controller shall function as a pass-thru controller only.
10. Monitor shall generate a local visual alarm upon loss of room pressure after a time delay. Monitors used on patient spaces shall have their audible alarms silenced. See Contract Documents for alarm setpoints and time delay.
11. DDC interface: Device shall be integrated to the BMS front-end via BACnet MS/TP or IP.
12. Provide panel with Room Differential Pressure Transmitter, specified herein.
13. Approved Manufacturers: Critical Room Control CRC-IRC-TM

T. Indoor Air Quality (IAQ) Monitor

1. IP smart sensor that utilizes Power over Ethernet (PoE) to monitor a room's indoor air quality. Provide with ethernet connectivity to hospital network.
2. Wifi versions are not allowed.
3. Max dimensions: 4" square, 1.5" deep.
4. Operating environment: 41-113°F, 10-80% RH non-condensing.
5. Sensor requirements:
 - a. Dust (PM2.5/PM10): 0 to 1,000µg/m³ ±15µg/m³ or 15%
 - b. TVOCs: 0 to 60ppm ±10%
 - c. CO2: 400-5,000ppm ±75ppm or 10%
 - d. Temperature: -40 to 125°C (-40 to +257°F) ±0.2°C
 - e. Humidity: 0 to 100% ±2%
 - f. Ambient light: 0.96 to 64,000lux
 - g. Ambient noise sensor:
 - 1) Sensitivity: -26dBFS
 - 2) SNR (Signal to Noise Ratio): Typical 61dB (A-weighted, 20Hz~20kHz)
6. Sensor shall auto-calibrate for sustained accuracy.
7. Wall mount with bracket to allow unit to be anchored to the wall with screws.
8. Acceptable Manufacturers:
 - a. Awair Omni
 - b. Siemens

SPECIFICATION EDITOR: SYSTEMS (AHU'S CHILLER, ETC) THAT ARE FED FROM EMERGENCY POWER SOURCES SHALL HAVE THEIR ASSOCIATED DDC CONTROLLERS AND DDC DEVICES FED FROM THE SAME EMERGENCY POWER SOURCE. A/E TO INDICATE PROPER CIRCUITS ON DOCUMENTS.

U. Controller Power Supplies:

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE SOURCE OF POWER FOR ALL DDC CONTROLS. POWER SOURCE (NORMAL VS EMERGENCY) & PRIORITY SHALL MEET OR EXCEED THAT OF THE EQUIPMENT BEING CONTROLLED.

1. Power to controllers and associated controlled devices shall be 24 VAC, provided by the MSCC. Power source (i.e. normal vs. emergency power & emergency power priority) shall match that of the equipment and/ or system being controlled.
2. See UNINTERRUPTABLE POWER SUPPLIES (UPS) INSTALLATIONS under section 3 of this specification for UPS applications.
3. Provide each DDC panel with a line filter, surge suppressor, electrical disconnect, control fuse, and control transformer. All sized and provided by the MSCC.
4. Provide fully enclosed power supplies located inside control enclosures with external 24 Vac terminals, on/off control, equipment overcurrent protection, power indication, high/low voltage separation, and convenience 120VAC outlets.
5. Provide insulated, modular, feed-through, clamp-style terminal blocks suitable for rail-mounting with end plates and partitions for the termination of all field wiring in control enclosures. Field wiring to equipment with integral terminals and/or unitary equipment (i.e., VAV's, EF"s, etc.) shall not be required to have terminal blocks.
6. Provide a minimum of 72 battery backup hours for complete system RAM memory and clock, with automatic battery charger. The backup power source shall have sufficient capacity to maintain volatile memory in event of an AC power failure.

SPECIFICATION EDITOR: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE LABORATORIES. UMH REQUIRES ALL LAB CONTROLS TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL LAB INTEGRATION LOCATIONS.

2.4 LABORATORY CONTROLS

- A. Provide laboratory controls for any space designated as a laboratory and where indicated, except for rooms with VAV fume hoods and hoods with combination sashes. System shall include: temperature, pressure, and other sensors/transmitters; control valves; control, network, and power wiring; power supplies; routers, servers, and all other devices required for a complete system.
 - 1. The system shall utilize conventional terminal air flow units for supply and general room exhaust and venturi style terminal air flow units for constant volume fume hoods and any other constant volume exhaust point. Refer to related section 233600.
 - 2. Provide programming of all laboratory controls.
 - 3. The system shall function to achieve the sequences of operation detailed on the drawings.
 - 4. Each room or zone shall have a dedicated control system. Systems shall be independent and stand-alone from the Owner's BMS. Failures of the BMS system or network communications between the BMS and the system (cut communication cables, router or server failures, etc.) shall have no impact on individual laboratory control.
 - 5. The system shall perform the following control functions:
 - a. Pressurization Control: Control supply and auxiliary/general exhaust at a volumetric offset to maintain lab pressurization (positive, negative, or neutral). Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms. Pressurization control shall consider networked devices, non-networked devices, and any number of constant volume devices.
 - b. Lab Temperature Control: Regulate lab space temperature through a combination of supply air volumetric control and control of reheat coils and other auxiliary temperature control devices, in response to temperature sensor(s).
 - c. Occupancy Control: Reset minimum volume settings and/or temperature control set points, based upon external signals from occupancy detectors, local over-ride buttons, and similar devices.
 - d. Constant volume fume hoods and other constant volume exhaust points (excluding general room exhaust): The self-actuated Constant Volume Venturi (CVV) Terminal Airflow Unit shall maintain a constant airflow set point.
 - e. Fume Hood Monitoring: Alarm unsafe condition at each fume hood.
 - f. Other control functions as indicated on the drawings.
 - g. Interface with the Owner's BMS thru BACnet IP.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- C. Provide power supplies for lab airflow controls in NEMA 1 metal enclosures, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 - 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 - 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 - 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
- D. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT. CONSIDER IF OTHER LABORATORY EQUIPMENT WOULD BENEFIT FROM BEING EQUIPPED WITH A FUME HOOD MONITOR AND INDICATE THAT EQUIPMENT ACCORDINGLY. EXAMPLES: EXISTING FUME HOODS, BIO-SAFETY CABINETS.

- E. Provide fume hood monitors for constant volume fume hoods and for other laboratory equipment where indicated.
 - 1. Monitor shall include audible alarm, visual LED alarm, and a common (single) alarm silence button.
 - 2. The fume hood monitor shall provide an alarm indication for the following conditions:
 - a. Low fume hood face velocity as detected by:
 - 1) Insufficient differential static pressure as detected by the TAU- CVV pressure switch (Phoenix CVV Terminal Air Flow Units).
 - 2) Insufficient air volume, as detected by the air flow station (Siemens CVV Terminal Air Flow Units).
 - 3) Sash raised above sash stop position.

- b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
- 3. Sash position shall be sensed by using a vertical sash position sensor. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. Resolution shall be +/- 1/2 inch or better. A stainless steel, burr and snag-free cable shall be attached to the spring reel. Expected lifetime based on manufacturer's tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in a location on the fume hood easily accessible for service.
- 4. Fume hood monitor shall be suitable for surface mounting on the front of the fume hood.
- 5. Approved fume hood monitors:
 - a. Phoenix FHM530 Controller (Provide for Phoenix CVV Terminal Air Flow Units)
 - b. Siemens (Provide for Siemens CVV Terminal Air Flow Units)

2.5 TEMPERATURE TRANSMITTERS AND ACCESSORIES

A. Duct, Outside Air, Liquid Immersion:

- 1. Temperature sensor assemblies used with Loop Power Indicators (LPI's) shall consist of a Resistive Temperature Device (RTD's) with a 4-20 mA 2-wire transmitter and gasketed utility box enclosure. All other temperature sensor assemblies shall match the requirements of the associated temperature controller and shall be based upon 10k or 20k thermistors. Sensors using 4-20 mA transmitters are preferred and specified herein, however sensors utilizing voltage signal transmitters (i.e. 0-5 VDC) are allowed if required by controller input requirements and sensor accuracy is not affected by sensor cable length. Sensing element shall be platinum with 100 ohms resistance at 32°F. Accuracy shall be +/- 1/2°F over the entire range. Installations using thermistors shall be field calibrated for the full range, see section 3. 4-20mA or 0-5V transmitter designs shall conform to the calibrated spans noted below.
 - a. Single point duct temperature sensor shall be rigid bulb type with stainless steel (SS) sheath, aluminum tip, and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
 - b. Averaging element duct mounted temperature sensor shall have a minimum 25 ft. long continuous element sensor along the entire length and have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications. Provide sufficient sensor(s)/sensor lengths so that the elements are strung at 2-foot increments horizontally across the entire face of the coil. Provide additional sensors and wiring back to the DDC panel as needed to meet this requirement.

- c. Rigid averaging element duct mounted temperature sensor shall have a brass case, bendable sheath, continuous element sensor along the entire length, and have a calibrated span of 20-120 deg.
- d. Outside air sensor shall be designed to mount on a conduit, include an elbow type enclosure, sun shield, and have a calibrated span of -58-122 deg.
- e. Liquid immersion temperature sensors shall have a probe with SS well, and weather tight enclosure. Sensor well length shall be 1/3 of the pipe diameter, minimum 2.5 inches. Transmitters for chilled water shall have a calibrated span of 20-120 deg. F or 30-250 deg. F for heating applications.
- f. Only when specifically indicated, surface mount thermal-ribbon flexible sensor for pipe mounting shall have SS braid over lead wires, use pressure sensitive adhesive, must be properly insulated, and have a calibrated span of 30-250 deg. F.
- g. Room temperature sensors (non-VAV) shall have a span of 20-120 deg. F, locking covers and when pneumatic, shall match the pneumatic thermostats used.
- h. Adjustable room temperature sensors (non-VAV) shall have a digital temperature display, high accuracy set point slide, flush mounted override button, and a temperature range of 55-85 deg. F.
- i. Approved Manufacturers:
 - 1) TCS
 - 2) Siemens
 - 3) Honeywell
 - 4) Johnson Controls
 - 5) Minco
 - 6) ASI
 - 7) ACI (Automation Components Inc)

B. High Precision Liquid Immersion: (for temperature inputs used for BTU calculations and where noted)

- 1. Temperature transmitter with 100 ohm platinum RTD sensor and 4-20 mA 2-wire DC output. Zero and span shall be continuously adjustable. Sensor and transmitter shall be a matched assembly. Accuracy shall be +/- 0.1% of calibrated transmitter span, including combined effects of repeatability, hysteresis and linearity. Calibrated range shall be 20 to 120 deg. F. Both CHWS and CHWR sensor/transmitter assemblies shall have the same span and shall be factory calibrated as a matched pair.
- 2. Liquid immersion sensors shall have welded stainless steel thermowell. Transmitters shall be of the potted type or shall have a thermally isolated watertight enclosure. Length of sensor and thermowell shall be selected based on the diameter of the pipe to provide accurate, reliable and homogeneous sensing of the liquid temperature.
- 3. Approved Manufacturers:
 - a. TCS
 - b. Minco

2.6 HUMIDITY TRANSMITTERS AND ACCESSORIES

A. Room and Duct Type:

1. Sensor element shall be thin film capacitive type or bulk polymer resistance type, accuracy of +/- 2% RH, range of 0-100% RH with 4-20 mA 2-wire linear output. Factory calibrate for maximum accuracy at mid-range of normal operating humidity. All humidity sensors shall be resistant to chlorine and other cleaning agents.
2. Room Sensors shall have locking cover.
3. Duct Sensors shall have duct probe and mounting plate.
4. Approved Manufacturers- Critical Applications (OR's/ Procedure Rooms, AHU's serving patient care, Central Sterile, animal research):
 - a. Vaisala
5. Approved Manufacturers- Non-critical Applications:
 - a. Siemens
 - b. TCS
 - c. General Eastern
 - d. Vaisala
 - e. Honeywell
 - f. ACI (Automation Components Inc)

2.7 COMBINATION TEMPERATURE AND HUMIDITY TRANSMITTERS AND ACCESSORIES:

- A. Combination Room Temperature and Humidity Transmitter:
 1. Single enclosure wall mounted room temperature and humidity sensor. Without display unless indicated otherwise on the contract documents. White casing/cover/fascia color. With service port to enable two-point calibration using either a PC or Vaisala HUMICAP Handheld Humidity and Temperature Meter HM70. Unit supply voltage 20-28 VDC.
 2. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA loop powered 2-wire output transmitter, 23-131°F temperature range, accuracy of +/- .54°F between 86-104°F.
 3. Room humidity sensor shall have a 4-20 mA loop powered 2-wire output transmitter, humidity range of 0-90 percent RH, accuracy of +/- 1.7 percent RH at temperature range of 50-104°F, stability in typical HVAC applications of +/- 0.5 percent RH/year.
 4. Provide with certificate of calibration.
 5. Approved Manufacturers:
 - a. Vaisala HMW92 Series
- B. Outside Air Temperature and Humidity Transmitter:
 1. Single point outside air temperature RTD shall be 1000-ohm thin film platinum resistor sensor with 4-20 mA 2-wire output transmitter with solar shield.
 2. Outside air humidity sensor shall be thin film alumina substrate capacitance signal generating sensor with 4-20 mA 2-wire output transmitter with 0-100% relative humidity range within +/- 1% RH.
 3. Approved Manufacturers:
 - a. Vaisala

2.8 VIVARIUM TEMPERATURE AND HUMIDITY TRANSMITTERS AND ACCESSORIES

- A. Vivarium Temperature and Humidity Transmitters for Wet Service:

1. Room temperature RTD shall be 100 ohm platinum sensor with 4-20 mA 2-wire output transmitter. Transmitter shall be waterproof or shall be remote mounted.
2. Room humidity sensor shall have a 4-20 mA 2-wire output transmitter, 0-100% relative humidity range, accuracy of +/- 2% RH, shall be waterproof, and shall be resistant to chlorine and other cleaning agents.
3. Combination T & H units shall comply with the above, but shall be mounted in a single enclosure.
4. All vivarium sensors shall have rust proof and waterproof covers and be protected by a stainless steel "U"-shaped guard firmly attached to the wall.
5. Approved Manufacturers:
 - a. Vaisala (combination temp. and humidity)
 - b. TCS (temp. only)
 - c. Siemens(temp. only)

2.9 PRESSURE TRANSMITTERS AND ACCESSORIES

A. Air Differential Pressure Transmitter:

1. Variable capacitance type with ranges not exceeding 150% of maximum expected input. Transducer shall have zero and span adjustment. Output shall be 2-wire 4-20 mA with 24 VDC input.
2. Safe over pressure rating shall be minimum 5 times the range.
3. Temperature compensated with thermal error of not greater than 0.04% of full scale in temperature range of 40 to 100 deg. F.
4. Accuracy shall be 1% of full scale.
5. Approved Manufacturers:
 - a. Air Monitor
 - b. Setra
 - c. Modus

B. Air Static Pressure Sensors- Duct, Area, Outside Air:

1. For use with Air Differential Pressure Transmitter
2. Duct mounted sensors shall be easily removable for cleaning, have multiple sensing ports, and fabricated of aluminum, copper, or SS. Sensors used in outdoor or condensing environments shall not be copper.
3. Wall or ceiling (area) mounted sensors shall be shielded, suitable for surface or flush mounting, complete with multiple sensing ports, contain a pressure impulse suppression chamber, and fabricated of aluminum, paintable steel, or SS as required.
4. Outside air mounted sensors shall be shielded, complete with multiple sensing ports, maintain sensing accuracy regardless of wind flow direction or pattern, and fabricated of aluminum or SS.
5. Accuracy shall be 1% of actual pressure value.
6. Provide a companion 4" Magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor. Gauges shall be graduated in inches W.C. Provide a phenolic identification tag for each gauge.
7. Approved Manufacturers:
 - a. Air Monitor
 - b. Siemens
 - c. Dwyer
 - d. Honeywell

C. Airflow Sensors:

SPECIFICATION EDITOR: UMH'S PREFERENCE IS TO USE AND AIRFLOW MEASUREMENT STATION INTEGRATED INTO THE FAN BELL HOUSING. IF USED, THIS DETAIL SHOULD BE REFLECTED IN THE FAN SPECIFICATION.

1. Airflow Traverse Probe Type:
 - a. For use with Air Differential Pressure Transmitter
 - b. Provide where indicated amplified signal airflow traverse probe(s) or airflow stations, complete with straighteners when required, capable of continuously monitoring the fan or duct capacities (air volumes) it serves.
 - c. Each airflow array shall contain multiple total and static pressure sensors positioned at the center of equal and symmetrical cross-sectional areas, and interconnected by their respective averaging manifolds.
 - d. Sensors shall not protrude beyond the surface of the array, nor shall be adversely affected by particle contamination normally present in building airflow systems.
 - e. The airflow array shall be fabricated of galvanized steel or aluminum of adequate gauge to withstand the velocities to be encountered and with all required mounting brackets, plates, gaskets, and flanges.
 - f. Accuracy shall be a minimum of 3 percent of actual airflow over the designed range of flow.
 - g. Provide a companion 4" Magnehelic gauge, mounted at auxiliary panel, of appropriate span for each sensor array. Gauges shall be graduated in CFM for airflow measurement. Provide a phenolic identification tag for each gauge.
 - h. Approved Manufacturers:
 - 1) Air Monitor
 - 2) Tek-Aire
 - 3) Dietrich-Standard
 - 4) Ramsey Air
2. Thermal Dispersion Type:
 - a. Sensors: Thermal mass flow, temperature and pressure compensating type.
 - b. Each sensor shall have an accuracy of +/-2% of reading over the entire operating airflow range. Each temperature sensor shall have an accuracy of +/-0.15 degree F (+/-0.07 degree C) over the entire operating temperature range. Each sensor assembly shall be calibrated to standards of the National Institute of Standards and Technology (NIST).
 - c. The combined accuracy of all components that make up the air measuring device shall meet the performance requirements specified above throughout the measurement range.
 - d. Multiple sensor circuits shall be equally weighted and averaged by the sensor multiplexing unit and communicate digitally to the control transmitter.
 - e. The operating temperature range for the sensor assembly shall be -20 degree F to 160 degree F (-29 degree C to 71 degree C). The operating humidity range for the sensor assembly shall be 0-99% RH (non-condensing).
 - f. The number of sensors for each probe array shall be:

Duct or Plenum Area (sq.ft)	Total # of Sensors /Location
<2	4
2 to <4	6

4 to <8	8
8 to <16	12
> = 16	16

- g. Fan Inlet Sensor Probe Assemblies shall either be contoured, low profile sensor housings mounted on the fan inlet bell to reduce pressure drop and effect on fan performance or shall be a face mount probe and bracket spanning the fan bell opening. Designs mounted in the throat of the fan bell are not allowed. The operating airflow range shall be 0 to 10,000 fpm.
- h. Duct/ Plenum mounted assemblies shall utilize bead-in-glass sensors/ elements housed in an anodized aluminum tube, suitable for duct/ plenum mounting. The operating airflow range shall be 0 to 5,000 fpm.
- i. Accessories: Include probe mounted transmitter junction box, connecting cables, transmitter and system electronic enclosure with a velocity profiler with digital display. Display shall display total airflow for each air handling unit as a whole, regardless of number of fans. Provide analog (4-20mA, 0-10VDC) transmitter outputs for interface with DDC BMS.
- j. Approved Manufacturers:
 - 1) Fan Inlet Assemblies: Ebtron GOLD Series
 - 2) Duct/ Plenum Assemblies: Ebtron GOLD Series, Air Monitor "Electra-flo"

D. Room Differential Pressure Transmitter

- 1. Provide room differential pressure transmitter and wall/ ceiling-shielded static air probes with trim kits and tubing.
- 2. Transducer accuracy shall be minimum $\pm 0.4\%$ full scale including the effects of linearity, hysteresis and repeatability. The transducer shall be dead-ended and not allow air to pass from controlled space to reference. Transducer sensing diaphragm shall be non-metallic, silicon-based. The transducer max change shall be $\leq 0.25\%$ per year. Provide with bidirectional range of ± 0.10 in wc. Each transducer shall be digitally compensated using an application specific integrated circuit (ASIC). The transducer shall have an integral LED power/status indicator. The room pressure transducer shall be factory calibrated with NIST traceable standards. Span and zero shall be individually adjustable. Implied pressure measurement systems utilizing thermal hot wire or thermal mass air velocity measurement are not acceptable.
- 3. Provide with aluminum or stainless-steel flush mounted, shielded static air probes, complete with pressure impulse suppression chamber and airflow shielding. Probe shall be capable of sensing static pressure within 1% of actual pressure value while being subjected to airflow at 1,000 FPM. Air Monitor model "SAP" or CRC "RST".
- 4. When used with RPMs, or as shown on contract documents, provide with door contact switch(es) for all doors into room. See construction documents for details.
 - a. Powered sliding doors shall utilize a relay in the door actuator as proof of door status, coordinate with door hardware.

- b. Hinged doors shall utilize a concealed, hermetically sealed magnetic reed switch, field mounted in the top of the door frame and correspondingly in the top of the door. Contact housing color shall match door frame. Contacts shall be UL listed, GE Sentrol Industrial series or CRC Solutions door contact.
 - 5. Acceptable Room Differential Pressure Transmitter Manufacturers:
 - a. Ashcroft CXLdp
 - b. CRC-DPT
- E. Steam/Liquid Differential Pressure Transmitters: (flow only)
 - 1. Each differential pressure transmitter shall be selected and calibrated for operations between 0 and 125% of the normal differential pressure and up to 150-psig line pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transmitter.
 - 2. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 0.25% of the span stated above throughout a minimum of a 6:1 turndown. Turndown ratio shall be based on the actual flow span.
 - 3. The transmitter shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
 - 4. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
 - 5. Span and zero shall be individually adjustable.
 - 6. Shall be 2-wire and 4-20mA output.
 - 7. Approved manufacturers:
 - a. Tobar
 - b. ITT Barton
 - c. Dietrich - Standard
 - d. ABB
 - e. Siemens
 - f. Rosemont/Fischer
 - g. Honeywell
- F. Steam/Liquid Differential Pressure Transmitters: (pressure only)
 - 1. Each differential pressure transmitter shall be selected and calibrated for operations between 0 and 200% of the normal differential pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transducer. Adjust output signal span to 150% of the differential pressure setpoint determined by the water balancer or the maximum differential pressure expected at the point of measurement.

2. The accuracy, including linearity, hysteresis and repeatability, of the transmitter for measuring differential pressure shall be better than 2% of the span stated above throughout a minimum of a 4:1 turndown. Turndown ratio shall be based on the actual differential span.
3. The transmitter shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
4. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
5. Span and zero shall be individually adjustable.
6. Shall be 2-wire and 4-20 mA output.
7. Approved manufacturers:
 - a. Tobar
 - b. ITT Barton
 - c. Dietrich - Standard
 - d. ABB
 - e. Siemens

G. Steam/Liquid Pressure Transmitters: (pressure only)

1. The pressure transmitter shall be selected and calibrated for 150% of the normal operating pressure at the location of installation.
2. The accuracy, including linearity, hysteresis and repeatability, of the transmitter for measuring differential pressure shall be better than 2% of the span stated above throughout a minimum of a 10:1 turndown.
3. The transmitter shall not be damaged by pressures of up to twice its range. All wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
4. Provide an isolation valve and pressure gauge on the inlet of each pressure transmitter.
5. Shall be 2-wire and 4-20 mA output.
6. Approved manufacturers:
 - a. ABB
 - b. Siemens
 - c. Kele
 - d. Setra
 - e. Dwyer

H. Steam/Liquid Flow Sensors: (differential pressure type)

1. Uni-directional sensors shall be of the venturi type or velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
2. Bi-directional sensors shall be of the velocity pressure type. They shall be constructed of stainless steel, sized to the system's range of flow, and have an accuracy of 0.5%.
3. Approved Manufacturers
 - a. Preso
 - b. Gerand
 - c. Dietrich-Standard (Annubar Diamond II)

I. Three Valve Manifolds for Steam/Liquid Pressure Transmitter:

1. Provide a three-valve manifold for each transducer. Pressures of up to 500 psig shall not damage the manifold. All wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
2. The manifold shall be designed for direct mounting on the transducer it serves and utilizes two quarter turn valves to provide zeroing, blocking and normal service modes.
3. Approved Manufacturers:
 - a. D/A Manufacturing

EDITOR: CONTACT THE FPD DEPARTMENT VIA THE U-M DESIGN MANAGER FOR INSTRUCTIONS ON TYPE OF FLOW METER TO USE FOR STEAM, CONDENSATE, CHILLED WATER, AND HEATING HOT WATER.

2.10 METERS AND ACCESSORIES

A. Liquid Electro-Magnetic Flowmeters:

1. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor shall be equipped with 150-lb. flanges. The meter system shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The meter shall be capable of bi-directional operation. The meter shall be sized appropriately for the range of flow for the system. The electrodes shall be SS or Hasteloy C. The transmitter shall be provided with a remote mounting bracket, cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow rate signal, and shall have a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. The primary flow sensor and transmitter shall be mounted in accessible locations. Unit shall have the capability to maintain flow total in non-volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - a. Flowmeter Liner:
 - 1) Heating hot water, domestic hot water, and other water systems operating at or above 110°F: Teflon
 - 2) Chilled water, domestic cold water, and other water systems operating below 110°F: Polyurethane
 - 3) Steam condensate: Teflon to 300°F, Ceramic over 300°F, and as suitable for the expected fluid conditions.
 - b. Accuracy:
 - 1) At 1 to 33 feet per second velocity: ±0.5% of rate.
 - 2) At 0.3 feet per second velocity: ±2% of rate.
 - c. Each unit shall be factory calibrated for the specified flow and shall be calibrated in both directions if the application is bi-directional. Calibration shall be a minimum of three point. Specific performance test data shall be furnished with the meter.
 - d. Each meter shall provide two analog 4-20 mA signals or a single 4-20 mA signal and a digital contact closure on reverse flow.

BuildingName

The Description of the Project

P00000000 0000 Issued for: (FILL IN) BID 230905 - - 39

- e. Meters for steam condensate shall be capable of sensing with condensate conductivity down to 6 μ S/cm.
 - 2. Provide a phenolic tag for each transmitter to identify service and meter ID number (i.e. SECONDARY CHILLED WATER FLOW, FM-1, etc.).
 - 3. Approved Manufacturers (Water)
 - a. ABB
 - b. Siemens
 - c. EMCO
 - d. Rosemount
 - e. Krohne
 - f. Onicon
 - 4. Approved Manufacturers (Steam Condensate)
 - a. Rosemount
 - b. Krohne
 - c. ABB
- B. Steam (Vapor) Flowmeters (Vortex-Shedding Type):
- 1. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor body and wetted parts shall be SS, and shall be flanged and suitable for the service rating. The meter shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The transmitter shall be provided with a remote mounting bracket and cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. Unit shall have the capability to maintain flow total in non-volatile memory. The primary flow sensor and transmitter shall be mounted in accessible locations. The flowmeter shall be provided with a 1-year warranty and application non-degradation performance guarantee. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - a. Temperature range shall be -40 to +750°F.
 - b. Accuracy shall be 1.0% of rate and 0.1% of full scale.
 - c. Repeatability shall be 0.15% of flow rate.
 - d. Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - e. Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - f. Meter shall be equipped with a temperature and pressure compensation feature.
 - 2. Provide a phenolic tag for each transmitter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, etc.).
 - 3. Approved Manufacturers
 - a. Rosemount
 - b. Krohne
 - c. ABB
- C. Steam (Vapor) Flow Meters (Differential-Pressure Type)

1. The meter system shall consist of a differential pressure primary flow element, a differential pressure transmitter (or transmitters), and a flow monitor/computer. The flow sensor body and wetted parts shall be SS, and shall be equipped with 150-lb. flanges. The transmitter(s) and flow computer shall be provided with a remote mounting bracket and cable, integral LCD display, and NEMA 4X housing. Flow computer shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. Unit electronics shall have noise immunity. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit shall have the capability to maintain flow total in non-volatile memory. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - a. Temperature range shall be -40 to +750°F.
 - b. Accuracy shall be 1.0% of rate or better and 0.1% of full scale.
 - c. Repeatability shall be 0.15% of flow rate.
 - d. Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - e. Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - f. Meter shall be equipped with a temperature and pressure compensation feature.
 - g. V-cone horizontal pilot lines shall be pitched back to steam lines and shall not trap condensate.
2. Provide a phenolic tag for each meter to identify service and Meter ID number (i.e. MEDIUM PRESSURE STEAM FLOW - LSI BUILDING, FM-1 etc.).
3. Approved Manufacturers
 - a. McCrometer (V-cone-style meter)
 - b. Preso (Venturi-style meter)
 - c. Gerand Engineering (Venturi-style meter)

TWO METHODS OF CALCULATING ENERGY CONSUMPTION (BTUS), WITH THE RESPECTIVE EQUIPMENT REQUIRED, ARE SPECIFIED BELOW: (1) BY THE DDC SYSTEM OR (2) BY A "BTU METER". D.2 IS USED WHEN UTILITY (REVENUE) BILLING OF A SYSTEM IS PLANNED. D.1 IS USED WHEN ENERGY CONSUMPTION IS COLLECTED FOR INFORMATIONAL PURPOSES ONLY. ASSURE THE CONTROL DRAWINGS INDICATE WHICH METHOD, IF ANY, IS TO BE USED FOR EACH SYSTEM.

D. BTU Metering

1. (BTU determination via virtual point) When the control drawings describe BTU or BTU/hr trending, provide the following for each point described:
 - a. One (1) liquid flowmeter unit with transmitter as specified elsewhere in this section.
 - b. Two (2) high-precision matched temperature sensor assemblies with transmitters as specified elsewhere in this section. Sensor with SS well shall be installed in each respective supply and return pipe as shown on project drawings.

- c. These devices shall be wired to a local DDC panel. Calculations for instantaneous and totalized load shall be incorporated into the panel control code, and the necessary virtual points shall be created to allow remote monitoring and trending via the DDC system.
2. When a BTU meter is indicated on the control drawings, provide all the requirements described above for BTU virtual points, and additionally provide a Flow/BTU computer. Flow/BTU computer shall be programmable for various flow meter types including linear, square law, or multi-point linearization data interpretation:
- a. Inputs shall include 4-20ma flow from flow meter, and 4-20ma from two temperature sensors.
 - b. Flow and temperature inputs shall be simultaneously connected to this computer and looped to the local DDC panel.
 - c. Flow/BTU computer shall operate in an environment of 0 to 50 C, shall include a keypad for data input and retrieval, and an EEPROM/nonvolatile RAM. Unit shall calculate and provide:
 - 1) Two 4-20ma analog outputs indicating btu, mass or volume flow rate, temperature 1, temperature 2, delta temperature, pressure, density, and peak demand.
 - 2) One isolated pulse output indicating btu, mass or volume total.
 - 3) Two NC/NO relay outputs assignable to trip according to various rate, total, temperature or pressure readings. Programmable as latching or non-latching, or as pulsed output of a total.
 - d. Outputs shall be stored in a battery backed data logger, selectable for continuous or periodic log modes.
 - e. Unit shall have a real time clock and shall date stamp logged data. Unit shall have an RS-232 port and shall be capable of setup from a laptop computer. The supplier shall set up and verify BTU measurement and shall train U of M personnel in all aspects of BTU computer setup and operation.
 - f. Computer shall calculate and display heat, mass or Volume flow rate, resettable total, non-resettable total, temperature input 1, temperature input 2, delta temperature, density, pressure, peak demand, and time/date stamp.
 - g. Provide a phenolic tag for each transmitter and flow computer (as applicable) to identify service and ID number (e.g. CHILLED WATER BTU METER - LSI BUILDING, etc.).
 - h. Mount Flow/BTU computer in a NEMA 4 enclosure: Minimum size 16" (H) x 14" (W) x 8" (D), hinged cover, pad-lockable latch, and stainless steel hinge. Provide cutout in enclosure face and mount computer in face. Where multiple computers are supplied, they may be mounted in a common enclosure.
 - i. Approved Manufacturers and Models for Flow/BTU Computer:
 - 1) Kessler-Ellis Supertrol II with MS816 enclosure.

2.11 MISCELLANEOUS DEVICES

- A. Alarm Indication Station

1. Alarm indicating station with red alarm LED, alarm horn, horn momentary silence switch, adjustable alarm delay and alarm repeat time, and alarm status relay.
 - a. Supply Voltage: 24 VAC @ 100 mA or 24 VDC @ 34 mA.
 - b. Alarm Time Delay: None, or 1 to 31 seconds in one-second increments, or 10 to 310 seconds in 10-second increments.
 - c. Alarm Horn: Continuous or pulsed tone, 70 db minimum.
 - d. Alarm Repeat Time: None, or 1 to 7 minutes in one-minute increments, or 10 to 70 minutes in 10-minute increments.
 - e. Alarm Relay: SPDT, 0.5A @ 24 VAC, 1.0A @ 30 VDC, follows horn or lamp action, selectable.
 - f. Connections: Screw terminals, 22 - 14 AWG wires.
 - g. Mounting: Brushed stainless steel plate mountable to standard single junction box, with two screws provided.
2. Accepted Manufacturer:
 - a. Kele Model RAD-1.

B. Carbon Dioxide Sensors:

1. Carbon dioxide sensing cell shall consist of a non-dispersive infrared carbon dioxide gas cell that uses a pulsed source and has no free air optical path. Output shall be linearized 4-20 mA for use with 24 VDC input. The unit shall be specifically designed for the wall or duct application specified. Duct aspiration boxes shall be by the manufacturer. Unit shall have span adjustment. The unit shall have no moving parts.
2. Minimum requirements:
 - a. Range: 0-2,000 ppm
 - b. Accuracy: 3 % of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: less than 3 watts
 - e. Zero Drift at Constant Temp.: 100 ppm per 24 hrs (random not cumulative)
 - f. Max. allowable Drift in 1 year: 20 ppm
3. Unit shall not require calibration for a period of 1 year or more.
4. Approved Manufacturers:
 - a. Valtronics
 - b. Telaire

C. Carbon Monoxide and Combustible Gas Sensors:

1. Sensors shall be a micro-processor-based system for continuous monitoring and use catalytic, electro-chemical, diffusion cell, or solid-state type sensing. Output shall be linearized 4-20 mA for use with 24 VDC input with green LED normal operation indicator. Unit shall provide a SPDT pilot duty low voltage alarm contact with an adjustable set point. The unit mounting shall be wall, duct aspiration, or ceiling to suit application. The unit shall specifically designed for the application and shall be explosion proof, as required. Unit shall have single point set point and span adjustment. The unit shall have no moving parts. Units mounted outdoors shall be waterproof and rustproof.
2. Minimum requirements:
 - a. Range: as required for application; ppm, %, % L.E.L.
 - b. Accuracy: 3-5% of full scale
 - c. Repeatability: 1% of full scale
 - d. Power Consumption: 5 watts or less

- e. Relay contact rating: 5 amp at 24 VDC, 150 VA max. inductive
 - f. Zero Drift at Constant Temp.: 0 per 24 hrs (random not cumulative)
 - g. Max. allowable Drift in 1 year: 1% of full scale.
3. Approved Manufacturers:
- a. Draegar
 - b. Vulcain
- D. Gas Detection System:
- 1. Each system shall be complete package with remote or local space sensors, detection instruments, alarm contacts, local indication of current measured value for each sensor and status indicator lights for power and status of each sensor. Devices not requiring remote mounting shall be housed in metal control panel. Status indicators shall be mounted on panel faceplate.
 - 2. Units shall be provided with local alarm horn & light with horn silence pushbutton, unless indicated otherwise.
 - 3. Sensor life shall be a minimum of one year.
 - 4. Units shall have adjustable setpoints and self-test diagnostics.
 - a. Gas to be Detected: Oxygen (O2)
 - b. Warning Setpoint: 20 %
 - c. Alarm Setpoint: 19.5 %
 - d. Alarm Relays: 3 Amps, 120 VAC (1 Warning relay, 1 Alarm relay and 1 Fault)
 - e. Range: 0-25% O2
 - f. Remote Sensor: Electrochemical O2 Sensor
 - 5. Provide phenolic plastic signs, minimum 1/2" high white engraved letters on red background at each light/horn location. Signs shall read "Do Not Enter -Oxygen Deficient Atmosphere".
 - 6. Approved Manufacturers:
 - a. Honeywell Analytics
 - b. MSA
 - c. Drager
 - d. Toxalert
 - e. MDA Scientific
 - f. Enmet
- E. Gas Detection System - MRI Oxygen Depletion:
- 1. Provide pumped sample oxygen depletion monitor for each MRI room. Systems shall be complete packages with sample tubing, end-of-line filters, monitors, alarm contacts, local indication of current measured value for sensor and status indicator lights for power and status of sensors. Devices shall be housed in metal control panels. Status indicators shall be mounted on panel faceplate.
 - 2. Units shall be provided with local alarm horn & light with horn silence pushbutton.
 - 3. Sensor life shall be a minimum of one year.
 - 4. Units shall have adjustable setpoints and self-test diagnostics.
 - a. Gas to be Detected: Oxygen (O2)
 - b. Warning Setpoint: 20 %
 - c. Alarm Setpoint: 19.5 %
 - d. Alarm Relays: 3 Amps, 120 VAC (1 Warning relay, 1 Alarm relay and 1 Fault)

- e. Range: 0-25% O2
 - f. Remote Sensor: Electrochemical O2 Sensor
 - g. Installation: Pumped remote sample. Sample tubing to penetrate ceiling above MRI unit through wave-guide. Provide non-metallic end-of-line filter.
5. Approved Manufacturers:
- a. Honeywell Analytics Midas
 - b. MSA Toxgard MRI
 - c. Critical Environment Technologies DCC-MRI
- F. Condensation Sensor - Pipe Mounting Type
1. Sensor with built-in relay contact that opens upon detection of condensation, for sensing condensation when mounted on bare pipe.
- a. Supply voltage: 24 VAC/VDC ±10%
 - b. Power consumption: Maximum 1.6 VA
 - c. Relays contacts: rated 1 amp @ 24 VAC/VDC
 - d. Operating temperature: -20... +50°C
 - e. Display: LED (visible without removing cover), green - power supply ok, red - condensation sensed, contact open.
 - f. With pipe mounting bracket.
- G. Current Sensing Relays
1. Provide current sensors with donut transformers capable of monitoring AC current, maximum input current ranges from 20 to 300 amp, peak, with digital output signals having adjustable high and low current trips. An LED shall provide visual indication and shall not bleed through.
- a. Provide special current sensing relays designed to monitor belt breakage, when indicated or described in the Sequence of Operation.
2. Approved Manufacturer:
- a. Neilsen Kuljian
 - b. Veris Industries
 - c. ACI (Automation Components Inc)
- H. Electronic to Pneumatic Transducers
1. Provide transducers to convert electronic signals from the DDC controller analog output modules to linear proportional pneumatic signals for all DDC controlled modulating pneumatic devices. The transducer shall be a panel-mounted device, with hand/auto switch, override dial for manual override control, and a 0-30 psig output gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 0-10 VDC or 4-20 mA. Output accuracy shall be 1/4 psig at 75 Deg. F, producing a 0-15 psig pneumatic signal. Output repeatability shall be .05 psig maximum. Transducers shall be high capacity non-bleed devices with a minimum output capacity of 500 SCIM, except special circumstances that require a constant bleed controller with branch exhaust on signal loss.
2. Approved Manufacturers:
- a. Non-bleed Type:
 - 1) Siemens
 - 2) ACI - PXP
 - b. Bleed Type:
 - 1) ACI - PXP

I. Liquid Detectors

1. Liquid detectors shall utilize microchip technology for detection of conductive liquids through one of the following types of sensors: gold-plated probes, self-adhesive sensor tape with copper electrodes and durable cotton cover, or rope type sensor. Detectors shall be selected based on the best use for the application. Power requirement shall be 11-27 VAC or VDC and have a green LED normal operation indicator. Unit shall have a SPDT pilot duty low voltage alarm contact. Unit shall be waterproof and rustproof. A red LED shall indicate the presence of liquid. Unit shall have an adjustable set point.
2. Approved Manufacturers- Spot Detectors:
 - a. DiversiTech "Wet Switch"
 - b. Water Alert
3. Approved Manufacturers- Rope or Ribbon Detectors
 - a. RLE Technologies
 - b. Water Alert
 - c. Kele

J. Loop-Powered Indicators:

1. Where indicated, analog sensors (i.e., temperature, humidity, CO₂, CO, etc.) shall be provided with a Loop-Powered Indicator (LPI) mounted on a separate dedicated LPI panel, except those sensors that are provided with a local display. Local displays shall be mounted at the DDC panel array.
2. Indicator shall be designed to display any 4-20 mA transmitter signal directly in the engineering unit of the measured media. The display shall be powered directly by the measured 4-20 mA signal without requiring an additional power supply. Indicator shall not impose impedance on the current loop beyond the capability of the transmitter.
3. Display shall have minimum 5/16" LCD digits, with 3-1/2 digit capability selectable decimal point and selectable scale. Accuracy of indication shall be 0.1% of scale.
4. Indicator shall be provided with a lettered plate indicating appropriate engineering units.
5. Approved Manufacturer:
 - a. R. E. Technologies, Inc. (Kele Assoc.)

K. Occupancy Sensors (Operating Rooms):

1. Sensors shall be from the same manufacturer as being provided with the building lighting control system, see division 26 specifications.
2. Occupancy sensors shall operate with combination ultrasonic and passive infrared technologies and shall be ceiling mounted.
3. Occupancy sensors shall have visible LED to indicate occupant detection.
4. Occupancy sensors shall contain an isolated relay with normally open, normally closed, and common outputs.
5. Approved Manufacturers:
 - a. Cooper Controls (Eaton)
 - b. Hubbell
 - c. Legrand WattStopper
 - d. Leviton
 - e. Lutron
 - f. Sensor Switch

- g. Tork Tekmar
- L. Occupancy Counters (People Counters)
 - 1. Dual Sensor - Differential Thermal Imaging Counter
 - a. General
 - 1) Provide combination BACnet-MS/TP and Analog Output counting devices for Dynamic Ventilation Reset Controls to be mounting where indicated on the plans and controlling ventilation to occupied zones as populations vary, in compliance with the Ventilation Rate Procedure in ASHRAE 62.1-2013 and 2016.
 - b. Counters shall provide data on net zone populations to dynamically calculate the ASHRAE Standard 62.1 Ventilation Rate.
 - 1) Each counter shall consist of a center-top door frame mounted counter, using a dual thermopile differential thermal imaging counters, an integral microprocessor-based design capable of providing net population data to the controls network for use in ventilation reset based on accurately measured real- time zone populations.
 - 2) Counter with steel enclosure shall have an overall size of: 6.12L x 2.94W x 1.36H inches and weigh approx. 0.25 lbs.
 - 3) Counters shall have an environmental operating range of no less than 65° F to 85° F and 5% - 95% RH, non-condensing.
 - c. Population Counter Design and Counting Performance
 - 1) Counter shall be mounted to provide zone entry and exit data to the network for maintenance of a net zone population value to less than ±5% of actual or ±3 people, whichever is larger.
 - 2) Counter design shall be optimized for single entry/exit interior doors, ≤ 42 x ≤ 96 in.
 - 3) Small deviations or accumulation in counts shall be adjusted when "population reset interval" is selected during configuration and set up. Upon activation, the total net population in memory shall be 'zeroed' based on the user-determined reset period selected or every 24 hours during a predetermined non-occupied period.
 - 4) Power, Connectivity and Communications
 - a) The BACnet / analog combination counters shall be capable of communicating with other devices using an RS-485 standard interface and BACnet-MS/TP protocol, implemented as a Master node.
 - b) Communication speed shall be field-selectable by dip switch between 9.6, 19.2, 38.4 and 76.9 kBaud.
 - c) The counter-network communications shall be capable of field configuration and setup using a simple dip- switch interface.
 - d) A simultaneous 0-10 VDC scalable and protected analog output shall also be available to provide net counts.
 - e) All counters shall be powered with individual 24 VAC transformers (22.8V to 26.4V under load) @1.2 V-A nominal.

2. The manufacturer's authorized representative shall review and approve counter position placement for each location indicated on the plans.
3. Accepted Manufacturer:
 - a. EBTRON, Inc. Model CENSUS - C100, Single-entry interior door occupancy counter.

M. Pressure to Electronic Transducers

1. Provide transducers to convert linear proportional pressure signals to interface with the Siemens analog input modules. The transducer shall be a panel-mounted device, with input pressure snubber, as required, and gauge. Supply voltage shall be 19-26 VAC. Control signal shall be 4-20 mA. Accuracy shall be 1 percent full scale. Thermal effect shall be less than 1 percent full scale on zero and less than 1 percent of reading on span. Transducer shall have elastomer seals and SS wetted parts.
2. Approved Manufacturers:
 - a. Siemens
 - b. Setra
 - c. Modus
 - d. ACI
 - e. Dwyer

N. Room Differential Pressure Indicating Gauges

1. Dial (4" dia.) in metal case, diaphragm actuated, black figures on white background, front recalibration adjustment, center zero scale with scale range of 0.05-0-0.2" WC with 0.005 minor divisions, suitable for surface or flush mounting. Accuracy +/- 2% of full scale. With plastic gauge mounting plate for flush mounting and space pressure sensor consisting of pressure port, barbed tubing connection, and sensor plastic mounting plate suitable for mounting on a standard electrical junction box.
2. Approved Manufacturers:
 - a. Dwyer "Magnehelic" 2000-00N with A-465 pressure sensor and A-464 flush mounting plate (provide A-368 mounting bracket for surface mount applications)

AE TO CONSIDER THE USE OF LOCAL, ROOM DIFFERENTIAL PRESSURE INDICATORS AS SPECIFIED BELOW ON PRESSURIZED ROOMS THAT DO NOT NEED TO BE INTEGRATED BACK TO THE HOSPITAL BMS. SEE DESIGN GUIDELINE 5.16: UMHS - REQUIREMENTS FOR PRESSURE SENSITIVE ROOMS AND REVIEW WITH FPD ENGINEER.

O. Room Pressure Indicator (RPI)

1. Provide local room differential pressure indicators and wall/ceiling-shielded static air probes with trim kits and tubing. The indicators provide local indication only and do not interface with the Building Management System.

2. Indicator accuracy shall be minimum $\pm 0.5\%$ full scale including the effects of linearity, hysteresis and repeatability. The transducer max change shall be $\leq 0.5\%$ per year. Provide with bidirectional range of ± 0.25 in wc. Span and zero shall be individually adjustable. Implied pressure measurement systems utilizing thermal hot wire or thermal mass air velocity measurement are not acceptable.
3. The indicator shall have an integral LED light indicating room pressure status - "Green" Normal, "Red" Alarm.
4. Provide with aluminum or stainless steel flush mounted, shielded static air probe, complete with pressure impulse suppression chamber and airflow shielding. Probe shall be capable of sensing static pressure within 1% of actual pressure value while being subjected to airflow at 1,000 FPM. Air Monitor model "SAP" or CRC "RST".
5. Acceptable Room Pressure Indicator Manufacturers:
 - a. Setra Lite
 - b. CRC Alpha

2.12 ELECTRIC COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.
- B. Low temperature detection thermostats shall be duct type, fixed 5 deg. F differential, range 30 to 60 deg. F. Sensing element shall have a 20-foot long capillary tube responding to the lowest temperature sensed along any 12 inches of bulb length. Switch shall be SPDT 120 VAC, UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset. Provide one thermostat for every 20 square feet of coil surface.
- C. High temperature detection thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load. Unit shall be manually reset.
- D. Immersion electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- E. Remote-bulb electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required, with stainless steel separable well as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- F. Wall-mounted electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole, normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.
- G. Strap-on electric thermostats shall be two-position type, range and element shall be suitable for the service, single or double pole,

BuildingName

The Description of the Project

P00000000 0000 Issued for: (FILL IN) BID 230905 - - 49

normally open or normally closed as required. Set point shall be adjustable over the full range. Switch shall be UL listed, rated for 10 amps at 120 VAC full load.

H. Differential Pressure Switches:

1. Shall provide electrical switching action upon a sensed pressure differential increase between two points. Sensitivity shall be suitable for the application. Set point shall be adjustable over the full range of the device. Switching action shall SPDT. Electrical switch rating shall be 10 amps at 120 VAC, minimum.
2. Pressure rating of switch and connecting tubing:
 - a. Fan - Rated for 12 inches WC.
 - b. Pump - Maximum deadhead system pressure.
3. Switches used for safety shutdown applications shall be of the manual reset type.
4. Approved Manufacturers:
 - a. Honeywell
 - b. Siemens
 - c. Dwyer
 - d. Cleveland Airflow

I. Limit Switches:

1. Limit switches shall be oil tight type with appropriate operator to provide required function.
2. Approved Manufacturers:
 - a. Honeywell
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

J. Control Relays and Contactors:

1. Relays shall be a minimum DPDT, of proper coil voltage, with neon indicator light, and of sufficient rating for specified purpose. Relay base shall be of the screwed terminal type.
2. Contactors shall be definite purpose type, have adequate number of poles, of proper coil voltage, and of sufficient rating for specified purpose. Contactors used for DDC interface control shall contain a Hand-Off-Auto switch.
3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D
 - f. Functional Devices- RIB
 - g. IDEC
 - h. Omron

K. Selector Switches:

1. Switches shall be multiple position type, oil-tight, water-tight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.

2. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

L. Push Buttons and Pilot Lights:

1. Push button switches and pilot lights shall be, oil-tight, watertight, dust-tight, have the adequate number of contact blocks, capable of additional contact blocks, and of sufficient rating for specified purpose. Nomenclature plate shall be provided with appropriate wording, units, etc.
2. Pilot lights shall be neon or LED, push-to-test type with replaceable lens. Lens shall be of the appropriate color for application served.
3. Approved Manufacturers:
 - a. Dayton
 - b. Siemens
 - c. Allen-Bradley
 - d. GE
 - e. Square D

M. Fuse Holder/Disconnects:

1. Fuse holder/disconnects shall be provided for all control circuits inside auxiliary control panels, and shall be of appropriate size/type for service.
2. Approved Manufacturers:
 - a. Little Fuse
 - b. Dayton
 - c. Buss
 - d. GE

N. Terminal Blocks:

1. Terminal blocks shall be modular, barrier type, direct mount, single pole, and snap together to any required number of poles. Units shall be rated for 300 volts, 20 amp., handle wire sizes from 22-12 AWG, and have a marking strip for identification.
2. Approved Manufacturers:
 - a. Cooper-Bussman
 - b. Weidmuller
 - c. Kele
 - d. Buss
 - e. GE

O. Toggle Switches:

1. A toggle switch shall be provided for every auxiliary and local control panel that utilizes a 120 VAC power source as a means to turn off the power to that panel and shall be of appropriate size/type for service. Toggle switches shall be rated 120/277 volts, 20 amps, SPDT, specification grade, extra-heavy duty, back and side wired, with brown handles.
2. Approved Manufacturers:
 - a. Leviton
 - b. Pass & Seymour
 - c. Hubbell

- d. Arrow Hart
- e. Bryant

2.13 ELECTRICAL ACCESSORIES

A. Wiring and Conduit

1. The MSCC shall provide all DDC and related control wiring, conduit, and J-hook cable hanging system. Wire and cable shall be pulled from device or control point to the DDC, Auxiliary, UPS, or LPI panels and run between DDC, Auxiliary, UPS, or LPI panels, with 6'-0" spare coiled at the panel. All wire and cable shall be labeled and tagged at each end, 4 inches down from the point at which the wire enters the cabinet with the corresponding point number. Labels shall be thermal printed type designed specifically for wiring identification.
2. All wiring carrying voltages greater than 24 volts shall be run in conduit.
3. All wiring carrying voltages 24 volts nominal or less shall be run as follows:
 - a. Wiring routed in shafts, walls, below grade, and in any concealed or inaccessible space, or above ceilings requiring the use of a tool to access or held in place by clips or similar devices: run wiring in conduit.
 - b. Wiring routed in exposed locations such as mechanical and electrical rooms or in rooms without ceilings (i.e. exposed to deck above): run in conduit.
 - c. Network wiring: run in conduit to nearest cable tray.
 - d. Wiring above accessible lay-in ceiling areas: Utilize J-hook hangers and/ or utilize facility cable tray.
 - 1) Provide UL Listed zinc electro-plated steel or plastic J-hooks, sky blue color, plenum use approved, with minimum 1-inch wide cable support area, rated for the cable type being supported. Provide with integral cable retainer strap to provide containment of cables within the hanger.
 - 2) Install J-hooks with J-hook bottoms a minimum of 10 feet A.F.F. and no less than 2 feet above the ceiling.
 - 3) Space hangers at maximum 5 foot intervals, with additional hangers located a maximum of 3 feet from both sides of any change in direction. Wiring shall not sag more than 12 inches between J-hooks. Install wiring and J-hooks in a neat and workman-like manner, routed parallel or perpendicular to the building column lines.
 - 4) Install to protect wire from damage and to allow for wire replacement. Do not exceed 50 % of the wire capacity specified by the J-hook manufacturer (first installation), or route control wiring in non-control-wiring J-hooks.
 - e. Wiring to wall mounted devices such as room sensors, switches, and similar devices:
 - 1) NEW CONSTRUCTION: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Install wall box for device mounting.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 52

- 2) RETROFIT (EXISTING WALL CONSTRUCTION): Route wiring in wall, no conduit is required. Install wall box for device mounting.
- f. Wiring to perimeter radiation valves and similar control devices requiring wiring to be routed in walls: Route wiring in wall in minimum 1/2 inch conduit. Stub conduit up/down into accessible ceiling space, terminating conduit with a 90 degree bend and a strain relief to prevent wire damage. Provide maximum 12 inch long flexible metal conduit for the final connection to the device.
4. Conduits shall be sized on a maximum fill of 40% capacity.
5. Five separate conduit systems shall be provided:
 - a. DO/DI and 120 VAC control wiring.
 - b. AO/AI wiring (may also contain DI wiring if rated as Class II teflon jacketed twisted pair)
 - c. Pneumatic tubing.
 - d. ALN/FLN cables.
 - e. 24VAC (note exception under terminal air unit Wiring Requirements)

Exception: DO's, DI's, AI's, and AO's (including pneumatic tubing) installed between VSD's and DDC panels may share the same conduit.
6. All junction boxes and couplings on conduit containing DDC related wiring or pneumatic tubing shall be painted sky blue color. Alternative: Allied Tube True Color® EMT, color blue, may be used in lieu of painted fittings and junction boxes.
7. All exposed DDC wiring shall utilize a sky blue insulation outer jacket color.
8. Data transmission cabling and equipment grounding procedures shall meet the latest FCC guidelines for electromagnetic field generation.
9. All control wiring sizes and types shall meet the equipment manufacturer's recommendations.
10. All control wiring shall have insulation rated for 300 volts minimum, and be installed per NEC requirements. Exposed wiring running in return plenums, air handling devices, and where required by code shall be plenum rated.
11. Wiring requirements for controllers on air terminal units:
 - a. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. to controllers for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.
 - b. Terminal fittings or insulating bushings shall be used to protect wiring associated with controllers at enclosures, junction boxes, etc.
- B. Provide all necessary 24 VAC transformers, 24 VAC power distribution wiring, etc. for a complete operating system. Transformers shall have primary and secondary fuse protection and shall be mounted in an electrical closet, auxiliary panel or other suitable accessible location with disconnecting means. Provide a pilot light for each transformer, to indicate the presence of load power.

- C. Provide conduit and wiring to power all 120 VAC control accessories such as flow meters, BTU meters, data acquisition panels and actuators. Feed this power from an auxiliary control panel, with a separate disconnect and fuse for each device, located in the auxiliary panel.
- D. For air terminal controllers, provide 120 VAC conduit and wiring between electrical panels and controller power supply transformers. Power for terminal controllers shall be from a dedicated 20A power circuit, as shown on construction documents (CD's). In general, only one circuit shall be allowed per electrical closet, unless otherwise directed by project engineer.
 - 1. For renovation work, MSCC shall utilize existing dedicated circuit when available and either utilize existing transformer if adequate or provide new transformer(s). When an existing dedicated circuit is not available, provide new per above and as shown on construction documents. When not shown on CD's, request proper circuiting by project engineer.

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE SOURCE OF POWER FOR ALL DDC CONTROLS. POWER SOURCE (NORMAL VS EMERGENCY) & PRIORITY SHALL MEET OR EXCEED THAT OF THE EQUIPMENT BEING CONTROLLED.

- E. Power source (i.e. normal vs. emergency power & emergency power priority) to all controllers and associated controlled devices shall match that of the equipment and/ or system being controlled.

2.14 AUTOMATIC CONTROL VALVES AND ACTUATORS

A. General:

- 1. Operators shall be electric unless specifically noted otherwise on the drawings
- 2. Unless indicated otherwise on the control drawings, provide the control valve body style (globe, ball, butterfly, etc.) indicated for each application (hydronic, steam, etc.) noted below.
- 3. Except where otherwise noted, valve bodies 2 inches IPS and smaller shall be single seated bronze, and shall have screwed end connections. Valve bodies 2-1/2 inches IPS and larger shall be cast iron, and shall have flanged end connections. Valve stem packing shall be PTFE or EPDM. Packless construction is acceptable. Valve linkage shall have an adjustment for valve lift.
- 4. Valve rangeability shall be no less than 50:1 for valve $C_v \leq 1$, no less than 100:1 for valve $C_v > 1$.
- 5. When indicated, provide separate SPDT limit switches which actuate at the full open and full closed valve position.
- 6. Electric actuators contained within air handling unit enclosures (and thereby subjected to maintenance power washing as part of regular PMs) shall be NEMA 4X or IP66 rated or shall be provided with weatherproof NEMA 4X stainless steel enclosures that have removable covers with clasps or machine screws (no sheet metal screws) and that do not require removing fasteners.
- 7. All electrically actuated control valves installed in locations exposed to outdoor conditions shall be provided with NEMA 4/4X weather resistant housings and thermostatically controlled heaters for climates that reach below freezing.

B. High Performance Butterfly Valves

1. May be used for hydronic applications, when approved, for valves 5" and larger.
2. High performance butterfly valves shall comply with Related Section 220523 Valves.
3. Approved Manufacturers
 - a. Per Related Section 220523 Valves

STEAM CONTROL VALVES: REVISE THE VALVE PRESSURE DROP SPECIFIED BELOW TO THAT APPROPRIATE FOR YOUR PROJECT. FOR EXAMPLE, FOR LOCATIONS CLOSE TO THE CENTRAL POWER PLANT, A PRESSURE DROP HIGHER THAN THE INDICATED 4 PSIG WOULD BE APPROPRIATE. ALSO NOTE THAT THE BELOW VALVE SIZING CRITERIA ASSUMES THAT THE STEAM PRESSURE REQUIREMENT FOR THE EQUIPMENT SERVED BY THE CONTROL VALVE IS 1 PSI OR LESS. ALWAYS VERIFY THE EQUIPMENT PRESSURE REQUIREMENT AND MODIFY THE BELOW ACCORDINGLY.

C. Hydronic Control Valves

1. General Valve Requirements
 - a. Maximum pressure drop across any hydronic system valve at maximum flow and valve size shall be as indicated.
 - b. When not indicated, valves shall be sized for a pressure drop of 3 psig for chilled water and 4 psig for hot water based on the maximum flow rate scheduled for the device controlled.
 - c. Two-way valves shall have equal percentage characteristics for heating and cooling applications, either linear or equal percentage for other applications as appropriate, linear for three-way valves.
 - d. 2 year unconditional warranty, parts and labor. 5 year unconditional parts warranty.
2. Globe Style Valves (May be used for sizes 1" and larger).
 - a. Bodies and trim shall be rated for service pressures through 125 psig at 250 deg. F, globe style.
 - b. Hydronic system valves shall have replaceable plugs and seats of SAE 72 brass or AISI 300 series stainless steel, selected for maximum lift under application conditions.
 - c. Shall provide safe and reliable operation in water or in up to 50% glycol/water solutions, at fluid temperatures between 35°F and 212°F and static pressures up to 300 psi.
 - d. Forged brass body with female NPT end connections.
 - e. Differential pressure rating (valve operating): 30 PSID maximum.
 - f. Provide valves with the flow coefficient indicated, or if not indicated, subject to engineer's approval, with a Cv appropriate for good control and considering the system differential pressure available.
 - g. Approved Manufacturers
 - 1) Siemens
 - 2) Honeywell
 - 3) Johnson

ALTHOUGH AVAILABLE UP TO 4", BALL VALVES SHOULD TYPICALLY ONLY BE USED FOR SMALL CONTROL VALVE APPLICATIONS, E.G. VAV BOXES, FAN COILS. THIS SPECIFICATION IS ONLY FOR BALL VALVES UP TO 3/4" DIAMETER.

3. Ball Style Control Valves

- a. Control Valve Body: Quarter turn ball valves, 2-way and 3-way configuration as indicated, for 2 position or modulating service, with the following features:
- 1) 1/2" or 3/4" valve size.
 - 2) Forged brass body with female NPT end connections.
 - 3) Nickel or chrome plated brass ball, with tetrafluorethylene reinforced EPDM O-ring seals.
 - 4) Blow-out proof brass stem with double O-ring EPDM seals.
 - 5) Shall provide safe and reliable operation in water or in up to 50% glycol/water solutions, at fluid temperatures between 35°F and 212°F and static pressures up to 300 psi.
 - 6) Ball and stem seals shall be formulated to prevent degradation by typical water treatment chemicals and Chloramines.
 - 7) Minimum close-off rating: 200 PSI.
 - 8) Differential pressure rating (valve operating): 30 PSID maximum.
 - 9) Downstream leakage: maximum of 0.01% of design flow at rated close-off differential pressure.
 - 10) 0 - 90 degree angle of rotation.
 - 11) Valves for modulating service shall be equipped with a characterized ball (glass filled polymer flow insert) that provides an equal percentage flow characteristic.
 - 12) Valves for two position control shall be reduced port type as required for the appropriate valve Cv.
 - 13) Provide valves with the flow coefficient indicated, or if not indicated, subject to engineer's approval, with a Cv appropriate for good control and considering the system differential pressure available.
- b. Approved Manufacturers:
- 1) Johnson Controls
 - 2) Belimo

D. Steam Control Valves

1. Globe Style.

- a. Bodies and trim shall be rated for scheduled saturated steam service pressures. Steam valve replaceable plugs and seats shall be stainless steel, hardened to not less than 500 Brinell.
- b. Valves shall have modified linear characteristics and shall be sized based on a 5 psig inlet pressure and a maximum drop of 4 psig.
- c. 2 year unconditional warranty, parts and labor. 5 year unconditional parts warranty.
- d. Approved Manufacturers
- 1) Siemens
 - 2) Honeywell
 - 3) Johnson

E. Control Valve Actuators

EDITOR: WHENEVER POSSIBLE, THE USE OF ELECTRIC ACTUATION FOR CONTROL VALVES IS PERFERRED. PNEUMATIC ACTUATION MAY ONLY BE CONSIDERED FOR PARTIAL RETROFITS OF EXISTING SYSTEMS WITH PNEUMATIC CONTROLS. CONSULT WITH THE UM DESIGN TEAM IF PNEUMATIC CONTROLS ARE REQUIRED. CONTROL VALVES LOCATED IN AN UNCONDITIONED ENVIRONMENT SHOULD BE ELECTRIC.

NOTE THAT MOST ELECTRIC BUTTERFLY VALVE ACTUATORS ARE NOT AVAILABLE WITH A SPRING RETURN OPTION WITHOUT THE ADDITION OF A BATTERY OR CAPACITOR TO DRIVE THE ACTUATOR TO ITS FAILSAFE POSITION. CAREFUL CONSIDERATION SHOULD BE GIVEN TO THE APPLICATION OF THIS TYPE OF CONTROL VALVE BEFORE USE.

WHEN THE USE OF ELECTRIC ACTUATORS IS PLANNED, THE METHOD OF GETTING POWER TO THOSE ACTUATORS MUST BE CONSIDERED. READ THE BELOW SPEC SECTION CAREFULLY AND NOTE THE SIZE RANGE FOR VARIOUS ACTUATOR VOLTAGES. THE CONTROLS CONTRACTOR SHALL NOT RUN POWER WIRING ABOVE 120V. THEREFORE:

FOR 120V ACTUATORS, POWER TO SUCH ACTUATORS IS THE RESPONSIBILITY OF THE CONTROLS CONTRACTOR AND IS TO BE ROUTED FROM THE DDC AUXILARY PANEL (SEE SECTION 2.5). IF YOUR PROJECT HAS A LARGE NUMBER OF 120V ACTUATORS, THE STANDARD (2) 20 AMP CURCUITS RUN TO THE DDC AUX PANEL MAY NOT BE ENOUGH. DETERMINE THE TOTAL AMPERAGE OF SUCH ACTUATORS AND DIRECT THE ELECTRICAL DESIGNER TO DESIGNATE ADDITIONAL 120V CIRCUITS TO THE DDC AUX PANEL, IF REQUIRED.

1. Except as noted otherwise, actuators shall be electric.
2. Provide actuator manufactured by the respective control valve manufacturer and factory assembled with the valve body.
3. Ball Style Control Valve Actuators
 - a. Actuator shall include a manually operated hand wheel/lever for manual override of the valve position.
 - b. Modulating Actuators (0-10V or 4-20mA)
 - 1) UL listed electronic rotary actuator designed for operation with the ball type control valve, with the following features:
 - 2) The actuator shall be of the same manufacturer as the valve body and shall be integrally mounted to the valve at the factory.
 - 3) For direct coupling to the valve shaft without the use of linkages, use an ISO-style mounting pad.
 - 4) Minimum cycle life: 60,000 full strokes at maximum rated torque.
 - 5) Torque: as required for smooth positioning and closure of the valve against a maximum differential pressure of 30 PSI and to provide close-off up to 200 PSI.
 - 6) Motor runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - 7) Spring return runtime to rotate the valve ball 90°: 90 seconds maximum, 20 seconds minimum.
 - 8) For use with a 24VAC power supply with the ability to operate off the same power supply required for the temperature controller.
 - 9) For use with 0-10Vdc output proportional plus integral room controllers, fully compatible with the specified temperature controller. Unless indicated otherwise on the control drawings:
 - a) Heating coil (non-vivarium applications): Normally open spring return actuation.

- b) Heating Coil(vivarium applications): Normally closed spring return actuation.
 - c) Cooling coil: Normally closed spring return actuation.
- 10) Electronic stall detection/overload protection. Actuator shall sense that maximum rotational position has been reached even when control signal is still applied and stop rotating prior to actuator damage.
 - 11) Rotation mechanically limited by adjustable integral limit stops.
 - 12) Mechanical range adjustment.
 - 13) Valve position indicator.
 - 14) Actuator/actuator housing: Brushless DC motor design, NEMA type 1 or 2 enclosure, die-cast aluminum alloy or UL 94 listed plastic housing, lubricated gears, with a thermal barrier to prevent condensation on the actuator parts when used for chilled water applications. It shall be possible to rotate the actuator to any of four rotational angles in 90° increments, relative to the valve body.
 - 15) Ambient temperature operating range: -20°F and 120°F.
 - 16) Maximum actuator noise level, running or spring return: 40 dBA.
- c. Floating Point Actuators
- 1) Shall only be used for VAV box applications
 - 2) 24 VAC 3-position floating control, 7/32" (5.5 mm) stroke minimum, direct-coupled to valve bodies without the use of tools, with sufficient power to prevent valves from lifting off their seats. With visual position indication, manual override knob, UL-listed for plenum installations.
 - 3) The actuators shall be fail-safe open for perimeter heating applications.
 - 4) The actuators shall be fail-in-place for reheat control valves.

4. Butterfly Valve Actuators

a. Electric Actuators

- 1) Actuators shall utilize split capacitor, reversible electric motor driving a compound epicyclic gear, thermal overload protected, factory tested, factory lubricated, localized mechanical position indicator readable at 25 feet, 0-90 degree reversible operation, bolt directly to valve top plate.
- 2) Housing shall be weatherproof and suitable for outdoor location (NEMA 4X or IP66 rated).
- 3) Provide thermostatically controlled heater for prevention of condensation at low temperatures.
- 4) Provide auxiliary limit switches to confirm open/closed valve position.
- 5) For modulating valves, provide 0-10 VDC or 4-20 mA feedback signal for valve position.
- 6) Actuator voltage shall be 120 VAC. 120V actuators shall be fed out of the DDC auxiliary panel with a separate disconnect and fuse. Disconnect and fuse to be located in the DDC auxiliary panel.

BuildingName

The Description of the Project

P00000000 0000 Issued for: **(FILL IN)** BID 230905 - - 58

- 7) In all cases the MSCC shall provide the required control wiring to the actuators.
 - 8) Actuator ambient temperature range shall be -20 deg. F to +140 deg. F.
 - 9) Actuator shall include a manually operated hand wheel for manual override of the valve position.
- b. Pneumatic Actuators
- 1) Pneumatic actuators shall be pneumatic rotary type with rack and pinion to provide constant output torque rated for at least 125 percent, pilot positioner with gauges, spring return, adjustable travel stops, factory tested, factory lubricated, self-draining body, integral pneumatic parting,
 - 2) Actuators shall have localized mechanical position indicator readable at 25 feet, 0-90 deg. reversible operation, capable of operating in any valve mounting position.
 - 3) Actuators shall be capable of being mounted in line or transverse to pipeline, and bolt directly to valve top plate.
 - 4) Valves shall be actuated with 60-psig air and 3-15 psig pilot service. Valves used for isolation do not require pilot positioners. Actuator shall include a manually operated hand wheel for manual override.
 - 5) Provide speed control valves for On/Off (2-position) actuators for adjustment of actuator speed
5. Globe Valve Actuators
- a. Valves shall spring return to normal position as indicated.
 - b. Select with sufficient close-off power for system pressure, pump shut off head, highest operating torque, and torque requirements of valves that may stick because of infrequent use.
 - c. Select to provide smooth proportioning control under operating conditions normal to the system.
 - d. Electric Actuators
 - 1) All actuators shall have visual position indication.
 - 2) Actuator shall be electric motor driving, microprocessor signal controlled.
 - 3) Modulating valves shall be positive positioning, responding to a 0-10VDC, 2-10VDC or 4-20mA signal.
 - 4) Power: All actuators shall be 24VAC power and less than 100VA draw. Power shall be via Class 2 wiring.
 - 5) Fail Safe: Valves actuators shall position the valve in a fail-safe position when the power supply is disrupted or the signal goes to 0.
 - 6) Valves shall have a means to manually open the valve when power is not available, such as a hand wheel or a geared crank with a clutch. A release button (clutch) or handle on the actuator shall be provided to allow for manual override.
 - 7) The actuator shall be designed with a current limiting motor protection.

- 8) Actuator shall provide minimum torque required for proper valve close-off. The close-off differential pressure rating of the valve shall exceed the highest possible head pressure available at the pump plus 10%, and still be rated for a Class IV leakage.
 - 9) The actuator shall have the capability of adding auxiliary switches or feedback potentiometer if specified.
 - 10) Actuators shall be UL and CSA listed.
- e. Pneumatic Actuators
- 1) Pneumatic, rolling diaphragm, spring loaded, piston type.
 - 2) Spring range shall be as required for non-overlapping sequencing or as indicated on drawings.
 - 3) Ratio relays or accumulators used for sequencing valves are not acceptable unless specifically indicated on the drawings.
6. Valve body/actuator control action shall be as follows unless noted otherwise:
- a. Heating coil valves (non-vivarium) shall be normally open to flow through the coil.
 - b. Heating coil valves (vivarium) shall be normally closed to flow through the coil.
 - c. Heat exchanger valves (steam or water) shall be normally open to flow through the heat exchanger.
 - d. Cooling coil valves shall be normally closed to flow through the coil.
 - e. Humidifier valves shall be normally closed to flow through the humidifier.
 - f. Condenser water valves shall be normally open to flow through the cooling tower.
 - g. Isolation valves shall be normally open.
 - h. Drain valves shall be normally closed.

2.15 AUTOMATIC CONTROL DAMPERS

EDITOR'S NOTE: CONTROL DAMPERS SHALL BE SCHEDULED ON THE DRAWINGS. INDICATE THE DAMPER STATIC PRESSURE AND VELOCITY RATING IN THE SCHEDULE. FOR DAMPERS USED IN ANY APPLICATIONS REQUIRING SPECIALTY MATERIALS OF CONSTRUCTION, REFER TO SECTION 2.10.E (CONSULT WITH UM DESIGN MANAGER).

- A. Multi-blade type. Provide with parallel blades for two-position, throttling, and modulating service unless noted otherwise. Provide required drive axles, linkage, jackshafts, and accessories for proper damper operation. Damper blades, frames, linkages, jackshafts and other parts of the damper actuation system shall not distort or rack during operation. Dampers shall close tightly, and operate in a smooth, hesitation and slack-free manner over the entire range of travel, at the maximum air pressure and velocity at the mounting location. Additionally, multiple section dampers shall operate in unison section-to-section.
- B. Face and bypass dampers shall each be capable of passing 100% of unit rated CFM. Pressure drops shall be approximately the same in either extreme position, including the pressure drops of coils and bypass components.
- C. All automatic control dampers shall conform to these specifications, including those provided by equipment manufacturers.

- D. All control dampers shall be low leakage type and shall meet the following minimum requirements:
1. Leakage: 6.0 CFM/sq. ft. max. at 3" WC.
 2. Frames: 12 gauge channel/ 16 gauge roll formed (minimum) galvanized steel, minimum 2 inches in frame depth, welded or riveted with corner reinforcement.
 3. Blades: 16 gauge (minimum) galvanized steel or aluminum airfoil type, maximum blade size 8 inches wide, 48 inches long. Axles and axle extensions shall be minimum 1/2 inch solid galvanized steel. Dampers which are required to have a static pressure rating over 4" WC shall have minimum 3/4 inch solid galvanized steel axles/axle extensions.
 4. Blade Seals: Synthetic elastomeric or neoprene, inflatable type, mechanically attached, field replaceable.
 5. Jackshafts: Provide to drive adjacent vertical sections of multiple damper assemblies to ensure uniform operation. Minimum 3/4 inch solid or 1" hollow (minimum 1/8 inch wall thickness) galvanized steel. Where jackshafts penetrate air handling casing walls, provide greasable ball bearing supports sleeved and sealed to prevent casing leakage. Provide intermediate greasable ball bearing supports bolted to damper frames for jack shafts extending across multiple damper sections.
 6. Jamb Seals: Stainless steel.
 7. Bearings: Oil impregnated sintered bronze or lubricant free, solid stainless steel. Provide thrust washers at bearings for all dampers that are to be mounted with blades in the vertical position.
 8. Linkages: Deflection and slack-free. Zinc plated, fully exposed, connected to blade faces (located in the air stream). Linkages may be located in-jamb for single damper flange mounting arrangements, provided linkage is external to the duct and easily accessible for maintenance.
 9. Static pressure Rating: As scheduled on the drawings, or provide dampers rated for the maximum pressure to be encountered at the mounting location but not less than 4" WC.
 10. Velocity Rating: As scheduled on drawings, or provide dampers rated for the maximum velocity to be encountered at the mounting location.
 11. Temperature Limits: -40 to 200 deg. F.
 12. Provide through-bolted connections for connecting axle or jackshaft extensions. Set screw arrangements are not allowed.
 13. Selection and sizing criteria: Damper selection and sizing shall be based on damper schedule shown on the drawings. For dampers that are not scheduled on the drawings, selection and sizing shall be based on the procedure contained in Engineering Manual of Automatic Control, Honeywell, Inc., 1997.
- E. For dampers located in stainless steel ductwork, PVC coated ductwork, fume hood exhaust ductwork, and exhaust fan outside air bleed-in ductwork, fabricate and size as indicated above, with the following additional requirements:
1. Frames, blades, blade axles and extensions, blade seals, jackshafts, linkages, and all other components exposed to the air-stream: Type 316 stainless steel.
 2. Bearings: Solid stainless steel.

3. Damper operators shall be mounted outside of air stream. Extend damper axles and jackshafts to permit mounting outside of air stream.

F. Damper End Switch

1. For dampers specified with confirmation of open/ closed position back to the BMS, provide end switches as part of the damper package, factory installed and tested by the damper manufacturer.
2. Minimum temperature limits of -50 to 40 degC
3. Minimum tested operational life of 10,000,000 cycles
4. End switches shall be constructed of similar materials (ie all aluminum/ stainless construction), NEMA rating for weather-proofness and UL/ CSA listing as damper.

G. Approved Manufacturers:

1. Honeywell
2. Ruskin
3. Vent Products
4. American Warming & Ventilating
5. Arrow United Industries
6. White Environmental
7. Johnson Controls
8. Nailor

2.16 DAMPER OPERATORS

EDITOR: WHENEVER POSSIBLE, THE USE OF ELECTRIC ACTUATION FOR DAMPER ACTUATORS IS PREFERRED. PNEUMATIC ACTUATION MAY ONLY BE CONSIDERED FOR PARTIAL RETROFITS OF EXISTING SYSTEMS WITH PNEUMATIC CONTROLS. CONSULT WITH THE UM DESIGN MANAGER IF PNEUMATIC CONTROLS ARE REQUIRED.

A. General:

1. Damper operators shall be electric unless specifically noted otherwise on the drawings.
2. Damper operators shall be installed in accessible locations. Damper operators shall not be installed inside ducts or air units that convey hazardous exhaust.
 - a. Single section dampers should be configured with an extended shaft actuator mounting arrangement with the actuator mounted in an accessible location outside the ductwork.
 - b. Multiple section dampers should be connected with a jackshaft arrangement which is extended to an accessible location outside the duct. Where possible tandem mounted actuation should be provided on one side of the damper assembly.
 - c. Damper actuators mounted onto the same jackshaft should be controlled using a leader/follower wiring design with the DDC panel signal being wired to the master actuator and the remaining slave actuators being controlled through the master feedback signal.
3. Electric Operators:
 - a. Maintenance free electric actuator, reversible, with push rod and bracket for swivel mounting and for the transmission of power.

- b. Synchronous motor with load independent running time providing parallel operation of several operators. Gear train with low noise level.
 - c. Magnetic hysteresis coupling with magnetic transmission of torque, with no mechanical contact between the coupling members.
 - d. The actuator shall be safe against blocking and overload proof even when operated continuously.
 - e. 24 or 120 VAC, 4-20 mA or 0-10 VDC input, reversible, direct-drive, metal or aluminum housing, brushless DC motor with stall protection, quiet, low-power operation, have visual position indicator, manual override, and a 0-10VDC feedback signal output.
 - f. Actuators located outdoors shall be provided with internal heaters and should operate in the ambient temperature range of -20°F to 140°F.
 - g. Actuators located outdoors shall be NEMA4x or IP66 rated or shall be provided with weatherproof NEMA 4X stainless steel enclosures that have removable covers with clasps or machine screws (no sheet metal screws) and that do not require removing fasteners.
 - h. Electric actuators contained within air handling unit enclosures (and thereby subjected to maintenance power washing as part of regular PMs) shall be NEMA 4X or IP66 rated or shall be provided with weatherproof NEMA 4X stainless steel enclosures that have removable covers with clasps or machine screws (no sheet metal screws) and that do not require removing fasteners.
4. Electronic damper operators used with TECs
- a. Operators shall be 24 VAC 3-position floating control type and utilize a 90-degree rotation.
 - b. Operators shall be direct-drive, have sufficient power to operate the damper against system pressures, provide visual position indication, have manual override, and shall be UL-listed for plenum installations. Operators shall be of the fail-in-place type.
5. Pneumatic Operators: Rolling diaphragm piston type with 8-13# spring range, as indicated on drawings, or as required to achieve specified performance.
- B. Provide operator mounting brackets. Provide devices to connect operator drive shafts to dampers, damper linkages, and jackshafts.
- C. Quantity of operators: Provide a sufficient number to achieve unrestricted movement throughout damper range, such that one operator does not operate more than the maximum square footage of damper area as recommended in standard catalog of manufacturer. Minimum torque rating for sizing electric actuators on duct systems that operate above 1" of static pressure is 14 in-lbs/ft². Provide sufficient number so dampers close tightly, operate in a smooth, hesitation and slack-free manner over the entire range of travel at the maximum air pressure and velocity at the mounting location, and so that multiple section dampers operate in unison section-to-section. Provide spring return to normal position.

- D. Where end switches are shown on control diagrams, it is not acceptable to utilize the internal damper operator end switches. Where shown, external end switches should be provided that are secured to the damper blades, linkages, or jackshaft independently of the damper operator(s).
- E. Approved Manufacturers:
 - 1. Honeywell
 - 2. Johnson
 - 3. Siemens
 - 4. Belimo

2.17 PNEUMATIC CONTROL COMPONENTS

- A. Components shall be Honeywell, Johnson, or Siemens, unless listed otherwise.
- B. Electric-pneumatic relays shall be two-position, have a metallic body, can be field or panel mounted, have a 120 VAC coil, and 3 or 4 ports. Only Johnson E.P. relays are acceptable.
- C. Pressure-electric switches shall be two-position, appropriate range and element, suitable for the service, single or double pole, normally open or normally closed as required. Set point shall adjustable over the full range. Switch rating shall be 8.0 amps at 120 VAC, minimum.
- D. Differential pressure transmitter shall be one-pipe, 3-15 psig output, capable of measuring pressure differentials of positive or negative type, operate on the force-balance principal, have an over-pressure rating of 30" WC, accuracy of 5 percent full scale, and of the range suitable for the service.
- E. Pneumatic room thermostats shall be direct acting, dual (minimum 5°F dead band - 2 output branch lines) or single setpoint, 2-pipe, large capacity, adjustable proportioning type, containing dual or single bi-metallic elements, adjustable differential, minimum setting no greater than 1-1/2 deg. F over a range of 55 to 85 deg. F. Provide tamperproof covers with exposed setpoint indicator in black lettering, exposed thermometer, exposed setpoint adjustment in non-public areas and key operated setpoint adjustment in public areas.
- F. Pneumatic humidistats shall be of the adjustable proportioning, 2-pipe type, duct or wall mounted, reverse acting, adjustable sensitivity, sensitive hygroscopic membrane, temperature compensated, 20-90% RH range room, 25-65% RH range for duct, and 55-95% RH range for high-limit applications. Room type shall have tamperproof cover. Duct type shall come mounted inside a galvanized duct mounting box.
- G. Temperature transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1/2% of range for 200 deg. F span and plus or minus 1% for 50 deg. F span, with appropriate 50, 100, 200 deg. F temperature range, compensated bulb, averaging capillary, rod and tube or room transmitter operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.

- H. Humidity transmitters shall be one pipe, directly proportional output signal to measured variable, linearity within plus or minus 1% of range, temperature compensated, sensitive hydroscopic membrane, room or duct mounted, operating on 20 psig input pressure and 3 to 15 psig output. Room transmitter shall be provided with cover and wall plate.
- I. Receiver-controllers shall be single or dual input models direct or reverse acting with mechanical set point adjustment, calibrated proportional band adjustment, and calibrated authority adjustment. Provide proportional control mode for temperature control applications, and proportional plus integral control mode for differential pressure control applications. Proportional band shall extend from 2 to 40% of primary sensor span, authority from 0 to 200% of primary sensor span and integral time from 1/2 to 20 minutes. Suitable for input signal of associated transmitter and output signal required by controlled device.
- J. Signal selector relays shall be capable of receiving two or more input signals and transmitting the highest or lowest pressure, with 1:1 input/output ratio.
- K. Booster relays shall be proportional type for increasing the volume capacity of an input signal to a directly proportional output signal.
- L. Pneumatic switching relays shall be snap acting, switching type with adjustable switching setpoint and fixed differential, single or double pole, and metallic body, for connecting a common port to either of two other ports based on the switching signal.
- M. Pneumatic multi-purpose relays shall be two-valve design, high accuracy, high repeatability, metallic body, internal relief, high capacity, proportional, with adjustable set point, capable of being used as direct or reverse acting, amplifying, signal advancing, minimum pressure output, or lower pressure transfer. Removal of main air to the relay causes the branch line output to go to zero.
- N. Pneumatic gradual position switches shall provide regulated pressure to a controlled device, with knob and pointer for manual adjustment, graduated scale plate with appropriate markings, suitable for surface or flush mounting on wall or panel as indicated.
- O. Pneumatic selector switches shall be two or three position with metallic bodies, have indicating plates with appropriate markings, and suitable for panel or wall mounting. Switches installed in finished rooms shall be recessed in wall and provided with faceplate.
- P. Field Mounted Gauges:
 - 1. Provide 1-1/2" air pressure gauges on branch lines of pneumatic systems at controllers, transmitters, valve and damper operators, relays, switches, regulators; and DDC output points. Accuracy shall be 2.5 percent of full scale for the middle half of scale and 3.5 percent elsewhere. At dampers or devices that utilize multiple actuators, a single gauge in a readily visible location is acceptable.
- Q. Panel Mounted Pneumatic Gauges:
 - 1. All transmitters shall be provided with receiver gauges.
 - 2. Door mounted analog indicator gauges shall be 3-1/2" diameter with 1% accuracy.

3. Sub-panel mounted analog indicator gauges shall be 2-1/2" diameter with 1% accuracy.
4. A 1-1/2" gauge shall be provided on the main air supply inside each control panel.

2.18 LOCAL, AUXILIARY, UPS, LPI AND SIMILAR PANELS

- A. Unitized cabinet type for each system under automatic control with relays and controls mounted in cabinet and temperature indicators, pressure gauges, pilot lights, push buttons and switches flush on cabinet panel face, or as detailed on drawings.
- B. Doors shall be removable, right or left hand hinged, locking, keyed alike and to other U-M control panels.
- C. Removable perforated subpanel to permit mounting of controls without drilling holes.
- D. Wall mounted or support kit or unistrut type frame for floor mounting.
- E. Unit shall have knockouts, NEMA Type 1, and listed under UL508 Industrial Control Panel Enclosures.
- F. LPI panel minimum size shall be 19-1/2" high by 16-3/8" wide by 5-3/4" deep.
- G. UPS panel minimum size shall be 19-1/2" high by 20" wide by 10" deep. Confirm with UPS dimensions & clearances

2.19 UNINTERRUPTABLE POWER SUPPLIES (UPS)

SPECIFICATION EDITOR: UMH REQUIRES ALL UPS'S TO BE INTEGRATED TO THE DESIGO CC FRONT END DIRECTLY OVER THE HITS NETWORK. AE SHALL PROVIDE A HITS DATA DROP AT ALL UPS LOCATIONS AND NETWORK COMM CARD INTEGRAL TO ALL UPS'S (SEE BELOW SPEC) TO FACILITATE SNMP INTEGRATION TO FRONT END.

- A. Provide local tower, dual conversion UPS for DDC Controllers and associated controlled devices. UPS shall meet the following minimum requirements:
 1. UPS shall be sized for continuous full load use of all components served plus an additional 25% for a period of at least 5 minutes. Minimum size shall be 300 VA/ 120V.
 2. UPS features:
 - a. Audible alarm when main power is not available
 - b. Automatic internal bypass to automatically maintain power to the load upon failure of the batteries.
 - c. Provide with a network communication card for remote monitoring by Web/SNMP thru UMH's layer 3 network.
 - d. RF noise filtering.
 - e. Over-voltage protection.
 - f. Four outlet receptacles minimum.
 - g. Visual status alert light.
 - h. Sealed maintenance-free batteries.
 - i. Batteries shall be replaceable while maintaining power to the load (hot-swappable)

3. UPS installations within electrical & telecommunication rooms free from dirt/ dust & damage shall mount the UPS exposed, with brackets securely anchoring the UPS to the wall. Installations elsewhere (i.e. mechanical rooms) shall mount the UPS in a dedicated, ventilated panel enclosure. Provide panel with filtered supply fan (Dayton 2RTE8, 120V, 3"dia, 40 CFM) powered from UPS with filter guard assembly (Dayton 4YD95) and 3" dia. aluminum screened outlet opening (Dayton 31CC63). The supply fan shall be mounted to blow through the filter into the panel so the panel is pressurized with filtered air.
4. Provide with and install UPS interface power control module, Functional Devices PSM2RB10. Do not cut plug head off UPS cords.
5. Integrate UPS into the MCS via dedicated HITS network connection.
6. Approved Manufacturers:
 - a. Eaton 9SX with Network Communication Card
 - b. APC SMART UPS SRT with Network Management Card

2.20 AHU SAFETIES ENCLOSURES (FIRE ALARM TO TEMPERATURE CONTROL INTERFACE BOX)

- A. Enclosures shall utilize a standard 4-11/16" x 4-11/16" square electrical box and blank clover. One half of the blank cover shall be painted red and the other blue. A red neon indicator light shall be installed in the red half of the cover and a blue neon indicator light shall be installed in the blue half of the cover. A terminal strip shall be installed inside the electrical box with two terminals in one half, labeled "H1" and "H2" (for HVAC use), and two additional terminals in the other half, labeled "F1" and "F2" (for fire alarm use). The red neon indicator shall be wired to the F terminals and the blue neon indicator to the H terminals.

2.21 PNEUMATIC ACCESSORIES

THE UNIVERSITY'S HIGH PRESSURE AIR SUPPLY IS AVAILABLE ON CENTRAL CAMPUS VIA THE STEAM TUNNEL SYSTEM. AS OF SEPTEMBER 2020 THE DEWPOINT IS NOT GUARANTEED. NEW PROJECTS CONNECTING TO THE TUNNEL SHOULD VERIFY THE DEWPOINT WITH UM CENTRAL UTILITY PLANT TO DETERMINE IF DESICCANT DRYERS ARE REQUIRED FOR THE CONTROL AIR.

- A. Control Air Supply
 1. Control air supply shall be from the University's high-pressure (steam tunnel) air supply or from a temperature control compressed air station as indicated on the project documents. System shall be sized for expected use, including air usage of laboratory airflow units or process control actuators (whether this equipment is provided by the MSCC or not), plus 10 percent extra capacity. When providing a control compressed air station, provide a Refrigerated Air Dryer if none of the pneumatic tubing or pneumatic components are exposed to outside air conditions. Provide a Regenerative Desiccant Air Dryer when pneumatic tubing or pneumatic components are exposed to outside air conditions. For projects utilizing the University's high pressure air supply, unless indicated otherwise on the drawings, no air dryers are required.

B. Compressed Air Station

1. Temperature control air compressors shall be reciprocating oil type through 25 HP, rotary screw over 25 HP, specifically designed for pneumatic controls, shall be of the simplex or duplex type, tank or base mounted unit assemblies, have combination intake filter/silencer, and totally enclosed belt guards. Compressors shall be sized based on no more than 1/3 run time with an appropriately sized tank and an average tank pressure of 70 psig for optimum performance. Simplex units shall only be used when backing up another control air supply.
2. Tank shall be of adequate size and contain a shut-off ball valve, ASME safety relief valve, pressure switch operated start/stop control, 120 VAC electronic automatic drain with manual bypass and air pressure gauge.
3. Duplex models shall be complete with NEMA 1 enclosure, starters, disconnects, automatic alternator, H-O-A switches (left H position spring return for test only), low oil shutdown switch, push-to-test pilot lights, and 3-position switch for selection of: compressor 1 only/automatic alternate/compressor 2 only operation. PRV/filter/dryer assemblies may be mounted to the compressor/tank assembly.

INCLUDE BELOW PARAGRAPH "4" FOR CRITICAL INSTALLATIONS REQUIRING COMPRESSED AIR REDUNDANCY WITHOUT CONNECTIONS TO THE UNIVERSITY'S HIGH PRESSURE AIR SUPPLY, OTHERWISE DELETE. EDIT ABOVE ACCORDINGLY

4. Provide (2) two fully redundant simplex or duplex air compressors, each sized for 100% of the total demand, per above requirements. Provide compressor alternating switch and associated piping and 120V power to automatically alternate lead compressor (similar to Ingersoll-Rand "Alternator Switch").
5. Approved Manufacturers:
 - a. Quincy
 - b. ACP
 - c. Divilbis
 - d. Ingersoll-Rand

C. Tubing

1. Copper tubing shall be new hard drawn, air grade, ASTM B75 for 3/8 inch and smaller or type L, ASTM B68 for 1/2 inch and larger, with solder joint or compression type fittings, at the option of the MSCC.
2. Plastic tubing (all sizes) shall be black virgin, polyethylene, ASTM D1248, Type 1, Class C, Grade 5, meeting crack test performance required by ASTM D1693 and be fire retardant (FR) rated. Multi-tube harness material shall be as specified above with a polyester film barrier and vinyl jacket not less than 0.062 inches thick. All non-metallic tubing shall be 1/4" O.D. minimum; micro-sleeve is not acceptable.

D. Pressure Reducing Valves:

1. Pressure reducing valves (PRV) shall be diaphragm operated, self-relieving, designed to provide precision control of air supply pressures, and shall be located after any filters or dryers.

2. PRV shall be capable of being mounted in any position, shall have locking set point handle, and SS inlet strainer.
3. PRV shall have metal or plastic body and shall be provided with 2-1/2" gauge of appropriate units.
4. PRV's that are not self-relieving shall be provided with a separate relief valve of appropriate range.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air
 - e. Johnson
 - f. Honeywell
 - g. Siemens

E. DDC/Auxiliary/Local Control Panel Air Filters:

1. Provide an in-line air filter for main air supply to all DDC, auxiliary and local control panels capable of removing solids and petroleum-based oils.
2. Filter efficiency shall be 99.9% of 0.5 micron particles.
3. Filter element shall be visible and shall change color to indicate when to be replaced.
4. Minimum capacity shall be 500 SCIM and 30 psig.
5. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

F. Coalescing Air Filters:

1. Provide a duplex set of coalescing air filters for the main air supply to all building temperature controls.
2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
3. Filter shall have a replaceable cartridge and drain port.
4. Filter shall be designed to remove oil and water droplets down to 0.01 microns and particulates down to 0.08 microns. Minimum capacity shall be 10 SCFM and 150 psig.
5. Coalescing filters shall be located downstream of refrigerated air dryers and upstream of chemical or desiccant dryers.
6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

G. Particulate Air Filters:

1. Whenever chemical or desiccant dryers are used, provide a duplex set of particulate air filters for the main air supply to all building temperature controls located downstream of chemical or desiccant dryers.
2. Duplex assembly shall include upstream and downstream pressure gauges and isolation ball valves for each filter.
3. Filter shall have a replaceable cartridge and drain port.
4. Filter shall be designed to remove particulates down to 0.1 microns. Minimum capacity shall be 10 SCFM and 150 psig.
5. Approved Manufacturers:

BuildingName

The Description of the Project

P00000000 0000 Issued for: (FILL IN) BID 230905 - - 69

- a. Wilkerson
- b. Hankison
- c. Parker
- d. Van-Air

H. Refrigerated Air Dryers:

- 1. Provide a 120 VAC air-cooled refrigerated dryer capable of providing 35 deg. F dew point air.
- 2. Unit shall have power on light, high temperature light, valved air bypass piping, and air-to-air precooler/reheater.
- 3. Heat exchanger to be non-fouling, tube-in-tube, self-cleaning with smooth surfaces.
- 4. Compressor shall have hot gas bypass, as required, and shall be protected by thermal and current overloads.
- 5. Condenser fan shall have thermal overload protection.
- 6. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

I. Regenerative Desiccant Air Dryers:

- 1. Provide a 120 VAC regenerative type desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing -40 deg. F dew point air at 150 psig.
- 2. Units shall have an adjustable solid-state timer and purge flow economizer valve, on/off switch, power on light, separate fill and drain ports for ease of desiccant replacement without piping removal, heavy duty purge exhaust mufflers for quiet operation, non-lubricated air control valves, Teflon seated check valves, visible moisture indicator, visible purge flow indicator, pressure relief valve, ASME code constructed/stamped pressure vessels, SS support screens and air diffusers, tower pressure gauges, structural floor frame and stand for large sizes, wall mounting brackets and supports for small sizes, pre-piped and wired, and complete with air bypass piping.
- 3. Approved Manufacturers:
 - a. Wilkerson
 - b. Hankison
 - c. Parker
 - d. Van-Air

J. In-line Desiccant Air Dryers:

- 1. Provide an in-line desiccant dryer of the optimal size to ensure sufficient contact time and capable of providing 4,000 cubic feet of -40 deg. F dew point air at 150 psig with a dryer inlet temperature of 68 deg. F.
- 2. Units shall have a removable bowl or fill port for ease of desiccant replacement without piping removal, visible moisture indicator, and air bypass piping.
- 3. Not to be used as a substitute for Regenerative Desiccant Air Dryers when providing a control compressed air station.
- 4. Approved Manufacturers:
 - a. Wilkinson
 - b. Hankison
 - c. Parker
 - d. Van-Air

2.22 IDENTIFICATION AND LABELS

- A. The MSCC shall provide black phenolic nameplates with engraved white minimum 1/4" high lettering, for each DDC or auxiliary panel, panel door mounted devices, and all LPI's, permanently attached, to identify field panel number, building, area, service, etc.
- B. All control devices located within auxiliary panels shall be labeled with legible identification that corresponds with the as-built drawings via black permanent marker. Use plastic or metal tags when it is not possible to mark directly on the device.

PART 3 - EXECUTION

SPECIFICATION EDITOR: ONLY USE THE FOLLOWING PARAGRAPH FOR ADDITION & RENOVATION PROJECTS. REMOVE THE FOLLOWING PARAGRAPH FOR NEW, STAND-ALONE FACILITIES.

3.1 DEMOLITION

- A. All existing control panels, devices, wiring and tubing that are to be abandoned as part of renovation work shall be demolished completely by the MSCC.
- B. All demolished controllers or control devices that are still in working condition shall be returned to UMH's HVAC maintenance department.
- C. Abandoned wiring shall be demolished back to the nearest connection point or junction box.
- D. Abandoned pneumatic tubing shall be demolished back to the nearest main line tap and shall be capped with a mechanical fitting.
- E. When controllers are removed, the MSCC shall ensure that the existing DDC panel communication bus is maintained during and after all demolition work.
- F. The MSCC shall be responsible for identifying the demolition/ decommissioning scope on UMH's legacy Siemens, Honeywell, Johnson Controls, and/ or ASI DDC systems impacted by the project scope.
 - 1. UMH Systems Monitoring shall be responsible for the removal/ decommissioning of all graphics, alarms, trends on UMH's legacy BMS front ends (ie Honeywell EBI & JCI Metasys) related to points, devices & controllers that have been modified as part of the MSCC's work.
 - 2. UMH BAS Controls shall be responsible for the removal/ decommissioning of all legacy DDC panel databases (ie Honeywell EBI & JCI Metasys) related to points, devices & controllers that have been modified as part of the MSCC's work.

3.2 INSTALLATION

- A. Install all system components as recommended by the manufacturer, including air compressors, dryers, filters, etc.

- B. Thermostats, room temperature sensors, push-buttons, Indoor Air Quality (IAQ) Monitors and other adjustable devices meant for room occupant operation shall be mounted 44" to center above the finished floor (or as permitted by ADA requirements referenced in UM Design Guideline 1.0 Codes and Regulatory Agencies). This requirement does not apply to control panels and devices mounted in penthouses, mechanical rooms, and other spaces normally inaccessible to room occupants. Contractor shall refer to architectural elevations for locations of sensors.
- C. Zone thermostatic controls used to control both heating and cooling, e.g. a variable volume terminal unit also controlling a reheat coil and/or fin tube radiation, shall be programmed (DDC systems) or set up (non-DDC systems) with a heating setpoint of 71°F and cooling setpoint of 76°F, and a dead-band of 5°F, unless indicated otherwise on the Drawings.
- D. System I/O's shall not be split between different DDC panels.
- E. AHU safeties enclosure shall be mounted at the wiring/tubing DDC panel array interface trough.
- F. Install all conduit, wiring, cable, tubing and equipment in a first-class manner, using proper tools, equipment, hangers, and supports, and in locations as required for a neat, attractive installation. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner. Conduit shall not be supported from work of other trades.
- G. Support all sensors and devices as recommended by the manufacturer. Space sensors shall be mounted on an electrical box. Averaging element temperature sensors and low temperature detectors shall be mounted securely from coil frames in a horizontal serpentine manner at intervals not to exceed 4 feet; provide rigid supplemental metallic support structure when required. For element directional changes, minimum bend radius shall be no less than 2". Use mounting clips which prevent element wear due to vibration.
- H. Provide a control air shut-off valve for each panel.
- I. Panels and meter enclosures shall be rigidly mounted.
- J. Plastic tubing may be used in all locations, except in mechanical rooms, shafts, or exposed locations, unless run in conduit.
- K. Tubing shall not be attached to conduits with current carrying conductors or fire protection piping. It shall be adequately supported with no noticeable sagging between supports, and protected from abrasion and galvanic corrosion. All pneumatic tubing shall be concealed in finished areas.
- L. A PRV shall be installed on each floor to provide control air supply.
- M. All wiring to devices installed inside auxiliary/local panels shall enter/exist via terminal strips, except twisted/shielded sensor wiring.
- N. Provide a pouch or other containing method inside each control panel and insert a copy of the corresponding system control drawings.

- O. Provide supplemental Hand-Off-Auto switches and contactors, as required, to permit automatic operation of equipment from the DDC system (i.e. single phase equipment which uses fractional motor starters, etc.).
- P. Extreme care shall be used in making connections to other equipment to see that the safeties on this equipment are not inadvertently bypassed or overridden by the DDC.
- Q. All equipment having moving parts and controlled by the DDC shall be provided with warning labels no less than 2 in. in height, and in bright warning color, stating that the equipment is remotely started by automatic controls. Such labels shall be posted clearly in the area of any moving parts, such as belts, fans, pumps, etc. The University of Michigan will furnish and install these warning labels.
- R. Ensure all dampers, valves, thermowells, flow meters, and other miscellaneous control components are located and installed correctly so that the specified and intended performance and the Sequence of Operation is achieved, including components supplied and installed by others.
- S. Limit switches used on dampers shall be set at approximately 95% of full stroke (opened and closed). Where a single limit switch is indicated, set at approximately 75% of full stroke.
- T. MSCC shall provide all necessary equipment, test gases, etc. for calibration, and shall calibrate all sensors (i.e. CO2, CO, combustible gas, etc.) in accordance with the manufacturer's recommendations. Specialized equipment, test gases, etc. shall be turned over to owner upon completion and acceptance.
- U. Flow meters shall be installed with at least 10 diameter of straight pipe length upstream and five diameter of straight pipe length downstream. Power supply to flow meters and BTU meters shall be 115 VAC from the auxiliary DDC panel, and power connection for each device shall be installed with a lockable local service disconnect. Flow meter transmitters/ displays and BTU meters, shall be mounted 4 feet above finished floor. They shall be located at the DDC panel array unless the maximum available cable length is exceeded. All meter components, including sensors, shall be mounted in accessible locations.
- V. Airflow sensors shall be installed with the appropriate upstream and downstream clearances per manufacturer's instructions.
- W. Remove any unused items that are part of renovations or demolition, including, but not limited to: conduit, wire, tubing, controllers, controlled devices, relays, enclosures, etc. Do not abandon in place.
- X. DDC sensor cabling shall not be spliced.
- Y. DDC Wiring shall be terminated at DDC sensors, relays, transducers, switches and control panels. Intermediate stops or terminations at any other terminal strips are not acceptable.
- Z. Locate all control components and accessories such that they are easily accessible for adjustment, service and replacement.

- AA. Participate in the commissioning process in accordance with the project commissioning documents.
- BB. Fire Alarm to Temperature Control Interface Boxes shall be mounted at the DDC panel arrays.
- CC. All set points and alarm points shown on the documents are preliminary. Finalize with the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
- DD. For fan coil/ terminal unit controllers and similar programmable electronic controllers, obtain approval of programmable settings from the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
- EE. Install constant flow fume hood sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal use, and allows vertical sashes to be positioned without binding, twisting or tangling.
- FF. Except as specified otherwise, throttling ranges, proportional bands, and switching differentials shall be centered on the associated set point.
- GG. All set points, unless otherwise indicated, are adjustable and shall be programmable for all control loops. All set points and alarm points shown on the documents are preliminary. Finalize with the Engineer and Commissioning Authority prior to programming. Revise settings as required during commissioning.
- HH. Where any sequence or occupancy schedule calls for more than one motorized unit to start simultaneously, the system start commands shall be staggered by 60-second (adj.) intervals to minimize inrush current.
- II. Optimal start/stop programs shall be applied to all regularly scheduled mechanical and electrical systems.
- JJ. Configure modular DDC panel terminations such that analog inputs and analog outputs terminate on separate modules, do not intermix analog outputs and inputs on the same module.
- KK. Provide temporary programming to provide building heating or cooling during construction.
- LL. Programming lines shall be grouped into subparts and explained with comment fields. The comment fields shall include the related part of the project sequence of operation that each program subpart is intended to accomplish.
- MM. MSCC shall be responsible for adding all DDC devices, logic, project files, etc. in the project scope of work to the UMH managed vendor specific engineering software to allow UMH to fully manage system code/logic, network settings, definitions, parameters, etc.
- NN. Coordinate with 3rd party equipment supplier BACnet object lists and integrate into Owner's BAS system, including assigning Instance numbers based on Owner's convention. Submit a list of available BACnet objects and proposed naming convention for owner approval. Map all BACnet objects selected by owner (using owner designated naming convention) to be viewable at the field panel and BAS server.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.

- OO. Install constant flow fume hood monitors surface mounted on the front of the fume hood. Furnish exact dimensions and location to the fume hood factory to allow for concealed wiring to the monitor.
- PP. Temperature and/ or humidity sensors using 10k or 20k thermistors shall be field calibrated with a NIST calibrated field device for the full span of control.
- QQ. Indoor Air Quality (IAQ) Monitors shall be securely attached to the wall with screws, per manufacturer recommendations. Do not mount directly over heat sources (monitors, printers, etc). Once installed, the MSCC shall verify accuracy of temperature and humidity readings via a NIST calibrated device, for all of the sensors used. Submit testing report, including date, time, NIST device (and last calibration), IP sensor reading and NIST device reading, to UMH FPD for records.

3.3 CONTROL PANELS

- A. All wire and pneumatic tubing within the control enclosure shall be neat and suitably bundled and contained in "Panduit" wire duct, or equivalent, parallel and/or perpendicular with enclosure. Alternately, bundle at 4-inch intervals using nylon tie straps. Wire bundle straps shall be secured to panel backplane using screws or mounting rails. Free-hanging, loose installations are not acceptable.
- B. All panels, enclosures, sub-panels, junction boxes, pull boxes, troughs, trays, etc. shall not exceed 70% maximum conductor fill.
- C. Each input/output device shall be controlled from a dedicated 2-pair conductor.
- D. Each input/output device requiring power shall have a dedicated power wire run to the control enclosure and shall be terminated to a dedicated terminal strip.
- E. Maintain separation of class 1 and class 2 wiring. Use separate conduit connections to control panel for each wire type. I/O wiring shall enter control panel through a conduit directly above the module that it will connect to.
- F. For door mounted devices, the installing contractor shall properly dress and bundle the wiring or tubing in a way that does not interfere with fully opening and closing the door.
- G. Wiring shall be tagged with point address or wire number 4 inches down from the point at which the wire enters the cabinet.
- H. The 24VAC power supply in the DDC panel shall only be used to power the controller and shall be fed by a dedicated 120V circuit. Provide separate control transformers as required to power other devices.
- I. Controller module labels shall be installed into each module with final point names and addresses listed. Where not possible, include a printout of panel point addresses with the asbuilt drawing set left in panel.

- J. Auxiliary panels shall be powered with a dedicated 120VAC circuit and contain a service disconnect in the upper right corner. Final circuit number shall be tagged on switch cover.
- K. Auxiliary panel components shall be laid out in an organized manner and positioned to conserve available space for future use. All devices shall be mounted on panel backplanes. Auxiliary panels shall not be loaded beyond 90% of the backplane capacity.
- L. Motor load wiring shall not be routed into or through control panels.
- M. No voltage higher than 120 VAC shall be routed into or through control panels.
- N. MSCC shall label panel power supply with power circuit and electrical panel information.
- O. All wiring and pneumatic tubing shall be suitably identified by thermal print labels at controller and input/output device.
- P. Labelling convention for DDC Panels shall follow that set forth under the Field Device Identification section of Part 3 "BACNET OBJECT / CONTROL POINT NAMING", along with the room number where the panel is mounted, and shall include a list of systems controlled/monitored/alarmed by that field device. Examples of this include:
 1. 0316-PNL-B2C326 services 0316-AHU-0202 and FCU-B2345. Panel is mounted in room B2C326.
 2. 0517-PNL-4745-IO1 services 4th Floor VAV boxes (indicates a remote I/O module off PNL2)

3.4 INSTALLATION - POWER, CONTROL, AND NETWORK WIRING

- A. All wiring to devices installed inside auxiliary/local panels shall enter/exist via terminal strips, except twisted/shielded sensor wiring.
- B. DDC sensor cabling shall not be spliced.
- C. Refer to Part 2 for additional installation requirements.

3.5 INSTALLATION - PNEUMATIC AIR

- A. Provide a control air shut-off valve for each panel. Downstream, install an in-line air filter for main air supply to each DDC, auxiliary and local control panel.
- B. Provide a control air shut-off valve for each panel. Downstream, install an in-line air filter for main air supply to each DDC, auxiliary and local control panel.
- C. Plastic tubing may be used in all locations, except in mechanical rooms, shafts, or exposed locations, unless run in conduit.
- D. Tubing shall not be attached to conduits with current carrying conductors or fire protection piping. It shall be adequately supported with no noticeable sagging between supports, and protected from abrasion and galvanic corrosion. All pneumatic tubing shall be concealed in finished areas.
- E. PRV shall be installed on each floor to provide control air supply, when control air is required on the floor.

- F. Provide all required control air and associated tubing.

3.6 LABELLING

- A. Labelling methods and color scheme shall be reviewed and approved by UM before proceeding.
- B. Labels for devices in offices, public, and similar spaces shall be thermal printed on clear adhesive tape.
 - 1. Label terminal unit controllers with address (non-BACnet) or Instance number (BACnet), affixing label to ceiling grid or access panel at unit location. Use nominal 3/16" high black block-style font.
 - 2. Label exterior of room mounted control devices with address (non-BACnet) or Instance number (BACnet). Use nominal 12 point block-style black font.
- C. Label the field end of every DO/DI/AO/AI connected to a B-BC controller. Labels shall be thermal printed on white adhesive tape.
 - 1. Nomenclature shall include point name and address (non-BACnet) or Instance number (BACnet). Use nominal 12 point block-style black font attached to exterior of device.
- D. Refer to Part 2 for additional labelling requirements.

3.7 HUMAN MACHINE INTERFACE PANEL(HMI) INSTALLATIONS

SPECIFICATION EDITOR: THE AE SHALL EDIT BELOW AND CLEARLY INDICATE ON CD'S WHERE LOCAL DDC PANEL HMI'S ARE REQUIRED. IN GENERAL, DDC HMI'S SHOULD BE PROVIDED FOR ALL CONTROLLERS SERVING THE EQUIPMENT IDENTIFIED BELOW IN ALL INPATIENT FACILITIES AND AMBULATORY SURGERY CENTERS. INSTALLATIONS WITHIN OUTPATIENT BUILDINGS OR MEDICAL OFFICE BUILDINGS TYPICALLY DO NOT WARRANT THE NEED FOR DDC PANEL HMI'S.

- A. MSCC shall provide a Human Machine Interface Panel (HMI) for the following room types/ applications, or as shown on contract documents:
 - a. All DDC Panels as specified herein and/ or as indicated on contract documents. The exception to this are DDC HMI's are NOT required for:
 - 1) DDC controllers only serving unitary/ terminal infrastructure (ie VAV's, CUHs, FCU's, etc).
 - 2) DDC controllers in non-Inpatient facilities and non-Ambulatory Surgery Centers (ie medical office facilities, outpatient facilities).
 - b. HMI shall be provided with a network connection to the HITs network as well as a connection to the local DDC controller.
 - c. MSCC shall be responsible for providing and installing the HMI, including all required power, communication and associated raceway. MSCC shall mount HMI in DDC panel door. MSCC shall validate proper IP & MS/TP communication to HMI.
 - d. MSCC shall be responsible for the configuration and generation of graphics on the HMI.

- 1) HMI shall display DDC points, as indicated on contract documents, in a tabular format, organized in columns. Provide point descriptor (ie AC-6 Discharge Air Temperature) along with point value and unit of measurement (ie 55 degF).
 - 2) HMI layout and graphic appearance shall match existing HMI's. Layout shall utilize yellow text on a blue background and include the UMH logo, panel name and date/ time in the upper banner.
 - 3) HMI information shall be readily available and always displaying. Passwords/ locked screens are not allowed.
- B. MSCC shall integrate HMI to the BMS. MSCC shall power monitors from an emergency power source, as shown on contract documents.
- C. Flush-mount room mounted HMI's adjacent to the door into each space, in the corridor wall. For rooms with an anteroom, mount monitor in corridor wall, outside anteroom.
- D. Contractor shall refer to architectural elevations for exact location of HMI's.

3.8 ROOM PRESSURE MONITOR/ INDICATOR AND PRESSURE TRANSMITTER INSTALLATIONS

SPEC WRITER NOTES: AE SHALL EDIT LIST BELOW AND REFLECT RPM/ RPI LOCATIONS ON CONTRACT DOCUMENTS.

- A. MSCC shall provide and configure Room Pressure Monitors (RPMs) for the following room types, or as shown on contract documents:
1. Delivery Room
 2. Emergency Department Decontamination
 3. Emergency Department Public Waiting Room
 4. Medical/ Anesthesia Gas Storage
 5. Newborn Intensive Care
 6. Operating Rooms (Type 1 Infection Control Room Type per SBA 5.13)
 7. Procedure Rooms (Type 2 & 3 Infection Control Room Type per SBA 5.13)
 8. Bronchoscopy Rooms (Type 6 Infection Control Room Type per SBA 5.13)
 9. Radiology Waiting Room
 10. Trauma Room
 11. Triage
 12. Airborne Infection Isolation Rooms & Anterooms
 13. Protective Environment Rooms & Anterooms
 14. Morgue/ Autopsy Rooms
 15. Endoscope Cleaning
 16. Clean Workroom (CSPD)
 17. Decontamination Room (CSPD)
 18. Sterile Storage Rooms
 19. Laboratories
 20. Pharmacy (including Radiopharmaceutical) Compounding, Workroom and Storage Areas (see SBA 5.17)
 21. Nuclear Medicine Hot Labs
 22. Nuclear Medicine Treatment Room

- B. MSCC shall provide and configure Room Pressure Indicators (RPIs) for the following room types, or as shown on contract documents:
 - 1. Dialyzer Reprocessing Room
 - 2. Nonrefrigerated Body-Holding Room
 - 3. Sterilizer Equipment Room
 - 4. Clean Linen Storage
 - 5. Soiled Linen Sorting & Storage
 - 6. Clean Workroom/ Holding
 - 7. Soiled Workroom/ Holding
 - 8. Hazardous Material Storage
- C. Transmitters shall be mounted in a wall mounted panel enclosure above the ceiling on the corridor side of the door into the space. Confirm mounting location with project engineer.
- D. The pressure port tube distance between transmitter and room pickup should be minimized as much as possible. Remote mounted transmitters utilizing extensive pickup tubing lengths have proven to yield inaccurate room pressure readings and are not allowed.
- E. Configure RPM's/ RPI's to display, allow adjustability and alarm DDC points as indicated on contract documents. Configure time delays as indicated on contract documents. Silence audible alarm (ie visual alarm only) as indicated on contract documents.
- F. MSCC shall field measure room volume to use in calculating room air change rates.

3.9 UNINTERRUPTABLE POWER SUPPLIES (UPS) INSTALLATIONS

SPECIFICATION EDITOR: THE AE SHALL CLEARLY INDICATE ON CD'S WHERE LOCAL UPS'S ARE REQUIRED TO POWER DDC PANELS. IN GENERAL, UPS'S SHOULD BE PROVIDED TO PROTECT AGAINST DAMAGE DUE TO POWER QUALITY AND TO MINIMIZE DISRUPTION.

- A. Provide local UPS as specified herein for all front-end DDC panel installations and/ or as indicated on contract documents. Local UPS is NOT required for:
 - 1. DDC controllers powered from a central UPS system.
 - 2. DDC controllers serving unitary/ terminal infrastructure (ie VAV's, CUHs, FCU's, etc).
 - 3. DDC controller installations that can utilize an existing, local UPS on an adjacent DDC installation. MSCC shall provide all raceways & cabling needed to extend power to new DDC devices. MSCC shall be responsible for validating that the existing UPS is capable of supporting the additional loads.
 - 4. DDC controllers in non-Inpatient facilities and non-Ambulatory Surgery Centers (ie medical office facilities, outpatient facilities).
- B. Rigidly mount and anchor UPS to wall, either in ventilated panel enclosure or on wall brackets, per specification section 2.5. Do not mount UPS on floor.
- C. Connect HITS provided patch cable at UPS and configure network communication card to facilitate communication and SNMP integration to the Desigo frontend.

3.10 BACNET OBJECT / CONTROL POINT NAMING

- A. The contractor shall use the BMS point naming convention outlined below. In instances where character restrictions prohibit use of this convention, or for other unique systems not covered below, contact project engineer for direction.
- B. The contractor shall provide a submittal for owner review and approval for the specific point naming convention proposed on the project. This shall be included in the BMS Temperature Controls submittal.
- C. All control points shall include two sections with decimal point separation: system identification and point description identification. See the example below:
 - 1. AHU22.DAT = Discharge Air Temperature on air handler AHU-22.
- D. Field Device Identification
 - 1. All field device identification shall include three sections with decimal point separation: 4 digit UM Building number, device identification and sequential number, and room where device is located. See the example below:
 - a. 0316.PNL1.3000M = DDC Panel #1 in room 3000M in the University Hospital Building (ID #0316).
 - 2. Device abbreviations shall conform to the following:
 - a. FCU = Terminal fan coil unit controller
 - b. HMI = Human Machine Interface Panel
 - c. RPM- Room Pressure Monitor
 - d. MON = Terminal controller with monitoring points only
 - e. PNL = DDC Panel (Controller)
 - f. RTR = Router (BACnet IP)
 - g. UPS = Uninterruptable Power Supply
 - h. VAV = Terminal VAV box controller
 - i. PM = General Power Meter
 - j. PQ = Power Quality Meter
 - k. ATS = Automatic Transfer Switch
 - l. STS = Static Transfer Switch
 - m. GW = Gateway
- E. System Identification
 - 1. The point system identification shall associate a point with the system it is directly related to. A system shall be an air handling unit, a heating system, a chilled water system, a VAV box, etc.
 - 2. System and equipment designations shall match those set forth on the equipment schedules in the project documents. When not clearly defined, systems shall be abbreviated in the point name as follows:
 - a. AHU = Air Handling Unit
 - b. CHW = Chilled Water and Primary Chilled Water Loop
 - c. CRAC = Computer Room Air Conditioning unit
 - d. CW = Condenser Water
 - e. DHW = Domestic Hot Water
 - f. FCU = Fan Coil Unit
 - g. HHW = Heating Hot Water
 - h. PCHW = Process Chilled Water
 - i. RTU = Rooftop Unit

- j. SCHW = Secondary Chilled Water
 - k. TCHW = Tertiary Chilled Water
 - l. UH = Unit Heater
 - m. VAV = Variable or Constant Air Volume Box
3. If the system is one of multiple common systems in a building (AHU's, etc.), the System Identification shall include the system identifier. See the examples below:
 - a. AHU01 = Air Handling Unit AHU-1
 - b. AHUH52 = Air Handling Unit AHU-H5-2
 - c. AHUOA1 = Outside Air Handling Unit AHU-OA-1
 4. Terminal equipment, such as VAV boxes or fan coil units, shall include the room number of the space served in the System Identification. If the equipment serves multiple rooms, the primary room or room including the thermostat shall be used for this identification. For areas such as operating rooms, where the room ID would be more commonly used than the actual room number, the ID shall be used (ie. OR-5 instead of 1C204). Terminal equipment served by central equipment shall include the central equipment ID as a prefix to the System abbreviation. See the examples below:
 - a. 12VAVB2C205 = VAV box serving room #B2C205 with ventilation supplied by AHU-12
 - b. HS01VAVOR5 = VAV box serving operating room OR-5 with ventilation supplied by AHU-HS-01

F. Point Description Identification

1. The point description identification shall identify the specific point and its function in the system. A Point Description shall identify and describe the field or virtual device, sensor, setpoint, mode, etc. It is understood and accepted that many terminal equipment controllers for VAVs, etc., will include pre-programmed Point Descriptions that do not match the identifications below. In those cases, terminal equipment points shall be named so its clear what the point is.
2. Points shall not be bundled into combined points. For example, a motor start DO and status DI points shall remain fully independent points with a separate programmed alarm point when these two do not match (ie. Siemens L2SL points, or equivalent, are not acceptable).
3. Spare DDC points shall be labelled as SPARE in the point description.
4. Descriptions shall be abbreviated in the point name as follows:
 - a. AHU = Air Handling Unit
 - b. AC = Air Conditioning Unit
 - c. BPV = Bypass Valve
 - d. BTU = Energy Units Btu
 - e. BTUH = Energy Rate Units Btu/hour
 - f. CCT = Cooling Coil Leaving Air Temperature
 - g. CCV = Cooling Coil Control Valve
 - h. CFM = Air Volume Flowrate
 - i. CH# = Chiller (ie. CH-1 is "CH1")
 - j. CO2 = Carbon Dioxide
 - k. CT# = Cooling Tower (ie. CT-1 is "CT1")
 - l. CT#VFD = Cooling Tower VFD (ie. CT-1 VFD is "CT1VFD")
 - m. DAPRS = Discharge Air Static Pressure
 - n. DARH = Discharge Air Relative Humidity
 - o. DAT = Discharge Air Temperature

- p. DECGPM = Decoupler Liquid Volume Flowrate
 - q. DIFCFM = Air Volume Flowrate Differential
 - r. DP = Differential Pressure
 - s. DPR = Damper
 - t. EAT = Exhaust Air Temperature
 - u. EODPRS = End of Duct Static Pressure
 - v. FLT = Filter Differential Pressure
 - w. FPM = Speed in Feet Per Minute
 - x. FRZ = Freezestat
 - y. GPM = Liquid Volume Flowrate
 - z. HCV = Heating Coil Control Valve
 - aa. HUV = Humidifier Control Valve
 - bb. HX# = Heat Exchanger (ie. HX-1 is "HX1")
 - cc. KW = Kilowatt
 - dd. KWH = Kilowatt Hour
 - ee. LVL = Level
 - ff. MAD = Mixed Air Dampers
 - gg. MAT = Mixed Air Temperature
 - hh. MAX = Maximum
 - ii. MIN = Minimum
 - jj. OACFM = Outside Air Volume Flowrate
 - kk. OAE = Outside Air Enthalpy
 - ll. OARH = Outside Air Relative Humidity
 - mm. OAT = Outside Air Temperature
 - nn. OAW = Outside Air Humidity Ratio
 - oo. OCC = Occupied Mode
 - pp. OS = Occupancy Sensor
 - qq. P# = Pump (ie. P-12 is "P12")
 - rr. P#VFD = Pump VFD (ie. P-12 VFD is "P12VFD")
 - ss. PHT = Preheat Coil Leaving Air Temperature
 - tt. PRS = Static Pressure
 - uu. RACFM = Return Air Volume Flowrate
 - vv. RAE = Return Air Enthalpy
 - ww. RAFVFD = Return Air Fan VFD
 - xx. RAF = Return Air Fan
 - yy. RARH = Return Air Relative Humidity
 - zz. RAT = Return Air Temperature
 - aaa. RAW = Return Air Humidity Ratio
 - bbb. RETT = Return Temperature (water)
 - ccc. RLA = % Rated Load Amps
 - ddd. RMT = Room Temperature
 - eee. SACFM = Supply Air Volume Flowrate
 - fff. SAFVFD = Supply Air Fan VFD
 - ggg. SAF = Supply Air Fan
 - hhh. SCV = Steam Control Valve
 - iii. SUPT = Supply Temperature (water)
 - jjj. TON = Cooling Load Tons
 - kkk. UNOC = Unoccupied Mode
 - lll. V# = Isolation/2-Position Valve (ie. V-12 is "V12")
 - mmm. VIBSW = Vibration Switch
 - nnn. VLT = Voltage
5. Point description shall include an underscore and additional tag for extra description such as setpoint, alarm, etc. Description add-ons shall be abbreviated in the point name as follows:
- a. _ALM = Alarm
 - b. _CLD = Closed

- c. `_CMD` = Command
 - d. `_END/DIS` = Enable/ Disable
 - e. `_HLSP` = High Limit Setpoint
 - f. `_LLSP` = Low Limit Setpoint
 - g. `_OPN` = Open
 - h. `_SP` = Setpoint
 - i. `_STS` = Status
- G. See below for several examples of implementation of this point naming convention:
- 1. AHUC4.DAT_SP = Discharge air temperature setpoint for AHU-C4.
 - 2. AHU18.SAF_STS = Status of supply fan in AHU-18.
 - 3. CHW.CH1SUPT = Chilled water supply temperature from Chiller CH-1.
 - 4. CHW.SUPT = Main primary chilled water loop supply temperature.
 - 5. SCHW.SUPT = Secondary loop chilled water supply temperature.
 - 6. HHW.HX1SCV_CMD = Command to Steam control valve on heat exchanger HX-1 in the Heating Hot Water plant.
 - 7. SCHW.DP_SP = Secondary chilled water loop differential pressure setpoint.
 - 8. C9VAV9938."sub-points" = Terminal DDC controller for a VAV box with a thermostat in room 9-938, served by Air Handling Unit AHU-C9. Terminal controller pre-programmed sub-points then follow in the Point Description Identification section.

3.11 TRENDDING, ALARMING & CHANGE OF VALUE SETTINGS

- A. Controllers shall have the capability of a time delay or maintenance mode to allow alarms to be delayed during maintenance overrides.
- B. Configuration of all required alarm and point/object trending is a shared responsibility between the MSCC & SI, as indicated by project documents.
 - 1. In general, all alarms and trends shall be configured by the MSCC at the local DDC panel and shared via BACnet objects with the BMS front-end.
 - 2. See "Alarm and Trend Requirements" Table on Contract Documents for alarm & trend requirements.
 - 3. All setpoints, time delays, and other control parameters shall be integrated and available for override or adjustment from the Desigo front-end.
- C. For all equipment where the MSCC has provided a command and status (ie fan, pump, valve with endswitch, etc), the MSCC shall program and broadcast a virtual point for alarming. Whenever the "enable" command does not match the status point, the virtual binary alarm point must change from normal to alarm.
- D. For every indicated or implied setpoint, MSCC shall create a variation from setpoint alarm. Examples include air handler discharge temperature, chilled water temperature, end-of-line DP, etc.
 - 1. MSCC shall disable variation from setpoint alarms when the associated equipment is not in use, i.e., disable discharge temperature alarm when the air handler is in unoccupied mode.
- E. Unless specifically indicated, alarms are not required for air terminal unit controllers (VAV's, etc) serving non-critical spaces.

- F. UMH uses a points' Change Of Value (COV) as a basis for trending, graphics and alarming. In order to limit excessive network communication traffic, the MSCC shall program controller COV settings to the maximum necessary threshold relative to the point being trended. In general, COV's shall be set to 5% of the point value. The exception to this would be room differential pressure readings, which shall use a COV of 0.01"
1. Data communication from Building Controllers to Engineering Workstation and BAS web server shall be programmed to use Change of Value (COV) data sending and not continuous data polling to limit network traffic.
 2. Data communication parameters for analog inputs and analog values shall be operator configurable and setup as follows:
 - a. Minimum Send Time (where property is available): 1 minute
 - b. Maximum Send Time (where property is available): 15 minutes
 - c. Send on Delta (COV):
 - d. Space Temperature: $\pm 1.0^{\circ}\text{F}$
 - e. Process Temperature: $\pm 1.0^{\circ}\text{F}$
 - f. Duct Static Pressure: $\pm 0.1''\text{WC}$
 - g. Relative Humidity: $\pm 1.0\%$
 - h. Air Flow: $\pm 5\%$ of calibrated span
 - i. Water Flow: $\pm 2\%$ of calibrated span
 - j. Water Pressure: ± 0.5 psi
 - k. Space Pressure (Pharmacy & ORs): $\pm 0.001''$ W.C.
 - l. Space/ Building Pressure (General): $\pm 0.01''$ W.C.
 - m. Space CO2 sensors: ± 100 ppm
 - n. Gas Monitoring (O2 Depletion): $\pm 0.1\%$ O2
 - o. Not Mentioned Above: $\pm 5\%$ of range of sensor
 - p. Analog Values (calculated values): Same as COV for calculation input values (e.g. calculated space air flow offset would have a COV of $\pm 5\%$ of the value range, same as individual air terminal air flows)
 3. Digital data points shall be sent whenever a state change occurs.

3.12 CONTROLLER ADDRESSING

- A. Connection of new BACnet IP routers and B-BC Controllers to the HITS network shall be closely coordinated with Facilities Applications and the SI.
- B. The MSCC shall obtain IP addresses for new devices and the necessary IP addresses of other BACnet IP devices (for the BACnet Broadcast Distribution Table) thru Facilities Applications.
- C. The MSCC shall obtain the BACnet Device Instance, Network numbers and MS/TP MAC address from the Facilities Applications group.
- D. The MSCC shall begin Device Instance Numbers where they were left off on the last installation that the MSCC performed so that Device Instance Numbers are never duplicated. MSCC shall verify the next available Device Instance Number with Facilities Applications group prior to installation.

3.13 NETWORK CONNECTIONS

SPECIFICATION EDITOR: THE AE SHALL CLEARLY SHOW ON PROJECT CD'S WHERE HITS NETWORK CONNECTIONS/ JACKS ARE REQUIRED. LOCATIONS ON CD'S ARE REQUIRED SO AS TO COORDINATE HITS NETWORK REQUIREMENTS OF PROJECT.

A. New MCS installations shall communicate with the existing Siemens Desigo CC servers over the HITS layer 3 network via BACnet IP communication. The following device types shall be provided with HITS network connections:

1. DDC Controllers and devices communicating BACnet IP
2. UPS's
3. HMI's (DDC Panel)
4. Routers (MS/TP to IP)
5. Utility Meters

SPECIFICATION EDITOR: INCLUDE BELOW PARAGRAPH "B" IF ALL INTERNET PROTOCOL (IP) COMMUNICATION IS DESIRED. CAUTION THAT ALL IP DDC SOLUTIONS ARE NOT UNIVERSALLY SUPPORTED BY ALL MSCC'S AND THEY REQUIRE A HIGH LEVEL OF COORDINATION WITH THE UMH HITS GROUP TO ENSURE ADEQUATE DATA CONNECTIONS CAN BE ACCOMODATED. MM IS BETA TESTING THIS ARCHITECTURE AND IS OPEN TO CONSIDERING IT ON A CASE-BY-CASE BASIS AND ONLY UPON REVIEW/ APPROVAL FROM UMH FPD ENGINEERING. PARAGRAPH "B" BELOW IS SHOWN IN HIDDEN TEXT, IF REQUIRED, AE SHALL UNHIDE TEXT TO REFLECT ALL IP REQUIREMENTS IN SPEC.

B. BMS BACnet IP network shall be designed to provide both star (single controller "home run") and multi-drop (daisy-chained) line topologies with final Ethernet connections to UMH's HITS Layer 3 network switches.

1. Star topology shall be provided for all critical system/utility level controllers as follows and as indicated on design documents:
 - a. Chilled water plant (chillers, pumps, cooling towers, etc.).
 - b. Heating hot water plant (boilers, heat exchangers, pumps, etc.).
 - c. Low Temp Chilled Water System
 - d. Process Cooling Water System
 - e. Air handling units (AHU) and associated Return air units (RAU).
 - f. Electrical Automatic Transfer Switch (ATS), generator and substation MVS switch monitoring
 - g. Critical exhaust fans:
 - 1) Med Gas exhaust
 - 2) Specialty exhaust
 - 3) Airborne Infection Isolation (AII) exhaust
 - 4) MRI Exhaust
 - 5) Sterile Processing exhaust
2. Line topology shall be limited to eight (8) controllers on a trunk and all controllers associated with a space shall reside on the same trunk (i.e. space supply and return air terminal controllers). Line topology shall be allowed for the following applications:
 - a. Non-critical room control (air terminals)
 - b. Fan Coil Units in non-critical applications

- c. Miscellaneous monitoring.
- 3. Critical room controllers shall utilize a star topology with a direct Ethernet connection to the HITS network switch. Where a critical space encompasses multiple rooms within a larger suite (i.e. Pharmacy), these controllers shall be allowed to be daisy-chained (line topology) as a suite-dedicated trunk. Critical room types are as follows:
 - a. Delivery Room
 - b. Emergency Department Decontamination
 - c. Emergency Department Public Waiting Room
 - d. Medical/ Anesthesia Gas Storage
 - e. Newborn Intensive Care
 - f. Operating Rooms (Type 1 Infection Control Room Type per SBA 5.13)
 - g. Procedure Rooms (Type 2 & 3 Infection Control Room Type per SBA 5.13)
 - h. Bronchoscopy Rooms (Type 6 Infection Control Room Type per SBA 5.13)
 - i. Radiology Waiting Room
 - j. Trauma Room
 - k. Triage
 - l. Airborne Infection Isolation Rooms & Anterooms
 - m. Protective Environment Rooms & Anterooms
 - n. Morgue/ Autopsy Rooms
 - o. Endoscope Cleaning
 - p. Clean Workroom (CSPD)
 - q. Decontamination Room (CSPD)
 - r. Sterile Storage Rooms
 - s. Laboratories
 - t. Pharmacy (including Radiopharmaceutical) Compounding, Workroom and Storage Areas (see SBA 5.17)
 - u. Nuclear Medicine Hot Labs
 - v. Nuclear Medicine Treatment Room
- C. The MSCC shall provide a single BACnet Broadcast Management Device (BBMD) per IP sub-net to properly broadcast a BACnet Distribution Table reflecting all BACnet devices connected to the BACnet network. This is required to permit streamlined and efficient integration with the BMS B-AWS. MSCC shall contact Facilities Applications to determine if an existing BBMD is present or if new is required.
- D. Devices connected to the HITS network must meet HITS minimum security requirements (ie MM "UDEW Process"). MSCC shall submit all network devices to be used on a project to the MM Facilities Applications group, who will validate devices are UDEW compliant. See Section 1.9.
 - 1. The MSCC shall remediate all devices that are not UDEW compliant and if necessary, provide alternate devices that meet the UDEW vulnerability scan.
- E. The MSCC shall obtain IP addresses for new devices and the necessary IP addresses of other BACnet IP devices (for the BACnet Broadcast Distribution Table) from the HITS group thru the Facilities Application group. See Section 1.9.

- F. MSCC shall provide a 1" conduit from the DDC panel to the cable tray for network connectivity (cabling by HITS). In facilities where a cable tray system is not provided, the MSCC shall provide a 1" conduit raceway to the nearest Telecommunication Room. Coordinate location of Telecommunication Room with HITS thru Project Manager. HITS shall provide all network patch cables and biscuit jack inside the MCS enclosure; MSCC shall be responsible for connecting all patch cables at respective IP devices and establishing communication.

3.14 COORDINATION WITH OTHERS

- A. The MSCC shall provide all necessary coordination with the Systems Integrator (SI) to achieve an operational front-end user interface for the project.
- B. Coordination requirements are outlined in the UMH BMS Integration Process flow diagram: [BMS Project Integration Process.pdf \(drop-box.com\)](#)
- C. All correspondence with the System Integrator or other UMH departments (ie HITS, Fac Apps, Systems, BAS Controls) involved in the project shall copy the respective owner's project manager (ie AEC).
- D. Provide all device PICS, a list of BACnet objects, approved submittals, as-built documents and all other relevant information to the SI before construction and at substantial completion as described in 1.9 "Submittals".
- E. Coordinate with SI as necessary to ensure that all system alarms that are generated by the DDC Controllers are communicated to the central BMS server(s) properly.

3.15 CALIBRATION, START-UP AND COMMISSIONING

- A. Perform commissioning activities as described here-in and in accordance with Related Sections. Participate in the commissioning process in accordance with the project commissioning documents. This applies to all controls including those provided as part of 3rd party equipment.
- B. The MSCC will start-up the DDC panels and provide calibration and start-up for temperature control devices and systems, including compressors, dryers, etc.
- C. MSCC shall provide commissioner with completed check-out and commissioning test reports, customized for each panel or system, filled out by the technician during start-up.
- D. Program all auto calibration routines to self-calibrate outside the hours of normal space occupancy. When this is not possible, program the self calibration to occur during hours of lowest occupancy. Establish with the Owner, working with the Commissioning Authority, a self calibration schedule that will be the least intrusive to building occupants. Phase self-calibration routines (as opposed to all devices simultaneously calibrating) to avoid negatively impacting air handler operation.

- E. Provide all necessary equipment, test gases, etc. for calibration, and calibrate all sensors (i.e., CO₂, CO, combustible gas, etc.) in accordance with the manufacturer's recommendations. Specialized equipment, test gases, etc. shall be turned over to owner upon completion and acceptance.
- F. Provide tuning of all control loops:
 - 1. Adjust PID control loop parameters to optimize system performance and response time.
 - 2. Loops shall be tuned to provide the accuracy indicated on the contract documents. Where not indicated, provide the following:
 - a. Temperature +/- 1 deg F
 - b. Duct static Pressure +/- 0.1 in WC
 - c. Hydronic pressure +/- 0.5 PSIG.
 - d. Other setpoints: As required for the application and directed by the Engineer.
 - 3. For system setpoints that are impacted by seasonal variations, return to verify and optimize control loop tuning.
 - 4. Response time to achieve setpoint shall be as typically achievable for such control loops or as indicated on the contract documents. Interpretation of typically achievable response times shall be as determined by the Engineer.
- G. After control components have been installed and connected, test, adjust and re-adjust as required all control components in terms of function, design, systems balance and performance. Control devices, linkages and other control components shall be calibrated and adjusted for stable and accurate operation in accordance with the design intent and to obtain optimum performance from the equipment controlled. MSCC shall utilize NIST calibrated devices for all device calibration/ verification. All control valves shall be stroked and spring ranges verified and set. All dampers shall be stroked to verify proper and smooth operation. Cause every device to automatically operate as intended to ensure its proper functionality. Make systems ready for acceptance tests.
- H. Provide any trend setup, reporting and trend graphs in advance of functional testing and by dates specified by the Commissioning Authority to verify proper operation of controls and systems. Trend intervals and storage duration shall be as designated by the commissioner. All such trends shall be deleted before each panel is connected to the BAS server.
- I. Perform point-to-point verification for all control inputs and outputs to confirm that all hardware points are terminated properly, ranges are calibrated and I/O's are functioning. MSCC shall schedule a verification exercise with the Systems Integrator for this exercise. Verification shall involve validating proper performance from device (i.e. sensor) to BMS graphic.
- J. Work with the SI to confirm that all control inputs and outputs are reporting properly to the BMS server(s) and that Systems Monitoring personnel are able to override all system outputs.
- K. After equipment has been accepted and operated in normal service for two weeks, check the adjustment of control components and recalibrate/replace where required.

SPEC WRITER NOTES: FUME HOOD MONITORS ARE TYPICALLY NOT PROVIDED BY THE MSCC ON UMH PROJECTS, BUT ARE RATHER PROVIDED WITH THE FUME HOOD. FOR RARE OCCASIONS WHERE THE MSCC WILL PROVIDE THE FUME HOOD MONITOR, CHANGE THE FOLLOWING PARAGRAPH FROM HIDDEN TEXT.

- L. Set constant flow fume hood monitor alarms as follows:
 - 1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.
 - c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.

3.16 OWNER INSTRUCTION AND TRAINING

SPECIFICATION EDITOR: THE REQUIRED AMOUNT OF TRAINING WILL DEPEND UPON THE SIZE AND COMPLEXITY OF THE PROJECT. FOR SMALLER, SIMPLER PROJECTS UMH MAY REQUIRE ONLY A LIMITED AMOUNT OF TRAINING (IE 8 HOURS) OR NO TRAINING AT ALL. FOR LARGER PROJECTS WITH COMPLEX SYSTEMS, UMH MAY REQUIRE SIGNIFICANT TRAINING HOURS (MIN 24 HOURS OF COMBINED ON-SITE & CLASSROOM INSTRUCTION) FOR BOTH MAINTENANCE AND SYSTEMS MONITORING PERSONNEL. TRAINING MAY ALSO NEED TO TAKE PLACE IN SEPARATE SESSIONS FOR DIFFERENT SHIFTS OF PERSONNEL. COORDINATE REQUIREMENTS WITH THE UMH FPD DESIGN MANAGER IN THE DESIGN PROCESS AND MODIFY THE FOLLOWING PARAGRAPH AS NECESSARY.

- A. Provide comprehensive training for the entire mechanical controls system.
- B. The party that performed the portion of the control work as outlined in Section 1 shall provide the training related to that work.
- C. Provide an agenda of the proposed training for approval by the Commissioning Authority.
- D. Training shall include a combination of site walkthrough and classroom training as required to review the complete control system. At minimum provide the following:
 - 1. One half hour minimum of classroom training per each construction drawing sheet included for the mechanical controls. Provide a complete explanation of the following for the controls on each sheet:
 - a. The Sequence of Operation, alarms, and trend logs
 - b. Schedule and grouping for each piece of equipment
 - c. Overview of program layout and modules including explanation of each section of code and variables used.
 - d. Identify which sensors are critical for the proper function of the controls.
 - e. Location of critical sensors and manual reset devices
 - f. The calibration, setup, and maintenance of all control devices

- g. Review the contents of the O&M relative to the controls on each sheet.
 - h. Graphical user interface training. Review each system and floor plan graphic and explain the meaning of each point type.
 - i. Review of terminal equipment controller applications used for the project including all subpoints and custom applications.
 - j. Interfaces to other systems (e.g. fire alarm system, packaged controllers, etc.)
2. Also to be provided as part of classroom training:
- a. A review of the network diagram and the type, location, and function of each network device
 - b. Demonstrate bench calibration of critical or unique sensors. The Owner and Commissioner shall have exclusive rights to identify which sensors require this training. Maximum 8 hours training.
 - c. Programming of non-DDC controllers including passwords, alarms and setting tuning parameters and set point limits.
3. One half hour minimum of field training per each construction drawing sheet included for the mechanical controls. At minimum provide the following:
- a. Walk down each piece of equipment controlled, generally reviewing the Sequence of Operation.
 - b. Identify the location of:
 - 1) Controllers and DDC panels
 - 2) Critical sensors and manual reset devices. Demonstrate the reset of devices.
 - 3) Damper operators and control valves
 - 4) Meters, including any UM data acquisition panels
 - 5) Pneumatic system components
 - 6) UPS
 - 7) Network devices
 - c. Review the information presented and operation of touch-screen displays and other indicating devices.
 - d. Interfaces to other systems (e.g. fire alarm system, packaged controllers, etc.)

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 230910 - VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC

END OF CONTENTS TABLE

NEW SECTION: OCTOBER 2011.

JULY 2013: REVISED TO INDICATE THAT ALL PHOENIX CONTROLS SHALL BE LONWORKS® BASED AND THAT BACNET PROTOCOL IS NOT ACCEPTABLE, TO ASSURE PHOENIX CONTROL POINTS CAN BE MONITORED BY BAS. D. KARLE FOR HVAC MTT.

DECEMBER 2013: ADDED (ALL IN PART 3): DO NOT "CLIP" VALVES. LTAU VOLUME FOR VALVES SERVING HOODS WITH HORIZONTAL SASHES TO BE SET TO MAINTAIN THE REQUIRED FACE VELOCITY WITH THE SASHES IN THE POSITION THAT CREATES THE MAXIMUM FREE AREA OPENING. ALSO: ALARM SETTINGS FOR FLOOR MOUNTED HOODS. D. KARLE FOR HVAC MTT.

JUNE 2015: REVISED TO REQUIRE REHEAT COIL BE PROVIDED BY LCC, ADDED REHEAT COIL SPEC. ADDED REQUIREMENT FOR VALVE CALIBRATION CERTIFICATE UNDER SUBMITTALS, ADDED POST SUBMITTALS ARTICLE. IMPROVED DESCRIPTION OF VALVE OPERATION UNDER 2.3.A TO REQUIRE THAT CHARACTERIZED VALVE POSITION BE THE PRIMARY MEANS OF ACHIEVING AIR VOLUME SETPOINT, ADDED THAT ADDITIONAL OR FEWER AIR VALVES ARE THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE IF A MANUFACTURER OTHER THAN THE DESIGN BASIS IS SUPPLIED SINCE FLOW RANGE V. VALVE DIAMETER VARIES BETWEEN MFR.S, REQUIRED THAT +/-5% VALVE ACCURACY BE OVER THE ENTIRE CATALOGED VOLUMETRIC OPERATING RANGE OF THE LTAU, REQUIRED FUME HOOD MONITORS BE PROVIDED WITH A COMMON ALARM SILENCE BUTTON SINCE SOME MFR.S WERE PROVIDING MULTIPLE SILENCE BUTTONS. REVISED BUILDING AUTOMATION INTERFACE REQUIREMENTS TO REQUIRE PHOENIX MACRO SERVER AND SIEMENS PXC. STRENGTHENED REQUIREMENT THAT LTAU INDICATED AIR VOLUME NOT TO BE ADJUSTED BASED UPON FIELD MEASUREMENTS (ART. 3.2). D. KARLE PER HVAC MTT.

JUNE 2016: DO NOT USE THIS SPECIFICATION WITHOUT DISCUSSION WITH THE HVAC AND CONTROLS MECH TECH TEAM. SPECIFICATION REVISED FOR APPLICABILITY TO HVAC LAB CONTROLS, BUT ONLY IN LABS WITH VARIABLE AIR VOLUME FUME HOODS, INCLUDING COMBINATION SASH HOODS. ALL OTHER LABS ARE INCLUDED IN SCOPE OF MS230900. REFER TO DESIGN GUIDELINE 230030 FOR ADDITIONAL GUIDANCE. D. APPEL

SEPT 2016: IMPROVED WORDING IN "SUMMARY", IMPROVED WORDING IN "DIVISION OF WORK" REGARDING WHERE THIS SPEC APPLIES, I.E. ALL LABS CONTAINING VAV OR COMBO SASH HOODS. PER HVAC MTT. D. KARLE

JUNE 2021: ADDED PRELIMINARY CHANGE OF VALUE INCREMENTS FOR DATA SHARING TO PART 3. D. KARLE, AS REQUESTED BY UM CONTROLS AD HOC TEAM.

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230910 - VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:

1. Section 115313: Laboratory Chemical Fume Hoods
2. Section 233300: Air Duct Accessories and RGDs
3. Section 230900: Mechanical Systems Controls
4. Section 230593: Testing, Adjusting, and Balancing (TAB)
5. Division 26: Electrical

1.2 SUMMARY

- A. Section Includes:

1. Controls and terminal airflow units for laboratories that contain variable air volume (VAV) and combination sash fume hoods, including controls for Laboratory Terminal Airflow Units (LTAUs), fume hoods, reheat coils, chilled beams, fin tube, and other devices to control laboratory (or other specialized spaces) pressurization, temperature, and other functions as indicated.
2. Reheat coils and sound attenuators for LTAUs.
3. Laboratory Control system interface with Owner's Building Automation System.

1.3 REFERENCES

- A. Abbreviations, Acronyms, Definitions (partial list)

1. BAS: Owner's Siemens Apogee brand Building Automation System.
2. Owner: The University of Michigan.
3. Laboratory: For the purposes of this specification, a broad designation for any space served by laboratory controls.

1.4 DIVISION OF WORK

IMPORTANT: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE TO BE SERVED BY 230910 "VAV/COMBINATION SASH FUME HOOD LABORATORY CONTROLS-DDC" (I.E. THIS SPECIFICATION) VERSUS 230900 "MECHANICAL SYSTEMS CONTROLS". MAKE A CLEAR DELINEATION ON THE CONTROL DRAWINGS. NORMALLY, LAB

MECHANICAL CONTROL OF ANY SPACE NOT UTILIZING VAV FUME HOODS ARE INCLUDED IN THE SCOPE OF 230900, INCLUDING ANIMAL ROOMS.

- A. The VAV fume hood Laboratory Controls Contractor (LCC) shall provide a complete lab control system as described in this specification.
 - 1. Any space containing VAV or combination sash fume hoods shall be provided with the laboratory controls and terminal devices specified in this specification section.
 - 2. All items specified shall be provided by the LCC, including items specified in Related Sections, except where explicitly indicated otherwise.
 - 3. The LCC shall be an installer authorized by the laboratory controls manufacturer.
 - 4. Provide supervision and instruction to insure proper installation of all furnished laboratory control components.
- B. The LCC shall furnish LTAUs, LTAU sound attenuators, and LTAU reheat coils to the mechanical contractor. The mechanical contractor shall install in the duct work.
- C. The mechanical contractor shall provide duct transitions to connect to LTAUs/LTAU reheat coils, and all other components not specified in this specification section.

1.5 COORDINATION

- A. Provide controls and control wiring compatible with equipment provided by others and with existing equipment and controls.
- B. Coordinate the installation of controls with the installation of other project equipment.
- C. Ensure all control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and/or installed by others.
- D. Coordinate with laboratory equipment suppliers (fume hoods, etc.) regarding cut-out dimensions for alarm monitors and to assure proper accommodation is made for the installation of sash sensors and other devices related to laboratory airflow controls.

1.6 ITEMIZED QUOTATION

- A. The Laboratory Controls Contractor shall submit with bid, an itemized cost breakdown listing all major components, labor cost (including subcontractor labor and material cost), and engineering costs, for base bid and for each alternate, for the entire work scope of the Laboratory Controls. When requested, provide the itemized breakdown to the Owner post bid, for review and approval.

1.7 SUBMITTALS

- A. Submit the following for approval:
 - 1. A separate schematic drawing and wiring diagram for each laboratory room or zone, with sequence of operation. Indicate all set points and alarm settings.

2. Equipment schedule for each room or zone, with the following information:
 - a. Equipment tag, room served, occupied/unoccupied min., max., and offset CFM; lab subnet description, name, and network address; network and power trunk identifier.
 - b. Model number of each LTAU and control component.
 - c. Function of each LTAU and control component.
3. Equipment data sheets indicating performance, wiring diagram, dimensions, weights, required clearances, component locations, and location and size of each field connection.
 - a. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. LTAUs, control valves, sensors, etc.)
4. Accuracy certificate, certified by an officer of the company, indicating that LTAU control error will not exceed +/- 5% of flow set point, over the manufacturer's cataloged volumetric operating range of the LTAU.
5. Ductwork connection types and sizes.
6. Network diagram indicating routers, servers, and peripheral devices, including location of each device (room number) and indicating network connection points to Owner's BAS system.
7. Wiring diagrams for each network device.
8. Wiring diagrams and locations of power supplies.
9. Conduit and wire/cable data sheets.
10. Octave band and A-weighted sound power data for each LTAU, with and without sound attenuators.
11. Installation, operation, and maintenance instructions for each component. Include calibration method, calibration tolerance, inspection period, and cleaning method.

1.8 CLOSE-OUT SUBMITTALS

- A. Submit the following as a condition of final payment:
 1. As-built schematic drawings and wiring diagrams. Indicate set points, settings and adjustments of all components.
 2. Calibration certificate, signed by an officer of the company, indicating that each LTAU was factory calibrated at a minimum of 48 points and that the factory determined calibration data was loaded into the LTAU's respective controller. Indicate if calibration data was loaded into the LTAU controller at the factory or in the field.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Mark each LTAU before factory shipment with a unique identifier corresponding to the LTAU drawing schedule.
- B. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.10 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions unless noted otherwise.
 - 1. AMCA 610 Laboratory Method of Testing Airflow Measurement Stations for Performance Ratings.
 - 2. AHRI Standard 410 "Forced-Circulation Air-Cooling and Air-Heating Coils.
 - 3. AHRI 880 Performance Rating of Air Terminals.
 - 4. NFPA 70 National Electric Code.
 - 5. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
 - 6. ASTM C916 Standard Specification for Adhesives for Duct Thermal Insulation.
 - 7. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
 - 8. UL 916 Energy Management Equipment
 - 9. Components shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.11 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 3 years from the date of Substantial Completion.
- B. Provide 24 hour per day service during the warranty period, with a maximum response time from when service is requested of 24 hours.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Laboratory Controls Manufacturers:
 - 1. Phoenix Controls
 - 2. Siemens (Direct Digital Control venturi valve solution)

2.2 GENERAL

- A. Provide a complete laboratory control system for any space containing VAV or combination sash fume hoods. This shall include all devices specified in this section and programming, controllers, software; temperature, pressure, and other sensors/transmitters; control valves; control, network, and power wiring; routers, servers, and all other devices required for a complete system.
 - 1. Laboratory control system shall be Direct Digital Control (DDC) type.
 - 2. Laboratory control system shall function to achieve the sequences of operation detailed on the drawings.

3. Each laboratory shall have a dedicated laboratory control system. Laboratory control systems shall be independent and stand-alone from the Owner's BAS. Failures of the BAS system or network communications between the BAS and the Laboratory control system (cut communication cables, router or server failures, etc.) shall have no impact on individual laboratory control.
4. The laboratory control system shall perform the following control functions:
 - a. Lab Pressurization Control: Control supply and auxiliary exhaust LTAUs at a volumetric offset to maintain lab pressurization positive, negative, or neutral. Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms. Pressurization control shall consider networked devices, non-networked devices, and any number of constant volume devices.
 - b. Lab Temperature Control: Regulate lab space temperature through a combination of supply air volumetric control and control of reheat coils and other auxiliary temperature control devices, in response to temperature sensor(s).
 - c. Occupancy Control: Reset LTAU minimum volume settings and/or temperature control set points, based upon external signals from occupancy detectors, local over-ride buttons, and similar devices.
 - d. Constant Volume Control: The LTAU shall maintain a constant airflow set point.
 - e. Fume Hood Control: Control the face velocity of fume hoods indicated to be variable air volume (VAV) type.
 - f. Fume Hood Monitoring: Alarm various conditions at each fume hood.
 - g. Other lab control functions as indicated on the drawings.
 - h. Interface with the Owner's Siemens Apogee PPCL Building Automation System.
5. Input power requirements for laboratory control devices shall not exceed 120 VAC.
6. Each lab room shall include a labeled Room Differential Pressure Indicating Gauge to indicate room pressurization relative to the adjacent room or corridor. Provide an engraved POS/NEG label (with 3/8" high lettering) adjacent to the gauge labeled "Correct Room Pressure Offset: X, where X = "POS" (positive) or "NEG" (negative) as indicated by the room volumetric offset indicated on the design documents.

2.3 LABORATORY TERMINAL AIRFLOW UNITS

- A. The laboratory terminal airflow unit shall be of venturi control type utilizing a cone shaped element. The position of the valve cone assembly shall be factory characterized to determine a position versus air flow volume relationship. Air flow control shall be achieved by moving the valve cone assembly to the factory characterized position that provides the required air volume. Air flow control shall not be achieved by air flow measurement. However, air flow measurement shall be permitted at inlet velocities 350 fpm and greater, for fine tuning valve cone assembly position after movement to the factory characterized position. Control shall be pressure independent, accomplished by the cone/spring element continuously adjusting position relative to the venturi orifice to compensate for duct pressure fluctuations.
- B. Provide LTAUs of the diameter and volumetric range indicated on the drawings. Provide larger, smaller, fewer, or additional valves versus that indicated when necessary to match the volumetric range specified on the drawings (this may be necessary when providing valves from a mfr. other than the design basis).
 - 1. Include all required costs to adjust duct layout and provide any required transition fittings or additional duct necessary to accommodate the particular valves provided.
- C. LTAUs shall have an equal percentage flow characteristic to provide stable control at low flow values. Butterfly, opposed blade, or parallel blade style dampers or VAV boxes are not acceptable
- D. LTAUs shall provide pressure independent air flow control and the scheduled air flows over a pressure range of 0.3" WG to 3.0" WG static pressure drop across the valve. LTAU shall respond within 1 second of a change in duct static pressure/flow change under all conditions.
- E. Total LTAU control error (including the combined effects of nonlinearity, hysteresis, repeatability, temperature and drift over a one year period) shall not exceed +/- 5% of flow set point. Example: If the LTAU's current flow set point is 1000 CFM, the volume of air delivered by the LTAU shall be within +/- 50 CFM of that set point. This error shall not be exceeded regardless of duct inlet or exit configurations, over the entire manufacturer's cataloged volumetric operating range of the LTAU, and at any pressure drop across the LTAU from 0.3" WG to 3.0" WG static pressure.
 - 1. Systems using air flow sensors (Siemens):
 - a. The +/- 5% control error specified above shall be achieved when one straight equivalent duct diameter is provided upstream of the inlet to the LTAU, regardless of LTAU exit conditions.
 - b. Provide minimum one straight equivalent duct diameter upstream of the inlet to the LTAU. Transitions connecting to the inlet or outlet of the LTAU and associated reheat coils shall not exceed 30 degrees.
 - c. Airflow sensors shall be constructed of corrosion proof material for room supply, return, and general exhaust air. Construct of 316L stainless steel (parts exposed to exhaust air) for all other exhaust applications.

- F. Every LTAU shall be factory calibrated across the manufacturer's cataloged volumetric flow range using NIST traceable air flow stations and instrumentation with a combined accuracy of +/- 1 percent of signal over the entire range of measurement. Air flow shall be verified to be within an accuracy of +/- 5 percent of signal at a minimum of 48 different air flows. LTAU air flow shall be calibrated with 0.6" of static pressure across the LTAU. The resulting factory determined calibration data shall be loaded into the LTAU's respective controller, at the factory or in the field during installation. Provide factory calibration certificate for each valve, certified by an officer of the manufacturer.
- G. LTAUs shall be constructed of minimum 16 gauge aluminum. Shaft and shaft support brackets shall be 316 stainless steel. Pivot arm and internal linkage shall be aluminum or stainless steel. Springs shall be spring-grade stainless steel. Shaft bearing surfaces shall be made of Teflon, polyester, or polyphenylene sulfide composite.

NOTE BELOW PARAGRAPH. IF LTAUS OTHER THAN FUME HOOD LTAUS (EXAMPLE: SNORKELS HANDLING CORROSIVE CHEMICALS) NEED CORROSION PROTECTION, BE SURE TO INDICATE THAT FACT ON THE DRAWINGS. NOTE THAT LTAUS SHOULD NOT BE USED ON THE EXHAUST OF CAGE AND RACK WASH EQUIPMENT BECAUSE EVEN LTAUS WITH ENHANCED COATING SYSTEMS HAVE NOT PROVEN TO HOLD UP TO THE CORROSIVE EFFECTS OF THE EXHAUST FROM THESE DEVICES. RATHER, CAGE OR RACK WASHERS SHOULD BE EXHAUSTED BY DEDICATED EXHAUST FAN(S).

1. Additional construction requirements for LTAUs connected to fume hood exhaust or where indicated on drawings:
 - a. Coat LTAU with minimum 5.0 mil dry film thickness Heresite P403 coating material, applied and baked per coating manufacturer's recommendations.
 - b. Shaft, pivot arm and linkage, and other internal metal parts (nuts, bolts, rivets, etc.) shall be stainless steel.
 - c. Shaft shall be Teflon coated.
 - d. Shaft bearing surfaces shall be made of Teflon or polyphenylene sulfide composite.

IF LOW LEAKAGE CONSTRUCTION IS REQUIRED, THE DESIGNER MUST SPECIFY THE MAXIMUM LEAK RATE PERMITTED FOR CASING LEAKAGE AND SHUT-OFF LEAKAGE. CONSULT MFR.'S CATALOGS TO DETERMINE AVAILABLE LEAKAGE PERFORMANCE OPTIONS.

- H. Low Leakage Construction
1. Provide where indicated.
 2. Provide low leak seal materials compatible with the severity of service indicated by the particular valve coating that has been specified.
- I. Supply air LTAUs shall come factory insulated with minimum 3/8" thick flexible closed cell polyethylene insulation with a flame/smoke rating not to exceed 25/50, K value not to exceed 0.270 btu-in/hr-ft²-°F @ 75°F mean temperature, and a permeability maximum of 0.08 Dry Cup. Perm-In. Rubatex Therma-Cel, AP/Armaflex, or equivalent. Insulation shall be installed per insulation mfr. recommendations using mfr. recommended adhesives and joint vapor barrier sealants.

DESIGNER SHALL PROVIDE PERFORMANCE DATA FOR THE SOUND ATTENUATORS ON THE DRAWINGS. DESIGNER MUST SPECIFICALLY INDICATE WHERE ATTENUATORS ARE REQUIRED. DESIGNER SHALL REVISE SPEC SECTION REFERENCE BELOW, IF REQUIRED.

2.4 LABORATORY TERMINAL AIRFLOW UNIT SOUND ATTENUATOR

- A. Furnish sound attenuators only when specifically indicated.
- B. Attenuator shall be properly matched to each individual LTAU to meet the sound performance scheduled. Provide stainless steel packless type attenuators for all fume hood and "wet" exhaust applications.
- C. Attenuator pressure drop shall not exceed 0.20 in. w.c. at the LTAUs maximum rated flow, unless indicated otherwise on drawings.
- D. Refer to Related Section "Sheet Metal Accessories" for additional attenuator specifications.

2.5 LTAU/LAB CONTROL

- A. The control devices (controllers) shall be microprocessor-based DDC type and shall linearly regulate airflow based on digital control signals. The device shall generate a digital feedback signal that represents its airflow.
- B. Laboratory controls shall be segregated into subnets at a lab room level. Provide commercially available routers to isolate each subnet from BAS communications, when required. All control points including all subnet points (both inputs and outputs) shall be available to the BAS for monitoring and trending. Laboratory control performance shall be unaffected by the quantity of points being monitored, processed, or controlled.
 - 1. Phoenix Controls: All control shall be LONWORKS® based. BACnet protocol is not acceptable.
- C. Speed of Response:
 - 1. Labs with VAV fume hoods or where indicated:
 - a. Speed of response shall be less than 1 second. High speed electronic actuators shall be provided.
 - 1) Phoenix Controls Accel II Venturi Valves/Celeris
 - 2) Siemens venturi style air valves with high speed actuators
- D. The control devices shall store control algorithms in non-volatile, re-writeable memory. The device shall be able to stand-alone or be networked with other room-level digital airflow control devices using an industry standard protocol.
- E. Room-level control functions shall be embedded in and carried out by the controllers using peer-to-peer distributed control architecture. Critical control functions shall be implemented locally.
- F. The control devices shall use industry standard 24 VAC power.
- G. It shall be possible to connect a notebook PC commissioning tool at each lab room and every point associated with that room's control shall be accessible from that connection point.

- H. The control devices shall have built-in integral input/output connections ("points") that address all network and non-network sensors switches and control devices indicated on the drawings and as necessary to accomplish the required sequence of operation. Unless explicitly indicated otherwise in the sequence of operation, every device controlled shall be controlled by an output dedicated to that device. For example, multiple actuators **shall not** be controlled by the same 0 to 10 Vdc or 4 to 20 mA output. At a minimum, the airflow controller shall have:
 - 1. Three universal inputs capable of accepting 0 to 10 Vdc, 4 to 20 mA, 0 to 65 K ohms, or Type 2 or Type 3 10 K ohm @ 25 degree C thermistor temperature sensors.
 - 2. One digital input capable of accepting a dry contact or logic level signal input.
 - 3. Two analog outputs capable of developing either a 0 to 10 Vdc or 4 to 20 mA linear control signal.
 - 4. One Form C (SPDT) relay output capable of driving up to 1 A @ 24 VAC/VDC.
- I. Provide any other devices necessary to accomplish the intended sequence of operation.
- J. Control devices shall meet FCC Part 15 Subpart J Class A and be UL 916 listed.
- K. Actuators

HIGH SPEED ELECTRONIC ACTUATORS CAN BE SET FAIL LAST POSITION AS WELL AS FAIL OPEN OR FAIL CLOSED.

- 1. High Speed Electronic:
 - a. UL 916 listed high-speed electronic actuator with an actuator stroke speed of 1 second or less when positioning the valve to respond to a flow change of 5:1. Factory mounted to the valve. Loss of main power shall cause the valve to position itself in a failsafe state. This position shall be maintained constantly without external influence, regardless of external conditions on the valve (within product specifications). Failsafe states shall be as indicated on drawings. Where not indicated, supply LTAUs shall fail normally closed-minimum position, exhaust LTAUs shall fail normally open-maximum position.

2.6 VAV FUME HOOD CONTROL

- A. The fume hood controller shall use a sash position sensor to measure sash opening to proportionally control the hood's exhaust airflow. Controller shall maintain an "average" constant face velocity to +/- 5% tolerance, over a minimum range of 20% to 100% of sash travel.
- B. The hood exhaust airflow control device shall respond to a change in sash position by reaching 90% of the final commanded position within one (1) second of the sash reaching 90% of its final position, with no more than a 5% overshoot or undershoot, and with no noticeable oscillation. This shall be accomplished at any sash movement rate up to 1-1/2 feet per second.

- C. The fume hood monitor shall receive sash position signals from sash sensors. The monitor shall compute the total open sash area and then output an exhaust airflow control command signal to the appropriate exhaust airflow control device (LTAU).
1. A vertical sash position sensor shall be employed to measure the height of each vertically moving fume hood sash. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. Resolution shall be +/- 1/2 inch or better. A stainless steel, burr and snag-free cable shall be attached to the spring reel. Expected lifetime based on manufacturer's tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in a location on the fume hood easily accessible for service.
 2. A horizontal sash position sensor shall be provided for each horizontal sash. The horizontal sash sensor shall consist of magnetic bars or a sensor strip/actuator block. Resolution shall be +/- 1/2 inch or better.
 3. Provide both vertical and horizontal sash position sensors for hoods with combination sashes.

2.7 FUME HOOD MONITORS

CONSIDER IF OTHER LABORATORY EQUIPMENT WOULD BENEFIT FROM BEING EQUIPPED WITH A FUME HOOD MONITOR AND INDICATE THAT EQUIPMENT ACCORDINGLY. EXAMPLES: EXISTING FUME HOODS, BIO-SAFETY CABINETS.

- A. Provide fume hood monitors for all chemical fume hoods and for other laboratory equipment where indicated.
1. Monitor shall include audible alarm, visual LED alarm, and a common (single) alarm silence button.
 2. The fume hood monitor shall provide an alarm indication for the following conditions:
 - a. Low fume hood face velocity as detected by:
 - 1) Insufficient differential static pressure as detected by the exhaust airflow LTAU pressure switch (Phoenix).
 - 2) Insufficient air volume, as detected by the air flow station (Siemens).
 - 3) Sash raised above sash stop position.
 - 4) Signal loss between the exhaust airflow LTAU and the fume hood monitor (VAV hoods only).
 - b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
 3. Sash position shall be sensed by using a vertical sash position sensor. Vertical sash position sensor shall be as specified under the article "VAV Fume Hood Control".
 4. Fume hood monitor shall be suitable for surface mounting on the front of the fume hood.
 5. Approved fume hood monitors:
 - a. Phoenix FHM430 Controller (Variable volume fume hoods)

- b. Siemens

2.8 SENSORS/TRANSMITTERS

- A. Except as noted below, sensors and transmitters shall comply with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.
 - 1. Room temperature sensors (RTS) shall have a digital temperature display, high accuracy temperature set point slide, and a minimum temperature range of 55-95°F. 10K Type 2 thermistor, inaccuracy of ±0.5°F or less between 55-95°F. Provide with integral communications jack.
 - a. Approved manufacturers: Phoenix, Siemens
 - b. Provide combination room temperature/humidity sensors where indicated.
 - 1) Features: same as RTS.
 - 2) Temperature: Thermistor, same as RTS.
 - 3) Humidity transmitter: 4-20 mA output, inaccuracy ±2% or less between 15%-95% RH at 25°C.
 - a) Approved manufacturer: Phoenix.

2.9 CONTROL VALVES

- A. Control valves shall comply with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.
 - 1. Unless noted otherwise, control valves for reheat coils, cooling coils, chilled beams, fin tube radiation, and other terminal devices shall utilize 3-position floating point electronic actuators as specified for "TECs" in Related Section Mechanical Systems Controls.
 - a. Fail-last-position: Reheat and cooling coils; chilled beams.
 - b. Fail open (maximum heat): Fin tube.
 - c. Fail closed (zero heat): Reheat coils serving animal rooms or ventilated cage racks.

2.10 ROOM DIFFERENTIAL PRESSURE INDICATING GAUGES

- A. Dial (4" dia.) in metal case, diaphragm actuated, black figures on white background, front recalibration adjustment, scale -0.25" WC to +0.25" WC, suitable for surface or flush mounting. Accuracy +/- 2% of full scale. With plastic gauge mounting plate for flush mounting and space pressure sensor consisting of pressure port, barbed tubing connection, and sensor plastic mounting plate suitable for mounting on a standard electrical junction box.
- B. Approved Manufacturers:
 - 1. Dwyer "Magnehelic" with A-465 pressure sensor and A-464 flush mounting plate (provide A-368 mounting bracket for surface mount applications)

2.11 MISCELLANEOUS COMPONENTS

- A. Except as specified in this section, laboratory controls shall be provided in compliance with the requirements of Related Section "Mechanical Systems Controls", including approved manufacturers.

2.12 POWER SUPPLIES

- A. Provide all necessary power supplies/control transformers, power distribution wiring, etc. for a complete operating system. This includes but is not limited to power supplies for lab airflow controls, sensors/transmitters, control valves, and network devices such as routers and servers.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.

- B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
- C. Provide power supplies for lab airflow controls in NEMA 1 metal enclosures, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 - 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 - 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 - 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
 - 4. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.
- D. Provide network power supplies of type and size recommended by lab control manufacturer.

THE UPS SHOULD BE CONNECTED TO A STANDBY POWER CIRCUIT (EMERGENCY GENERATOR) WHEN STANDBY POWER IS AVAILABLE IN THE BUILDING. COORDINATE WITH ELECTRICAL ENGINEER.

- E. Provide an uninterruptible power supply (UPS) for any server provided to allow communication to the BAS system.
 - 1. Provide a UPS large enough to operate the server for a minimum of 5 minutes upon a loss of normal power.

2.13 INTERFACE TO BUILDING AUTOMATION SYSTEM

- A. The laboratory control system network shall digitally interface with the BAS system. The interface to the BAS shall be BACnet over IP/Ethernet communications protocol.
- B. Every room-level point shall be available to the BAS for monitoring, trending and control, both inputs and outputs. The laboratory controls system shall maintain a cache of all points to be monitored by the BAS. The room-level airflow control devices shall update this cache continually.
- C. Provide all equipment, including but not limited to routers, servers, software interface drivers, and network interface cards to allow communication between the laboratory airflow controls and the BAS.

DESIGNER MUST INDICATE ON THE DRAWINGS, THE QUANTITY OF FIELD LEVEL NETWORKS CONNECTING LAB CONTROLS TO THE U-M BAS, AND THE LOCATIONS WHERE THE NETWORKS CONNECT TO U-M BAS. TYPICALLY THIS WILL BE AT A DATA CLOSET OR AT BUILDING DDC PANELS. CONTACT THE U-M DESIGN MANAGER, WHO WILL OBTAIN A NETWORK RISER DIAGRAM FROM U-M PLANT DEPARTMENT FOR DESIGNER'S USE.

- 1. The LCC is responsible for providing the entire network up to and including final network connection to Owner's BAS via connection to an Ethernet switch at a building direct digital controller or data closet location(s), as indicated on the drawings.
- 2. Provide servers and routers specifically designed for the laboratory controls network and recommended by the laboratory control manufacturer.

THE NEXT PARAGRAPH SPECIFIES A "RMI (ROOM INTEGRATOR)" FOR PHOENIX AND A "PXC" SERVER FOR SIEMENS, WHICH ARE REQUIRED TO PROVIDE BACNET OVER IP/ETHERNET COMMUNICATION FOR CONNECTION TO U-M'S BAS SYSTEM. FOR RENOVATIONS, A MACROSERVER OR PXC MAY ALREADY EXIST THAT CAN BE UTILIZED FOR THE PROJECT. CONSULT WITH U-M PLANT ENGINEERING THROUGH THE DESIGN MANAGER TO DETERMINE, THEN EDIT THE NEXT PARAGRAPHS ACCORDINGLY.

- a. Phoenix Controls Server: Provide Phoenix Controls RMI Room Integrator.
- b. Siemens Server: Siemens model PXC100-E96.A BACnet IP controller with a PXC expansion module.
 - 1) Mount in a NEMA Type 1 metal control panel enclosure with removable door, right or left hand hinged, locking, with perforated subpanel, keyed to match other U-M control panels. Minimum size 19-1/2" x 16-3/8" x 5-3/4" deep. Provide 120 VAC service box, disconnect, power supply, UPS, and bus connection module. All components shall be in compliance with related articles of this specification.

BELOW PARAGRAPH INDICATES THAT NETWORK DEVICES SHOULD BE INSTALLED ABOVE LAB DOORS AND IN ELECTRICAL CLOSETS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. LAB CONTROL NETWORK EQUIPMENT SHOULD NOT BE INSTALLED IN BUILDING DATA CLOSETS DUE TO RESTRICTIONS ON THE PERSONNEL ALLOWED TO ACCESS DATA CLOSETS.

- D. Install routers secured to a wall and mounted above the doors to labs, or where indicated.
 - 1. Provide in a wall mounted metal enclosure, adequately ventilated to prevent overheating of the equipment, and separate from lab control power supply cabinets.
 - a. Routers may be mounted in lab control power supply cabinets.
 - b. Maximum cabinet projection from wall shall be 8 inches.
- E. Install servers and server UPS in building electrical closets, or where indicated.
- F. Label router and server cabinets "VAV Fume Hood Laboratory Controls Network" and with router/server tag number.
- G. Provide communication cable types, connectors, termination devices, and other accessories recommended specifically for the lab control networks by the lab control manufacturer.
- H. The Owner shall configure any BAS alarms, trending, or control commands at the BAS; LCC shall assist in trouble shooting the creation of such items for a period of one year after the final acceptance of the lab control system.

2.14 MISCELLANEOUS ELECTRICAL

- A. Provide all wiring in conduit and J-hooks per Related Section Mechanical Systems Controls, except as noted below:
 - 1. Wiring between occupancy sensors and lab controls shall be run in conduit at all locations.
 - 2. J-hooks shall be painted bright white color.
 - 3. Conduit fittings and junction box covers shall be painted bright white. Alternative: Allied Tube True Color® EMT, color white, may be used in lieu of painted fittings and junction boxes.
- B. Provide 120 VAC wiring from receptacle panels to power supplies and to any other equipment associated with the laboratory airflow controls.
- C. All electrical work shall conform to Related Sections Division 26 and Mechanical Systems Controls. Maintain all NEC clearances.

2.15 REHEAT COILS

- A. Acceptable Manufacturers:
 - 1. Trane, a business of Ingersoll Rand.
 - 2. York by Johnson Controls.
 - 3. McQuay International.
 - 4. Aerofin.
 - 5. Marlo DRS Technologies, Inc.
 - 6. Coil Replacement Co.
 - 7. Heatcraft Worldwide Refrigeration.
 - 8. USA Coil & Air.
- B. Provide coils factory-mounted to the LTAU, with capacities and characteristics as scheduled on the Drawings. Provide slip and drive or flanged connections to allow removal and reversal of coils in field.

- C. Coils: Maximum of 10 fins per inch, minimum 2 rows, same side supply and return piping connections, enclosed in a sheet metal casing to match the size of the attached terminal airflow unit.
- D. Coil Header and Connection Materials: Seamless copper with extruded tube holes to permit expansion and contraction without creating undue stress or strain. Copper connections.
- E. Rated for 200 psi working pressure, 250 deg. F, with 3/8 inch copper tubing, minimum wall thickness of 0.016 inch, and mechanically bonded aluminum fins, 1/2 inch or larger solder connectors, and manual air vent on return. Hydrostatically test coils at 250 psi, or at 250 psi air pressure under water. Maximum pressure drop at design flow shall not exceed 10 feet or as scheduled. Hot water shall be equally distributed through all tubes by means of orifices or a header design.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install all components in strict compliance with component manufacturers' recommendations.

DESIGNER SHALL LAY OUT SHEET METAL DUCTWORK TO PROVIDE ONE STRAIGHT EQUIVALENT DUCT DIAMETER UPSTREAM OF THE INLET TO ALL LTAUS (REGARDLESS OF BASIS OF DESIGN MFR.).

- B. Systems using air flow sensors (Siemens):
 - 1. Provide one straight equivalent duct diameter upstream of the inlet to the LTAU. Transitions connecting to the inlet or outlet of the LTAU and associated reheat coils shall not exceed 30 degrees.
- C. Configure all controllers to serve BACnet data to BACnet Clients installed on the network. Each controller shall be configured and programmed to map all the BACnet objects associated with the controller, as selected by UM BAS. Provide a list of all objects to UM BAS at least 2 weeks in advance of this work. UM BAS will return the list indicating the specific objects to be mapped. Configure the controllers to utilize a change of value subscription with the clients that reside on the IT network. Change of value increments shall be as selected by the UM BAS department and tuned to minimize IT network traffic.
 - 1. Data Sharing:
 - a. Data communication from Building Controllers to Engineering Workstation and BAS web server shall be programmed to use Change of Value (COV) data sending and not continuous data polling to limit network traffic.
 - b. Data communication parameters for analog inputs and analog values shall be operator configurable. Preliminary values are provided below, obtain approval from UM BAS of specific values for the project:
 - 1) Minimum Send Time (where property is available): 1 minute

- 2) Maximum Send Time (where property is available): 15 minutes
- 3) Send on Delta (COV):
 - a) Space Temperature: ±1.0°F
 - b) Process Temperature: ±1.0°F
 - c) Duct Static Pressure: ±0.1" WC
 - d) Relative Humidity: ±1.0%
 - e) Air Flow: ±5% of calibrated span
 - f) Water Flow: ±2% of calibrated span
 - g) Water Pressure: ±0.5 psi
 - h) Space Pressure (Pharmacy & ORs): ±0.005" WC
 - i) Space/Bldg Pressure (General): ±0.01" WC
 - j) Space CO2 sensors: ±100 ppm
 - k) Gas Monitoring (O2 Depletion): ±0.1% O2
 - l) Not Mentioned Above: ±5% of range of sensor
 - m) Analog Values (calculated values): Same as COV for calculation input values (e.g. calculated space air flow offset would have a COV of ±5% of the value range, same as individual air terminal air flows)
 - n) Digital data points shall be sent whenever a state change occurs.

- D. Install fume hood monitors surface mounted on the front of the fume hood. Furnish exact cut-out dimensions to the fume hood factory to allow for concealed wiring to the monitor.
- E. Install the sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal fume hood use, and allows horizontal and vertical sashes to be positioned in any combination without binding, twisting or tangling.
- F. Terminate wiring at all devices.
- G. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner.
- H. Installation shall also comply with Related Sections Mechanical Systems Controls and Division 26.
- I. Install components so that they are easily accessible for service and in conformance with NEC clearance requirements.

DESIGNER: NOTE THE PARAGRAPH BELOW AND INCLUDE U-M STANDARD DETAIL "SUPPLY AIR LTAU CLEARANCE" ON THE DESIGN DRAWINGS.

- J. Install LTAUs with proper NEC clearances at LTAU mounted controls, including at actuators.

3.2 SYSTEM START-UP

- A. Program, start-up, calibrate, and test all laboratory controls.
- B. Program, start-up, and test integration to the BAS system.
- C. Adjust LTAU air volume to provide hood face velocity to within +/- 5% of required setpoint. Operate the lab controls to assist the TAB Contractor in verifying that correct airflow rates and alarm settings are within +/- 5% tolerance.

1. All adjustments to the LTAUs shall be done by the LCC, not the TAB contractor.
 2. TAB contractor shall take flow readings to verify that the air flow volumetric flow rate indicated by the LTAU matches the measured air flow volume, and to assist in setting alarms. Assist the TAB contractor in verifying measured LTAU air flow against that reported by the LTAU controller, at design minimum and maximum CFM.
 3. LTAU air flow shall not be adjusted based on field air flow measurements. If LTAU air flow verification indicates calibration is not within +/- 5% tolerance, do not field adjust. Notify Owner and return to factory for recalibration.
- D. Unless indicated otherwise, set controls to maintain hood face velocities as follows:
1. VAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) for the entire sash travel, for all vertical and horizontal sash positions. Note: The LTAU's capacity may be insufficient to maintain the required air flow velocity through the entire travel of the sash as it is raised above the sash stop. Do not "clamp" hood LTAU air flow, allow the LTAU to open as far as it can in an attempt to maintain face velocity, except limit travel to the extent necessary so that the room cannot become more negative than indicated; clamp valve if necessary to prevent room from going more negative.
 - 1) Hoods with Horizontal Sashes: Set controls to maintain the required face velocity with the sashes in the position that creates the maximum free area opening. Example:, If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed)
- E. Set fume hood monitor alarms as follows:
1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - b. LTAU valve cone at maximum travel.
 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.
 - c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.
- F. Set other control parameters/alarms to comply with the laboratory airflow control drawings.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

- B. Demonstrate that the laboratory controls perform per the sequence of operation and the design intent.
- C. Demonstrate every fume hood monitor alarm set point.
- D. Demonstrate that the laboratory control system communicates properly to the BAS system, including:
 - 1. Every point specifically indicated on the drawings as to be monitored, logged, or controlled by the BAS.
 - 2. For each pressure zone, a minimum of 10% of points. Specific points to be designated by the U-M Commissioning Authority (CxA).
 - 3. If more than 20% of the demonstrated points fail to communicate correctly, demonstrate that every point on the system communicates correctly to the BAS
- E. Demonstrate that UPS' support connected loads for the specified duration.
- F. Perform other demonstrations as may be required by the CxA.

3.4 CLOSEOUT ACTIVITIES

- A. Submit as-built documentation per article "Submittals". Obtain approval of as-built documentation prior to Owner training.
- B. Provide on-site training to Owner's maintenance personnel. Familiarize personnel with location of LTAUs, controllers, system components, power supplies, and network devices. Review the control concept for each lab and room type.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 230920 - LABORATORY AIRFLOW CONTROLS- ANALOG ELECTRONIC

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 230920 - LABORATORY AIRFLOW CONTROLS-PNEUMATIC AND ANALOG ELECTRONIC

DECEMBER 2013: REVISED PART 1 TO MASTER SPEC TEMPLATE FORMAT. MOVED ITEMS IN PART 1 THAT BELONG IN PART 2. REVISED FUME HOOD MONITOR TO INCLUDE SASH ALARM, THE SAME AS REQUIRED FOR DDC LAB CONTROLS. REVISED 3.2 TO MATCH DDC LAB AIR FLOW CONTROLS SPEC. D. KARLE FOR HVAC MTT.

JUNE 2015: ADDED REQUIREMENT FOR VALVE CALIBRATION CERTIFICATE UNDER SUBMITTALS, ADDED POST SUBMITTALS ARTICLE. IMPROVED DESCRIPTION OF VALVE OPERATION UNDER 2.3.A TO REQUIRE THAT CHARACTERIZED VALVE POSITION BE THE PRIMARY MEANS OF ACHIEVING AIR VOLUME SETPOINT, ADDED THAT ADDITIONAL OR FEWER AIR VALVES ARE THE RESPONSIBILITY OF THE CONTRACTOR TO PROVIDE IF A MANUFACTURER OTHER THAN THE DESIGN BASIS IS SUPPLIED SINCE FLOW RANGE V. VALVE DIAMETER VARIES BETWEEN MFR.S, REQUIRED THAT +/- 5% VALVE ACCURACY BE OVER THE ENTIRE CATALOGED VOLUMETRIC OPERATING RANGE OF THE LTAU. STRENGTHENED REQUIREMENT THAT LTAU INDICATED AIR VOLUME NOT TO BE ADJUSTED BASED UPON FIELD MEASUREMENTS (ART. 3.2). D. KARLE PER HVAC MTT.

CAUTION: ANALOG STYLE LTAUS TYPICALLY NOT AVAILABLE OR USED FOR CURRENT PROJECTS SO THIS SPECIFICATION SHOULD NOT NORMALLY BE USED, INSTEAD USE DDC VERSION (230910). IN THE UNUSUAL CONDITION THAT THIS SPEC IS USED, EDIT CAREFULLY TO MAKE PROJECT SPECIFIC.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:

1. Section 115313: Laboratory Chemical Fume Hoods
2. Section 233300: Air Duct Accessories and RGDs
3. Section 230900: Mechanical Systems Controls
4. Section 230593: Testing, Adjusting, and Balancing (TAB)
5. Division 26: Electrical

1.2 SUMMARY

- A. Section Includes:

1. Laboratory Airflow Control (LAC) system, including controls for Laboratory Terminal Airflow Units (LTAUs), fume hoods, and other devices to control laboratory (or other specialized spaces) pressurization, temperature, and other functions as indicated.
 2. Laboratory terminal airflow units.
 3. Sound attenuators for LTAUs.
- B. The Laboratory Controls Contractor shall be a direct Subcontractor to the Contractor.

1.3 REFERENCES

- A. Abbreviations, Acronyms, Definitions (partial list)
1. Owner: The University of Michigan.
 2. Laboratory: For the purposes of this specification, a broad designation for any space served by laboratory airflow controls.

1.4 DIVISION OF WORK

- A. As it relates to the extent of responsibility for work within this specification section, "provide" shall mean the identified party both furnishes and installs such item(s). "Furnish" shall mean the identified party furnishes the item to the project site for installation by others.

IMPORTANT: DESIGNER SHALL CLEARLY DELINEATE ON THE PROJECT DRAWINGS WHICH SPACES ARE TO BE SERVED BY 230920 "LABORATORY AIRFLOW CONTROLS-DDC" (I.E. THIS SPECIFICATION) VERSUS 230900 "MECHANICAL SYSTEMS CONTROLS". MAKE A CLEAR DELINEATION ON THE CONTROL DRAWINGS. NORMALLY ANY SPACE UTILIZING LTAUS IS CONSIDERED LABORATORY CONTROL, BUT IN SOME CASES A SPACE MAY BE SERVED BY BOTH TYPES OF CONTROL (ANIMAL ROOMS ARE AN EXAMPLE WHERE THIS FREQUENTLY OCCURS). SUCH SPACES REQUIRE SPECIAL CARE TO INDICATE THE BOUNDARIES OF THE SPLIT.

- B. The Laboratory Controls Contractor (LCC) shall provide a complete LAC system as described in this specification.
1. Any space designated as a laboratory, served by LTAUs, or where indicated, shall be provided with a LAC system.
 2. All items specified shall be provided by the LCC, including items specified in Related Sections, except where explicitly indicated otherwise.
 3. The LCC shall be an installer authorized by the laboratory controls manufacturer.
 4. Provide supervision and instruction to insure proper installation of all furnished laboratory control components.
 5. Furnish and install all control wiring and pneumatic tubing related to laboratory controls, including interconnection tubing and wiring to thermostats, switches, etc. Temperature Control Contractor (TCC) shall provide and install the control air main tubing to the lab area to be used by the LCC. TCC shall also provide and install all room level control components, including thermostats, control valves (on LTAU reheats, fin tube, chilled beams, etc.), switches, etc.

6. Furnish and install differential pressure gauges at locations indicated on the drawings to indicate (visually) the room pressurization.

C. The LCC shall furnish LTAUs and LTAU sound attenuators to the mechanical contractor. The mechanical contractor shall install in the duct work.

D. The mechanical contractor shall provide reheat coils, duct transitions to connect to LTAUs/LTAU reheat coils, and all other components not specified in this specification section.

1.5 COORDINATION

A. Provide supervision and instruction to insure proper installation of all laboratory airflow components installed by others.

B. Coordinate work with Temperature Controls Contractor (TCC).

C. Coordinate work with Air Balancing Contractor.

D. Coordinate with Architectural Trades regarding location and exact dimensions of recessed components.

E. Provide controls and control wiring compatible with equipment provided by others and with existing equipment and controls.

F. Coordinate the installation of controls with the installation of other project equipment.

G. Ensure all control components are located and installed correctly so that the specified and intended performance and the sequence of operation is achieved, including components supplied and/or installed by others.

H. Coordinate with laboratory equipment suppliers (fume hoods, etc.) regarding cut-out dimensions for alarm monitors and to assure proper accommodation is made for the installation of sash sensors and other devices related to laboratory airflow controls.

1.6 ITEMIZED QUOTATION

A. The Laboratory Controls Contractor shall submit with bid, an itemized cost breakdown listing all major components, labor cost (including subcontractor labor and material cost), and engineering costs, for base bid and for each alternate, for the entire work scope of the Laboratory Controls. When requested, provide the itemized breakdown to the Owner post bid, for review and approval.

1.7 SUBMITTALS

A. Submit the following for approval:

1. A separate schematic drawing and wiring diagram for each laboratory room or zone, with sequence of operation. Indicate all set points and alarm settings.

2. Equipment schedule for each room or zone, with the following information:

- a. Equipment tag, room served, occupied/unoccupied min., max., and offset CFM.
- b. Model number of each LTAU and control component.
- c. Function of each LTAU and control component.
- 3. Equipment data sheets indicating performance, wiring and tubing diagram, dimensions, weights, required clearances, component locations, and location and size of each field connection.
 - a. Data sheets shall be organized behind sheet tabs. Each sheet tab shall indicate the category or component name (i.e. LTAUs, controllers, sensors, etc.)
- 4. Accuracy certificate, certified by an officer of the company, indicating that LTAU control error will not exceed +/- 5% of flow set point, over the manufacturer's cataloged volumetric operating range of the LTAU.
- 5. Ductwork connection types and sizes.
- 6. Wiring diagrams and locations of power supplies.
- 7. Conduit and wire/cable data sheets.
- 8. Octave band and A-weighted sound power data for each LTAU, with and without sound attenuators.
- 9. Installation, operation, and maintenance instructions for each component. Include calibration method, calibration tolerance, inspection period, and cleaning method.

1.8 CLOSE-OUT SUBMITTALS

- A. Submit the following as a condition of final payment:
 - 1. As-built schematic drawings and wiring diagrams. Indicate set points, settings and adjustments of all components.
 - 2. Calibration certificate, signed by an officer of the company, indicating that each LTAU was factory calibrated at a minimum of 48 points and that the factory determined calibration data was loaded into the LTAU's respective controller. Indicate if calibration data was loaded into the LTAU controller at the factory or in the field.

1.9 DELIVERY, STORAGE AND HANDLING

- A. Mark each LTAU before factory shipment with a unique identifier corresponding to the LTAU drawing schedule.
- B. Shipping and storage protection shall be provided by manufacturer to insure that the interior and exterior of components are completely protected from damage, dirt or weather. Components shall be continuously covered with plastic or other durable means, until just prior to installation. Maintain protection after installation to protect against on-going construction activities.

1.10 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions unless noted otherwise.

1. AMCA 610 Laboratory Method of Testing Airflow Measurement Stations for Performance Ratings.
2. AHRI 880 Performance Rating of Air Terminals.
3. NFPA 70 National Electric Code.
4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
5. ASTM C916 Standard Specification for Adhesives for Duct Thermal Insulation.
6. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
7. UL 916 Energy Management Equipment
8. Components shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.11 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 3 years from the date of Substantial Completion.
- B. Provide 24 hour per day service during the warranty period, with a maximum response time from when service is requested of 4 hours.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Laboratory Controls Manufacturers:
 1. Phoenix Controls

2.2 GENERAL

- A. All control components except for pneumatic actuators shall be strictly analog electronic in nature.
- B. All laboratory airflow controls and laboratory terminal airflow unit system components shall be products of a single manufacturer.

2.3 FUME HOOD MONITORS AND CONTROLS

- A. Monitors
 1. Monitor shall include emergency exhaust control switch and LED (VAV hoods only), audible alarm, visual alarm, and alarm silence switch.
 - a. VAV system - Phoenix FHM430 Controller
 - b. CAV system - Phoenix FHM530 Controller
 2. Normal operation and alarm conditions
 - a. The fume hood monitor shall provide an alarm indication for the following conditions.
 - 1) Insufficient differential static pressure as detected by the exhaust airflow LTAU pressure switch.
 - 2) Signal loss between the exhaust airflow LTAU and the fume hood monitor(VAV hoods only).
 - 3) Sash raised above sash stop position.

- b. When an alarm condition is detected, audible and visual alarm indicators shall activate. Pushing the alarm silence button shall mute the alarm for an adjustable time delay, initially set at 10 minutes. Alarm shall re-sound after the time delay, until alarm condition clears. Visual alarm shall remain lit until alarm conditions clears.
 - 1) Sash position shall be sensed by using a vertical sash position sensor. Vertical sash position sensor shall be as specified under the article "VAV Fume Hood Controls".

B. VAV Fume Hood Controls

- 1. The fume hood controller shall use a sash position sensor to measure sash opening to proportionally control the hood's exhaust airflow. Controller shall maintain an "average" constant face velocity to +/- 5% tolerance at all sash positions.
- 2. Signal
 - a. The fume hood monitor shall receive the sash opening signals from the sash sensors. The monitor shall compute the total open sash area and then output an exhaust airflow control command signal to the appropriate exhaust airflow control device.
 - b. Vertical Sash Sensor
 - 1) A vertical sash sensor shall be employed to measure the height of each vertically moving fume hood sash. The vertical sash sensor shall consist of a precision 10-turn potentiometer mechanically coupled to a constant tension spring reel. A stainless steel, vinyl coated cable shall be attached to the spring reel. Expected lifetime based on manufacturer's component data and tests shall be over 200,000 full height sash movements. Sash sensor shall be installed in an easily accessible location on the fume hood for service.
 - a) Phoenix VSS
 - c. Horizontal Sash Sensor
 - 1) A horizontal sash sensor shall be provided for each pair of horizontal or overlapping sashes that are located on horizontal, combination or walk-in sash fume hoods. The horizontal sash sensor shall consist of two long flat bars for each pair of overlapping sashes. The first bar shall contain a magnetic element to send magnetic flux to the second bar. The second bar shall contain a multitude of magnetic sensors spaced every .75" or less. The bars shall be mounted at the top of each sash, one per sash. As the two sashes slide past each other, the bars shall overlap to determine the total amount of sash opening.
 - a) Phoenix HSS
 - d. Combination Horizontal & Vertical Sash Sensor
 - 1) Provide the required combination of vertical and horizontal sash sensors as required by the types of fume hoods to be controlled.
 - a) Phoenix CSS
- 3. Emergency Exhaust

- a. An emergency exhaust capability shall be provided to override the sash sensor and command maximum exhaust airflow. A push-to-start, push-to-stop, push button switch shall initiate this mode.
- 4. The fume hood control system shall respond to a step change in sash position by reaching 90% of the final position CFM value within 3 seconds with no more than a 5% overshoot or undershoot and with no noticeable oscillation.

C. Mounting of Monitor

- a. Fume hood monitor shall be suitable for surface or fully recessed mounting on the front of the fume hood.

2.4 LABORATORY TERMINAL AIRFLOW UNITS (LTAU)

A. Description

- 1. The laboratory terminal airflow unit (LTAU) shall be of venturi control type utilizing a cone shaped element. The position of the valve cone assembly shall be factory characterized to determine a position versus air flow volume relationship. Air flow control shall be achieved by moving the valve cone assembly to the factory characterized position that provides the required air volume. Air flow control shall not be achieved by air flow measurement. Control shall be pressure independent, accomplished by the cone/spring element continuously adjusting position relative to the venturi orifice to compensate for duct pressure fluctuations. All LTAUs shall have an equal percentage flow characteristic to provide stable control at low flow values. Butterfly, opposed blade, or parallel blade style damper or VAV boxes are not acceptable.

B. Accuracy

- 1. Total LTAU control error (including the combined effects of nonlinearity, hysteresis, repeatability, temperature and drift over a one year period) shall not exceed +/- 5% of flow set point. Example: If the LTAU's current flow set point is 1000 CFM, the volume of air delivered by the LTAU shall be within +/- 50 CFM of that set point. This error shall not be exceeded regardless of duct inlet or exit configurations, over the entire manufacturer's cataloged volumetric operating range of the LTAU, and at any pressure drop across the LTAU from 0.3" WG to 3.0" WG static pressure..

C. Calibration

- 1. Every LTAU shall be factory calibrated across the manufacturer's cataloged volumetric flow range using NIST traceable air flow stations and instrumentation with a combined accuracy of +/- 1 percent of signal over the entire range of measurement. Air flow shall be verified to be within an accuracy of +/- 5 percent of signal at a minimum of 48 different air flows. Provide factory calibration certificate for each valve, certified by an officer of the manufacturer.

D. Construction

EDITOR: IF VALVES OTHER THAN FUME HOOD VALVES (FOR EXAMPLE SNORKELS (THOUGH COATING IS NOT ALWAYS REQUIRED FOR SNORKELS)) NEED TO BE COATED VALVES, BE SURE TO INDICATE SO ON THE DRAWINGS.

1. LTAUs shall be constructed of heavy gauge aluminum. All bearing surfaces related to the control of airflow shall be made of Teflon or Teflon coated aluminum.
2. Supply air LTAUs shall come factory insulated with minimum 3/8" thick flexible closed cell polyethylene insulation with a flame/smoke rating not to exceed 25/50, K value not to exceed 0.270 btu-in/hr-ft²-°F @ 75°F mean temperature, and a permeability maximum of 0.08 Dry Cup. Perm-In. Rubatex Therma-Cel, AP/Armaflex, or equivalent. Insulation shall be installed per mfg. recommendations using mfg. recommended adhesives and joint vapor barrier sealants.
3. LTAUs on fume hoods or as indicated on drawings shall be coated with at least two baked coats of Heresite P403 coating material. The shaft and other exposed metal parts shall be made of 316 stainless steel. Stainless steel shaft shall be Teflon coated.
4. LTAUs used on cage or rack washer equipment shall be coated with two coats on all surfaces, including body, cone, shaft and hardware. Coating shall be suitable to eliminate corrosion for each installation application.

E. Electronically Controlled LTAUs:

1. Description
 - a. Valves shall be pressure independent and use closed loop control to regulate air volume linearly proportional to a 0-10 volt DC analog electronic control signal. Valves shall also generate a 0-10 volt DC feedback signal linearly proportional to valve airflow for internal volume control, monitoring, or airflow tracking control. Signal shall be factory calibrated using NIST traceable instrumentation.
2. Actuator
 - a. A pneumatic actuator shall be factory mounted to the LTAU body to vary the position of the internal cone from its minimum to maximum flows. Provide electronic "stops" to set maximum and minimum controllable airflows. Loss of control signal or power shall cause the units to fail to the position indicated on drawings. Fail-in-last-position actuators are not acceptable.
3. Flow Measuring Devices
 - a. No electronic (hot wire, thermistor, etc.) flow measuring devices may be used.
4. Power Supply to LTAU
 - a. Unless power supply is integral to a wall mounted control panel, provide a unit mounted power supply and disconnect switch on same side of LTAU as controller for each LTAU.
5. Static Pressure Switch:
 - a. Fume hood exhaust LTAUs shall include a unit-mounted static pressure switch to sense and alarm on a reduction in airflow below set point. The switch shall operate by measuring the pressure drop across the unit's orifice.

F. Pneumatically Controlled LTAUs:

1. Description

- a. LTAUs shall be pressure independent and shall have two factory calibrated min/max flow set points in the form of mechanical stops. Valves shall reposition between min/max flow set points based on a switched 0 to 20 psi pneumatic signal. Where required, LTAU shall generate a 0 to 10 volt feedback signal linearly proportional to LTAU airflow. Signal shall be factory calibrated to a stated CFM per volt scale factor using NIST traceable instrumentation.
- 2. Actuator
 - a. A pneumatic actuator shall be factory mounted to the unit body to vary the position of the internal cone from its minimum to maximum flows. Loss of pneumatic supply air shall cause the units to fail to the position indicated on the drawings. Fail-in-last-position actuators are not acceptable.
- 3. Flow Measuring Device
 - a. No electronic (hot wire, thermistor, etc.) flow measuring devices may be used.
- G. Constant Volume Airflow Control Valves:
 - 1. Valve Description:
 - a. Valve shall be pressure independent and shall maintain a constant volume set point. Valves shall be factory calibrated, NIST traceable and set for the desired airflow rate. Valves shall also be field adjustable to allow for future changes of airflow rate.

2.5 VAV FUME HOOD ROOM CONTROLLER

- A. Make-up/supply air and exhaust air controller shall control the airflow balance of the laboratory. The controller shall be unit mounted or wall mounted, as indicated on drawings. If no indication is given on drawings, provide wall-mounted controller.
- B. Controller shall maintain a constant offset (adjustable) between the sum of the room's total exhaust and the make-up/supply air volumes. This offset shall represent the volume of air that will transfer to or from the corridor or other adjacent rooms.
- C. The controller shall generate signals linearly proportional to the airflow of each exhaust LTAU as indicated by the calibrated input signals. Similar outputs signals shall also be provided for the supply, other general exhaust (where appropriate), and total exhaust airflow volume signals.
- D. An integral power supply for each wall-mounted controller shall power the complete laboratory airflow control system from one (1) 120 volt AC line connection. Provide a labeled disconnect switch at each 120 volt AC connection. Locate switch above ceiling.

2.6 ENHANCED TRACKING CONTROL SYSTEM

EDITOR: ENHANCED TRACKING CONTROL REQUIRES MORE EXPENSIVE VALVES FOR PHOENIX SYSTEMS (AND FOR PHOENIX IS TYPICALLY CHARACTERIZED BY "MAV" AND "EXV" VALVE COMBINATIONS) AND IS TYPICALLY USED ONLY IN VAV FUME HOOD APPLICATIONS OR WHERE THERE IS A HIGH

PROBABILITY VAV FUME HOODS WILL BE USED IN THE FUTURE. SINCE IT REQUIRES MORE EXPENSIVE PHOENIX VALVES IT SHOULD NOT BE INDISCRIMINATELY SPECIFIED BY THE DESIGNER OR ACCEPTED FROM PHOENIX.

- A. Tracking controller shall control the operation of electronically controlled supply, exhaust, or return air LTAUs to provide proper room pressurization and airflow balance. Provide this system only when specifically indicated on the design drawings, and where VAV type fume hoods are indicated.
- B. The tracking controller shall be unit mounted and shall accept one input signal (multiple sources summed as one input) and produce one output signal.
- C. Tracking controller shall maintain a constant offset between the room's exhaust (return) and make-up/supply volumes. This offset shall be electronically adjustable.
- D. It shall be possible to electronically scale and calibrate the input and output signals. Both the minimum and maximum value of the tracking airflow shall be separately adjustable.

2.7 STANDARD TRACKING CONTROL SYSTEM

EDITOR: STANDARD TRACKING CONTROL CAN BE USED FOR MOST APPLICATIONS AND FOR PHOENIX IS TYPICALLY CHARACTERIZED BY "BSV" AND "EXV" VALVE COMBINATIONS.

- A. Tracking controller shall control the operation of supply, exhaust, or return air LTAUs to provide proper room pressurization and airflow balance. Provide this system unless specifically noted otherwise on the drawings. One LTAU within the system shall be electronically controlled; the other shall be pneumatically controlled with a feedback potentiometer.
- B. The tracking controller shall be unit mounted and shall accept one input signal (multiple sources summed as one input) and produce one output signal.
- C. Tracking controller shall maintain a constant offset between the room's exhaust (return) and make-up/supply volumes.
- D. Both the minimum and maximum value of the tracking airflow shall be separately adjustable.

2.8 LABORATORY TERMINAL AIRFLOW UNIT SOUND ATTENUATOR

EDITOR: DESIGNER SHALL PROVIDE PERFORMANCE DATA FOR THE SOUND ATTENUATORS ON THE DRAWINGS. DESIGNER MUST SPECIFICALLY INDICATE WHERE ATTENUATORS ARE REQUIRED. DESIGNER SHALL REVISE SPEC SECTION REFERENCE BELOW, IF REQUIRED.

- A. Sound attenuator shall be furnished by the LTAU manufacturer. Attenuator shall be properly matched to each individual LTAU to meet sound performance as scheduled. Provide packless type stainless steel attenuators for all fume hood and "wet" exhaust applications. Provide attenuators only where specifically indicated.

- B. Refer to other Division 23 sections for additional attenuator specifications.
- 2.9 FUME HOOD CALIBRATION BLAST GATE**
- A. Refer to other Division 23 sections for specifications for the blast gate used for low flow alarm calibration.
- 2.10 HOOD OCCUPANCY SENSOR**
- A. Provide manufacturer' standard occupancy sensors when specifically indicated on the drawings.
- 2.11 DIFFERENTIAL PRESSURE GAUGE**
- A. Provide where indicated. Dwyer Series 2000 Dual Scale (-0.25" to 0.25" W.G.)
- 2.12 ELECTRICAL**
- A. Provide all necessary power supplies/control transformers, power distribution wiring, etc. for a complete operating system. This includes but is not limited to power supplies for lab airflow controls, sensors/transmitters, etc.

BELOW PARAGRAPH INDICATES THAT POWER SUPPLIES SHOULD BE INSTALLED ABOVE DOORS TO LABS. DESIGNATE THE LOCATION OF THIS EQUIPMENT ON THE DRAWINGS. WORK WITH ELECTRICAL ENGINEER TO DESIGNATE THE RECEPTACLE PANEL CIRCUITS TO FEED LAB CONTROL POWER SUPPLIES. DEPENDING ON LOAD, MULTIPLE POWER SUPPLIES MAY BE FED FROM A SINGLE 120 VAC CIRCUIT.
 - B. Install power supplies secured to a wall and mounted above the doors to labs, unless indicated otherwise. Utilize receptacle panel circuits designated for powering lab control power supplies.
 - C. Provide power supplies for lab airflow controls in NEMA 1, metal, adequately ventilated to prevent overheating of the equipment, with exterior labeled "Laboratory Airflow Controls Power Supply", and listing the room numbers served. Maximum cabinet projection from wall shall be 8 inches. Label each secondary circuit inside the cabinet with the room number(s) served.
 1. Control transformers shall be rated NEC Class 2 and shall meet all the requirements and recommendations of the laboratory airflow controls manufacturer.
 2. No more than five pressurization zones shall be served from a single control transformer. No control transformer shall exceed 500 VA.
 3. Each pressurization zone shall be powered by a dedicated (isolated) secondary circuit. Each secondary circuit shall include a disconnect switch, "power on" indicator, and be current limited with a slow blow fuse or circuit breaker.
 4. Provide a disconnect switch, with shielded terminations, for line side power (one per control transformer). Locate inside the power supply enclosure.

- D. Conduit fittings and junction box covers shall be painted bright orange.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install all components in strict compliance with component manufacturers' recommendations.
- B. Install fume hood monitors surface mounted on the front of the fume hood. Furnish exact cut-out dimensions to the fume hood factory to allow for concealed wiring to the monitor..
- C. Install the sash position sensors and sash travel limit brackets in a neat and workmanlike manner. Install cables and wires in a manner which avoids contact by the user during normal fume hood use, and which allows both the horizontal and vertical sashes to be opened and closed in any combination without binding, twisting or tangling.
- D. Terminate wiring at all devices.
- E. No material shall be exposed if it is possible to conceal it. Exposed materials shall be installed only with consent of the Owner. Installation shall also comply with Related Sections Mechanical Systems Controls and Division 26.
- F. Install components so that they are easily accessible for service and in conformance with NEC clearance requirements.

DESIGNER: NOTE THE PARAGRAPH BELOW AND INCLUDE U-M STANDARD DETAIL "SUPPLY AIR LTAU CLEARANCE" ON THE DESIGN DRAWINGS.

- G. Install LTAUs with proper NEC clearances at LTAU mounted controls.

3.2 SYSTEM START-UP

- A. Program, start-up, calibrate, and test all laboratory airflow controls.
- B. Adjust LTAU air volume to provide hood face velocity to within +/- 5% of required setpoint. Operate the lab airflow controls to assist the TAB Contractor in verifying that correct airflow rates and alarm settings are within +/- 5% tolerance.
 - 1. All adjustments to the LTAUs shall be done by the LCC, not the TAB contractor.
 - 2. TAB contractor shall take flow readings to verify that the air flow volumetric flow rate indicated by the LTAU matches the measured air flow volume, and to assist in setting alarms. Assist the TAB contractor in verifying measured LTAU air flow against that reported by the LTAU controller, at design minimum and maximum CFM.
 - 3. LTAU air flow shall not be adjusted based on field air flow measurements. If LTAU air flow verification indicates calibration is not within +/- 5% tolerance, do not field adjust. Notify Owner and return to factory for recalibration.
- C. Unless indicated otherwise, set controls to maintain hood face velocities as follows:

1. VAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) for the entire sash travel, for all vertical and horizontal sash positions. Note: The LTAU's capacity may be insufficient to maintain the required air flow velocity through the entire travel of the sash as it is raised above the sash stop. Do not "clamp" hood LTAU air flow, allow the LTAU to open as far as it can in an attempt to maintain face velocity, except limit travel to the extent necessary so that the room cannot become more negative than indicated; clamp valve if necessary to prevent room from going more negative.
 - 1) Hoods with Horizontal Sashes: Set controls to maintain the required face velocity with the sashes in the position that creates the maximum free area opening. Example:, If the sash has 4 horizontal sashes, the face velocity must be achieved with 2 sashes in the full open position (with the sash vertical position closed)
 2. CAV Hoods
 - a. To maintain 100 fpm (standard hoods) and 70 FPM (Reduced Face Velocity Hoods) at sash stop position.
- D. Set fume hood monitor alarms as follows:
1. Insufficient differential static pressure/air volume:
 - a. Face velocity 80 FPM (standard hoods) or 60 FPM (Reduced Face Velocity Hoods).
 - b. LTAU valve cone at maximum travel (VAV hoods).
 2. Sash above the sash stop position.
 - a. Time delay to re-alarm after silence button pushed: 10 minutes.
 - b. Alarm shall clear when sash returned to sash stop position or lower.
 - c. Floor mounted hoods: Alarm shall activate when any sash is above its sash stop position; time delay and alarm clear shall be same as above.
- E. Set other control parameters/alarms to comply with the laboratory airflow control drawings.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents..
- B. Demonstrate that the laboratory controls perform per the sequence of operation and the design intent..
- C. Demonstrate every fume hood monitor alarm set point.
- D. Perform other demonstrations as may be required by the CxA.

3.4 CLOSEOUT ACTIVITIES

- A. Submit as-built documentation per article "Submittals". Obtain approval of as-built documentation prior to Owner training.

- B. Provide on-site training to Owner's maintenance personnel. Familiarize personnel with location of LTAUs, controllers, system components, power supplies, and network devices. Review the control concept for each lab and room type.

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 230924 - SYSTEMS INTEGRATION (HOSPITAL PROJECTS)

REVISION NOTES:

MARCH 2024: MODIFIED 1.3.B AND 3.1.G FOR DESCRIPTION OF SIEMENS SERVER ARCHITECTURE AND INTEGRATION REQUIREMENTS. UPDATED LINK PROVIDED UNDER 3.5.B

FEBRUARY 2023: NEW SPEC

EDITOR'S NOTE:

THESE SPECIFICATIONS MUST BE CUSTOMIZED APPROPRIATELY FOR EACH PROJECT. IN ADDITION TO THESE SPECIFICATIONS, THE PLANS ARE TO INCLUDE THE FOLLOWING, AS A MINIMUM:

- **TEMPERATURE CONTROL DIAGRAM / SCHEMATIC OF EACH SYSTEM (AIR HANDLING UNIT, CHILLED WATER, HOT WATER, AIR TERMINIALS, ETC.) INDICATING ALL CONTROL AND MONITORING INSTRUMENTS AND COMPONENTS. ALL POINTS AND POINT TYPES (AI, DO, ETC) SHALL BE CLEARLY INDICATED.**
- **A DETAILED SEQUENCE OF OPERATION, INCLUDING ALL SETPOINTS**
- **INDICATION OF WHICH DDC POINTS ARE ALARMED AND TRENDED, INCLUDING ALARM THRESHOLDS. INDICATION WHERE ALARM/ TREND RESIDES, IE IN FIELD DDC PANEL OR AT THE BMS FRONT END.**
- **INDICATION OF WHAT NEW OR MODIFIED GRAPHICS ARE REQUIRED FOR THE PROJECT.**

PART 11 - GENERAL

1.1 DEFINITIONS

- A. BMS: Building Management System
- B. BBMD: BACnet Broadcast Management Device
- C. BDT: BACnet Distribution Table
- D. CxA: Commissioning Authority
- E. DDC: Direct Digital Control
- F. UMH Facilities Applications: UMH department responsible for maintaining the hospital's Building Management System application
- G. UMH BAS Controls: UMH department responsible for maintaining the hospitals BMS hardware and devices
- H. FLN: Field Level Network
- I. FPD: UMH Facilities Planning and Development department responsible for design & construction
- J. HITS: Health Information Technology & Services

- K. HMI: Human Machine Interface Panel
- L. MSCC: Mechanical Systems Controls Contractor
- M. SI: Systems Integrator
- N. Systems Monitoring: UMH department responsible for operating the hospital's Building Management System
- O. TC: Temperature Controls
- P. UMH: University of Michigan Health

1.2 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections
 - a. Division 26: Electrical
 - b. 230905 Mechanical Systems Controls (Hospital Projects)

1.3 SCOPE OF WORK

- A. The complete control system work shall be split between the Mechanical Systems Controls Contractor, the Systems Integrator and UMH's HITS department as described below and under section 1.4 "Related Work by Others". As it relates to the extent of responsibility for work within this specification section, "provide" shall mean the identified party both furnishes and installs such item(s). "Furnish" shall mean the identified party furnishes the item for installation by others.
- B. University of Michigan Health (UMH) maintains an existing Siemens Desigo CC BACnet Advanced Workstation (B-AWS), which provides system monitoring, alarming, scheduling, reporting and historical trend functions via graphical user interface. This software is installed on application servers located in the HITS data center. For a description of Desigo application servers, see "Hospital Facilities - Desigo BMS Integration Guidelines" (https://michmed.servicenow.com/sp?id=kb_article_view&sysparm_article=KB0023632) .
- C. Desigo client workstations are located in University Hospital, Systems Monitoring, Room B2C204. All BMS installations shall be integrated into this front-end thru BACnet IP over UMH HITS's layer 3 network.
- D. The Systems Integrator shall be responsible for integrating the DDC systems provided by the MSCC under 230905. Physical connection of BACnet devices supplied under Section 230905 shall be via Ethernet and utilize BACnet/IP over the HITS network.
- E. Summary of work by the Systems Integration Contractor shall include, but not be limited to:
 - a. Engineering of all integration work.

- b. Integration of all DDC points into the UMH BMS front-end, as indicated on the contract documents, for a complete and operational control system. Integration shall include creation of all graphics, floor plans, point mapping, alarm/ trend collection and/ or generation of alarm/ trends as indicated on contract documents. Including:
 - i. BACnet device and object discovery.
 - ii. BACnet object instantiation (creation of object classes, naming and location meta data).
 - iii. Collection of all required alarming and point/object trending from the local DDC panel, as indicated by project documents.
 - iv. Configuration of all required alarming and point/object trending at the Desigo CC frontend, as indicated by project documents.
 - v. Generation of Desigo system graphics, alarm summary pages and point/object trend views.
- c. Re-establish and validate existing DDC controller communication/integration to the BMS frontend, modified by the scope of work.
- d. All other work and components required for complete and operational temperature control systems as specified herein, excluding work specified below in "Related Work by Others" section that is to be provided or furnished by the MSCC.
- e. Project management services as a single point contact to coordinate construction related activities.
- f. Commission all mechanical controls provided. Provide a detailed list of every control point integrated, as well as all trends, alarms and graphics to the project Commissioning Authority (CxA) and verify proper integration of each component prior to commissioning the controls with the CxA.
- g. Participation in point-to-point verification with MSCC for all control points.
- h. Coordination with MSCC as well as UMH's HITS, Facilities Applications and Systems Monitoring groups.
- i. Review with UMH personnel to familiarize operations staff with the configuration and operation of project's BMS front-end changes.
- j. Provides systems integration for temporary heating/cooling/ventilation during construction, as required by the owner's construction manager.

1.4 RELATED WORK BY OTHERS

- A. BMS related work by the Mechanical Systems Controls Contractor (MSCC)
 - a. See specification SECTION 230905 - MECHANICAL SYSTEMS CONTROLS
- B. BMS related work by UMH HITS:
 - a. Providing IP Layer 3 networking for all IP communication between the Desigo front-end and DDC controllers, mechanical equipment, and electrical equipment. The MSCC shall be responsible for coordinating implementation of the mechanical control system on the HITS network without disruption.
 - b. HITS will verify network connectivity and establish a TCP connection between the BMS server and the network drop termination.
 - c. HITS will provide all required patch cables. MSCC shall be responsible for connecting all patch cables at respective IP devices (controllers, routers, UPS's, etc).

- d. Confirmation of Telecommunication Rooms to extend network communications to IP devices.
- C. BMS related work by UMH Facilities Applications:
 - a. Management of existing and assignment of new:
 - i. IP addresses
 - ii. BACnet Device Instance and Network numbers
 - iii. BACnet Broadcast Management Device (BBMD) and Broadcast Distribution Table (BDT)
 - iv. MS/TP MAC Addresses
 - b. Validation that network devices meet the HITS "UDEW Process" to validate network security.
 - c. Onboarding IP devices onto HITS network.
- D. BMS related work by UMH Systems Monitoring:
 - a. Removal/ decommissioning of all graphics, alarms, trends on UMH's legacy BMS front ends (ie Honeywell EBI & JCI Metasys) related to points, devices & controllers that have been modified as part of the MSCC's work.
 - b. Validation of final integration services.
- E. BMS related work by UMH BAS Controls:
 - a. Removal/ decommissioning of all legacy DDC panel databases (ie Honeywell EBI & JCI Metasys) related to points, devices & controllers that have been modified as part of the MSCC's work.
 - b. Review IP configuration of IP controllers.

1.5 ACCEPTABLE SYSTEMS INTEGRATION CONTRACTORS

- A. The following SIs are acceptable for the furnishing and installation of pneumatic, electric and DDC components as specified in this section:
 - a. Siemens Industry Inc.
 - b. Fontanesi & Kann
 - c. Syenergy

1.6 QUALITY ASSURANCE

- A. Systems Integration contractor shall be trained and experienced in the integration, graphic & alarm/ trend creation within the Siemens Desigo frontend.
- B. At a minimum, SI shall have graduated from Siemens training sessions Desigo CC Workstation I ST 9202/ 9203 and Desigo CC Workstation II ST 9263/ 9254.

1.7 COORDINATION

- A. Coordinate with the Systems Integrator, as well as UMH's HITS, Systems Monitoring, and Facilities Applications groups as specified.
- B. All correspondence with UMH Facilities Applications shall be via email directed to bmsIntegrationRequest@umich.edu.
- C. All correspondence with Systems Monitoring shall be via email directed to HFAC-OPERATIONS-SYSTEMS-MONITORING@med.umich.edu.

- D. All correspondence with the Mechanical System Controls Contractor (MSCC) or other UMH departments (ie HITS, Fac Apps, Systems, BAS Controls) involved in the project shall copy the respective owner's project manager (ie AEC).

1.8 WARRANTY

- A. All Systems Integration work on UMH's BMS shall be guaranteed for a period of one year after final approval has been granted by the Owner and the project Architect/Engineer. The warranty shall be provided for a completely installed system, including all components, parts and assemblies. The warranty shall cover parts, materials and labor to correct any defects in materials and workmanship.
- B. The SI shall initiate the warranty period by formally transmitting to the Owner commencement notification of the period for the system and devices accepted.

1.9 SUBMITTALS

- A. Submit shop drawings to the project AE of record for their review and approval and to UMH FPD Engineer.
- B. No work shall be done until the final submittals are approved by project AE.
- C. Shop drawings shall contain, as a minimum, all changes to UMH's Desigo frontend, including the following:
 - a. Main campus and building screens
 - b. Floor plans
 - c. Dashboards
 - d. Equipment Graphics
 - e. Applications Graphics
 - f. Alarm configuration
 - g. Schedule Configuration
 - h. Trend Configuration and Data Archiving
 - i. Naming Convention for Desigo Point Descriptors
- D. Where graphics are existing and need to be modified to reflect project changes, SI shall clearly indicate changes to be made (ie cloud changes, notes, etc).
- E. Submittal Requirements
 - a. Shop drawings shall be 8-1/2" x 11" and 11" x 17" size, in PDF format.
 - b. All schematics and drawings shall be done on CAD. The electronic files shall be in the latest version of AutoCAD (or as noted otherwise)
- F. Project Record Documents
 - a. Submit Project Record Documents at the time of substantial completion.

- b. Revise shop drawings to reflect actual installation and operating sequences and provide final electronic files in PDF.
- c. All files shall be dated and shall contain the UMH project RTN number and UM AEC P100 number when applicable.

PART 12 - PRODUCTS

2.1 NOT APPLICABLE

PART 13 - EXECUTION

3.1 INSTALLATION

- A. Provide integration of all DDC input / output points as defined in point lists and control sequences on the Contract Documents and MSCC's final approved shop-drawing submittal to the existing Desigo front-end.
- B. SI shall only import those DDC points called for on the Contract Documents and MSCC's temperature control submittal. Spare DDC points, or DDC points not called for on the Contract Documents or temperature control submittal, shall NOT be imported into Desigo.
- C. All points shall be made available to be overridden from the front-end.
- D. DDC point naming conventions shall be consistent with UMH's point naming standards outlined in specification 230905. Work with the MSCC contractor to ensure BACnet point naming is consistent with UMH standards and auto-discovery can be executed without renaming.
- E. The SI shall utilize point descriptors in Desigo to further define the point functionality. See section 3.4 for descriptor requirements.
- F. All alarms, trending, schedules shall be through standard BACnet objects and shall not utilize proprietary software that would be incompatible with ANSI/ASHRAE Standard 135-2001 BACnet technology communication protocol.
- G. All new DDC points added to the UMH front-end, and associated graphics, alarms and trends, shall be properly integrated consistent with "Hospital Facilities - Desigo BMS Integration Guidelines" (https://michmed.service-now.com/sp?id=kb_article_view&sysparm_article=KB0023632).
- H. SI shall provide any temporary integration to the UMH BMS frontend to provide building temporary heating or cooling during construction. SI shall remove all temporary integration and decommission any graphics/ alarms & trends upon project completion.

3.2 DESIGO SOFTWARE PROGRAMMING

- A. User Access Permissions shall be managed configured by MM Facilities Applications.
- B. Alarm, Trend and Event Management:

- a. Configuration of all required alarm and point/object trending is a shared responsibility between the MSCC & SI, as indicated by project documents.
 - i. In general, all alarms and trends shall be configured by the MSCC at the local DDC panel and shared via BACnet objects with the BMS front-end.
 - ii. Alarms and trends that are indicated on the contract documents to be configured at the front-end shall be by the SI.
 - iii. See "Monitoring Points, Alarm & Trend Requirements" Table on Contract Documents for alarm & trend requirements.
 - iv. All setpoints, time delays, and other control parameters shall be integrated and available for override or adjustment from the Desigo front-end.
 - b. SI shall configure the front-end to receive BACnet alarm event notifications from individual controllers and manage system alarm/event notification and routing.
 - c. SI shall configure the front-end to monitor status of each IP-based controller and provide alarms on loss of communication/status.
 - d. All alarms, trending, schedules shall be through standard BACnet objects and shall not utilize proprietary software that would be incompatible with ANSI/ASHRAE Standard 135-2001 BACnet technology communication protocol.
 - e. Alarm logs shall be configured to be accessible for a minimum of 1 year.
- C. Scheduling:
- a. SI shall configure the front-end to provide scheduling interface for individual HVAC system, space and lighting Occupied/Unoccupied operation as indicated in Control Sequences.
- D. Trending & Data Archiving:
- a. SI shall configure the front-end to provide data archiving for all inputs, outputs, setpoints, integration points and calculated values, as shown on the contract documents
 - b. All trend log information shall be displayed in standard engineering units.

3.3 GRAPHICS PROGRAMMING

- A. Graphics shall be designed to match graphic displays on the existing system following existing UMH graphics standards and utilizing owner furnished templates. Transition from existing graphics to new graphics shall be seamless transition for operator in look, functionality, and operation.
- B. SI shall follow UMH BMS Graphic Template standards included under design guideline 230924-H: [SYSTEMS INTEGRATION](https://docs.google.com/document/d/1fm_s8-OUOBeRcx4mNF-Tuggcu7yQ_d0cU/edit)
(https://docs.google.com/document/d/1fm_s8-OUOBeRcx4mNF-Tuggcu7yQ_d0cU/edit)
- C. Navigation Scheme: System graphic displays of HVAC, plumbing and electrical systems and points shall be hierarchical displays using a building-to-equipment point-and-click navigation scheme. Each display shall show the building/ area name and number.

- D. Program color graphic displays for each system as described herein. Graphic displays shall consist of pictorial presentations with text description, system schematic, or picture; alarm fields; and database fields for associated points, including dynamic input values, output values, set points, gains, time schedules, etc.
- E. Make use of color to highlight system components.
 - a. Color and texture meanings shall be consistent across all displays. Components of similar type shall be of same color for graphics.
 - b. Point in alarm shall have their background turn yellow.
- F. Each display shall clearly distinguish between the following point data types and information:
 - a. Real-time data
 - b. User-entered data (setpoints)
 - c. Overridden or operator-disabled points
 - d. Devices in alarm (unacknowledged)
 - e. Out-of-range, bad, or missing data
- G. Dynamic graphics depicting chillers flowing water, fans/ pumps rotating, etc. shall be used to depict status of equipment. Status shall be determined by status indicating equipment such as current sensing switches, auxiliary contacts, or position switches. Commands to field devices shall be shown separately.
- H. Graphics shall be configured to automatically update values without any action by the operator.
- I. A description of a point shall be included on the Graphic next to the object's value whenever there is any ambiguity about the value's meaning. For example, when status and command points are both shown on a graphic, they shall both be labeled with separate identifying descriptions. If a description of a point in a point block is not adequate, then a separate note may be added to the graphic background near the point block clarifying function or purpose.
- J. Display all control loop and alarm setpoints on respective system graphic. Provide ability to change control loop setpoints, alarm setpoints and start/stop equipment from system graphic, provided user has appropriate access. If system graphic seems too cluttered, provide separate, text-based, System Overview page.
- K. Graphic displays shall be designed to be easily understood. When display screen is too cluttered due to size, limit information to important monitoring data. Provide sub-graphic(s) to display data not displayed on main display.
- L. Each graphic shall have a shortcut to the main menu graphic and to previous graphic.
- M. Main menu graphic shall be automatically displayed when user logs on to system.

3.4 CONTROL POINT DESCRIPTION NAMING CONVENTION

- A. The contractor shall use the following convention for point description naming convention in Desigo. In instances where naming convention is not covered below, contact project engineer for direction.

- B. Point descriptions shall generally follow the DDC point naming convention as outlined under section 3 of specification 230905 "MECHANICAL SYSTEMS CONTROLS", with the exception that
 - a. Descriptors shall fully spell out the point functionality so its clear to the BMS operator (ie use Discharge Air Temperature, not DAT).
 - b. Descriptors shall include a prefix of the building # and building abbreviation (ie 0317 THC or 0316 UH, etc).
- C. Where pre-programmed point names are imported (ie INP-1 off a VAV controller), the SI shall provide a point description in Desigo following this standard.
- D. All points imported into Desigo shall have point descriptions. The exception are points that are not indicated on contract documents to be monitored, alarmed or trended, which are not required nor desired to be imported into Desigo.
- E. See below for several examples of implementation of this point naming convention:

DDC Point	Desigo Point Description
AHUC4.DAT_SP off a controller in THC	0317 THC AHU-C4 Discharge air temperature setpoint
AHU18.SAF_STS off a controller in UH	0316 UH AHU-18 Supply Fan Status
CHW.SUPT off a controller in CC	0301 CC Chilled water supply temperature
SCHW.SUPT off a controller in CC	0301 CC Secondary loop chilled water supply temperature
HHW.HX1SCV_CMD off a controller in UHS2	0312 UHS2 Heating Hot Water heat exchanger HX-1 Steam control valve command
SCHW.DP_SP off a controller in UHS3	0314 UHS3 Secondary chilled water loop differential pressure setpoint
C9VAV9938.DPR_POS off a controller in Brehm	5102 AHU-C9 VAV-9938 Damper Position
AC2VAV1345.HTG.RMT.SP off a controller in Brehm	5102 AC-2 VAV-1345 Heating temperature setpoint

3.5 COORDINATION WITH OTHERS

- A. The SI shall provide all necessary coordination with the Mechanical Systems Controls Contractor (MSCC) and Facilities Applications to achieve an operational front-end user interface for the project.

- B. Coordination requirements are outlined in the UMH BMS Integration Process flow diagram: [BMS Project Integration Process.pdf \(drop-box.com\)](#)
- C. All correspondence with the Mechanical System Controls Contractor (MSCC) or other UMH departments (ie HITS, Fac Apps, Systems, BAS Controls) involved in the project shall copy the respective owner's project manager (ie AEC).

3.6 START-UP AND COMMISSIONING

- A. Perform commissioning activities as described here-in and in accordance with Related Sections. Participate in the commissioning process in accordance with the project commissioning documents. This applies to all controls including those provided as part of 3rd party equipment.
- B. Each integration point (ie 100%) shall be checked to confirm mapping, ranges, engineering units, tagging and point description align what is shown on the building control system being integrated.
 - a. Perform point-to-point verification for all control inputs and outputs to confirm that all points are integrated properly, and alarms are configured correctly. SI shall schedule a verification exercise with the MSCC for this. Verification shall involve validating proper performance from device (i.e. sensor) to BMS graphic.
 - b. Alarms, including network failures, shall be tested for each integrated point. Ensure that alarms are properly acknowledged at operator's workstation. Each point shall be checked for proper setting of alarm values, per values on the contract documents. Where deviations are found, submit to UMH FPD Engineer for direction.
 - c. Schedules for each system/device shall be verified.
 - d. Graphics shall be verified for functionality including password protection, floor plan displays, system displays, alarm messaging, historical trends, report generation and HVAC schedules.
- C. Confirm all integrated output points and virtual point can be overridden thru the frontend graphic.
- D. Confirmation that integrated points follow the UMH standard point naming convention indicated under 230905 Mechanical Systems Controls. Where deviations are found, submit to UMH FPD Engineer for direction.
- E. Create and run a report of all integrated controllers and respective COV limits. Validate COV limits are per specification 230905 Mechanical Systems Controls.
- F. Provide any trend setup, reporting and trend graphs in advance of functional testing and by dates specified by the Commissioning Authority to verify proper operation of controls and systems. Trend intervals and storage duration shall be as designated by the commissioner. All such trends shall be deleted before each panel is connected to the BAS server.

DIVISION 23

SECTION 230930 - REFRIGERANT DETECTION AND ALARM

REMOVED THE STATEMENT THAT U-M PROVIDES THE REFRIGERANT MONITOR AND CALIBRATES IT. PART 1 UPDATED TO THE CURRENT U-M MASTER SPEC FORMATTING TEMPLATE. PART 2 UPDATED TO PROVIDE TECHNICAL DETAIL ON REFRIGERANT MONITORS. PART 3 UPDATED TO REQUIRE FINAL SETUP AND CALIBRATION OF MONITOR BY A FACTORY SERVICE REP. D. KARLE FOR HVAC MTT OCT. 2014

AUGUST 2015: REVISED TO DELETE HORNS, LIGHTS, TUBING, WHICH WILL NOW BE PROVIDED BY THE MECHANICAL SYSTEMS CONTROLS CONTRACTOR (MSCC). REVISED TO DELETE CHILLGARD MODEL LE BECAUSE OF ONGOING RELIABILITY ISSUES REPORTED BY PLANT. D.KARLE FOR STEAM/HYDRONICS MTT.

NOV. 2018 REVISED TO ADD BACHARACH AS APPROVED, REVISE MSA MODEL NUMBER, REDUCE ACCURACY REQUIREMENTS, AND OTHER MINOR CHANGES. D. KARLE PER HYDRONICS MTT WITH INPUT FROM C. BUTCHER.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, apply to this Section.
- B. Related Sections:
 - 1. Section 019110/019100 - Commissioning
 - 2. Section 221113 - Piping Materials and Methods
 - 3. Section 220500 - Common Work Results for Mechanical
 - 4. Section 230900 - Mechanical Systems Controls
 - 5. Division 26: - Electrical.

1.2 SUMMARY

- A. Refrigerant monitor/controller and accessories for detecting refrigerant leaks, controlling equipment, and providing local and remote alarms.

1.3 SUBMITTALS

- A. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, rough-in requirements, materials of construction, and operating and maintenance clearance requirements. Additionally include::
 - 1. Project specific wiring diagram indicating inputs and outputs to the refrigerant monitor/controller.
 - 2. Installation, operation, and maintenance instructions for all devices.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Michigan Mechanical Code.
 - 2. ASHRAE Standard 15: Safety Standard for Refrigeration Systems (ANSI Approved).
 - 3. ASHRAE Standard 34: Designation and Classification of Refrigerants.
 - 4. UL 2075: UL Standard for Safety Gas and Vapor Detectors and sensors.
 - 5. UL 61010-1: Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and accessories raised off the floor or ground on pallets and protected with coverings to prevent damage or contamination due to weather and construction activities. Provide temporary protective caps on pipe or tubing ends. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Protect from damage, dirt and debris at all times.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

DESIGNER TO PROVIDE REFRIGERANT DETECTION, ALARM, AND VENTILATION SYSTEM THAT COMPLIES WITH ASHRAE STANDARD 15 AND THE BUILDING CODE.

INDICATE ON THE DESIGN DRAWINGS THE NUMBER AND LOCATION OF WARNING HORNS AND LIGHTS THAT ARE ACTIVATED WHEN A REFRIGERANT LEAK IS DETECTED, AND THE NUMBER AND LOCATION OF SAMPLE POINTS.

PROVIDE A CONTROL DRAWING INDICATING THAT THE REFRIGERANT MONITOR PLACES THE MACHINERY ROOM INTO THE CODE REQUIRED VENTILATION MODE UPON DETECTION OF A REFRIGERANT LEAK. USE U-M STANDARD DETAIL MD 230930 001 "REFRIGERANT MONITOR CONTROL" FOR THIS PURPOSE, REVISED TO BE PROJECT SPECIFIC AND TO INDICATE THE REFRIGERANT TYPE(S) TO BE MONITORED ALONG WITH THE CORRESPONDING ALARM SET POINTS. THE LOW ALARM SET POINT SHALL BE 1/10 THE OEL, THE HIGH ALARM SET POINT SHALL BE 1/2 THE OEL, WHICH ARE LISTED IN CHAPTER 11 OF THE MICHIGAN MECHANICAL CODE, EXCEPT R123 SHALL BE SET FOR ≥ 30 PPM (LOW) AND ≥ 50 PPM (HIGH).

2.1 REFRIGERANT MONITOR

- A. Approved Manufacturers: Bacharach HGM-MZ, MSA Chillgard 5000
- B. Provide infrared technology refrigerant monitor and controller, capable of detecting the refrigerant types in the machinery room.
 - 1. Measurement range: 0-1000 ppm
 - 2. Minimum detection limit: +/- 1 ppm
 - 3. Accuracy: ±10% of reading
 - 4. Display resolution: 1 ppm
 - 5. 4-20mA isolated output indicating refrigerant concentration
 - 6. Manual alarm reset
 - 7. Capable of sensing the number of locations indicated on the design documents.
 - 8. With alarm beacon and horn mounted on the monitor cabinet.
 - 9. Capable of sampling up to 400 feet with 1/4" I.D. copper tube.
 - 10. Provide end of line sample tube filters, quantity to match the number of sensing locations indicated.
 - 11. 120 VAC power supply
- C. Provide remote relay modules and a multipoint sequencer, as required to accomplish the design intent expressed in the contract documents. At minimum provide outputs to provide the following functionality:
 - 1. A low alarm which activates by latching a normally open Form C (SPDT) contact.
 - 2. A high alarm which activates by latching a normally open Form C (SPDT) contact.
 - 3. A refrigerant monitor fault alarm, which de-energizes a normally closed contact to indicate there is problem with the refrigerant monitor system. The same contact shall de-energize upon a loss of power to the monitor.
 - 4. A reset switch that resets the high and low alarm states if the condition that caused the alarm has abated.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation shall comply with the refrigerant monitor manufacturer's recommendations and the contract documents.

3.2 FIELD QUALITY CONTROL

- A. Provide a manufacturer trained service technician to perform start-up services. The service technician shall perform the following:
 - 1. Verify correct installation of the monitor.
 - 2. Perform set-up and calibration of the monitor using a NIST traceable test mixture. Attach a calibration sticker on the monitor listing date of calibration and calibration details.
 - 3. Participate in the commissioning of the refrigerant monitor system.
 - 4. Provide all the monitor passwords to the Owner.

5. Fill out and submit the UM standard calibration and testing report form provided by UM. Provide a written service report prepared on site and submit both at the time of the service visit (with copies immediately provided to the Owner and Commissioner). Service report shall indicate services provided and list all controller settings and alarm setpoints.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 1 Section titled Commissioning and other requirements of the Contract Documents.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 231113 - FUEL OIL SYSTEMS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 231113 - FUEL OIL SYSTEMS

REVISIONS:

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. This Section includes fuel oil piping system and equipment, including:
 - 1. Piping, fittings, and specialties.
 - 2. Oil transfer equipment.
 - 3. Oil storage tanks and accessories.

SPEC EDITOR: LIST ONLY MATERIALS IN THIS PROJECT WHICH THE READER MAY EXPECT TO FIND IN THIS SECTION. VERIFY THAT LISTED SECTIONS ARE INCLUDED IN THIS PROJECT SPECIFICATION AND THAT THEIR TITLES ARE CORRECTLY INDICATED HERE.

1.3 DEFINITIONS

- A. Pipe sizes used in this Specification are Nominal Pipe Size (NPS).

1.4 QUALITY ASSURANCE

- A. Qualify welding processes and welding operators in accordance with ASME "Boiler and Pressure Vessel Code," Section IX, "Welding and Brazing Qualifications."
- B. Regulatory Requirements: Comply with provisions of the following codes:
 - 1. NFPA 31 - Standard for the Installation of Oil Burning Equipment, for oil piping materials and components, oil piping installations, and inspection, and testing of fuel oil piping systems.

SPEC EDITOR: MODIFY BELOW BY SUBSTITUTING PLUMBING CODE ENFORCED BY THE AUTHORITY HAVING JURISDICTION. INSERT THE EDITION IN FORCE.

- 2. BOCA Basic National Mechanical Code.
- C. UL Compliance: Provide fuel oil piping components and storage tanks which are listed and labeled by UL.

1.5 SEQUENCING AND SCHEDULING

- A. Coordinate the size and location of concrete ballast pads and fill and sounding boxes for underground storage tanks, and housekeeping equipment pads for oil transfer pumps. Cast anchor bolt inserts into pad. Concrete reinforcement and formwork requirements are specified in Division 3.

1.6 WARRANTY

SPEC EDITOR: BE CAUTIOUS NOT TO REDUCE THE PROTECTION THE OWNER MIGHT OTHERWISE BE ENTITLED TO, BY INCLUDING UNINFORMED REQUIREMENTS FOR WARRANTIES. SEE EVALUATIONS AND DIVISION 1 SECTION "WARRANTIES AND BONDS."

SPEC EDITOR: RETAIN THIS ARTICLE WHEN SPECIFYING STEEL TANKS WITH STI-P3 CATHODICALLY PROTECTED TANKS.

- A. Special Product Warranty: Submit a written warranty for the underground fuel oil storage tanks, executed by the manufacturer, agreeing, at the manufacturer's option, to repair the failure, replace the failed tanks limited to delivery of new tank to the site of original installation, or refund the original purchase price of the tanks, provided the tanks are installed in accordance with the manufacturer's instructions. Warranty shall protect the Owner for a period of 30 years from the date of original purchase, against structural failures of the tanks, including cracking, breakup, or collapse; and failure of the tanks due to external corrosion, and internal corrosion when the tanks are used for storage of fuel oils at temperatures not exceeding 150 deg. F. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the Contract Documents.

SPEC EDITOR: USE THE ARTICLE BELOW WHEN SPECIFYING GLASS-FIBER REINFORCED PLASTIC TANKS.

- B. Special Project Warranty: Submit a written warranty for the underground fuel oil storage tanks, executed by the manufacturer, agreeing, at the manufacturer's option, to repair the failure, replace the failed tanks limited to delivery of new tank to the site of original installation, or refund the original purchase price of the tanks, provided the tanks are installed in accordance with the manufacturer's instructions. Warranty shall protect the Owner for a period of 30 years from the date of original purchase, against failure of the tanks due to external corrosion, and internal corrosion when the tanks are used for storage of fuel oils at temperatures not exceeding 150 deg. F. This warranty shall be in addition to, and not a limitation of, other rights the Owner may have against the Contractor under the Contract Documents.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Vertical Ball Check Valves:
 - 1. Keystone
 - 2. Milwaukee
 - 3. Grinnell
 - 4. APCO
 - 5. Crane
 - 6. Stockham

- B. Strainers:
 - 1. Armstrong Machine Works.
 - 2. Hoffman Specialty ITT; Fluid Handling Div.
 - 3. Metraflex Co.
 - 4. R-P&C Valve; Div. White Consolidated Industries, Inc.
 - 5. Spirax Sarco.
 - 6. Trane Co.
 - 7. Victaulic Co. of America. (low pressure applications only)
 - 8. Watts Regulator Co.

- C. Oil Transfer Pumps:
 - 1. ITT Marlow.
 - 2. Roper Pump Co.
 - 3. Viking Pump Div.; Houdaille Industries, Inc.
 - 4. Webster Electric Co; Sub. of Sta-Rite Industries, Inc.

- D. Oil Piping Specialties:
 - 1. McDonald Mfg. Co., A.Y.
 - 2. OPW Division; Dover Corp.

- E. Steel Underground Oil Storage Tanks:
 - 1. Adamson Co., Inc.
 - 2. Buffalo Tank, Div. Bethlehem Steel Corp.
 - 3. Highland Tank & Mfg. Co.
 - 4. Modern Welding Co., Inc.

- F. Glass Fiber Reinforced Plastic Underground Oil Storage Tanks:
 - 1. Lifetime Fiberglass Tank Co.
 - 2. Owens-Corning Fiberglas Corp.
 - 3. Xerxes Fiberglass Inc.

2.2 PIPE AND TUBE MATERIALS

SPEC EDITOR: SELECT ONE - ANNEALED COPPER IS NOT TO BE USED INDOORS.

- A. Steel Pipe: ASTM A 120, Schedule 40, seamless, black steel pipe, with beveled ends, with threaded joints and fittings for 2 inch and smaller, and with welded joints for 2-1/2 inch and larger.

- B. Copper Tubing: ASTM B 88, Type L, hard drawn copper tubing with wrought copper fittings and brazed joints for 2 inch and smaller, above ground, within building. Use Type K, annealed copper tubing for 2 inch and smaller without joints, for underground installations.

2.3 FITTINGS

SPEC EDITOR: FITTINGS BELOW ARE ALSO AVAILABLE IN CLASS 250.

- A. Cast-Iron Threaded Fittings: ANSI B16.4, Class 125, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.

SPEC EDITOR: FITTINGS BELOW ARE ALSO AVAILABLE IN CLASS 300.

- B. Malleable Iron Threaded Fittings: ANSI B16.3, Class 150, standard pattern, for threaded joints. Threads shall conform to ANSI B1.20.1.
- C. Steel Fittings: ASTM A 234, seamless or welded, for welded joints.
- D. Wrought-Copper Fittings: ANSI B16.22, streamlined pattern.

SPEC EDITOR: FLANGES BELOW ARE ALSO AVAILABLE IN CLASS 250.

- E. Cast-Iron Threaded Flanges: ANSI B16.1, Class 125; raised ground face, bolt holes spot faced. Threads shall conform to ANSI B1.20.1.

SPEC EDITOR: BELOW FLANGES AND FITTINGS ARE AVAILABLE IN SEVERAL CLASSES, MATERIALS, FACINGS, AND END CONNECTIONS. VERIFY WITH PROJECT REQUIREMENTS.

- F. Steel Flanges and Flanged Fittings: ANSI B16.5, including bolts, nuts, and gaskets of the following material group, end connection and facing:
 - 1. Material Group: 1.1.
 - 2. End Connections: Butt Welding.
 - 3. Facings: Raised face.

2.4 JOINING MATERIALS

- A. Brazing Filler Metals: AWS A5.8, Classification BAgl (silver).
- B. Gaskets for Flanged Joints: Gasket material shall be full-faced for cast-iron flanges and raised-face for steel flanges. Select materials to suit the service of the piping system in which installed and which conform to their respective ANSI Standard (A21.11, B16.20, or B16.21). Provide materials that will not be detrimentally affected by the chemical and thermal conditions of the fluid being carried.

2.5 PIPING SPECIALTIES

- A. Y-Pattern Strainers: 125 psig working pressure; cast-iron body conforming to ASTM A 126, Class B; flanged ends for 2-1/2 inch and larger, threaded connections for 2 inch and smaller, bolted cover, perforated stainless steel screen, and plugged blow-down drain.

SPEC EDITOR: THE FOLLOWING ARE FOR 1-1/2 INCH PIPE AND SMALLER.

- B. Flexible Connectors: minimum 150 psig working pressure, maximum 250 deg F operating temperature; stainless steel bellows with woven flexible bronze wire reinforcing protective jacket. Connectors shall have flanged or threaded end connections to match equipment connected; and shall be capable of 3/4 inch misalignment.

2.6 GENERAL DUTY VALVES

- A. General duty valves (i.e., gate, globe, ball, and butterfly valves) are specified in Division 22 Section "Valves". Special duty valves are specified in this Article by their generic name. Refer to Part 3 below, Article "VALVE APPLICATION" for specific uses and applications for each valve specified.

2.7 SPECIAL DUTY VALVES

SPEC EDITOR: INTEGRAL RELIEF VALVE ON OIL TRANSFER PUMP MAY BE SUFFICIENT TO ELIMINATE INLINE SAFETY RELIEF VALVES.

- A. Oil Safety Valves: 250 psig maximum working pressure, 550 deg. F. maximum operation temperature; ASTM B 61 bronze body and bronze bases and discs, and field adjustable cadmium-plated carbon steel springs factory-set at 20 percent above operating pressure. End connections shall be inside threaded with threads conforming to ANSI B1.20.1. Valve shall be UL-listed for flammable or volatile liquids.
- B. Vertical Ball Check Valves: Class 200, 400 psig maximum operating pressure, 2-piece bronze construction with threaded end connections; integral bronze seats and replaceable stainless steel ball.

2.8 FUEL OIL TRANSFER PUMPS AND ACCESSORIES

SPEC EDITOR: CAPACITY IN GPM MAY BE PRESENTED IN A SCHEDULE IF THERE ARE SEVERAL PUMPS WITH VARIOUS CAPACITIES, OR MAY BE SPECIFIED HERE. ALSO AVAILABLE WITH FLANGE MOUNTING MANY OPTIONAL FEATURES AVAILABLE TO SUIT UNIQUE PROJECT REQMTS, CONSULT MFR LITERATURE.

- A. General Description: single-stage, positive displacement rotary type, with the following features and accessories; foot-mounted, cast-iron housing, steel gears, bronze bearings, steel shaft, standard mechanical seals; built-in pressure relief bypass; steel base; and drive coupling. Provide pumps with capacities and electrical characteristics as scheduled for number 2 or 3 fuel oil. Pumps shall be constructed in accordance with UL 343, and be UL-listed and bear the UL label.

SPEC EDITOR: SELECT FROM THE FOLLOWING 2 DRIVE OPTIONS.

- B. Drive: V-belt drive, with belt guard.
- C. Drive: direct drive, close coupled.
- D. Motor: Split phase for single-phase motors; capacitor-start, induction-run, totally enclosed for 3-phase motors.

2.9 STEEL UNDERGROUND STORAGE TANKS AND ACCESSORIES

SPEC EDITOR: SELECT ONE OF 2 OPTIONS BELOW. INDICATE SIZE AND CAPACITY ON THE DRAWINGS.

- A. General Description: single-wall factory-fabricated and tested, cathodically-protected, and bearing UL and sti-P3 labels. Fabricate wall and headers using hot-rolled carbon steel plates or sheets, as specified in UL 58. Size and capacity as indicated.
- B. General Description: double-wall, factory-fabricated and tested, cathodically-protected, and bearing UL and sti-P3 labels. Fabricate inner and outer walls and headers using hot-rolled carbon steel sheets or plates, as specified in UL 58. Size and capacity as indicated.
- C. Fabrication: Tanks shall be fabricated for operation at atmospheric pressure; to store liquids with specific gravities up to 1.1, and with maintained temperatures of up to 150 deg. F. Fabricate shell and head joints, lifting lugs, manholes, masonry supports, and pipe connections in accordance with UL 58. Fabricate tanks for the following internal and external loads:
 - 1. External Hydrostatic Pressure: 3'-0" depth of bury from top of tank and hole fully flooded; withstand general buckling with safety factor of 2:1.
 - 2. Surface Loads: H-20 axle loads when installed in accordance with manufacturer's installation instructions.
- D. Tank Fittings and Accessories: Provide storage tank with the following factory-installed fittings and accessories:

SPEC EDITOR: INCLUDE TANK DETAILS ON DRAWINGS INDICATING LOCATION OF FITTINGS. FLANGED FITTINGS ARE ALSO AVAILABLE.

- 1. Tank Manhole: 24 inch diameter, bolted, flanged, and gasketed manhole, with extension collar, for access to inside of tank.
- 2. Threaded pipe connection fittings on top of tanks, for fill, supply, return, vent, gages, heating coils, and hot-well in locations and of sizes as indicated. Provide cast-iron plugs for shipping.

3. Anchor Straps: Provide manufacturer's standard anchoring system (straps, cables, turnbuckles, etc.) with the strength of at least 1-1/2 times the maximum uplift force of the empty tank without backfill in place.
4. Lifting Lugs: Provide lifting lugs to facilitate handling and installation.

SPEC EDITOR: IF PARAGRAPH BELOW IS RETAINED, INDICATE LADDER LOCATION ON TANK DETAIL ON DRAWINGS.

5. Ladders: Provide carbon steel ladder inside tank, anchored to top and bottom, and located as indicated.
6. Masonry Supports: (2) 6" x 6" x 3/8" steel angles 6' - 0" long located longitudinally on each side of the manhole and continuously welded in place.

SPEC EDITOR: SELECT FROM 2 OPTIONS BELOW, BUT ONLY FOR HEAVY OIL STORAGE TANKS. HOT-WELLS ARE USED IN SOME AREAS IN LIEU OF HEATING COILS FOR HEAVY OIL. EDIT AS DESIRED. SCHEDULE HEATING CAPACITY OR INDICATE ON DRAWINGS.

7. Heating Coils: Provide heating capacity as scheduled. Coils shall be continuous spiral having a 3 inch slope, made of Type K soft annealed copper with no joints within the tank.
8. Hot-Wells: Provide 8 inch diameter hot-well extending from 4 inch above tank top to 4 inch above tank bottom. Provide tappings above tank for connection of oil suction and return piping. Provide 2 inch hole in well, just below top of tank, for venting.
9. Supply Tube: Provide extension of transfer pump suction line fitting into tank, terminating 6 inch above tank bottom and cut at 45 degree angle.
10. Vent Cap: cast iron threaded tee inlet; 40 mesh brass wire cloth screen.
11. Fill Box: Flush heavy duty, waterproof, cast iron body and top cap, and brass inner cap with lock with key wrench.
12. Remote Oil Gages: Balanced hydraulic type providing a true volumetric indication. Gage volume range to suit capacity storage; UL-listed and labeled.

SPEC EDITOR: RETAIN ONLY ONE OF THE 3 PARAGRAPHS BELOW, DEPENDING UPON REQUIREMENTS WITHIN YOUR LOCAL AREA. AUTHORITY HAVING JURISDICTION MAY WAIVE THE REQUIREMENTS FOR CORROSION PROTECTION WHERE EVIDENCE IS PROVIDED THAT SUCH PROTECTION IS NOT NECESSARY.

- E. Corrosion Protection System: Tanks and their piping shall be protected by a properly engineered, installed, and maintained corrosion protection system in accordance with the Steel Tank Institute of Standard No. sti-P3 "System for External Corrosion Protection of Underground Steel Storage Tanks." Provide means monitoring cathodic protection by either "Protection Prover 1" or "Protection Prover 2" monitoring system.

2.10 SOURCE QUALITY CONTROL

- A. Perform tests at the factory after fabricating and prior to shipment in accordance with sti-P3.

2.11 GLASS-FIBER-REINFORCED POLYESTER UNDERGROUND STORAGE TANKS

- A. General Description: double-wall factory-fabricated and tested, in conformance with ASTM D 4021; bearing UL label. Tanks shall be designed to be vented and operated at atmospheric pressure; designed to store liquids with specific gravities up to 1.1, and with maintained temperatures of up to 150 deg F; and shall be chemically inert to petroleum being stored, plus their additives.

SPEC EDITOR: COORDINATE ELECTRICAL CONNECTIONS.

- B. Hydrostatic Monitoring System: Include a brine antifreeze solution, UL listed reservoir sensor, and UL listed electronic control panel to monitor leaks in inner and outer tank walls. Controls shall operate with 120 volts A.C.
- C. Tank Fittings and Accessories: Provide storage tank with the following factory-installed fittings and accessories:

SPEC EDITOR: INCLUDE TANK DETAILS ON DRAWINGS INDICATING LOCATION OF FITTINGS. FLANGED FITTINGS ARE ALSO AVAILABLE.

- 1. Tank Manhole: 24 inch diameter, bolted, flanged, and gasketed manhole, with extension collar, for access to inside of tank.
- 2. Threaded pipe connection fittings on top of tanks, for fill, supply, return, vent, gages, heating coils, and hot-well in locations and of sizes as indicated. Provide cast-iron plugs for shipping.
- 3. Anchor Straps: Provide manufacturer's standard anchoring system (straps, cables, turnbuckles, etc.) with the strength of at least 1-1/2 times the maximum uplift force of the empty tank without backfill in place.
- 4. Lifting Lugs: Provide lifting lugs to facilitate handling and installation.

SPEC EDITOR: IF BELOW IS RETAINED, INDICATE LADDER LOCATION ON TANK DETAIL ON DRAWINGS.

- 5. Ladders: Provide carbon steel ladder inside tank, anchored to top and bottom, and located as indicated.

SSPEC EDITOR: ELECT FROM 2 OPTIONS BELOW, BUT ONLY FOR HEAVY OIL STORAGE TANKS. HOT-WELLS ARE USED IN SOME AREAS IN LIEU OF HEATING COILS FOR HEAVY OIL. EDIT AS DESIRED.

- 6. Heating Coils: Provide spiral type heating coil of capacity as scheduled, installed in tank manhole.
- 7. Hot-Wells: Provide 8 inch hot-well extending from 4 inch above tank top to 4 inch above tank bottom. Provide tappings above tank for connection of oil suction and return piping. Provide 2 inch hole in well, just below top of tank, for venting.
- 8. Supply Tube: Provide extension of transfer pump suction line fitting into tank, terminating 6 inch above tank bottom and cut at 45 degree angle.
- 9. Vent Cap: cast iron threaded tee inlet; 40 mesh brass wire cloth screen.
- 10. Fill Box: Flush heavy duty, waterproof, cast iron body and top cap, and brass inner cap with lock with key wrench.

11. Remote Oil Gages: Balanced hydraulic type providing a true volumetric indication. Gage volume range to suit capacity storage; UL-listed and labeled.

2.12 GRADE MANHOLE

- A. Precast Concrete Manhole Sections: ASTM C478, base and concentric cone sections with integral ladder.
- B. Cast-Iron Ring and Cover: heavy-duty, water-resistant, cast-iron manhole frame, gasket, and bolted lid; 24 inch diameter inside opening dimension; 8 inches overall height.

PART 3 - EXECUTION

3.1 PIPE INSTALLATIONS

- A. General: Refer to Section 221113 - Piping Materials and Methods" for basic piping installation instructions.
- B. Install supply, return, fill, and vent piping at a uniform grade of 1/4 inch in ten feet downward in the direction of the storage tank.

3.2 UNDERGROUND TANK INSTALLATION

- A. Perform air pressure test on tanks prior to placing into excavations. Test pressure shall not exceed 5 psi. Apply a soap solution to joints.
- B. Excavate to a sufficient depth for a minimum of 3 foot earth cover from top at tank to grade; allowing for cast-in-place, reinforced concrete ballast pad, plus 6 inches of sand or pea gravel between ballast pad and tank. Excavation shall extend one foot around the perimeter of the tank.

SPEC EDITOR: BALLAST PAD SIZE AND REINFORCING SHOULD BE SUFFICIENT TO HOLD DOWN EMPTY TANK COMPLETELY SUBMERGED IN WATER.

- C. Place reinforcing and concrete as specified in Division 03. Excavation floor and walls may serve as forms. Use ASTM C150 Portland Cement concrete, Type I, with normal weight aggregate conforming with ASTM C33, and having a 28 day compressive strength at 3,000 psi.
- D. Set tiedown eyelets for hold-down straps in concrete ballast pad and tie to reinforcing steel.
- E. Place 6 inches of clean sand or pea gravel on top of ballast pad.
- F. Set tank on fill materials.

SPEC EDITOR: RETAIN BELOW FOR STEEL TANKS.

- G. Protect anodes during tank placement and backfilling operations.
- H. Install holddown straps.
- I. Make piping connections.

- J. Backfill excavation with clean sand or pea gravel. Tamp backfill to consolidate.

3.3 FIELD QUALITY CONTROL

- A. Test oil piping in accordance with NFPA 31.
- B. Remake leaking joints and connections using new materials.

3.4 COMMISSIONING

- A. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.
- B. Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance.
- C. Review data in Operating and Maintenance Manuals. Refer to Division 01 section "Project Closeout."
 - 1. Schedule training with Owner through the Architect, with at least 7 days advance notice.
- D. Before activating system perform these steps:
 - 1. Open valves to full open position. Close bypass valves.
 - 2. Remove and clean strainer screens.
 - 3. Check pump for proper direction of rotation.
 - 4. Fill oil storage tank with proper fuel type.
 - 5. Check operating controls of fuel burner units.
 - 6. Check operation at automatic bypass valves.
 - 7. Check and set operating temperature controls on oil heaters.
 - 8. Check corrosion monitoring systems for proper operation.

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 231123 - FACILITY NATURAL-GAS PIPING

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 231123 - FACILITY NATURAL-GAS PIPING

REVISIONS:

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide piping, fittings, and specialties for Natural Gas Systems

1.3 WORK BY OTHERS - UTILITY COMPANY:

SPEC EDITOR: GAS METERS ARE TYPICALLY FURNISHED AND INSTALLED BY THE MICHCON, WITH CHARGES BILLED DIRECTLY TO THE OWNER. IF OTHER THAN MICHCON, CONTACT THE UTILITY SERVING THE SITE FOR INFORMATION AND COORDINATE WITH CONSTRUCTION MANAGEMENT. VERIFY AVAILABLE PRESSURE WITH MICHCON AND REQUIRED PRESSURE AT APPLIANCES. MICH CON GENERALLY LIMITS PRESSURE TO 14"WC UNLESS YOU CAN PROVE THE NEED FOR HIGHER PRESSURE.

- A. Gas meter, pressure regulator and related valves will be furnished and installed by MichCon.
- B. All gas piping outside the building, upstream of the gas meter is provided by MichCon.
- C. Contractor shall coordinate installation of meter and related components with MichCon and owner.
- D. Expenses and fees for MichCon work shall be paid for by the owner.

1.4 QUALITY ASSURANCE:

- A. Comply with the requirements of NFPA 54 - National Fuel Gas Code, for gas piping materials and components, and gas piping systems installation, inspection, testing, and purging.

PART 2 - PRODUCTS

2.1 GAS LINE PRESSURE REGULATORS:

SPEC EDITOR: DO NOT SPECIFY APPLIANCE PRESSURE REGULATORS HERE IF THEY ARE SPECIFIED TO BE INTEGRAL WITH GAS APPLIANCE IN EQUIPMENT SECTION. GAS LINE PRESSURE REGULATORS ARE NORMALLY FURNISHED BY GAS SUPPLIER, AND BY GAS-FIRED EQUIPMENT MANUFACTURER. ADDITIONAL PRESSURE LIMITING AND RELIEF VALVES ARE NOT REQUIRED IN ALL CASES. CONSULT NFPA 54 AND GAS SUPPLIER.

SPEC EDITOR: IF USED, INCLUDE SCHEDULE OR OTHERWISE INDICATE INLET AND OUTLET PRESSURES AND FLOW

- A. Single stage, steel jacketed, corrosion-resistant gas pressure regulators; with atmospheric vent, elevation compensator; with threaded ends for 2 inch and smaller, flanged ends for 2-1/2 inch and larger; for inlet and outlet gas pressures, specific gravity, and volume flow indicated.

SPEC EDITOR: VEN WILL ADD NAMES BELOW

- B. Manufacturers:

- 1. _____
- 2. _____
- 3. _____
- 4. Etc..

2.2 LUBRICATED PLUG VALVES:

SPEC EDITOR: THIS GAS ISOLATION VALVE IS TYPICALLY SPECIFIED FOR LARGER PIPING ONLY, AT BOILERS ETC. FOR LAB ISOLATION, USE BALL VALVES SPECIFIED IN 220523. DELETE PARAGRAPH 2.2.A IF BALL VALVES ARE SPECIFIED FOR 2" AND LESS IN SECTION 220523.

- A. GGas Cocks 2-1/2 Inch and Larger: MSS SP-78; 175 psi, lubricated plug type, semi-steel body, single gland, wrench operated, flanged ends. For valves 2" and smaller, see Section 220523 Valves
- B. Manufacturers: Homestead, Milliken, Resun

2.3 MASTER GAS SHUT OFF VALVE AND VALVE BOX

SPEC EDITOR: THIS WAS REQUIRED ON LABS AT ONE TIME, BUT IS NO LONGER. SPECIFIC APPLICATIONS MAY WARRANT ITS USE. ADDITIONAL RESEARCH SHOULD BE DONE PRIOR TO SPECIFYING. CONSIDER CHEMTROL.

- A. Master gas shut off valve shall be bronze body ball valve. Recessed valve box constructed of extruded aluminum with aluminum back plate and frame cover. Assembly shall include clear flexible window with emergency pull ring. Permanently affix the following to the window:

CAUTION: MASTER GAS SHUT OFF VALVE
a) CLOSE ONLY IN EMERGENCY

- B. Manufacturers: Ohmeda, Mueller

PART 3 - EXECUTION

SPEC EDITOR: DELETE ARTICLE 3.1 AND 3.2 FOR NEW PROJECTS.

3.1 PREPARATION:

- A. Precautions: Before turning off gas, turn off all equipment valves. Perform a leakage test to determine that all equipment is turned off.

3.2 HANDLING FLAMMABLE LIQUIDS:

- A. Remove and legally dispose of liquid from drips in existing gas piping. Handle cautiously to avoid spillage or ignition.

3.3 NATURAL GAS PIPING INSTALLATION REQUIREMENTS:

- A. See Section 221113 for piping materials and installation requirements.
- B. Install, inspect, test, and purge natural gas systems in accordance with NFPA 54, and local utility requirements.
- C. See Section 220523 for valve installation requirements.

SPEC EDITOR: INDICATE ON THE DRAWINGS, THE ROUTING AND TERMINATION LOCATION OF THE CONDUIT VENT PIPE.

- D. Gas piping in air plenum ceilings shall be continuously welded or installed in air-tight conduit constructed of Schedule 40 seamless black steel pipe with welded joints. Vent conduit to the outside and terminate with a screened vent cap. Valves shall not be installed in plenums.
- E. Drips and Sediment Traps: Install a drip leg at inlet to terminal equipment, points where condensate may collect, and at the outlet of the gas meter. Do not install drips where condensate is likely to freeze. Construct drips using a tee with plugged or capped bottom outlet. Drip shall be minimum of 3 pipe diameters long, same size as pipe. Locate drips to permit cleaning and emptying.

3.4 GAS LINE PRESSURE REGULATOR INSTALLATION:

SPEC EDITOR: REFER TO NFPA 54 FOR OVERPRESSURE PROTECTION.

- A. Install a gas isolation valve upstream of each gas pressure regulator. Where two gas pressure regulators are installed in series in a single gas line, a valve is not required at the second regulator.
- B. Install pressure relief or pressure limiting devices so they can be readily operated to determine if the valve is free; so they can be tested to determine the pressure at which they will operate; and examined for leakage when in the closed position.
- C. Install vent line from pressure regulators to outdoors.

3.5 ELECTRICAL BONDING AND GROUNDING:

- A. Install above ground portions of gas piping systems, upstream from equipment shutoff valves electrically continuous and bonded to a grounding electrode in accordance with NFPA 70 - "National Electrical Code."
- B. Do not use gas piping as a grounding electrode.
- C. Conform to NFPA 70 - "National Electrical Code," for electrical connections between wiring and electrically operated control devices.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 232116 - HYDRONIC PIPING SPECIALTIES

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232116 - HYDRONIC PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Provide hydronic specialties for the following systems:
 - 1. Chilled Water System
 - 2. Condenser Water System
 - 3. Hot Water Heating System
 - 4. Process Cooling Water System

PART 2 - PRODUCTS

2.1 AUTOMATIC AND MANUAL AIR VENTS:

- A. Manual air vents shall be ¾" ball valve per Section 220523.
- B. Automatic air vents shall be non-ferrous, rated for 150 psig maximum operating pressure.
 - 1. Manufacturers:
 - a. For pipe sizes 2" and less. Bell & Gosset model 87, Armstrong model 75, Taco Hy-Vent
 - b. For pipe sizes 2 ½" and larger. Hoffman model 78, Armstrong model 75.

2.2 SUCTION DIFFUSERS:

- A. Provide angle pattern suction diffusers rated at 175 psig, 250 F., having cast iron or ductile iron body, with flanged (grooved piping if grooved piping is specified for system) connections. Provide a stainless steel combination diffuser-strainer cylinder with 3/16" or 1/8" diameter perforations, stainless steel flow straightening inlet vanes, a 16 mesh bronze start-up strainer, a permanent magnet and an adjustable support foot.
- B. Manufacturers: Bell & Gossett, Armstrong, Wheatley, Taco, Grinnell, Victualic

2.3 TRIPLE DUTY VALVE:

- A. Provide a straight or angle pattern combination bubble tight shut-off, calibrated balancing and non-slam check valve rated at 175 psig working pressure and 250 degrees F. Body shall be cast iron or ductile iron, with flanged or grooved piping connections.
- B. Valve shall have a bronze seat, replaceable bronze disc with EDPM seat insert, stainless steel stem and spring. Provide brass readout valves with integral check valves to measure differential pressure readings across the orifice.
- C. Valve design shall permit re-packing under full system pressure.
- D. Manufacturers: Bell & Gossett model 3D or 3DS, Armstrong, Wheatley, Taco

2.4 WATER PRESSURE REGULATING/REDUCING VALVE:

- A. Bronze valve body, renewable stainless steel seat. Adjustable reduced pressure range, built-in bypass, diaphragm type with spring cage and orifice. Pressure to be adjustable from a top screw on the valve.
- B. Manufacturers: Watts model 223BHP, Bell & Gossett, Hoffman

2.5 WATER PRESSURE RELIEF VALVE:

- A. ASME rated, sized for the full installed capacity of the low pressure side of the regulating station. Factory set valve at not more than 20% above low side pressure. Furnish seat material suited for the service.
- B. Manufacturers: Consolidated, ITT Bell & Gossett, ITT McDonnell Miller, Watts

2.6 COALESCING SEPARATOR:

- A. Provide coalescing type air/dirt or dirt separator, type and sized to match main system piping or as indicated on the drawings. Air/dirt separator shall include separate air chamber for air removal and a lower vessel extension for dirt separation.
- B. Separator shall be welded carbon steel fabricated with ANSI B16.5 flange connections and rated for 150 psig design pressure and 250F design temperature. Separator shall include an internal assembly of rigidly constructed vertical tubes of stainless steel or copper wire matrix designed to coalesce microbubbles out of solution and form larger air bubbles that rise to the top of the vessel and to separate dirt particles that collect at the bottom.
- C. Separators shall include manufacturer's integral high capacity air vent or cast iron air vent as specified in Section 2.1, flanged lower head to allow coalescing media removal, side tap valve to facilitate system filling and bottom drain connection with ball valve for draining.
- D. Separators shall be capable of removing 100% of the free air, 100% of the entrained air, and up to 99.6% of the dissolved air in the system fluid. Dirt separation shall be at least 80% of all particles 30 micron and larger within 100 passes.
- E. Approved Manufacturers:

1. Spirotherm
2. Thrush Aar-O-Vent
3. Bell & Gossett CRS Air and Dirt Separator

2.7 EXPANSION TANKS:

- A. Provide expansion tank, constructed of welded steel with butyl rubber bladder, replaceable and full acceptance volume, ASME stamped for 125 psig at 240F. Tank shall have capacity, size and operating pressures as shown on drawings.
- B. Manufacturer: Bell & Gossett, Wessels, Amtrol, Armstrong or Taco.

2.8 CENTRIFUGAL SOLID SEPARATOR:

- A. Provide centrifugal solids separator, with efficiency of 98% to 40 microns, as scheduled and detailed on drawings. Body shall be steel, ASME stamped for 125 psig, with flanged connections and factory painted exterior. Provide 4"x6" cleanout for lower section, and flanged upper dome for easy maintenance access.
- B. Provide automatic recovery tank with bag filter (solids collection vessel) as scheduled and detailed. Controlled continuous flow, 25 micron solids collection bag, 600 cubic inches capacity, manual isolation valves, sight glass for flow verification and differential pressure switch, Annunciator in an independent junction box, contacts rated for 4 amps at 115 volts, set at 10 psid with a range of 4 to 25 psid.
- C. Manufacturers: LAKOS, Griswold Controls

2.9 IN -LINE FILTER:

- A. Cartridge type impingement filter, with replaceable 100 micron or 300 micron filter media. Size and capacity shall be as indicated on drawings.
- B. Manufacturers: Bruner, Culligan, Cuno, Dollinger, Honeywell.

PART 3 - EXECUTION

3.1 INSTALLATION OF AUTOMATIC & MANUAL AIR VENTS

- A. Install automatic air vents at high points (where pipe drops in direction of flow) in hydronic systems. Isolate the auto air vent with an isolation valve.
- B. Where manual air vents are indicated, they shall consist of an isolation valve terminated with an elbow, threaded hose connection, and hose cap.

3.2 INSTALLATION OF SUCTION DIFFUSERS:

- A. Install to allow complete removal of strainer elements. Remove 16 mesh bronze start-up mesh after system start-up and flushing is complete. Replace with standard operating strainer. Adjust support foot to carry weight of suction piping (to inertia pad where applicable).

3.3 INSTALLATION OF EXPANSION TANK:

- A. See drawings for locations, support and piping details. Document initial and operating pressures, and temperature, and submit report for approval.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232123 - PLUMBING AND HYDRONIC PUMPS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232123 - PLUMBING AND HYDRONIC PUMPS

THIS SECTION SPECIFIES CENTRIFUGAL PUMPS FOR HVAC SYSTEMS (CHILLED WATER, CONDENSER WATER, HEATING HOT WATER), PROCESS COOLING, AND DOMESTIC HW RETURN PUMPS. STEAM CONDENSATE PUMPS AND RECEIVERS, SMALL HVAC CONDENSATE PUMPS, CW BOOSTER PUMP PACKAGES, AND HEAT TRANSFER PACKAGES, SUMP PUMP, FIRE PUMPS ARE SPECIFIED ELSEWHERE.

7/16/12: ADDED THAT PUMP SEALS SHALL BE UNAFFECTED BY CHLORAMINES. ADDED NSF 61 REFERENCE UNDER QUALITY ASSURANCE.

2014-01-06: IMPROVED LEAD FREE REQUIRMENTS TO REFLECT U.S SAFE DRINKING WATER ACT REQUIREMENTS THAT WENT INTO EFFECT JAN. 4, 2014. D.KARLE FOR MTT.

2016-10-31: ADDED TO PART 2 - WET ROTOR, ECM VARIABLE SPEED IN-LINE CIRCULATOR PUMP FURNISHED AS AN ASSEMBLY WITH SPEED CONTROLS. WPG FOR HYDRONICS/STEAM MTT.

APRIL 2018: ELIMINATED A-C PUMPS, NOT OFFERED AS A HVAC PUMP BY B&G. D. KARLE FOR HYDRONICS MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220513: Motors.
 - 2. Section 220548: Vibration Control
 - 3. Division 26: Electrical.

1.2 SUMMARY

- A. Includes pumps for hydronic and domestic hot water return service. Includes process pumps except those covered in other specification sections.
 - 1. Does not include steam condensate, domestic booster package, sump, or fire pumps.

1.3 SUBMITTALS

- A. Submit the following product data for approval:
 - 1. Manufacturer information.

2. Dimensions and elevations.
3. Performance data/pump curves.
4. Materials of construction.
5. Motor data including motor manufacturer.
6. Vibration isolation and inertia bases

1.4 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 1. Hydraulic Institute Compliance: Design and manufacture pumps in accordance with ANSI/ Hydraulic Institute Standards.
 2. National Electrical Code Compliance: Provide components complying with NFPA 70 National Electrical Code.
 3. UL Compliance: Provide HVAC pumps which are listed and labeled by UL, and comply with UL Standard 778 "Motor Operated Water Pumps."
 4. Pumps used for potable water service: National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 5. Pumps used for potable water service: U.S Safe Drinking Water Act.
- C. Single Source Responsibility: Obtain pumps from a single manufacturer.

SPEC EDITOR: REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL PUMP REQUIREMENTS:

- A. Unless noted otherwise, provide pumps meeting these general requirements.

SPEC EDITOR: NOTE THE GENERALIZED PUMP AND SEAL T/P RATINGS AND THE NOTATION "SUITABLE FOR SERVICE," INDICATED BELOW. EDIT THE SPECIFIC PUMP SECTIONS IF YOUR PROJECT HAS SEVERE SERVICE OR MORE DEMANDING T/P REQUIREMENTS.

- B. Suitable for the service, rated for the temperature and pressure indicated. When not indicated, pump and pump seals shall be rated for not less than 175 psig working pressure and 225 degrees F continuous water temperature. Provide pumps with capacities and performance as scheduled on the Drawings.
- C. Pumps shall have steel shaft, cast iron case, and cast bronze or stainless steel impeller. Flanged pumps shall have suction and discharge taps in flanges, and drain and vent taps in the volute. Piping connections shall be flanged for connection sizes 2 1/2 inches and larger.
- D. Pumps shall have statically and dynamically balanced impeller, with a constantly dropping head curve from shutoff to cutoff, and shall not overload their respective motors on any point throughout the head capacity curve. Key and lock impeller to shaft.
- E. Motors shall be factory coupled to pump and comply with requirements of Related Section Motors, with rpm, voltage and HP as scheduled. Single phase motors shall have built-in overload protection.
- F. Where flexible coupling is specified, coupling shall be EPDM, center dropout type, capable of absorbing torsional vibration and shaft misalignment, complete with ANSI B15.1/OSHA 1910.219 coupling guard.
- G. Pumps for domestic water systems shall be lead free (less than 0.25 percent lead by weight in all wetted surfaces) all bronze or stainless steel construction.

SPEC EDITOR: FOR PUMPS USED FOR GLYCOL SERVICE, SILICON CARBIDE SEALS SHOULD BE SPECIFIED. HOWEVER, ENGINEER MUST VERIFY WHICH MFR.S CAN OFFER SILICON CARBIDE SEALS, AND THEN EDIT THE SPEC ACCORDINGLY.

- H. Pump seals shall be unaffected by chloramines.
- I. Pumps used for glycol shall have seals rated for glycol service.
- J. Pump selection:
 - 1. Select pumps so an impeller/volute is sized to accommodate 10 percent more head than at duty point, unless noted otherwise on pump schedule.
 - 2. Select pump no greater than 85 percent of end of curve flow.
 - 3. Select pump at the point of best efficiency for a given impeller-casing combination. Deviations shall be within 3 percent of maximum efficiency point on the increasing capacity side of the maximum efficiency point.
 - 4. Maximum Pump Suction velocity:
 - a. Inline: 12 fps.
 - b. End Suction: 13 fps.
 - c. Double Suction: 15 fps.

- K. Balance pumps per ANSI / Hydraulic Institute procedures. Perform electronic vibration analysis for all pumps 1/2 hp and above. Unless noted otherwise, the maximum allowable RMS (filter in) velocity at maximum pump motor speed, measured at each pump and motor bearing, shall not exceed 0.13 inches/sec in the vertical, horizontal and axial directions. For pumps to be applied in variable speed applications, balance and test to assure this vibration limit is not exceeded at any pump speed. Pumps may be field tested after installation by an independent testing agency. Any pump found to exceed the specified vibration limits shall be corrected to perform within those limits without cost to the Owner.

2.2 IN-LINE CIRCULATORS

SPEC EDITOR: GENERALLY NOT RECOMMENDED FOR MORE THAN 1/2HP. SYSTEM LUBRICATED/NO OILING. 3-PIECE OIL LUBE MODELS TO BE PHASED OUT. TYPICAL CONSTRUCTION HAS MOTOR CARTRIDGE REPLACEABLE WITH ROTOR ATTACHED. SLEEVE TYPE BEARINGS IN LIEU OF BALL TYPE. NO MECHANICAL SEAL. AVAILABLE METALLURGY CI BODY W/ BRONZE IMPELLER; CI BODY W/ STAINLESS STEEL IMPELLER. THESE PUMPS ARE USUALLY SUPPORTED BY THE PIPE; DO NOT USE INLET/OUTLET FLEXIBLE PIPE CONNECTORS. THEY COME IN STANDARD SIZES; IMPELLER TRIMMING IS NOT DONE; SINGLE PHASE MOTORS.

- A. Domestic Hot Water: Close coupled, single suction, lead free bronze or stainless steel impeller and body. System-lubricated, ceramic shaft. Permanently lubricated, bronze or carbon sleeve bearings.
- B. Hydronic Systems: Close coupled; single suction bronze or stainless steel impeller. System-lubricated, alloy steel shaft, Cast iron body. Permanently lubricated sleeve bearings.
- C. Rated for 150 psig working pressure, minimum.
- D. Acceptable Manufacturers:
1. ITT Bell & Gossett.
 2. Armstrong.
 3. Grundfos.
 4. Weinman.
 5. Taco In-Line Circulators.
 6. Patterson.

NOTE THAT FACTORY-ASSEMBLED ECM CIRCULATORS WILL NOT COMPLY WITH UM MASTER SPEC REQUIREMENTS FOR MOTORS AND VARIABLE SPEED DRIVES.

2.3 IN-LINE WET ROTOR VARIABLE SPEED ECM CIRCULATORS

THE FOLLOWING SECTION COVERS SMALL CAPACITY AND HEAD SINGLE PHASE FRACTIONAL TO 1 HORSEPOWER, SINGLE PHASE, ELECTRONICALLY-COMMUTATED MOTOR DRIVEN SINGLE STAGE CIRCULATING PUMPS. TYPICAL CONSTRUCTION HAS BUILT-IN, FACTORY ASSEMBLED VARIABLE SPEED DRIVE AND CONTROLS FURNISHED AS AN ASSEMBLED PRODUCT. SLEEVE TYPE BEARINGS TYPICAL V. BALL TYPE. NO MECHANICAL SEAL. THESE PUMPS ARE USUALLY SUPPORTED BY THE PIPE; TYPICALLY DO NOT USE INLET/OUTLET FLEXIBLE PIPE CONNECTORS. EDIT THIS SECTION CAREFULLY FOR THE SPECIFIC APPLICATION.

- A. Factory-assembled and tested, self-regulating, in line wet rotor type circulator pump, with synchronous, permanent-magnet type motor and integrated variable speed electronically commutated motor.

Construction Features:

1. Single phase, 120 VAC or 208-230 VAC as scheduled, 60 Hz.
 2. Pump Shaft: Stainless steel.
 3. Bearings. Metal impregnated carbon sleeve or ball bearing type.
 4. Connection Style: Flanged
 5. Rating: 145 psig at 230 F
- B. Domestic Hot Water: Lead free bronze, glass-filled polypropylene engineered composite or stainless steel impeller; lead free bronze or stainless steel body.
- C. Hydronic Systems: cast iron, glass-filled polypropylene engineered composite, or stainless steel impeller. System-lubricated, cast iron body.
- D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application. UL 778 listed for motor-operated water pumps, including protection against over/under voltage, thermal over-load (motor and electronics), over current, and protection for locked rotor and dry run/no-load condition.
- E. Terminal Box to include gasketed cover, NPT power cable/conduit connection, with coded terminal strip indicating common/neutral/ground.
- F. Controls: Single Phase Electronic Control Converter.

SPEC EDITOR: SELECT THE APPROPRIATE CONTROL SCHEME BELOW. EDIT FOR PROJECT-SPECIFIC PUMP CONTROL REQUIREMENTS. SOME PUMPS PROVIDE THE LISTED FUNCTIONS WITH THE ON-BOARD CONTROLLER VIA INTERNAL ALGORITHM OR SENSOR, SOME REQUIRE AN EXTERNAL SIGNAL, AND SOME CAN ACCOMMODATE EITHER. SOME LISTED FUNCTIONS ARE NOT OFFERED BY ALL THE LISTED MFRS. FURTHER, THE CHOSEN CONTROL SCHEME WILL DICTATE WHETHER THE PRODUCT REQUIRES A DIGITAL RS-485 COMMUNICATION CONNECTION (BACNET, MODBUS, OR LONWORKS), A 4-20MA EXTERNAL SIGNAL, OR CAN USE A SENSORLESS METHOD. CONTROL VIA DIGITAL COMMUNICATIONS WOULD LIKELY REQUIRE AN ADDITIONAL CONTROL MODULE.

1. Sensorless Control: Integral electronic variable speed controller shall provide the following user selectable modes of operation without the use of external(remote)sensors:
 - a. Proportional Pressure/Maintain Flow Set Point.
 - b. Constant Differential Pressure/Maintain Pressure Set Point.
 - c. Constant Speed.
 - d. Constant Temperature/Maintain Temperature Set Point
 - e. Constant Temperature Rise/Differential
 - f. Proportional P-T/Maintain Pressure Proportional to Varying Temperature
2. Sensor Control: The integral electronic variable speed controller shall accept an external sensor input of 4-20 mA and provide the following user selected modes of operation:

- a. Proportional Pressure/Maintain Flow Set Point.
 - b. Constant Differential Pressure/Maintain Pressure Set Point.
 - c. Constant Temperature/Maintain Temperature Set Point
 - d. Constant Temperature Rise/Differential
 - e. Proportional P-T/Maintain Pressure Proportional to Varying Temperature
3. Remote Communication and Local Display: Provide single port BACnet 3-wire communication cable CAT 5/6 connection. The local display shall be field adjustable for horizontal or vertical position, allow control mode and set point changes, and display the following information:
- a. Operating Status - On/Off.
 - b. Control Mode.
 - c. Current Set Point Parameter.
 - d. Fault and Warning Signals.

SPEC EDITOR: BASIS OF DESIGN: GRUNDFOS MAGNA 3; WILO STRATOS; B & G ECOCIRC XL.

G. Acceptable Manufacturers:

- 1. ITT Bell & Gossett.
- 2. Wilo.
- 3. Grundfos.

2.4 IN-LINE HORIZONTAL CLOSE COUPLED PUMPS - HANGER SUPPORTED

SPEC EDITOR: SIZE GENERALLY 1/4 TO 3HP. KEEP MOTOR IN HORIZONTAL POSITION WHERE POSSIBLE, BUT UNIVERSAL MOUNT MOTOR ALLOWS FOR ANY PIPE ORIENTATION. SUPPORT PUMP VIA PIPES, NOT MOTOR. TYPICALLY DO NOT USE FLEXIBLE COUPLINGS. CONSIDER ADDING CAST IMPELLER (VS STAMPED) AS REQUIRED.

- A. Close/rigid coupled, single suction impeller. Ceramic mechanical seal. Permanently sealed, permanently lubricated.
- B. Domestic Hot Water: Lead free.
- C. Pump shall be equipped with an internally flushed seal assembly.
- D. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings. Motor shall be provided with heavy-duty, permanently lubricated ball bearings rated for the maximum load for which the pump is designed.
- E. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett Series 60.
 - 2. Armstrong.
 - 3. Grundfos.
 - 4. Weinman.
 - 5. Taco Series 1600.
 - 6. Patterson.

2.5 FLOOR-MOUNTED, VERTICAL IN-LINE SPLIT COUPLED PUMPS

SPEC EDITOR: GENERALLY, FOR SIZES MORE THAN 3HP; TO 1000 HP. TYPICAL SPLIT-COUPLED PUMPS CAN BE DIRECT-COUPLED OR FLEXIBLE-

COUPLED. CONSTRUCTION HAS BALL BEARINGS, MECHANICAL SEAL; THESE PUMPS ARE SUPPORTED/ANCHORED TO CONCRETE PAD, WITH INLET/OUTLET FLEXIBLE PIPE CONNECTORS. CONSIDER ADDING REQUIREMENT FOR FLEXIBLE COUPLING (DODGE, OMEGA, DURA - FLEX) FOR SEPARATE REMOVAL/REPLACEMENT OF LARGER (+15 HP) MOTORS. USE SLOWER SPEEDS 1800/1200 RPM FOR HIGH FLOW, LOW HEAD APPLICATIONS. VERTICAL MOTOR ORIENTATION OFFERS LOWER VIBRATION/NOISE, LOWER IMPELLER/SHAFT LOADING (LESS PRESSURE IMBALANCE), LOWER CAVITATION POTENTIAL. NO SUCTION DIFFUSER REQUIRED.

- A. Split-coupled, single suction enclosed impeller. Mechanical seals. Carbon graphite throttle bushing.
- B. Pump shall be equipped with an externally flushed seal assembly with manual air vent valve.
- C. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings. Motor shall be provided with heavy-duty, greaseable or permanently lubricated ball bearings rated for the maximum load for which the pump is designed.
- D. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett Series 80-SC.
 - 2. Armstrong.
 - 3. Grundfos.
 - 4. Weinman.
 - 5. Taco KS Vertical Split coupled.

2.6 FLOOR MOUNTED, DOUBLE SUCTION PUMPS

SPEC EDITOR: THIS SECTION CAN BE USED FOR VERTICAL OR HORIZONTAL SPLIT CASE. EDIT TO SUIT PROJECT REQUIREMENTS. VERTICAL SPLIT CASE PUMPS SAVE SPACE BUT ARE SINGLE SOURCE AND SHALL ONLY BE SPECIFIED WITH THE PERMISSION OF THE U-M DESIGN MANAGER.

- A. Single stage, double suction centrifugal, bronze fitted, base mounted, flexibly coupled pump.
- B. Vertical or horizontal split case as indicated, cast iron volute with integrally cast feet, gauge ports at nozzles, vent, and drain ports. Horizontal shaft unless specifically indicated otherwise.
- C. Stainless steel shaft designed for less than 0.002 inch deflection, with mechanical seals suitable for temperature and service scheduled, with re-greaseable bearings. Bearing life shall be L10 50,000 hr. life minimum. Bearing grease shall be rated to 700 Deg F and resist water/condensation washout.
- D. Mechanical carbon face seal rotating against a stationary silicon carbide face.
- E. Pump shall be equipped with an internally flushed seal assembly.
- F. Impeller shall be of the enclosed double suction type made of low zinc silicon brass or bronze, hydraulically and dynamically balanced and keyed to shaft.
- G. The pump bearings and mechanical seals shall be serviceable without disturbing the upper casing half, piping connections or electrical motor connections.

- H. Base: Pump and motor shall be mounted on a single, rigid, groutable, welded, structural steel frame.
- I. Acceptable Manufacturers Vertical Split Case Pumps:
 - 1. ITT Bell & Gossett VSX.
- J. Acceptable Manufacturers Horizontal Split Case Pumps.
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Paco.
 - 5. Patterson.

2.7 END-SUCTION, CLOSE-COUPLED PUMPS

SPEC EDITOR: BASIS OF DESIGN: SERIES 1531 BELL & GOSSETT. OCCASIONALLY USED FOR HYDRONIC SERVICE, OFTEN USED FOR DOMESTIC BOOSTERS.

- A. Single stage, end suction centrifugal, bronze fitted, close-coupled with base plate.
- B. Provide lead free when used for domestic water service.
- C. Mechanical seals with ceramic seal seat and carbon seal ring. Oil or grease lubricated, bronze sleeve bearings. Provide slinger on motor shaft between motor and seals to prevent liquid that leaks past pump seals from entering the motor bearings.
- D. Back pull-out design to allow pump bearings and seals to be serviced without disturbing piping.
- E. Provide universal mount motors that meet NEMA specifications and of size, voltage and enclosure indicated on Drawings.
- F. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Taco.
 - 5. Patterson.

2.8 FLOOR-MOUNTED, END-SUCTION, FLEXIBLY-COUPLED PUMPS

SPEC EDITOR: BASIS OF DESIGN: SERIES BELL & GOSSETT 1510

- A. Single stage, end suction centrifugal, bronze fitted, base mounted pump, flexibly-coupled.
- B. Vertical split case back pull-out design to allow pump bearings and seals to be serviced without disturbing piping connections or electric motor connections.
- C. Wear Rings (if provided as standard): Replaceable, bronze.
- D. Mechanical seals with ceramic seat and carbon seal ring. Oil or grease lubricated, bronze sleeve bearings.
- E. Base: Pump and motor shall be mounted on a single, rigid, groutable, welded, structural steel frame.

- F. Acceptable Manufacturers:
 - 1. ITT Bell & Gossett.
 - 2. Armstrong.
 - 3. Weinman.
 - 4. Taco.
 - 5. Patterson.

PART 3 - EXECUTION

3.1 GENERAL PUMP INSTALLATION

- A. Install the pump as recommended by the manufacturer and as shown on the Drawings. Provide adequate clearance for service access.
- B. Independently support piping from the pump casing, regardless of what is recommended by the manufacturer. Demonstrate to the Commissioner that the piping is independently supported.
- C. Fill and vent the system of all air. Purge the pump of air as recommended by manufacturer; check for proper rotation.
- D. Place the pump in service and check for proper operation. When required by the Commissioner, record voltage and amperage draw (separate from the T&B contractors work) and provide report to Commissioner.

3.2 IN-LINE PUMP INSTALLATION

- A. Install suction and discharge flexible connectors as recommended by the manufacturer and as shown on the drawings.
- B. Verify pump is designed for the intended orientation; horizontal versus vertical motor/shaft orientation.
- C. Support the pump as recommended by manufacturer. Do not attach supports to motor.

3.3 FLOOR-MOUNTED PUMP INSTALLATION

- A. Set pump base level, using stainless steel shims and metal blocks designed for leveling machinery bases. Anchor/attach to base as recommended by the manufacturer. Pre-align, connect piping, re-check alignment, and then grout with non-shrink grout.
- B. Provide final alignment in field via laser alignment device, by the manufacturer's representative. Submit alignment test data for approval. If report indicates pump cannot be aligned properly, correct conditions and re-laser-align.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.5 MANUFACTURER INSPECTION AND START-UP

- A. For all floor mounted pumps and for all inline pumps greater than 3 HP, after installation and prior to operation, pump manufacturer's factory trained field representative shall inspect the pumps for proper installation and lubrication, final align pump/motor/coupling using laser alignment, conduct start-up, and submit written report.

SECTION 232216 - STEAM AND CONDENSATE PIPING SPECIALTIES

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232216 - STEAM AND CONDENSATE PIPING SPECIALTIES

REVISIONS:

8-1-99: CONTENT APPROVED AS NEW MASTER

3-29-05: LAST SPEC TEAM REVISION

1-05-07: UPDATED PER STEAM & HYDRONICS COMMITTEE MTG JAN 07

06-03-08: ADDED WATON-MCDANIEL TO FLASH TANK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Furnish and install piping, fittings, and specialties for the following systems:
 - 1. Low pressure steam and condensate systems (nominal 5 to 15 psig)
 - 2. Medium pressure steam and condensate systems (nominal 60 psig)
 - 3. Pumped condensate

PART 2 - PRODUCTS

SPEC EDITOR: FOR ALL TRAPS, PROVIDE A SCHEDULE ON DRAWINGS WITH MAKE AND MODEL NUMBER.

2.1 FLOAT AND THERMOSTATIC TRAPS:

SPEC EDITOR: F&T TRAPS ARE FOR LOW PRESSURE STEAM, 25 PSI AND UNDER. THEY ARE SUBJECT TO DAMAGE IF WATER HAMMER, EXCESSIVE TEMPERATURES OR PRESSURES ARE PRESENT. THEY CAN BE USED FOR 60 PSIG STEAM.

- A. Cast iron body, bolted cap, renewable, stainless steel internal components, balanced pressure thermostatic air vent. Internal parts shall be accessible without disturbing piping.
- B. Capable of discharging condensate, air and other non-condensable gasses at pressures from 125 psig to 25 inches of vacuum without loss of steam.
- C. Manufacturers: Armstrong A and B series, ITT Hoffman, Spirax-Sarco, Watson McDaniels.

2.2 INVERTED BUCKET TRAPS:

SPEC EDITOR: BUCKET TRAPS ARE INFREQUENTLY USED. USE WHERE CONDENSATE MUST BE LIFTED, AND FOR 60 PSIG TRAPS

- A. ASTM A 278, class 30 cast iron body and cap, pressure rated for 250 psi; stainless steel head and seat; stainless steel valve retainer, lever, guide pin assembly, brass or stainless steel bucket.
- B. Manufacturers: Armstrong Series 800, ITT Hoffman, Spirax-Sarco, Watson McDaniels

2.3 CONDENSATE FLASH TANK:

SPEC EDITOR: FOR USE WITH 60 PSIG STEAM ONLY.

- A. Provide condensate flash tank of size and with openings as shown on drawings. Tank shall be ASME constructed and stamped for 125 PSIG.
- B. Manufacturers: Cemline, Spirax-Sarco, Wessels, Watson Mcdaniel.

2.4 VACUUM BREAKERS:

SPEC EDITOR: PSIG. IS THIS THE MINIMUM ? 125 OR 150 PSIG ?

- A. Brass body, stainless steel retainer tube, ball and spring, rated for 365F, 300 psig.
- B. Manufacturers: Hoffman, Spirax-Sarco, Bell & Gossett

SPEC EDITOR: USED TYPICALLY WHEN VENTING STEAM.

2.5 DRIP PAN ELBOWS:

- A. Cast iron construction, ASTM A126, Class B, rated for 250psig, 450F.
- B. Manufacturers: Keckley, Spence, Spirax-Sarco.

2.6 GATE VALVE - CAST STEEL (FOR USE IN CENTRAL POWER PLANT ONLY):

SPEC EDITOR: USED ONLY IN POWER PLANT WORK.

- A. Cast steel body, bolted bonnet, rising stem, seal-welded seat rings, flanged connections, with chromium stainless steel trim, O.S. & Y class 150, type 410 stainless steel hard facing seating surfaces, rated for steam at 1000 F.
- B. Valves 10" and larger shall be positively proven to be new with a dated certificate of manufacture from the manufacturer.
- C. Manufacturers: Crane No: 47XU, Stockham No: J1009B8F, Nibco, Grinnell.

2.7 GATE VALVE - CAST IRON (FOR USE AT BUILDING BOILERS ONLY):

SPEC EDITOR: REVISE TO MEET BOILER CODE WITH INTERGRAL DRAIN.

SPEC EDITOR: USED ONLY AT THE DISCHARGE FROM STEAM BOILERS.

- A. Cast iron body ASTM A126 class B or class C, bolted bonnet, rising stem, flanged connections, bronze trim with bronze seat rings, nickel plate steel stem, wedge disk type gate, O.S.& Y. class 125.
- B. Manufacturers: Crane Fig. 465, Grinnell 6020A, NIBCO F-637-31, Stockham

2.8 GLOBE VALVE:

SPEC EDITOR: ONLY USED FOR STEAM PRV BYPASS.

- A. Through 2": 150 pound rated, bronze body, threaded, Teflon disc, rising stem.
Manufacturer: Crane No. 7TF, Grinnell No. 3240, Nibco, Stockham B-22-T.
- B. 1/2" and larger": 125 pound rated, iron body, bronze trim, renewable seat and disc.
Manufacturer: Crane No. 351, Grinnell No. 6200A, Nibco, Stockham G-512.

2.9 SAFETY RELIEF VALVES:

SPEC EDITOR: IF SAFETY RELIEF VALVES ARE REQUIRED, ADD TEXT TO SPECIFICATIONS. USE THIS RELIEF VALVE WITH PRV INSTALLATION. BOILER RELIEF VALVES SHOULD BE SPECIFIED WITH THE BOILER.

SAFETY RELIEF VALVES IN FLASH TANKS - VM/RP TO ADD SPECS.

2.10 PRESSURE REDUCING VALVES:

SPEC EDITOR: VERIFY SECO METAL DISC.

- A. Pressure reducing valves shall be single seated, flanged, ASA 250 lb.; cast iron body, stainless steel diaphragm, Seco metal disc, stainless steel stem, and carbon steel main spring. Valves shall be normally closed type and designed for dead end service. Steam velocity through the valve shall be limited to 7,000 fpm.
- B. Provide muffling orifice required to limit sound level to 85 dba, 3 feet from the valve.
- C. Manufacturers: Armstrong, Leslie, Spirax-Sarco, Spence.

PART 3 - EXECUTION

3.1 PIPING INSTALLATION:

- A. See Section 221113 for piping materials and installation requirements.
- B. Do not raise gravity condensate return pipe unless authorized by the engineer.

SPEC EDITOR: DRIP LEG AND ALL THE TRAP LOCATIONS SHALL BE INDICATED IN DRAWINGS

- C. Drip and Trap: At end of steam mains, at the end of horizontal runs, prior to control valves (where condensate will collect behind valve when closed), at low points (where steam pipe rises in direction of flow), at intervals of no less than 200 feet for continuous pipe, and where noted on the drawings, provide drip leg and connect to gravity condensate return piping through float and thermostatic, minimum 3/4". See drawings for drip size and detail.

3.2 STEAM TRAP SELECTION AND INSTALLATION:

SPEC EDITOR: INSTALLATIONS AND PIPING ARRANGEMENTS VARY WITH EQUIPMENT SERVED, STEAM PRESSURES, TRAP TYPE AND MANY OTHER CONSIDERATIONS. CONSULT MANUFACTURER'S REPRESENTATIVE FOR PROPER APPLICATION AND INSTALLATION DETAILS.

- A. Unless noted otherwise, select traps for three times design load for coils, and two times design load for converters. Install steam traps in accessible locations as close as practical to connected equipment. Locate trap below outlet of equipment served to minimize condensate accumulation in equipment. See drawings for installation requirements.

3.3 PRESSURE REDUCING STATION INSTALLATION:

SPEC EDITOR: DRIP PAN ELBOW IS REQUIRED ON RELIEF VALVE INSTALLATION WHERE DISCHARGE MUST GO UP AFTER COMING OUT OF RELIEF VALVE. SHOW ROUTING OD RELIEF VALVE ON DRAWINGS. ROUTE TO SAFE LOCATION, WHERE DISCHARGE WILL NOT POSE A HAZARD TO PEOPLE.

- A. Provide single stage PRV stations where indicated and as scheduled on drawings. Each station shall consist of steam pressure reducing valves, strainers, relief valves, isolation gate valves, globe style bypass valves, pressure gauges etc. as detailed.

3.4 BYPASS AND DRAIN INSTALLATION:

SPEC EDITOR: THIS IS USED TO SLOWLY ACTIVATE STEAM LINES, AND TO REDUCE WATER HAMMER. IT IS NOT REQUIRED AT TERMINAL CONNECTION (ABSORPTION CHILLERS). IT IS USED PRIMARILY IN MAIN VALVES. INDICATE REQUIRED LOCATIONS ON DRAWINGS.

- A. Provide bypass and drain connection for steam valves 8" and larger. Comply with MSS SP-45 bypass and drain connections.

3.5 PRESSURE REDUCING STATION INSTALLATION:

- A. Install drip pan elbow as close as possible to relief valve. Extend drains for drip pan elbow to indirect waste at floor drain.
- B. Extend relief valve discharge as indicated on drawings.

- C. Set valves to relieve at 15 psig.
- D. Properly hang, guide and anchor all related piping to secure the pipe during PRV operation.

3.6 SAFETY RELIEF INSTALLATION:

- A. Install in vertical upright position as close as possible to the pressure reducing valve.
- B. The installation shall comply with all manufacturer's recommendations.

3.7 FLASH TANK INSTALLATION:

- A. Install as detailed and per manufacturer's recommendation.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232300 - REFRIGERANT PIPING

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232300 - REFRIGERANT PIPING

REVISIONS:

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK

- A. Provide refrigerant piping and accessories used for air conditioning applications.

1.3 QUALITY ASSURANCE

- A. Regulatory Requirements: Comply with provisions of the following codes:
 - 1. ANSI B31.5: ASME Code for Pressure Piping - Refrigerant Piping.
 - 2. ANSI/ASHRAE Standard 15: Safety Code for Mechanical Refrigeration.
 - 3. ASHRAE Standard 34: Number Designation and Safety Classification of Refrigerants.
 - 4. EPA requirements in Section 608: Prohibition of Venting and Regulation of CFC Requirements

1.4 ACCEPTABLE MANUFACTURES

- A. Refrigerant Valves and Specialties: Alco Controls Div., Emerson Electric., ASCO, Danfoss Electronics, Inc., EATON Corporation, Control Div., Henry Valve Company, Parker-Hannifin Corporation, Refrigeration and Air Conditioning Division, Sporlan Valve Company, Hansen.

PART 2 - PRODUCTS:

2.1 REFRIGERANT PIPING

- A. Refer to Section 221113 for piping, fittings, and joints.

2.2 REFRIGERANT VALVES

- A. General: Complete valve assembly shall be and designed to conform to ARI 760.
- B. Globe: 450 psig maximum operating pressure, 275 deg. F maximum operating temperature; cast bronze body, with cast bronze or forged brass wing cap and bolted bonnet; replaceable resilient seat disc; plated steel stem. Valve shall be capable of being repacked under pressure. Valve shall be straight through or angle pattern, with solder-end connections.
- C. Check Valves - Smaller Than 7/8 Inch: 500 psig maximum operating pressure, 300 deg. F maximum operating temperature; cast brass body, with removable piston, Teflon seat, and stainless steel spring; straight through globe design. Valve shall be straight through pattern, with solder-end connections.
- D. Check Valves - 7/8 inch and Larger: 450 psig maximum operating pressure, 300 deg. F maximum operating temperature; cast bronze body, with cast bronze or forged brass bolted bonnet; floating piston with mechanically retained Teflon seat disc. Valve shall be straight through or angle pattern, with solder-end connections.

SPEC EDITOR: REVIEW SOLENOID VALVES CAREFULLY, SELECT VOLTAGE AND NORMAL POSITION

- E. Solenoid Valves: UL-listed, 250 deg. F temperature rating, 400 psig working pressure; forged brass, with Teflon valve seat, two-way straight through pattern, and solder end connections. Provide manual operator to open valve. Furnish complete with NEMA 1 solenoid enclosure with 1/2 inch conduit adapter, holding coil, voltage to meet controls requirements.
- F. Thermal Expansion Valves: thermostatic adjustable, modulating type; size as required for specific evaporator requirements, and factory set for proper evaporator superheat requirements. Valves shall have copper fittings for solder end connections; complete with sensing bulb, a distributor having a side connection for hot gas bypass line, and an external equalizer line.
- G. Hot Gas Bypass Valve: adjustable type, sized to provide capacity reduction beyond the last step of compressor unloading; and wrought copper fittings for solder end connections.
- H. Charging and Purging Valves:
Manufacturer: Henry Series.
- I. Refrigeration Ball Valve:
Manufacturer: Henry Series 900,000

2.3 REFRIGERANT PIPING SPECIALTIES

- A. General: Complete refrigerant piping specialty assembly shall be UL-listed and designed to conform to ARI 760.
- B. Strainers: 500 psig maximum working pressure; forged brass body with monel 80-mesh screen, and screwed cleanout plug; Y-pattern, with solder end connections.

- C. Moisture/liquid Indicators: 500 psig maximum operation pressure, 200 deg. F maximum operating temperature; forged brass body, with replaceable polished optical viewing window, and solder end connections.

SPEC EDITOR: CAREFULLY REVIEW AND EDIT PARAGRAPHS D, E AND F.

- D. Filter-driers: 500 psig maximum operation pressure; steel shell, flange ring, and spring, ductile iron cover plate with steel capscrews, and wrought copper fittings for solder end connections. Furnish complete with replaceable filter-drier core kit, including gaskets, as follows:

SPEC EDITOR: SELECT FROM THE FOLLOWING TWO OPTIONS.

1. Standard capacity desiccant sieves to provide micron filtration.
 2. High capacity desiccant sieves to provide micron filtration and extra drying capacity.
- E. Suction Line Filter-Drier: 350 psig maximum operation pressure, 225 deg. F maximum operating temperature; steel shell, and wrought copper fittings for solder end connections. Permanent filter element shall be molded felt core surrounded by a desiccant for removal of acids and moisture for refrigerant vapor.
- F. Suction Line Filters: 500 psig maximum operation pressure; steel shell, flange ring, and spring, ductile iron cover plate with steel capscrews, and wrought copper fittings for solder end connections. Furnish complete with replaceable filter core kit, including gaskets, as follows:
- G. Flexible Connectors: 500 psig maximum operating pressure; seamless tin bronze or stainless steel core, high tensile bronze braid covering, solder connections, and synthetic covering; dehydrated, pressure tested, minimum 7 inch in length.

PART 3 - EXECUTION

3.1 REFRIGERANT PIPING INSTALLATION

- A. General: Install refrigerant piping per Section 221113, and in accordance with ASHRAE Standard 15.
- B. Arrange piping to allow normal inspection and servicing of compressor and other equipment. Install valves and specialties in accessible locations to allow for servicing and inspection.
- C. Install branch tie-in lines to parallel compressors equal length, and pipe identically and symmetrically.
- D. Slope refrigerant piping as follows:
1. Install horizontal hot gas discharge piping with 1/2" per 10 feet downward slope away from the compressor.
 2. Install horizontal suction lines with 1/2 inch per 10 feet downward slope to the compressor, with no long traps or dead ends which may cause oil to separate from the suction gas and return to the compressor in damaging slugs.

3. Install traps and double risers where indicated, and where required to entrain oil in vertical runs.
 4. Liquid lines may be installed level.
- E. Install strainers immediately ahead of each expansion valve, solenoid valve, hot gas bypass valve, compressor suction valve, and as required to protect refrigerant piping system components.
 - F. Install moisture/liquid indicators in liquid lines between filter/driers and thermostatic expansion valves and in liquid line to receiver.
 1. Install moisture/liquid indicators in lines larger than 2-1/8 inch OD, using a bypass line.
 - G. Install unions to allow removal of solenoid valves, pressure regulating valves, expansion valves, and at connections to compressors and evaporators.
 - H. Install flexible connectors at the inlet and discharge connection of compressors.

3.2 VALVE INSTALLATION

- A. General: Install refrigerant valves where indicated, and in accordance with manufacturer's instructions.
- B. Install globe valves on each side of strainers and driers, in liquid and suction lines at evaporators, and elsewhere as indicated.
- C. Install a full sized, 3-valve bypass around each drier.
- D. Install solenoid valves ahead of each expansion valve and hot-gas bypass valve. Install solenoid valves in horizontal lines with coil at the top.
 1. Electrical wiring for solenoid valves is specified in Division 26 and 230900. Coordinate electrical requirements and connections.
- E. Thermostatic expansion valves may be mounted in any position, as close as possible to the evaporator.
 1. Where refrigerant distributors are used, mount the distributor directly on the expansion valve outlet.
 2. Install the valve in such a location so that the diaphragm case is warmer than the bulb.

SPEC EDITOR: VERIFY PROPER LOCATION FOR BULB WITH VALVE MANUFACTURER.
 3. Secure the bulb to a clean, straight, horizontal section of the suction line using two bulb straps. Do not mount bulb in a trap or at the bottom of the line.
 4. Where external equalizer lines are required make the connection where it will clearly reflect the pressure existing in the suction line at the bulb location.
- F. Install pressure regulating and relieving valves as required by ASHRAE Standard 15.

3.3 FIELD QUALITY CONTROL

- A. Inspect, test, and perform corrective action of refrigerant piping in accordance with ASME Code B31.5, Chapter VI.
- B. Repair leaking joints using new materials, and retest for leaks.

3.4 CLEANING

SPEC EDITOR: THIS ARTICLE IS REQUIRED WHERE OTHER THAN TYPE ACR TUBING IS ALLOWED.

- A. Before installation of copper tubing other than Type ACR tubing, clean the tubing and fitting using following cleaning procedure:
 - 1. Remove coarse particles of dirt and dust by drawing a clean, lint free cloth through the tubing by means of a wire or an electrician's tape.
 - 2. Draw a clean, lint free cloth saturated with trichloro-ethylene through the tube or pipe. Continue this procedure until cloth is not discolored by dirt.
 - 3. Draw a clean, lint free cloth, saturated with compressor oil, squeezed dry, through the tube or pipe to remove remaining lint. Inspect tube or pipe visually for remaining dirt and lint.
 - 4. Finally, draw a clean, dry, lint free cloth through the tube or pipe.

3.5 ADJUSTING

- A. Verify actual evaporator applications and operating conditions, and adjust thermostatic expansion valve to obtain proper evaporator superheat requirements.
- B. Adjust controls and safeties. Replace damaged or malfunctioning controls and equipment with new materials and products.

3.6 CHECK, TEST AND START-UP

- A. Charge system using the following procedure:
 - 1. Install core in filter dryer after leak test but before evacuation.
 - 2. Evacuate refrigerant system with vacuum pump; until temperature of 35 deg F is indicated on vacuum dehydration indicator.
 - 3. During evacuation, apply heat to pockets, elbows, and low spots in piping.
 - 4. Maintain vacuum on system for minimum of 5 hours after closing valve between vacuum pump and system.
 - 5. Break vacuum with refrigerant gas, allowing pressure to build up to 2 psi.
 - 6. Complete charging of system, using new filter dryer core in charging line. Provide full operating charge.
- B. Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance of refrigerant piping valves and refrigerant piping specialties.

SECTION 232513 - CHEMICAL WATER TREATMENT, CLOSED LOOP WATER SYSTEMS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232513 - CHEMICAL WATER TREATMENT, CLOSED LOOP WATER SYSTEMS

SPEC EDITOR: THE CHILLED WATER SYSTEM AT UNIVERSITY HOSPITAL IS A HYBRID CLOSED/OPEN LOOP SYSTEM; THIS SPECIFICATION MUST BE SPECIALLY MODIFIED WHEN USED FOR WORK ON THAT SYSTEM. CONTACT THE U-M DESIGN MANAGER FOR DIRECTION.

JAN. 2017: ADDED U.S. WATER AS APPROVED CSP PER STM/HYDRONICS MTT. D. KARLE

SEPT. 2017: REMOVED GE WATER AS APPROVED CSP PER HYDRONICS AND STEAM MTT DUE TO POOR SERVICE. D. KARLE

JUNE 2018: ADDED NOVATECH AND ADVANTAGE CONTROLS AS APPROVED MFR.S FOR COUPON RACKS, DELETED VECTOR INDUSTRIES (DOES NOT MAKE RACKS), PER REQUEST OF FACILITIES MAINTENANCE/N. VANDERKOLK. D. KARLE.

FEB. 2019: REVISED CROWN SOLUTIONS TO VEOLIA WATER, NEW CORPORATE NAME. D. KARLE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

SPEC EDITOR: IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO THE PROJECT.

- B. Related Sections:
1. Section 018113 - Sustainable Design Requirements
 2. Section 019110/019100 - Facilities Commissioning
 3. Section 220500 - Common Work Results for Mechanical
 4. Section 221113 - Piping Materials and Methods
 5. Section 220523 - Valves
 6. Section 220519 - Thermometers, Pressure Gauges, and Accessories
 7. Section 220553 - Mechanical Identification
 8. Section 220719 - Mechanical Systems Insulation

1.2 SUMMARY

- A. Products specified in this section include the following:
1. Chemical Inhibitors for Water
 2. Chemicals for Inhibitors and cleaning
 3. Shot Feeder

4. Corrosion Coupon Rack
 5. Glycol Feed System
 6. Ethylene Glycol
- B. Provide a Chemical Services Provider (CSP) to perform the services described below.
- C. Provide water treatment products and services including:
1. Chemicals for cleaning, passivation, and treatment of each system.
 2. On-going treatment, chemicals, testing, certification, and reports to demonstrate effective water treatment is maintained at all times.
 3. Start-up and operation of chemical treatment equipment.
- D. Provide a complete chemical water treatment program during construction for all new and reused piping networks. This program shall begin from the point each system is filled during construction and extend until Substantial Completion or final Owner acceptance of each system, whichever occurs later. The program shall include water analysis, chemicals, testing, equipment, consulting and service for the following systems:
1. Heating Hot Water System
 2. Chilled Water System
 3. Dual Temperature Water System
 4. Process Cooling System
 5. Glycol System
 6. All other closed loop systems
- E. Attend project meetings as required to plan, schedule and coordinate above activities with other project contractors and the Owner.
- F. Provide recommended testing procedures and chemical treatment schedule for Owner's personnel. This information shall be submitted to the owner in a Program Administration Manual.

1.3 SUBMITTALS

- A. Product Data: Include rated capacities; water-pressure drops; shipping, installed, and operating weights; and complete data on furnished products listed below:
1. Shot Feeders
 2. Coupon Racks
 3. Glycol Feed System
 4. Flow Indicators
 5. Valves
 6. Product specifications and MSDS's for each chemical used
 7. Cleaning Procedures
 8. Passivation Procedures
 9. Chemical Treatment Procedures
 10. Shop Drawings
- B. Shop Drawings to include detailed equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and the location and size of each field connection as necessary to assist the mechanical contractor with proper system installations

- C. Submit resume of water treatment personnel and name of Chemical Services Provider.
- D. Service Reports as indicated under Part 2 below.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. American Society for Testing and Materials (ASTM)
 - a. D859 - Test Method for Silica in Water
 - b. D1067 - Test Methods for Acidity/Alkalinity in Water
 - c. D1068 - Test Methods for Iron in Water
 - d. D1126 - Test Method for Hardness in Water
 - e. D3370 - Practices for Sampling Water from Closed Conduits
 - f. D4012 - Test Method for Adenosine Triphosphate (ATP) Content of Microorganisms in Water
 - g. D5465 - Practice for Determining Microbial Colony Counts from Waters Analyzed by Plating Methods
- C. Conform to all applicable Codes, Regulations, and Municipal requirements for the use and disposal of chemicals (including cleaning compounds) and waste to public sewer systems.
 - 1. Wastewater shall be discharged to the sanitary sewer only if it has a pH between 5.0 and 10.0 and meets the requirements of the City of Ann Arbor Sewer Use Ordinance. For wastewater not meeting such criteria, contact U-M Occupational Safety and Environmental Health (OSEH) Hazmat at 734-763-4568 for proper disposal instructions. City of Ann Arbor Sewer Use Limitations can be found at the following website: <http://www.municode.com/resources/gateway.asp?pid=11782&sid=22> or by contacting U-M OSEH Environmental Protection & Permitting Program (EP3) at 734-936-1920
 - 2. Glycols (of any type) shall not be discharged to the sanitary sewer. Contact U-M OSEH HazMat at 734-763-4568 for proper disposal instructions.
- D. Wastewater containing any chemical or sediment is prohibited from discharge to the storm water system. No chemical shall contain Chromates or Inorganic Phosphates.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Package for delivery to best protect finished surfaces while using the least amount of single-use packaging as possible. Deliver equipment and components adequately packaged for lifting, skidding, or rolling into final position, according to manufacturer's instructions. If possible, package and ship products using reusable blankets and fabrics, or reusable cardboard and crate systems.

- B. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- C. Store chemicals in curb protected area. Such secondary containment areas must have the capacity to hold the volume of the largest container or 10% of the combined containers, whichever larger. If room has no floor drains, then the room itself may be considered sufficient secondary containment. If the room is considered the secondary containment ensure there is a lip at the door so no liquids can exit the room in the event of a leak. Verify field conditions before storing any chemicals
 - 1. Provide temporary containment areas when permanent containment areas do not exist. Remove temporary containment at the end of construction.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion. This warranty does not include ongoing chemical treatment or monitoring.

1.7 ACCEPTABLE CHEMICAL SERVICE PROVIDERS (CSPS)

- A. Approved CSPs
 - 1. Chemtreat
 - 2. Veolia Water
 - 3. Kroff
 - 4. Mitco
 - 5. Nalco
 - 6. Rochester Midland
 - 7. U.S. Water Services

PART 2 - PRODUCTS

2.1 GENERAL

- A. CSP Services:
 - 1. The CSP shall provide all cleaning and treatment chemicals, basic services, testing, equipment and materials necessary for a complete water treatment program.

2. The CSP shall perform an analysis of the supply water to determine the type and quantities of chemical treatment needed to maintain the required water quality to prevent corrosion, scaling, and biological growth. The CSP will at minimum provide weekly site visits to verify proper water treatment for the first month after any system or part of a system is treated. Provide monthly visits thereafter, or more often if required to assure performance requirements are being met, to analyze water samples, inspect equipment, and add additional chemicals as required to maintain proper water treatment, until final written Owner acceptance of the respective system.
3. At each site visit CSP shall analyze each system for corrosion inhibitors, pH, total iron, total copper, bacteria levels (provide monthly analytical laboratory analysis), and conductivity; inspect loss from corrosion coupons (provide analytical laboratory analysis every three months), record make-up meter readings, and perform any other tests necessary to validate that corrosion, scale, and organic growth is being prevented.
4. Reports:
 - a. Submit a written startup test report for each system placed into service.
 - b. A service report shall be prepared on site by the CSP, submitted at the time of each service visit (with copies immediately provided to the Owner and Commissioner), which shall include all required test results and recommendations.
 - c. Additionally, provide final reports for approval to the Owner and Commissioner regarding each site service visit, certified by an Officer of the CSP, within one week of any water treatment activity. Such reports shall include the results of any field or lab tests. Reports shall clearly state if the required water quality and maximum corrosion rates are being achieved.
 - d. At a minimum, each report shall include the following information:
 - 1) System Treated:
 - 2) Date
 - 3) Conductivity
 - 4) pH
 - 5) Total Iron
 - 6) Total Copper
 - 7) Bacteria(cfu) (monthly analytical laboratory analysis)
 - 8) Coupon Corrosion Rates (three month analytical laboratory analysis)
 - 9) Make-up Water Quantity since Last Visit
 - 10) Corrosion Inhibitor level (ppm)
 - 11) Silica level (ppm)
5. Conduct final on-site system turn over meeting with Owner and Commissioner. Present final validation report demonstrating that performance requirements have been achieved and that each system is currently properly treated.
6. When required by Part 3, train Owner's maintenance personnel in water treatment procedures.
7. Program Administration Manual:

- a. The CSP shall provide the Owner with two (2) Program Administration Manuals including sections covering program control, testing requirements, in plant logs, safety data and system information. Each section shall include the following:
 - 1) Program Control: Include a complete program outline with chemical descriptions, control ranges, and required action for "out of range" situations. Also include complete ordering instructions with applicable account numbers and phone numbers.
 - 2) Testing Requirements: This section will include basic testing practices as well as detailed test instructions for each test to be performed.
 - 3) In-Plant Logs: Include detailed testing log sheets for each system to be tested including room to record one (1) month's data on one (1) sheet and a section to log chemical inventory.
 - 4) Safety Data: Include the CSP's 24-hour toll free safety hotline number as well as MSDS sheets for each chemical used.
 - 5) System Information: Include any equipment manuals and related information.

2.2 TREATMENT PROGRAM - FLUSHING AND CLEANING

- A. Cleaning chemicals shall be non-phosphate and non-acidic.
- B. Flush and clean all new and reused piping.
- C. Provide a flush/clean plan for approval. Provide and later remove all temporary bypasses, drains, vents, etc. required to flush and clean the system. Temporary components for flushing and cleaning are not indicated on the drawings.
- D. Flush and clean systems per the general procedures specified in Related Sections; clean systems per the approved cleaning procedures submitted under this specification section. Provide and install all required cleaning chemicals.
- E. Verify that adequate cleaning chemical was added, that cleaning was effective, and test that cleaning chemicals were properly rinsed from the system. Provide a report certifying that cleaning and rinsing, was properly executed.
- F. Provide passivation and chemical treatment immediately after each system has been cleaned and flushed. Systems shall not stand filled with fluids for periods longer than 48 hours without beginning flushing and cleaning which shall immediately be followed by the passivation and chemical treatment procedures.

2.3 TREATMENT PROGRAM - CHEMICAL TREATMENT AND PASSIVATION

- A. Provide passivation and chemical treatment per the approved chemical treatment procedures. Chemically treat new and reused piping networks using chemicals and treatment procedures compatible with the system being cleaned and the chemical treatment chemicals in existing piping systems being connected to. Test existing piping systems or otherwise determine chemical treatment in existing piping and validate compatibility. Note that existing systems may be silica based, adjust water treatment program accordingly.

SPEC EDITOR: WHEN CONNECTING INTO EXISTING ACTIVE SYSTEMS, DEVELOP A COORDINATION PLAN IN CONSULTATION WITH U-M PLANT AND REVISE THE BELOW SAMPLE PARAGRAPH ACCORDINGLY. THIS SPECIFICATION REQUIRES POLYMER BASED INHIBITORS, EXISTING SYSTEMS MAY BE SILICA BASED. IT MAY BE DESIRABLE TO CONVERT THE EXISTING PIPING NETWORK TO POLYMER BASED AS A PART OF YOUR PROJECT.

- B. When connecting into active existing systems, treat piping networks installed or reused by the project and verify by lab analysis that the treatment levels per the treatment plan have been attained prior to connecting into the existing active system. Submit validating report for approval.
 - 1. Do not connect into existing active system until report is approved by Owner.
 - 2. Provide temporary valves, piping, and accessories as required to treat the project's piping prior to connection to the active system.
- C. Provide passivation/chemical treatment at system startup or immediately upon operation of a system for temporary cooling and heating, whichever comes first.
- D. Provide chemical treatment immediately after each system has been cleaned and flushed. Thereafter immediately begin the approved water treatment maintenance program to passivate and prevent corrosion, scale, and organic growth and to maintain treatment chemical levels. Note that systems or parts of systems will not typically be started at the same time; adjust treatment strategy accordingly.
- E. Provide chemicals that comply with State and Federal regulations.
- F. Chemical inhibitor shall be polymer based and contain azole in an amount appropriate for the percentage of internal copper surface area of the system piping. Provide products with PTSA (p-Toluenesulfonic acid) florescent tracer dyes. Molybdenum shall not be used as a tracer. Optionally, for hot water heating systems only, nitrite/azole based inhibitors may be used.
- G. No chemicals shall contain chromates or inorganic phosphates.
- H. Utilize non-oxidizing biocides in the event sterilization is required.
- I. Adjust chemical concentrations as required to achieve the required performance

2.4 PERFORMANCE REQUIREMENTS

- A. The water treatment programs proposed by the CSP shall maintain corrosion rates below 0.5 mils per year for mild steel and 0.1 mils per year for copper. These rates shall be verified with corrosion coupons provided by the CSP. Coupons shall be analyzed in the CSP's analytical laboratory every three months, more often if required, to assure these levels are not exceeded.
- B. Microbiological growth levels shall be maintained below 10,000 cfu's aerobic bacteria and 10 cfu's anaerobic bacteria. The CSP shall perform detailed microbiological culturing at the CSP's company's analytical laboratory monthly, more often if required, to assure these levels are not exceeded.

2.5 EQUIPMENT

- A. Provide all components required for a fully operational water treatment system. Provide components that are not adversely affected by the treatment chemicals employed.

CHEMICAL SHOT FEEDERS: OTHER MFR.S OF SHOT FEEDERS SUCH AS WINGERT AND VECTOR OFFER ONLY QUARTER-TURN STYLE TOPS WHICH U-M PLANT HAS DETERMINED TO BE UNSAFE. IF OTHER MFR.S CAN BE FOUND THAT INCLUDE ALL THE FEATURES LISTED BELOW, THEY MAY BE ADDED AS ACCEPTABLE MFR.S.

- B. Chemical Shot Feeders:
 - 1. Acceptable Manufacturers:
 - a. Neptune
 - 2. Provide shot feeders for each system. Provide steel 5-gallon minimum tank with interior and exterior epoxy coating, removable screwed and gasketed top (4" diam. minimum), pipe threaded inlet and outlet, dish bottom style with floor skirt, rated at 200 psi, 200°F.
- C. Corrosion Coupon Rack:
 - 1. Acceptable Manufacturers:
 - a. Cannon Water Technology
 - b. J.L. Wingert
 - c. Advantage Controls
 - d. Novatech
 - 2. Supply for each corresponding shot feeder:
 - a. Chilled water: ¾" stainless steel coupon rack, with two coupon holders, inlet/outlet 316 stainless steel full port ball valves, and a ¼" sample valve. Include a 0-5 gpm nominal range variable area flow meter ("rotameter"), rated 150 psig at 70°F, with graduated polysulfone or acrylic cylinder, with an accuracy of +/-5%. Provide mild steel and copper coupons.

- b. Heating hot water and dual temperature systems: ¾" stainless steel coupon rack, with two coupon holders, inlet/outlet 316 stainless steel full port ball valves, and a ¼" sample valve. Include a 0-5 gpm nominal range variable area flow meter("rotameter"), rated 100 psig at 250°F, graduated glass cylinder with stainless steel or brass connections, with an accuracy of +/-2%. Provide mild steel and copper coupons.

SPEC EDITOR: GLYCOL FEED SYSTEMS MUST BE INSTALLED WITHIN A CONTAINMENT AREA, CONTACT U-M DESIGN MANAGER FOR SPECIFIC REQUIREMENTS.

D. Glycol Feed System:

- 1. Acceptable Manufacturers:
 - a. J.L. Wingert Co.
 - b. Neptune Chemical Pump Co.
 - c. Advantage Controls Inc.
 - d. Wessels Co.
- 2. Provide a floor mounted packaged glycol feed system that is pre-wired and pre-plumbed, and includes a storage tank, control panel, controls, pump, piping, and valves, all supported on a steel frame.
- 3. Provide a 50-gallon minimum translucent polyethylene single wall tank with polyethylene cover. Minimum ¼ inch thick walls.
- 4. Provide a welded steel stand suitable for floor mounting and painted with two coat system consisting of oxide primer and alkyd enamel finish. Provide holes in the base for the installation of anchor bolts and leveling of equipment.
- 5. Provide a bronze gear pump, 120 V, single phase, and rated for a minimum of 1.5 gpm at 90 psig.
- 6. Valves and Piping: Pump suction shall include ball valve and Y-strainer. Pump discharge shall include silent check valve, pressure switch, pressure gauge, and 150 psi relief valve piped back to tank. All piping shall be Type L Copper. Connect pump suction and discharge with braided stainless steel or bronze flex connectors. All piping, valves and accessories shall conform to Related Sections.
- 7. Provide a NEMA 4X control panel with 8 foot, 120 V grounded power cord. Equip the panel with motor starter, 2-position main power switch with light, hand /off/ auto switch with light for gear pump, low level red light, low level audible alarm with push button silence switch, dry contacts for remote monitoring of alarm, and a 15 amp fuse.

SPEC EDITOR: PROVIDE THE PRESSURE SWITCH RANGE AND SET POINT EITHER IN THE BELOW PARAGRAPH OR ON THE PROJECT DRAWINGS.

- 8. Provide an adjustable pressure switch, selected with a range to match system operating pressure.
- 9. Provide electrical components that conform to Division 26 requirements. Provide all wiring in conduit. Loose, exposed or unprotected wire is not acceptable

SPEC EDITOR: REVISE CONCENTRATION IN ARTICLE BELOW AS REQUIRED: AT MINUS 15°F, A CONCENTRATION OF 30% IS RECOMMENDED FOR BURST PROTECTION, 45% FOR FREEZE PROTECTION. FREEZE PROTECTION

CONCENTRATIONS ALLOW FLUID TO BE PUMPED. EDITOR SHOULD CAREFULLY DETERMINE IF THE CONCENTRATION IS FOR BURST PROTECTION OR FREEZE PROTECTION. AVOID SPECIFYING EXCESS CONCENTRATIONS SINCE FLUID HEAT TRANSFER RATE DECREASES AS CONCENTRATION INCREASES.

DO NOT SPECIFY ETHYLENE GLYCOL FOR SNOW MELTING SYSTEMS; USE PROPYLENE GLYCOL.

2.6 PREMIXED INHIBITED ETHYLENE GLYCOL

- A. Acceptable Manufacturer and Product:
 - 1. Dow Chemical - Dowtherm SR-1
- B. Provide for hydronic systems as indicated on the drawings.
- C. Provide inhibited ethylene glycol, factory pre-mixed with water at a concentration of 30% by volume Dowtherm SR1.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Pre-Treatment Conference: Prior to treatment activities, meet with the Project Engineer, Commissioner and contractors to verify treatment procedures, discuss coordination with existing piping networks, and to coordinate treatment activities with construction schedule.
- B. Flush and clean systems per Related Sections and Part 2 above.

3.2 INSTALLATION

- A. Install all required components, and chemically passivate/treat and maintain the system as described in Part 2.
- B. Use and dispose of chemicals and wastewater (including from existing piping networks) per the Quality Assurance section of this specification. All costs of disposal shall be borne by the contractor.
- C. Provide and install all chemicals and all incidental components. Install equipment at locations shown on the Drawings. Follow the manufacturer's installation and startup instructions.
- D. Passivate and chemically treat each system immediately after it has been cleaned and flushed.
- E. Install shot feeders with openings no higher than 4' above finished floor. Pipe shot feeder drain to nearest floor drain. Install top coupon of corrosion coupon rack no higher than 6' above finished floor.

SPEC EDITOR: SOME PROJECTS, SUCH AS HOSPITAL PROJECTS, MAY DESIRE THAT WATER TREATMENT SERVICES CONTINUE BEYOND SUBSTANTIAL COMPLETION, E.G. A ONE OR MORE YEAR SERVICE CONTRACT. CONTACT THE U-M DESIGN MANAGER FOR DIRECTION, AND IF NEEDED, REVISE THE PARAGRAPH BELOW TO INCLUDE THAT REQUIREMENT.

- F. The treatment program shall begin at system start-up or immediately upon first operation of the system by the contractor for temporary heating and cooling, whichever comes first. Continue the program until Substantial Completion.

3.3 INSTALLATION OF PREMIXED INHIBITED ETHYLENE GLYCOL SYSTEM

- A. Following system flushing and cleaning, drain the entire piping system. Add premixed ethylene glycol/inhibitor solution into the system. Circulate system fluid, adding additional pre-mixed glycol/inhibitor as required until all air is purged from the system.
- B. Sample fluid, measure concentration of glycol and inhibitor. Drain system fluid as required and add additional pre-mixed solution to achieve the design concentration of glycol and the manufacturer's recommended concentration of inhibitor. Submit report of activities, including volumes of all fluids used.

3.4 INSTALLATION OF GLYCOL FEED SYSTEM

- A. Level and bolt Glycol Feed System to the floor within the containment area. Support all piping and conduits independent of the Glycol Feed Unit.

3.5 FIELD QUALITY CONTROL:

- A. The CSP shall:
 - 1. Verify that systems and equipment have been properly cleaned, flushed, and filled with water, and are fully operational before introducing operational chemicals for water-treatment systems.
 - 2. Introduce and maintain chemical treatment to achieve the specified performance requirements.
 - 3. Submit a written startup test report for each system placed into service.
 - 4. Provide validation testing and required reports.
 - 5. Attend final on-site system turn over meeting with Owner and Commissioner. Present final validation report demonstrating that performance requirements have been achieved and that each system is currently properly treated.

3.6 COMMISSIONING:

- A. Perform Commissioning activities per Related Sections above.

SPEC EDITOR: CONSULT WITH THE U-M DESIGN MANAGER TO DETERMINE IF TRAINING IS DESIRED FOR YOUR PARTICULAR PROJECT; KEEP OR DELETE OR MODIFY THE ARTICLE BELOW ACCORDINGLY.

3.7 OWNER TRAINING

- A. CSP shall train Owner's maintenance personnel on equipment operation, adding and maintaining proper chemical levels, troubleshooting, servicing and preventative maintenance procedures. Do not conduct training until after start up and commissioning is completed. Provide training using documents including the Program Administration Manual and the approved Operations and Maintenance manuals. Provide these documents to the Owner at least two weeks prior to the training to allow sufficient time for review.
 - 1. Provide 2 hours training minimum.
- B. Schedule training at least 7 days in advance, at date and time approved by Owner.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 232516 - CHEMICAL WATER TREATMENT - OPEN LOOP SYSTEMS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 232516 - CHEMICAL WATER TREATMENT - OPEN LOOP SYSTEMS

NEW MARCH 2013.

THIS SPECIFICATION IS DESIGNED FOR CHILLED WATER COOLING TOWER CONDENSER WATER SYSTEMS AND MAY NEED REVISION IF USED FOR OTHER OPEN LOOP SYSTEMS, SUCH AS EVAPORATIVE COOLERS AND AIR WASHERS.

THE CHILLED WATER SYSTEM AT UNIVERSITY HOSPITAL IS A HYBRID CLOSED/OPEN LOOP SYSTEM; THIS SPECIFICATION MUST BE SPECIALLY MODIFIED WHEN USED FOR WORK ON THAT SYSTEM. CONTACT THE U-M DESIGN MANAGER FOR DIRECTION.

ADDED SPEC FOR INJECTION QUILL. D. KARLE FOR HYDRONICS MTT 6/17/2013.

ENHANCED THE DESCRIPTION OF BROMINE TABLETS PER RECOMMENDATION FROM M. WILLET AND M. MAU. D. KARLE 9-5-2013.

JAN. 2017: ADDED U.S. WATER AS APPROVED CSP PER STM/HYDRONICS MTT. D. KARLE

SEPT. 2017: REMOVED GE WATER AS APPROVED CSP PER HYDRONICS AND STEAM MTT DUE TO POOR SERVICE. D. KARLE

JUNE 2018: ADDED NOVATECH AND ADVANTAGE CONTROLS AS APPROVED MFR.S FOR COUPON RACKS, DELETED VECTOR INDUSTRIES (DOES NOT MAKE RACKS), PER REQUEST OF FACILITIES MAINTENANCE/N. VANDERKOLK. IMPROVED COUPON RACK DESCRIPTION SIMILAR TO CLOSED LOOP SPEC. D. KARLE.

FEB. 2019: REVISED CROWN SOLUTIONS TO VEOLIA WATER, NEW CORPORATE NAME. D. KARLE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT. DELETE COMMISSIONING IF NOT APPLICABLE TO PROJECT.

- B. Related Sections:

1. Section 019110/019100 - Commissioning

2. Section 220500 - Common Work Results for Mechanical
3. Section 221113 - Piping Materials and Methods
4. Section 220523 - Valves
5. Section 220553 - Mechanical Identification
6. Section 230900 - Mechanical Systems Controls
7. Section 26 - Electrical

1.2 SUMMARY

- A. Products for chemical water treatment systems specified in this section include the following:
 1. Chemical Inhibitors and Biocides for Water
 2. Motor Operated Ball Valves
 3. Chemical Feed Pumps
 4. Bromine Feeder Tank
 5. Chemical Treatment Controller with Conductivity Probe and flow switch.
 6. Corrosion Coupon Rack
 7. Solid Corrosion Inhibitor Dissolver
 8. Clear Plastic Strainers
 9. Flow Indicators
 10. Ball Valves
 11. Injection Quill Assembly
 12. Chemical Solution Tubing
- B. Provide a Chemical Services Provider (CSP) to perform the services described below.
- C. Provide water treatment products and services including:
 1. Chemicals for cleaning, passivation, and treatment of each system.
 2. On-going treatment, chemicals, testing, certification, and reports to demonstrate effective water treatment is maintained at all times.
 3. Start-up and operation of chemical treatment equipment.
- D. Provide a complete chemical water treatment program during construction for all new and reused piping networks. This program shall begin from the point each system is filled during construction and extend until Substantial Completion or final Owner acceptance of each system, whichever occurs later. The program shall include water analysis, chemicals, testing, equipment, consulting and service for the following systems:

REVISE BELOW, THE SYSTEMS COVERED BY THIS SPEC FOR YOUR PARTICULAR PROJECT.

 1. Chilled Water Condenser Water System
- E. Attend project meetings as required to plan, schedule and coordinate above activities with other project contractors and the Owner.
- F. Provide recommended testing procedures and chemical treatment schedule for Owner's personnel. This information shall be submitted to the owner in a Program Administration Manual.

1.3 SUBMITTALS

- A. Product Data: Include rated capacities; water-pressure drops; shipping, installed, and operating weights; and complete data on furnished products listed below:
 - 1. Product specifications and MSDS's for each chemical used
 - 2. Cleaning Procedures
 - 3. Passivation Procedures
 - 4. Chemical Treatment Procedures
 - 5. Motor Operated Ball Valves
 - 6. Chemical Feed Pumps
 - 7. Bromine Feeder Tank and Piping Kit
 - 8. Chemical Treatment Controller with Conductivity Probe
 - 9. Corrosion Coupon Rack
 - 10. Solid Corrosion Inhibitor Dissolver
 - 11. Clear Plastic Strainers
 - 12. Flow Indicators
 - 13. Ball Valves
 - 14. Injection Quill
 - 15. Chemical Solution Tubing
 - 16. PVC back-board
- B. Schematic diagram of the water treatment system showing the arrangement of all components and piping connections.
- C. Project specific wiring diagram reflecting wiring between all devices and connections to Owner's monitoring system.
- D. Details regarding the construction, support, and arrangement of devices on the PVC back-board.
- E. Submit resume of water treatment personnel and name of Chemical Services Provider.
 - 1. Provide a current copy of CSPs State of Michigan Commercial Pesticide Applicators Category 5B certification.
- F. Service Reports as indicated under Part 2 below.
- G. Sequence of Operation: Provide a written sequence of operation detailing the operation of the chemical treatment system.
- H. Program Administration Manual.
- I. Passivation Confirmation Report (provide when passivation is specified): Verify passivation of galvanized-steel surfaces, and confirm this observation in a written report to the Architect and Construction Manager.
- J. Shop Drawings to include detailed equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and the location and size of each field connection as necessary to assist the mechanical contractor with proper system installations.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The manufacturer listed as the "Basis of Design" establishes the standard of quality that shall be provided for the Work. Subject to compliance with all requirements indicated and the features provided by the Basis of Design, provide specified products from the manufacturers named in Part 2.
- B. Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. American Society for Testing and Materials (ASTM)
 - a. D859 - Test Method for Silica in Water
 - b. D1067 - Test Methods for Acidity/Alkalinity in Water
 - c. D1068 - Test Methods for Iron in Water
 - d. D1126 - Test Method for Hardness in Water
 - e. D4012 - Test Method for Adenosine Triphosphate (ATP) Content of Microorganisms in Water
 - f. D5465 - Practice for Determining Microbial Colony Counts from Waters Analyzed by Plating Methods
 - 2. NFPA 70 National Electric Code
- C. CSP shall be currently certified by the State of Michigan for Commercial Pesticide Application Category 5B.
- D. Chemicals shall comply with all Federal, State and Local/Municipal requirements as defined by the governing agencies.
- E. Conform to all applicable Codes, Regulations, and Municipal requirements for the use and disposal of chemicals (including cleaning compounds) and waste to public sewer systems.
 - 1. Wastewater shall be discharged to the sanitary sewer only if it has a pH between 5.0 and 10.0 and meets the requirements of the City of Ann Arbor Sewer Use Ordinance. For wastewater not meeting such criteria, contact U-M Occupational Safety and Environmental Health (OSEH) Hazmat at 734-763-4568 for proper disposal instructions.
 - 2. City of Ann Arbor Sewer Use Limitations can be found at the following Ann Arbor City website: <http://www.municode.com/resources/gateway.asp?pid=11782&sid=22> or by contacting U-M OSEH Environmental Protection & Permitting Program (EP3) at 734-936-1920.
 - 3. Contact U-M OSEH HazMat at 734-763-4568 for special disposal requirements and proper disposal instructions.
 - 4. Wastewater containing any chemical or sediment is prohibited from discharge to the storm water system. No chemical shall contain Chromates or Inorganic Phosphates.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Package for delivery to best protect finished surfaces while using the least amount of single-use packaging as possible. Deliver equipment and components adequately packaged for lifting, skidding, or rolling into final position, according to manufacturer's instructions. If possible, package and ship products using reusable blankets and fabrics, or reusable cardboard and crate systems.

- B. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- C. Store chemicals in curb protected area. Such secondary containment areas must have the capacity to hold the volume of the largest container or 10% of the combined containers, whichever larger. If room has no floor drains, then the room itself may be considered sufficient secondary containment. If the room is considered the secondary containment ensure there is a lip at the door so no liquids can exit the room in the event of a leak. Verify field conditions before storing any chemicals
 - 1. Provide temporary containment areas when permanent containment areas do not exist. Remove temporary containment at the end of construction.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion. This warranty does not include ongoing chemical treatment or monitoring.

1.7 ACCEPTABLE CHEMICAL SERVICE PROVIDERS (CSP)

- A. Approved CSPs
 - 1. Chemtreat
 - 2. Veolia Water
 - 3. Kroff
 - 4. Mitco
 - 5. Nalco
 - 6. Rochester Midland
 - 7. U.S. Water Services

PART 2 - PRODUCTS

2.1 GENERAL

- A. CSP Services:
 - 1. The CSP shall provide all cleaning and treatment chemicals, basic services (including set-up and programming of all water treatment control devices), testing, equipment and materials necessary for a complete water treatment program.

2. The CSP shall perform an analysis of the supply water to determine the type and quantities of chemical treatment needed to maintain the required water quality to prevent corrosion, scaling, and biological growth. The CSP will at minimum provide weekly site visits to verify proper water treatment after any system or part of a system is treated. Weekly visits shall be conducted to assure performance requirements are being met, analyze water samples, inspect equipment, and adjust feed rates as required to maintain proper water treatment, and continue until final written Owner acceptance of the respective system.
3. At each site visit CSP shall analyze each system for corrosion inhibitors, pH, total iron, total copper, bacteria levels (provide analytical laboratory analysis monthly) and conductivity; inspect loss from corrosion coupons (provide analytical laboratory analysis monthly), record make-up meter readings, and perform any other tests necessary to validate that corrosion, scale, and organic growth is being prevented.
4. Reports:
 - a. Submit a written startup test report for each system placed into service.
 - b. A service report shall be prepared on site by the CSP, submitted at the time of each service visit (with copies immediately provided to the Owner and Commissioner), which shall include all required test results and recommendations.
 - c. Additionally, provide final reports for approval to the Owner and Commissioner regarding each site service visit, certified by an Officer of the CSP, within one week of any water treatment activity. Such reports shall include the results of any field or lab tests. Reports shall clearly state if the required water quality and maximum corrosion rates are being achieved.
 - d. At a minimum, each report shall include the following information (levels shall be reported in ppm unless noted otherwise):
 - 1) System Treated
 - 2) Date
 - 3) Conductivity (microsiemens)
 - 4) pH
 - 5) Total Iron
 - 6) Total Copper
 - 7) Coupon Corrosion Rates (monthly analytical laboratory analysis)
 - 8) Make-up Water Quantity Since Last Visit
 - 9) Corrosion Inhibitor Level
 - 10) Silica Level
 - 11) Biocide Level
 - 12) "P" Alkalinity
 - 13) Free "OH" Alkalinity
 - 14) Chemical Oxygen Demand
 - 15) Total Suspended Solids (TSS)
 - 16) Ammonia
 - 17) Calcium Carbonate Hardness
 - 18) Calcium Carbonate Alkalinity
 - 19) Microbiological in organisms/mL (monthly analytical laboratory analysis)

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

232516 - 6

- a) Total Aerobic Plate Count
 - b) Total Anaerobic Plate Count
 - c) Nitrate Reducers
 - d) Sulfate Reducers
 - e) Iron Bacteria
5. Conduct final on-site system turn over meeting with Owner and Commissioner. Present final validation report demonstrating that performance requirements have been achieved and that each system is currently properly treated.
 6. When required by Part 3, train Owner's maintenance personnel in water treatment procedures.
 7. Program Administration Manual:
 - a. The CSP shall provide the Owner with two (2) Program Administration Manuals including sections covering program control, testing requirements, in plant logs, safety data and system information. Each section shall include the following:
 - 1) Program Control: Include a complete program outline with chemical descriptions, control ranges, and required action for "out of range" situations. Also include complete ordering instructions with applicable account numbers and phone numbers.
 - 2) Testing Requirements: This section will include basic testing practices as well as detailed test instructions for each test to be performed.
 - 3) Sequence of operation detailing the operation of the chemical treatment system.
 - 4) In-Plant Logs: Include detailed testing log sheets for each system to be tested including room to record one (1) month's data on one (1) sheet and a section to log chemical inventory.
 - 5) Safety Data: Include the CSP's 24-hour toll free safety hotline number as well as MSDS sheets for each chemical used.
 - 6) System Information: Include any equipment manuals and related information.

2.2 TREATMENT PROGRAM - FLUSHING AND CLEANING

- A. Cleaning chemicals shall be non-phosphate and non-acidic.
- B. Flush and clean all new and reused piping.
- C. Provide a flush/clean plan for approval. Provide and later remove all temporary bypasses, drains, vents, etc. required to flush and clean the system. Temporary components for flushing and cleaning are not indicated on the drawings.
- D. Flush and clean systems per the general procedures specified in Related Sections; clean systems per the approved cleaning procedures submitted under this specification section. Provide and install all required cleaning chemicals.
- E. Verify that adequate cleaning chemical was added and that cleaning was effective. Test that cleaning chemicals were properly rinsed from the system. Provide a report certifying that cleaning and rinsing, was properly executed.

- F. Provide chemical treatment immediately after each system has been cleaned and flushed. Systems shall not stand filled with fluids for periods longer than 48 hours without beginning flushing and cleaning of the system, which shall then be immediately followed by the chemical treatment procedures.

2.3 CHEMICAL TREATMENT - GENERAL

- A. Provide passivation and chemical treatment per the submitted and reviewed chemical treatment procedures and Program Administration Manual and to maintain the Performance Requirements.
- B. Chemically treat new and reused piping networks using chemicals and treatment procedures compatible with the system being cleaned and the chemical treatment chemicals in existing piping systems being connected to. Test existing piping systems or otherwise determine chemical treatment in existing piping and validate compatibility.

THE BELOW PARAGRAPH IN HIDDEN TEXT IS FOR EQUIPMENT WITH SUBSTANTIAL QUANTITIES OF WET GALVANIZED METAL SURFACES; UNHIDE WHEN APPROPRIATE. NORMAL U-M PRACTICE IS TO REQUIRE STAINLESS STEEL HOT AND COLD WATER BASINS ON COOLING TOWERS IN WHICH CASE PASSIVATION IS NOT CONSIDERED NECESSARY FOR THE SMALL AMOUNT OF REMAINING GALVANIZED COMPONENTS.

- C. Passivate cooling towers, evaporative coolers, and similar equipment with galvanized-steel components in strict compliance with manufacturers recommendations. Maintain the pH of the circulating water between 7.0 and 8.0 for a minimum of 8 weeks after start-up until zinc surfaces turn a dull gray color; maintain manufacturer's recommended hardness and alkalinity levels during the passivation interval. If white deposits form on galvanized surfaces after pH is returned to normal service levels, repeat the passivation process until galvanized surfaces are properly passivated/no white deposits form.

WHEN CONNECTING INTO EXISTING ACTIVE SYSTEMS, DEVELOP REQUIREMENTS AND A COORDINATION PLAN IN CONSULTATION WITH U-M PLANT AND REVISE THE BELOW SAMPLE PARAGRAPH ACCORDINGLY.

- D. When connecting into active existing systems, treat piping networks installed or reused by the project and verify by lab analysis that the treatment levels per the treatment plan have been attained prior to connecting into the existing active system. Submit validating report for approval.
 - 1. Do not connect into existing active system until report is approved by Owner.
 - 2. Provide temporary valves, piping, and accessories as required to treat the project's piping prior to connection to the active system.
- E. Provide chemical treatment program at system startup or immediately upon operation of a system for temporary cooling, whichever comes first.

- F. Provide chemical treatment immediately after the system has been cleaned and flushed. Immediately thereafter, begin the approved water treatment maintenance program to passivate and prevent corrosion, scale, and organic growth and to maintain treatment chemical levels.
- G. Chemical inhibitors for open loop chemical systems shall be polymer based without molybdenum as a corrosion inhibitor and contain azole in an amount appropriate for the percentage of internal copper surface area of the system piping. Provide products with PTSA (p-Toluenesulfonic acid) florescent tracer dyes. Molybdenum shall not be used as a tracer.
- H. Use 1" halogenated isocyanurate bromine tablets for biological control.
- I. No chemicals shall contain chromates or inorganic phosphates.
- J. Adjust chemical concentrations as required to achieve the required performance.

2.4 PERFORMANCE REQUIREMENTS

- A. The water treatment programs proposed by the CSP shall maintain corrosion rates below 0.5 mils per year for mild steel and 0.1 mils per year for copper. These rates shall be verified with corrosion coupons provided by the CSP. Coupons shall be analyzed in the CSP's analytical laboratory monthly, or more often if required, to assure these levels are not exceeded.
- B. Microbiological growth levels shall be maintained below 10,000 cfu's aerobic bacteria and 10 cfu's anaerobic bacteria. The CSP shall perform detailed microbiological culturing at the CSP's company's analytical laboratory monthly, or more often if required, to assure these levels are not exceeded
- C. The Langelier Stability Index shall be maintained to not exceed 2.50.

2.5 EQUIPMENT - GENERAL

- A. Provide all components required for a fully operational water treatment system. Provide components that are not adversely affected by the treatment chemicals employed, and that are rated for the maximum pressures and temperatures that may be encountered by the treatment system.

DESIGNER MUST INCLUDE U-M DETAIL 15710002 - CONDENSER WATER TREATMENT EQUIPMENT DIAGRAM ON THE DESIGN DRAWINGS.

- B. Refer to the condenser water treatment equipment detail for additional equipment requirements.

2.6 MOTOR OPERATED BALL VALVE:

- A. Acceptable Manufacturers:
 - 1. Belimo (Basis of Design)
 - 2. Siemens
 - 3. Johnson Controls

- B. 120 VAC, on/off control, normally closed/fail closed/spring return, full port ball valve, 1 inch size with NPT female ends.
- C. Forged Brass, nickel plated body, stainless steel ball and stem, PTFE seals and lubricated O-ring packing. Rated for minimum 200 PSI at 212°F.
- D. 200 PSI close-off pressure rating, capable of operation at differential pressures up to 30 PSI.
- E. Actuator with visual position indicator, manual hex crank valve over-ride, and conduit fitting for electrical connection.
- F. Valve and actuator shall also comply with the requirements for ball style control valves in Related Section "Mechanical Systems Controls".

2.7 CHEMICAL FEED PUMP

- A. Acceptable Manufacturers:
 - 1. Pulsatron Series E Plus model LPB4 (Basis of Design)
 - 2. Grundfos
 - 3. LMI-Flomotion
- B. Nominal capacity of 1.00 GPH (24 GPD) at 100 PSIG.
- C. 120 VAC/60 HZ/1 PH with minimum 6 foot long three prong grounded plug. UL or ETL approved for indoor and outdoor use.
- D. Reproducibility +/- 2% at maximum capacity.
- E. It shall be possible to manually adjust the stroke rate and stroke length via an adjustment means located on the pump body. Provide the following minimum adjustment ranges:
 - 1. Stroke rate turn down ratio 10:1
 - 2. Stroke length turn down ratio 10:1
- F. It shall also be possible to start and stop the pump via an external mechanical or solid state relay contact.
- G. Provide hand-off-auto switch, circuit protection, and solenoid thermal overload protection with automatic reset.
- H. Pump shall be constructed of glass filled polypropylene (GFPPPL), with Teflon diaphragm. Fittings, bleed valve, injection valve, and foot valve shall be GFPPPL. Fittings shall accommodate 1/4" to 3/8" I.D. tubing. Provide guided check valves with ceramic balls and Teflon seats and o-rings. With bleed valve for priming.

2.8 BROMINE FEEDER TANK

- A. Acceptable Manufacturers:
 - 1. Neptune Chemical Pump Company model BT (Basis of Design)
- B. Vinylester resin body tank, minimum capacity of 20 gallons. 4 inch top opening with threaded, gasketed closure. Two threaded side connections and one threaded bottom connection, all 1 inch NPT. Maximum tank diameter 18 inches.
- C. Tank rated 150 PSI at 150°F.

- D. Provide with accessory piping kit to include inlet diffuser/strainer fitting and exit strainer fitting.
 - 1. All accessories to be rated 150 PSI at 73°F
 - 2. All components, including manufacturer, shall comply with the requirements of the related articles in this specification section.
 - 3. Unions shall have buttress threads.
- E. All materials shall be compatible with a 20% bromine solution at a pH of 5.0-7.5. All seals shall be Viton, PTFE, or FKM.

2.9 CHEMICAL TREATMENT CONTROLLER WITH CONDUCTIVITY PROBE

- A. Acceptable Manufacturers:
 - 1. Pulsafeeder "Microvision" model MVS1PB (Basis of Design)
- B. Multi-function chemical treatment controller for controlling inhibitor feed, biocide feed, and bleed (blow-down). Complete with toroidal conductivity sensor assembly and back-board for mounting of indicated chemical treatment devices. UL, CSA or ETL listed.
- C. Controller features shall include:
 - 1. Polypropylene enclosure rated NEMA 4X
 - 2. Pre-wired 15 ft. power cord and pigtails for 115 VAC.
 - 3. Large LCD display with statistics screen
 - 4. 0-9,999 μ S/cm setpoint range
 - 5. Battery backup
 - 6. Password protection
 - 7. Selectable timer
 - 8. Flow switch to make controller inoperative when no flow is detected. Rated minimum 125 PSIG at 122°F.
 - 9. Water meter inputs: dry contact and Hall Effect types
 - 10. Three drum level detection inputs (opened/closed relay type detection)
 - 11. Dual biocide output relays
 - 12. Inhibitor output relay
 - 13. Bleed output relay
 - 14. Dry contact alarm relay output
 - 15. All relay outputs rated for 2 amps
 - 16. Conductivity output: 4-20 mA isolated analog output
 - 17. PVC back-board for mounting the controller with PVC chemical feed pump shelf attached to the back-board.
- D. Toroidal sensor assembly features shall include:
 - 1. No exposed electrodes
 - 2. Temperature compensated
 - 3. With in/out ball valves, strainer, injection tee, and rail.
 - 4. Rated minimum 125 PSI at 122°F

2.10 CORROSION COUPON RACK:

- A. Acceptable Manufacturers:
 - 1. Cannon Water Technology
 - 2. J.L. Wingert
 - 3. Advantage Controls

4. Novatech

- B. 3/4" diameter Schedule 80 PVC coupon rack with two coupon holders, and a 1/4" sample tee with valve. Include inlet/outlet PVC full port ball valves and strainer, and a 0-5 gpm nominal range variable area flow meter ("rotameter") rated minimum 150 psig at 70°F, with graduated polysulfone or acrylic cylinder, with an accuracy of +/-5%. Provide mild steel and copper coupons.

2.11 SOLID CORROSION INHIBITOR DISSOLVER

- A. Acceptable Manufacturers:
1. Solv-Ultima Model 150 (Basis of Design)
 2. Hydro Systems Company Model 590
- B. Rated for 1.2 GPM minimum, and 100 PSIG at 100°F.
- C. Constructed of chemical resistant parts molded of polypropylene and polyethylene.
- D. Back-up reservoir and float for overflow protection.
- E. Pressure regulator adjustable between 20-40 PSIG.
- F. Pressure gauge and removable filter.
- G. Atmospheric siphon breaker for backflow prevention.

2.12 STRAINERS- CLEAR PLASTIC

- A. Acceptable Manufacturers:
1. Spears Manufacturing
 2. Hayward
 3. Nibco
- B. Clear PVC y-strainer rated 150 PSI at 73°F, with removable basket. With 8 mesh (0.094 inch opening) stainless steel screen.

2.13 FLOW INDICATORS

- A. Acceptable Manufacturers:
1. Blue White model F-440 (Basis of Design)
 2. King Instrument
 3. GF Signet
- B. Variable area flow meter, 0-10 gpm (conductivity loop) 5-21 gpm (brominator loop) nominal range, rated 150 psig at 68°F, with graduated polysulfone or acrylic cylinder, with an accuracy of +/-5%. Rod guided float with stainless steel rod. Provide 3/4 inch pipe size union end connections.

2.14 PVC BALL VALVES

- A. Acceptable Manufacturers:
1. Spears Manufacturing
 2. Hayward
 3. Nibco

- B. True union PVC ball valve rated 200 PSI at 73°F. Full port, PTFE ball seat, peroxide cured EPDM seals, polypropylene handle, buttress threaded union nuts.
- C. Ball valves downstream of the brominator shall be provided with Viton or FKM seals.

DUE TO THE CORROSIVE NATURE OF BROMINE, THE QUILL ASSEMBLY COMPONENTS SPECIFIED BELOW SHOULD NOT BE INDISCRIMINATELY MODIFIED. FOR THE SAME REASON, REVIEW QUILL SUBMITTAL CAREFULLY FOR COMPLIANCE TO THE BELOW. ASSURE ALL COMPONENTS UTILIZE VITON, PTFE, OR FKM SEALS, INCLUDING UNIONS AND BALL VALVES AT AND DOWNSTREAM OF BROMINATOR. CHECK VALVE PREVENTS BACK FLOW DURING CIRCUMSTANCES SUCH AS A HOSE LEAK.

2.15 RETRACTABLE INJECTION QUILL ASSEMBLY

- A. Acceptable Manufacturers:
 1. Saf-T-Flo Water Services Inc. EB-159 (Basis of Design)
 2. Hydro Instruments
- B. Injection quill assembly allowing retraction under pressure consisting of 1-1/2 inch brass stop (ball valve) and compression gland, 1 inch diameter sch. 80 PVC solution tube with 45 degree bevel end, check valve, and 1 inch braided PVC hose assembly. All seals shall be Viton or FKM accept as noted.
 1. All components shall be rated for 150 PSIG working pressure at 100°F. All bromine wetted materials shall be compatible with a 20% bromine solution at a pH of 5.0-7.5.
 2. With 1 inch male inlet connection, 1-1/2 inch male main connection, brass solution tube adapter and packing nut, stainless steel restraint hook, and stainless steel restraint chain. Restraint chain length shall be selected by the manufacturer to allow closure of the stop before withdrawal of the solution tube.
 3. Check valve: Diaphragm style with PVC body, FKM diaphragm, and union nut body. Plast-O-Matic Series CKM. May be provided separate from quill assembly. Mount on solution tube inlet, at downstream end of PVC hose.
 4. Solution tube length shall project into the pipe for a distance equal to 1/3 the diameter of the pipe.
 5. Provide braided PVC hose length adequate to allow solution tube retraction.
 6. Provide stainless steel hose clamps and PVC fittings to allow quill, hose, and pipe connections.

2.16 PIPING AND MISCELLANEOUS COMPONENTS

- A. Provide per Related Sections. For components at or downstream of the brominator, provide with Viton, PTFE, or FKM seals.

2.17 CHEMICAL SOLUTION TUBING

- A. Chemical solution tubing for connection to suction and discharge of chemical feed pump and inhibitor dissolver:

1. Opaque polyethylene tubing rated minimum of 125 PSIG from - 50°F to 140°F. Provide polypropylene or stainless steel threaded, compression, or other positive locking style fittings of equivalent rating as required for connection to pump, inhibitor vessel, and rigid piping. Push-on "barbed" style fittings shall not be used.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Pre-Treatment Conference: Prior to treatment activities, meet with the Project Engineer, Commissioner and contractors to verify treatment procedures, discuss coordination with existing piping networks, and to coordinate treatment activities with construction schedule.
- B. Flush and clean systems per Related Sections and Part 2 above.
- C. Examine roughing-in for equipment support, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install all required components per manufacturer's recommendations and per Related Sections and chemically passivate, treat, and maintain the system per the requirements of Part 2.
- B. Use and dispose of chemicals and wastewater (including from existing piping networks) per the Quality Assurance section of this specification. All costs of disposal shall be borne by the contractor.
- C. Install equipment at locations shown on the Drawings.
- D. Provide all chemicals and all incidental components.
- E. Provide union connections at inlet and outlet to the bromine feed tank.
- F. Make piping connections between dissimilar-metal piping with dielectric fittings per Related Sections.
- G. Provide electrical components in conformance with Related Section.
- H. Provide interconnecting control wiring for chemical treatment controls and sensors per Related Section 230900.
- I. Rigidly support PVC piping at injection quill assembly to prevent pipe movement when operating the isolation valve upstream of the hose connection. Support the quill hose with a hanger that does not abrade the hose surface. Verify that all components at and downstream of the brominator are equipped with the specified seals. Install quill in a location easily accessible for quill removal. Do not mount quill in bottom of pipe. Provide caution label, per detail.
- J. Mount sensors, meters, and all other required components.

- K. Passivate and chemically treat each system immediately after it has been cleaned and flushed.

SOME PROJECTS, SUCH AS HOSPITAL PROJECTS, MAY DESIRE THAT WATER TREATMENT SERVICES CONTINUE BEYOND SUBSTANTIAL COMPLETION, E.G. A ONE OR MORE YEAR SERVICE CONTRACT. CONTACT THE U-M DESIGN MANAGER FOR DIRECTION, AND IF NEEDED, REVISE THE PARAGRAPH BELOW TO INCLUDE THAT REQUIREMENT.

- L. The treatment program shall begin at system start-up or immediately upon first operation of the system by the contractor for temporary use, whichever comes first. Continue the program until Substantial Completion of the system.

3.3 FIELD QUALITY CONTROL

- A. The CSP shall:
 1. Verify that systems and equipment have been properly cleaned, flushed, and filled with water, and are fully operational before introducing operational chemicals for water-treatment systems.
 2. Introduce and maintain chemical treatment to achieve the specified performance requirements.
 3. Set-up and program all water treatment control devices. Program water treatment controller to be inoperative when no flow is detected.
 4. Submit a written startup test report for each system placed into service.
 5. Provide validation testing and required reports.
 6. Attend final on-site system turn over meeting with Owner and Commissioner. Present final validation report demonstrating that performance requirements have been achieved and that each system is currently properly treated.

INCLUDE THE BELOW ARTICLE IN EVERY SPECIFICATION SECTION.

3.4 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

CONSULT WITH THE U-M DESIGN MANAGER TO DETERMINE IF TRAINING IS DESIRED FOR YOUR PARTICULAR PROJECT; KEEP OR DELETE OR MODIFY THE ARTICLE BELOW ACCORDINGLY.

3.5 OWNER TRAINING

- A. CSP shall train Owner's maintenance personnel on equipment operation, adding and maintaining proper chemical levels, troubleshooting, servicing and preventative maintenance procedures. Do not conduct training until after start up and commissioning is completed. Provide training using documents including the Program Administration Manual and the approved Operations and Maintenance manuals. Provide these documents to the Owner at least two weeks prior to the training to allow sufficient time for review.
- B. Provide 4 hours training minimum.

1. Schedule training at least 14 days in advance, at date and time approved by Owner.

SECTION 232519- STEAM BOILER CHEMICAL WATER TREATMENT

REVISIONS:

12-7-09: APPROVED AS NEW MASTER.

**SPEC EDITOR: DEVELOPED BY HYDRONICS AND STEAM MECH TECH TEAM.
EDIT CAREFULLY ON A PROJECT SPECIFIC BASIS.**

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. Section Includes
 - 1. This Section of the Specification includes the provision of all the materials, equipment and chemicals to provide complete chemical treatment systems for the steam boilers.

1.3 REFERENCES

- A. American Society for Testing and Materials (ASTM)
 - 1. D859 - Test Method for Silica in Water.
 - 2. D1066 - Practice for Sampling Steam.
 - 3. D1067 - Test Methods for Acidity or Alkalinity in Water.
 - 4. D1068 - Test Methods for Iron in Water.
 - 5. D1126 - Test Method for Hardness in Water.
 - 6. D3370 - Practices for Sampling Water from Closed Conduits.
- B. Underwriters Laboratories Inc. (UL)
 - 1. 486A - Wire Connectors and Soldering Lugs for Use With Copper Conductors.

1.4 SYSTEM DESCRIPTION

- A. Provide complete chemical water treatment system.
- B. Provide chemicals required for the water treatment systems in sufficient quantities for initial operation of the systems.
- C. Provide controls, control wiring, motors and starters. Refer to Div. 26 for electrical requirements for motors and starters and electrical items.
- D. submittals

- E. Product Data: Include rated capacities; water-pressure drops; shipping, installed, and operating weights; and furnished products listed below:
 - 1. Pumps.
 - 2. Chemical solution tanks.
 - 3. Agitators.
 - 4. Control equipment and devices.
 - 5. Test equipment.
 - 6. Chemical feeders.
- F. Shop Drawings: Detail equipment assemblies indicating dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 1. Wiring Diagrams: Detail power and control wiring and differentiate between manufacturer-installed and field-installed wiring.
- G. Water Analysis: Submit a copy of the water analysis to illustrate water quality available at Project site.
- H. Field Test Reports: Indicate and interpret test results for compliance with performance requirements.
- I. Maintenance Data: For pumps, agitators, filters, system controls, and accessories to include in maintenance manuals specified in Division 01.

1.5 QUALITY ASSURANCE

- A. Field Samples
 - 1. Procure and perform an analysis of a sample of the local water supply and base the water treatment proposal on the results therefrom.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion. This warranty does not include ongoing chemical treatment or monitoring..

PART 2 - PRODUCTS

2.1 STEAM BOILER CHEMICAL TREATMENT SYSTEM

- A. General
 - 1. Provide a complete chemical treatment system as detailed in the drawings with operational sequence as indicated in the drawings.
- B. Treatment Chemicals

1. The chemicals for periodic regular boiler water treatment will be by owners' chemical treatment contractor, WATCON; contact Dave Russell, 419-283-4495. This contractor shall provide initial chemicals, required for flushing and boil out of the boiler and boiler feed water unit. The chemicals shall be provided by WATCON and paid for by this contractor.

C. Chemical Treatment Equipment

1. Provide one control panel as detailed in the drawings.
2. Enclosure: NEMA 1, general purpose, with all controls, switches, and lights mounted on the front.
3. Provide chemical metering pumps as detailed in the drawings.
4. Provide an external pressure relief valves constructed of type 316 stainless steel to protect the chemical pumps and discharge piping.
5. Chemical tank assembly, where indicated in the detail, shall consist of a polyethylene tank, welded steel support frame with agitator support, removable cover, suction strainer, drain fitting, and inter-connecting suction piping to chemical pumps with a tank capacity of ___ gallons.
6. For convenience of servicing and adjusting the chemical pumps, mount the pumps on a side mount platform.
7. Provide one agitator, where indicated in the details, with mounting hardware for chemical tank assembly of the direct drive type suitable for the mixing of low viscosity chemical treatment solutions. Provide agitator motor not less than 1/4 hp, 115/1/60, 1500/1750 rpm. Construct shaft and impeller of type 304 stainless steel.
8. Provide one dip tube assembly for each boiler constructed so that it may be inserted through any standard threaded 1/2-inch or larger fitting on the boiler drum, above or below the water line. Provide the insertion length to be adjustable at the time of installation so that the dip tube extends 4 to 6 inches below the normal water level in the boiler. Provide the tubing material of type 304 stainless steel and the fittings of type 316 stainless steel. Rate the tubing and fittings at not less than 150 percent working pressure of the boiler.

PART 3 - EXECUTION

3.1 PREPARATION

A. Chemical Treatment Program - Steam Boilers

1. Cleaning
 - a. Immediately after the hydrostatic testing of the system has been completed, drain each boiler, flush with clean water, and refill with clean water to which the appropriate cleaning compound has been added to remove pipe joint compound, fabrication lubricants, oils, welding slag, loose mill scale, and other extraneous materials. Then boil out the boilers in accordance with the boiler manufacturer's instructions. Cool the boilers slowly and flush with clean water.
2. Chemical treatment

- a. Once each boiler is clean, immediately fill it with clean water to which appropriate scale and corrosion inhibitors have been added. Then slowly bring the boilers up to boiling temperature and steam slowly with vents open for 60 minutes to deaerate the boiler water. Then close the boilers and put into service. Upon operation, dump the returning condensate to waste for the first 24 to 48 hours, or until it is free of contaminants and debris.
- b. Sample boiler water at one-week intervals after boiler startup for a period of five weeks, and prepare certified test report for each required water performance characteristic. Where applicable, comply with ASTM D 3370 and the following standards:
 - 1) Silica: ASTM D 859.
 - 2) Steam System: ASTM D 1066.
 - 3) Acidity and Alkalinity: ASTM D 1067.
 - 4) Iron: ASTM D 1068.
 - 5) Water Hardness: ASTM D 1126.

3.2 CHEMICAL CONTAINMENT

- A. Install the chemical drums on 2-drum polyethylene, 235-liter (62-gallon) capacity, 419 mm (16-1/2-inch) high pallets with top grating deck; McMaster-Carr Model 12635T13 or as approved.

3.3 WATER ANALYSIS

- A. Perform an analysis of supply water periodically to determine the type and quantities of chemical treatment needed to maintain the water quality.

3.4 INSTALLATION

- A. Install treatment equipment level and plumb.
- B. Add cleaning chemicals as recommended by manufacturer.

3.5 CONNECTIONS

- A. Piping installation requirements are specified in other Division 22 Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to equipment to allow service and maintenance.
- C. Confirm applicable electrical requirements in Division 26 Sections for connecting electrical equipment.
- D. Ground equipment.
 - 1. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A.

3.6 FIELD QUALITY CONTROL

- A. Coordinate with outlying boiler group technicians and WATCON representative and perform startup service under their supervision.
 - 1. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
 - 2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
- B. Test chemical feed piping as follows:
 - 1. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
 - 2. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
 - 3. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
 - 4. Cap and subject piping to static water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.
 - 5. Repair leaks and defects with new materials and retest piping until satisfactory results are obtained.
 - 6. Prepare test reports, including required corrective action.

3.7 ADJUSTING

- A. Occupancy Adjustments: Within 12 months of Substantial Completion, perform two separate water analyses to prove that automatic chemical feed systems are maintaining water quality within performance requirements specified in this Section. Perform analyses at least 60 days apart. Submit written reports of water analysis.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220500: Common Work Results for Mechanical
 - 2. Section 220548: Vibration Control
 - 3. Section 220719: Mechanical Systems Insulation
 - 4. Section 233300: Air Duct Accessories and RGDs
 - 5. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:
 - 1. Ductwork materials, plenums, construction, , fabrication, and support
 - 2. Galvanized steel ductwork.
 - 3. Polyvinyl chloride coated galvanized steel ductwork (PCD).
 - 4. Stainless steel ductwork.
 - 5. Round and flat oval ductwork.
 - 6. Reinforcing and supports.
 - 7. Flexible duct.
 - 8. Flexible nonmetallic duct.

9. Special ductwork construction including exhaust plenums; perchloric acid ductwork system; double-wall ductwork; and exhaust stacks.
10. Custom fabricated canopy hoods.
11. Double-walled panels, plenums, and duct at outside air intake plenums.
12. Blank-off panels for unused louver areas.
13. Dryer vent ductwork.
14. Bellmouth connections.
15. Duct sealants.
16. Duct cleaning and disinfecting
17. Ductwork sealing, inspection, and leakage testing.

1.3 **QUALITY ASSURANCE**

- A. **Manufacturers and Products:** The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. **Reference Standards:** Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
- C. ASTM A653 / A653M Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
- D. ASTM A 666 - Standard Specification for Austenitic Stainless Steel Sheet, Strip, Plate, And Flat Bar.
- E. ASTM B 209 & 209M - Standard Specification for Aluminum and Aluminum Alloy Sheet and Plate.
- F. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems.
- G. NFPA 90B - Standard for the Installation Of Warm Air Heating and Air Conditioning Systems.
- H. NFPA 91 - Standard for Exhaust Systems for Conveying of Materials.
- I. NFPA 92A - Standard for Smoke Control Systems.
- J. NFPA 92B - Standard for Smoke Management Systems.
- K. NFPA 96 - Standard for Ventilation Control of Cooking Operations.
- L. NFPA 99 - Standard for Health Care Facilities.
- M. SMACNA - All standards.
- N. AWS - All applicable standards.
- O. UL 181, 181A, & B - Factory-made Air Ducts and Connectors and Closure Systems.
- P. UL 760 - Standard for Exhaust Hoods For Commercial Cooking Equipment.
- Q. UL 723 - Standard for Surface Burning Characteristics of Building Materials.
- R. Air Diffusion Council - Flexible Duct Performance and Installation Standards.

Building Name

Edit Custom Properties

P00000000 0000 Issued for: 233100 - - 2

- S. National Air Duct Cleaners Association (NADCA).

1.4 SUBMITTALS

- A. Provide the following information and product data:
 - 1. Project specific duct fabrication schedule including materials, methods of installation, and location of fitting types. Indicate the metal gauge and reinforcement method intended for each pressure classification and size of duct.
 - 2. Construction details for double wall duct and panels, plenums, stacks, canopy hoods, etc.
 - 3. Double wall duct and panel fill material
 - 4. Hangers and supports
 - 5. Duct fittings
 - 6. Turning vanes
 - 7. Duct sealant
 - 8. Flexible duct
 - 9. Dryer duct and fittings

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provided duct and fittings of G90 galvanized steel unless otherwise indicated.
- B. Constructed duct and fittings in compliance with SMACNA standards and recommendations and per the additional requirements indicated.
- C. Duct dimensions indicated on drawings are inside dimensions. The sheet metal dimensions shall be increased an equivalent amount to accommodate internal liner where liner is required.
- D. Drawings are diagrammatic and indicate the arrangement of the principal apparatus, ductwork, and piping, and shall be followed as closely as possible. All the required offsets, rises, drops, fittings and accessories are not indicated on the drawings, but shall be provided as required for a complete system. Carefully investigate structure, finish conditions, and the work of other sections affecting sheet metal work, including work associated with testing, adjusting and balancing, in order to arrange all items accordingly. Provide best possible arrangement to provide maximum headroom and maintenance clearances.
- E. In addition to sheet metal ductwork specified herein, provide, or install as furnished by other sections, accessories and devices including, but not limited to, smoke detectors, plenums, canopy hoods, control dampers, and blank-off panels at unused louver areas.
- F. Provide intake and exhaust plenums attached to louvers.

- G. Alternate Joining Methods: As an alternate to SMACNA joining methods, Contractor may propose proprietary joining systems with performance equivalent to SMACNA for Owner's approval.

IMPORTANT: INCLUDE THE DUCT APPLICATION SCHEDULE ON DRAWINGS AND EDIT APPROPRIATELY FOR SPECIFIC PROJECTS. SEE U-M STANDARD DETAILS FOR SAMPLE SCHEDULE, CONSTRUCTED FOR USE WITH THIS SPECIFICATION.

- H. Refer to Drawings for ductwork construction and application schedule.

2.2 DUCTWORK MATERIALS AND FABRICATION

- A. General Ductwork Fabrication Requirements:

1. Provide fittings, branches, inlets and outlets in such a manner that air turbulence is reduced to a minimum.
2. Turns:
 - a. Use radius type elbows wherever possible. Where it is not possible to install a 1.5 times width to centerline radius elbow (full radius elbow), use lesser radii configurations, with 'radius-proportional' splitter vanes permanently installed within. No radius shall be less than 1.0 times width. Provide square elbows of equivalent pressure drop in rectangular ducts where radius elbows will not fit or where specifically noted on drawings. Elbows shall be installed with vanes in accordance with Related Section "Sheet Metal Accessories." Stamped elbows may be used up to and including a diameter of 12 in.
3. Transitions:
 - a. Limit transition angles (for each side) to 15 degrees diverging and 30 degrees converging.
4. Take-Off Fittings:
 - a. For take-offs carrying more than 25 percent of duct main, provide an increasing branch elbow with an inside radius equal to branch duct width. Size branch and main at elbow for equal velocity.
 - b. For take-offs carrying 25 percent or less of duct main, provide flanged increased area branch take-off (45 degree entry, "shoe" type) or 45 degree lateral wye takeoffs. Conical fittings shall be used for spiral, round, and oval ductwork.
 - c. For take-offs directly to side outlet for register or grille, provide an increased area tap. For take-offs directly to diffusers see appropriate SMACNA figures.
 - d. Acceptable take-off fitting manufacturers:
 - 1) Sheet Metal Connectors, Inc.
 - 2) United Sheet Metal.
 - 3) McGill AirFlow LLC.
 - 4) Set Duct.
 - 5) Tangent.
 - 6) Flexmaster.
 - 7) SEMCO Incorporated.
 - 8) Sheet Metal Connectors, Inc.
5. Crossbreak or bead rectangular ductwork.

Building Name

Edit Custom Properties

P00000000 0000 Issued for: 233100 - - 4

6. Rectangular duct longitudinal seams shall be Pittsburgh lock 3/8 in. minimum pocket.
7. Bolts and Fasteners
 - a. Carbon steel, zinc coated per ASTM A153 for G-90 and stainless steel for aluminum and stainless steel ducts.
8. Welding Materials
 - a. Refer to SMACNA "Guidelines for Welding Sheet Metal" for applicable requirements.

B. Galvanized Steel Ductwork:

1. Minimum steel rectangular duct gage shall be as follows:
 - a. Ducts through 12 in. wide: 24 Gage
 - b. Ducts 13 in. through 30 in. wide: 22 Gage.
 - c. Ducts 31 in. through 84 in. wide: 20 Gage.
 - d. Ducts 84 in. and larger: 18 Gage
2. ASTM A653, A924 mill galvanized steel sheet, 1.25 oz per sq. ft. zinc coating on each side in conformance with coating designation G-90.

C. Galvanized Touch-Up Paint: Inorganic zinc-rich touch up paint containing a minimum of 65 percent metallic zinc by weight for damaged galvanized coating.

1. Acceptable manufacturers/product: Carboline/Carbo-Zinc, Tnemec/Tneme-Zinc.

D. Polyvinyl Chloride Coated Galvanized Steel Ductwork (PCD):

1. Except where noted, comply with Galvanized Steel Ductwork paragraph above. Factory coat interior and exterior with a 4 mil thick coat of fused polyvinyl chloride. Construct and install horizontal ductwork and fittings with longitudinal seam located on top of duct.
2. Screws and rivets that penetrate ducts shall be stainless steel.
3. Cut edges or coating damage shall be touched up to match the 4 mil thick coat of fused polyvinyl chloride.
4. Acceptable Manufacturers: Set Duct, Tangent, United McGill, Foremost, Semco

E. Stainless Steel Ductwork

CONSIDER IF THE LESS EXPENSIVE 304 STAINLESS STEEL IS SUITABLE FOR YOUR APPLICATION.

1. Minimum stainless steel rectangular duct gauge shall be 18 gauge, for welding.
2. ASTM A167, type 316L.
3. Concealed stainless steel ductwork shall have an ASTM mill rolled No.1 or No.2 D finish.
4. Exposed stainless steel ductwork shall have an ASTM mill rolled No.2 B finish, or as indicated. Welds shall be ground smooth and final brushed with stainless steel wire brushes. Welds on exposed stainless steel ductwork shall be free of stain, burn-through, or discoloration to the satisfaction of the University's Representative/Project Design Engineer.
5. Screws and rivets shall be stainless steel.

F. Round and Flat Oval Ductwork

1. All round and oval duct shall be manufactured of spiral lock seams, with minimum gage per the appropriate SMACNA Tables and per manufacturers recommendations. Ductwork up to 12 in. diameter and 2 in. w.g. can be manufactured with longitudinal lock seams.
2. Tees shall be conical. Laterals shall be straight. Taps through 10 in. diameter in size shall have a machine drawn entrance and fittings shall have longitudinal seams, continuously welded. Both sides of welds shall be primed with zinc chromate. Tap entrances shall be free of weld build-up.
3. Elbows in diameters 2 in. through 10 in. shall be stamped or pleated. Elbows shall be 5 gore for 90 degrees and 3 gore for 45 degrees. Elbows shall have 1.5 times width to centerline radius (full radius elbow).
4. Flanges, access doors and taps into spiral ducts shall be factory fabricated.
5. Field joints in diameters through 48 in. shall be made with 2 in. long slip-fit, sleeve coupling, or flanges. Ductwork 48 in. diameter and over, and for all sizes where disassembly or removal is required, shall be joined with flanges.

G. Reinforcing and Supports

1. Structural steel per ASTM A36; Mill galvanized per ASTM A653, Coating Designation G-90. Equivalent rolled steel structural support systems (such as TDF or TDC) may be used in lieu of mill rolled structural steel. Use double nuts and lock washers on threaded rod supports.
2. Tie-Rods
 - a. Maximum tie rod spacing shall be 42 in., unless specifically engineered in accordance with SMACNA Industrial Rectangular Duct Standard.
 - b. Minimum tie rod diameter shall be 1/2 in.
 - c. Tie Rods shall not be used in any plenum or ducts that require access.
 - d. Tie rods shall not be used in any PCD, cage wash, BSL-3 or BSL-4, Vivarium, stainless steel, or ducts carrying lint.
 - e. Tie rods shall not be used in any return or exhaust ducts in health care facilities.

2.3 FLEXIBLE DUCT

A. General

1. Flexible duct shall be UL listed, and shall maintain shape when installed. Sagging shall not exceed 1/2 in. per linear foot when installed horizontally.
2. Flexible duct shall not be used where system pressure is greater than plus or minus 2 in. w.g.
3. Insulated flex shall have a gray fire retardant polyethylene outer jacket with an 8 oz. density, 1-1/3 in. thick fiberglass insulation blanket, factory wrapped.
4. Flexible duct used on negative pressure systems shall be specifically rated for negative pressure use.

FLEXIBLE METALLIC DUCT IS SELDOM USED, AND NOT COVERED BELOW.

B. Flexible Nonmetallic Duct

1. Flexible nonmetallic duct shall be constructed of sound transparent foil. Material shall be mechanically locked to the outside helix. Use of adhesives to lock fabric in place is not acceptable. The helix shall be constructed of corrosion resistant galvanized steel, formed and mechanically locked to the duct fabric on the outside to prevent tearing.
2. Flexible fabric duct shall be rated at 6 in. positive pressure and at 4 in. negative pressure.
3. Flexible nonmetallic duct shall be listed UL Class 1.
4. Acceptable manufacturers:
 - a. Flexmaster.
 - b. Hart & Cooley.
 - c. Atco.
 - d. Peppertree Air Solutions

2.4 SPECIAL DUCTWORK CONSTRUCTION

- A. Ductwork required to be removable shall utilize companion flanges.
- B. Ductwork systems serving areas of high process humidity shall be constructed of aluminum, min. thickness of 0.040 in., or 316L stainless steel. Ductwork shall be continuously welded and watertight. Pitch duct to low point drains. Pipe drains to floor drains or utility sinks.
 1. Provide in the following areas, and where indicated:
 - a. Non-insulated ductwork exposed on roof.
 - b. Dishwasher exhaust.
 - c. Within 20 feet of a shower area exhaust register/grille.
 - d. From sterilizer and glass washer exhaust register/grille, canopy, or equipment connection to main or lateral duct (stainless steel only).
- C. Exhaust plenums on roof shall be double wall with 2 in. thick duct liner, G-90 stainless steel solid inner wall (gauge per specified duct minimum standards) and minimum 18 gauge, G-90 stainless steel outer wall.

SEE THE U-M DESIGN GUIDELINE FOR PERCHLORIC ACID SYSTEMS. EDIT PARAGRAPH BELOW ACCORDINGLY.
- D. Perchloric Acid Ductwork System.
- E. Double Wall Ductwork.

AVOID THE USE OF PERFORATED DOUBLE WALL DUCT DUE TO CONCERNS WITH ABILITY TO CLEAN PROPERLY, INSULATION EROSION, MOLD/FUNGUS GROWTH, AND COST. INDICATE ON DRAWINGS OR IN SPECIFICATION WHERE SOLID DOUBLE WALL AND PERFORATED DOUBLE WALL IS TO BE USED.

1. Solid outer and inner wall, or solid outer wall and perforated inner wall, as indicated.
 - a. Outer wall: comply with Galvanized Steel Ductwork paragraph above.
 - b. Insulation: 1-in. thick, 3.0 lb. density fiberglass acoustical liner with fire resistant fiber bonding coating and a 1 mil vapor barrier on inside of Tedlar or Mylar.
 - c. Inner wall solid: Minimum 18 gauge.

Building Name

Edit Custom Properties

P00000000 0000 Issued for: 233100 - - 7

- d. Inner wall perforated: Minimum 18 gauge perforated steel, nominal 3/32 in. diameter perforations, overall open area of 23 percent. Tightly secure liner along all seams.
2. Double wall ductwork from a point 10 feet upstream of steam humidifiers to a point 20 feet downstream of humidifiers shall have a solid inner wall.
3. Acceptable manufacturers: McGill AirFlow LLC; Semco, or as approved.

DETAIL THE STACK HEIGHT AND CONSTRUCTION ON DRAWINGS.

- F. Exhaust Stacks:
1. Construct stacks from same material as exhaust duct or as indicated on drawings.
 2. Stacks shall be self-supporting and constructed for wind velocities at a minimum of 100 MPH from all directions.

2.5 CUSTOM FABRICATED CANOPY HOODS

DETAIL CANOPY CONSTRUCTION ON DRAWINGS.

- A. Fabricate from 18 gauge 316L stainless steel, all welded construction, number 2B finish, or from material as indicated on Drawings.
- B. Welds shall be ground smooth and final brushed with stainless steel wire brushes. Welds shall be free of stain, burn-through, or discoloration.
- C. Provide a continuous turned-up lip forming a trough around the inside perimeter of the hood with separate drain connections consisting of a welded stainless steel nipples, and as indicated on the drawings.
- D. Size and configuration of each hood shall be as indicated on the drawings. Coordinate with other trades for lights, fire protection, controls, and other interconnections.

2 1/2 IN. THICK PANELS ARE DESCRIBED BELOW, EDIT TO MAKE PROJECT SPECIFIC.

2.6 DOUBLE-WALLED PANELS, PLENUMS, AND DUCT AT INTAKES AND RELIEFS

- A. Double-walled type panels, 2-1/2-in.-thick, constructed from smooth or embossed mill finish G-90 galvanized steel or aluminum facing sheets. Each panel shall contain an integral frame of G-90 galvanized steel or extruded aluminum bonded to the facing sheets to provide a moisture-tight seal at the panel perimeter. Panels shall be load bearing and capable of forming the plenum or duct without the installation of structural members. Join panels together with G-90 galvanized steel or extruded aluminum mullions and fasten with closed end rivets. Make connections to the duct or plenum using a support mullion that is an integral part of the panel and not bolted to or through the panel. Gasket all joining mullions with a double vinyl gasket or a double butyl gasket to provide a permanent air-tight seal. Design panel skins, core density, rib spacing, and mullion spacing to eliminate panel pulsation and to a maximum deflection of 1/200 of any span at design pressure, positive or negative. The overall "U" factor of the panels shall not exceed 0.14 BTU/ft²/°F.
- B. Removable panels shall be the same construction as described above, with double seals around periphery to guarantee tight closure.
- C. Access doors shall be constructed as follows:
 - 1. Doors shall be minimum 24 in. wide whenever possible, or widths as indicated on drawings. Provide doors that are the full height of the panel, maximum 5 ft. high.
 - 2. Each access door shall be equipped with continuous double gaskets and shall fit in the door frame in a manner to guarantee tight closure.
 - 3. Hinges and hardware shall be galvanized, stainless steel or aluminum. Outdoor unit hardware shall be stainless steel, or aluminum. Provide at least 2 handles per door, operable from either side.
 - 4. Access doors in positive pressure sections shall open inward, in negative pressure sections shall open outward.
 - 5. Where indicated, provide a glass window in the access door, minimum 6 in. by 6 in. size, located at a height convenient for viewing, sealed to prevent leakage, rated to operate safely against the duct/plenum pressure rating. Provide double pane insulating type glass at all locations connected to outdoors/exterior or exposed to air temperatures below 55F; single pane at other locations.
- D. The manufacturer shall have published literature available stating the coefficient of absorption and the sound transmission loss characteristics of the panels system per ASTM C 423 and the sound transmission loss properties per ASTM E 90 and E 413. Published acoustic data shall show the trademark or name of the manufacturer, shall have been verified by a recognized independent testing laboratory, and shall specify the coefficient of acoustic absorption and attenuation by octave band. Submit acoustic performance data in graphic and tabular form as part of the shop drawings. Minimum panel performance for 2-1/2 inch thick panels shall be as follows:

Frequency (Hz)	125	250	500	1000	2000	4000	
Transmission Loss (dB)		14	22	28	35	43	48
Absorption Coefficient		0.3	0.7	0.95	0.95	0.95	0.85

- E. The duct and plenum systems, in addition to supporting indicated equipment, scheduled maximum operating pressure, and system test pressure, shall sustain a 35 lb. per sq. foot maintenance function load without permanent deformation or damage.
- F. Acceptable Manufacturers:
 1. McGill Airflow LLC.
 2. Semco Mfg Co.
 3. Vibro-Acoustics
 4. VAW Systems

2.7 BLANK-OFF PANELS FOR UNUSED LOUVER AREAS

- A. Provide a minimum 20 gauge, G-90 galvanized or aluminum, insulated sheet metal blank-off panels for unused louver sections. Panels may be of the double-walled or single wall insulated type. For double-walled type panels, the insulation shall have an overall "U" factor of 0.14 BTU/ft²/°F. Insulation for single skin panels shall be of the rigid type and of the thickness as specified for outside air intake ducts located in mechanical rooms in Related Section "Mechanical Systems Insulation," permanently secured to the panel skins. Panels shall have a maximum deflection of 1/200 of any span at wind velocities of up to 100 MPH.
- B. Exterior/visible face of blank-off panel shall be cleaned and painted flat black, prior to installation.

THE SPECIFICATION BELOW FOR CLAMP-TOGETHER DRYER VENTING IS INTENDED FOR HEAVY USE CLOTHES DRYER APPLICATIONS SUCH AS RESIDENT HALL LAUNDRY ROOMS WITH MULTIPLE DRYERS WHERE ACCESS TO DISASSEMBLE DUCT FOR PERIODIC CLEANING MAY BE CHALLENGING. FOR SIMPLE DRYER APPLICATIONS, SPECIFYING CONVENTIONAL DUCT MAY BE MORE APPROPRIATE.

2.8 CLOTHES DRYER VENT DUCTWORK

- A. Dryer vent duct system shall consist of a clamp-together rigid duct system utilizing single lever reusable clamps at transverse joints.
- B. Ductwork and fittings shall be round G-90 galvanized steel, of gauge and construction as recommended by SMACNA for the system's static pressure, minimum 22 gauge.
- C. Duct shall be roll formed and continuously laser welded along longitudinal seams with the exception of the 3-in. duct that may be lock formed. Non laser welded elbows, branches, reducers, etc. to have a buffed smooth interior. End connections shall be die-formed rolled edge for use with single lever clamps.
- D. All connections and seams shall have gaskets, seals and sealant compatible with the application, not degraded by chemicals with a PH range of 0-14, temperature rating not less than 500°F. Duct leakage shall not exceed SMACNA Class 3 at 5 in. w.g. static pressure.
- E. Clamp gaskets shall be PTFE.
- F. Include all elbows, fittings, adapters and accessories for a complete installation.

- G. Elbows shall be long radius type with centerline radii of 1.5 x diameter whenever space permits. Elbows with centerline radii of 1.0 x diameter in congested spaces: submit for approval. Branch fittings shall be concentric.
- H. Approved manufacturer: Nordfab Quick-Fit/ACS, Fenton, MO.

2.9 BELLMOUTH CONNECTIONS

- A. Bellmouth fittings shall be constructed to match material requirements as indicated on drawings.
- B. Bellmouth shall have a minimum radius of 1 1/2 in. with 1/2 in. flange and 1/2 in. by 1/8 in. thick neoprene gasket.
- C. Manufacturers:
 - 1. Buckley Associates.
 - 2. McGill Airflow LLC. Semco.

2.10 DUCT SEALANTS

DETERMINE IF SOLVENT BASED DUCT SEALANT IS APPROPRIATE FOR THE AREA OF WORK AND EDIT THE BELOW ACCORDINGLY. NOTE THAT LEED© TYPICALLY PERMITS SOLVENT BASED DUCT SEALANTS IN WELL-VENTILATED AREAS DURING LOW AMBIENT TEMPERATURES (<40°F), BUT WATER BASED SEALANTS OTHERWISE.

- A. Solvent-based sealants may only be used if the outdoor air temperature will be below 40°F within 24 hours of applying.
- B. Sealant shall be non-asbestos type, and comply with UL and NFPA 90A.
- C. Sealant: Water or solvent based elastomeric compound, gun or brush grade, maximum 25 flame spread and 50 smoke developed (dry state) specifically for sealing ductwork. Use products as recommended by manufacturer for low, medium or high-pressure systems.
 - 1. Manufacturers
 - a. Hardcast.
 - b. McGill Airflow LLC.
 - c. Polymer Adhesives.
 - d. Ductmate.
- D. Tape shall not be used.
- E. Gaskets and mastics used for flanged joints shall be compatible for the service of use and per the manufacturer's recommendations.

2.11 DUCTWORK CLEANING AND DISINFECTING

DETERMINE IF THIS SECTION IS REQUIRED. INSERT AND EDIT THE NADCA SPECIFICATION APPROPRIATELY.

- A. When scheduled, the minimum requirements for commercial HVAC system cleaning shall be as described in the National Air Duct Cleaners Association (NADCA) "General Specifications for the Cleaning of Commercial Heating, Ventilation and Air Conditioning Systems."
- B. Approved Cleaning Specialists:

1. Sani-Vac Service
2. Power Vac
3. High Tech Vacuum
4. Aero Filter Inc.
5. Stanley Steemer Great Lakes Inc.
6. Ventcon

PART 3 - EXECUTION

3.1 GENERAL SHEET METAL INSTALLATION

- A. Ductwork shall be installed to true alignment, parallel or perpendicular to adjacent building walls, floors and ceilings, to present a neat and workmanlike appearance.
- B. Provide necessary offsets and transitions to avoid interference with the building construction, piping, or equipment. Locate ducts with sufficient space around equipment to allow operating and maintenance activities.
- C. Bullhead tees and straight tap connections are not acceptable.
- D. Provide straight runs of ductwork, upstream and downstream, at equipment, fans, coils, TAU's, LTAUs, and humidifiers per manufacturer's recommendations and as indicated on drawings.
- E. Provide flexible connector where ductwork connects to fans, air handling units and other rotating equipment and where indicated on drawings.
- F. Repair damaged galvanized surfaces with zinc rich paint.
- G. For ductwork mounted outdoors, install duct with slight lateral pitch to prevent water ponding on top of duct.
- H. Repair PCD ductwork where coating is damaged or exposed by connections with compatible liquid PVC or per manufacturer's recommendations.
- I. Enclose dampers located behind architectural intake or exhaust louvers in a sheet metal collar and seal to building construction.
- J. Air volume control on parallel flow branches shall be accomplished with branch dampers; splitter type dampers are not acceptable.
- K. Install special equipment items in ductwork systems including, but not limited to: control dampers, thermometers, airflow measuring devices and other related items, according to manufacturer's recommendations.
- L. Set plenum doors 6 in. to 12 in. above floor. Arrange door swings so that fan static pressure holds door in closed position.
- M. Store duct at least 4 in. above floor on wood pallets or similar devices. Protect duct from odors, dust, moisture, and other debris while stored on or off the jobsite, and when transporting to the jobsite, by tightly covering with plastic.
- N. Ductwork openings shall remain protected and covered until just prior to connection. Immediately after assembly, restore all protection to prevent odors, dust, moisture, and other debris from entering ductwork system. Remove any internal labels.

Building Name

Edit Custom Properties

P00000000 0000 Issued for: 233100 - - 12

- O. Provide required penetrations and sleeves in building structure.
- P. Blank-off panels shall be screwed to louver blades and caulked to provide a weather tight seal.

3.2 FLEXIBLE DUCT INSTALLATION

- A. Flexible duct runs shall not exceed 5 ft. long. Cut to length so that it is not compressed. Trim ends squarely. Sag shall not exceed 1/2 in. per linear foot when installed horizontally.
- B. Provide a minimum of 3 ft. of flexible non-metallic duct at connections to supply, return and exhaust diffusers/grilles, unless otherwise noted.
- C. Support at a maximum spacing of 2 ft. using 4 in. wide sheet metal protection saddles at each duct hanger. Flex duct directional changes shall not exceed 45 deg with centerline radius of bend no less than one-half times duct diameter.
- D. For connection to supply, return and exhaust diffusers/grilles located in horizontal ceilings, use pre-fabricated 90 degree plastic supports (such as the Flexflow Elbow by Thermafex), or 90 degree sheet metal elbow fittings.
- E. Apply duct sealant to outside surface of collars and secure with metallic draw-band where flexible duct joins other duct or devices.
- F. Flexible duct shall not be used to connect terminal units to branch or main ducts.

3.3 DUCTWORK HANGERS AND SUPPORTS

- A. Generally, hang and support ductwork per the latest edition of SMACNA. Additionally, adhere to the more specific requirements found in this specification section, the Related Sections, and as indicated on the project drawings.
- B. Hanging duct, equipment, or accessories with cables or wires is prohibited.
- C. Comply with Related Sections and drawing details regarding hangers, building attachments, fasteners, beam clamps and retaining clips, and as note below.
- D. Provide vibration isolation as specified in Related Section.
- E. Ductwork shall be supported and anchored to structure so that horizontal ducts are without sag or sway, vertical ducts without buckle and all ducts are free from deformation, collapse or vibration
- F. Support un-insulated rectangular ducts in sizes to 36 in. by non-perforated galvanized steel strap or by trapeze hangers. Support insulated rectangular ducts and ducts larger than 36 in. with trapeze hangers.
- G. Provide at least one support for each length of duct, with a maximum hanger spacing of 10 feet. Install supports on both ends of duct turns, branch fittings and transitions.
- H. Do not hang ductwork from piping, ducts, other trades hangers, existing hangers, or equipment.

- I. Single band hangers are not acceptable on ducts greater than 24 in. diameter.
- J. Provide supports on each side of any duct mounted equipment or device, including fans, coils, dampers, etc, to permit removal of item without removal of adjacent duct sections.
- K. Provide supplemental steel required to support ductwork in shafts, mechanical rooms or on the floor where structural steel is not properly positioned.
- L. Beam clamps shall be double sided on ducts over 36 in. by 36 in. Use double sided or single sided beam clamps with retaining clips on all other sizes.
- M. Do not modify existing structural steel without approval of U-M project manager and a structural engineer's review.
- N. Provide clamping systems that are compatible with the structural steel system of the building.
- O. Use angle iron "V" construction supports or similarly rigid construction for vertical ducting that requires lateral support.
- P. Ductwork mounted on roof or otherwise exposed to elements shall be supported with frames constructed of galvanized steel angles and channels, regardless of duct size. Supports shall not rest on top of roof, but shall be firmly attached to roof structure and properly flashed. Ducts that penetrate through the roof shall utilize curbs and shall be counter-flashed. All fasteners shall be galvanized.
- Q. Provide angle sway bracing and diagonal cross bracing to the structure to provide support against maximum lateral loads that may be imposed on the ductwork installed downstream of fan discharges and ductwork exposed to wind loads, and any other locations exposed to lateral loads.

3.4 DUCT PAINTING

- A. Where the interior of duct is visible through grilles, registers, diffusers or other air diffusion devices, paint the interior flat black. Coordinate work with Architectural Trade.
- B. For plenum returns, where equipment and structure above ceiling is visible through return air grilles, provide black sheet metal baffle with turned edges suspended from building construction. Size and position the baffle to prevent restriction of air flow. Where space above ceiling precludes use of a baffle, paint visible building surfaces flat black.

3.5 TEMPORARY USE

- A. Develop a plan that assures ductwork is protected during temporary use. Obtain approval of the plan from the Owner's Representative.
- B. Maintain the protection plan until just prior to Owner turn-over.
- C. Successfully complete return/negative pressure duct leak testing prior to duct temporary use.

- D. Temporary filters shall be provided in return or negative pressure duct to protect ductwork and building contents when any fans are operated during construction. Filters shall have an equal or better performance rating than the air handling unit pre-filters specified for permanent use, but not less than MERV 8, in order to prevent construction dirt infiltration into duct systems. Install filters over grilles, diffusers, and all duct openings. Provide filters over supply grilles, diffusers and duct openings if construction dust and debris will enter when operated for temporary service (e.g. air system cycles off during periods when construction continues). Seal around temporary filters to prevent filter bypass.
- E. Continuously maintain all filters and replace when pressure drop exceeds 1 in. w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.
- F. Remove temporary filters and associated materials, and clean any adhesive residue from finished surfaces, at completion of temporary use.

3.6 DUCTWORK SEALING, INSPECTING AND LEAKAGE TESTING

- A. Seal, inspect and test prior to insulating or concealing ductwork. Leak test per procedures in the latest edition of SMACNA.

FOR EXPOSED DUCT IN FINISHED AREAS, CONSIDER IMPACT OF SEALANT ON AESTHETICS OF DUCT. POSSIBLE OPTIONS ARE NO SEALANT, WELDED JOINTS, OR BANDS TO COVER THE SEALANT.

- B. Seal ductwork to meet the following SMACNA seal classifications:

BELOW DUCT SEAL REQUIREMENTS MEET OR EXCEED ASHRAE 90.1 2007 REQUIREMENTS EXCEPT FOR UNCONDITIONED SPACES. ENGINEER TO REFER TO 90.1 FOR THE DEFINITION OF AN UNCONDITIONED SPACE AND IDENTIFY IF THE PROJECT HAS ANY DUCT RUNNING IN UNCONDITIONED SPACES. IF SO, SPECIFICALLY IDENTIFY WHICH SPACES ARE CONSIDERED UNCONDITIONED AND INDICATE THE REQUIRED SEAL CLASS, MATCHING 90.1 REQUIREMENTS.

- 1. Pressure class 2 in. w.c. or less (except exhaust or outdoor): Class C (seal transverse joints only.)
 - 2. Exhaust ductwork, pressure class 2 in. w.c. or less: Class B (seal all transverse joints and longitudinal seams).
 - 3. All outdoor ductwork: Class A (seal all transverse joint, longitudinal seams, and duct wall penetrations)
 - 4. All ductwork rated for a pressure greater than 2 in. w.c: Class A (seal all transverse joints, longitudinal seams, and duct wall penetrations).
 - 5. All inaccessible ductwork (duct in shafts, above hard ceilings, and any made inaccessible by work of other trades): Class A.
- C. Perform measured leak testing on the following ductwork:
 - 1. All duct sealed to SMACNA Class A.
 - 2. All welded duct.
 - 3. Maximum permissible leakage rate:
 - a. SMACNA Leakage Class 3.
 - b. Welded Ductwork: Zero leakage.
 - D. Duct Leakage Testing Procedures:

1. Prior to fabrication and installation, develop and submit for approval a ductwork testing plan, indicating locations of temporary caps, surface area of ductwork test sections, test pressure, leakage class and allowable leakage in cubic feet per minute.
2. Notify the Owner's Representative at least 2 days prior to each test.
3. Provide all blank-off plates, flanges, and safing required to isolate each section of duct to be tested.
4. Provide necessary testing apparatus.
5. For all ducts, pressurize ductwork to the specified pressure class and inspect ductwork for visual and audible leaks, and leaks perceptible to a hand 2 in. from duct. Reseal all perceptible leaks until acceptable to Owner's Representative.
6. After completing visual and audible inspection, conduct measured ductwork leakage tests at the specified pressure class for the duct. Reseal and retest as required until successfully achieving the specified leakage class.
7. Submit leakage test report for approval, using SMACNA or other approved form.

3.7 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.8 DUCTWORK CLEANING

DETERMINE IF THIS SECTION IS REQUIRED. INSERT AND EDIT THE NADCA SPECIFICATION APPROPRIATELY.

- A. Clean HVAC system as specified in the National Air Duct Cleaners Association (NADCA) "General Specifications for the Cleaning of Commercial Heating, Ventilation and Air Conditioning Systems."
- B. Approved Ductwork Cleaning Specialists: Sani-Vac, Power Vac, High Tec Vacuum, Aero Filters Inc., and Stanley Steemer Great Lakes Inc.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 233300 - AIR DUCT ACCESSORIES AND RGD'S

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 233300 - AIR DUCT ACCESSORIES AND RGD'S

REVISIONS

12-17-2010: APPROVED AS NEW MASTER

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

2024-01-02: REVISED SMOKE/FIRE DAMPER ACTUATORS TO BE ELECTRIC FOR ALL NEW PROJECTS. PNEUMATIC ACTUATORS ARE ONLY PERMITTED TO BE USED IN MAINTENANCE REPLACEMENTS.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

CAREFULLY EDIT AND COORDINATE RELATED SECTIONS.

RETAIN THE DIVISION 26 ELECTRICAL REFERENCE IN THIS SECTION TO ASSURE THAT ELECTRICAL WORK STANDARDS ARE OBSERVED AND ENFORCED

- B. Related Sections:

1. Section 233100: HVAC Ducts and Casings.
2. Section 230900: Mechanical Systems Controls.
3. Section 233600: Air Terminal Units.
4. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:

1. Sheet metal accessories as shown in the Contract Documents and required for a complete and operable air distribution system
2. Access doors in ductwork.
3. Duct test holes.
4. Duct air turning vanes.
5. Flexible connectors.
6. Fire dampers, fire/smoke dampers, smoke dampers, and combination smoke/isolation dampers.
7. Balance dampers.
8. Iris balance dampers
9. Backdraft dampers.
10. Sound attenuators.
11. Registers, grilles and diffusers.

12. Duct connections to laboratory airflow units.
13. Fume hood low airflow alarm set-up damper.
14. Wire mesh screens.

- B. This Section does not include sheet metal accessories for fiberglass reinforced duct (FRP) or other specialty duct systems. Refer to other specification sections for requirements.
- C. Section does not include automatic control dampers. See Related Section 230900 Mechanical Systems Controls.

1.3 SUBMITTALS

- A. Product Data: Submit performance data, rated capacities, furnished specialties, sound-power ratings, and accessories for each type of product.
- B. Duct Silencers: Include pressure drop and dynamic insertion loss data. Include breakout noise calculations for high transmission loss casings.
- C. Damper manufacturer's installation instructions.
- D. Product Data for each type of product.
- E. Shop Drawings:
 1. Indicate the location and rating of all dampers on shop drawings and submittals.
- F. Operation and maintenance data.

1.4 QUALITY ASSURANCE

RETAIN PARAGRAPHS A AND B IN EVERY PROJECT SPECIFICATION SECTION.

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
- C. NFPA 90A, "Installation of Air Conditioning and Ventilating Systems," and NFPA 90B, "Installation of Warm Air Heating and Air Conditioning Systems."
- D. SMACNA "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods, unless otherwise indicated.
- E. UL 555C "Standard for Fire Dampers."
- F. UL 555S "Standard for Smoke Dampers."

REVIEW WARRANTY TERM PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. RETAIN THIS ARTICLE IN EVERY PROJECT SPECIFICATION.

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ACCESS DOORS IN DUCTWORK

- A. Provide access doors in ductwork to permit access to the linkage side of automatic dampers, fire dampers, smoke damper, combination fire/smoke dampers, upstream side of coils, filters, humidifiers, airflow measuring stations, other equipment or devices requiring access or other locations as indicated on Drawings for cleaning, maintenance, or inspection purposes.
- B. Hang access doors on heavy gauge continuous hinges and secure in the closed position by means of metal clinching type cam latches. Hinges shall move freely. Where space conditions preclude hinges, provide four heavy duty cam-lock type latches, in addition to a retainer chain.
- C. Access doors shall be of double wall insulated construction of not less than 20 gauge sheet metal, neoprene gasketed around the entire perimeter. Insulation between the metal panels shall be of the same thickness as the duct or panel adjacent to the access doors. Doors shall match duct material type, and at a minimum, the pressure class of the duct system in which they are installed.
- D. Minimum Size: 24 inches by 24 inches when permitted by duct size. For smaller ducts, provide largest size access door that can be accommodated by duct height or width.
- E. Acceptable Manufacturers:
 - 1. Air Balance, Inc.
 - 2. Ruskin Company,
 - 3. Ductmate Industries, Inc.
 - 4. Nailor Industries, Inc.
 - 5. American Warming & Ventilating.

2.2 DUCT TEST HOLES

- A. A. Permanent, factory fabricated duct test holes, with air-tight flanged fittings and screw cap. Provide extended neck fittings to clear insulation. Acceptable manufacturer and model:
 - 1. Ventlock Model 699 by Ventfabrics, Inc.

2.3 DUCT AIR TURNING VANES

- A. Provide factory manufactured turning vanes in each elbow where inside radius is less than the width of the duct, and in all square elbows located in duct construction of greater than 2 inches w.g.
- B. Turning vane assemblies shall be adequately supported and affixed to prevent rattling, breakaway, and shall not deform. Assemblies longer than 12 inches shall be double wall.

- C. Turning vanes in negative pressure ductwork with pressure rating above 2 inches shall be installed in accordance with SMACNA Industrial Duct Construction Standard.
- D. Turning vanes shall match the duct material construction.
- E. In lieu of turning vanes, use long radius elbows when the elbow free area is less than one square foot.
- F. Airfoil turning vanes are not permitted.
- G. Acceptable Manufacturers:
 - 1. Aero Dyne.
 - 2. Ductmate Industries, Inc.
 - 3. Sheet Metal Connectors, Inc.
 - 4. Duro-Dyne.
 - 5. DynAir Inc.

2.4 FLEXIBLE CONNECTORS

- A. Provide flexible connectors of 4-inch minimum fabric width.
- B. Fabric for flexible duct connectors at equipment shall be a minimum of 22 oz. glass fabric, double coated with neoprene, fire retardant, flame-proofed, waterproof, airtight, and approved by UL and conforming to NFPA 90A. Flexible connectors susceptible to sweating shall be of the insulated type.
- C. Flexible connectors shall be rated for the same pressure as duct or equipment.
- D. Flexible connectors in laboratory and process exhaust systems shall be of the material and type suitable for that environment.
- E. Acceptable Manufacturers:
 - 1. Senior Flexonics Pathway, Inc.
 - 2. McGill AirFlow LLC, An enterprise of United McGill Corporation.
 - 3. Duro-Dyne.
 - 4. Ventfabrics, Inc.
 - 5. Fanair
 - 6. Pathway
 - 7. Ductmate
 - 8. Ventglas

DESIGNER SHALL EDIT U-M DAMPER CONSTRUCTION AND APPLICATION SCHEDULE DETAIL TO MAKE IT PROJECT SPECIFIC, AND INCLUDE IT ON THE DRAWINGS. SEE:

[HTTP://WWW.UMAEC.UMICH.EDU/FOR.ARCHS/STANDARDDETAILS.HTML.](http://www.umaec.umich.edu/for.archs/standarddetails.html)

2.5 GENERAL DAMPER CONSTRUCTION REQUIREMENTS

- A. Dampers shall be rated for the maximum close-off pressure at the installed location, but not less than the rating as indicated in the Damper Construction and Application Schedule.
- B. Dampers installed in galvanized ductwork shall be all galvanized construction including blades, shafts, bearings, linkages, etc. or as indicated in other sections.

- C. Dampers installed in stainless steel ductwork, polyvinyl coated ductwork (PCD), or located in any corrosive atmosphere shall be constructed of Type 304 or Type 316 stainless steel construction including blades, shafts, bearings, linkages, etc.
- D. Refer to the Damper Construction and Application Schedule on the Drawings for additional requirements. If not on the Drawings, refer to the following location for the Damper Construction and Application Schedule.
 - 1. <https://umaec.umich.edu/for-vendors/design-guidelines/standard-details-and-schedules/>.

2.6 FIRE DAMPERS, FIRE/SMOKE DAMPERS, SMOKE DAMPERS, AND COMBINATION SMOKE/ISOLATION DAMPERS

DESIGNER SHALL SHOW ALL REQUIRED FIRE, FIRE/SMOKE, SMOKE, AND SMOKE/ISOLATION DAMPERS ON DRAWINGS.

- A. General:
 - 1. Devices shall be of the appropriate service for the partition rating into which they are installed.
 - 2. Dampers shall meet the requirements of NFPA 90A and labeled in accordance with the latest editions of UL 555, UL 555S, and UL 555C.
 - 3. Provide dynamic rated dampers.
 - 4. Each damper shall be rated to close against the maximum design air velocity and pressure at its installed location, with an additional 400 fpm velocity and 0.5 in. w.g. static pressure safety factor.
 - 5. Dampers of all ratings and types shall be of the nominal 100 percent face area type, with blade package and frame components out of the airstream (type B). Dampers shall include the required oversize enclosures that shall be sealed by the damper manufacturer for the appropriate duct pressure class. Dampers shall have rectangular, flat oval or round duct collars for connection to mating ductwork.
 - 6. Furnish sleeves and mounting accessories as required per code.
- B. Fire Dampers
 - 1. Fire dampers shall be provided as shown on the Drawings and wherever Drawings indicate fire rated partitions.
 - 2. Fusible link temperature rating for fire dampers shall be 165 degrees F, or 50 degrees F above the highest duct system temperature, whichever is greater.

ENGINEER MUST EDIT THE SPECIFICATION TO INCLUDE THE PROJECT SPECIFIC REQUIREMENTS FOR SMOKE AND COMBINATION FIRE/SMOKE DAMPERS. INCLUDE INFORMATION ON REMOTE AND/OR LOCAL OVERRIDES, PRIMARY/SECONDARY HEAT SENSING DEVICE TEMPERATURE SET POINTS, MANUAL OR AUTOMATIC RESET FEATURES, AND OTHER REQUIRED FUNCTIONS, AS WELL AS A SEQUENCE OF OPERATION FOR EACH SMOKE AND FIRE / SMOKE DAMPER TYPE. NEW PNEUMATIC ACTUATORS SHALL ONLY BE PERMITTED WHEN REPLACING EXISTING PNEUMATIC ACTUATORS FOR MAINTENANCE APPLICATIONS.

- C. Smoke Dampers and Combination Fire/Smoke Dampers

1. Provide smoke dampers and combination fire/smoke dampers as shown on the Drawings and where architectural drawings indicate smoke/fire rated partitions.
2. Smoke dampers and combination fire/smoke dampers and actuators shall meet the requirements of NFPA 92A and NFPA 92B and shall be labeled as a "Leakage Rated Damper for Use in Smoke Control Systems" in accordance with latest edition of UL 555S. Smoke dampers shall be of low leakage design qualified to UL 555S leakage Class I and shall have a UL 555S elevated temperature rating of 350 degrees F minimum.
3. Supply each smoke damper and combination fire/smoke damper with a factory mounted damper actuator. Combination fire/smoke dampers shall be manufactured with a metal sleeve of appropriate length and thickness for the required damper installation, and the damper actuator shall be installed on the sleeve exterior. Damper actuators shall be electric unless otherwise indicated. Dampers shall fail to the closed position.
4. Damper Frame: Galvanized steel formed into a structural hat channel shape with reinforced corners. The blades shall be airfoil type. Bearings shall be sintered bronze sleeve turning in an extruded hole in the frame. Blade edge seals shall be silicone rubber designed to withstand 250 degrees F and jamb seals shall be stainless steel flexible metal compression type with silicone rubber backing, Class I rated.

ENGINEER MUST ADD THE PROJECT SPECIFIC REQUIREMENTS FOR COMBINATION FIRE/SMOKE DAMPERS NO DETAILS HAVE BEEN PROVIDED IN THIS SECTION.

5. Each combination fire/smoke damper shall also be equipped with a temperature limited re-openable feature as required by Code to meet the smoke control sequence of operation.

D. Smoke/Isolation Damper:

1. Smoke/isolation dampers, typically used at air handling units in discharge and return ductwork, shall comply with NFPA 90A and the above requirements for smoke dampers, except that dampers shall have UL rated electric actuators, with a minimum of one actuator for each sixteen square feet of damper area.

E. Acceptable Manufacturers:

1. Ruskin Company.
2. Air Balance Inc, a Mestek Company.
3. American Warming & Ventilating Co.
4. Vent Products Co., Inc.
5. Nailor Industries Inc.
6. Greenheck.

2.7 BALANCE DAMPERS

DESIGNER SHALL SHOW ALL REQUIRED BALANCE DAMPERS ON DRAWINGS.

- A. For pressure dependent systems, as a minimum, provide balance dampers at each branch duct, at each outlet or inlet, and as indicated for supply air, return air, and exhaust air duct systems.

- B. For pressure independent systems, as a minimum, balance dampers shall be provided at each branch for each outlet downstream of each supply air Terminal Airflow Unit (TAU) or Laboratory Terminal Airflow Unit (LTAU) and at each branch inlet upstream of each return air or exhaust air TAU or LTAU box and as indicated.
- C. Comply with SMACNA requirement and provide continuous rod and bearings on each end of shaft regardless of pressure class.
- D. Use 3/8 inch continuous square rod and 18 gauge stiffened blade for duct sizes 18 inches wide by 18 inches high and smaller, or 12 inches diameter and smaller.
- E. Use 1/2 inch continuous square rod and 16 gauge stiffened blade for single blade dampers in ducts 19 inches to 48 inches wide by a maximum of 10 inches high; and in 12-inch to 16-inch round ducts.
- F. When multi-blade dampers are required, use a manufactured 16 gauge, stiffened, opposed blade damper in a 14 gauge hat channel steel frame with reinforced corners. All hardware shall be galvanized, except use brass trunnions and bronze, steel, or synthetic bearings.
- G. Quadrant shall be locking type.
- H. Quadrant end of damper rod shall be factory slotted to indicate blade position.
- I. Provide galvanized or stainless steel sheet metal "hat section" on ducts with exterior insulation so that quadrant will be exposed. Provide tight sealing nylon brushing at duct opening for damper shaft under hat section.
- J. Each square rod shall be installed so that quadrant will be accessible for adjusting.
- K. Provide 24-inch-by-24-inch access door through ceiling or wall construction for each balance damper that is not accessible.
- L. Acceptable Manufacturers:
 - 1. Ruskin Company.
 - 2. Young Regulator Company,
 - 3. American Warming & Ventilating Co.
 - 4. Vent Products Co., Inc.
 - 5. Arrow United Industries.
 - 6. Greenheck.
 - 7. Flexmaster

2.8 IRIS BALANCE DAMPERS

- A. Supply and exhaust air duct connections at ventilated animal racks, and where indicated, shall utilize Iris type balance dampers.
- B. Damper shall use interlocking steel plates and a calibrated positioning system to form an adjustable aperture. Differential pressure ports on either side of aperture shall allow airflow measurement from catalogued (damper position vs. differential pressure) performance curves.
- C. Accuracy of measurement shall be plus or minus 7 percent with one diameter of straight duct upstream of damper.

- D. Damper shall be constructed of heavy gauge galvanized steel and suitable for slip-in duct installation.
- E. When indicated, provide positive seal type iris dampers capable of being set at a fully closed position.
- F. Acceptable Manufacturer:
 - 1. Continental Fan Manufacturing Inc.

2.9 BACKDRAFT DAMPERS

- A. Frames shall be flanged, a minimum of 3 inches wide, and a minimum of 20 gauge roll formed galvanized steel or 0.125 inch extruded aluminum with pre-punched mounting holes and welded corner clips for maximum rigidity.
- B. Blades shall be a single piece, with a maximum width of 6 inches, counter-balanced, and shall be constructed of a minimum of 28 gauge roll formed galvanized steel or 0.070 inch extruded aluminum. Blade ends shall overlap for maximum weather protection.
- C. Blade seals shall be extruded vinyl and mechanically attached to blade edge.
- D. Bearings shall be corrosion resistant synthetic.
- E. Linkages shall use a galvanized tie bar with stainless steel pivot pins.
- F. Axles shall be stainless steel.
- G. Mounting shall be suitable for the required orientation.
- H. Acceptable Manufacturers:
 - 1. Young Regulator Company.
 - 2. American Warming & Ventilating Co.
 - 3. Vent Products Co., Inc.
 - 4. Arrow United Industries.

2.10 SOUND ATTENUATORS

- A. Silencers shall be of the size, configuration, capacity, and acoustic performance as indicated on drawings.
- B. Insertion losses listed in the schedule are minimums allowable and pressure drops are maximum allowable. Silencer performance data shall be in accordance with ASTM E477 and validated by a National Voluntary Laboratory Accreditation Program (NVLAP) accredited independent testing laboratory.
- C. All silencers shall be factory fabricated and supplied by the same manufacturer. Inlet and outlet dimensions must be equal to duct sizes shown whether rectangular or round. Duct transitions at silencers are not permitted unless shown.
- D. Outer casing shall be a minimum of 20 gauge G-90, galvanized steel. Inner partitions shall be minimum of 24 gauge G-90 galvanized steel. Casings shall be airtight.

- E. Filler material shall be inorganic glass fiber of proper density to obtain specified performance and packed under a minimum of 5 percent compression to eliminate voids due to vibration and settling. Material shall be inert, vermin-proof, moisture-proof, and shall be totally encapsulated with a 1.5 mils thick Mylar or Tedlar film.
- F. Combustion rating for fill shall be in accordance with ASTM E84, NFPA 255, or UL 723.
- G. Provide packless type attenuator when indicated.
- H. Mounting shall be suitable for the required orientation.
- I. Acceptable Manufacturers:
 - 1. Industrial Acoustics.
 - 2. SEMCO Incorporated.
 - 3. Vibro-Acoustics.
 - 4. Ruskin
 - 5. United McGill
 - 6. VAW Systems
 - 7. Price

REVIEW THIS SECTION CAREFULLY AND SPECIFY DIFFUSERS THAT ARE APPROPRIATE FOR THE PROJECT OR APPLICATION. ADD SPECIALTY DIFFUSERS AS REQUIRED.

2.11 REGISTERS, GRILLES AND DIFFUSERS

- A. General:
 - 1. Diffusers, grilles, and registers shall be of steel or aluminum construction, factory primed and painted with baked enamel or acrylic, white color, unless otherwise scheduled.
 - 2. Diffusers, registers and grilles shall be compatible with the designed ceiling/wall type. Provide registers and grilles with frames that are compatible with adjacent construction, with countersunk mounting holes. Refer to architectural drawings for exact details of ceiling/wall construction.
 - 3. Engineering data shall be based upon tests conducted in accordance with the latest ASHRAE Standard 70, Method of Testing for Rating the Performance of Air Outlets and Inlets at non-isothermal conditions. Published Noise Criteria (NC) data shall be determined based upon a 10 dB room attenuation across all octave bands. Lab test reports shall be available upon request.
- B. Supply diffuser:
 - 1. Diffusers shall be of the restricted multi-orifice jet induction and air mixing type, consisting of louvered sections with built-in diffusing vanes.
 - 2. Diffusers shall be square with neck sizes to match connecting duct size.
 - 3. Diffusers shall be assembled for indicated patterns that provide 1-way, 2-way, 3-way or 4-way air discharge with each side delivering a quantity of air proportional to the area served.

4. The diffusers shall be constructed with an integral leak-proof collar extending minimum 1 inch above the core to accommodate duct connection. Square and rectangular collars shall have welded corners.
- C. Return and Exhaust diffuser:
1. Diffusers shall be square with neck sizes to match connecting duct size.
 2. The diffusers shall be constructed with an integral leak-proof collar extending minimum 1 inch above the core to accommodate duct connection. Square and rectangular collars shall have welded corners.
- D. Sidewall Adjustable Supply Register:
1. Sidewall registers shall have mitered corners, double deflection adjustable blades, and horizontal front blades.
- E. Low Wall Return/Exhaust registers:
1. Return and exhaust registers shall have (1) set of fixed blades, 42 to 45 degree deflection.
 2. Wall return and exhaust registers mounted 18 inches AFF or lower, shall be have mitered corners, fixed blades, horizontal front louvers. Frame and blade shall be manufactured of minimum 8 gauge aluminum or 12 gauge steel for rugged use.
 3. Low wall registers used in UMHHC facilities for clinical rooms shall utilize a hinged register face with turn screws for access to filter media, mounted in a factory provided channel behind the register face.
- F. Supply and Return Bar Grille
1. Bar grilles shall be extruded aluminum, nominal 1/8 inch wide bars with 0 degree deflection, on maximum 1/4 inch centers, or as scheduled.
 2. Continuous grilles over 72 inches in length shall be butted together using keyed splices for precise alignment.
 3. Concealed spring latch fasteners shall be used for attaching grille to plaster frame. No screw holes shall be visible on plaster frame or grille.
 4. Provide blank-off baffles for inactive sections of grilles, as noted on the drawings.
- G. Plenum Slot Diffusers
1. Diffusers shall be insulated for supply and uninsulated for return and shall have of the slot widths, number of slots, and lengths as indicated on the Drawings.
 2. Units shall be constructed of a minimum of 24 gauge galvanized steel with a black face.
 3. Inlets shall be drawn from the plenum wall to eliminate leakage and shall have a minimum of a 1 inch duct connection flange.
 4. Slot face shall be constructed of double metal thickness to provide rigidity and pattern controller shall be of the adjustable type.
 5. Provide blank-off baffles for inactive sections, as indicated on Drawings.
- H. Acceptable Manufacturers:

1. Tuttle & Bailey.
2. MetalAire.
3. Titus.
4. Price Industries.
5. Nailor Industries, Inc.
6. Carnes
7. Krueger

2.12 DUCT CONNECTIONS TO LABORATORY TERMINAL AIRFLOW UNITS

- A. Inlet and outlet connections may utilize draw bands with dual bolts/nuts and elastomeric gasket or, as a minimum, be permanently attached using appropriate fasteners and sealed with appropriate duct sealant.

2.13 FUME HOOD LOW AIRFLOW ALARM SET-UP DAMPER

- A. Provide a fume hood low airflow alarm set-up damper with locking quadrant at the outlet (downstream) of each fume hood laboratory terminal airflow unit.
- B. Damper shall be constructed of a minimum of 16 gauge Type 304 stainless steel with bearings and extended shaft. End of shaft shall indicate blade position.
- C. Gauge and construction of sleeve and blade components shall be as required to meet project duct static pressure ratings.

2.14 WIRE MESH SCREENS

- A. Screen assemblies shall be removable.
- B. Mesh: 1/2 -inch square pattern, 1/16 inch galvanized wire, interwoven, welded at wire intersections and to the frame to prevent rattles.
- C. Frames: Minimum of 1 inch by 1 inch by 1/8 inch galvanized steel angles for duct sizes through 24 inches, 1-1/2 inch by 1-1/2 inch by 3/16 inch for duct sizes between 25 inches to 48 inches, and 2 inches by 2 inches by 3/16 inch for ducts larger than 48 inches continuous around perimeter of screen. Provide intermediate supports to limit screen deflection to 1/16 inch at maximum design airflow.

PART 3 - EXECUTION

3.1 SHEET METAL ACCESSORIES INSTALLATION

- A. Install sheet metal accessories in accordance with manufacturers' recommendations, Contract Drawings and approved submittals.
- B. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
- C. Refer to other related sections for installation requirements, including joint connections and sealant requirements.

- D. Install duct accessories according to applicable details in SMACNA "HVAC Duct Construction Standards - Metal and Flexible."
- E. Install duct accessories of materials suited to duct materials. Use galvanized-steel accessories in galvanized-steel ducts, stainless-steel accessories in stainless steel ducts, use aluminum accessories in aluminum ducts.

3.2 DUCT ACCESS DOORS INSTALLATION

- A. Locate access doors so they can be opened completely without interferences and to allow easy access by maintenance personnel.
- B. Fire, smoke, combination fire/smoke damper or similar automatic shutting device access doors shall be mounted downstream (after shutoff) to permit resetting and inspection.
- C. Doors shall seal tightly into frame.
- D. Label access doors to note equipment that is accessed through the door. Labels and lettering on labels shall be in accordance with the mechanical identification section. Provide 1-inch-high minimum letters.

3.3 DUCT AIR TURNING VANES INSTALLATION

- A. Mount the outboard-most vane in the duct heel. Vanes shall be spaced across the entire corner diagonal, parallel to the airstream, adequately supported and affixed to prevent rattle and breakaway.

3.4 DUCT TEST HOLES INSTALLATION

- A. Provide duct test holes where required for testing and balancing purposes and as shown on Drawings.

3.5 DAMPER- INSTALLATION - GENERAL (INCLUDING AUTOMATIC CONTROL DAMPERS FURNISHED UNDER RELATED SECTION)

- A. Dampers shall be installed square and plumb to casing, duct, wall, etc. without racking. Align and adjust dampers to ensure proper opening and closing without binding or hesitation.
- B. Seal completely around frame.
- C. Install dampers designed for horizontal mounting in horizontal orientation, and dampers designed for vertical mounting in vertical orientation.
- D. Adequately reinforce multiple section dampers per manufacturer's recommendations.
- E. Install dampers so quadrants will be accessible for adjusting.
- F. Coordinate access through ceilings or walls to ensure each damper is accessible.

TO MINIMIZE DUCT NOISE GENERATED BY VOLUME DAMPERS, SMACNA RECOMMENDS LOCATING DAMPERS AT LEAST TWO DUCT DIAMETERS FROM FITTINGS AND AS FAR AWAY AS POSSIBLE FROM OUTLETS.

- G. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel.
- H. Set dampers to fully open position before testing, adjusting, and balancing.

3.6 FIRE, SMOKE, AND COMBINATION FIRE/SMOKE DAMPERS INSTALLATION

- A. Provide sleeves, mounting angles, and all other required accessories.
- B. Fire dampers shall not be installed in hazardous exhaust systems.
- C. Demonstrate re-setting of fire dampers to authorities having jurisdiction.
- D. Install fire, smoke, and combination fire and smoke dampers according to UL listing.

3.7 FLEXIBLE CONNECTORS INSTALLATION

- A. Flex connectors shall be used in all ductwork that crosses building expansion joints and at attachment to any equipment mounted on vibration isolators, and inlets and outlets of fans.
- B. The connectors shall be installed as close to equipment as practical and the clear gap at rest shall not be less than 3 inches.
- C. There shall be no tension of the fabric under static or dynamic loads. Connector shall be free of wrinkles caused by misalignment or fan reaction. End and overlaps shall be sealed airtight.
- D. Check connections during operation for leaks and binding.
- E. Outdoor flexible connectors shall be protected by a three-sided sheet metal weatherhood, open on the bottom, securely anchored on one side of the flexible connector only. Weatherhood to be of the same material as the ductwork.

3.8 REGISTERS, GRILLES AND DIFFUSERS INSTALLATION

- A. Support devices independent of the ceiling construction when required for safe and workmanlike installation.
- B. Paint visible duct, mounting clips, and accessories behind registers and grilles flat black.
- C. Adjust throw patterns as shown on Drawings.

3.9 FUME HOOD LOW AIRFLOW SET-UP DAMPER INSTALLATION

- A. Install the damper a minimum of four duct diameters downstream of each fume hood laboratory terminal airflow unit.
- B. Assure the damper is mounted downstream of any differential pressure switch probe or bulkhead fitting.

3.10 WIRE MESH SCREEN INSTALLATION

- A. Screen assemblies shall be firmly affixed and shall not vibrate.

3.11 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 1. Operate dampers and operators to verify full range of movement.
 2. Inspect locations of access doors and verify proper labeling and access to equipment.
 3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
 4. Inspect turning vanes for proper and secure installation.

INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

3.12 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

END OF SECTION 233300

BuildingName

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 233400 - FANS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 233400 - FANS

REVISIONS:

*MAJOR REVISIONS - D. KARLE FOR AEC MECH TECH TEAMS -
HVAC/CONTROLS GROUP, OCT 13, 2006.*

*REVISED SECTION 1.3 TO INCLUDE NEW AMCA STANDARD FOR INDUCED
FLOW FANS D. KARLE FEB 15, 2008.*

*REVISED TO REQUIRE CERTAIN PRODUCT DATA W/SUBMITTALS, PER MECH
TECH TEAM. D. KARLE, 7/29/08.*

*REVISED HIGH PLUME INDUCTION FAN SPEC TO ALLOW MULTIPLE FAN
MANUFACTURERS TO BE IN COMPLIANCE, PER MECH TECH TEAM. D.
KARLE, 09/10/09.*

REVISED CONTENT AND FORMAT MARCH 2011

*7-19-2012: ADDED THAT MULTIPLE BELTS ARE TO BE PROVIDED AS A
MATCHED SET, SO THAT BELT DRIVE INFO IN 220500 COULD BE
REMOVED AND ALL BELT DRIVE INFO CARRIED IN THE SPECIFIC
SECTIONS WHERE BELT DRIVES ARE USED. D. KARLE FOR MTT.*

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

*2024-01-02: REMOVED PNEUMATIC ACTUATION AS AN OPTION FOR
DAMPER ACTUATORS ON HIGH-PLUME INDUCTION TYPE LAB FANS.*

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 019100/019110: Commissioning.
 - 2. Section 220513: Motors.
 - 3. Section 220548: Vibration Control
 - 4. Section 233300: Air Duct Accessories and RGDs
 - 5. Section 230593: Testing, Adjusting, and Balancing
 - 6. Section 230900: Mechanical Systems Controls.
 - 7. Division 26: Electrical.

1.2 SUMMARY

ROOF CURBS ARE NOT SPECIFIED IN THIS SECTION. IF A ROOF CURB IS NEEDED, MAKE SURE IT IS SPECIFIED IN THE ARCHITECTURAL SPEC. SECTIONS OR ADD TO THIS SECTION.

A. Section Includes:

1. Centrifugal Fans:
 - a. Housed centrifugal fans.
 - b. Utility Sets.
 - c. Domed roof, up blast roof and sidewall exhaust fans.
 - d. Ceiling fans.
 - e. Cabinet fans.
 - f. Inline fans:
 - 1) Square Inline Centrifugal.
 - 2) Tubular Inline Centrifugal.
2. Inline Fans:
 - a. Propeller fans.
 - b. Tube-axial fans.
 - c. Vane-axial fans.
3. Specialty Use Fans:
 - a. Plenum fans.
 - b. High-plume induction type lab fans.
 - c. Smoke purge fans.
 - d. Kitchen exhaust fans.

1.3 SUBMITTALS

A. Submit the following product data for each unit:

1. Static pressure, airflow (CFM), speed (RPM), system curve, outlet velocity and fan tag for each fan.
2. Certified fan curves showing fan performance with the system operating points identified on curves. Surge, or "Do not operate" line, shall also be indicated on fan curve.
3. Performance curves shall be published by the fan manufacturer and based on tests in accordance with AMCA 210. The curves shall be drawn with the fan flow rate plotted against fan total pressure and fan brake horsepower as per section 10.2.1 of AMCA 210.
4. Bearing sizing and life calculations for each similar size and type of fan. Fan bearing calculations shall be based on fan maximum operating conditions including belt pull. Calculations shall be provided for both fan bearings and motor bearings.
5. Sound power levels for each size and type of fan. Sound levels shall be provided for all 8 octave bands for discharge of fan, inlet to fan, and radiated noise through casing.
6. Dimensional data for each size and type of fan, including operating and maintenance clearances.
7. Details of vibration isolation bases including selections for vibration isolation springs.
8. Details of fan discharge flexible duct connector.
9. Details of motor and belt guards.
10. Motor ratings, electrical characteristics, and motor accessories.
11. Fan anti-corrosion coating data sheets.

1.4 QUALITY ASSURANCE

- A. **Manufacturers and Products:** The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. **Reference Standards:** Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - 1. AMCA Standard 99-0401, "Classification for Spark Resistant Construction."
 - 2. ANSI/AMCA Standard 99-2404, "Drive Arrangements for Centrifugal Fans."
 - 3. ANSI/AMCA Standard 99-2406, "Designation for Rotation and Discharge of Centrifugal Fans."
 - 4. AMCA Standard 99-2408, "Operating Limits for Centrifugal Fans."
 - 5. ANSI/AMCA Standard 210 ANSI/ASHRAE 51, "Laboratory Methods of Testing Fans for Certified Aerodynamic Performance Rating."
 - 6. ANSI/AMCA Standard 260 "Laboratory Methods of Testing Induced Flow Fans for Rating."
 - 7. ANSI/AMCA Standard 300, "Reverberant Room Method for Sound Testing of Fans."
 - 8. ANSI/AMCA Standard 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data."
 - 9. ANSI/AMCA Standard 204, "Balance Quality and Vibration Levels for Fans."
 - 10. UL-705, "Power Ventilators" (applies only for fans exposed to outdoor conditions).
 - 11. UL-762, "Power Roof Ventilators for Restaurant Exhaust Appliances."
 - 12. UL-793, "Standard for Automatically Operated Roof Vents for Smoke and Heat."
 - 13. American Bearing Manufacturers Association (ABMA) Standards.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Fan manufacturer shall provide protection to insure that the interior and exterior of each fan is completely protected from dirt or weather during shipping. Openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:

1. All fan types specified in this Section, except Vane Axial, Tube Axial, and High-Plume Induction Type Lab Fans:
 - a. Loren Cook Co.
 - b. Acme.
 - c. Twin City.
 - d. Aerovent.
 - e. Greenheck.
 - f. Trane.
 - g. Barry Blower.
 - h. Penn.
 - i. Buffalo.
2. Vane-Axial and Tube-Axial:
 - a. Buffalo Fan Co.
 - b. Howden Buffalo, Inc.
 - c. Woods.
 - d. Trane.
 - e. Greenheck.
 - f. Cook
 - g. Joy

IF FRP INDUCTION FANS ARE REQUIRED, THE FOLLOWING MANUFACTURER MAY BE ADDED WITH APPROVAL FROM U-M HVAC MECH TEAM. CONSULT WITH U-M DESIGN MANAGER. MANUFACTURER: M-K PLASTICS.

3. High-Plume Induction Type Lab Fans:
 - a. Strobic.
 - b. Greenheck Vektor.
 - c. Cook Hi-Plume

2.2 GENERAL CONSTRUCTION- ALL FANS

- A. Provide balanced variable sheaves for motors 7.5 HP and under and fixed sheaves for motors 10 HP and over. Size variable sheaves at midpoint of specified operating conditions to allow field adjustment up or down during balancing procedures. Where fixed speed sheaves are specified for a specific fan, provide one (1) additional sheave set, if required, for final balancing.
- B. Fan selection and ratings shall be based on tests made in accordance with AMCA 210.
- C. Fans shall be AMCA licensed and shall bear the AMCA seal for both sound and performance levels.
- D. Fan shall be minimum Class I construction with proper UL label.
- E. The specified fan RPM, outlet velocity, and tip speed are the maximum acceptable. The motor horsepower, CFM, and static pressure are the minimum acceptable.
- F. Unless noted otherwise by specific fan type or per schedule, fan housing shall be heavy gauge continuous welded corrosion resistant steel construction with fan scroll and bearings supported from structural steel framework.
- G. All fasteners shall be corrosion resistant type.
- H. Fan housing shall be of suitable thickness and bracing required for stable and rigid construction, with no deflection, and to prevent vibration and pulsation.

- I. Fans having duct-connected inlets shall be provided with a flanged inlet and/or outlet collar matching companion flange.
- J. Provide OSHA belt guards on all belt driven fans.
- K. Fans shall be spark-proof Type A, B or C (AMCA 99-0401) as required by application.
- L. For exterior mounted fans, a weatherproof housing shall be provided with ventilation grilles to cover motor and drive assembly.
- M. Provide special construction fans, such as spark-proof, explosion-proof, or specially coated fans as required by schedules or as specified herein.
- N. Provide birdscreen on fans exposed to the exterior environment.
- O. Provide adequate space for service of fan, motor and bearings.
- P. The fan shaft shall be solid high carbon steel, accurately turned, ground and polished, and ring gauged for accuracy.
- Q. Recommended bearing manufacturer tolerances shall be met in the area of the shaft in contact with the bearings.
- R. Shafts must be dial indicator inspected for straightness after the keys are cut.
- S. Fan shaft shall be coated with rust inhibitive coating.
- T. Fan wheel assembly or propeller assembly shall be statically and dynamically balanced prior to fan assembly.
- U. The entire rotating assembly shall be designed so the first critical speed is at least 25% over the maximum fan class speed.
- V. Fan Shaft Bearings
 - 1. Fan bearings shall be bolted on a rigid welded steel framework integral with the housing.
 - 2. Bearings shall be designed and individually tested specifically for use in air handling applications.
 - 3. Bearings shall be sized for a minimum L-10 life of 200,000 hours at the maximum fan class operating speed and horse power. Selection shall account for all operating conditions including belt pull. Bearings shall be selected in accordance with standards set forth by the American Bearing Manufacturers Association (ABMA).
 - 4. Bearings shall be grease lubricated self-aligning ball or roller type. Provide tapered roller bearings for vertical applications.
 - 5. Bearing housings shall be solid cast iron, pillow block or flange mount type. Provide split pillow block bearings where required by the application speed.
 - 6. Stamped bearing housings are permitted on fans of 1/4 HP or less.
 - 7. Bearings shall be of the type that can be re-lubricated, and shall be equipped with grease fittings.
- W. Where fan bearings are not easily accessible or are installed in a hazardous exhaust airstream, provide clear plastic grease leads, properly secured to avoid damage or fatigue, routed to an accessible location.

X. Fan Drive

1. Fan drive shall be a multiple V-belt type sized for 1.65 times the fan motor horsepower. Sheaves shall be fixed or adjustable based on fan motor horsepower as specified herein before. Fan sheave shall have a tapered lock, split and keyed hub. Groove spacing on equipment and motor pulleys shall align. For fans 1/2 HP and larger, quantity of belts shall be such that if any one belt fails, remaining belts shall allow fan to continue functioning as designed. Multiple belts shall be provided as a matched set.
2. Motors shall meet requirements as specified in Motors section.
3. Motor shall be 1800 rpm maximum for belt driven or direct drive fans.
4. On OSHA approved type fan drive guard shall be provided with provision for RPM measurement at both motor and fan without removing the guard. The guard shall be made of 1/2 in., 16 gauge flattened expanded steel, wrapped around a 16 gauge channel frame suitably braced to prevent vibration. Guard shall be G-90 galvanized, or painted to match fan housing paint.
5. Fan belts shall be oil resistant 24,000-hour non-static belts.

Y. Provide thrust arrestors as required to limit movement of the fan upon start-up.

Z. Provide riveted, engraved aluminum nameplate containing pertinent, specific fan data, including manufacturer, model, serial number, and electrical data, etc.

2.3 PAINTING

A. Each fan component shall be thoroughly cleaned, degreased and deburred.

B. Prior to assembly, prime coat all non-galvanized ferrous metal parts with zinc rich primer (minimum 70 percent zinc), total dry film thickness of not less than 1.3 mils.

C. For interior units, finish paint all non-galvanized ferrous metal parts with alkyd enamel paint.

1. Low-luster interior enamel; total dry film thickness of not less than 2.6 mils.

D. For exterior units, finish paint all non-galvanized ferrous metal parts with alkyd enamel paint.

1. Semi-gloss exterior enamel; total dry film thickness of not less than 2.6 mils.

E. Aluminum and stainless steel parts do not require painting.

F. Special coatings for corrosive exhaust systems are specified in the exhaust fan specifications.

2.4 CENTRIFUGAL FANS

A. General

1. Centrifugal type fans shall be belt drive, unless noted otherwise
2. Fans shall be backwardly inclined, airfoil, or flat blade type with a minimum of 9 blades.
3. Fans shall have sharply rising pressure characteristics at the operating point specified and shall be quiet and stable in operation. Horsepower characteristics shall be self-limiting (non-overloading) and at peak value at the specified operating point.
4. Each fan base shall be fully assembled with motor and drive on a structural steel base.

B. Fan Base

1. Fan with motor and drive shall be mounted on a structural steel base.
2. Base shall be welded. After welding, the base shall be cleaned, primed and painted to match fan coating.
3. Base steel sizing and construction shall be sufficient to allow the entire assembly to withstand the rigors of shipping and rigging.
4. Base shall be provided with lifting lugs and motor slide rails.
5. Fans with inertia bases shall be in accordance with Mechanical Vibration Control section.
6. Bases shall be constructed with gusseted brackets to accommodate field installed spring isolators as specified in Mechanical Vibration Control section.

C. Fan Housing

1. Fans having wheel diameters 36 in. and larger shall have horizontally flanged split housings as required for installation.
2. Fan housing and inlet shall be constructed to allow the fan wheel(s) to be removed through the inlet opening when the inlet cone is removed.
3. Provide a quick opening inspection door with heavy duty latches.
4. A 1/2 in. NPT tapped 3/4 in. diameter pipe coupling drain connection shall be welded to the fan scroll at the lowest point, equipped with a pipe plug.
5. Class I and II fans shall be convertible to a minimum of 8 standard discharge arrangements.
6. Provide a Fan cut-off to deliver good pressure distribution.

D. Fan Inlet and Wheel Cone

1. Provide a precision die-spun or formed, and matched inlet and wheel cones for streamlined airflow into the wheel to ensure full loading of the blades.
2. Inlet and wheel cones shall be hyperbolic. Radial side sheets are not acceptable.
3. Inlet cone shall be heavy gauge, bolted to fan housing to allow for removal.
4. Fans that are not duct-connected shall be provided with inlet/outlet screen(s). Screen(s) shall be standard manufacturer provided screen or galvanized maximum nominal 1 in. by 1 in. mesh fabricated 10 gauge steel.

5. Hubs shall be straight bored or use taper lock bushings, keyed and set screwed to shaft for positive attachment. Hubs shall be securely riveted or bolted to the backplate or center plate. Bushed hubs are not acceptable.
 6. Double-width double-inlet fans shall be a single wheel of the common center plate design or 2 single-width single-inlet wheels back-to-back, each keyed and set screwed to a common shaft.
 7. Fan blades shall be continuously welded to the inlet hub and the backplate.
 8. Wheel center plate or backplate shall be heavy gauge steel construction with a minimum gauge as indicated in material construction schedule.
- E. Housed Centrifugal Fans
1. Housing shall be per Related Section "Custom Air Handling Units."
 2. Access doors shall be per Related Section "Custom Air Handling Units."
- F. Utility Set Fans
1. Utility sets shall meet all applicable centrifugal fan specification requirements.
- G. Domed Roof, Up Blast Roof and Sidewall Exhaust Fans
1. General:
 - a. Housing shall be constructed of heavy gauge spun aluminum with a rigid internal support structure.
 - b. Fan wheel shall be backward inclined.
 - c. Drive frame assembly shall be constructed of heavy gauge steel.
 - d. Motors and drives shall be mounted on vibration isolators, out of the air stream.
 - e. Fresh air for motor cooling shall be drawn into the motor through a tube free of contaminants or through a space between the fan shroud and the motor cover.
 - f. Fan drives shall be sized for 1.5 times the motor horsepower. Pulleys shall be cast type, keyed and securely attached to the wheel and motor shafts.
 - g. Motor pulleys shall be adjustable for final balancing.
 - h. Provide a factory-installed disconnect switch, wired from the fan motor to a junction box installed within the motor compartment. Provide a conduit chase through the base to the motor compartment.
 - i. When backdraft dampers are installed below fan, provide a heavy gauge hinge kit to allow entire fan to tilt away from roof curb for access to dampers. Construct hinge kit with aluminum hinges and hold open cables for field installation.
 2. Roof-mounted up blast exhaust fans shall have a leak proof housing constructed with a one-piece windband with an integral rolled bead, and shall be joined to the curb-cap with a continuously welded seam.
 3. Sidewall mounted exhaust fans shall have a leak proof housing constructed with a one-piece windband with an integral rolled bead. Provide a mounting plate that will be attached and sealed to the wall prior to installing fan.

H. Ceiling Fans

1. Fans shall be direct drive.
2. Outlet duct collar shall include an aluminum backdraft damper and shall provide for connection to ductwork as required.
3. Grille shall attach firmly and securely to housing and shall be easily removable for access to motor.
4. Fan wheel shall be forward curved.
5. Mount motor on vibration isolators.
6. Access to wiring shall be external.
7. Motor disconnect shall be internal and of the plug-in type.
8. Sound power rating shall not exceed 5 sones.

I. Cabinet Fans

1. Duct mounted fan shall be belt-driven, inline type.
2. Housing shall be rectangular, galvanized steel and shall include rectangular duct mounting collars.

CAUTION, FORWARD CURVED FANS MAY OVERLOAD IF RESISTANCE DOES NOT MEET DESIGN ASSUMPTIONS (IF RESISTANCE IS LESS THAN DESIGN ASSUMPTIONS).

3. Fan wheel shall be backward inclined or forward curved.
4. Fan drives shall be sized for 1.65 times the motor horsepower. Pulleys shall be cast type, keyed and securely attached to the wheel and motor shafts.
5. Motor pulleys shall be adjustable for final balancing.
6. Provide a hinged or removable panel in the fan cabinet of sufficient size to allow access for service to all internal fan components without dismantling cabinet.

J. Centrifugal Inline Fans

1. Tubular Inline Centrifugal
 - a. Fan housing shall be provided with mounting brackets at both inlet and discharge suitable for hanger rods or bolting directly to structure.
 - b. Fan shall be suitable for horizontal or vertical mounting.
 - c. Motor, drive and bearings shall be out of the airstream and housed to facilitate ease of maintenance. Motor cooling shall be through the fan drive and motor housing. Housing for motor drive and bearings shall be of same construction as the fan housing.
2. Square Inline Centrifugal
 - a. Fan housing shall be of bolted and welded construction utilizing corrosion resistant fasteners. Housing shall include airflow straightening vanes and integral duct flanges. Adjustable motor plate shall utilize threaded studs for positive belt tensioning. Access doors and mounting feet shall be located as required for the specified position.
 - b. Construct fan wheel of 100 percent aluminum, including a precision-machined cast aluminum hub. Wheel inlet shall overlap an aerodynamic aluminum inlet cone to provide maximum performance and efficiency.

2.5 **INLINE FANS**

- A. General: The aerodynamic design of the fan is such that the maximum power absorbed by the impeller occurs within the normal working range, i.e., the fan has a non-overloading characteristic.
- B. Propeller Fans

CONSIDER IF FAN SHOULD BE BELT OR DIRECT DRIVE. CONSIDER IF THE FOLLOWING ACCESSORIES ARE REQUIRED FOR YOUR APPLICATION: WEATHER HOOD, FILTERS, ACTUATED (INSTEAD OF GRAVITY) BACK-DRAFT DAMPERS, DIFFUSERS.

1. Entire fan shall be heavy duty, industrial type construction.
2. Provide direct or belt drive fans, as scheduled.
3. Construct fan panel of heavy gauge plate steel with a die-formed or spun venturi-shaped inlet cone built into the panel.
4. Fan panel edges shall be formed back. Corners shall be welded and ground.
5. Fan wheel, motor, and bearings shall be supported from fan panel using structural channel or heavy plate steel. Bearing housings and motor base shall be mounted on a heavy steel plate spanning the 2 vertical support members. All construction shall be welded or bolted.
6. Wheel shall have a minimum of 4 propeller blades, die-formed constructed of heavy gauge steel or aluminum. A reinforcing gusset shall be welded or riveted to the blades and to a machined hub.
7. Provide a protective welded-wire steel guard to completely enclose the motor/drive/fan assembly.
8. Provide heavy duty gravity operated back draft dampers made of galvanized steel, with blade and jamb seals.

YOUR APPLICATION MAY NOT REQUIRE A DAMPER GUARD. DELETE BELOW IF NOT REQUIRED.

9. Provide an OSHA damper guard that completely encloses the damper. Damper guard shall consist of galvanized expanded metal screen welded to a galvanized metal frame.
- C. Tube-Axial Fans
 1. Fans shall be Arrangement No.9 for belt drive or Arrangement No.4 for direct drive.
 2. Fan casing, flanges and supports shall be of suitable thickness and bracing required for stable and rigid construction, with no deflection, and to prevent vibration and pulsation.
 - a. Fans 38 in. diameter or less shall be minimum 12 gauge construction.
 - b. Fans over 38 in. diameter shall be min 10 gauge construction.
 3. Fan casings shall be fitted with mounting legs or hanging clips as required for the mounting arrangement indicated.
 - a. Fan mounting legs shall be fabricated from steel plate suitably braced to ensure stability and rigidity.
 - b. Clips for horizontal suspension shall be minimum 3/8 in. steel plate welded and mounted at fan centerline.

- c. Clips for vertical suspension shall be minimum 3/8 in. steel plate welded and mounted at center of moment of inertia of fan assembly.
- 4. Fans shall be provided with supports for horizontal or vertical mounting, as required. When required, inlet bell, inlet screen, acoustical diffuser and outlet cone shall be provided by the manufacturer.
- 5. The impeller shall be secured to the motor shaft by a key and keyway. Axial location shall be provided by a collar or shoulder on the drive shaft with a retaining washer and screw fitted into a tapped hole in the end of the shaft. The screw shall be locked in position.
- 6. External grease fittings with extended grease leads shall be provided for motor lubrication. Motor shall be removable from either end of the fan. Foot mount or "C" face flange mount motors are acceptable.

D. Vane-Axial Fans

- 1. Adjustable pitch vane-axial fans shall be direct or belt driven, as indicated, axial flow type, with fan blade angle capable of manual adjustment while fan is stopped.
- 2. Fans shall be Arrangement No.9 for belt drive or Arrangement No.4 for direct drive. The fan rotor shall be mounted directly on the motor shaft with the assembly enclosed entirely within the fan casing, suitable for inline duct mounting.
- 3. Fan casing, flanges and supports shall be of suitable thickness and bracing required for stable and rigid construction, with no deflection, and to prevent vibration and pulsation.
 - a. Fans 38 in. diameter or less shall be min 12 gauge construction.
 - b. Fans over 38 in. diameter shall be min 10 gauge construction.
- 4. Fan casings shall be fitted with mounting legs or hanging clips as required for the mounting arrangement indicated.
 - a. Fan mounting legs shall be fabricated from steel plate suitably braced to ensure stability and rigidity.
 - b. Clips for horizontal suspension shall be minimum 3/8 in. steel plate welded and mounted at fan centerline.
 - c. Clips for vertical suspension shall be minimum 3/8 in. steel plate welded and mounted at center of moment of inertia of fan assembly.
- 5. Fans shall be provided with supports for horizontal or vertical mounting, as required. Inlet bell, inlet screen, acoustical diffuser and outlet cone shall be provided by the manufacturer.
- 6. Fan shall have inlet and outlet static regain cone.
- 7. Provide discharge cone silences, as scheduled, optimized to fan discharge geometry with minimum dynamic insertion loss of 15/18 dB at 250/500 Hz at 2000 fpm duct velocity.
- 8. Fan blades and hubs shall have aluminum castings, alloy 356 T6 aluminum alloy. Fan blades shall be designed for maximum efficiency and be airfoil shaped, varying in twist and width from base to tip. Blade tip clearance shall be within tolerance to meet certified performance of fan. Fan hub shall be one-piece aluminum casting. The fan hub shall have the capacity to add or delete impellers in the field for final balance.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

233400 - 11

9. Fan blade pitch angle shall be individually, manually adjustable using common wrenches. Special tools shall not be required to adjust blade angle.
 - a. Fan manufacturer shall install and adjust linkages for controllable and manually adjustable pitch vane axial fans in the field. Field adjustment of the pitch range shall be provided by the fan manufacturer to balance the fan to maximum and minimum conditions. Field adjustment of the adjustable pitch setting shall be provided by the fan manufacturer to balance the fan to the required conditions.
10. The impeller shall be secured to the motor shaft by a key and keyway. Axial location shall be provided by a collar or shoulder on the drive shaft with a retaining washer and screw fitted into a tapped hole in the end of the shaft. The screw shall be locked in position.
11. Provide external grease fittings with extended grease leads for motor lubrication. Motor shall be removable from either end of the fan. Foot mount or "C" face flange mount motors are acceptable.

2.6 PLENUM FANS

- A. Provide single width non-overloading centrifugal type, mounted on rigidly built and braced all welded fan pedestals made of structural steel, mounted to square, flat mounting plates, and equipped with lifting lugs.
- B. Provide belt driven type unless noted otherwise.
- C. Wheels shall be 12 bladed air foil shaped to reduce sound and increase efficiency.
- D. Wheel shall be carefully matched to inlet cone to provide precise running tolerances and maximum operating performance and efficiency.
- E. Provide the fan wheel with a completely enclosing protective cage with a removable section large enough to service the fan or drive easily. Cages across the fan plenum access door are not acceptable.
- F. Provide lubrication lines with Zerk fittings, extended to the exterior of the protective fan cage, securely mounted to prevent stress.
- G. Provide removable fan inlet screen.

2.7 HIGH-PLUME INDUCTION TYPE LAB FANS

PAY CAREFUL ATTENTION TO HOW FANS WILL BE SUPPORTED ON ROOF. IF FANS OR PLENUM ARE TO BE SUPPORTED ON STRUCTURE, ENSURE THAT A MINIMUM 3 -FT. CLEARANCE IS MAINTAINED BELOW PLENUM TO ALLOW ROOF MAINTENANCE.

- A. Provide exhaust fans with induction windbands that discharge air at no less than 3000 FPM at the design air volume.

- B. Fans shall meet the scheduled performance requirements, including system effects from provided plenums. Manufacturer shall be responsible to account for system effects created by backdraft dampers, plenum size/aspect ratio, and connection sizes and locations at the specified connection air volumes.

ENGINEER MUST SPECIFY THE INDUCTION PERFORMANCE (AMOUNT OF INDUCED AIR VERSUS PRIMARY AIR). EDIT PART C BELOW CAREFULLY. 270 PERCENT IS ABOUT THE MAXIMUM INDUCTION PERCENTAGE CATALOGUED, AND MAY NOT BE POSSIBLE DEPENDING ON THE FAN SELECTION.

- C. Discharge shall include FRP nozzles with passive central stack that is capable of generating aspiration. The FRP shall be chemically and UV resistant.
- D. Steel entrainment windbands shall provide secondary induction of outside air. Induction shall take place downstream of the fan impeller. Windbands shall discharge 270 percent of the design primary airflow rate, or as scheduled. Manufacturer shall certify primary and discharge (induced plus primary) air volumes, and provide these air volumes and a certification statement with the submittal.

CONSIDER IF FACTORY TESTING OF INDUCTION FAN IS APPROPRIATE FOR YOUR PROJECT TO VERIFY INDUCTION PERCENTAGE. IF SO, EDIT THE ARTICLE "SOURCE QUALITY CONTROL," SEVERAL PAGES BELOW. WITH THE ADVENT OF ANSI/AMCA STANDARD 260, FACTORY TESTING OF INDUCTION FANS HAS BECOME LESS NECESSARY.

- E. Impellers shall be mounted to the motor shaft to provide a direct drive, Arrangement No.2, or No.4 type fan. Motors shall be isolated from the primary exhaust air stream and shall be visible and accessible from the fan exterior for inspection and service.
- F. Mixed flow impellers shall consist of a combination of axial/backward curved blades, and shall be of welded steel construction. The impeller shall have non-stall and non-overloading performance characteristics with stable operation at any point on the fan curve.
- G. Stationary discharge guide vane sections shall be provided to increase fan efficiencies.
- H. Vibration isolation shall be limited to rubber-in-shear pad type isolators, unless noted otherwise.
- I. Fan assemblies shall be designed for a minimum wind loading of 100 mph, and for mounting on a conventional roof curb or plenum as indicated, without the need for guy wire supports.
- J. Provide sound attenuators if required to meet specified sound levels. Specified sound power levels shall not be exceeded, including impacts from bypass damper airflow noise. Provide acoustical louvers if required. Sound power levels shall be guaranteed with the attenuator installed on the fan in the specified configuration.

SELECT ONE OF THE FOLLOWING SOUND ATTENUATOR OPTIONS.

- K. Provide fan manufacturer's sound attenuator, installed integral as part of exhaust nozzles for each fan.

1. Maximum attenuator air pressure drop shall be 0.1 inch W.C. Provide performance data of fans de-rated for the pressure loss related to attenuator.
 2. Attenuator shall provide attenuation values and fan sound pressure levels as indicated. The published insertion loss values shall be obtained from testing with the attenuator installed in the specified configuration.
 3. Silencer shall be constructed of FRP, aluminum, or 316 stainless steel for both inner and outer liners.
 4. Acoustical media shall be minimum 3 pcf density fiberglass, isolated from the air stream by a Tedlar film, or the attenuator design shall be packless type.
 5. Silencer interior and exterior shall be coated to match fan, including color.
 6. Attenuator shall be self-supporting, equipped with bracing and lifting lugs suitable to support the weight of the attenuator.
 7. Flow direction shall be clearly marked on side of attenuator.
 - 8.
 9. Provide inline sound attenuator with length as indicated.
 10. Maximum air pressure drop shall be 0.1 in. W.C. when installed. Provide performance data of fans de-rated for the pressure loss related to attenuator.
 11. Attenuator shall provide attenuation values and fan sound pressure levels as indicated. The published insertion loss values shall be obtained from testing with the attenuator installed in the specified configuration.
 12. Construct attenuator casing of FRP with minimum 3/16 in. wall thickness or minimum 14 gauge welded galvanized steel. Silencer interior and exterior shall be coated to match fan, including color. Casing shall be of welded construction.
 13. Acoustic media shall be minimum 3 pcf density fiberglass. Media shall be chemically protected from air stream by a Tedlar scrim. Inner surface of media shall be covered with perforated galvanized steel. The leading edge of the perforated metal shall not be exposed to the air stream.
 14. Attenuator shall be bolted to fan and discharge stack with flanges and stainless steel hardware. Attenuator shall be self-supporting, equipped with bracing and lifting lugs suitable to support the weight of the attenuator.
 15. Flow direction shall be clearly marked on side of attenuator.
- L. Fan construction shall be AMCA Spark Class C.
 - M. Fans shall be modular construction and capable of field assembly on roof.
 - N. PTFE gaskets shall be provided at all companion flange joints.
 - O. Fasteners shall be type 316 stainless steel.
 - P. A bolted access door shall be provided for impeller inspection on each fan.
 - Q. Fans and accessories shall have internal drain systems to prevent rainwater from entering building duct system.
 - R. Electric motors shall be TEFC and as specified in Motors section.

- S. Provide a NEMA 3R, heavy-duty rated, non-fused disconnect switch mounted and wired to motor. Mount switch adjacent to access door. Disconnect shall include early break contacts for fans driven by variable frequency drives.

ENGINEER MUST SPECIFY THE REQUIRED FAN COATING. EDIT BELOW CAREFULLY, IN CONSULTATION WITH FAN VENDORS, BASED ON CHEMICALS EXHAUSTED.

- T. All steel and aluminum surfaces shall be prepared for coating by blasting or chemical etching. Prime coat with zinc rich paint (minimum 70 percent zinc). Topcoat with amine epoxy or polyester coating, non-caulking in sunlight, UV inhibited medium gray color. The minimum DFT of the coating system shall be 6 mils. The coating system shall exceed a 4000-hour ASTM B117 Salt Spray Resistance test.

U. Accessories

1. Inlet mixing plenums shall be provided by the fan manufacturer. Each plenum shall be sized to support weight and performance requirements for all fans indicated. Plenums shall be capable of supporting fans without need for guy wires or supports.
 - a. Plenums shall be double wall construction with structural stiffeners or shall be continuously welded, heavy gauge single wall construction.
 - b. Plenums shall include hinged access doors with heavy duty latches and screens over primary air inlets.
 - c. Plenums shall be coated to match fans.
 - d. Unless noted otherwise, plenums shall be suitable for mounting on roof curbs.
2. Dampers:
 - a. Airfoil type, opposed blade, stainless steel construction.
 - b. Stainless steel damper linkage, rods, bearings, and jamb seals.
 - c. Polymer blade edge seals. Select blade edge seal material to match the chemical resistance of the fan's coating system.
 - d. Damper frames shall be minimum 13 gauge stainless steel.
 - e. Damper linkage shall be exposed blade-mounted type. Linkages concealed in the damper frame are not allowed.
 - f. Damper drive linkage shall be set by the manufacturer and welded or bolted through the shaft to eliminate slippage; set screws shall not be used.
 - g. Leakage shall not exceed 6.0 CFM/sq. ft. at 3 in. WC.
 - h. Damper and actuator shall operate smoothly and without deformation affecting specified performance, at a differential pressure no less than the maximum deadhead (zero flow) pressure the fan is capable of producing.
 - i. Dampers shall be accessible for maintenance. Damper actuators shall be accessible for maintenance from outside the contaminated interior parts of the plenum.
3. Bypass dampers shall be provided with all plenums for mixing outside air with primary exhaust. Provide:

CHOOSE ONE OF THE BELOW FOR EACH FAN, AND EDIT CAREFULLY.

- a. Louver/damper combinations, manual locking quadrant. Provide rain hood w/ birdscreen.
- b. Dampers with extended shaft for connection to an actuator. Provide rain hood with birdscreen for each damper.
- 4. Provide isolation (backdraft) dampers at the inlet to each fan.
- 5. Provide damper actuators, capable of properly throttling and tightly closing the dampers.
 - a. Damper actuators shall be spring return electric.
 - b. Isolation damper actuators shall be factory wired (via transformer when required) to the fan disconnect switch to open when the fan is energized, close via a spring when the fan is de-energized, and open on a loss of normal power.
 - c. If the fan is shipped separately from the plenum, all wiring and conduit shall be factory supplied for easy connection in field.
- 6. Provide extended clear plastic, UV resistant motor lube lines. Extend lines to a mounting bracket located on the fan roof base with Zerk fittings for each line.
- 7. Provide a structural mounting pedestal for a portable jib crane as part of each fan roof base, in sufficient quantities to reach all fans.
- 8. Vortex breakers shall be provided on all side inlet and multiple fan plenums.

PARAGRAPH BELOW IS FOR PERCHLORIC ACID FANS ONLY. DELETE IF N/A FOR YOUR PROJECT. NOTE: ADDITIONAL SPECIFICATION MAY BE REQUIRED FOR FANS ON PERCHLORIC SYSTEMS. DO NOT RELY ON THIS PARAGRAPH ALONE.

- 9. Inlet spray nozzle(s) shall be mounted at fan inlet to provide complete wash-down capability of fan while in operation. Spray nozzle(s) shall be suitable for water or steam output. Nozzle(s) shall be piped to exterior of fan with threaded end for field connection. Nozzle(s) and all associated piping shall be stainless steel construction.

2.8 SMOKE PURGE FANS

ENGINEER SHOULD CALCULATE ACTUAL TEMPERATURE AND MODIFY THIS SECTION ACCORDINGLY. SEE MICHIGAN MECHANICAL CODE.

- A. Fans for smoke purge/exhaust applications shall be rated at 500 Deg F for (4) hours continuous operation and 1,000 Deg F for 15 minutes. Fans shall be UL 705 listed (electrical components). If belt driven, fans shall have 2 belts or a minimum of 1.5 times the required number of belts, whichever is greater. Butterfly damper mechanisms shall be UL 793 listed. Motors shall have a minimum service factor of 1.15.

2.9 KITCHEN EXHAUST FANS

- A. Fans shall UL 705 listed (electrical components) and UL 762 listed for electrical components and grease removal.
- B. Construct spun aluminum housing of heavy gauge aluminum with a rigid internal support structure.

- C. Fan wheel shall be backward inclined.
- D. Construct drive frame assembly of heavy gauge steel.
- E. Mount motors and drives on vibration isolators, out of the air stream.
- F. Fresh air for motor cooling shall be drawn into the motor through a tube free of contaminants or through a space between the fan shroud and the motor cover.
- G. Mount fan shafts in permanently sealed, lubricated pillow block ball bearings. Bearings shall be sized for a minimum L-10 life in excess of 200,000 hours at maximum fan class operating conditions including belt pull.
- H. Size fan drives for 1.65 times the motor horsepower. Pulleys shall be cast type, keyed and securely attached to the wheel and motor shafts.
- I. Motor pulleys shall be adjustable for final balancing.
- J. Provide a factory-installed disconnect switch, wired from the fan motor to a junction box installed within the motor compartment. Provide a conduit chase through the base to the motor compartment.
- K. Roof-mounted upblast exhaust fans shall have a leak proof housing constructed with a one-piece windband with an integral rolled bead and shall be joined to the curb-cap with a continuously welded seam.
- L. Sidewall mounted exhaust fans shall have a leak proof housing constructed with a one-piece windband with an integral rolled bead. Provide a mounting plate that will be attached and sealed to the wall prior to installing fan.
- M. Provide a drain connection constructed of aluminum to allow for single point drainage of grease, water and other residue. Grease trap shall include the drain connection and shall be constructed of aluminum. Unit shall collect grease and water from fan and extract grease from water for ease of disposal.
- N. When dampers are installed below fan, provide a heavy gauge hinge kit to allow entire fan to tilt away from roof curb for access to dampers. Construct hinge kit with aluminum hinges and hold open cables for field installation.
- O. Provide aluminum wheel coated with a non-stick coating.
- P. Clean out port shall have a hole on the outside of windband and a grease repellent compression rubber fitting, allowing access to entire wheel for cleaning.
- Q. If motor is installed in airstream, extend ball bearing leads through an airtight conduit to a suitably sized conduit box in accordance with NFPA and NEC, mounted on the exterior of the fan casing. External grease fittings with extended grease leads shall be provided for motor lubrication. Motor shall be removable from either end of the fan. Foot mount or "C" face flange mount motors are acceptable.

2.10 SOURCE QUALITY CONTROL

- A. Run test all fans 1 HP and larger at the factory before shipment. Testing shall be conducted at the maximum fan class speed.
- B. Statically and dynamically balance each fan per AMCA procedures. Perform electronic vibration analysis at the maximum fan class speed for all fans over 5 HP.
- C. Unless noted otherwise, the installed maximum allowable RMS velocity at maximum fan class speed measured at each bearing shall not exceed 0.09 inches/sec in vertical, horizontal, and axial directions.
- D. Fans may be field tested after installation by an independent third party. Any fan found to exceed specified vibration limits shall be corrected to perform within those limits without cost to the Owner.

CONSIDER IF FACTORY TESTING IS APPROPRIATE FOR HIGH-PLUME INDUCTION-TYPE LAB FANS WHEN USED ON THE PROJECT. DELETE BELOW IF THERE IS TO BE NO FACTORY TESTING.

- E. High-plume Induction-Type Lab Fans: One fan of each size shall be factory tested and certified to have achieved the specified primary and secondary induction air volumes. Provide certified reports. Owner's representative shall be permitted to witness factory testing.

PART 3 - INSTALLATION

3.1 FAN INSTALLATION

- A. Coordinate the fan arrangement with project conditions prior to ordering the fan.
- B. Receive and inspect fans for defects. All defective or damaged fans shall be replaced at no cost to the Owner.
- C. Openings shall remain protected during storage. Immediately after installation and assembly, all factory protection shall be restored. Unit shall remain protected until just prior to final acceptance by Owner.
- D. Use spreader bars on lifting cables when hoisting fans from lifting lugs to prevent cable damage to housing or components. Rig fans per fan manufacturer's recommendations.
- E. Fans shall be installed as shown on drawings, in accordance with details, approved submittals and the fan Manufacturer's installation requirements and recommendations. Ensure fans are installed to allow easy accessibility for service or removal of fan components.
- F. Provide and install supplemental steel, supports, isolators and hangers necessary to hang or mount fans. Coordinate final location and placement of intermediate steel and ductwork connections in field. Install suspended fans with supports attached to structural members.

- G. Install any associated motors, drives, or other components that have been shipped loose. Fan shall be installed, made fully operation, and tested.
- H. Install flexible inlet and discharge couplings to prevent vibration transmission to ductwork.
- I. Inlet and discharge ductwork shall have a minimum straight run of two (2) fan diameters upstream and downstream of the fan.
- J. Just prior to final acceptance fan shall be thoroughly cleaned of all grease, dirt, and dust, etc. Apply touch-up paint or touch-up coating after final cleaning to repair any damage to the finish.
- K. Provide or coordinate the scope of work associated with the installation of fans as specified in the following sections:
 - 1. Roof curbs
 - 2. Concrete Housekeeping Pads
 - 3. Vibration isolation
 - 4. Sheet Metal accessories
 - 5. Interconnection wiring and conduit from power source to fan connection (starter).
- L. Perform the following tests and inspections prior to fan operation:
 - 1. Verify that shipping, blocking, and bracing are removed.
 - 2. Verify that unit is secure on mountings and supporting devices, and that connections to ducts and electrical components are complete.
 - 3. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
 - 4. Verify that cleaning and adjusting are complete.
 - 5. Inspect fan scroll for debris or water.
 - 6. Remove guards. Align and adjust belt tension, verify that fan wheel and motor rotate freely, and that bearing operation is smooth. Re-install belt guards.
 - 7. Adjust damper linkages for proper damper operation.
 - 8. Verify lubrication of bearings and other moving parts. Use proper bearing venting procedures, in particular at motor bearings. Use only grease type specifically recommended by fan mfr. Do not over-grease. Fill extended grease lines if not already filled, using mfr. recommended grease and proper venting procedures.
 - 9. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
 - 10. Verify proper motor and fan rotation.
 - 11. Remove and replace malfunctioning units and retest as specified above.
- M. Temporary Use of Fans
 - 1. Contractor shall thoroughly clean unit of all grease, dirt, and dust, etc. and perform manufacturer's pre-start protocol and commissioning activities just prior to being placed into temporary service.

2. During temporary service, perform all of manufacturer's required routine maintenance procedures. Continuously maintain a log of all such procedures. Store log at unit during temporary use period and include log as part of the final O&M manual.
3. Contractor shall thoroughly clean unit of all grease, dirt, and dust, etc., lubricate bearings, align and tighten belts and perform manufacturer's pre-start protocol and commissioning activities after unit has completed temporary service, and install a new, complete set of filters just prior to final acceptance by Owner.

3.2 FIELD QUALITY CONTROL

- A. Each fan shall be field tested. Any deficiencies related to performance, manufacture or installation shall be corrected without cost to Owner.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 233600 - AIR TERMINAL UNITS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 233600 - AIR TERMINAL UNITS

REVISIONS:

6/16: ADDED CONSTANT AIRFLOW VENTURI VALVES (CVV) FOR LABORATORY FLOW APPLICATIONS. CVV VALVES ARE TO BE PROVIDED BY THE SHEET METAL TRADE TO SUPPORT CONSTANT FLOW APPLICATIONS, INCLUDING FUME HOODS, COVERED BY SPECIFICATION 230900. D. APPEL.

6/21/13: MINOR REVISION TO CLARIFY QUALITY ASSURANCE STANDARDS AND TO SPECIFY THAT LINER EROSION RESISTANCE IS TO BE RATED AT 6000 FPM.

2024-01-02: REMOVED PNEUMATIC CONTROLS. FOR SELECT PROJECTS PERMITTED TO USE PNEUMATIC CONTROLS, REMOVED PORTIONS OF THE SPECIFICATION CAN STILL BE FOUND IN THE EDITOR'S NOTES.

NOTE THAT THIS SECTION DOES NOT INCLUDE FAN-POWERED TAU'S.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

CAREFULLY EDIT AND COORDINATE RELATED SECTIONS.

RETAIN THE DIVISION 16 ELECTRICAL REFERENCE IN THIS SECTION TO ASSURE THAT ELECTRICAL WORK STANDARDS ARE OBSERVED AND ENFORCED

- B. Related Sections:
1. Section 230900: Mechanical Systems Controls
 2. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:
1. Terminal airflow units (TAUs) of the various types, arrangements and sizes as specified in this Section and scheduled on Drawings.
 2. Constant (CAV) and Variable Volume (VAV) Terminal Airflow Units.
 3. Dual Duct Terminal Airflow Units.
 4. Retrofit Terminal Airflow Units.
 5. Terminal Airflow Unit-Mounted Sound Attenuators.

WHEN PNEUMATIC CONTROLS ARE PERMITTED - TERMINAL AIRFLOW UNIT PNEUMATIC CONTROLLER AND ACTUATOR.

6. Terminal Airflow Unit-Mounted Reheat Coils.
7. Airflow-sensing array(s) and dampers on TAUs to be equipped with DDC controls.

WHEN PNEUMATIC CONTROLS ARE PERMITTED - PNEUMATIC DAMPER OPERATOR(S) AND AIRFLOW-SENSING ARRAY(S) ON PNEUMATIC VAV, CAV, AND DUAL DUCT TERMINAL BOX.

8. Constant Volume Venturi (CVV) Terminal Airflow Units

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Mechanical Systems Controls Contractor shall coordinate with the terminal airflow unit manufacturer to provide a complete operating system.

1.4 SUBMITTALS

- A. Product Data: Provide performance data, rated capacities, furnished specialties, sound-power ratings, weights, operation and maintenance, and accessories for the following.
 1. Terminal airflow units.
 2. Liners and adhesives.
 3. Sealants and gaskets.
 4. Sound attenuators.
 5. Airflow sensing array and damper.
 6. Damper and casing leakage data.
 7. Hangers and supports, including methods for duct and building attachment and vibration isolation.
 8. Constant Volume Venturi (CVV) Terminal Airflow Units
- B. Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment.

1.5 QUALITY ASSURANCE

RETAIN PARAGRAPHS A AND B IN EVERY PROJECT SPECIFICATION.

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 1. AHRI 880: "Performance Rating of Air Terminals." Test in an AHRI certified laboratory. Units shall be AHRI 880 sealed.
 2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. Insulation/liner:

- a. UL 723, "UL Standard for Safety Test for Surface Burning Characteristics of Building Materials."
 - b. UL 181 "UL Standard for Safety Factory-Made Air Ducts and Connectors." Limited to mold growth and humidity test and erosion test.
 - c. ASTM C1071 - 05e1 "Standard Specification for Fibrous Glass Duct Lining Insulation (Thermal and Sound Absorbing Material)."
 - d. ASTM E84-10 "Standard Test Method for Surface Burning Characteristics of Building Materials."
 - e. NFPA 90a: "Standard for the Installation of Air-Conditioning and Ventilating Systems."
 - f. NFPA 90b: "Standard for the Installation of Warm Air Heating and Air-Conditioning Systems."
- 4. Coils: AHRI Standard 410 "Forced-Circulation Air-Cooling and Air-Heating Coils."
 - 5. SMACNA "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
 - 6. ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-Up."

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Mark each terminal unit before shipment to the job site with a unique identifier corresponding to its location and function in the building. Identifier nomenclature shall correspond to the Terminal Airflow Unit Detail.

REVIEW WARRANTY TERM PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. RETAIN THIS ARTICLE IN EVERY PROJECT SPECIFICATION.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Terminal Airflow Unit Manufacturers:
 - 1. Titus.
 - 2. Krueger.
 - 3. Metalaire.
 - 4. Nailor Industries, Inc.
 - 5. Price Industries.
 - 6. Tuttle and Bailey.

COORDINATE THE FOLLOWING REQUIREMENT WITH DRAWINGS.

- B. Acceptable CVV Terminal Airflow Unit Manufacturers:
 - 1. Phoenix
 - 2. Siemens

WHEN PNEUMATIC CONTROLS ARE PERMITTED - ACCEPTABLE PNEUMATIC CONTROLLER MANUFACTURER:

KMC CONTROLS, INC.

2.2 ACOUSTIC PERFORMANCE

- A. Provide acoustic performance, including performance supplemented by sound attenuators, as scheduled on Drawings. Acoustical performance shall be met at all damper positions with 1 inch static pressure at the TAU inlet.

2.3 FIRE AND SMOKE TEST PERFORMANCE

- A. Insulation: Maximum flame-spread index of 25 and a maximum smoke-developed index of 50, for insulation and adhesive, when tested according to ASTM E 84.

2.4 SINGLE AND DUAL DUCT TERMINAL AIRFLOW UNIT (TAU) (CAV AND VAV)

- A. Provide single duct, variable or constant volume terminal units as scheduled and detailed.
- B. Provide dual duct, variable or constant volume terminal units as scheduled and detailed.
 - 1. Construct unit casings of 22 gauge, minimum, galvanized steel sheet.
- C. Damper Assembly: Minimum 20 gauge construction with a mechanical stop to prevent overstroking.
- D. Terminal unit: Mechanically assemble and seal to provide an airtight casing. Casing air leakage shall not exceed 10 cfm at 1 inch w.c. differential pressure.

WHERE ACOUSTICAL PERFORMANCE IS PARTICULARLY IMPORTANT, SPECIFY THE LINER'S ACOUSTICAL PERFORMANCE.

- E. Line interior walls of the terminal casing with 1/2 inch minimum, 4 lbs./cu.ft. dual density fiberglass acoustical/thermal insulation with a non-porous, aluminum foil reinforced face sheet covering of the acoustical/thermal liner. Rate liner covering for a maximum air velocity of 6,000 fpm. Wrap and seal exposed foil lining edges from the airstream, and tucked and secured with metal barriers.
- F. Provide a position indicator on the damper shaft marked on the end to verify damper position.
- G. Screw damper blade through the shaft to prevent slippage and include a closed cell foam gasket to ensure minimum leakage.
- H. Damper air leakage shall not exceed 5 cfm at 3.0 inches w.c. differential pressure.
- I. Provide damper pivot with a Celcon or Delrin bearing.

- J. Equip the terminal unit with a multi-axis flow sensor with amplifying pressure pick-up points connected to a center averaging chamber. The chamber shall be designed to provide a differential pressure signal at least 1.5 times the normal unit velocity pressure over the full capacity range of the unit. Pressure sensing pick-ups shall be extended to the outside of the casing and have capped TEEs to permit parallel pressure measurements. A flow curve for field balancing shall be affixed to the terminal unit casing on the controller side. Minimum accuracy shall be 90 percent, regardless of inlet conditions.
- K. Provide pneumatic tubing in accordance with the requirements of the Temperature Controls Section.

2.5 CONSTANT VOLUME VENTURI (CVV) TERMINAL AIRFLOW UNITS

- A. The terminal airflow unit shall be of venturi control type utilizing a cone shaped element.
- B. Flow shall be pressure independent at the scheduled air flow over a pressure range of 0.3" WG to 3.0" WG static pressure drop across the valve. Valve shall respond within 1 second of a change in duct static pressure under all conditions.
- C. Accomplish pressure independence by the cone/spring element continuously adjusting position relative to the venturi orifice to compensate for duct pressure fluctuations.
- D. Provide CVV TAUs of the diameter and volumetric range indicated on the drawings. Provide larger, smaller, fewer, or additional valves versus that indicated when necessary to match the volumetric range specified on the drawings (this may be necessary when providing valves from a manufacturer other than the design basis).
- E. Total CVV TAU error (including the combined effects of nonlinearity, hysteresis, repeatability, temperature and drift over a one year period) shall not exceed +/- 5% of flow set point. This error shall not be exceeded regardless of duct inlet or exit configurations, over the entire manufacturer's cataloged volumetric operating range of the LTAU, and at any pressure drop across the LTAU from 0.3" WG to 3.0" WG static pressure.
- F. Provide sound attenuators only when specifically indicated. Attenuator shall be properly matched to each individual CVV TAU to meet the sound performance scheduled. Provide stainless steel packless type attenuators for all fume hood and "wet" exhaust applications. Attenuator pressure drop shall not exceed 0.20 in. w.c. at the CVV TAUs maximum rated flow, unless indicated otherwise on drawings.
- G. Valves shall be constructed of minimum 16 gauge aluminum. Shaft and shaft support brackets shall be 316 stainless steel. Pivot arm and internal linkage shall be aluminum or stainless steel. Springs shall be spring-grade stainless steel. Shaft bearing surfaces shall be made of Teflon, polyester, or polyphenylene sulfide composite.
- H. Low Leakage Valves
 - 1. Provide where indicated.

2. Provide low leak seal materials compatible with the severity of service indicated by the particular valve coating that has been specified.
- I. Valves connected to fume hood exhaust or where indicated on drawings:
 1. Coat LTAU with minimum 5.0 mil dry film thickness Heresite P403 coating material, applied and baked per coating manufacturer's recommendations.
 2. Shaft, pivot arm and linkage, and other internal metal parts (nuts, bolts, rivets, etc.) shall be stainless steel.
 3. Shaft shall be Teflon coated.
 4. Shaft bearing surfaces shall be made of Teflon or polyphenylene sulfide composite.
 - J. Provide required valve accessories to support the controls contractor.
 1. Phoenix fume hood CVV TAU require corrosion proof 316L stainless steel pressure taps for monitor installation.
 2. Siemens fume hood CVV TAU require corrosion proof 316L stainless steel restricting orifices for monitor installation.

2.6 DUAL DUCT TERMINAL AIRFLOW UNITS

- A. Units shall be constructed the same as the single duct units, but shall have separate damper assemblies for each airstream and shall include an integral sound attenuator/mixer section.

2.7 RETROFIT (SLIDE-IN) TERMINAL AIRFLOW UNITS)

- A. Design the retrofit unit to slide into the side of existing ductwork, with a maximum length of duct opening of 10 inches. Gaskets shall be attached to the orifice plate and mounting plate to provide a tight seal against the inner duct walls. Formed flanges shall provide added duct stiffness at the insertion point and for fastening the terminal to the ductwork with sheet metal screws.
- B. Unit casings shall be constructed of a minimum 22 gauge galvanized steel and shall be configured to mount on either the right or left side of the duct.
- C. Damper assembly construction: Minimum 14 gauge.
- D. Damper shall have blade seals and flexible metal compressible jamb seals. Damper leakage shall not exceed 5 cfm at 3.0 inches w.c. differential pressure
- E. Provide damper shaft position indicator marked on the end to verify damper position.
- F. Provide Celcon or Delrin Damper bearing pivot.

- G. Equip terminal unit with a multi-axis flow sensor with amplifying pressure pick-up points connected to a center averaging chamber. Design the chamber to provide a differential pressure signal at least 1.5 times the normal unit velocity pressure over the full capacity range of the unit. Pressure sensing pick-ups shall be extended to the outside of the casing and have capped TEE's to permit parallel pressure measurements. A flow curve for field balancing shall be affixed to the terminal unit casing on the controller side. Minimum accuracy shall be 90 percent regardless of inlet conditions.

2.8 TERMINAL AIRFLOW UNIT-MOUNTED SOUND ATTENUATORS

- A. Provide factory fabricated, integral-type sound attenuators with aluminum foil faced liners. Wrap, tuck and secure exposed foil lining edges with metal brackets. Attenuators shall be one-piece construction using the same materials as the attached terminal airflow unit.
- B. For supply units, install attenuator at the discharge of supply air terminal units, between the terminal air flow unit damper and any air diffusion devices.
- C. For exhaust/return units, install attenuator upstream of terminal airflow unit damper, but downstream of any exhaust/return connections.
- D. Sound attenuator performance shall be as scheduled.

2.9 TERMINAL AIRFLOW UNIT COMPONENTS

WHEN PNEUMATIC CONTORLS ARE PERMITTED - PNEUMATIC CONTROLS: PROVIDE CONTROLLER, DAMPER, DAMPER ACTUATOR, LINKAGE, FLOW SENSOR AND INTERCONNECTING PNEUMATIC TUBING. CONTROLLER OPERATION OVER AN 8-13 PSIG CONTROL SIGNAL. FACTORY-SET CONTROLLER FOR DIRECT ACTING CONTROL. MOUNT DAMPER ACTUATOR TO DAMPER SHAFT IN A NORMALLY OPEN DAMPER CONFIGURATION. DAMPER ACTUATOR LINKAGE SHALL ALLOW EASY CONVERSION TO A NORMALLY CLOSED DAMPER CONFIGURATION WITHOUT REMOVING THE ACTUATOR. FACTORY PIPE FLOW SENSOR AND DAMPER ACTUATOR TO THE CONTROLLER.

PROVIDE KMC CONTROLS CSC-3011 PRESSURE INDEPENDENT CONTROLLER.

- A. DDC Controls: Provide damper and flow sensor.

2.10 TERMINAL AIRFLOW UNIT-MOUNTED REHEAT COILS

- A. Provide coils by the terminal airflow unit manufacturer as a complete factory-mounted assembly, with capacities and characteristics as scheduled on the Drawings. Provide slip and drive or flanged connections to allow removal and reversal of coils in field.
- B. Coils: Maximum of 10 fins per inch, same side supply and return (steam/condensate) piping connections, enclosed in a sheet metal casing to match the size of the attached terminal airflow unit.

- C. Water Coil: 2-rows, rated for 200 psi working pressure, 250 deg. F, with 3/8 inch copper tubing, minimum wall thickness of 0.016 inch, and mechanically bonded aluminum fins, 1/2 inch or larger solder connectors, and manual air vent on return. Hydrostatically test coils at 250 psi, or at 250 psi air pressure under water. Maximum pressure drop at design flow shall not exceed 10 feet or as scheduled. Hot water shall be equally distributed through all tubes by means of orifices or a header design.

IF FREEZING CONDITIONS EXIST, SPECIFY DISTRIBUTING TYPE STEAM COILS (TUBE - IN - TUBE). NON-DISTRIBUTING TYPE IS TYPICALLY AVAILABLE WITH OPPOSITE END CONNECTIONS. DISTRIBUTING TYPE ARE TYPICALLY AVAILABLE WITH OPPOSITE OR SAME END CONNECTIONS.

- D. Steam Coil: Specifically designed for modulating control steam service, non-distributing type, rated for 200 psi working pressure, 250 deg. F, with 3/8 inch copper tubing, minimum wall thickness of 0.020 inch, and mechanically bonded aluminum fins, 1/2 inch or larger threaded, opposite end connections. Hydrostatically test coils at 250 psi or at 250 psi air pressure under water.
- E. Electric Coil: Provide UL listed coils. Set coil in an attenuator section integral with the terminal unit. Recess the element grid a minimum of 5 inches from the unit discharge. Elements shall be derated nickel chrome, supported by ceramic isolators a maximum of 3-1/2 inches apart, staggered for maximum thermal transfer and element life, and balanced to ensure equal output per stage. House the integral control panel in a NEMA 1 enclosure with hinged access door. Provide an integral door interlock-type disconnect switch which will prevent the access door from being opened while power is on. Coil units shall contain a primary automatic thermal cutout, a secondary manual reset thermal cutout, airflow proof switch, and terminal block.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Review and examine conditions affecting work. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Commissioning: Review and perform required commissioning activities in the pre-construction phases.

3.2 HANGER AND SUPPORT INSTALLATION

- A. Comply with applicable SMACNA HVAC Duct Construction Standards and Hanger and Support construction standards, and applicable Division 23 Sections.
- B. Support TAU's independently from adjacent ductwork. Ensure supports do not interfere with accessibility of other equipment, e.g., access to TAU DDC control enclosure. Do not hang TAUs from piping, other ducts or equipment.

3.3 TERMINAL AIRFLOW UNIT INSTALLATION

- A. Install TAUs in accordance with manufacturer recommendations, Contract Drawings, and reviewed submittals.
- B. Provide a minimum of 2 duct diameters rigid straight duct upstream of terminal unit with a bell-mouth or shoe-tap to minimize pressure drops.
- C. Label unit according to the applicable detail.
- D. Position terminal air flow unit, unit-mounted controller, reheat coil, and sound attenuators to comply with clearance requirements and for ease of maintenance.

3.4 CONSTANT VOLUME VENTURI TERMINAL AIRFLOW UNIT INSTALLATION

- A. Install CVV TAUs in accordance with manufacturer recommendations, Contract Drawings, and reviewed submittals.
- B. Install one straight equivalent duct diameter upstream of the inlet to the CCV TAU. Transitions connecting to the inlet or outlet of the CCV TAU shall not exceed 30 degrees.
- C. Label unit according to the applicable detail.
- D. Position terminal air flow unit and sound attenuators to comply with clearance requirements and for ease of maintenance.

3.5 REHEAT COIL INSTALLATION

- A. Install reheat coils per applicable SMACNA Standards.

3.6 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.7 SYSTEM START-UP

- A. After start-up and operation of the HVAC system, sensors and controllers shall be cleaned and "blown-out" before final calibration of airflows and controls.

3.8 ADJUSTING, CLEANING, PROTECTION

- A. Protect open end of terminal boxes, flow sensors and controllers throughout the entire construction period, until Commissioning and Substantial Completion.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 234000 - HVAC AIR CLEANING DEVICES

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 234000 - HVAC AIR CLEANING DEVICES

4-12-07: REVISED D. KARLE: FILTER FRAME FROM SAME MFG., FILTER FRAME TO WITHSTAND DOUBLE DIRTY FILTER DROP

ADDED SUBMITTAL REQUIREMENTS PER MECH TECH TEAM. JULY 29, 08, D. KARLE.

REVISED FORMAT AND CONTENT. ADDED MERV-A REQUIREMENTS. 4/2011. D. KARLE AND M. PLATT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

RETAIN THE DIVISION 26 ELECTRICAL REFERENCE IN THIS SECTION TO ASSURE THAT ELECTRICAL WORK STANDARDS ARE OBSERVED AND ENFORCED

- B. Related Sections:

1. Section 019100/019110: Commissioning.
2. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:

1. Filter holding frames.
2. Pleated filters- MERV 8.
3. Bag filters- MERV 11.
4. Bag filters- MERV 14.
5. HEPA filters (air handler applications only).
6. Gas adsorption filters.
7. Ring Panel Filters.
8. Filter housing.
9. Filter gauges.

1.3 SUBMITTALS

- A. Submit the following product data for each unit:

1. Dimensions, performance characteristics, class, details of filter rack construction, maintenance access, and information on all accessories.

1.4 QUALITY ASSURANCE

*INCLUDE PARAGRAPHS A AND B IN EVERY SPECIFICATION SECTION.
EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.*

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards:
 - 1. Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - a. AHRI 850-Commercial and Industrial Air Filter Equipment.
 - b. ASHRAE 52.1-Gravimetric and dust-spot procedures for Testing Air Cleaning Devices Used in General Ventilation for Removing Particulate Matter.
 - c. ASHRAE 52.2 (including Appendix J) Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size.
 - d. MIL-STD-282-Filter Units, Protective Clothing, Gas-Mask Components, and Related Products; Performance-Test Methods; current edition.
 - e. UL 586-Test Performance of High Efficiency Particulate, Air Filter Units.
 - f. UL 900-Test Performance of Air Filter Units.
 - g. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems.
 - h. IES-RP-CC-001 HEPA and ULPA Filters.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. All Filters and Accessories
 - 1. Store at least 4 inches above floor on wood pallets or similar devices. Protect from odors, dust, moisture, and other debris while stored on or off the jobsite, and when transporting to the jobsite, by tightly covering with plastic.
- B. HEPA Filters

EDIT HEPA FILTER REQUIREMENTS BELOW CAREFULLY, OR DELETE ENTIRELY IF PROJECT DOES NOT INCLUDE HEPA FILTERS.

- 1. Delivery
 - a. Inspect cartons and filters for damage when received at the job site along with an Owner-designated representative.
 - b. Reject cartons with damaged corners, punctures, water damage or not stacked with up arrow in proper position. Do not stack cartons higher than 6 ft. (1.8 meters).
 - c. Open cartons and inspect filter face for sagging pleats and separators, cracks, pinholes or breaks. Check gaskets for position and full adhesion to the frame. Use a 125-watt flood lamp during inspection.
 - d. Do not open filters packed in sealed plastic bags during inspection unless the filter is obviously damaged.
 - e. Do not attempt to repair damaged filters at the job.
- 2. Handling

- a. Handle filters and cartons so pleats remain vertical. Arrow on cartons indicates direction of pleats.
 - b. Handle filters in sealed cartons until installed.
 - c. Do not handle with chains, slings or hooks.
 - d. Do not drop or jar the carton of filter.
 - e. Do not lift filter from carton. Fold carton tops back and invert carton. Withdraw the carton from the filter.
 - f. Lift unpacked filters only by the outer surface of cell frame.
3. Storage
- a. Repack filter after inspection and seal carton.
 - b. Store cartons with pleats in a vertical position.
 - c. Do not stack more than 6 feet high (1.8 meters).

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers- Pleated and Bag Filters:
 - 1. Camfil Farr.
 - 2. Purolator.
 - 3. American Air Filter.
 - 4. Flanders Corporation.
 - 5. Eaton Corporation.
 - 6. Tri-Dim Filter Corporation.
- B. Acceptable Manufacturers- HEPA Filters:
 - 1. Flanders Corporation.
 - 2. Camfil Farr.
 - 3. Eaton Corporation.
- C. Acceptable Manufacturers- Gas Adsorption Filters:
 - 1. Flanders Corporation.
 - 2. American Air Filter.
 - 3. Camfil Farr.
 - 4. Flanders/CSC Corporation.
 - 5. Purolator.
- D. Acceptable Manufacturers- Filter Gauges:
 - 1. Dwyer Instruments.
 - 2. Deiterich Standard, Inc.
 - 3. Bacharach, Inc.
 - 4. Moeller Instrument Co., Inc.

THIS SPECIFICATION SECTION DOES NOT INDICATE WHERE VARIOUS FILTER TYPES SHOULD BE USED. THE TYPE OF FILTERS REQUIRED FOR PARTICULAR PROJECT LOCATIONS MUST BE INDICATED ON DRAWINGS (SCHEDULES PREFERRED) OR IN OTHER SPEC. SECTIONS.

2.2 GENERAL

- A. Base filters and filter rack design on the use of 24-inch by 24-inch filters whenever possible. The use of 12-inch by 24-inch filters to complete rack configurations is acceptable. If 24-inch by 24-inch and 12-inch by 24-inch modules are not possible, use industry standard filter sizes for basis of design.
- B. Provide filters and filter holding frames by the same manufacturer.

2.3 HOLDING FRAMES

- A. Provide grid type holding frames, similar to Camfil Farr Type 8 or equivalent, factory fabricated of a minimum of 16 gauge galvanized steel, capable of normal operation at twice the maximum filter drop without deformation and equipped with gaskets and 4 spring type positive sealing fasteners. Fasteners shall be capable of being attached or removed without deforming the gaskets and without the use of tools. Frames shall be capable of supporting filters of different efficiencies and depths by change of fasteners.
 - 1. Unless indicated otherwise, provide grid type (face loading) frame in air handling units.
 - 2. Unless indicated otherwise, provide side slide filter frames for duct applications only, up to a maximum frame size of 24 inches by 24 inches. Sizes above 24 inches by 24 inches shall be face loading type frames.
- B. Holding frames shall, at minimum, withstand double the scheduled dirty filter pressure drop without deformation or air bypass.
- C. Design Frames so that the housing can be stacked on top of the other without deformation.
- D. Completely safe off filter frame to eliminate air from bypassing filters.
- E. Filters shall be inserted and seal from the upstream side of the frame.
- F. Filter frame maximum allowable leakage rate 0.5 percent at 6 inches wc.

ASSURE FILTERS HAVE THE SPECIFIED MERV-A RATING WHEN REVIEWING SUBMITTALS. MERV-A ASSURES ELECTRO-STATICALLY CHARGED FILTERS CAN NOT BE SUPPLIED WHOSE PERFORMANCE DEGRADES TO A LOWER MERV RATING SOON AFTER INSTALLATION.

2.4 FILTERS

- A. MERV 8 Pleated Filters (30 percent).
 - 1. Filters: 2-inch, medium efficiency, pleated, disposable type as shown on the drawings. Each filter shall consist of a non-woven fabric media, support grid and enclosing frame. The filter shall be UL listed as Class I or Class II.
 - 2. Filter media: cotton and synthetic blend.
 - a. Average dust-spot efficiency of 30 percent to 35 percent and an average arrestance of 90 percent to 92 percent in accordance with ASHRAE 52-1.

- b. Minimum MERV 8 per ASHRAE 52.2 and a MERV-A rating of 8 when tested per Appendix J of ASHRAE 52.2.
3. Effective filter media shall be at least 7.0 sq.ft. media per 1.0 sq.ft. filter face area and shall contain at least 11 pleats per linear foot. Initial resistance at 500 fpm face velocity shall not exceed 0.30 inch wg.
4. Media support shall be a welded wire grid or expanded metal with an effective open area of at least 96 percent. Bond the welded wire grid to the filter media to eliminate the possibility of media oscillation and media pull-away. Form the media support grid in a manner that it affects radial pleat design, allowing total use of filter media.
5. Construct the enclosing frame of a rigid, heavy duty, high wet strength beverage board, with diagonal support members bonded to the air entering and exiting side of each pleat to ensure pleat stability. Bond the inside periphery of the enclosing frame to the filter pack, thus, eliminating the possibility of air bypass.

B. MERV 11 Bag Filters (65 percent)

1. Filter: 22 inches deep, high performance, totally disposable, bag type. Filter UL listed as Class I or Class II.
2. Filter media: High-density, microfine glass fibers.
 - a. Average dust-spot efficiency of 60 percent to 65 percent and an average arrestance greater than 95 percent per ASHRAE 52-1.
 - b. Minimum MERV 11 rating per ASHRAE 52.2 and a MERV-A rating of 11 when tested per Appendix J of ASHRAE 52.2.
3. Filter shall have a minimum of 40 support points per sq.ft.
4. Filter shall have 10 pockets. The initial resistance at 500 fpm face velocity shall not exceed 0.25 inch wg.
5. Form filter pockets by a linear sewing process to maintain the pocket configuration when in use. Seal all stitching points completely with a positive leak-free sealant. Chemically adhere the pockets around the periphery of the galvanized steel retainers. Retainers shall have rolled edges for enhanced pocket support.
6. Filter headers: Constructed of a deep grooved "J" retainer channel of galvanized steel. Closure corner shall be riveted, with mitered joints sealed against air leakage. Filters shall have minimum 7/8 inch headers.

C. MERV 14 Bag Filters (95 percent)

1. Filter: 30-inch-deep, high performance, totally disposable, bag type. The filter shall be UL listed as Class I or Class II.
2. Filter media: High-density, microfine glass fibers.
 - a. Average dust spot efficiency of 90 percent to 95 percent and an average arrestance greater than 98 percent per ASHRAE 52-1.
 - b. Minimum MERV 14 rating per ASHRAE 52.2 and a MERV-A rating of 14 when tested per Appendix J of ASHRAE 52.2.
3. Filter shall have a minimum of 40 support points per sq.ft.
4. Filter shall have 10 pockets and the initial resistance at 500 fpm face velocity shall not exceed 0.50 inch wg.

5. Form filter pockets by a linear sewing process to maintain the pocket configuration when in use. Completely seal all stitching points with a positive leak-free sealant. Chemically adhere the pockets around the periphery of the galvanized steel retainers. Retainers shall have rolled edges for enhanced pocket support.
6. Construct filter headers of a deep grooved "J" retainer channel of galvanized steel. Closure corner shall be riveted, with mitered joints sealed against air leakage. Filters shall have minimum 7/8 inch headers.

EDIT HEPA FILTER REQUIREMENTS BELOW CAREFULLY, OR DELETE ENTIRELY IF PROJECT DOES NOT INCLUDE HEPA FILTERS. THIS GENERIC HEPA FILTER SPEC MAY NOT BE APPROPRIATE FOR YOUR PROJECT.

2.5 HEPA FILTER (AIR HANDLER APPLICATIONS ONLY)

- A. Filters shall have a minimum efficiency of 99.97 percent on 0.3 micron particles when tested with thermally generated DOP in accordance with the latest Industry and Military Standards. The media shall be glass paper. Filters shall be factory constructed and assembled of metal frames, corrugated aluminum separators and 100 percent solid resin sealant.
 1. Cell sides: 20 gage galvanized steel with edges sealed and riveted to insure a strong corner joint.
 2. Filter Media: 0.015-inch-thick (0.38 mm thick), plus or minus 0.003 inch (0.08 mm), waterproofed, fire retardant, 100 percent glass fiber construction, assembled in closely pleated panel packs, separated by double-thickness ribbons of filter media on both faces of the panel. Install the media packs with the metal cell sides in a multiple V-bank arrangement sealed on all edges with a thermoset bond.
 3. Provide gasket on each filter, made of neoprene rubber SCE-41, 5-10 durometer, 1/4 inch (6 mm) by 3/4 inch (19 mm) wide.
 4. Filter dimensions: 24 by 24 by 1.5 inches (600 by 600 by 290 mm) (without gaskets).
 5. Provide filter having a nominal rating of 2000 cfm (0.94 cu. m/s) with a maximum initial pressure drop of 1.4 inch water gage (349 Pa) or less, tested in accordance with Mil-Std-282 and IES-CS-1T, and having a minimum efficiency MERV 17 per ASHRAE Standard 52.2. Provide each filter with a UL 586 label as an indication of its fire retardancy. Provide to withstand 250 deg. F (121 deg.C) continuous temperature and plus 100 deg. F (38 deg. C) peaks for a maximum of one hour.
 6. Mark the cell sides of each filter with indelible ink showing the following information:
 - a. Manufacturer's name.
 - b. Style Code.
 - c. Serial Number.
 - d. Efficiency and resistance.
- B. Holding frames shall consist of holding frame section, reinforcing flanges, annular-based dimples and mounting holes, receptacle guides, and removable swing bolt assemblies.

1. Construct the holding frame of not less than 14 gauge galvanized steel and shall be of all welded construction, factory fabricated and assembled. All welds shall be ground and smoothly finished to provide a uniform sealing surface.
 2. Reinforcing flanges shall be an integral part of the holding frame in order to preclude the possibility of deflection of the sealing flange.
 3. Annular-based dimples and mounting holes shall be an integral part of the holding frame to provide ease of installation and mounting, and to preclude the possibility of mounting bolt interference.
 4. Four receptacle guides shall be an integral part of the holding frame and shall be mounted on the two vertical sides of the frame. They shall be designed to align the properly filter when placed into the frame and shall function as fulcrum for the swing bolt assemblies.
 5. Four swing bolt assemblies shall be provided for each holding frame. Swing bolts shall be constructed of 5/16 inch zinc electroplated steel and be provided with equi-bearing clamps and hex nuts in order to affect adequate and uniform pressure against the periphery of the HEPA filter. Hex nuts shall be capable of being torqued to 30 inch/lbs. each, providing for a 50 percent gasket compression. The swing bolt assembly shall be such that it provides for individual sealing of filters.
- C. HEPA Filters shall meet leak free scan test requirements of IES-RP-CC-001 Type A.

EDIT GAS ADSORPTION FILTER REQUIREMENTS BELOW CAREFULLY, OR DELETE ENTIRELY IF PROJECT DOES NOT INCLUDE GAS ADSORPTION FILTERS. THIS GENERIC GAS ADSORPTION FILTER SPEC MAY NOT BE APPROPRIATE FOR YOUR PROJECT.

2.6 GAS ADSORPTION FILTERS

- A. Gas adsorption filter manufacturer shall provide gas adsorption filter racks.
- B. Gas adsorption filters shall be total-detention type.
- C. Construction
 1. Construct adsorbers of multiple media-filled panels. Panels shall be 1 inch (25mm) thick moisture-resistant corrugated, kraft honeycomb sealed to top and bottom end plates with non-volatile adhesive.
 2. Completely fill Panels with adsorption media held in place by nylon screens.
 3. Top and bottom end plates shall be injection-molded high strength ABS plastic with integral headers.
 4. Assemble the cell with aerodynamically-designed vertical front struts and vertical steel rod supports on the downstream side.
 5. Seal each filter in a polyethylene bag before placing in its shipping carton.
- D. Media

1. Media shall be 50 percent activated carbon and 50 percent potassium permanganate coated activated alumina.
2. Activated carbon media shall be virgin coconut shell base, minimum 60 percent CTC activity by the ASTM D-3467 test method, minimum apparent density of 0.49 g/mL, minimum hardness of 97 by the ASTM D-3802 method and a minimum surface area of 1100m²/g by the N₂ BET method.
3. At 2000 CFM (0.94 m³/s), the media shall have an airway resistance no greater than 0.50 inch wg (0.12 kPa) and a residence time no less than 0.030 seconds.

2.7 RING PANEL FILTER

- A. Construct duct mounted filter racks for animal room exhaust of heat-sealed layers of 2-ply polyester (minimum MERV rating 6, minimum MERV-A rating 6), UL 900 Class 2, over corrosion resistant support frame. Filter shall be overcut. Media shall extend outside frame 1 inch on each side. Initial resistance shall be no more than 0.2 inch wg at 500 fpm.

DELETE FILTER GAUGE SECTION BELOW IF THE CONTROL DRAWINGS SHOW FILTER GAUGES AT ALL FILTER LOCATIONS.

2.8 FILTER GAUGES

- A. Provide 1 filter gauge for each filter bank. Select the scale so it allows for 1 inch wc greater than the final filter resistance.
- B. Locate static pressure taps in the airstream as recommended by the manufacturer and connect to gauges located on air handling unit casings, or on walls for in-duct filter, as indicated, with 1/4 inch o.d. aluminum or copper tubing.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install filters, filter frames, filter housings, and filter gauges in accordance with manufacturer's recommendations and approved submittals.
- B. Install filters to ensure easy accessibility for service, removal and replacement of filters.
- C. Do not operate any system without filters.
- D. For any equipment used for temporary ventilation, install a complete set of filters prior to start-up. This set of filters shall be in addition to the final set.
 1. While operating for temporary use, install a complete set of filters of the same quality and efficiency as the specified permanent filters for the project.
 2. Continuously maintain filters and replace when pressure drop exceeds 1 inch wc, or at manufacturer's recommended change-out pressure drop, whichever is lower.
 3. Install a new, complete set of filters just prior to final acceptance by Owner

CONSIDER ADDING REQUIREMENTS FOR SPARE FILTERS HERE, OR IN INDIVIDUAL EQUIPMENT SPEC. SECTIONS. TYPICALLY U-M DOES NOT DESIRE SPARE FILTERS, WITH THE POSSIBLE EXCEPTION OF CERTAIN SPECIALTY FILTERS; IN WHICH CASE CONSULT THE U-M DESIGN MANAGER FOR DIRECTION.

3.2 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235100 - BREECHINGS, CHIMNEYS AND STACKS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235100 - BREECHINGS, CHIMNEYS AND STACKS

REVISIONS:

APRIL 2018: REVISED TO LIST MFR.S FROM PML. R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. This section specifies double wall metal vents and accessories for gas fired appliances.

1.3 QUALITY ASSURANCE:

- A. Welder's Qualifications: All welders shall be certified in accordance with AWS Standard D9.1, Specifications for Welding Sheet Metal.
- B. Codes and Standards:

SPEC EDITOR: INSTALLATION AND REQUIREMENTS FOR SAFETY OF HEAT PRODUCING APPLIANCES AND THEIR VENTING, INCLUDING CHIMNEYS, IS PRESCRIBED BY BUILDING CODES AND INSTALLATION STANDARDS. STATE AND LOCAL LAWS CONTROL THE ADOPTION OF BUILDING CODES. DETERMINE WHICH EDITION OF A NATIONAL CODE IS ADOPTED BY REFERENCE. FAMILIARITY WITH APPLICABLE BUILDING CODES IS ESSENTIAL BECAUSE OF THE GREAT VARIATION IN LOCAL CODES.

1. NFPA: Comply with NFPA 211 "Standard for Chimneys, Fireplaces, Vents and Solid Fuel Burning Appliances".
2. UL: Comply with applicable portions of UL safety standards; provide products which have been UL listed and labeled.
3. SMACNA: Comply with SMACNA Low Pressure Duct Standards for fabricated breeching and smokepipe.
4. AWS: Comply with AWS Structural Welding Code for welders' qualifications, welding details, and workmanship standards.

SPEC EDITOR: ASHRAE EQUIPMENT HANDBOOK, CHAPTER 27, GIVES A COMPLETE LIST OF NATIONAL BUILDING CODES AND NATIONAL STANDARDS WHICH ARE APPLICABLE TO MOST APPLICATIONS.

5. ASHRAE: Comply with the ASHRAE Equipment Handbook, Chapter 27, for Chimney, Gas Vent, and Fireplace Systems, material requirements and design criteria.

1.4 ACCEPTABLE MANUFACTURERS:

1. Selkirk Metalbestos model PS
2. Van Packer Co.
3. AMP Co. model VSI
4. Metal Fab Inc.
5. Schebler

1.5 INSURANCE APPROVAL:

- A. The entire installation shall be FM approved, Owner's insurance company.

PART 2 - PRODUCTS

2.1 DOUBLE WALL METAL VENTS:

SPEC EDITOR: TYPE "B" VENTS ARE USED FOR VENTING GAS (ONLY) APPLIANCES WITH DRAFT HOODS, AND OTHER APPLIANCES LISTED FOR USE WITH TYPE B VENTS. IT HAS BEEN FOUND THAT A NONCOPPER-BEARING ALUMINUM ALLOY OF 99 PERCENT PURITY OR BETTER PROVIDES SATISFACTORY PERFORMANCE IN PREFABRICATED METAL GAS VENT PRODUCTS.

A. Type B Gas Vents:

1. Description: Double wall gas vents, UL listed for Type B, consisting of an inner pipe of sheet aluminum, and other pipe of galvanized sheet steel.
2. Accessories: UL-labeled tees, elbows, increasers, draft hood connectors, metal cap with bird barrier, adjustable roof flashing, storm collar, support assembly, thimbles, fire stop spacers, and fasteners, fabricated of similar materials and designs as vent pipe straight sections.

SPEC EDITOR: FOR CHIMNEY SERVICE, TEMPERATURES FROM APPLIANCES BURNING OIL OR SOLID FUELS MAY EXCEED THE MELTING POINT OF ALUMINUM; THEREFORE, STEEL IS REQUIRED. STAINLESS STEELS SUCH AS TYPE 430 OR TYPE 304 GIVE GOOD SERVICE IN RESIDENTIAL CONSTRUCTION AND ARE RECOGNIZED IN UL LISTED PREFABRICATED CHIMNEYS. WHERE MORE CORROSIVE ENVIRONMENTS ARE ANTICIPATED, SUCH AS HIGH SULFUR FUEL OR CHLORIDES FROM SOLID FUELS OR REFUSE, TYPE 316 STAINLESS STEEL OFFERS A GOOD COMPROMISE OF CORROSION RESISTANCE AND MECHANICAL PROPERTIES. IN ADDITION, FORCED DRAFT APPLIANCES REQUIRE POSITIVE LISTED VENTS PRODUCTS.

B. All Steel, Positive Pressure, Double Wall Vents

1. Double wall stack: The double wall stack shall have an outer jacket of aluminum coated steel .025" thick in 6 inches through 24" diameters and .034" thick for larger diameters. There shall be a minimum 1" air space between the walls. The inner gas carrying pipe shall be type 304 stainless steel for gas and No. 2 fuel oil, type 316 stainless steel for coal, or No. 4 and No. 6 oil or any other solid fuels. The inner liner shall be .035" nominal thickness for all diameters.

2. Inner pipe joints shall be sealed by use of V Bands and RTV Silicone Sealant for flue gas temperatures up to 600 degrees F; above this temperature joints shall be sealed with V Bands and High Temperature Joint Cement as outlined in the installation instructions and supplied by the manufacturer.
3. Stack extending above roof surfaces must terminate as required by local code, or as required in NFPA 211. All parts exposed to the outer atmosphere should be protected by a minimum of one base coat and one finish coat of paint, such as series 4200-4300 Heat Resistant paint manufactured by Rust-O-Leum Corporation, or equivalent. Paint to be supplied and applied by installing contractor.

PART 3 - EXECUTION

3.1 INSTALLATION OF DOUBLE WALL CONNECTORS, BREECHINGS, AND VENTS:

- A. Install Type B gas vents in accordance with manufacturer's installation instructions and UL listing. Maintain minimum clearances from combustibles specified in UL listing.
- B. Install all steel, positive pressure, double wall gas vents in accordance with manufacturer's installation instructions and UL listing. Maintain minimum clearances from combustibles specified in UL listing.
- C. Seal joints between sections of positive pressure vents in accordance with manufacturer's installation instructions, and using only sealants recommended by manufacturer.
- D. Support vents at intervals recommended by the manufacturer to support the weight of the vent and all accessories, without exceeding loading of appliances.
- E. Provide a drain section for each boiler in the vertical section of breeching at the boiler to prevent condensed liquids from draining back into the boiler. 1" drain piping is to be run to the nearest floor drain.

3.2 INSTALLATION OF DAMPERS:

- A. Install barometric and thermostatically operated dampers in accordance with manufacturer's instructions. Locate as close to draft hood collar as possible.

3.3 ADJUSTING AND CLEANING:

- A. Clean breechings internally during installation, to remove dust and debris. Clean external surfaces to remove welding slag and mill film. Grind welds smooth.

3.4 PROTECTION:

- A. Temporary Closure: At ends of breechings and chimneys which are not completed or connected to equipment, provide temporary closure which will prevent entrance of dust and debris until installations are completed.

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235150 VENTING SYSTEMS FOR SPECIALTY GAS FIRED APPLIANCES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. 235239 Fire Tube Boilers (Hot Water)

1.2 SUMMARY

- A. Section Includes:
 - 1. This Section includes all specifications relating to the furnishing and installing of venting systems for condensing type gas fired appliances.

1.3 REFERENCES

- A. Definitions
- B. Abbreviations and Acronyms

1.4 SUBMITTALS

- A. Product Data: Include manufacturer, catalog number, catalog illustrations, rated capacities, performance characteristics, weights, rough-in requirements and details, materials of construction, accessories and clearance requirements from combustible materials.
- B. Additionally include:
 - 1. Shop Drawings - Catalog Cuts, Diagrams and Descriptions
 - 2. Sizing Calculations
 - 3. Installation Instructions and Installation Drawings
 - 4. Operation and Maintenance Manuals
 - 5. Warranty Documentation

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Reference Standards:

- a. UL 1738 / ULC-S636 the U.S. Standard for Venting Systems for Gas -Burning Appliances, Category II, III and IV and ULC-S636, the Canadian Standard for Type BH gas vent systems.
- b. The National Fuel Gas Code
- c. ANSI Z223.1
- d. NFPA-54

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to extreme temperatures or sunlight. Protect from damage, dirt and debris at all times.

1.7 WARRANTY

- A. Contractor shall provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

1.8 INSURANCE APPROVAL

- A. The entire installation shall be FM approved, Owner's insurance company.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Polypropylene Single Wall Vent (4" and Smaller)
 - a. DuraVent Polypro Polypropylene Venting System
 - b. Z-Flex - Z-DENS Polypropylene Venting System
 - c. ECCO Polypropylene Venting System
 - d. Heatfab Polyflue Polypropylene Venting System
 - 2. Vent Double Wall (Larger Than 4")
 - a. DuraVent FasNSeal or DuraSeal
 - b. Selkirk Heatfab CI Plus
 - c. Z-Flex Double Wall pipe
 - d. ICC Model VIC

2.2 POLYPROPYLENE SINGLE WALL VENT (4" AND SMALLER)

- A. The vent shall be of rigid single wall, factory built type, designed for use in conjunction with Category II or IV condensing or non-condensing gas fired appliances or as specified by the heating equipment manufacturer.
- B. Maximum continuous flue gas temperature shall not exceed 110°C (230°F).

- C. Vent shall be listed for a minimum positive pressure rating of 6" W.C. and shall have passed at 15" W.C.
- D. The vent system shall be continuous from the appliance's flue outlet to the vent termination outside the building. All outside vent components must be UV rated if exposed to the atmosphere. All system components shall be ULC listed and supplied from the same manufacturer.
- E. All cascade (common vented) systems must be approved by the manufacturer of the appliance and conform to CSA approval.
- F. PolyPro concentric vent systems shall require an adapter where the appliance being used has an outlet diameter of 110mm.
- G. The vent shall be constructed from polypropylene, with a minimum wall thickness of 2.2mm for 60mm (2"), 80mm (3"), 100mm (4"), diameter vents.
- H. All system components such as vent supports, roof or wall penetrations, terminations, appliance connectors and drain fittings require to install the vent system shall be UL and ULC listed and provided by the vent manufacturer.
- I. Vent layout shall be designed and installed in compliance with manufacturer's installation instructions and all applicable local codes.

2.3 VENT DOUBLE WALL (LARGER THAN 4")

- A. The vent shall be of double wall, factory built type, designed for use in conjunction with Category II or IV condensing gas fired appliances or as specified by the heating equipment manufacturer.
- B. Maximum continuous flue gas temperature shall not exceed 480°F (249°C).
- C. Vent shall be listed for a minimum positive pressure rating of 6" W.C. and shall have passed at 35" W.C.
- D. The vent system shall be continuous from the appliance's flue outlet to the vent termination outside the building. All system components shall be ETL listed and supplied from the same manufacturer.
- E. The vent shall be constructed with an inner and outer tube, where the annular space between the tubes is 1-inch.
 - 1. The inner tube (flue gas conduit) shall be constructed from either AL29-4C® or 316L stainless steel. The AL29-4C stainless steel will have a wall thickness of .015" for 3" through 9" diameter vents, .020" for 10" through 16" and .024" for 18" through 24" diameter vents. The 316L stainless steel will have a minimum wall thickness of .015" for 3"-9" diameter vents, .019" for 10"-16" diameter vents and .024" for 18"-24" diameter vents.
 - 2. The outer tube (jacket) shall be constructed from 441 stainless steel with a minimum wall thickness of .015" for 3" through 9" diameter vents, .020" for 10" through 16" and .024" for 18" through 24" diameter vents.

- F. All system components such as vent supports, roof or wall penetrations, terminations, appliance connectors and drain fittings require to install the vent system shall be ETL listed and provided by the vent manufacturer.
- G. Inner pipe joints shall be sealed by means of gasketing and overlap where gasket material is not exposed to condensing flue products. Use of caulking material or silicone sealant to seal joints in field is prohibited.
- H. Vent layout shall be designed and installed in compliance with manufacturer's installation instructions and all applicable local codes.

PART 3 - EXECUTION

3.1 INSTALLATION OF DOUBLE WALL CONNECTORS, BREECHINGS, AND VENTS:

- A. Install UL 1738 venting system in accordance with manufacturer's installation instructions and UL listing. Maintain minimum clearances from combustibles specified in UL listing.
- B. Connect and secure joints between sections of vents in accordance with manufacturer's installation instructions.
- C. Support vents at intervals recommended by the manufacturer to support the weight of the vent and all accessories, independent of appliance it serves.
- D. Install vent with a continuous 3/8" per foot (minimum) slope, as is required by the National Fuel Gas Code for all gas-fired appliances. Manufacturer's supplied tees and elbows that are built incorporating minimum required slope, are an allowable means to generate system slope.

3.2 ADJUSTING AND CLEANING:

- A. The vent system and breechings shall be inspected and cleaned, to remove dust and debris before the final connection to the appliances.
- B. Clean external surfaces upon completion of the installation.

3.3 PROTECTION:

- A. Temporary Closure: At ends of venting system which are not completed or connected to equipment, provide temporary closure which will prevent entrance of dust and debris until installations are completed.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 235239- FIRE TUBE BOILERS (HOT WATER)

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235239- FIRE TUBE BOILERS (HOT WATER)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Section:
 - 1. Section 220513 - Motors
 - 2. Section 235150 Venting Systems For Specialty Gas Fired Appliances
 - 3. Section 220523 Valves
 - 4. Section 220519 Thermometers and Gauges
 - 5. Section 033000 Cast-in-Place Concrete.
 - 6. Section 230548.13 Vibration Controls

1.2 SUMMARY:

- A. This section includes packaged, factory-fabricated and assembled, gas-fired, fire-tube condensing boilers, trim and accessories for generating hot water.

1.3 SUBMITTALS:

- A. Submit one complete all-electronic file of the boiler package and accessories shop drawings and performance data.
 - 1. Submit product data, including rated capacity, weight, furnished specialties and accessories; with installation and start-up instructions.
 - 2. Submit manufacturer's assembly type shop drawings indicating dimensions, weight loading, required clearances, methods of components assembly, and location and size of each field connection.
 - 3. Submit manufacturer's wiring diagrams for interlock and control wiring, clearly identifying required field wiring.
 - 4. Clearly identify control points, terminal block positions, relays, contacts that will generate the required status and alarm points that will be remotely monitored; as well as receipt of boiler group permissive signal to operate; and CSD-1 Emergency shutdown.
- B. After equipment has been installed, and successfully started, submit one complete all-electronic file of the boiler package as part of Operation and Maintenance Manuals, including the following.
 - 1. Complete shop drawing submittal specified in paragraph B.
 - 2. Factory Testing Report.
 - 3. UM Inspector approval forms.
 - 4. Project commissioner final report.
 - 5. Warranty documentation as specified in Article 1.4.

6. Complete job specific as-built wiring diagram indicating interlocks, etc. Standard factory wiring diagrams are not acceptable.

1.4 QUALITY ASSURANCE:

A. Codes and standards:

1. UL compliance: The control panel shall be UL labeled. The burner system shall be designed, built and tested to guidelines established by UL-795.
2. NFPA compliance: Install fire tube boilers in accordance with NFPA code 54 "national fuel gas code".
3. DOE Compliance: Minimum efficiency shall comply with 10 CFR Part 431, Subpart G, Appendix C, "Uniform Test Method for the Measurement of Thermal Efficiency and Standby Loss of Gas-Fired Instantaneous Hot Water Supply Boilers.
4. ASME compliance: Construct fire tube boilers in accordance with ASME boiler and pressure vessel code, section IV "heating boilers".
5. UL and NEMA compliance: provide fire tube boiler and ancillary electrical components which have been listed and labeled by UL and comply with NEMA standards.
6. FM compliance: Provide control devices and control sequences in accordance with requirements of Factory Mutual system (FM).
7. NEC compliance: Provide control panels and assembly and wiring of all devices in accordance with requirements of latest edition of NEC. All control panels shall have a label indicating listing by a nationally recognized testing agency such as UL, ETI or MET.
8. CSA Compliance: Test condensing boiler to comply with CSA Safety Certified to ANSI 221.13. Additionally, safeties for burner controls must comply with latest requirements of applicable township and state codes.
9. Gas train, including pilot gas train, must comply with current IRI requirements and township and state codes.

1.5 ADMINISTRATIVE REQUIREMENTS

- A. Provide a qualified service technician from the Manufacturer's staff to supervise installation and reconnection of unit sections and to perform start-up, testing and training as detailed in part 3.

1.6 COMMISSIONING:

- A. Comply with commissioning as specified in Division 01. The boiler start up engineer and the installing contractor shall cooperate and coordinate their activities with the commissioning engineer.

1.7 INSURANCE COMPANY:

- A. The owner's insurance company is Factory Mutual. The complete boiler and accessory installation shall meet all of the requirements of F.M. whether or not indicated in the plans and specifications, for each device and/or component.

1.8 SHIPPING, HANDLING AND DELIVERY

- A. Manufacturer shall provide shipping protection to ensure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.
- B. Support or restrain equipment components independently during transport to prevent to prevent damage during shipping.
- C. Shipment: Shipment to be F.O.B. jobsite destination with freight prepaid and delivered to job site, or any other location designated by the installation contractor. All truck services will be arranged by manufacturer with a minimum notice of 5 working days to the installation contractor in advance of delivery. Delivery typically to be between the hours of 8:00 A.M. and 2:00 P.M. on a normal work weekday. The equipment manufacturer's representative shall be present when the equipment is delivered to inspect for any damage during both initial custody transfer receipt, and after setting boilers in Mechanical Room.
- D. Handling: The equipment will be received by the installing contractor for installation. The Contractor will provide the crane and/or other rigging, and unload, inspect and accept the equipment. The installing contractor will do the rigging and move the equipment to the final locations, preceding the required piping and wiring. Crane lift details shall be fully outlined in the project-specific Safety Plan.
- E. Delivery: Delivery of units is required to allow sufficient time for installation, startup and commissioning of the HHW system upgrades on or before the Substantial Completion date. The equipment shall be stored at the manufacturer's site if necessary and shipped on notification from the installation contractor. The exact delivery date is to be reflected in the contractor's construction schedule.
- F. Achieving Substantial Completion includes obtaining State of Michigan Boiler Code Inspector Certificate to Operate, UM inspector Installation Approvals, project Commissioner final report.

1.9 WARRANTY:

- A. Pressure vessel warranty:
 - 1. The pressure vessel shall be guaranteed against flue gas corrosion and materials/workmanship for a period of 15 years.
 - 2. Pressure vessel shall be warranted against thermal shock for the lifetime of the boiler.
- B. Heat exchanger warranty
 - 1. The heat exchanger shall carry a 15-year from shipment, prorated, limited warranty against any failure due to condensate corrosion, thermal stress, mechanical defects, or workmanship.
- C. Condensate collection box warranty
 - 1. The condensate collection box shall be guaranteed for 15 years.
- D. Complete package warranty:

1. The complete package shall be warranted for a period of 2 years from the date of acceptance of the installation by the University. Warranty shall include all labor, materials and associated costs.

1.10 ACCEPTABLE MANUFACTURERS:

- A. Subject to compliance with the requirements, provide fire tube boilers by one of the following manufacturer(s):
 1. AERCO International, Lochinvar, Cleaver Brooks, Viessmann, Fulton, Raypack.

PART 2 - PRODUCTS

2.1 FIRE TUBE CONDENSING BOILER - GENERAL REQUIREMENTS:

- A. Factory-fabricated, assembled, and tested, fire-tube, forced-draft, fully condensing boiler with heat exchanger sealed pressure tight, built on a steel base, including insulated jacket; flue-gas vent and combustion-air intake connections; water supply, return, and condensate drain connections; and controls.
- B. Each boiler shall be natural gas fired, fully condensing and fire-tube design. Power burner shall have full modulation and discharge into a positive pressure vent. Boiler efficiency shall increase with decreasing load (output) and/or HHWR temperature, while maintaining HHWS temperature setpoint. Boiler shall be factory-fabricated, factory-assembled and factory-tested, fire-tube condensing boiler with heat exchanger sealed pressure-tight, built on a steel base, including insulated jacket, flue-gas vent, combustion-air intake connection, HHW supply & return, and condensate drain connections, unit maintenance drain, gas supply, pressure relief, and controls.
- C. Manufacturer's proposed package shall include all options, accessories, instruments and control devices as part of the boiler package, or clearly identified as furnished by the installation contractor, to allow the package to fully function as specified and provide all of the required functions, features, alarms and remote communications as described in the Sequence of Operation and drawings.
- D. Expected items included, but are not limited to the following:
 1. Boiler Lead Lag controls via the boiler mounted control panel, with a Master/Slave arrangement.
 2. Outdoor air Reset
 3. Boiler Group Efficiency Optimization
 4. Off-line individual boiler flow isolation
- E. Each unit shall be a complete package ready for connection of electrical, water, blowdown, fuel and venting.
- F. Each hot water boiler unit shall be AGA-certified, UL-labeled and constructed and tested in accordance with ASME pressure vessel code, section IV, for maximum working pressure of 30 psig. Each boiler assembly shall be hydrostatically pressure tested for 60 psig ASME working pressure. Each boiler must bear ASME stamp and be inspected under the national board rules.

- G. Each hot water boiler shall be provided with an ASME listed safety relief valve and have a discharge capacity equal to or greater than the listed gross output of the boiler.
- H. The boiler water pressure drop shall not exceed 3 psig at maximum flow conditions.
- I. The boiler water connections shall be minimum, boiler pipe size connection.
- J. The boiler support frame shall have a maximum width of X'-Y" to allow setting on existing housekeeping pad, or on new house keeping pad as shown in the plans.

2.2 CONDENSING BOILER CONSTRUCTION:

- A. Heat Exchanger: The heat exchanger shall be constructed of corrosion-resistant Type 316 stainless steel fire tubes and tube sheets, with a one-pass combustion gas flow design. The fire tubes shall be 5/8" OD, with no less than 0.04" wall thickness. The upper and lower stainless steel tube sheet shall be no less than 0.25" thick. The pressure vessel/heat exchanger shall be welded construction. The heat exchanger shall be ASME stamped for a working pressure not less than 150 psig. Access to the tube sheets and heat exchanger shall be available by burner and exhaust manifold removal. Minimum access opening shall be no less than 8-inch diameter.
- B. Pressure Vessel: Pressure vessel shall be constructed of SA53 carbon steel with welded heads and tube connections, with minimum 0.25-inch thick wall and 0.50-inch thick upper head. Inspection openings in the pressure vessel shall be in accordance with ASME Section IV pressure vessel code. The boiler shall be designed so that the thermal efficiency increases as the boiler firing rate decreases and/or HHWR temperature decreases. The pressure vessel shall have a minimum water volume as scheduled.
- C. Burner - Natural gas, forced draft: Modulating Air/Fuel Valve and Burner: The boiler burner shall be capable of a **5 to 1** (boilers less than 2500 MBH and **10 to 1** (2500 MBH to 6000 MBH boilers) turndown ratio of the firing rate without loss of combustion efficiency or staging of gas valves. The burner shall meet Michigan Air Quality Regulations, Chapter 1, Part 8 Rules: "Oxides of Nitrogen (NOx). The burner shall be metal-fiber mesh covering a stainless steel body with pilot ignition system and flame rectification. All burner material exposed to the combustion zone shall be of stainless steel construction. There shall be no moving parts within the burner itself. Burner air-fuel regulation shall be accomplished by either: a linkage-less, self-regulating, air-fuel ratio gas valve-venturi system or by use of modulating air/fuel valve to meter the air and fuel input. The modulating motor must be linked to both the gas valve body and air valve body with a single linkage. The linkage shall not require any field adjustment. A cast aluminum pre-mix centrifugal blower with a variable frequency drive (VFD), or variable speed ECM motor with integrated drive electronics, shall be controlled to ensure the optimum mixing of air and fuel between the air/fuel regulator and the burner. The burner firing sequence of operation shall include pre-purge, firing, modulation, and post-purge operation.

D. Minimum boiler efficiencies shall be as follows at a 20 degree F HHWS&R temperature differential:

1.	<u>EWT</u>	<u>100% Fire</u>	<u>50% Fire</u>	<u>7% Fire</u>
2.	160° F	86.5%	87%	87%
3.	140° F	87%	87.5%	87.5%
4.	120° F	88%	89%	90%
5.	100° F	93%	94.5%	95%
6.	80° F	95.5%	96.8%	98%

E. Exhaust Manifold: The exhaust manifold shall be of corrosion resistant cast aluminum or 316 stainless steel flue connection. The exhaust manifold shall have a fully welded 316L stainless steel collecting reservoir and a gravity drain for the elimination of condensation.

F. Ignition: Ignition shall be via spark ignition or proven pilot with 100 percent main-valve shutoff and electronic flame supervision.

G. The boiler's manufacturer recommended annual replacement parts, necessary to complete State of Michigan CSD-1 re-certification shall be non-proprietary.

H. The boiler shall be designed such that the combustion air is pre-heated inside of the boiler enclosure to increase efficiency.

I. Enclosure: The sheet metal enclosure shall be fully removable, allowing for easy access during servicing.

J. Condensate Trap: The boiler manufacturer shall furnish a condensate drain trap and neutralization unit for installation in the field, with quench water connection provision, to create the necessary pressure seal and collect the exhaust flue condensate, per boiler manufacturer's recommended installation requirements.

K. Individual condensate trap and neutralizing tank complete with neutralization media shall be furnished for each boiler.

L. Each boiler shall be constructed in accordance with the A.S.M.E. Section IV Code and bear the "H" stamp and shall be manufactured within an ISO 9001 Certified facility to ensure high quality standards.

M. Boiler design and warranty shall be based on operation with closed loop HHW pH range held at 8.0 - 9.5.

2.3 BOILER TRIM:

A. Boiler trim shall include the following items mounted and piped on boiler:

B. Safety Relief Valve: ASME rated.

C. Pressure and Temperature Gauge: Minimum 3-1/2-inch- (89-mm-) diameter, combination water-pressure and -temperature gauge. Gauges will be mounted on water inlet and outlet. Gauges shall have operating-pressure and -temperature ranges, so normal operating range is about 50 percent of full range.

D. High and low gas-pressure switches.

E. Audio alarm with silence switch.

F. Boiler Air Vent: Automatic.

- G. Drain Valve: Minimum NPS 3/4 (DN 20) hose-end gate valve.
- H. Boiler Primary Pump: Non-overloading, [**in-line pump with split-capacitor motor having thermal-overload protection and lubricated bearings**] [**in-line pump with a variable frequency drive (VFD)**] [**variable speed ECM motor with integrated drive electronics**], designed to operate at specified boiler pressures and temperatures. Pump and motor shall meet all requirements of Section 220513 - Motors and Section 232123 - Plumbing and Hydronic Pumps.

2.4 ADDITIONAL EQUIPMENT & ACCESSORIES:

- A. Gas Regulator: Provide a dedicated gas regulator at each boiler. Incoming gas pressure to building is currently regulated to 14" w.c. maximum, with available pressure in boiler room expected to range from 7 - 14" w.c.
- B. Digital Remote Alarm Contacts: 1) Provide in each boiler one set of discrete auxiliary alarm contacts to close when the boiler control panel goes in to a Boiler Fault alarm mode; 2) Provide a set of discrete auxiliary alarm contacts to close when unit is not achieving set point temperature, after an appropriate timed delay. These contacts will be wired to the University DDC system for remote alarm annunciation.
- C. Digital Remote Status Contacts: 1) Provide in each boiler one set of discrete auxiliary alarm contacts to close when the boiler is in operation or burner is firing. This contact will be wired to the University DDC system for remote status annunciation.
- D. 120 VAC CSD-1 Emergency Shutdown Contacts: Provide for each boiler, a relay or set of contacts to receive the CSD-1 Emergency Shutdown signal, to stop all boiler group operations.

2.5 BOILER CONTROLS

- A. Refer to Division 23 Section 230900 Controls specification."
- B. The boiler control system, panel and components shall be Underwriters Laboratories recognized.
- C. The control panel shall consist of circuit boards using state-of-the-art surface-mount technology in a single enclosure, including:
 - 1. A display board incorporating LED display to indicate temperature and all message annunciation
 - 2. Individual replaceable circuit boards including CPU for all control functions, electric low-water cutoff with test and manual reset functions, power supply, ignition /stepper board incorporating flame safeguard control, and connector.
- D. The combustion safeguard/flame monitoring system shall use spark ignition and a rectification-type flame sensor.
- E. The control panel hardware shall support both RS-232 and RS-485 remote communications.
- F. The controls shall annunciate boiler and sensor status and include extensive self-diagnostic capabilities that incorporate separate status and fault messages.

- G. The control panel shall incorporate features designed to enhance operation in modes where it receives an external control signal by eliminating nuisance faults due to over-temperature, improper external signal or loss of external signal. These features include:
1. Setpoint High Limit, with selectable maximum boiler outlet temperature, acting as a temperature limiting governor, based on a PID function to limit firing rate to maintain outlet temperature within a 0 to 10 degree selectable band.
 2. Setpoint Low Limit, with selectable minimum operating temperature.
 3. Failsafe Mode, allowing the boiler to switch to an internal setpoint if its external control signal is lost, rather than shut off.
- H. The boiler control system shall include the following additional features for enhanced external system interface:
1. System start temperature feature (separate from external DDC system permissive)
 2. Pump delay timer
 3. Auxiliary start delay timer
 4. Auxiliary temperature sensor
 5. Analog output feature to enable simple monitoring of temperature setpoint, outlet temperature or fire rate
 6. Remote interlock circuit
 7. Delayed interlock circuit
 8. Fault relay for remote fault alarm
- I. Each boiler shall include an electric, single-seated combination safety shutoff valve/regulator with proof of closure switch in its gas train. Each boiler shall incorporate dual over-temperature protection with manual reset, in accordance with ASME Section IV and CSD-1.
- J. Each boiler shall have an oxygen monitoring system that will measure the oxygen content of the exhaust gasses in real-time. Output of O2 information shall be accessible via the boiler control panel.
- K. The Boiler Manufacturer shall supply as part of the boiler package the specified Boiler Master Control (whether built in to each unit, or as a separate, additional BMCP panel) a completely integrated control system to control all operation and energy input of the multiple boiler group. The control system shall include a microprocessor, utilizing the MODBUS protocol to communicate with the Boilers via the RS-485 port.
- L. The controller shall have the ability to vary the firing rate and energy input of each individual boiler throughout its full modulating range to maximize the condensing capability and thermal efficiency output of the entire heating plant. The BMCP shall control the boiler outlet header temperature within +2°F. The controller shall be a PID type controller and uses Ramp Up/Ramp Down control algorithm for accurate temperature control with precise variable load response.
- M. The BMCP shall have the following anti-cycling features:
1. Manual designation of lead boiler and last boiler.
 2. Lead boiler rotation at user-specified time interval.

3. Delay firing/shutting down of boilers when header temperature is within a predefined dead band.

N. Control Modes:

1. When set on Internal Setpoint Mode, temperature control setpoint shall be fully field adjustable from 50°F to 190°F in operation. When set on Indoor/Outdoor Reset Mode, an adjustable inverse ratio is used in response to outdoor temperature to control the main header temperature. Reset ratio shall be fully field adjustable from 0.3 to 3.0 in operation. When set on 4ma to 20ma Temperature Control Mode, the BMCP will operate the boiler group to vary header temperature setpoint linearly as an externally applied 4-20 ma signal is supplied.
2. When set on MODBUS Temperature Control Mode, the BMCP will vary header temperature setpoint as an external communication utilizing the MODBUS protocol is supplied via the RS-232 port. The ACS controller shall have local panel display screens for monitoring of all sensors and interlocks. Non-volatile memory backup of all control parameters shall be internally provided. The controller will automatically balance the sequence of operating time on each boiler by a first-on first-off mode and provide for setback and remote alarm contacts. Connection between individual boilers (and with the separate BMCP if required) shall be twisted pair low voltage wiring, with the boilers 'daisy-chained' for ease of installation.
3. Communication interface: Provide the necessary hardware and software for future BACNET MS/TP monitoring of the boiler plant remotely. All equipment shall be BTL certified. UM BAS/DDC system for remote monitoring and interface utilizes the Siemens Apogee system.

O. Boiler operating controls shall include the following devices and features:

1. Control transformer.
2. Set-Point Adjust: All set points shall be adjustable.
3. Electric, factory-fabricated and installed panel to control burner-firing rate, to reset supply-water temperature inversely with outside-air temperature. Refer to Hot Water Heating Outdoor Air Reset Schedule on plans.
 - a. Include automatic, alternating-firing sequence for multiple boilers to ensure maximum system efficiency throughout the load range and to provide equal runtime for boilers.

P. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation.

1. High Cutoff: Manual reset stops burner if operating conditions rise above maximum boiler design temperature.
2. Low-Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manual-reset type.
3. Blocked Inlet Safety Switch: Manual-reset pressure switch factory or field mounted on boiler combustion-air inlet.
4. Audible Alarm: Factory mounted on control panel with silence switch; shall sound alarm for above conditions.

- Q. Building Automation System Interface: Factory install hardware and software to enable building automation system to monitor, control, and display boiler status and alarms.
 - 1. Hardwired Points:
 - a. Monitoring: On/off status and common fault alarm.
 - b. Control: On/off operation.

2.6 ELECTRICAL POWER

- A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are shown on Drawings and specified in electrical Sections.
- B. Single-Point Field Power Connection: Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field power connection to boiler.
 - 1. House in NEMA 250, Type 1 enclosure.
 - 2. Wiring shall be numbered and color coded to match wiring diagram.
 - 3. Install factory wiring outside of an enclosure in a metal raceway.
 - 4. Field power interface shall be to [**fused disconnect switch**] [**nonfused disconnect switch**] [**circuit breaker**].
 - 5. Provide branch power circuit to each motor and to controls[**with a disconnect switch or circuit breaker**].
 - 6. Provide each motor with overcurrent protection.

2.7 CONDENSATE-NEUTRALIZATION TANKS

- A. Description: Provide minimum 4.8 gallon polypropylene condensate-neutralizing tank and lid with two 1" FNPT threaded or flanged inlet and outlet pipe connections. Plastic/PVC canister type device is not permitted. Device functions to prevent acidic condensate from damaging drain system. It is to be piped to receive acidic condensate discharged from condensing boiler and neutralize it by chemical reaction with replaceable neutralizing agent. Neutralized condensate is then piped to suitable drain.
- B. Tank features:
 - 1. All polypropylene material.
 - 2. Suitable for use on all natural gas and propane boilers.
 - 3. Includes initial charge of neutralizing agent.
 - 4. Neutralizing agent to be easily replaceable when exhausted.
 - 5. Inlet and outlet pipe connections.
- C. Tank Configuration:
 - 1. Utilized where boiler is elevated or where tank is installed in a pit with tank top flush with floor.
 - 2. Top easily removed for neutralizing agent replacement.
 - 3. Internal baffles to channel flow for complete neutralization.
 - 4. Integral bypass to prevent condensate backflow into appliance.
 - 5. Multiple units may be used for larger capacity.
- D. Tank Manufacturer:

1. Axiom NT25 Condensate Neutralization Tank or equal

2.8 VALVES, MOTORS AND OTHER ITEMS SPECIFIED ELSEWHERE:

- A. All motors shall meet requirements of Section 220513.
- B. All valves shall meet requirements of Section 220523.
- C. Thermometers and gauges shall meet requirements of Section 220519.
- D. Positive Pressure Vent For Condensing Gas Fired Appliances shall meet requirements of Section 235150

2.9 SOURCE QUALITY CONTROL

- A. UL Compliance: Test gas-fired boilers having input of more than 400,000 Btu/h for compliance with UL 795. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- B. UL Compliance, Gas-Fired: Test gas-fired boilers for compliance with UL 2764. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- C. CSA Compliance: Test boilers for compliance with ANSI Z21.13-2017/CSA 4.9.
- D. Performance Testing: Test and label boilers for efficiency to comply with AHRI 1500.
- E. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, and carbon monoxide in flue gas and to achieve combustion efficiency; perform hydrostatic test.
- F. Test and inspect factory-assembled boilers, before shipping, in accordance with 2017 ASME Boiler and Pressure Vessel Code. Factory test boilers for safety and functionality; fill boiler with water, and fire throughout firing range, to prove operation of all safety components.
- G. Allow Owner access to source quality-control testing of boilers. Notify Architect 14 days in advance of testing.

PART 3 - EXECUTION

3.1 DEMOLITION AND PREPARATION:

- A. Demolish existing boilers and associated piping and controls as indicated on drawings.
- B. Each existing boiler is expected to be removed off site as a complete unit. Contractor may choose to disassemble or cut up each boiler, HOWEVER contractor shall maintain complete responsibility for any exposed hazardous material (asbestos) handling issues created by such an approach.
- C. Modify existing housekeeping pad as indicated on drawings for installation of new boilers.

3.2 EXAMINATION

- A. The plans shown are intended to be schematic and may not be correct in all details (such as the location of all outlets and inlets) to the unit, manufacturer and model, being provided by awarded contractor. The Contractor shall review the shop drawing available from the vendor and allow sufficient funds in his base bid for any additional work required to suit the unit being supplied. All equipment shipped loose shall be installed and piped as directed by the manufacturer and/or owner, by this contractor.
- B. Examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting performance of the Work.
 - 1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- C. Examine mechanical spaces for suitable conditions where boilers will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 BOILER INSTALLATION:

- A. Install the boilers in strict compliance with manufacturer's written instructions, and as shown on drawings. Position boilers, install ducts, pipe to allow necessary access to components for service/maintenance.
- B. Elevate boiler 6" (or as required) above the housekeeping pad, via prime and finish painted structural steel support frame, to allow for condensate drainage to slope to drain. Coordinate minimum requirements with boiler manufacturer.
- C. The HWH safety valve outlet shall be piped to the nearest floor drain, with an air gap. The safety valve discharge must not be piped to any area where freezing temperatures could occur. Connect safety valve piping with union to allow for ease of relief valve replacement.
- D. Following installation, flush and clean piping in compliance with the associated specification section.
- E. Fill the boiler with water, and pressure-test the boiler and system per schedule on the drawings, or alternatively up to the rating of the relief valve. Clean the system per associated spec section and manufacturer's instructions; flush the system to remove all trash and dirt; and refill the system with water. Reconnect the existing water treatment chemical feed system and engage Owner, who will dose the closed HWH piping loop to the proper pH level.
- F. Compressed air blow clean the new gas piping, and perform pressure test. Bleed air from the gas line in a safe manner.
- G. All equipment, piping, valves and other components shipped loose shall be installed per manufacturer's instruction, whether indicated or not, in these plans and specifications.

- H. Complete power and control interconnecting wiring. Perform continuity checks and energize the boiler controls.

3.4 PIPING CONNECTIONS

- A. Comply with requirements for hydronic piping specified in Section 232113 "Hydronic Piping."
- B. Connect piping to boilers, except safety relief valve connections, with flexible connectors of materials suitable for service. Flexible connectors and their installation are specified in Section 232116 "Hydronic Piping Specialties."
- C. Drawings indicate general arrangement of piping, fittings, and specialties.
- D. When installing piping adjacent to boiler, allow space for service and maintenance of condensing boilers. Arrange piping for easy removal of condensing boilers.
- E. Install condensate drain piping to condensate-neutralization unit and from neutralization unit to nearest floor drain. Piping shall be at least full size of connection. Install piping with a minimum of 2 percent downward slope in direction of flow.
- F. Install condensate piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection. Install piping with a minimum of 2 percent downward slope in direction of flow.
- G. Connect gas piping to boiler gas-train inlet with union. Piping shall be at least full size of gas-train connection. Provide a reducer if required.
- H. Connect hot-water piping to supply- and return-boiler tappings with shutoff valve, and union or flange at each connection.
- I. Install piping from safety relief valves to nearest floor drain.

3.5 DUCT CONNECTIONS

- A. Boiler Venting and Combustion Air Intake:
 - 1. Install boiler venting system and combustion-air intake.
 - 2. Boiler venting system shall meet requirements of Section 235150 "Venting Systems for Specialty Gas Fired Appliances", and comply with UL 1738.
 - 3. Provide combustion air intake duct material, size, and configuration as indicated in boiler manufacturer's instructions and to comply with UL 1738.
 - 4. Comply with all boiler manufacturer's installation instructions.
 - 5. Connect boiler vent full size to boiler connections.

3.6 ELECTRICAL CONNECTIONS

- A. Connect wiring in accordance with Section 260513 "Medium, Low and Control Voltage Cables."
- B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

- C. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.
- D. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
 - 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."

3.7 CONTROL CONNECTIONS

- A. Install control and electrical power wiring to field-mounted control devices.
- B. Connect control wiring in accordance with Section 260513 "Medium, Low and Control Voltage Cables "
- C. Install nameplate for each control connection, indicating field control panel designation and I/O control designation feeding connection.
 - 1. Nameplate shall be laminated plastic, as specified in Section 260533 "Electrical Materials and Methods."

3.8 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections with the assistance of a factory-authorized service representative:
- C. Tests and Inspections:
 - 1. Perform installation and startup checks in accordance with manufacturer's written instructions.
 - 2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
 - 3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - a. Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level, and water temperature.
 - b. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- D. Boiler will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.
- F. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.9 FIELD TEST:

- A. Observe the ignition of the pilot and the main burner to make sure they are smooth and complete. Perform combustion efficiency test, provide a report on measured carbon monoxide, carbon dioxide and oxygen and measured efficiency. Check out the safety controls and verify that they are functioning properly. Set the operating controls for the proper pressure.
- B. Submit a blank copy of the proposed start-up report form for review and approval by the project engineer at least two (2) weeks before start-up.
- C. Start-up report shall include, but not necessarily be limited to the following:
 - 1. Amperage and air flow on forced draft (combustion air) fan at low and high fire
 - 2. Gas pressures prior to and after regulators
 - 3. Gas pressure through gas train
 - 4. Draft pressure at boiler outlet
 - 5. Combustion efficiency test
 - 6. Safety control check out
 - 7. Operating control check out
- D. Operate the boiler for no less than 2 hours. Provide a written report, through channels and on company letterhead, stating that ignition is proper, safety controls have been checked and operating controls are set and functioning properly. The system is not complete until this report has been received.

3.10 START UP SERVICE:

- A. After the boiler installation is completed, a factory trained technician shall supervise starting, boil out and adjusting the initial fire, schooling for the operators in the care and handling of the equipment and 12 months warranty service after initial firing to cover warranty service. Start-up services shall include all labor, materials and associated costs. The boiler manufacturer shall provide a letter stating the technician is factory trained to start-up their boilers.

3.11 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, maintenance and to obtain maximum efficiency in plant operation. Refer to Section 017900 "Demonstration and Training. Video record the training sessions and provide electronic copy to Owner.]
 - 1. Provide not less than two hours of training.
 - 2. Obtain Owner sign-off that training is complete.
 - 3. Owner training shall be held at Project site.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 235240 - FIRE TUBE BOILERS (STEAM)

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235240 - FIRE TUBE BOILERS (STEAM)

REVISIONS:

NOV.9,2004: CONSIDERABLE REVISIONS NOT FOR MASTER SPECIFICATIONS
MAR.7,2005: LAST REVISION.

APRIL 2018: REVISED TO LIST MFR.S FROM PML AND PER WAYNE GROTH.
R BENEDEK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

SPEC EDITOR: REVISE NUMBER OF BOILERS FOR THE PROJECT

- A. The work includes furnishing and installing three (3) water back fire tube gas fired packaged boilers with capacities as scheduled on the plans.
- B. Boiler package shall consist of a boiler, boiler fittings, burner equipment, forced draft fan, safety controls and accessories all piped, wired and assembled on a structural steel base.
- C. Each unit shall be a complete package ready for connection of electrical, feed water, steam, blowdown, fuel and venting.

1.3 QUALITY ASSURANCE:

- A. Codes and Standards:
1. UL Compliance: The complete boiler burner unit shall be approved and labeled as a unit by Underwriters Laboratories.
 2. NFPA Compliance: Install gas-fired fire tube boilers in accordance with NFPA Code 54 "National Fuel Gas Code".
 3. ASME Compliance: Construct fire tube boilers, receivers, blow down tank, etc. in accordance with ASME Boiler and Pressure Vessel Code, Section IV "Heating Boilers".
 4. UL and NEMA Compliance: Provide fire tube boiler and ancillary electrical components which have been listed and labeled by UL and comply with NEMA standards.
 5. FM Compliance: Provide control devices and control sequences in accordance with requirements of Factory Mutual System (FM).

6. NEC compliance: Provide control panels and assembly and wiring of all devices in accordance with requirements of latest edition of NEC. All control panels shall have a label indicating listing by a nationally recognized testing agency such as UL, ETL or MET.
7. Additionally, safeties for burner controls must comply with latest requirements of applicable township and state codes.
8. Gas train, including pilot gas train, must comply with current IRI requirements and township and state codes.

B. Pressure Vessel Warranty:

1. If, within fifteen (15) years from and after the date of acceptance of the boilers, the tube sheets, furnace and furnace throat, rear combustion chamber, or front and rear flue doors fail under normal use and service, the Company will repair the part or compartment as required for proper operation of the boiler. This also specifically includes all refractory at the front and rear of the boiler.

C. Complete package warranty:

1. The complete package shall be warranted for a period of 12 months from the date of acceptance of the installation by the University. Warranty shall include all labor, materials and associated costs.

1.4 ACCEPTABLE MANUFACTURERS:

A. Subject to compliance with the requirements, provide fire tube boilers by one of the following manufacturer(s):

1. Johnston Boilers
2. Easco Boilers
3. Burnham
4. Cleaver Brooks
5. Johnston

B. Subject to compliance with other requirements, provide burner manufactured by:

1. Webster Manufacturing Co.

1.5 COMMISSIONING:

A. Comply with commissioning as specified in Division 01. The boiler start up engineer and the installing contractor shall cooperate and coordinate their activities with the commissioning engineer.

SPEC EDITOR: VERIFY WITH UM PROJECT ENGINEER AND EDIT AS REQUIRED.

1.6 INSURANCE COMPANY:

A. The Owner's insurance company is Factory Mutual. The complete boiler and accessory installation shall meet all of the requirements of F.M., whether or not indicated in the plans and specifications, for each device and/or component.

PART 2 - PRODUCTS

2.1 BOILER - GENERAL REQUIREMENTS:

- A. Each Steam boiler unit shall be AGA-certified, UL-labeled and constructed and tested in accordance with ASME Pressure Vessel Code, Section IV, for maximum working pressure of 15 psig. Each boiler assembly shall be hydrostatically pressure tested for 60 psig ASME working pressure. Each boiler must bear ASME stamp and be inspected under the National Board Rules.
- B. Each steam boiler shall be provided with an ASME listed safety valve set at 15 PSIG and have a discharge capacity equal to or greater than the listed Gross Output of the boiler.

SPEC EDITOR: REVISE THE FOLLOWING PARAGRAPH FOR EACH PROJECT OR EDIT TO SUIT EXISTING CONDITIONS

- C. The boiler support frame shall have a maximum width of X'-Y" to allow setting on existing housekeeping pad / or new housekeeping pads as shown on plans.

2.2 BOILER CONSTRUCTION:

- A. Boiler shall be four (4) pass water back Scotch Marine type with a front or rear exhaust vent, listed and rated by the American Boiler Manufacturer's Association, Fire tube Section, designed and built to comply with the latest ASME Code rules for fifteen (15) lbs. per sq. inch steam working pressure and be inspected and stamped by an authorized boiler inspector. The boiler shall have not less than 5 sq. ft. of heating surface per boiler horsepower, measured on the fireside (ASME method), a furnace heat release of not more than 142,000 BTU/HR/CFT or as scheduled, whichever is lower, when operating at rating and the rear combustion chamber shall be submerged within the boiler water. The boiler shall have flanged and/or threaded openings for trimmings and external connections; sufficient hand holes and manhole for thorough inspection and cleaning; burner inspection sight ports ant front and rear; gas tight inspection doors; and dial stack thermometer.
- B. The boiler shall be factory insulated with 2" fibrous insulation, covered by a sheet metal jacket, assembled with lock seam joints.

2.3 BOILER TRIM:

- A. Boiler trim shall include the following items mounted and piped on boiler combination type water column with primary low water cut-off and pump control, auxiliary (manual reset) low water cut-off switch wired to prevent burner operation if water level falls below safe level, chain operated water gauge, gauge glass drain valve and water column drain valve piped into blow-off header; 6" diameter steam gauge mounted adjacent to water column and fitted with pigtail cock and test tee; main blow-off and surface blow-off valves and the main blow-off valves shall be piped into the blow-off header; bronze feed stop and check valves; ASME safety valve(s) sized to comply with Code Requirements and flue gas thermometer and high limit pressure switch wired to prevent burner operation if pressure exceed a set safe limit.

- B. The boiler shall be furnished with compound pressure vacuum gauge to indicate the system pressure. The compound gauge shall be of rugged guarded type construction and the gauge dial shall be clearly marked and easy to read.

2.4 BOILER CONTROLS:

- A. The operating limit pressure control shall be set according to the design requirements of the heating system. The high limit pressure control should be set approximately 2 psig higher than the low limit control setting (15 psig maximum allowable steam boiler pressure).

SPEC EDITOR: FILL IN DIMENTIONS BELOW, AND REVISE PARAGRAPH TO ACCOMMODATE EACH PROJECT. ENGINEER MUST VERIFY THESE SETTINGS WITH BOILER MANUFACTURER)

- B. Each boiler shall have at least two independent automatic low water fuel cut-offs, one of which may be combined low water fuel cut off and pump control. One cut-off control shall be set to function ahead of the other. Functioning of the lower of the two cut-off controls shall cause a safety shutdown (lock out) requiring manual reset. The combination low water cut-off and pump control must be located on the boiler so the burner will become de-energized should the boiler water level fall to within _____ inches above the lowest visible point in the water gauge glass. The boiler feed pump will become energized with a boiler water level of approximately _____ inches above the lowest visible point in the water gauge glass

2.5 BURNERS:

- A. The entire fuel burner system and its installation shall conform to the manufacturer's erecting instructions, with applicable codes. The burner fuel shall be natural gas.
- B. Each gas burner shall be a retention ring type, with full flame retention, designed for natural gas with a heating value of 1020 BTU per cubic foot. The burner shall be complete with gas-electric ignition, main gas shut-off cock, characterized main gas pressure regulator, manual test cock, modulating valve, high and low gas pressure switches, dual motorized safety shut-off valves, one with proof of closure normally open vent valve and all other devices as required to satisfy the regulatory requirements specified.

SPEC EDITOR: REVISE PARAGRAPH FOR EACH PROJECT. REVIEW THE GAS PRESSURE AVAILABLE AND CORRECT AS REQUIRED

- C. The burner heads shall be designed to insure flame retention, stability and quietness of operation. The gas pressure in the boiler room will be approximately _____ (60?) Inches water column at the gas meter outlet, _____ (48?) Inches at the inlet to the gas train and the relief valve at the gas company outlet set at 10 lbs. All the gas train components shall be selected for these operating conditions.

- D. The burner shall be full modulation type, equipped with a fuel and airflow control. Burner shall have a turndown capability of 10:1. Please see the schedule for the maximum input to each boiler. Fuel air ratio control shall be achieved by the use of independent servomotors linkage-less control system.
- E. The combustion air fan shall be direct drive forward curve design statically and dynamically balanced. Draft equipment shall include combustion air switch, air intake silencers, air dampers actuated by the modulating motor and electronically interlocked with the modulating fuel valves.
- F. To ensure reliability, repetition and accuracy a gasketed louver box, capable of registering movement of 0.10", is to be installed on each burner. The louver box shall be of a multiple, opposed, blade type. Each of the blades shall incorporate an EPDM seal on the front edge. The inside walls of the box itself shall have a gasketed seal against the edge of the damper blades. The entire assembly shall be capable of attaining air tightness in accordance with DIN 1946/4. The blades shall be coupled outside the frame using permanently attached drive bars with all adjustments being factory set to have zero play. Louver box shall also incorporate in its design, an air inlet silencer which shall limit the noise due to the sound of the combustion air entering for combustion.
- G. Individual Gas Flow Control Valves shall be provided for on each burner. The use of Butterfly type gas valves is prohibited. The Gas Flow Control Valves shall be Honeywell Model: V5197A1003 for firing rates up to 6,300 MBH, V5197A1011 for firing rates up to 16,000 MBH. The appropriate N.P.T. pipe adapters, also manufactured by Honeywell, shall also be furnished. The Individual Servo-Motors shall be attached to the flow control valve in the following manner. The Servo-Motor shall be mounted, on the flow control valve using the adapter coupling and mounting bracket supplied by Fireye. The stems of the Servo-Motors and the stem of the Flow Control Valves shall, in addition to using the adapter coupling above, be permanently attached through the use of roller pins after combustion is set-up in the field.
- H. Burner ring shall be designed, installed and adjusted so that the flame will not impinge on rear wall refractory in firebox.
- I. Burner unit must meet UL, FM, IRI and the latest NFPA requirements.
- J. The burner shall be tuned to achieve maximum firing rate with a noise level of less than 81 Db as measured on the A scale, at 3 feet and shall conform to MIOSHA requirements as well.

2.6 INTEGRATED BURNER CONTROL SYSTEM:

- A. Each burner shall be equipped with a Micro-Processor Based Burner Management Flame Safeguard and Parallel Positioning Control System. The control shall fully integrate/provide all the required Flame Safeguard functions and Combustion Control functions into a single module.
- B. The entire burner control system and its components shall be as manufactured by Fireye and the model numbers are as below.

- C. The system shall consist of Fire eye integrated Nexus module.
- D. In addition to providing the standard features as detailed by Fireeye in their literature for the control modules specified, the following optional features shall be provided.
 - 1. Servo positioning motors operating at the same voltage as the controller with torque ratings as selected by the burner manufacturer for proper operation with the gas pressure and air box specified.
 - 2. Steam pressure and gas pressure sensors with full self-checking capability.
 - 3. Remote communications capability using the Protocol Interface specified in section 230900 DDC Controls, and elsewhere in the specifications, provide all the necessary communications module, other hardware and software to enable communication between the Burner Control System and owners PC via the Ethernet.
 - 4. O2 Trim capability utilizing zirconium oxide "in situ" fast response probe. The hardware and software for this function shall be provided under Alternate 1.
- E. Codes and Standards: The Control shall be listed by Underwriters Laboratories carrying US and C designations for UL 372 Primary Safety Controls for Gas and Oil Fired Appliances.
- F. System Hardware
 - 1. Controller; The controller shall provide individual outputs for Burner damper, Ignition, Pilot Valve, Gas Valve , Vent Valve and Auxiliary Relay. In addition provide the manufacturer's standard features as detailed by Fireeye in their literature for the controller.
 - 2. Display; The Display shall provide full text messaging and access to the Profile and Option Parameter Set points. The Display shall be cabinet mounted.
 - 3. Sensors; Pressure sensor shall be provided for Steam Pressure indication and control. The Pressure Sensor shall be Fireeye Model NX1025 for 0-28PSI. Gas Pressure Sensor shall be provided for gas pressure supervision. The Gas Pressure Sensor shall be Fireeye Model NX1020 0 - 4.5 PSI sensing range.
 - 4. Provide auxiliary low pressure and high pressure switches in the gas train, manual reset type, wired to shut the burner off. The switches shall be model C6097 made by Honeywell. Provide a steam high pressure switch in each boiler, manual reset type, wired to shut the burner off. Switch shall be Honeywell model #L404C1147.
 - 5. Servo Motors; Individual Servo Motors shall be supplied for each of the controlled elements, Air and Gas. These shall be Fireeye model NX-series, torque rating to be selected for each project.
 - 6. The wiring base shall provide individual terminal connections for the various inputs and outputs.

7. Expansion Interface; the expansion interface shall provide individual terminal connections for the various inputs and outputs. The expansion interface shall further provide power source and connections for dedicated zirconium oxide in situ probe, when O2 trim system is provided. The expansion interface shall further provide analogue input and output capability for control of a variable speed drives, if they are provided. The expansion interface shall further provide analogue input and output capability for input of external analogue signals and transmission of system variables.
8. Provide Fireye "Nexus Modbus Interface" module in the boiler panel of the 70 boiler HP boiler to map all the three Nexus modules and convert to Modbus protocol. In the same panel provide a E+ series Protocol Interface device as manufactured by Cimetrics to convert the Modbus protocol to BACnet/IP protocol. The University will install an Ethernet outlet next to the boiler control panel and wire the E+ converter to the Ethernet outlet.

2.7 O2 TRIM SYSTEM :(ALTERNATE 1)

- A. The O2 values utilized for trim shall be measured by an in situ exhaust gas probe. This shall be a zirconium oxide device.
- B. Reaction time of the O2 trim to changes in O2 level (measured at the device) shall be not greater than 5 seconds.
- C. The O2 Trim Analyzer shall measure and display via the controller display, wet O2, dry CO2, exhaust temperature, combustion efficiency and applied trim action.
- D. The O2 Analyzer shall have no moving parts, pumps or sample lines.
- E. O2 trim system and all of its components shall be by Fireye and shall not be combined with equipment provided by other manufacturers.

2.8 CONTROL CABINET :

- A. The burner unit shall have steel NEMA 1 control cabinet with a hinged door locked mounted on the boiler frame and shall incorporate the electronic burner sequencing equipment, main disconnect switch, fused, motor starter, relays and burner switch. All wiring in the panel and to the boiler shall be color coded with numbered terminal strip, numbered wiring and engraved plates. Provide five indicating lights to indicate safe water level, low water alarm, flame safety alarm, ignition and main fuel valve. All wiring in the panel and to the boiler and burner controls shall be completely numerically identified.

- B. The power supply characteristics shall be 440/208/60/3. Control circuit to be 115 volt, 1 phase, supplied from panel mounted control transformer. There will be two independent power supplies from lockable breakers provided to the boiler control panel. One shall be used for normal boiler function and control transformer. The other shall be utilized to power two (2) optional relays, provided with the panel. The first relay, 3PST rated for 10 amps cont, shall be activated whenever the boiler goes under an alarm condition such as flame failure or low water level. The second relay, DPST rated for 10 amps cont, shall be activated whenever the steam header pressure falls below a set pressure. The pressure sensor shall be furnished, installed (by the mechanical contractor) and wired by the electrical contractor as shown in the plans. Identify the relay contacts terminal strip rows in the shop drawings. These relays will be wired to power a red light and a yellow light outside the boiler room.

SPEC EDITOR: REVISE FOR THE PROJECT. COORDINATE THE POWERING REQUIREMENT WITH THE EE

- C. Provide a separate NO contact to open the mechanical room combustion air dampers on boiler start up or set the speed of the supply air fan to match the combustion air requirement. Power the damper operator, if used, from the burner control panel.

2.9 AUXILIARY EQUIPMENT:

- A. Additional control sequences are indicated in the plans. All of the required optional additional contacts and devices shall be provided to achieve the specified control sequence, even if the required devices are not specifically noted in these specifications.

2.10 BURNER/BOILER EMISSIONS

- A. At the time of start up a calibrated electronic flue gas analyzer shall be used. Provide a print out of the analysis to prove compliance with the following requirements.
- B. At low fire, Carbon dioxide shall not exceed 9.50%, oxygen shall not exceed 7.00%, thermal nitrous oxide shall not exceed 75 PPM and no trace of carbon monoxide shall be present.

FILL IN THE CORRECT EMISSIONS DATA IN THE BELOW PARAGRAPH. BELOW DATA IS SAMPLE ONLY.

- C. At high fire, Carbon dioxide shall not exceed 8.00%, oxygen shall not exceed 4.5%, thermal nitrous oxide shall not exceed 75 PPM and no trace of carbon monoxide shall be present [vsm1].

2.11 ELECTRICAL CONTROL PANEL LABELING:

- A. All control panels provided with burner, boiler or feed water unit shall bear a label from UL, ETL or MET. All wiring including the control wiring shall be installed in a NEC compliant conduit system.

2.12 VALVES, MOTORS AND OTHER ITEMS SPECIFIED ELSEWHERE:

- A. All motors shall meet requirements of Section 220513.

- B. All valves shall meet requirements of Section 220523.
- C. Thermometers and gauges shall meet requirements of Section 220519.

2.13 BOILER DESIGN NOTE:

- A. The plans shown are based on Superior/Easco/Johnston Boilers and are intended to be schematic and may not be correct in all details (such as the location of all outlets and inlets) to the unit pre-purchased by the University or being provided by this contractor. The Contractor shall review the shop drawing available from the University or his vendor and allow sufficient funds in his base bid for any additional work required to suit the unit being supplied. All equipment shipped loose shall be installed and piped as directed by the manufacturer and/or owner, by this contractor.

PART 3 - EXECUTION

3.1 FACTORY TESTING

- A. Each complete boiler/burner unit must be fire tested at the manufacturer's plant prior to shipment. Owner has the option to witness the test. Provide at least six weeks' notice. Provide test report for field setup.

3.2 BOILER EFFICIENCY AND PERFORMANCE GUARANTEE:

- A. The unit shall operate at minimum of 84.75% overall efficiency, based on higher heating value for natural gas. The following procedure shall be employed for determining the boiler's efficiency. If the indicated efficiency is not achievable, indicate with the bids, achievable efficiency.
- B. Operation of the boiler shall be to establish efficient and stable fuel air ratio over the complete load range. Operation of the unit shall then be continued for testing and demonstration of the certified efficiency at rated capacity. This test is to take place on the factory fire test stand.
- C. The efficiency test shall consist of the accurate measurements and recording of the following listed factors:
 - 1. O₂ and combustibles in stack gases
 - 2. Ambient air temperature
 - 3. Feed water temperature
 - 4. Stack temperature
 - 5. Steam pressure
 - 6. Feed water flow
- D. On completion of the test, the following listed heat losses shall be calculated as prescribed under "Heat Loss Efficiency" of the ASME TEST FORM ABBREVIATED EFFICIENCY per Power Test Codes PTC41:
 - 1. Heat loss due to dry gas
 - 2. Heat loss due to moisture in fuel
 - 3. Heat loss due to moisture from combustion of hydrogen

- E. The following data shall be utilized in conjunction with the calculation of the above listed heat losses to determine the certified efficiency.
 - 1. Analysis of fuel fired
 - 2. Unaccounted, radiation and convection loss as calculated for the model being tested. Calculated data taken from actual measured test results.
- F. The test results shall be certified to the customer by the boiler manufacturer in a report which shall include all supporting data and appropriate calculations showing the resulting efficiency. In the event the test does not yield results which are at least as good as the attached required Minimum Efficiency stated above, the customer may refuse shipment of the unit until such time as the boiler manufacturer can demonstrate the required Minimum Efficiency.

3.3 MECHANICAL SPACE AND INSTALLATION:

- A. The equipment shall be installed where shown on the drawings and in accordance with the manufacturer's written instructions.
- B. Field installation of the boiler and boiler feed unit shall be done under the supervision of a trained representative of the boiler manufacturer.
- C. Provide for connection to electrical service, gas service, steam outlet, condensate inlet, vents, etc., for a complete and operating system.
- D. Pipe relief valves, boiler drains, boiler blow downs, etc., to nearest floor drain.
- E. Installation shall be performed by a firm certified by the State of Michigan to install boilers of the type specified.
- F. The installer shall construct a level concrete housekeeping pad for boiler foundation according to boiler manufacturer's erecting instructions and as shown in the plans.
- G. Fill the boiler with water and pressure-test the boiler and system up to the rating of the relief valve. Clean the system per manufacturer's instructions; flush the system to remove all trash and dirt; and refill the system, including inhibitor as specified.
- H. Bleed the gas line in a safe manner and energize the boiler controls.
- I. All equipment, piping, valves and other components shipped loose shall be installed per manufacturer's instruction, whether indicated or not, in these plans and specifications.

3.4 START UP SERVICE:

- A. After the boiler installation is completed, a factory trained technician shall supervise starting, boil out and adjusting the initial fire, schooling for the operators in the care and handling of the equipment and 12 months warranty service after initial firing to cover warranty service. Start-up services shall include all labor, materials and associated costs. The boiler manufacturer shall provide a letter stating the technician is factory trained to start-up their boilers.

3.5 BOIL OUT CHEMICALS:

- A. The chemicals for periodic regular boiler water treatment will be by owners' chemical treatment contractor, **WATCON; contact Dave Russell, 419-283-4495.** This contractor shall provide initial chemicals, required for flushing and boil out of the boiler and boiler feed water unit. The chemicals shall be provided by WATCON and paid for by this contractor.

3.6 FIELD TEST:

- A. Observe the ignition of the pilot and the main burner to make sure they are smooth and complete. Perform combustion efficiency test, provide a report on measured carbon monoxide, carbon dioxide and oxygen and measured efficiency. Check out the safety controls and verify that they are functioning properly. Set the operating controls for the proper pressure.
- B. Submit a blank copy of the proposed start-up report form for review and approval by the Project Engineer at least two (2) weeks before start-up.
- C. Start-up report shall include, but not necessarily be limited to the following:
 - 1. Amperage and air flow on forced draft (combustion air) fan at low and high fire
 - 2. Gas pressures prior to and after regulators
 - 3. Gas pressure through gas train
 - 4. Draft pressure at boiler outlet
 - 5. Combustion efficiency test
 - 6. Safety control check out
 - 7. Operating control check out
- D. Operate the boiler for no less than 2 hours. Provide a written report, through channels and on company letterhead, stating that ignition is proper, safety controls have been checked and operating controls are set and functioning properly. The system is not complete until this report has been received.
- E. When the weather is cold enough for the boiler to be fully loaded perform proof of capacity test and burner modulation test. These tests will have to be performed during the month of December or January.

3.7 PROOF OF CAPACITY AND MODULATION:

- A. The maximum capacity, turn down ratio and full modulation from low fire to high fire shall be proven by "clocking the meters".
- B. The amount of gas burnt and the steam generated will be measured by clocking the existing gas meter and the existing flow meter in the boiler feed water line to each boiler. The meters shall be clocked by operating one boiler at a time.
- C. The gas input will be calculated using the following formula:

$$\text{Input in cft/hr} = \frac{\text{CUFT} \times 3600 \times \text{PC1} \times \text{TC1}}{\text{TIME}}$$

Where CUFT is gas used in the measured TIME interval, PC1 is the pressure correction factor (check with Michcon 0.951?), TC1 is

temperature correction factor (check with Michcon 1.104?) and TIME is time interval in seconds for which CUFT was measured by reading the meter.

- D. The steam output will be calculated using the following formula:

$$\text{Steam output in PPH} = \frac{\text{FLOW} \times 3600 \times 8.33}{\text{TIME}}$$

Where "FLOW" is the measured feed water volume in gallons per the given "TIME" interval in seconds.

- E. The burner shall function properly at the maximum output, at part loads and at low fire start up demonstrating full modulation.
- F. The commissioner and a representative from the Outlying Boiler Group shall be present during all the testing. Provide at least 7 days' notice prior to scheduling the tests. If the boilers cannot be loaded to the rated capacity, the contractor shall return to perform this work during the winter season; date and time will be scheduled by the Outlying Boiler Group from the University.
- G. If the boilers fail the capacity and or modulation tests, the contractor shall remedy the situation and complete the test successfully within 30 calendar days. If the contractor fails to do so, the university will take whatever remedial actions the university sees necessary. The university will back charge the contractor for all the costs associated with the remedial actions.

SECTION 235300 - HEATING BOILER FEEDWATER AND BLOW-DOWN EQUIPMENT

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 235300 - HEATING BOILER FEEDWATER AND BLOW-DOWN EQUIPMENT

REVISIONS:

NOV.9,2004: NEW SECTION CREATED FOR THE MASTER SPECIFICATIONS.

MAR.11,2005: LAST REVISION.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

1.2 SCOPE OF WORK:

- A. Provide packaged boiler feed water preheat system, packaged boiler feed water system (no preheat), Deaerator system, blowdown tank and accessories as specified and scheduled.

1.3 QUALITY ASSURANCE:

SPEC EDITOR: DELETE ITEMS NOT IN THE PROJECT

- A. Codes and Standards:
1. UL Compliance: The complete Deaerator, boiler feed water unit, unit shall be approved and labeled as a unit by Underwriters Laboratories.
 2. ASME Compliance: Construct Deaerator, boiler feed water unit, blow down tank in accordance with ASME Boiler and Pressure Vessel Code, Section IV "Heating Boilers".
 3. UL and NEMA Compliance: Provide all ancillary electrical components which have been listed and labeled by UL and comply with NEMA standards.
 4. FM Compliance: Provide control devices and control sequences in accordance with requirements of Factory Mutual System (FM).
 5. NEC compliance: Provide control panels and assembly and wiring of all devices in accordance with requirements of latest edition of NEC. All control panels shall have a label indicating listing by a nationally recognized testing agency such as UL, ETL or MET.
- B. Pressure Vessel Warranty:
1. If, within fifteen (15) years the tank fails under normal use and service, the manufacturer shall replace tank and the part or component as required for proper operation of the unit.

- C. Complete Package Warranty:
 - 1. The complete package shall be warranted for a period of 12 months from the date of acceptance of the installation by the University.

1.4 ACCEPTABLE MANUFACTURERS:

SPEC EDITOR: ALWAYS SPECIFY ELEVATED TANK AND 212 F PUMPS GOOD 2' NPSH

- A. Subject to compliance with requirements, provide boiler feed-water system by one of the following manufacturers:
 - 1. ITT Domestic Model CMED
 - 2. Industrial Steam
 - 3. Skidmore
- B. Subject to compliance with requirements, provide blow-down separator by one of the following manufacturers:
 - 1. PENN
 - 2. Industrial Steam
 - 3. Wilson
 - 4. Johnston Boiler
 - 5. Cemline
- C. Subject to compliance with requirements, provide Deaerator by one of the following manufacturers:
 - 1. Sellers Engineering
 - 2. Industrial Steam
 - 3. *add another vendor*

PART 2 - PRODUCTS

2.1 BOILER FEED WATER UNIT (WITHOUT PREHEAT):

SPEC EDITOR: REVISE THE NUMBER OF PUMPS FOR EACH PROJECT. BOILER FEED WATER UNIT WITH NO PREHEAT USED IN ALL LOW PRESSURE BOILERS.

- A. Furnish and install according to drawings and manufacturers' requirements single compartment boiler feed unit as shown on drawings. It shall consist of the following: (1) single compartment steel receiver with (3) three boiler feed pumps, electrical controls and accessories.
- B. The boiler feed receivers shall be of welded ¼ inch steel construction single compartment design, elevated to meet the 2' NPSH requirements of the pumps. The unit shall be factory equipped with the following
 - 1. Make up water assembly consisting of externally adjustable float switch and solenoid valve sized equal to one of the boiler feed pumps
 - 2. Make up valve strainer
 - 3. Three valve bypass for make-up valve
 - 4. Make up valve pressure gauge

5. Manhole for inspection and repairs and Inspection port hand hole
6. Chemical injection quill
7. One gauge glass assembly with shut off valves
8. One dial thermometer
9. One set of lifting eyes
10. Three pumps suction, discharge, strainers, check valves and pressure gauge etc.
11. One low level pump cut off switch and low water level alarm switch.
12. Cast iron basket strainer with bronze screen on condensate inlet location
13. Sampling valve.

C. A magnesium anode shall be mounted in the receiver compartment.

D. The pumps shall be 2' NPSH close coupled vertical design with axial flow impeller that builds positive suction pressure of 5 psig. Provide a cast bronze impeller that is bronze fitted to the cast iron pump housing with a bronze sleeve. The mechanical seal shall be rated for 250F service. Provide isolation valves, check valve and strainers as shown in plans for each pump.

E. The unit manufacturer shall mount and wire a separate NEMA 1 control cabinet with hinged door and grounding lug and include the following:

1. Combination magnetic starters with overload relays and circuit breakers or fused disconnects for each pump.
2. Door interlock.
3. Momentary contact test buttons for each pump.
4. Numbered terminal strip.
5. H-O-A switch with indicating light for each pump.
6. Contacts for ON-OFF signals from boiler control panel. (The pump to run only when the corresponding boiler is operational).
7. Low level alarm.
8. Low water cutoff.
9. Control transformer with secondary fused 115 volts single phase control circuit.
10. Single point power connection.
11. Totalizing run hour meter for each pump.
12. Alarms to be audible and visual with silencing push button. Provide indicating light for each alarm. All indicating lights shall be push to test type.
13. All electrically operated valves shall be powered from the control cabinet.
14. Single point power connection.

F. Control Sequence: Under normal operation the three boiler feed pumps are left in auto mode. The boiler level controllers cycle the respective boiler feed water pump.

2.2 PREHEATING TYPE BOILER FEED WATER UNIT:

SPEC EDITOR: REVISE THE NUMBER OF PUMPS FOR EACH PROJECT. PREHEATING TYPE BOILER FEED WATER UNIT IS REQUIRED ONLY FOR HIGH PRESSURE BOILERS.

- A. Furnish and install according to drawings and manufacturers' requirements single compartment preheat boiler feed unit as shown on drawings. It shall consist of the following: (1) single compartment steel receiver with (3) three boiler feed pumps, (1) direct injection steam heating assembly, electrical controls and accessories.
- B. The boiler feed receivers shall be of welded ¼ inch steel construction single compartment design, elevated to meet the NPSH requirements of the pumps. The unit shall be factory equipped with the following
1. Steam heater as described below.
 2. Make up water assembly consisting of externally adjustable float switch and solenoid valve sized equal to one of the boiler feed pumps
 3. Make up valve strainer
 4. Three valve bypass for make-up valve
 5. Make up valve pressure gauge
 6. Inspection port hand hole
 7. Chemical injection quill
 8. One gauge glass assembly with shut off valves
 9. One dial thermometer
 10. One set of lifting eyes
 11. Three pumps suction, discharge and pressure relief valves, strainers, check valves and pressure gauge etc.
 12. Three valve bypass with strainer, steam regulating valve, upstream and downstream pressure gauges.
 13. One low level pump cut off switch and alarm
 14. Cast iron basket strainer with bronze screen on condensate inlet location
 15. Sampling valve
- C. A magnesium anode shall be mounted in each receiver compartment.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- D. An injection steam heating assembly shall consist of a double flange mounted injection stainless steel tube, Spence or Hoffman pressure and temperature regulator, wye strainer and pressure gauge. Capacity to heat 5 gpm from 50F to 200F, 9 psig steam at the inlet valve.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- E. The pumps shall be 2' NPSH close coupled vertical design with axial flow impeller that builds positive suction pressure of 5 psig. Provide a cast bronze impeller that is bronze fitted to the cast iron pump housing with a bronze sleeve. The mechanical seal shall be rated for 250F service. Provide isolation valves, check valve and strainers as shown in plans for each pump.
- F. The unit manufacturer shall mount and wire a separate NEMA 2 control cabinet with hinged door and grounding lug and include the following:
1. Combination magnetic starters with overload relays and circuit breakers or fused disconnects for each pump.

2. Door interlock.
 3. Momentary contact test buttons for each pump.
 4. Numbered terminal strip.
 5. H-O-A switch with indicating light for each pump.
 6. Contacts for ON-OFF signals from boiler control panel. (The pumps to run only when anyone of the two boilers are operational).
 7. Low level alarm.
 8. Low water cutoff.
 9. Control transformer with secondary fused 115 volts single phase control circuit.
 10. Single point power connection.
 11. Totalizing run hour meter for each pump.
 12. Alarms to be audible and visual with silencing push button. Provide indicating light for each alarm. All indicating lights shall be push to test type.
 13. All electrically operated valves shall be powered from the control cabinet.
 14. Single point power connection.
- G. Control Sequence: Under normal operation the three boiler feed pumps are left in auto mode. The boiler level controllers cycle the respective boiler feed water pump.

SPEC EDITOR: THE FOLLOWING IS A COPY OF THE DEAERATOR SPECIFICATIONS USED FOR G G BROWN BOILER REPLACEMENT PROJECT. VERIFY WITH OUTLYING BOILER GROUP WHETHER TRAY AND SPRAY TYPE IS REQUIRED INSTEAD OF THIS.

2.3 DEAERATING TYPE BOILER FEED WATER UNIT:

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- A. Furnish and install according to drawings and manufacturers' requirements single compartment pressurized De-aerating boiler feed unit as shown on drawings. The unit shall be nominally rated for 35,000 lbs/hr guaranteed to remove oxygen in the condensate to a level of not more than 0.005 cc/liter. It shall consist of the following: (1) single compartment steel receiver with (3) three boiler feed pumps, (1) direct injection steam heating assembly, (1) de-aerating spray and tray section, electrical controls and accessories. The receiver shall be constructed in accordance with ASME code and 50 psig stamped.
- B. The boiler feed receivers shall be of welded carbon steel construction single compartment design, elevated to meet the NPSH requirements of the pumps. The de-aerator shall be factory equipped with the following
 1. Steam heater as described below.
 2. Spray manifold
 3. Chemical injection quill
 4. One gauge glass assembly
 5. One receiver pressure gauge
 6. One relief valve
 7. One throttling vent valve with orifice plate
 8. One overflow drainer
 9. One dial thermometer

10. One set of lifting eyes
 11. Three pump suction, discharge and automatic (balancing) flow control valves, strainers, check valves and pressure gauge etc.
 12. One steam, strainer, pressure gauge, isolation valves etc.
 13. One low water level switch, low water level auto off and alarm, & high level alarm.
 14. One electric make up valve and make up valve modulating controller.
 15. Manhole.
 16. Plasite 7156 epoxy lining
 17. Internal overflow loop with anti-siphoning orifice
 18. Sampling valve.
 19. One makeup water strainer and pressure gauge
 20. One manual 3 valve bypass for makeup valve.
 21. All of the above (except for the accumulator tank) factory assembled, pre-piped and pre-wired on a floor mounted structural steel base.
- C. A stainless steel de-aerating section with integral stainless steel cascade trays containing a vent condensing spray manifold with stainless steel spray nozzles shall be integral to condensate receiver. A dial thermometer and pressure gauge shall be integral part of the manifold assembly.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- D. The capacity of the make-up valve shall be 20 gpm, at a 20 psig supply pressure.
- E. A magnesium anode shall be mounted in the receiver compartment.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- F. A direct injection steam heating assembly shall consist of a double flange mounted injection tube, electric steam control valve and temperature regulator, wye strainer and pressure gauge. Capacity to heat 70 gpm from 140F to 227F, 9 psig steam at the regulator. Provide a three valve bypass.
- G. The centrifugal boiler feed pumps shall be flange mounted on the receiver suction piping. The pumps shall be 2-stage close coupled vertical design. The first stage shall be a stainless steel axial flow impeller discharging through a stainless steel diffuser to the second stage. The second stage shall be a cast bronze impeller that is bronze fitted to the cast iron pump housing with a renewable bronze wearing ring. The mechanical seal shall be rated for 250F service. Provide isolation valves, check valve and strainers as shown in plans for each pump. Each pump shall be of 2' NPSH design.
- H. The unit manufacturer shall mount and wire a separate NEMA 2 control cabinet for the de-aerator. Cabinet shall have hinged door and grounding lug and include the following:
1. De-aerator
 2. Combination magnetic starters with overload relays and circuit breakers for each pump.
 3. Door interlock.
 4. Momentary contact test buttons for each pump.

5. Numbered terminal strip.
 6. H-O-A switch with indicating light for each pump.
 7. Contacts for ON-OFF signals from boiler control panel. (Each pump to run only when the respective boiler level controller calls for it).
 8. Low level and high level alarms.
 9. Low water cutoff.
 10. Control circuit disconnect switch
 11. Power on light
 12. Control transformer with secondary fused 115 volts, single phase control circuit.
 13. Alarms to be audible and visual with silencing push button. Provide indicating light for each alarm. All indicating lights shall be push to test type.
 14. All electrically operated valves shall be powered from the control cabinet.
 15. Single point power connection.
- I. Control Sequence: The boiler to be run is selected manually and run. While selecting the boiler the corresponding the boiler feed water pump is set in auto mode. The boiler level controller cycles the respective boiler feed water pump. The built in level controller in the de-aerator unit modulates the make-up valve.
- J. The entire unit shall be factory assembled and wired on a 48" high structural steel support. The unit shall be started up and operating personnel trained by a factory authorized field representative.

2.4 BLOW DOWN SEPARATOR:

- A. Furnish and install as shown on the drawings a boiler blowdown separator with stainless steel striking plate, minimum 3/8" thickness, at point of inlet impingement.
- B. Separator shall be designed in accordance with ASME code, shall comply with Michigan regulations and shall handle blowdown from the following boilers operating at 60 psig. For sizing purposes assume only two boilers will blow down at any given time. Minimum size as shown in the schedule. If the minimum size shown is inadequate, advise the U of M project engineer.

SPEC EDITOR: REVISE AS REQUIRED FOR EACH PROJECT

- | | |
|--------------------|--------|
| 1. Boiler No. LP-1 | 125 HP |
| 2. Boiler No. LP-2 | 125 HP |
| 3. Boiler No. LP-3 | 70 HP |

- C. Separator shall include the following accessories:
1. Pressure gauge.
 2. After cooler with automatic temperature regulating valve, strainer and bimetal thermometer.
 3. Three angle legs for floor mounting or wall brackets for wall mounting. See plans for requirements.

2.5 ELECTRICAL CONTROL PANEL LABELING:

- A. All control panels provided with burner, boiler feed water unit shall bear a label from UL, ETL or MET. All wiring including the control wiring shall be installed in a NEC compliant conduit system.

2.6 VALVES, MOTORS AND OTHER ITEMS SPECIFIED ELSEWHERE:

- A. All motors shall meet requirements of Section 220513.
- B. All valves shall meet requirements of Section 220523.
- C. All piping shall meet requirements of Sections 221113 and 232216.
- D. Thermometers and gauges shall meet requirements of Section 220519.
- E. Unit to be field insulated per section 220719.

PART 3 - EXECUTION

3.1 START UP SERVICE:

- A. After the boiler feed water/ Deaerator unit installation is completed, a factory trained representative shall supervise starting, boil out and adjusting the pump flow rates, schooling for the operators in the care and handling of the equipment and provide warranty service after initial firing.

3.2 MECHANICAL SPACE AND INSTALLATION:

- A. The equipment shall be installed where shown on the drawings and in accordance with the manufacturer's written instructions.
- B. Field installation of the boiler feed unit shall be done under the supervision of a trained representative of the unit manufacturer.
- C. Provide for connection to electrical service, steam outlet, condensate inlet, vents, etc., for a complete and operating system.
- D. Pipe relief valves, drains, blow downs, etc., to nearest floor drain.
- E. Installation shall be performed by a firm certified by the State of Michigan to install equipment specified.
- F. The installer shall construct a level concrete housekeeping pad for equipment foundation according to unit manufacturer's erecting instructions and as shown in the plans.
- G. Clean the system per manufacturer's instructions; flush the system to remove all trash and dirt; and refill the system, including inhibitor as specified.
- H. All equipment, piping, valves and other components shipped loose shall be installed per manufacturer's instruction, whether indicated or not, in these plans and specifications.

SECTION 235716 - STEAM-TO-WATER HEAT EXCHANGERS

END OF CONTENTS TABLE

DECEMBER 2014 - ADOPTED AS NEW MASTER.

11-12-19: THRUSH ADDED AS APPROVED BY HYDRONICS MTT.

1-20-2020: REVISED TO ADD GASKET REQUIREMENTS AFTER REPEATED FAILURES OF B&G "STANDARD" GASKETS. D. KARLE AS APPROVED BY THE HYDRONICS/STEAM MTT.

DIVISION 23

SECTION 235716 - STEAM-TO-WATER HEAT EXCHANGERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 019100/019110 - Commissioning
 - 2. Section 232116 - Hydronic Piping Specialties
 - 3. Section 232216 - Steam & Condensate Piping Specialties

1.2 SUMMARY

- A. Section Includes
 - 1. Shell and tube, steam-to-hot water, low pressure heat exchangers, components and accessories. Maximum operating steam pressure of 15 PSI.

1.3 SUBMITTALS:

- A. Provide product data as follows:
 - 1. Rated capacity, weight with and without liquid, furnished specialties and accessories.
 - 2. Manufacturer's assembly type shop drawings indicating certified dimensions, required clearances (including tube pull clearance), pipe connection types, locations and sizes, component assembly methods, support details, and location and size of all field connections.
 - 3. Certified computerized selections based on scheduled conditions, including leaving water temperature and flow rates and fouling factor allowances.
 - 4. Shipping, rigging, handling, storage, installation, start-up, operation, and maintenance instructions.
 - 5. Certification of compliance with ASME, UL, & ASHRAE fabrication requirements, specified elsewhere in these specifications.

1.4 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - 1. ANSI /ASME SEC VIII Div. 1 Boiler and Pressure Vessel Code for construction and testing.

ALTHOUGH ATYPICAL, IF THE HEAT EXCHANGER MUST BE DISASSEMBLED TO BE SET IN PLACE, PROVIDE INFORMATION ON THE DRAWINGS AND OTHER CONTRACT DOCUMENTS DESCRIBING DISASSEMBLY/REASSEMBLY REQUIREMENTS.

1.5 DELIVERY, STORAGE, AND HANDLING:

- A. Ship heat exchangers with weather-protected wrap for storage outdoors. Protect pipe openings and other sensitive components with heavy plastic or other durable means to ensure unit cleanliness is maintained during shipping and storage.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 1 year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Bell & Gossett
 - 2. Taco
 - 3. Armstrong
 - 4. Mueller
 - 5. Thrush

2.2 GENERAL

- A. Provide factory assembled heat exchangers consisting of shell steam and water tube construction. Include the following accessories: relief valve, air vent, and vacuum breaker, of proper size for the heat exchanger.
- B. All accessories listed above shall be provided by the heat exchanger manufacturer.
- C. Tag heat exchanger with mark and design capacity scheduled in the construction documents. Mark all material shipped loose to easily identify it with the corresponding heat exchanger.

- D. Design, materials, manufacturing methods, and factory-testing of the heat exchanger units shall be in conformance with all applicable sections of the ASME code, and shall bear the standard ASME symbol.
- E. Design working pressure and temperature shall be 125 PSIG and 375 deg. F.
- F. Tube bundle shall be removable for maintenance and replacement.
- G. Head material shall be cast iron or steel.
- H. The heat exchanger shall be pressure tested at the factory prior to shipment.
- I. All nozzle connections shall be factory sealed prior to shipment to prevent the entrance of foreign materials.
- J. Flanged pipe connections shall be provided for all sizes 2-1/2" or greater. Flanged or screwed pipe connections shall be provided for all sizes 2" or smaller.

2.3 SHELL REQUIREMENTS

- A. Shell material shall be steel.
- B. Steam connection size shall match drawing pipe connection size.

2.4 TUBE REQUIREMENTS

- A. Tube bundle shall consist of 3/4 inch copper tubes with a minimum wall thickness of 0.035".
- B. The tube sheet, tie rod, spacers, and baffle material shall be steel.
- C. Water connection size shall limit nozzle velocity to no greater than 8 FPS.
- D. Tube velocity shall be limited to no more than 7.5 FPS.

2.5 GASKET REQUIREMENTS

- A. Tank and Head Gaskets: 304 or 316 stainless steel core material with flexible graphite facing on both faces. Minimum thickness of 1/8". Compressed fiber gaskets are not acceptable.
- B. Acceptable manufacturers:
 1. Teadit: Camprofile Style 942
 2. Bell & Gossett: High Temperature, High Pressure "ElastaGraph"

2.6 PERFORMANCE REQUIREMENTS

- A. Refer to schedules on Drawings for performance requirements.
 1. Fouling Factor Allowance: water side tubes: 0.00025 h·ft²·°F/Btu
 2. Fluid type shall be as noted in the drawing schedule and shall be factored into the performance data.

PART 3 - EXECUTION

3.1 EXAMINATION, STORAGE, AND PREPARATION

- A. Upon delivery, validate integrity of the delivery protection has been maintained, the heat exchanger is undamaged, and all accessory parts were delivered. Reject damaged units. Restore protection. Provide a delivery report indicating unit condition to the Owner's Representative.
- B. Rig units off delivery trucks. Comply with Manufacturer's rigging instructions.
- C. Store units protected from weather, dirt, water, construction debris, and physical damage.
- D. Just before installation, verify that units are undamaged. Provide a pre-installation report indicating unit condition to the Owner's Representative.
- E. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and miscellaneous connections to verify actual locations, sizes, and other conditions affecting performance, maintenance, and operations, before equipment installation.
 - 1. Locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and other connections.
- F. Rig units into final locations. Comply with Manufacturer's rigging instructions.

MAKE THE BELOW ARTICLE PROJECT SPECIFIC, AS REQUIRED.

3.2 HEAT EXCHANGER INSTALLATION

- A. Install units in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Install heat exchangers on support structures to achieve proper steam trap inlet leg height and to allow trap gravity drainage.
- C. Install accessories shipped loose for Contractor installation, including relief valves, vacuum breakers and air vents, in accordance with manufacturer recommendations.
- D. Provide offset pipe connections, or make other provisions, to allow adequate space for tube bundle removal without removal of pipe, components or accessories.
- E. Insulate exchangers with insulation of same type and thickness as the connecting steam piping. Do not insulate or conceal nameplates or ASME stamps.
- F. Provide isolation valves for service and maintenance of each heat exchanger.
- G. Provide temperature and pressure gauges at the water side inlet and outlet of each exchanger, and as detailed.
- H. The heat exchanger shall be bypassed during system clean and flush.

- I. Complete the manufacturer's pre-start checklist and submit to Owner's Representative.

3.3 COMMISSIONING

- A. Perform the commissioning activities as outlined in Related Section "Commissioning" and other requirements of the Contract Documents.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 019100/019110 - Facilities Commissioning
 - 2. Section 221113 - Piping Materials and Methods

1.2 SUMMARY

- A. Section Includes:
 - 1. Plate style heat exchangers.

1.3 SUBMITTALS

- A. Product Data: Include catalog illustrations, model, rated capacities, performance, weights, dimensions, component sizes, rough-in requirements, piping details, materials of construction, accessories, operating and maintenance clearance requirements.
- B. Provide the following additional information:
 - 1. Pipe connection size and connection type.
 - 2. When additional frame length is specified to allow for a future capacity increase, provide substantiating "future" performance data including quantity of plates and stack depth.
- C. Installation, Operation and Maintenance Manuals

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards, latest editions, unless noted otherwise.
 - 1. ANSI/AHRI Standard 400 Liquid to Liquid Heat Exchangers

DESIGNER SHOULD UNHIDE THE BELOW TEXT IF THE APPLICATION WARRANTS A U-STAMP.

2. ANSI/ASME SEC VIII Div. 1 Boiler and Pressure Vessel Code with U-1 stamp.
3. ASHRAE 90.1 Energy Standard for Buildings Except Low Rise Residential Buildings
4. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
5. U.S Safe Drinking Water Act.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Ship all components in weather-proof wrap for storage outdoors. Protect nozzle pipe openings with heavy plastic and other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 1. Alpha-Laval
 2. Armstrong
 3. Bell and Gossett
 4. Mueller
 5. Tranter

2.2 PLATE HEAT EXCHANGER

- A. The heat exchanger shall consist of stainless steel heat transfer plates of corrugated/chevron design, steel end plates and frame, and a metal carrying bar that allows disassembly of the plates for cleaning and seal replacement without disconnecting piping or removing plates. Provide brazed plate type when indicated. Units shall be designed for a minimum 150 PSIG working pressure at 225°F.
- B. Flow through the plates shall be single pass counter flow design.
- C. Heat transfer plates shall be of type 304 or 316 stainless steel with a minimum thickness of 0.40 millimeter, or as required to meet pressure requirements.
- D. Heat transfer plate ports shall be double gasketed to prevent cross contamination of hot and cold side fluids.
- E. Gaskets shall be of a one piece design formulated from nitrile or peroxide cured EPDM rubber for operating temperatures below 180°F, and peroxide cured EPDM for applications above 180°F.

- F. Heat transfer plates shall be grooved to accept the gaskets. The gaskets shall be held in place with gasket clips to minimize movement and to provide a seal. Glued gaskets are not acceptable.

INDICATE DOUBLE WALL UNITS ON THE SCHEDULE FOR POTABLE WATER APPLICATIONS.

- G. Double wall units shall include an air space between adjoining heat transfer plates to allow for any leakage to exit to atmosphere and avoid cross contamination.
- H. Heat exchangers used for domestic water service shall be of lead free construction and in compliance with NSF/ANSI-61 and NSF-61 Annex G (and/or NSF/ANSI-372) and Annex F, and the U.S. Safe Drinking Water Act.
- I. Provide OSHA approved splash guard, enclosing exterior of heat transfer plates and gasketed surfaces, to prevent leaks from spraying.
- J. Heat transfer plate carrying bar shall be of carbon steel with zinc chromate finish, aluminum, or stainless steel.

FOR FREE COOLING APPLICATIONS, SPECIFY THAT THE HEAT EXCHANGER FRAME LENGTH ALLOW PLATES TO BE ADDED IN THE FUTURE TO BOOST CAPACITY 25% BY UN-HIDING THE HIDDEN TEXT IN THE PARAGRAPH BELOW. CONSIDER IF YOUR APPLICATION WARRANTS SPECIFYING ROOM FOR MORE THAN A 25% CAPACITY INCREASE.

- K. Fixed frame plates, frame, and movable pressure plates shall be corrosion resistant epoxy painted carbon steel. Provide zinc plated carbon steel or stainless steel bolting system ("tie-rods") to compress plate pack. No special tools shall be required to assemble or disassemble the heat exchanger. Provide a frame length that will allow for additional plates to be added to provide a 25 percent increase in exchanger capacity at the scheduled inlet and outlet temperatures.
- L. Connections 2.5 inches and smaller shall be alloy nozzles with NPT threaded ends meeting ASME B1.20.1. Connections 3 inches and larger shall be alloy nozzles with flanged ends meeting ASME B16.5 for steel and stainless-steel flanges, and meeting ASME B16.24 for copper and copper-alloy flanges (provide connections that match the connecting pipe material). Alternatively for connections 3" and above, provide studed ports that allow proper sealing to the same flange types specified for nozzles. Connections shall be integral to the frame or pressure plate; inlet and outlet connections shall be on the same side of the heat exchanger. Maximum velocity through nozzle or studed port shall be 25 feet per second at scheduled flow rates. The heat exchanger connections shall be labeled to indicate fluid type and flow direction.

DESIGNER SHOULD UNHIDE THE BELOW TEXT IF THE APPLICATION WARRANTS A U-STAMP.

- M. Unit shall be designed, constructed, and tested in accordance with all applicable ASME Code Rules and shall have a manufacturer's data report for pressure vessels, form No. U-1. Form U-1 shall be furnished to the engineer for the owner upon request. An authorized inspector, holding a National Board commission, certifying that construction conforms to the latest ASME Code for pressure vessels must sign this form. The ASME "U" symbol shall be stamped on the heat exchanger. In addition, each unit shall be registered with the National Board of Boiler and Pressure Vessel Inspectors.
- N. The plate heat exchanger shall be shipped to the site as a completely assembled unit.
- O. Where indicated provide heat exchanger of alternate materials of construction as noted on schedule and drawings.

THE INSULATION JACKET SPECIFIED BELOW IS APPROPRIATE FOR THE OPERATING RANGE ANTICIPATED TO BE MOST TYPICAL FOR U-M APPLICATIONS (40°F-105°F, I.E. "FREE COOLING") AND TO MIMIC ASHRAE 90.1-2010 ENERGY CODE REQUIREMENTS. IF THE HX IS USED IN AN APPLICATION AT TEMP.S SIGNIFICANTLY HIGHER OR LOWER THAN THIS RANGE, REVISE ACCORDINGLY (FOR APPROPRIATE THICKNESS AND "C" VALUES, ASHRAE 90.1 PIPE INSULATION THICKNESS REQUIREMENTS MAY BE CONSULTED FOR GUIDANCE). IF CONDENSATION IS A CONCERN, DELETE THE BELOW AND REQUIRE FLEXIBLE CLOSED CELL INSULATION, E.G. ARMAFLEX.

2.3 HEAT EXCHANGER INSULATION JACKET

- A. Heat exchanger shall include a 1" thick insulation blanket system with jacket designed specifically to fit the heat exchanger over-all size and nozzle openings. The blanket shall cover both end plates, the entire plate pack (below the plate pack compression bolts) and any nozzle carrying fluid $\leq 60^\circ\text{F}$ or $\geq 105^\circ\text{F}$. The blanket shall be removable by the use of Velcro® or wire tie fasteners. Insulation blanket shall have a maximum conductivity of 0.27 btu inch/h ft² °F. The jacket shall be PTFE Teflon impregnated fiberglass cloth.

2.4 SOURCE QUALITY CONTROL

- A. The heat exchanger shall be pressure tested at the factory prior to shipment. Provide a report of the results of the pressure test, certified with a signature of an officer of the manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Prior to installation, store units protected from weather, dirt, water, construction debris, and physical damage. Nozzle ends must be sealed water tight at all times to prevent freezing damage. Support stored units at points as required by manufacturer.

- B. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Do not lift heat exchanger by nozzle connections.
- B. Install in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- C. Support piping connecting to the heat exchanger fully independent of the heat exchanger connections.
- D. Install isolation valves, pressure gauges and thermometers in piping at each nozzle connection. Install air vents in piping at each top nozzle connection and drains on the bottom connections.
- E. Install insulation after all pressure testing is complete.
- F. During system cleaning and flushing, protect the heat exchanger as described in Related Sections.

3.3 TEMPORARY SERVICE

- A. Start units for temporary use only with the expressed written permission of the Project Manager and in compliance with the requirements of the Contract Documents.
- B. Units shall not be put into temporary service prior to the entire chilled water and condenser water system being flushed and cleaned per Related Section, and after such flushing and cleaning is approved by the Commissioning Authority.
- C. Prior to placement into temporary service perform manufacturer's pre-start protocols.
- D. Commission equipment prior to putting into temporary service to the extent required by the Commissioning Authority. Re-perform all commissioning activities prior to Owner acceptance, even if previously commissioned to prepare for temporary service.

3.4 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 236416 - CENTRIFUGAL WATER CHILLERS

END OF CONTENTS TABLE

MPLE ECONOMIC ANALYSIS FOR DESIGNERS USE AND/OR TO BE COMPLETED BY BIDDERS IS AVAILABLE FOR THIS SPECIFICATION SECTION; SEE THE "STANDARD DETAILS" SECTION OF THE U-M A.E.C. WEBSITE: WWW.UMAEC.UMICH.EDU. AN ECONOMIC ANALYSIS SHOULD TYPICALLY BE PERFORMED TO COMPARE CHILLER ALTERNATIVES.

REVISED FORMAT AND CONTENT 04/2011 D. KARLE AND M. PLATT.

CHANGED TO INDICATE LINE REACTORS CAN BE USED ON VSD PROVIDED THEY ARE NOT MOUNTED EXTERNAL TO THE DRIVE. D. KARLE/K. BIRRINGER 2-7-12.

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 236416 - CENTRIFUGAL WATER CHILLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220548: Vibration Control
 - 2. Section 019100/019110: Commissioning
 - 3. Division 26: Electrical

1.2 SUMMARY

- A. Section Includes
 - 1. Centrifugal chiller(s), both semi-hermetic and open drive types.
 - 2. Centrifugal chiller installation, testing, commissioning, and start-up services.

TURN ON HIDDEN TEXT AND MAKE THE BELOW PARAGRAPH PROJECT SPECIFIC, IF IT APPLIES TO THE PROJECT.

- B. The chiller(s) will be prepurchased and assigned to the contractor for installation. Except as otherwise indicated, chiller manufacturer/vendor is responsible for items listed in PART 1 and Part 2 of this specification, installing contractor is responsible for items listed in PART 3.

THE BELOW ARTICLE (IN HIDDEN TEXT) CONTAINS SAMPLE LANGUAGE FOR CHILLER ALTERNATES. PARAGRAPH "A" IS TYPICALLY USED ONLY IF THE CHILLER IS BEING PREPURCHASED. PARAGRAPH "B" IS USED TO SOLICIT ALTERNATIVE CHILLER SELECTIONS FOR TOTAL COST OF OWNERSHIP (TCO) EVALUATIONS. ONE MEANS OF SOLICITING TCO OPTIONS IS BY PREPURCHASING THE CHILLER(S); THERE ARE OTHER METHODS. THIS ARTICLE COULD ALSO BE USED TO DESCRIBE OTHER ALTERNATES BEING SOLICITED. EDIT THE ARTICLE TO MAKE IT PROJECT SPECIFIC, OR DELETE.

1.3 ALTERNATES

- A. Manufacturers are encouraged to submit deduct alternates for early payment.

- B. In addition to submitting a base bid proposal that complies with this specification and the scheduled performance data, manufacturers are encouraged to submit alternate chiller selections that provide best value/lowest total cost of ownership to the University. Clearly identify each alternate proposal, and highlight how it differs from base bid requirements. Alternative selections should typically be chillers that provide the scheduled capacity but with improved energy performance, while otherwise fully complying to this specification. For each alternative proposed, provide complete submittal data.

EDIT SUBMITTAL PARAGRAPHS ACCORDING TO BASE BID AND ALTERNATE CONDITIONS.

1.4 SUBMITTALS:

- A. Provide product data as follows:
1. Rated capacity, weight with and without refrigerant charge, furnished specialties and accessories.
 2. Manufacturer's assembly type shop drawings indicating dimensions, required clearances; pipe connection types, locations and sizes; component assembly methods, support and vibration isolator details, marine water box details, and location and size of all field connections.
 3. Impeller speed (RPM), number of bearings, type of bearings, high speed impeller shaft RPM, number of stages, number of sets of inlet guide vanes, type and amount of refrigerant charge (in pounds), and amount of oil required.
 4. "A"-weighted sound pressure level and octave band sound pressure levels in accordance with AHRI Standard 575. Provide sound data in the format recommended by the AHRI Standard 575 Appendix D and E.
 5. Manufacturer's wiring diagrams for interlock and control wiring, clearly identifying required field wiring.
 6. AHRI-550/590 certified computerized selections, adjusted for zero capacity and zero NPLV tolerance. Provide capacity and NPLV performance selections at 100/75/50/25 percent load, with a condenser water temperature of 85°F at 100 percent load; 75°F at 75 percent; 65°F at 50 percent, and 65°F at 25 percent load; at the specified evaporator leaving water temperature and condenser/evaporator water flow rates and fouling factor allowances. Provide complete performance data at all selection points, to include all data required by AHRI-550/590 Minimum Data Requirements for Published Ratings.

STRIKE THE BELOW PARAGRAPH WHEN AN ECONOMIC ANALYSIS TABLE IS NOT BEING REQUESTED. IF SUCH A TABLE IS BEING REQUESTED, INCLUDE THE BLANK TABLE ON THE DRAWINGS OR AS A PART OF THIS SPECIFICATION.

7. Manufacturer shall complete and submit one Chiller Economic Analysis Table form for each base and alternate selection.
8. For open motors, provide curve showing motor heat loss versus chiller load.
9. Shipping, handling, and storage instructions.
10. Installation and start-up instructions.

11. Project specific maintenance and operating data, and recommended spare parts list.
12. Certification of compliance with ASME, UL, & ASHRAE fabrication requirements, specified elsewhere in these specifications.
13. Certified factory test results as specified in Part 2.
14. Confirmation that Coefficient of Performance (COP) for centrifugal chiller is not less than prescribed by ASHRAE 90.1.
15. Reports specified in Part 3.

1.5 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
- C. UL, CSA, ETL, or MET label for chiller electrical requirements.
- D. ANSI/ASME SEC VIII Div. 1 Boiler and Pressure Vessel Code for construction and testing.
- E. NFPA 70/NEC 2005
- F. ANSI/NEMA 250 Enclosures for Electrical Equipment (1000 volts maximum).
- G. ANSI/NEMA MG 1 Motors and Generators.
- H. ANSI/ASHRAE 15 Safety Code for Mechanical Refrigeration.
- I. ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings
- J. ANSI/AHRI: Standard 550/590 Performance Rating of Water Chilling Packages Using the Vapor Compression Cycle.
- K. ANSI/AHRI 575 Method of Measuring Machinery Sound Within an Equipment Space
- L. ANSI/AHRI 580 Non-Condensable Gas Purge Equipment For Use With Low Pressure Centrifugal Liquid Chillers
- M. ASTM C 534 Specification for Preformed Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form.

IF THE CHILLER MUST BE DISASSEMBLED TO BE SET IN PLACE, PROVIDE INFORMATION ON THE DRAWINGS AND OTHER CONTRACT DOCUMENTS DESCRIBING DISASSEMBLY/REASSEMBLY REQUIREMENTS.

1.6 DELIVERY, STORAGE, AND HANDLING:

- A. Ship the chiller with weather-protected wrap for storage outdoors. Protect control panels, pipe openings, and other sensitive components with heavy plastic or other durable means to ensure unit cleanliness is maintained during shipping and storage.

- B. Provide rigging and installation instructions in advance to allow for planning.

TURN ON HIDDEN TEXT AND MAKE THE BELOW PARAGRAPH PROJECT SPECIFIC, IF IT APPLIES TO THE PROJECT. SEE RELATED PART 3 ARTICLE.

- C. The chiller will require disassembly and reassembly to allow movement into final location. The chiller manufacturer shall provide all labor and supervision to disassemble and reassemble the chiller, including any rigging required for these operations. The installing contractor shall provide all rigging to move the chiller to the point of final assembly. The chiller manufacturer shall assemble the unit complete with holding charge, ready for piping and electrical connections.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of 1 year from the date of Substantial Completion. Warranty coverage shall include loss of refrigerant.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. York International by Johnson Controls
 - 2. Trane Co.

2.2 CENTRIFUGAL PACKAGED CHILLER

- A. Provide factory assembled, factory-tested, packaged, water cooled, centrifugal liquid chiller consisting of compressor, starter or variable speed drive as indicated, condenser, evaporator, built in purge system, refrigeration accessories, lifting lugs for servicing and installation, and factory-mounted instrument/direct digital control panel.
- B. Provide chillers with complete oil and refrigerant charge.
- C. Provide chiller vibration isolation.
- D. All components listed above shall be provided by the chiller manufacturer.

2.3 PERFORMANCE REQUIREMENTS

- A. Refer to schedules on Drawings for fundamental performance requirements. Also comply with the performance requirements specified in this Section.
 - 1. Fouling Factor Allowance:
 - a. Evaporator tubes: 0.00010 h·ft²·°F/Btu
 - b. Condenser tubes: 0.00025 h·ft²·°F/Btu

**DO NOT MODIFY TERMINOLOGY (E.G. "NET REFRIGERATION CAPACITY")
IN BELOW PARAGRAPH, INCLUDING CAPITALIZATION OF WORDS. THESE
TERMS MATCH DEFINITIONS IN AHRI 550/590.**

- B. Rated in compliance with AHRI-550/590, zero Net Refrigeration Capacity, zero Total Power Input, and zero Energy Efficiency (kW/ton) tolerance.
- C. All chiller selections shall be capable of unloading to 15 percent of design tonnage at 85°F entering condenser water temperature while maintaining surge-free, stable operation.
- D. Maximum self-excited vibration velocity at compressor and motor bearings in the vertical, horizontal and axial directions shall not exceed, in any direction, 0.19 inches per second RMS over the entire chiller operating range.

2.4 COMPRESSOR

- A. Single or multiple stage compressor, inlet guide vanes or multi stage capacity control guide vanes, shrouded aluminum alloy impellers designed and assembled for no critical speeds within operating range.
- B. The compressor shall be dynamically balanced and overspeed tested to 120 percent of design speed.

2.5 EVAPORATOR AND CONDENSER

- A. Carbon steel plate shells with carbon steel tube sheets and intermediate tube support sheets as required to prevent tube vibration and to allow replacement from either end of heat exchangers. Provide suitable baffles or distributing plates in condenser tubes to distribute refrigerant discharge gas on tubes evenly. Test refrigerant side under vacuum and test water side at minimum 225 psig.
- B. Tubes shall be seamless copper internally and externally enhanced, individually cleanable and replaceable. Tubes shall be minimum 0.025 inches wall thickness and provide 0.050 inches tube wall thickness at the plain lands contacting the intermediate tube supports and end sheets. Expand ends of tubes in tube sheets with intermediate tube support for tight fit.
- C. Evaporator and condenser water boxes shall be marine type (unless otherwise indicated) of fabricated steel with integral water connections bolted to shell of vessel, with vent and drain connections and hinged water box covers on both ends of the condenser and evaporator. Provide water piping stub outs with welded flanges for flanged connections.
- D. Units with multi-stage compressors shall incorporate an inter-stage flash vessel "economizer." Units with single stage compressor shall have the condenser circuited for liquid sub-cooling and be provided with a thermometer well to monitor the amount of sub-cooling.

- E. Provide service valves and other factory-installed accessories required to facilitate transfer of refrigerant from chiller shell to chiller shell or from chiller to a remote refrigerant storage/recycling system and to sense refrigerant pressure or temperature.

2.6 COMPRESSOR CASING AND SHELL FINISHES

- A. Casing shall be fine grain cast iron with gasket sealed joints.
- B. Factory applied paint, all exposed ferrous metal surfaces on assembled chiller. Minimum one coat of primer, minimum 2 mils dry film thickness (DFT). Final finish with two coats of air dried or baked alkyd enamel metal coating, minimum 4 mils total DFT. Two coats of matching, insulation compatible paint on all factory installed insulation.
- C. Factory applied insulation. 3/4 inch minimum thickness for the evaporator water box, compressor motor, motor barrel, suction elbow and suction cover, 3/8 inch minimum thickness on economizer, 1/2 inch thick pipe insulation on liquid lines and all cold surfaces of chiller capable of forming condensation.
- D. Insulation: Flexible, closed cell elastomeric insulation, meeting requirements of ASTM C534, conductivity of 0.30, water vapor permeability of 0.20. Materials shall have a flame spread index of less than 25 and a smoke-developed index of less than 50 when tested in accordance with ASTM E 84, latest revision.
- E. Before insulating steel surfaces, prepare surfaces for paint and prime and paint as indicated for other painted components.
- F. Seal seams and joints to provide a vapor barrier.
- G. Acceptable product and manufacturer:
 - 1. AP Armaflex by Armacell LLC, or equivalent.

2.7 COMPRESSOR LUBRICATION SYSTEM

- A. Submerged pump and replaceable oil filter; complete with automatic oil heater designed to separate refrigerant from oil, site glass and oil cooler. System shall provide positive pressure lubrication of journals, bearing, and seals (if any), during start-up, operation and coast-down of chiller, including power interruptions.

2.8 PRESSURE RELIEF DEVICES

- A. Comply with ASHRAE 15; provide rupture disc(s) or pressure relief device(s).
- B. Additionally provide spring-loaded relief valve (s) (Trane Rupture-guard or York Vent-guard) to help contain refrigerant charge after an over-pressure event.

2.9 PURGE SYSTEM (R123 SYSTEMS ONLY)

- A. Rated, tested, marking and nameplate data; meeting all conformance requirements of AHRI 580. To include purge tank with dryer elements and 115v/60/1 pump out compressor. Rated for no more than 0.0049 lb. of refrigerant per 1 lb. non-condensable at standard room conditions with condensing refrigerant temperatures greater than 80°F.

2.10 REFRIGERANT FLOW CONTROL DEVICES

- A. Provide refrigerant flow control devices between evaporator and condenser (and as required elsewhere) to regulate refrigerant flow at volume and pressure required to maintain evaporator liquid refrigerant level sufficient to keep evaporator tubes adequately wetted through full range of chiller operation.

CHILLERS THAT ARE LOCATED ON SLAB ON GRADE DO NOT TYPICALLY REQUIRE SPRING ISOLATORS TO CONTROL VIBRATION TRANSMISSION TO THE BUILDING STRUCTURE. CONSULT WITH STRUCTURAL ENGINEER/VIBRATION CONSULTANT TO DETERMINE VIBRATION ISOLATION SYSTEM THAT IS REQUIRED. EDIT BELOW ARTICLE ACCORDING TO REQUIRED VIBRATION ISOLATION SYSTEM. BE SURE TO INDICATE ANY SUPPLEMENTAL STEEL REQUIREMENTS ON THE DRAWINGS AND TO INCLUDE THE VIBRATION CONTROL SPECIFICATION IF VIBRATION ISOLATION IS REQUIRED.

2.11 VIBRATION ISOLATION

- A. Chiller manufacturer shall furnish vibration isolators of the type and performance specified in Related Section "Vibration Control." Quantity, location, attachment method, and compatibility with the specific chiller provided shall be the responsibility of the chiller manufacturer.
- B. Spring isolators shall be of the low profile "height saving" arrangement designed to minimize chiller height above finished floor.
- C. When no vibration isolation is specified, provide neoprene pad isolators.

2.12 COMPRESSOR MOTOR AND ACCESSORIES

- A. Continuous duty, squirrel cage, induction type, either hermetically sealed, refrigerant cooled or open drive/open drip proof, rated for operation at 460 volts, 3 phase, 60 Hz. Full load operation of the motor shall not exceed nameplate full load current rating or enter into the service factor. The first critical speed shall be above the operating speed. Provide for removal of the stator without breaking the main refrigerant piping connections. Provide RTD's or thermistors, one per phase, to monitor motor winding temperature.
- B. Motors used with variable frequency drives shall be rated inverter duty and comply with NEMA MG-1 Part 31, with minimum insulation Class F and insulation temperature rise rating of Class B.

SELECT STARTER TYPE OR VARIABLE SPEED DRIVE FROM THE THREE SECTIONS BELOW. DELETE THE OTHER TWO SECTIONS. CONSULT WITH ELECTRICAL ENGINEER AND U-M DESIGN MANAGER TO DETERMINED WHICH STARTER TYPE OR IF A VSD IS APPROPRIATE FOR THE PROJECT. VARIABLE SPEED DRIVES ARE NORMALLY INSTALLED TO IMPROVE PART-LOAD EFFICIENCY. HIGH MAINTENANCE COST OF VSD'S HAS REOPENED THE ARGUMENT FOR CONSIDERING A STARTER IN LIEU OF VSD, ESPECIALLY IN MULTIPLE CHILLER PLANTS.

2.13 WYE DELTA STARTER

- A. Unit mounted and pre-wired, wye-delta, closed-transition, reduced voltage type motor starter mounted in a NEMA 1 enclosure. The enclosure shall include a lockable hinged door with locking type retaining latches able to receive a padlock, and shall be UL labeled 508 compliant. Starter shall include a prewired pilot relay to initiate start sequence from the chiller controller, 4 contactors, motor overload protection and a 3 phase starting resistor/reactor bank.
- B. The startup current draw shall be limited to 33 percent of locked rotor amps (LRA) for an adjustable time of 2 to 15 seconds minimum.

CONTACT ELECTRICAL ENGINEER AND SPECIFY BELOW THE SHORT CIRCUIT RATING REQUIRED FOR YOUR SPECIFIC PROJECT.

- C. Starter shall have a 100,000 AIC short circuit withstand rating.
- D. Provide 120 volt control power transformers to power chiller controller, purge system, oil system, and all other auxiliary equipment and controls.
- E. The following motor protection features shall be integrated with the chiller controller:
 - 1. Current phase loss
 - 2. Current phase unbalance
 - 3. Current phase reversal
 - 4. Excessive acceleration time
 - 5. Incomplete starting sequence
 - 6. Over/Under line voltage
 - 7. Motor current overload during start up and running
 - 8. Momentary power loss protection with auto restart
 - 9. Starter contactor fault protection
 - 10. Starter transition failure

2.14 SOLID STATE STARTER

- A. Unit mounted and pre-wired solid state type motor starter utilizing silicon controlled rectifiers, mounted in a NEMA 1 enclosure. The enclosure shall include a lockable hinged door with locking type retaining latches able to receive a padlock, and shall be UL labeled 508 compliant. Starter shall include a two-wire control input to initiate start sequence from the chiller controller.

- B. The starter mode shall be closed loop, current limit control and shall provide a smooth acceleration of the motor without current transitions or transients. The following shall be user programmable:
 - 1. Acceleration ramp time, 1 to 30 seconds minimum adjustment range.
 - 2. Motor start current.
 - 3. The starter shall provide transient voltage protection to the SCR's through RC snubbers and MOV's connected line-to-line and line-to-ground. High heat sink temperature protection shall also be provided

CONTACT ELECTRICAL ENGINEER AND SPECIFY BELOW THE SHORT CIRCUIT RATING REQUIRED FOR YOUR SPECIFIC PROJECT

- C. Starter shall have a 100,000 AIC short circuit withstand rating.
- D. Provide 120 volt control power transformers to power chiller controller, purge system, oil system, and all other auxiliary equipment and controls
- E. Provide the following motor protection features:
 - 1. Current phase loss
 - 2. Current phase unbalance
 - 3. Current phase reversal
 - 4. Excessive acceleration time
 - 5. Over/Under line voltage
 - 6. Motor current overload during start up and running
 - 7. Momentary power loss protection with auto restart

2.15 VARIABLE SPEED DRIVE

- A. Unit mounted and pre-wired variable speed drive to adjust compressor motor speed automatically in conjunction with compressor vane position, to maximize part load efficiency. Drive shall be mounted in a NEMA 1 enclosure and UL labeled 508C
- B. PWM type, utilizing IGBT's with a power factor of 0.96 or higher at all loads and speeds.
- C. Drive efficiency shall be 97 percent or higher at full load and full speed.

CONTACT ELECTRICAL ENGINEER AND SPECIFY BELOW THE SHORT CIRCUIT RATING REQUIRED FOR YOUR SPECIFIC PROJECT

- D. Drive shall have a 65,000 AIC short circuit withstand rating.
- E. Drive shall be insensitive to incoming power phase rotation and shall be capable of auto restart after a momentary power loss.
- F. Provide 120 volt control power transformers to power chiller controller, purge system, oil system, and all other auxiliary equipment and controls
- G. Variable speed drive shall include the following features:
 - 1. Over-voltage and-under voltage protection; 3-phase sensing motor over-current protection, single phase protection, and over temperature protection

2. Digital readout at the chiller controller of output frequency, input voltage, 3-phase output current, input kilowatts, and self-diagnostic service parameters. Separate meters for this information will not be acceptable.
3. kW Meter - The unit's input power consumption shall be measured and displayed digitally via the chiller controller. The kW meter accuracy shall be +/- 3 percent of reading.
4. Ammeter - Simultaneous three-phase true RMS digital readout via the chiller controller. Three current transformers shall provide isolated sensing. The ammeter accuracy shall be plus or minus 3 percent of reading.
5. Voltmeter - Simultaneous three-phase true RMS digital readout via the chiller controller. The voltmeter accuracy shall be plus or minus 3 percent of reading.
6. Elapsed Time Meter - Digital readout of the unit's elapsed running time (0 - 876,600 hours, resettable) shall be displayed via the chiller controller.

HOSPITAL PROJECTS MAY REQUIRE AN "IEEE 519" STUDY THAT ADDRESSES HARMONIC CONCERNS RELATED TO THE ELECTRICAL SYSTEM AS A WHOLE (NOT JUST HARMONIC CONCERNS THAT ARE SPECIFIC TO ANY PARTICULAR PIECE OF EQUIPMENT). AE SHALL DISCUSS THIS POSSIBLE REQUIREMENT WITH THE HOSPITAL'S ASSIGNED DESIGN MANAGER.

- H. At any VSD operating speed from 20% to 100%, current total harmonic distortion (THD) shall not exceed 100% of the VSD input current waveform, and voltage THD shall not exceed 3% of the VSD input voltage waveform, both as measured at the drive's incoming power connection lugs. Provide UL listed harmonic filter or power conditioner if required to guarantee these limits. Line reactors mounted external to the drive shall not be used. Filter/conditioner shall be unit mounted on the chiller. Manufacturer shall provide all wiring and conduit between filter, variable speed drive and motor.

2.16 CHILLER DISCONNECT SWITCH

THE ELEVATION OF THE DISCONNECT SWITCH INDICATED BELOW IS EXACTLY PER NATIONAL ELECTRIC CODE REQUIREMENTS AND WILL BE STRICTLY ENFORCED BY THE U-M INSPECTION DEPARTMENT. DURING DESIGN, VERIFY WHAT DISCONNECT HEIGHT IS AVAILABLE AS STANDARD WITH CHLR. MFR. AND MAKE DESIGN PROVISIONS ACCORDINGLY. FOR EXAMPLE, AN ELEVATED SERVICE PLATFORM MAY BE REQUIRED.

- A. Provide a factory-mounted, prewired, NEMA heavy-duty rated, fused disconnect switch with the starter. The disconnect switch shall be lockable in the "off" position and shall serve as the single point of power connection to the chiller.
- B. Configure the disconnect switch for top or side conduit entry. Provide line side lugs of the long barrel, two hole, compression type. Mechanical lugs are not acceptable.

- C. Mount the disconnect switch to comply with NEC requirements. The distance from the finished floor to the center of disconnect handle grip in its highest position shall not exceed 6 feet 7 inches, inclusive of housekeeping pad and vibration isolator heights.

2.17 CHILLER CONTROLLER

- A. Unit mounted pre-wired chiller controller mounted in a NEMA 1 enclosure, labeled by UL, CSA, ETL or MET. All external factory wiring shall be installed to minimize potential damage, and all power wiring, 110V and higher, shall be in a NEC compliant conduit system. Controller shall include an adjustable mounting system such that center of panel may be set at a maximum of 6 feet 6 inches above the finished floor, inclusive of housekeeping pad and vibration isolator heights.
- B. The chiller controller shall automatically adjust compressor pre-rotation vane position, variable speed drive when provided, and other chiller systems to maximize part-load efficiency and to provide capacity control.
 - 1. Capacity modulation shall be maintained within plus or minus 0.5°F of CHW set point, at entering condenser water temperatures as low as 65°F from full load to 15 percent load, without overshoot, hunting, surging, or cycling the machine off.
- C. Provide the chiller controller with the required hardware and software for the following functions.
 - 1. Safeties:
 - a. Compressor starter failure detection
 - b. Compressor start up, shut down sequences
 - c. High compressor discharge temperature
 - d. Surge detection and protection
 - e. High lubricating oil temperature
 - f. Low lubricating oil pressure
 - g. High bearing temperature
 - h. Evaporator and or condenser loss of flow
 - i. High condenser pressure limit and high pressure cut out
 - j. Evaporator low refrigerant temperature limit
 - k. Low evaporator leaving fluid cut out
 - l. Motor current limit, motor current overload
 - m. High motor winding temperatures
 - n. High vacuum operation limit
 - o. Power loss, phase unbalance, phase loss, reverse rotation
 - p. Over/under voltage
 - q. Short cycling protection
 - 2. Front panel display in clear English language and inch/pound units of the following:
 - a. Operating mode run status
 - b. Set point source or reset source
 - c. Password protection security
 - d. Evaporator freeze protection and low limit control data
 - e. Evaporator leaving fluid set point
 - f. Evaporator and condenser flow proof

- g. Calculated chiller capacity (tons)
 - h. Compressor discharge temperature
 - i. Chiller starts and run-time counter
 - j. Entering and leaving evaporator water temperature
 - k. Entering and leaving condenser water temperature
 - l. Saturated condenser temperature and pressure
 - m. Saturated evaporator temperature and pressure
 - n. Bearing or bearing oil temperatures
 - o. Lubricating oil temperature and pressure
 - p. Current limit or demand limit
 - q. Phase voltage and current
 - r. Motor winding temperature
 - s. Power demand (kW) and power factor
 - t. Purge compressor suction temperature (R123 machines only)
 - u. Purge pump out rate (R123 machines only)
 - v. Purge pump out time last or current cycle (R123 machines only)
 - w. Total purge pump out time (R123 machines only)
 - x. Total purge run time (R123 machines only)
3. DDC Control Inputs:
- a. Remote Start/Stop
 - b. Chilled water temperature set point reset
4. Binary Outputs:
- a. Evaporator Pump Relay
 - b. Condenser Pump relay
 - c. Chiller Running Relay
 - d. Alarm Relay (manual reset required)
- D. The controller shall provide an output signal to the Owner's DDC system for controlling condenser water temperature to maximize chiller operating efficiency while maintaining proper refrigerant head pressure at all times. Provide in the chiller controller a 4 to 20 mA or 0 to 10 volt output signal to allow Owner's DDC system to reset condenser water temperature via cooling tower fan speed control and tower bypass valve modulation while maintaining proper chiller refrigerant head pressure.
- E. Provide an ON-OFF-AUTO rocker switch on the front of the controller panel to allow local control or remote control of the start/stop function by Owner's DDC system. When switch is set to ON or OFF positions, the remote start or stop signal from the Owner's DDC shall be ignored. If turning the chiller on or off at the chiller control panel interface accomplishes the same thing, an ON-OFF-AUTO rocker switch is not required.
- F. Provide factory installed and pre-wired proof-of-flow switches that confirm flow thorough the evaporator and condenser to the chiller control panel. Alternatively, provide United Electric Model J21K-14829 differential pressure switches for field installation to prove evaporator and condenser water flows.
- THE BELOW ARTICLE (IN HIDDEN TEXT) CONTAINS SAMPLE LANGUAGE FOR VARIABLE PRIMARY FLOW (VPF) CONTROL. THE ADDITIONAL FEATURES TO PROVIDE ACCURATE CONTROL ON VPF SYSTEMS IS AN OPTION ON CHILLERS AS OF MARCH 2011.**
- G. Variable Primary (Evaporator) Flow Compensation

1. The controller shall provide accurate and stable response to changes in evaporator water flow rate. The control algorithm shall automatically adjust the control gain (and/or other control parameters) to maintain leaving chilled water temperature within +/- 0.5°F of set point at flow rate variations up to 25% change per minute, and within +/- 2°F of set point at flow rate variations up to 50% per minute.
2. Include factory mounted transducers to read differential evaporator water pressure and differential condenser water pressure, and any other necessary parameter.
3. The controller shall display the following additional data:
 - a. Evaporator differential pressure
 - b. Condenser differential pressure
 - c. Evaporator water flow rate
 - d. Condenser water flow rate
 - e. Evaporator capacity (tons)

IF THE PROJECT INVOLVES THE PURCHASE OF MULTIPLE CHILLERS OF THE SAME TYPE AND SIZE, CONSIDER REVISING THE BELOW TO ONLY REQUIRE A FACTORY TEST ON ONE OF EACH TYPE AND SIZE.

2.18 SOURCE QUALITY CONTROL

- A. Chiller shall be factory performance tested in an AHRI certified test facility per AHRI standard 550/590. Factory test instrumentation calibration shall be traceable to the National Institute of Standards And Technology.
 1. Chiller shall be tested at the following load/condenser water temperature conditions, at the specified evaporator leaving water temperature and condenser/evaporator water flow rates and fouling factor allowances:
 - a. No Chiller Economic Analysis Table Requested: 100 percent/85°F, 75 percent/75°F, 50 percent /65°F, 25 percent /65°F, 15 percent/85°F.
 - b. Chiller Economic Analysis Table Requested: At any four loads and conditions indicated in the table, as selected by the Owner, and at 15 percent/85°F.
- B. Factory vibration test to demonstrate compliance to vibration performance requirements.
- C. The Owner's Representative shall be allowed to witness the factory testing. An officer of the manufacturer's company shall certify by signature that the factory tests were performed as specified, the report accurately reflects the test results, and that the chiller met or exceeded all performance requirements. The report shall clearly identify any performance requirements that were not achieved.

DO NOT MODIFY TERMINOLOGY (E.G. "NET REFRIGERATION CAPACITY") IN BELOW PARAGRAPH, INCLUDING CAPITALIZATION OF WORDS. THESE TERMS MATCH DEFINITIONS IN AHRI 550/590

- D. The equipment will be accepted by the Owner if the manufacturer's certified test results are provided and the equipment met or exceeded all performance requirements (zero Net Refrigeration Capacity, zero Total Power Input, and zero Energy Efficiency (kW/ton) tolerance).

PART 3 - EXECUTION

3.1 EXAMINATION, STORAGE, AND PREPARATION

- A. Upon delivery, validate holding charge and that integrity of the delivery protection has been maintained, the chiller is undamaged, and all accessory parts were delivered. Reject damaged chillers. Verify that center of disconnect and chiller control panel height will be a maximum of 6 feet 7 inches above the finished floor, inclusive of housekeeping pad and vibration isolator heights. Restore protection. Provide a delivery report indicating chiller condition to the Owner's Representative.
- B. Rig units off delivery trucks. Comply with Manufacturer's rigging instructions.
- C. Move all refrigerant or oil supplied by the manufacturer to a location next to the chiller and contact the Owner's Representative to inform them of the amount and type of refrigerant and oil delivered.
- D. Store units protected from weather, dirt, water, construction debris, and physical damage. Support stored units at points as required by manufacturer.
- E. Verify during storage that unit refrigerant or nitrogen holding charge levels are being maintained. Record the charge pressure and ambient temperature weekly and provide report to Owner's Representative. Take immediate action under the supervision of the manufacturer to restore any significant reduction in charge pressure level.
- F. Examine chillers before installation. Validate holding charge has been maintained and that the chiller is undamaged. Provide a pre-installation report indicating chiller condition to the Owner's Representative.
- G. Examine roughing-in for equipment support, anchor-bolt sizes and locations, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting chiller performance, maintenance, and operations before equipment installation.
 - 1. Final chiller locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- H. Rig units into final locations. Comply with Manufacturer's rigging instructions. Conduct a pre-installation conference to review rigging and installation requirements with all parties involved.

TURN ON HIDDEN TEXT AND MAKE THE BELOW ARTICLE PROJECT SPECIFIC, IF IT APPLIES TO THE PROJECT.

3.2 CHILLER ASSEMBLY

- A. The chiller will require disassembly and reassembly to allow movement into final location. The chiller manufacturer shall provide all labor and supervision to disassemble and reassemble the chiller, including any rigging required for these operations. The installing contractor shall provide all rigging to move the chiller to the point of final assembly. The chiller manufacturer shall assemble the unit complete with holding charge, ready for piping and electrical connections.

3.3 CHILLER INSTALLATION

- A. Install the chiller in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Install chiller on support structure or concrete base as indicated. Install the specified vibration isolation, furnished by the chiller manufacturer, in strict compliance with chiller manufacturer's directions.
- C. Provide connection-size ball valves with threaded hose end connections at all water vent and drain connections on the evaporator and condenser, whether indicated on Drawing details or not.
- D. Install relief vent piping in strict accordance with chiller manufacturer's recommendations.
- E. Adjust chiller control panel so that center of panel is set at maximum of 6 feet 7 inches above finished floor, inclusive of housekeeping pad and vibration isolator heights.
- F. Install separate devices furnished by manufacturer and not factory installed.
- G. Repair all damaged insulation to factory equivalent.
- H. Repair scratches to factory equivalent finish, using chiller manufacturer provided paint.
- I. Complete the manufacturer's pre-start checklist and submit it for scheduling of the manufacturer's field startup technician.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in Related Section "Commissioning" and other requirements of the Contract Documents.

3.5 SYSTEM STARTUP

- A. Manufacturer shall provide a factory-trained representative for the time required to complete start-up, commissioning, and testing each chiller. This service shall be provided on days and at times required to meet the construction schedule and/or project phasing requirements, at the complete discretion of the Owner's representative, without additional charges. There shall be no time limit on this service, but shall be the time required to bring the unit to proper operation. This service must include all necessary written and verbal instructions to U of M operating personnel. The manufacturer's factory-trained representative shall:
1. Verify correct installation and organize, instruct and assist the mechanical contractor's personnel in start-up procedures.
 2. Fill chiller with oil if not factory installed, and charge the chiller with refrigerant.
 3. Verify all pre-start checks. Start-up the chiller, set controller parameters, make field adjustments, refrigerant balance the chiller, verify proper chiller operation. Assist Owners personnel with proper set-up of remote control operation of the chiller. Provide a written report after each visit, prior to leaving.
 4. Participate in the commissioning of the chiller to the extent required by the project Commissioner.
- B. If the initial start-up and machine trim is accomplished under chiller load condition of less than 100 percent load, the manufacturer's representative shall return to the job site and re-adjust the machine during 100 percent load conditions at no additional cost.
- C. The manufacturer representative's written report shall include complete data on all services provided, and document all programmed settings as well as the amount of refrigerant and other fluids installed, both from the factory and in the field during startup.

3.6 OWNER TRAINING

- A. Manufacturer's factory-trained representative shall train Owner's maintenance personnel on start-up and shutdown procedures, trouble-shooting, vibration test locations, service schedules, and preventative maintenance procedures, minimum of 8 hours. Review with Owner's personnel, the data contained in the Operating and Maintenance Manuals.
- B. Schedule training with Owner through the Architect/Engineer with at least 7 days prior notice. Training and start up services are separate functions and training shall not be combined with startup services.

3.7 FIELD QUALITY CONTROL

- A. Chiller manufacturer shall perform vibration testing. Measure at compressor and motor bearings in the vertical, horizontal and axial directions, to demonstrate compliance with Part 2 vibration performance requirements. Permanently label the location where each vibration measurement was taken with a unique identification number.
- B. Provide report to owner within 1 week of testing. Include diagram of chiller with measurement points labeled to match field labels.
- C. The Chiller manufacturer shall make corrections and retest if it is determined the cause of excess vibration is due to defective equipment. The Installing contractor shall make corrections and pay for a chiller mfr. retest if it is determined the cause of excess vibration is improper installation.

SECTION 236500 - COOLING TOWERS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 236500 - COOLING TOWERS

REVISIONS:

3-31-04: SUBSTANTIALLY REVISED AND POSTED TO WEB.

**04-10-08: HYDRONICS MECH TECH GROUP REVISIONS: ADDED TOWER
TECH AND EVAPCO. BOTH PRODUCTS ARE UNDER CONSIDERATION AND
SHOULD ONLY BE USED IF APPROVED BY H&S MECH TECH TEAM. MINOR
REVISIONS IN OTHER AREAS.**

06-09-08 APPROVED FOR WEB.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SCOPE OF WORK:

- A. Furnish and install the cooling towers specified in this section, and as detailed and scheduled in the drawings.

1.3 RELATED SECTIONS:

**SPEC EDITOR: THIS PARAGRAPH CAN BE DELETED IF COOLING TOWER
IS INCLUDED IN GENERAL CONTRACT.**

- A. Section 220513 - Motors

1.4 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Cooling Tower shall be CTI certified.
- C. Handrails and ladders shall meet OSHA and MIOSHA requirements.

1.5 COOLING TOWER WARRANTY:

SPEC EDITOR: AS IS FOR MARLEY QUADRAFLOW. MODIFY FOR OTHERS.

- A. The mechanical equipment including the motor must be warranted by the manufacturer against any failure caused by defects in materials and workmanship for at least five years from date of tower shipment. The balance of the cooling tower shall be warranted by the manufacturer for at least one (1) year from start-up, not to exceed 18 months from equipment ship date.

1.6 THERMAL PERFORMANCE WARRANTY:

SPEC EDITOR: RETAIN FOR ALL PROJECTS UNLESS TESTING IS INCLUDED AS PART OF THE PROJECT).

- A. The Tower performance will not be verified, by independent tests, initially under this contract. Balancing will be limited to the extent described in section 230593. The owner, at his option, may hire an independent testing agency, during the performance guarantee period of five years, to test the cooling tower in accordance with applicable Cooling Technology Institute (CTI) standards and in the presence of a representative of the cooling tower manufacturer. If the performance does not meet specifications with no damage to any components of the tower, the tower manufacturer shall pay for the test done by the owner per CTI (Cooling Tower Institute) requirements and for the remedial actions required to meet the performance. Thermal performance must be warranted by the manufacturer for at least five (5) years from start-up.

MOST TOWERS BELOW ARE SPECIFIED AS FM APPROVED. VERIFY THE NEED FOR FM APPROVAL FOR YOUR SPECIFIC PROJECT, AND EDIT THE BELOW ACCORDINGLY. DEPENDING ON TOWER TYPE, SOME MANUFACTURERS MAY NOT BE ABLE TO PROVIDE A FM APPROVED TOWER.

PART 2 - PRODUCTS

2.1 GENERAL COOLING TOWER REQUIREMENTS

- A. Design structural system for the following live loading in addition to tower dead-loads and operating-loads:
 - 1. Wind Loading: 30 psf on exposed vertical surfaces.

SPEC EDITOR: DELETE IF NOT WINTERIZED / SELECT APPLICABLE

- B. Basin Heater: Basin heaters sized by manufacturer to maintain basin water at 40 deg.F (4.4 deg.C) at ambient temperature of -10 deg.F and wind velocity of 15 mph.

SPEC EDITOR: ONLY ELECTRIC HEATER FOR MARLEY QUADRAFLO

SPEC EDITOR: CONSIDER TWO HEATER ELEMENTS IN LARGE COOLING TOWER CELLS IN SINGLE CELL APPLICATION.

- 1. Steam injection nozzle for each cold water basin for direct injection of steam into basin. Nozzle shall be Penberthy Model NWH steam injection nozzle with line size discharge pipe and all associated fittings required for a complete installation. Nozzles, piping, etc. shall be field installed.

2. Electric basin heater: One 480v or 208v (as scheduled), 3 phase basin heater element per cell, shipped loose to prevent damage during shipment. 480v or 208v (as scheduled), 3 phase contactor, fixed lockable disconnect, circuit breaker, and control transformer in a NEMA 4, 3R if mounted outdoors, NEMA 1 if mounted indoors, electrical panel. Control system shall be wired to a terminal strip allowing Owners Building Management System to energize contactor coil from a remote set of contacts. Manufacturer's standard combination water level and temperature sensor wired to terminal strip.

C. Water Level Control:

1. Float operated water make-up valves, one per cell, unless detailed or scheduled otherwise on the contract drawings. Make-up valves shall be actuated by a 2 piece float/valve rod assembly, with one rod oriented approximately vertically and connected to the float, and the second rod oriented horizontally and connected to the valve. Valve on-off shall be adjustable by adjustment of the vertical rod length. Floats shall be welded copper or polystyrene filled plastic. All castings for the float valves, float rod and keys, etc. shall be bronze construction with a complete non corroding construction assembly.

SPEC EDITOR: VSD IS ALWAYS REQUIRED.

- D. Motor: Unless noted otherwise provide TEFC, inverter duty, 1800 rpm, located outside air stream. Refer to 220513 "Motors" for additional requirements

SPEC EDITOR: VERIFY ACCESS REQUIREMENTS. HANDRAIL AND LADDER NOT AVAILABLE ON QUADRAFLO.

SPEC EDITOR: INDICATE IN DRAWINGS LADDER AND HANDRAIL GENERICALLY. HANDRAIL REQUIRED ON TOP OF TOWER FOR EVAPCO.

- E. Handrails: Unless noted otherwise, provide galvanized steel or aluminum pipe rails of required height above tower. Include knee and toe rails of required diameter and heights, meeting all the OSHA and MIOSHA requirements.

- F. Ladders: Galvanized steel or aluminum ladder, to the access door and to top of cooling tower working surface, meeting OSHA and MIOSHA requirements. If access platforms are not provided then ladders shall extend beyond bottom of the cooling tower to access from roof, but shall not be supported from the roof.

1. Safety Cage: Include safety cage of galvanized steel or aluminum.
2. Provide ladder from roof to top of tower or highest service level.
3. Provide ladder from service platform to top of tower.

SPEC EDITOR: CONSULT WITH PROJECT DESIGNER, COORDINATE AS TO WHETHER THIS PARAGRAPH SHOULD BE INCLUDED.

- G. Maximum Permissible Sound Pressure Level: Use 0.0002 microbar as reference. Measure at 50' in several directions, uniformly covering 360 deg. Do not exceed maximum permissible dB level each of the following octave bands:

SPEC EDITOR: CONTACT REPRESENTATIVE TO FILL IN THE BLANKS.

63 Hz - ?? dB
125 Hz - ?? dB
250 Hz - ?? dB
500 Hz - ?? dB
1000 Hz - ?? dB
2000 Hz - ?? dB
4000 Hz - ?? dB
8000 Hz - ?? dB

- H. Vibration Control: Coordinate vibration support locations for cooling towers with steel support.

SPEC EDITOR: CHOOSE TYPE OF COOLING TOWER.

2.2 INDUCED DRAFT CROSSFLOW COOLING TOWER:

SPEC EDITOR: BASED ON MARLEY NC OR BAC SERIES 3000

- A. General: Factory fabricated cooling tower, induced draft crossflow type. Cooling tower shall be FM approved.
- B. Casings: 16 gauge G-235 galvanized steel minimum, with hot dipped galvanized steel screws and bolts.
- C. Collecting Basin and Sump: Welded stainless steel. Collecting basin and sump, including lift-out stainless wire strainer with openings smaller than nozzle orifices, and with connections for equalizer piping, drain, overflow and water make-up.
- D. Wetted-Surface Fill: Wave form vertical sheets of PVC having flame spread rating of 5 per ASTM E 84 - 77A.
- E. Drift Eliminators: Limit drift-loss to indicated maximum percentage of 0.005 of total water circulated, with PVC, having flame spread rating of 5 per ASTM E 84 formed integral with the fill.

SPEC EDITOR: GALVANIZED STEEL IS BAC. INTEGRAL IS MARLEY.

- F. Louvers: Designed and installed by manufacturer, and of sufficient thickness and rigidity to prevent visible sagging. Provide galvanized steel or PVC integral with fill.
- G. Water Distribution System: Stainless steel, open basin, gravity-flow type with plastic metering orifices; installed by manufacturer to ensure even distribution of water over wetted-surface-fill, unless otherwise indicated on drawings, provide self-draining internal PVC piping from bottom inlet connection to distribution system.
- H. Basin Covers: Galvanized steel or stainless steel sheet removable cover with handles of sufficient construction to permit walking upon, installed by manufacturer to prevent debris from entering basin and to inhibit algae growth by eliminating sunlight.

- I. Air Inlet Screens: Galvanized steel mesh, mounted in removable frames by manufacturer or inert PVC integral to fill.

SPEC EDITOR: CAN BE OMITTED WITH TOWERS WITH BOTTOM INLET CONNECTIONS. DESIGNER TO INDICATE SEPARATE SHUT-OFF VALVES TO EACH CELL.

- J. Flow Control Valves: Angle valves for balancing flow to each distribution basin or self-balancing distribution system.

- K. Fans and Drives: Aluminum propeller-fan. Gear-drive including speed reducer with extended oil line and dipstick.

SPEC EDITOR: COORDINATE WITH ELEC. ENGINEER. SHOW FIELD WIRING TO NEMA 4 JUNCTION BOX WITH RESET BUTTON MOUNTED OUTSIDE OF TOWER. SHOW ON ELECTRICAL DRAWING, REFER TO STANDARD DETAIL.

- L. Vibration Cutout Switch: Provide switch to de-energize fan motors if excessive vibration occurs due to fan imbalance. If vibration switch is located inside tower, provide remote reset feature wiring. Manufacturer: Metrix #5550.

- M. Fan Guard: Galvanized steel welded steel rod and wire guard

FOR LARGE TOWERS WHERE THE FAN SPEED REDUCER IS NOT ACCESSIBLE FOR SERVICE FROM THE INTERNAL WALKWAY THAT IS SPECIFIED BELOW, DESIGNER SHOULD SPECIFY A SECONDARY PLATFORM WITH LADDER TO REACH THE SPEED REDUCER, WHEN AVAILABLE FROM THE MANUFACTURERS.

- N. Access: Large access door at both ends of tower to eliminators and air plenum. Provide with internal walkways that extend the full length of the cooling tower basin, constructed of G-235 galvanized steel with hot dipped galvanized steel screws and bolts.

- O. Cooling tower manufacturer: Marley NC or BAC Series 3000.

2.3 INDUCED DRAFT COUNTERFLOW COOLING TOWER:

SPEC EDITOR: BASED ON EVAPCO AT, UNDER CONSIDERATION ON A PROJECT TO PROJECT BASIS. TO BE APPROVED BY HYDRONICS MECH TECH TEAM.

- A. General: Factory fabricated cooling tower, induced draft counter flow type. Cooling tower shall be FM approved.

- B. Casings: 16 gauge G-235 galvanized steel minimum, with steel screws.

- C. Collecting Basin and Sump: Welded 304 stainless steel. Collecting basin and sump, including lift-out stainless wire strainer with openings smaller than nozzle orifices and with connections for equalizer piping, drain, overflow and water make-up, as required for specified application.

- D. Wetted-Surface Fill: Wave form vertical sheets of PVC having flame spread rating of 5 per ASTM E 84 - 77a .

- E. Drift Eliminators: Limit drift-loss to the indicated maximum percentage of 0.001 of total water circulated, with PVC, having flame spread rating of 5 per ASTM E 84-81a formed integral with the fill.
- F. Louvers: Designed and installed by manufacturer, and of sufficient thickness and rigidity to prevent visible sagging. Provide drift eliminators for cooling tower to be PVC and mounted horizontally above the water distribution system.
- G. Water Distribution System: Cooling tower to be equipped with a non-corrosive water distribution system consisting of schedule 40 polyvinyl chloride (PVC) header and spray branches, nozzles are to be clog resistant and thread into the PVC header pipe.
- H. Air Inlet Screens: Cooling tower shall be equipped with PVC inlet louvers mounted in removable frames by manufacturer.
- I. Fans and Drives: Aluminum propeller-fan. Gear-drive including speed reducer with extended oil line and dipstick.

SPEC EDITOR: COORDINATE WITH ELEC. ENGINEER. SHOW FIELD WIRING TO NEMA 4 JUNCTION BOX WITH RESET BUTTON MOUNTED OUTSIDE OF TOWER. SHOW ON ELEC. DRAWING.

- J. Vibration Cutout Switch: Provide switch to de-energize fan motors if excessive vibration occurs due to fan imbalance. If vibration switch is located inside tower, provide remote reset feature wiring. Manufacturer: Metrix #5550.
- K. Fan Guard: Galvanized steel welded steel rod and wire guard
- L. Access: Cooling tower shall be equipped with fan plenum access. Provide removable access port at end of headers to facilitate cleaning of distribution piping.
- M. Side mounted Working Platform, Handrail & Ladder with Davit: Provide working platform for access to motor and fan plenum with ladder.
- N. Inlet & Outlet connections: Grooved to accept a mechanical coupling device.

SPEC EDITOR: BOTTOM INLET AVAILABLE IN SPECIFIC TONNAGES. FLANGED CONNECTIONS IS AN OPTION AT ADDITIONAL COST.

- O. Cooling Tower Manufacturer: Evapco AT series.

2.4 INDUCED DRAFT COUNTERFLOW MODULAR COOLING TOWER

SPEC EDITOR: BASED ON TOWER TECH TTXE SERIES MODULAR; UNDER CONSIDERATION ON A PROJECT BY PROJECT BASIS. TO BE APPROVED BY HYDRONICS MECH TECH GROUP

- A. General: Furnish and install as shown on the plans, a Tower Tech factory-assembled, forced draft, counterflow, modular cooling tower, Model TTXE _____. The tower's principal construction shall be of pultruded Fiberglass Reinforced Polyester (FRP) and must have a flame spread rating less than 25 or a flammability coefficient of 94-V0. The module must be capable of operating independently or in combination with future modules.

- B. Tower shell and substructure: (legs) shall be designed to withstand a wind load equivalent to 80 MPH and be able to resist seismic forces classified under Zones 1 and 2.
- C. Casing: The cold water basin and the tower casing shall be constructed of pultruded Fiberglass Reinforced Polyester (FRP) with UV inhibitors. It shall have a minimum thickness of ¼" and a minimum density of 0.07 lb/in cubed. Specially placed reinforcement and a UV veil layer will ensure the structural strength and longevity. Wall panels shall be covered by a five (5) year warranty, excluding cosmetic or superficial damage/wear.
- D. Water Distribution System: Water shall enter the tower through a single inlet comprised of an enclosed, low pressure, non-corrosive Polyvinyl Chloride (PVC) Schedule 40 piping system. Water will be distributed further using Schedule 40 PVC lateral(s). Water shall be uniformly sprayed over the fill media by evenly spaced and sized rotary spray nozzles that are capable of automatically adjusting the size of their exit orifices to accommodate varying water flows. The nozzles shall have a four (4) inch orifice for clog free operation, produce a square pattern, and shall be located no more than three inches above the fill media. The nozzles must operate between a minimum ½ pound of pressure and a maximum 1½ pounds of pressure. The nozzles shall be made of High Density Polyethylene (HDPE) and/or Acrylonitrile Butadiene Styrene copolymer (ABS). Water distribution system shall be covered by a one (1) year warranty.
- E. Perimeter Basin: Tower shell or casing shall have an integral perimeter basin. Its elevated location shall reduce operational pump head requirements. Its high velocity water flow during operation shall prevent accumulation of sediment. Perimeter basin shall be equipped with one inspection port at each corner.
- F. Sump: Tower shall be equipped with a terminally mounted (end wall) outlet sump with a flanged discharge connection for simplified piping. Sump casing shall be manufactured of rotationally molded Polypropylene (PP). Standard equipment shall include a mechanical float valve, flanged overflow/equalization connection, and a corrosion-free, easily removable sump screen. Sump shall be covered by a one (1) year warranty.
- G. Fill & Drift Eliminators: Fill shall be Polyvinyl Chloride (PVC) of cross-fluted design, 10 mil (after forming), impervious to decay, fungus and biological attack. Fill sheets shall be self-spacing, supported on maximum spans of 12". Each fill sheet shall have a microstructure to improve heat transfer. Fill sheets shall be bonded together to give a cross-corrugated pattern by application of glue only to dedicated glue joints. Fill packs made from random application of glue shall not be acceptable. Fill packs or blocks shall be placed in the tower so as to provide the tightest fit possible without damage to the fill. Drift eliminators shall be minimum three-pass Polyvinyl Chloride (PVC) material of cellular design impervious to decay, fungus and biological attack. Drift losses shall not exceed 0.005% of the design circulating flow rate.

- H. Water Collection System: The tower shall utilize a water collection system positioned beneath the fill media and above the air inlet. The water collection system shall collect cold water as it falls from the fill media and channel the cooled water into the tower's elevated perimeter basin permitting the mechanical equipment to be mounted in the cool dry entering air stream beneath the tower. The water collectors shall be made of extruded flame retardant Acrylonitrile Butadiene Styrene copolymer (ABS) material and shall contain an integral damper system that opens mechanically with airflow. The damper system will prevent entry of airborne debris when the fan below it is off. The water collection system shall be covered by a one (1) year warranty.
- I. Motor: The tower shall contain ____ motors at ___ horsepower per motor for a total installed horsepower of _____. The motors shall be Totally Enclosed Air Over (TEAO) with a service factor of 1.15 and must be suitable for 230/460-Volt, 3-phase, 60-Hz service. Motors shall operate at 860-900 RPM and be single-speed, single winding. Maximum brake horsepower shall not exceed the nameplate horsepower at design operating conditions. The motor(s) shall be mounted to a 304 stainless steel sub-structure using 304 stainless steel bolts.
- J. Fans: Fans shall be of an axial, airfoil design positioned within an aerodynamically streamlined fiberglass shroud and installed with a minimum of tip clearance for maximum efficiency. A fan shall have four (4), eight (8), or six (6) blades when powered by a 3, 5, or 7.5 horsepower motor, respectively. Fan blades shall be manufactured of Fiberglass-Reinforced Polypropylene and be pitch-adjustable. Fan hubs shall be manufactured of high strength, low weight aluminum alloy to minimize stress and wear on motor bearings. The cooling tower shall have ___ direct-drive fans per cell. Both the fan assembly and motor shall be installed outside the tower's hot moist exiting air stream. Towers utilizing gear reducers or belt driven units will not be accepted. A corrosion resistant mesh fan guard to prevent entry of airborne objects into the fan is required.
- K. Cooling Tower Manufacturer: Tower Tech TTXE Series.

2.5 FIBERGLASS CROSSFLOW COOLING TOWER:

SPEC EDITOR: BASED MARLEY QUADRAFLOW.

SPEC EDITOR: FIBERGLASS TOWER NOT FM APPROVED. COORDINATE WITH PROJECT FM REQUIREMENTS.

- A. General: Induced draft cooling tower constructed entirely from fiberglass reinforced polyester with stainless steel fasteners except where specified below.
- B. Casings: Fiberglass Reinforced Polyester (FRP), fabricated and installed by manufacturer to make tower watertight.

SPEC EDITOR: DESIGNER NEEDS TO PROVIDE SUFFICIENT HEIGHT FOR MAINTENANCE PERSONNEL TO ACCESS HATCH IN CENTER OF TOWER. PROVIDE SUFFICIENT SPACE AROUND ENTIRE PERIMETER OF TOWER TO

ALLOW ACCESS TO BASIN COVERS VIA AN EXTERNAL PERIMETER PLATFORM WITH HANDRAILS OR WITH A PORTABLE LADDER.

- C. Collecting Basin and Sump: FRP. Provide integral type collecting basin and sump with lift-out strainer with openings smaller than nozzle orifices, and with connections for equalizer piping in multiple cell installation, drain, overflow and water make-up. See plans for requirement on make-up valve and backflow preventer.
- D. Wetted-Surface Fill: Wave form vertical sheets of PVC having flame spread rating of 5 per ASTM E 84 - 81A.
- E. Drift Eliminators: Limit drift-loss to the indicated maximum percentage of 0.005 of total water circulated, with PVC plastic, having flame spread rating of 5 per ASTM E 84.
- F. Louvers: Designed and installed by manufacturer, and of sufficient thickness and rigidity to prevent visible sagging: PVC, integral with fill.
- G. Water Distribution System: FRP basin with polypropylene nozzles shall provide full coverage of the fill by gravity flow.
- H. Basin Covers: Provide removable cover with handles, installed by manufacturer to prevent debris from entering basin and to inhibit algae growth by eliminating sunlight. Made of FRP.
- I. Air Inlet Screens: Stainless steel mesh, mounted in removable frames by manufacturer.
- J. Fans and Drives: Aluminum propeller-fan of adjustable-pitch type. Provide gear-drive including speed reducer with extended oil line and dipstick.

SPEC EDITOR: COORDINATE WITH ELEC. ENGINEER. SHOW FIELD WIRING TO NEMA 4 JUNCTION BOX WITH RESET BUTTON MOUNTED OUTSIDE OF TOWER. SHOW ON ELEC. DRAWING.

- K. Vibration Cutout Switch: Provide switch to de-energize fan motors if excessive vibration occurs due to fan imbalance. Vibration switch shall be Metrix model #550. If vibration switch is located inside tower, provide remote reset feature with required wiring.
- L. Fan Guard: Stainless steel welded steel rod and wire guard
- M. Cooling tower manufacturer: Marley Quadraflow

2.6 FORCED DRAFT COOLING TOWERS:

SPEC EDITOR: BASED ON BAC SERIES V AND MARLEY

SPEC EDITOR: PROVIDE ADEQUATE SPACE FOR FAN SHAFT REMOVAL.

- A. General: Forced draft cooling tower with vertical discharge and side intake. Cooling tower shall be FM approved.
- B. Casings: Galvanized steel fabricated and installed by manufacturer to make tower watertight.
- C. Fan/Pan Section: The combination Pan/Fan section shall be constructed with galvanized steel. The fans and motors shall be located in the dry air stream.

- D. Surface Section: Removable from the Pan/Fan section to facilitate rigging. Provide serpentine PVC wet deck surface with individually supported fill sheets installed no closer than ¾" to one another, and galvanized casing steel panels.
- E. Eliminators: Eliminators shall be steel galvanized and shall limit drift losses to 0.002% of total water circulated.
- F. Water Distribution System: One of the following materials designed and installed by manufacturer to ensure even distribution of water over wetted-surface-fill.
 - 1. Schedule 40 PVC pipe header and removable schedule 40 PVC pipe branches.
 - 2. Nozzles: Provide removable plastic or brass.
 - 3. Pressure Drop: Maximum pressure drop of 5 psi.
- G. Air Inlet Screens: Galvanized steel mesh , mounted in removable frames by manufacturer:
- H. Fans and Drives: Provide forward curved centrifugal fans with galvanized steel blades and V-belt drive with sheave sized for rated air flow.
- I. Fan Bearings: Self-aligning ball bearings; include external extended grease lines, and fittings. Installed by manufacturer.
- J. Water Distribution System: Water shall enter the tower through a single inlet comprised of an enclosed, low pressure, non-corrosive Polyvinyl Chloride (PVC) Schedule 40 piping system. Water will be distributed further using Schedule 40 PVC lateral(s). Water shall be uniformly sprayed over the fill media by evenly spaced and sized rotary spray nozzles that are capable of automatically adjusting the size of their exit orifices to accommodate varying water flows. The nozzles shall have a four (4) inch orifice for clog free operation, produce a square pattern, and shall be located no more than three inches above the fill media. The nozzles must operate between a minimum ½ pound of pressure and a maximum 1½ pounds of pressure. The nozzles shall be made of High Density Polyethylene (HDPE) and/or Acrylonitrile Butadiene Styrene copolymer (ABS). Water distribution system shall be covered by a one (1) year warranty.
- K. Cooling tower manufacturers: Marley, Baltimore Air Coil, Evapco.

PART 3 - EXECUTION

3.1 STORAGE:

- A. Store tower and materials off ground until unit is placed. Follow manufacturer's requirements for support.
- B. Perform all maintenance as required by manufacturer during storage until unit is turned over to owner Provide documentation on date and type of maintenance preformed.

3.2 INSTALLATION:

- A. Any and all items shipped loose with the tower, such as rails, float valves fan shroud, walkways, ladder, motor, motor mount and any item required for proper operation of tower, shall be assembled and installed per manufacturer's requirements.
- B. Access: Provide access and service space around and over cooling towers as indicated, but in no case less than that recommended by manufacturer.
- C. Support: Install floor-mounted units on 4" high reinforced concrete pad, 4" larger on each side than cooling tower base. Cast anchor bolt inserts into pad.

SPEC EDITOR: STEEL SUPPORT PAINTING BY ARCH. TRADES.

- D. Support: Install roof-mounted units on structural steel mechanical equipment supports as shown in the drawings. Anchor cooling tower to supports with removable fasteners. Verify support configuration against tower shop drawing prior to tower delivery.

SPEC EDITOR: DO NOT PLACE TOWER DIRECTLY ON VIBRATION ISOLATORS. CONFIRM WITH MANUFACTURER REQUIREMENTS FOR SECONDARY STEEL.

- E. Placement: Mount unit on vibration isolators. Install gaskets or sealants between cooling tower cells. Level units to tolerance of 1/8" in 10'-0", in both directions.
- F. Condenser Water Piping: Provide flanged or union connections to cooling tower, with flexible pipe connections if tower is mounted on vibration isolators. Pitch lines so water will drain into sump. Connect inlets to cooling tower with shutoff valve, and balancing valve (if 2 or more inlets). Connect outlets with shutoff valves.

SPEC EDITOR: MAKE SURE THIS IS DETAILED ON DRAWING.

- G. Make-up and Water Piping: Provide flanged or union connections to cooling tower, with flexible pipe connections if tower is mounted on vibration isolators. Pitch lines so water will drain into sump.(Engineer to verify need for backflow preventer.)
- H. Drain Piping: Connect drain and overflow to cooling tower as indicated, full size of connection on cooling tower.
- I. Electrical Wiring: Install electrical devices furnished by manufacturer but shipped loose. Furnish copy of manufacturer's wiring diagram submittal to Electrical Installer.
- J. Final Alignment: Factory trained technician shall verify and align if necessary the drive system prior to start-up, within 0.004".

3.3 ADJUSTING AND CLEANING:

- A. Start-up: Check, test and startup by manufacturer's technical representative, including final adjustments to blades and drives. Comply with manufacturer's instructions for filling and start-up of operation, but not less than the following:

1. Verify lubrication of rotating parts; lubricate as needed.
2. Verify fan rotation direction.
3. Verify that motor amperage is in accordance with manufacturer's data.
4. Balance water flow to each tower and to each inlet for multiple inlet towers.
5. Adjust water level control for proper operating level.
6. Balance equalizer lines between multiple towers (if any).

B. Commissioning:

1. Manufacturer's representative shall attend pre-field assembly meeting to verify, in writing, that all tower parts have been shipped without damage and to instruct installing contractor on proper assembly.
2. Manufacturer's representative shall attend initial tower startup to verify, in writing, that the tower is properly assembled and fastened, the flow to the hot basins is properly balanced, the float valve operates properly, the fans operate properly through the entire speed range and the fan motors are drawing the proper amperage and verify operation & setting of vibration switch.

SPEC EDITOR: ADD FOR BASIN ELECTRICAL HEATER

3. Manufacturer representative shall verify in writing that each heater element draws the proper amperage and shuts off on low water level

3.4 CLOSEOUT PROCEDURES:

- A. Provide services of manufacturer's technical representative for one 8-hour day to instruct Owner's personnel in operation and maintenance of factory-fabricated cooling towers.
 1. Schedule training with Owner, provide at least 7-day notice to Contractor and Engineer of training date.

*AUGUST 2105: UPDATE TO IMPROVE CROSS WHEEL LEAKAGE REQUIREMENTS,
ADD ROTATION DETECTION DEVICE, IMPROVE BEARING REQUIREMENTS,
MODIFY DUAL BELT REQUIREMENT TO ALLOW SPARE BELTS ILO DUAL BELTS,
PROVIDE AHRI CERTIFICATION DOCUMENTS, ADD FACTORY TESTING
REQUIREMENT, ADVISE DO NOT USE WHEELS IN HAZARDOUS EXHAUST, ADD
SOURCE QUALITY CONTROL SECTION, AND MISC. MINOR IMPROVEMENTS,
ALL AS A RESULT OF FIELD EXPERIENCE. D. KARLE FOR HVAC MTT.*

MAY 2016: REVISED TO ADD INNERGYTECH AND DROP DRI DUE TO DRI NOT BEING ABLE TO COMPLY WITH THE SPECIFICATION. ADDITIONAL MINOR REVISIONS. D. APPEL FOR HVAC MTT. NEVER ISSUED AS MASTER.

DECEMBER 2016: UPDATED TO DROP MOTORS AS A RELATED SECTION TO ALLOW WHEEL MFR.S TO SUPPLY SPECIALTY MOTORS THAT ALLOW SLOW ROTATION OF THE ENERGY WHEEL WHEN DRIVEN BY VFD. ALSO TO POST THE APPEL MAY 2016 CHANGES THAT HAD NEVER BEEN ISSUED AS A MASTER SPEC. D. KARLE FOR HVAC MTT.

DIVISION 23

SECTION 237213 - ROTARY AIR-TO-AIR ENERGY RECOVERY WHEELS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including Standard General Conditions, Supplemental General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT.

B. Related Sections:

1. Section 018113: Sustainable Design Requirements.
2. Section 019100/019110: Facilities Commissioning
3. Section 220500: Common Work Results for Mechanical
4. Section 220514A: Variable Frequency Drives (Constant Torque)
5. Section 237323: Custom Air Handling Units
6. Section 237324: Semi Custom Air Handling Units
7. Section 230900: Mechanical Systems Controls
8. Section 230593: Testing, Adjusting and Balancing
9. Division 26: Electrical

1.2 SUMMARY

- A. Products specified in this section include the following:
1. Desiccant coated rotary air-to-air heat exchangers for the recovery of sensible and latent energy.
 2. Rotary air-to-air heat exchangers for the recovery of sensible energy.

1.3 SUBMITTALS

- A. Product Data: For each energy recovery wheel indicated, provide the following:

1. Complete performance data including sensible, latent and total effectiveness as well as pressure drops, cross-leakage (EATR & OACF) at scheduled conditions using an AHRI certified software shall be provided. In the case of unbalanced airflows (supply/return), the wheel manufacturer shall confirm that the energy recovery wheel meets the ASHRAE 90.1 minimum 50% Enthalpy Recovery Ratio.
2. AHRI component official certificates shall be provided to confirm model number, certification software name and version.
3. Motor ratings, manufacturer, electrical characteristics, and motor accessories.
4. Belt, gear reducer, coupling, and tensioner, or direct drive data.
5. Identify the minimum and maximum rotor speed and the design frequency of the variable frequency drive associated with each speed. A minimum of 80:1 speed ratio shall be achieved by the motor/VFD package. To ensure constant torque operation, VFD's shall be used in vector mode. Volt-Frequency (V/f) mode shall be avoided for its limited low speed performance.
6. Rotation detection device
7. Certified bearing calculations demonstrating that air handler quality minimum L-10 200,000 hour rotor bearings will be provided.
8. Materials, gages and anti-corrosion finish data.

B. Shop Drawings:

1. Project specific drawings with dimensions of each wheel assembly.

ASHRAE 84 DATA WILL PROVIDE DATA CLOSE TO OR AT PROJECT DESIGN CONDITIONS V. EXTRAPOLATED DATA BASED UPON AHRI CERTIFICATION AND THEREFORE IT IS IMPORTANT TO REQUIRE ASHRAE 84 DATA TO ASSURE WHEEL PERFORMANCE.

- C. Submit AHRI Certification sheet for each specific wheel model proposed. Also submit independent testing in accordance with the full ASHRAE Standard 84 requirements showing, as required, recovery efficiencies at 400 to 1000 ft/min in 100 cfm increments and for flow ratios from 1.0 to 0.5 in 0.1 ratio increments.

CROSS CONTAMINATION DATA IS REQUIRED IF THE WHEEL IS TO BE USED FOR A LABORATORY. IF NOT USED IN A LAB APPLICATION, DELETE THE BELOW PARAGRAPH.

- D. Using the design static pressure values, the official AHRI 1060 performance data shall not exceed the limits of ASHRAE 62.1 for air class 1, 2 or 3. For projects requiring lower EATR values (less than 5%), the energy recovery wheel certified data shall not exceed the maximum value.
- E. The wheel media shall not promote the growth of mold or bacteria. Official test results per AATCC30 (mold) & ISO 846c (bacteria) shall be provided upon request.
- F. Installation, operation, and maintenance manuals.

1.4 MAINTENANCE MATERIAL SUBMITTALS

- A. Spare parts to be provided (belt driven wheels only):
 - 1. One spare rotor belt.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. AHRI 1060 - Performance Rating for Air-to-Air Exchangers for Energy Recovery Ventilation Equipment
 - 2. ASHRAE Standard 111 Measurement, Testing, Adjusting and Balancing of Building Heating, Ventilation and Air-Conditioning Systems
 - 3. ASHRAE 62.1 - Ventilation for Acceptable Indoor Air Quality
 - 4. ASHRAE 84 - Method of Testing Air-to-Air Heat/Energy Exchangers
 - 5. NFPA 90A - Standard for the Installation of Air Conditioning and Ventilating Systems
 - 6. ASTM E84 - Standard Test Method of Surface Burning Characteristics of Building Materials
 - 7. UL 1812 - Standard for Ducted Heat Recovery Ventilators
 - 8. NFPA 70 - National Electric Code.
 - 9. AFBMA 9 - Load Ratings and Fatigue Life for Ball Bearings.
 - 10. NEMA MG-1 - National Electrical Manufacturers Association Motor Standards.
 - 11. SMACNA - HVAC Duct Construction Standards- Metal and Flexible
 - 12. AABC - National Standards for Field Measurement and Instrumentation - Total System Balance", Current Volume and Supplements
 - 13. NEBB - Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems

1.6 DELIVERY, STORAGE AND HANDLING

- A. Ship all components in weather-proof wrap for storage outdoors. Protect wheels, housings, control panels, and any other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.

1.7 WARRANTY

- A. Provide a complete warranty for **parts and labor** for a minimum of **ten** years from the date of Substantial Completion. Exception: Belts shall be warranted 1 year.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturers:

1. Semco LLC
2. Innergytech Inc

2.2 ENTHALPY ENERGY RECOVERY WHEELS

A. General

ROTARY AIR-TO-AIR HEAT EXCHANGERS SHOULD NOT BE USED IN HAZARDOUS EXHAUST SYSTEMS.

THIS SPECIFICATION IS WRITTEN ASSUMING THE ENERGY RECOVERY WHEEL WILL BE INSTALLED IN AN AIR HANDLER/ENERGY RECOVERY UNIT, AND THEREFORE ACCESS DOORS WILL BE PROVIDED ON ALL FOUR SIDES OF THE WHEEL PER THE SPECIFICATION FOR THAT EQUIPMENT. IF THE WHEEL IS TO BE INSTALLED IN DUCTWORK, THE DESIGNER MUST DESIGNATE ACCESS DOORS OR PANELS UPSTREAM AND DOWNSTREAM OF BOTH SIDES OF THE WHEEL TO PERMIT ACCESS.

FAN LOCATIONS SHOULD BE CAREFULLY SELECTED TO CREATE A POSITIVE PRESSURE DIFFERENTIAL AT THE WHEEL (HIGHER STATIC ON THE SUPPLY VS RETURN SIDE).

1. The recovery wheel assembly shall be furnished in an air handler casing. Recovery wheel casing construction and performance shall match that of the associated air handler/energy recovery unit of which the recovery wheel is a component.
2. Recovery wheel manufacturer shall provide a complete sequence of operation to allow the Owner's Direct Digital Control System to provide proper recovery wheel control. The sequence shall include how motors speed is to be adjusted to optimize heat recovery, the minimum and maximum motor frequency/speed, summer/winter change-over, economizer mode, and defrost control.

B. Performance

1. The energy recovery wheel manufacturer must participate in the AHRI certification program, and the energy recovery wheel performance submitted must come from AHRI certified selection software. The recovery wheel shall bear the AHRI Certification Seal and be UL 1812 listed.
2. The submitted performance data must meet or exceed both the sensible and latent performance requirements indicated on the project equipment schedule. The pressure loss data must be no greater than indicated on the project equipment schedule.
3. The recovery wheel shall meet NFPA 90A requirements for flame spread and smoke generation when tested per ASTM E84.

4. The manufacturer shall guarantee that the performance requirements stated below and scheduled on the project drawings will be met by the recovery wheel as installed at the project site, when tested per ASHRAE Standard 84 and AHRI STANDARD 1060. The manufacturer similarly guarantees all Application Ratings submitted for review. The Owner reserves the right to field verify that the performance requirements and Application Ratings were met by testing in accordance with ASHRAE Standard 84/AHRI STANDARD 1060, utilizing an independent testing agency. The Owner may also field verify seal leakage and purge volume at the actual wheel pressure differentials by measurement and calculation, utilizing NEBB or AABC air flow measurement procedures. The Owner has exclusive right to select the testing agency. Recovery wheels found deficient of any performance requirement shall be corrected and retested by the manufacturer (utilizing the testing agency that performed the original tests) without additional cost to the Owner until all the requirements are achieved.
5. The Exhaust Air Transfer Ratio (EATR) shall be less than 1 percent at the scheduled air flow and pressure conditions. The purge volume required to achieve this EATR shall not exceed the purge volume indicated by the scheduled air flows.

THE BELOW PARAGRAPH REQUIRES THAT LESS THAN 10% LEAKAGE OCCUR FROM THE EXHAUST TO THE SUPPLY SIDE OF THE RECOVERY WHEEL WITH THE PURGE SET TO ZERO. ASHRAE 62.1-2010 PERMITS UP TO 10% LEAKAGE OF AIR THAT IT DEFINES AS CLASS 2, FOR EXAMPLE TOILET EXHAUST. THIS ALLOWS THE RECOVERY WHEEL TO BE USED IN CLASS 2 AIR WITHOUT THE NEED FOR PURGE AIR, WHICH WASTES ENERGY AND REQUIRES THAT APPLICABLE AIR HANDLING UNIT FANS BE OVERSIZED TO ACCOMMODATE THE PURGE. HOWEVER, THE DESIGNER NEEDS TO WEIGH ANY DISADVANTAGES THAT MAY OCCUR IF THE PURGE SECTOR IS SET TO ZERO. FOR LOW RISK APPLICATIONS INVOLVING CLASS 2 AIR, DESIGNERS SHOULD STRONGLY CONSIDER SPECIFYING THAT THE PURGE BE SET TO ZERO. FOR HIGH RISK APPLICATIONS SUCH AS HOSPITAL AND LABORATORY GENERAL EXHAUST A PURGE ANGLE SHOULD BE SET. ALSO NOTE THAT THE WORDING BELOW "RECIRCULATION FROM LEAKAGE, CARRYOVER, OR TRANSFER FROM THE EXHAUST SIDE SHALL NOT EXCEED 10.0 PERCENT OF THE OUTDOOR INTAKE FLOW" IS TAKEN FROM ASHRAE 62.1 AND SHOULD NOT BE MODIFIED INDISCRIMINATELY.

6. With the adjustable purge sector set to zero degrees (zero purge), recirculation from leakage, carryover, or transfer from the exhaust side shall not exceed 10.0 percent of the outdoor intake flow at a differential pressure between the supply and exhaust/return air streams at the recovery wheel location of up to 12 inches water column.

C. Rotor Media:

FOR CORROSIVE SERVICE A MORE ROBUST COATING THAN MFR.'S STANDARD ANTI-CORROSION COATING MAY BE APPROPRIATE. CONTACT MFR. FOR OPTIONS.

1. The heat transfer substrate shall be constructed of aluminum formed into a honeycomb media structure. Non-metallic substrates made from paper, plastic, synthetic or glass fiber media are not acceptable.

2. The faces of the substrate surfaces shall have an anti-corrosion and anti-microbial coating.
3. The faces of the recovery wheel shall be sealed with a two part acid resistant coating that limits surface oxidation.
4. Dry particles up to 800 microns shall pass freely through the media.
5. The media shall be cleanable with hot water and mild detergent, without degrading the sensible or latent recovery capabilities of the energy recovery wheel system.
6. Desiccant coating:
 - a. All substrate surfaces shall be coated with a non-migrating solid absorbent desiccant layer prior to being formed into the honeycomb.
 - b. The desiccant coating shall be applied to both surfaces of the aluminum substrate.
 - c. The desiccant shall be an inorganic 3Å molecular sieve type certified by the manufacturer to have an internal pore diameter distribution which limits adsorption to materials not larger than the critical diameter of a water molecule (2.8 Å).

DO NOT DELETE EQUAL SENSIBLE AND LATENT PARAGRAPH BELOW. EQUAL SENSIBLE AND LATENT HEAT TRANSFER CAPABILITY ALLOWS THE WHEEL TO OPERATE AT MUCH LOWER TEMPERATURES WITHOUT FROSTING, INCREASING HEAT RECOVERY SAVINGS SIGNIFICANTLY.

- d. Provide official software selection data for the selected unit at the 100% cooling and heating conditions demonstrating that desiccant loading delivers equal sensible and latent heat transfer from the rotor assembly.
- e. An independent test from a credible test laboratory shall document that the desiccant material utilized does not transfer pollutants typically encountered in the indoor environment. The independent test report shall document the ability of the media to limit the transfer of chemical pollutants to within OSHA PEL's for acetaldehyde, isopropyl alcohol, propane, methane, MIBK, methanol and xylene.

THE BELOW SAMPLE LANGUAGE (IN HIDDEN TEXT) FOR AN ANTIMICROBIAL AGENT MAY BE APPROPRIATE FOR HOSPITAL AND OTHER CRITICAL APPLICATIONS. IF REQUIRED, VERIFY WITH WHEEL MFR.S EXACTLY WHAT CAN BE SUPPLIED, THEN REVISE THE BELOW AFTER UN-HIDING THE TEXT.

- f. The media shall be treated with an antimicrobial agent, tested and certified by an independent testing agency for effective antimicrobial action and bacteria-static properties in an energy recovery wheel (or functionally equivalent) application. .

D. Rotor Assembly

FOR CORROSIVE SERVICE A MORE ROBUST COATING THAN MFR.'S STANDARD ANTI-CORROSION COATING MAY BE APPROPRIATE. CONTACT MFR. FOR OPTIONS.

1. Rotor media shall be supported in a spoked rotor-wheel system constructed of an extruded aluminum ring and extruded aluminum spokes and welded or bolted construction. All rotor assembly surfaces shall be coated with an anti-corrosion coating except aluminum and stainless steel components.

2. The rotor media shall be provided in segments to allow for field erection or replacement of one section of media at a time by removal from the rotor face. Provide as many segments as necessary to allow the media segment to be removed through the air handler/energy recovery unit rotor section access door. Media segments shall be compressed in place independent of other segments and shall not be secured with adhesives or silicone.
3. The rotor shall be supported by grease lubricated or lubricated for life air handler quality tapered roller or ball bearings in pillow block housings. The bearings shall be selected to provide a minimum L-10 life of 200,000 hours at maximum operating speed and horsepower. Bearing calculations shall be provided. It shall be possible to replace the bearings without removing the rotor or rotor shaft. Shaft journals shall be machined to proper tolerance as specified by the bearing manufacturer. The Shaft shall be machined to provide a shoulder against the bearings to eliminate any lateral movement of the rotor due to axial bearing loads. When provided, grease fittings shall be easily accessible.
4. The rotor structural support framework shall be aluminum, galvanized or epoxy painted tubular steel, welded construction, and suitably braced for rigging and operation to assure all performance requirements are achieved.
5. The deflection of the entire rotor assembly, as measured at the outer radius for wheels under 10 foot in diameter, shall not exceed 1/32" at the scheduled maximum rotor air pressure drop and at the maximum pressure difference between the exhaust/return and the supply side of the recovery unit.
6. Provide a field adjustable purge sector, factory set. Mark the factory set purge sector position.
7. Rotor seals shall be non-contact multi-pass labyrinth type, secured and field adjustable via an aluminum retainer or stainless steel or aluminum clips, adjustable by means of slots and bolts, and factory set to the rotor manufacturer's specified gap required to achieve the specified leakage values. When subjected to a pressure difference up to 12 in. w.c., the seal system shall be undamaged and shall achieve the specified leakage rates and all other performance requirements when the pressure difference is restored to the design operating range.

E. Rotor Drive System

1. Provide motor, speed reducer, and enclosed/beltless direct drive system or V-belt riding in a groove in the rotor rim to eliminate side-to-side movements and slippage. Provide a spare belt for belt driven wheels.
2. Speed reducers shall be grease lubricated and easily removable from motor.

RE. BELOW PARAGRAPH: A RECOVERY WHEEL THAT CAN'T BE SLOWED ENOUGH RESULTS IN LESS ENERGY SAVINGS BECAUSE IT MUST BE TURNED OFF EARLIER DURING MILD OUTSIDE AIR CONDITIONS TO AVOID OVER-RECOVERY AND OVER-SHOOT OF THE AIR TEMPERATURE SET POINT. THE DESIGNER SHOULD ESTABLISH PROJECT SPECIFIC MINIMUM AND MAXIMUM ROTOR SPEEDS WITH THE WHEEL MFR. AND SCHEDULE BOTH ON THE DRAWINGS. ASSURE THE MINIMUM ROTOR SPEED IS LOW ENOUGH TO ALLOW CONTINUED RECOVERY UNDER FROST AVOIDANCE AND MILD CONDITIONS. A

MODULATING DAMPER IN A BYPASS AROUND THE WHEEL ON THE EXHAUST SIDE MAY BE A BETTER SOLUTION THAN TRYING TO OPERATE THE ROTOR AT VERY LOW SPEED.

3. The motor/speed reducer/belt or direct drive system shall provide smooth control of the rotor speed throughout the minimum and maximum rotor speed range scheduled. The gear reducer motor speed in all cases shall be adjustable between a range of not less than 0.75-60 hertz without motor or speed reducer damage, when operated with a variable frequency drive that complies with Related Section 220514A.
4. Locate the motor and gear reducer in the supply air stream in an easily accessible location.
5. Provide a rotor rotation detection device compatible with the Owner's Building Automation System (BAS) that provides a dry electrical contact that automatically closes when the rotor rotates and automatically opens when the rotor stops. Provide conduit routed from the detection device to the exterior of the air handler to allow connection to Owner's BAS.

F. Variable Frequency Drive

1. Energy recovery wheel manufacturer shall provide a variable frequency drive for variable speed control of the energy recovery wheel. The inverter shall include all digital programming with a manual speed adjustment on the front of the inverter. The drive system shall allow for an energy recovery wheel turndown ratio of 80:1 (20 rpm to 1/4 rpm).
2. Refer to specification section 220514A for further requirements.

2.3 SENSIBLE ENERGY RECOVERY WHEELS

- A. Provide sensible energy recovery wheels matching all the requirements specified for Enthalpy Energy Recovery wheels with the exception that desiccant coating shall not be provided and replaced with phenol-epoxy coated aluminum.

2.4 SOURCE QUALITY CONTROL

- A. Recovery wheels shall be assembled with the respective air handling equipment and factory tested prior to shipping to validate the performance requirements indicated below. Provide all temporary equipment required to perform testing. Correct deficiencies at the factory prior to shipping.
- B. Testing shall comply with ASHRAE Standard 111. Submit proposed test procedure to the University representative for approval, detailing methods, equipment, and techniques to be employed for each specific test. Equipment will not be considered approved until written approval of testing procedures is attained. Testing must also be in accordance with Quality Assurance Standards section.
- C. Tests shall meet the required acceptance criterion without the use of temporary seals.
- D. At the conclusion of factory testing, a formal written report of results shall be submitted to the University Representative for approval.

- E. Factory test the following:
1. Verify that supply, return, and exhaust airflow rates are within the range of 100 percent to 110 percent of the scheduled CFM requirements when operating at scheduled design total static pressure and fan brake horsepower.
 2. Verify that leakage (at the design pressure differentials) between the supply and return/exhaust is less than scheduled. Rotors shall be rotated at maximum speed when taking air flow measurements to determine leakage rates.
 3. Calculate the Outside Air Correction Factor (as defined by AHRI 1060). Variation from design shall be the same allowance permitted by AHRI 1060.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Store units protected from weather, dirt, water, and construction debris, and per manufacturer's recommendations.

3.2 INSTALLATION

- A. Install Energy Recovery Wheel assemblies in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.
- B. Rig units with spreader bars and at adequate lifting points to prevent twisting and bending of the recovery wheel assembly.
- C. Verify the orientation of the purge sector relative to the direction of the supply air stream.
- D. Install rigid card board of plywood over both wheel faces to prevent media damage. Maintain this protection until the point the wheel is started for testing.
- E. Install a complete set of filters of the same quality and efficiency as the specified permanent filters for the project, if the system into which the recovery wheel is installed is to be run for temporary service. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.
- F. The Test and Balance Contractor shall verify purge volumes and adjust the purge sector, if required, to achieve the required purge volumes. Before adjusting the purge sector consult with the wheel manufacturer for adjustment instructions.

3.3 START-UP

- A. Provide a qualified service technician from the Manufacturer's staff to perform recovery wheel start-up, prior to any temporary use. Coordinate start-up of recovery wheel to occur in conjunction with air handler/energy recovery unit start-up. Coordinate visit with Test and Balance contractor. The manufacturer's service technician shall perform the following tasks:

1. Verify correct installation of recovery wheel.
2. Grease bearings, verify motor direction and adjust belt tension if required.
3. Adjust recovery wheel seals.
4. Caulk all energy wheel components at locations recommended by the wheel manufacturer.
5. Verify purge volumes and cross wheel leakage in cooperation with the Test and Balance contractor. Adjust purge and make other corrections to achieve specified unit performance.
6. Perform any other manufacturer's recommended prestart activities.
7. Start-up wheel and verify proper operation. Verify that the rotor drive system when controlled by the variable speed drive operates across the entire speed range without motor, gear reducer, or belt problems.
8. Before leaving premises, provide the Owner's representative a start-up report certifying that all start-up activities were completed and that the energy recovery wheel operates properly.

3.4 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.5 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures, minimum of 1 hour or 30 minutes per unit if multiple units were supplied. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall include belt and rotor seal adjustment, bearing greasing, motor, belt and bearing replacement, media removal, media cleaning methods, and a description of purge sector operation and what position the purge sector should be set at for the project's particular application.
- C. Schedule training with Owner with at least seven (7) days prior notice. Training and start up services are separate functions - training shall not be combined with startup services.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 237323 - CUSTOM AIR HANDLING UNITS

END OF CONTENTS TABLE

DIVISION 23

SECTION 237323 - CUSTOM AIR HANDLING UNITS

REVISED TO REQUIRE CERTAIN PRODUCT DATA W/SUBMITTALS, AND TO ALLOW A SMOOTH FLOOR ILO A CHECKER PLATE FLOOR, ALL PER MECH TECH TEAM. D. KARLE, 7/29/08.

ADDED SPECIFICATION FOR HINGED PRIMARY RACK. MINOR IMPROVEMENTS TO ELECTRICAL AND TEMPERATURE CONTROL WIRING SECTION BY K. BIRRINGER AND D. KARLE, ALL 07/01/09.

REVISED TO ELIMINATE SEALTITE AND FIBERGLASS LIGHT FIXTURES DUE TO NEC CODE CHANGE. CLARIFIED FILTER REQUIREMENTS DURING TEMPORARY USE (3.1.J.) D. KARLE FOR MECH TECH TEAM, 3/26/10.

GENERAL IMPROVEMENT OF CONTENT ARRANGEMENT AND REVISION TO NEW FORMAT, MARCH 2011.

CORRECTED FORMATTING ERROR THAT HAD MADE SOUND TRANSMISSION LOSS DATA IN ARTICLE 2.5 APPLY TO EXTERIOR UNITS ONLY. D. KARLE 1-25-13.

AIR ENTERPRISES AND VENTROL ADDED AS APPROVED 3/26/13, PER HVAC MTT.

REVISED TO ALLOW THINNER ALUMINUM GAUGE FOR ALUMINUM FOAM PANELS PER MTT 7/11/13.

6/2015: REVISED 2.6.F.8 TO INDICATE WHEN COIL VENTS AND DRAINS ARE TO BE EXTENDED TO THE OUTSIDE OF THE CASING. D. KARLE PER HVAC MTT.

8/2015: REVISED TO ADD ASHRAE 111 TO 1.3 AND 2.8, TO ASSURE FACTORY AIR FLOW MEASUREMENTS ARE PERFORMED TO A RECOGNIZED STANDARD. ADDED TO 2.8 THAT FLOW PERFORMANCE DURING FACTORY TESTING MUST BE ACHIEVED AT SCHEDULED FAN BRAKE HP. D. KARLE PER HVAC MTT.

10/2015: ADD INGENIA TECHNOLOGIES AS APPROVED MFR. D. KARLE PER HVAC MTT.

PART 1 - GENERAL

REVISE CAREFULLY IF SPECIFICATION IS TO BE USED FOR PREPURCHASE; TO SPECIFY WHO PROVIDES FILTERS FOR THE AIR HANDLER IF IT WILL BE USED FOR TEMPORARY SERVICE. IT IS SUGGESTED THAT THE AIR HANDLER SUPPLIER PROVIDE ONE SET OF FILTERS, AND THE MECHANICAL CONTRACTOR RUNNING THE UNIT DURING TEMPORARY SERVICE PROVIDE THE ADDITIONAL FILTER SETS, SINCE IT IS UNKNOWN HOW MAY FILTER SETS WILL BE REQUIRED DURING TEMPORARY OPERATION. THIS SECTION SPECIFIES FILTERS SUPPLIED IN THIS MANNER (PER PART 2, MFR. SUPPLIES FILTERS WITH UNIT. PER PART 3, UNIT MUST BE TURNED OVER WITH NEW FILTERS).

THIS SPEC CANNOT BE USED STAND-ALONE FOR AIR HANDLERS! THE RELATED SPEC SECTIONS LISTED IN PART 1 MUST BE INCLUDED IN THE PROJECT SPEC BOOK TO PROVIDE THE COMPLETE REQUIREMENTS. HOWEVER, INFO IN THIS SECTION IS COMPLEMENTARY TO THOSE RELATED SECTIONS; THEREFORE DO NOT DELETE, FOR EXAMPLE INFO IN THIS SECTION REGARDING COILS, DRAIN PANS, FILTERS, ETC.

1.1

1.1 SUMMARY

A. Section Includes:

1. Custom built-up supply and return/exhaust air handling units.
2. Factory and field testing of custom air handling units.

1.2 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

B. Related Sections:

1. Section 220500: Common Work Results for Mechanical.
2. Section 220513: Motors.
3. Section 220548: Vibration Control
4. Section 238216: Coils and Drain Pans
5. Section 233400: Fans
6. Section 234000: HVAC Air Cleaning Devices.
7. Section 233300: Air Duct Accessories and RGDs
8. Section 230900: Mechanical Systems Control
9. Section 230593: Testing, Adjusting, and Balancing.
10. Division 26: Electrical.

1.3 QUALITY ASSURANCE

A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.

1. ANSI/AHRI Standard 430 - Performance Rating of Central Station Air-Handling Units.
2. ANSI/AHRI Standard 260 - Sound Rating of Ducted Air Moving and Conditioning Equipment.
3. ASHRAE Standard 111 - Measurement, Testing, Adjusting and Balancing of Building Heating, Ventilation and Air-Conditioning Systems
4. NFPA 70 - National Electric Code.

5. NFPA 90A - Standard for the Installation of Air-Conditioning and Ventilating Systems

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Manufacturer shall provide shipping protection to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.
- B. Support coil headers independently during transport to prevent potential damage from vibration.
- C. Restrain fans and other components to prevent damage during shipping.

1.5 ADMINISTRATIVE REQUIREMENTS

- A. Provide a qualified service technician from the Manufacturer's staff to supervise installation and reconnection of unit sections and to perform start-up, testing and training as detailed in part 3.

1.6 SUBMITTALS

- A. Submit the following product data for approval, for each unit:
 1. Overall unit dimensions, weight, and center of gravity.
 2. Ductwork connections including sizes, locations, and methods of connecting to mating ductwork.
 3. Piping connections including size, material types, and dimensioned locations for each service.
 4. Detail methods of sealing inner and outer walls at locations of pipe penetrations.
 5. Locations and sizes of access doors.
 6. Details of access door handles, latching mechanisms, hinges, and vision panels.
 7. Locations of interior light fixtures and light switches.
 8. Locations of electric power convenience receptacles.
 9. Dimensions, weights and centers of gravity for each section when units will be shipped in multiple sections.
 10. Cabinet material, metal thickness, finishes, insulation and accessories.
 11. Details of vibration isolation bases including selections for vibration isolation springs.
 12. Details of fan discharge flexible duct connector where required.
 13. Details of motor and belt guards.
 14. Motor ratings, electrical characteristics, and motor accessories.
 15. Sound power data for the entire air-handling unit for each octave band at the following locations: At unit inlet, at unit discharge, and transmitted sound.
 16. Factory testing procedure.
 17. Factory test results.
 18. Field test results.

REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Buffalo Air Handling.
 - 2. TMI Custom Air Systems.
 - 3. Nortek Air Solutions - Governair Division.
 - 4. Mafna Air Conditioning, Inc.
 - 5. Air Flow Equipment.
 - 6. Air Enterprises
 - 7. Nortek Air Solutions - Ventrol Division.
 - 8. Ingenia Technologies
 - 9. ClimateCraft
 - 10. Johnson Controls Inc/York - York Custom

2.2 GENERAL

- A. Provide factory fabricated, double-wall air handling units with components and equipment as scheduled and detailed on Drawings.
- B. Components shall be fabricated in major sections at the Manufacturer's factory and shall carry the Manufacturer's nameplate. Sections, after having framework completely installed on their base structures, shall be final assembled at factory into one-piece for testing and to ensure that sections will fit together properly when reassembled in the field.
- C. Provide units of height, width, and length indicated, and that comply with project weight and spatial limitations.
 - 1. Weight, spatial, and dimensional limitations shall also apply to individual sections, including to facilitate unit rigging and installation.
- D. Provide a minimum of four lifting lugs per separately shipped section, of adequate strength to allow rigging without damage.
- E. Manufacturer shall supply gasketing, sealant, and installation instructions.
- F. Manufacturer shall provide touch-up paint(s) for use after field assembly.
- G. Touch up all galvanized surfaces damaged from welding or other fabrication operations with zinc rich paint, minimum 65 percent metallic zinc by weight.

2.3 COMPONENTS- GENERAL REQUIREMENTS

- A. Provide all components integral to the air handling unit including, but not limited to, the following. These components shall comply with Related Sections and any additional requirements of this Section.

EDIT THESE ITEMS FOR EACH PROJECT

- 1. Motors
- 2. Vibration Isolation
- 3. Coils and Drain Pans
- 4. Fans and Accessories
- 5. Air Filters
- 6. Sheet Metal Accessories
- 7. Dampers (as specified in Controls section)
- 8. Energy Recovery Wheels/Heat Exchangers
- 9. Sound Attenuators

2.4 MANUFACTURING

- A. Casings shall be manufactured only after panel components (structural members, facing sheets and insulation) have been thoroughly cleaned of mill grease, dirt and oxidation.
 - 1. Interior and exterior of panel system shall be thoroughly protected from contamination from the manufacturing process through start-up procedures and acceptance.
 - 2. Internal components (fans, coils, air filter frames, equipment and piping) shall arrive from their respective manufacturing facilities free of grease and dirt.
- B. In general, products such as sealants and gaskets, used within the unit, shall be non-petroleum based products, with no outgassing characteristics.
- C. Equip, prepare, identify and match-mark individual shipping sections so that field reassembly and installation can be performed without reworking, interchanging, adjusting, springing, drilling new bolt holes, etc. All supplemental supplies necessary to assemble the unit shall be provided by the Manufacturer.

2.5 UNIT HOUSING

- A. Performance
 - 1. Maximum U-Value: 0.07
 - a. Minimum insulation density (fiber glass): 3 lbs/sq. ft.
 - 2. Under normal operating conditions there shall be no condensation on the exterior at 100 deg F db/74 deg F wb ambient.
 - 3. Maximum deflection of walls shall be L/250 at plus or minus 10 in. w.c. (L = span in inches.).
 - 4. Maximum deflection of roof and floor shall be L/250 at design loading. (L = span in inches).
 - a. Minimum floor design load: 150 lbs/sq. ft.
 - b. Minimum roof design load: 75 lbs/sq. ft. plus snow load for exterior unit.
 - 5. Outdoor design conditions
 - a. Minimum wind load: 120 mph.

- b. Minimum snow load: 50 lbs/sq. ft., or per applicable codes, whichever is greater.

REVISE SOUND TRANSMISSION LOSS DATA BELOW AS NECESSARY TO MEET PROJECT PERFORMANCE REQUIREMENTS, THE BELOW IS A GENERAL GUIDELINE. ALSO FILL IN 64 AND 8000 HZ OCTAVE BANDS WHEN THESE FREQUENCIES ARE IMPORTANT TO PROJECT PERFORMANCE REQUIREMENTS.

6. Minimum sound transmission loss

Octave Band (Hz)	DB Reduction
--XX	
	30
--250	42
--500	40
--1000	46
--2000	53
--4000	52
--8000	

B. Construction

1. Materials

- a. Exterior of unit: Galvanized steel (G-90), aluminum, or stainless steel
 b. Interior of unit: Solid galvanized steel (G-90) or aluminum

2. Minimum Panel Thickness: 4 inches. Minimum 2-inch panel construction with a foam insulation core that meets all the requirements of this specification, including sound transmission loss, is also permitted. Foam insulation shall be UL Class 1 rated.

3. Minimum Gauge: The following are minimum gauges. Heavier gauges may be required to meet the performance deflections and/or sound transmission loss specified, or to allow for proper welding:

- a. Roof interior and exterior: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels).
 b. Wall interior and exterior: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels).
 c. Floor interior: steel 10 gauge smooth or 1/8" checker plate or aluminum 1/8" checker plate.
 d. Floor exterior (bottom/underliner): steel 20 gauge or aluminum 0.063" (0.040" aluminum for foam core insulated panels).
 e. Partition walls: steel 16 ga. or aluminum 0.09" (0.040" aluminum for foam core insulated panels)
 f. Safing at cooling coils: stainless steel 18 ga. or aluminum 0.071".
 g. Safing all other: steel 18 ga. or aluminum 0.071".

4. Openings and penetrations

- a. On any piping subject to sweating, including condensate drains, piping penetrations shall be sleeved.
 1) Sleeve shall extend fully from interior to exterior of unit.
 2) Sleeve shall be continuously welded or seamless, rolled (round), and sealed airtight to unit.

- 3) Provide rubber grommet or similar mechanical seal on unit interior and exterior to seal between sleeve and piping.
 - b. All non-sweating piping or conduit penetrations shall be sealed airtight with rubber grommet or similar mechanical seal.
 - c. At openings, cover exposed edges of insulation with structural steel angles and seal edges.
 - d. Protect exposed fastener ends with plastic caps.
 - e. Floor penetrations shall incorporate a minimum 1 in. high waterproof dam fabricated of steel angle iron or equivalent, seal welded to floor.
 - f. For units located outside, no penetrations shall be made through the roof.
5. For units located outside, slope roof to prevent standing water.
 6. Unit shipping sections shall be fabricated to have air and water tight connections. Seals between sections shall consist of 1/4 in. thick by minimum 1-1/2 in. wide neoprene gaskets and continuous caulking on contact surfaces.

C. Floor/Base Frame

1. Floor shall be continuously welded between mating sections and along wall edges to form a watertight surface. Watertight floor shall not be used as part of a coil drain pan system. Provide sleeves for any piping penetrating the unit; if through the floor, continuously weld to waterproof the floor.
2. Floor shall be min. 4 in. thick, insulated with 3-lb./cu. ft. density fiberglass (or 4 in. of U.L. Class 1 foam insulation of equivalent or better R-value), sealed airtight in place by solid galvanized or aluminum underliner.
3. Fabricate base frame of welded structural steel or aluminum members as required to accommodate drain outlet height requirements for proper drain pan trapping, and around the entire unit and under major internal equipment such that all components are completely supported by the factory installed base frame.

D. Ductwork Connections

1. Provide flanged connections with flanges extending a minimum of 2 in. past the outside wall of the unit.
2. For fans discharging directly at the unit casing, provide flexible duct connector internal to the unit.

E. Paint

1. Prior to assembly, prime coat all non-galvanized ferrous metal parts with two coats of lead-free prime paint.
 - a. Quick-drying, rust-inhibitive, alkyd-based primer; total dry film thickness of not less than 1.3 mils.
 - b. Paint: Benjamin Moore IronClad Alkyd Low Luster Metal and Wood Enamel C163, or equivalent.
2. For interior units, finish paint the same surfaces with two coats of enamel paint of a different color.
 - a. Low-luster (eggshell), acrylic-latex, interior enamel; total dry film thickness of not less than 2.6 mils.
 - b. Paint: Benjamin Moore Super Spec Latex Eggshell Enamel 274 or equivalent.

3. For exterior units, finish paint the same surfaces with two coats of enamel paint of a different color.
 - a. Semi-gloss, alkyd, exterior enamel; total dry film thickness of not less than 2.6 mils.
 - b. Paint: Benjamin Moore IronClad Alkyd Low Luster Metal and Wood Enamel 163 or equivalent.
4. Prepare surfaces per paint manufacturer's recommendations before painting.

F. Sealants:

1. Provide sealant that is non-toxic, including outgassing during curing period.
2. Sealant shall be warranted to maintain the leak-test performance for 25 years.

G. Access Doors and Panels

1. Access doors and panels shall be of same construction as unit housing, including insulation.
2. Doors shall be minimum 24 in. wide. Provide doors that are the full height of the unit, maximum 6' high.
3. Each access door and panel shall be equipped with continuous gaskets and shall fit in the door frame in a manner to guarantee the same leakage criteria as the unit casing.
4. Each access door shall be mounted with stainless steel, cast aluminum, or fiberglass reinforced nylon (Klima-flex or similar) hinges and hardware. Provide a minimum of two handles per door, operable from either side.
5. Access doors in positive pressure sections shall open inward. Access doors in negative pressure sections shall open outward.
6. Each door shall contain a non-fogging thermal window of double pane safety glass. Coordinate height of window with housekeeping pads, base frame and isolators to ensure that location is at approximate eye level when standing outside of unit. Each window shall be a minimum 12 in. by 12 in., properly sealed to prevent condensation and to operate safely against positive or negative pressure.
7. Each access door shall have a built-in static pressure probe port.
 - a. Ventlock Model 699 by Ventfabrics, Inc.
8. Removable access panels shall be provided in unit sections where components contained are larger than door opening and where access to components for cleaning and maintenance is required.

H. Outside and exhaust air openings

1. Outside air and exhaust openings shall be furnished with 25 mesh, galvanized steel or aluminum bird screen. Rain hood velocities shall not exceed 1,000 FPM.

***SELECT BELOW IN COORDINATION WITH ARCHITECTURAL SPECIFICATIONS.
ENSURE LOUVERS ARE NOT SPECIFIED IN ARCHITECTURAL DIVISIONS.
DELETE THIS PARAGRAPH IF LOUVERS ARE SPECIFIED BY THE ARCHITECT.***

I. Louvers

1. Provide louvers as shown and scheduled on Drawings. Louver airstream shall not entrain water or snow.

2. Louvers shall be self-draining.

2.6 COMPONENTS

MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER. AVOID MIXING BOXES WHICH ALMOST ALWAYS RESULT IN STRATIFICATION (FREEZE STAT TRIPPING) PROBLEMS.

A. Mixing Box Section

1. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.
2. Outside and exhaust air openings shall not be on the same side of the unit in order to minimize recirculation, if air is exhausted at the unit.

B. Dampers

1. Provide dampers as specified in Related Section Mechanical Systems Controls.
2. In addition to the requirements in Mechanical Systems Controls, dampers designated as smoke dampers shall be labeled in accordance with the latest editions of UL 555S.

C. Filters

1. Provide filters and filter gauges of types as shown and scheduled on Drawings and as specified in Related Section.
2. Provide hinged primary filter frames where indicated, complying to the following:
 - a. Primary filters shall be mounted on vertically hinged non-racking frames that are completely independent of the secondary filter frame. Frames shall swing away from the secondary filter frame in a door-like manner to allow secondary filter removal without removing the primary filters.
 - b. Provide multiple hinged frames. Primary filter frames shall be no wider than 2 ft. Frames shall swing out on an arc of 90 degrees, or to the degree required to allow the secondary filters to be easily removed, whichever is greater.
 - c. Frame hinges shall be continuous piano type.
 - d. The primary filter frames shall be supported by galvanized structural steel support members. Arrange frame and support system relative to the secondary filters to provide a gap long enough to allow accurate measurement of static pressure between the two filter types with a static pressure tap.
 - e. Frames shall be gasketed on all four sides. Provide spring type tension fasteners and latching system to lock and seal the hinged frames to the support members. Lock system shall be operable without tools.
 - f. Primary filter frame and support system shall meet or exceed all of the performance requirements of the Related Section "Air Filters." Provide all accessories required by that section.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 237323 - - 9

BLENDERS ARE NOT PREFERRED. MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER TO AVOID THE NEED FOR BLENDEES WHICH HAVE GENERALLY PROVEN TO BE INEFFECTIVE. SEE RELATED DESIGN GUIDELINE. IF BLENDEES MUST BE USED, CHANGE BELOW HIDDEN TEXT TO VISIBLE TEXT.

D. Blender Assembly

1. Blender assemblies shall be welded, rigid, vibration and deflection free, and adjustable; designed to impart a counter-rotational mixing to the air stream, producing a minimum standard deviation through a plane parallel with the blenders between entering air streams.
2. Mixing performance: Constant from 500 fpm to 2500 fpm blender velocity.
3. Minimum mixing effectiveness: 80 percent and plus or minus 5 deg F standard deviation when mixing 30 percent outdoor air and 70 percent return air at 50 degrees F inlet temperature differential. Capable of acceptable performance throughout entire operating range of unit, including system turndown.
4. Acceptable Manufacturers:
 - a. RM Products
 - b. Blender Products, Inc.

THE FOLLOWING SPECIFICATION FOR AN AIR TO AIR HEAT EXCHANGER (IN HIDDEN TEXT) IS PROVIDED FOR CONVENIENCE AND SHALL BE EDITED TO BE PROJECT SPECIFIC. "TURN ON" THIS TEXT IF REQUIRED.

E. Air-to-Air Heat Exchanger Section

1. Minimum capacities shall be as scheduled on the Drawings.
2. Heat exchanger shall be furnished as an integral part of the overall air-handling unit.
3. Heat exchanger shall be a cross-flow, fixed-plate exchanger with a diamond-shaped cross section. Plates shall be fabricated of aluminum and formed with profiles that maximize heat transfer and minimize pressure loss. Frames shall be constructed of galvanized steel and/or aluminum. Configuration shall allow for access and cleaning of each of the air pathways.
4. Furnish the heat exchanger with bypass dampers and a bypass air pathway to allow for the automatic prevention of frost formation on the plates. Provide dampers as specified in the Related Section "Mechanical Systems Controls".
5. Casing for the heat exchanger shall be constructed to the standards indicated elsewhere in this section for the overall air-handling unit. Provide baffle plates to seal and separate the two air streams from each other. Provide condensate drain pan(s) in compliance with Related Section, beneath the heat exchanger media.
6. Provide the air handling unit a total of 4 access sections at the inlet and discharge of each air path. Each access section shall be furnished with an access door.

F. Coils and drain pans

1. Provide preheat, energy recovery, heating, cooling coils and associated drain pans as shown and scheduled on Drawings and as specified in Related Sections.

2. Provide drain pans and drain connections for the following sections: cooling coils, humidifiers, and energy-recovery coils or wheels.
3. All coil assemblies shall be safed on top and bottom and at all coil splits.
4. Drain pans shall be sloped in a minimum of 2 planes to eliminate standing water and shall be stainless steel construction. Drain pans shall be constructed of adequate downstream length to collect any condensate that blows off the coil at air velocities up to the design air flow rate or 500 FPM, whichever is greater.
5. Insulate drains pans, including intermediate drain pans, to prevent sweating.

COILS MUST BE REMOVABLE VIA COIL TRACKS OR TROLLEY BEAMS. UM'S PREFERENCE IS COIL TRACKS SINCE IT IS DIFFICULT TO REMOVE THE TOP COIL IN A STACK WITH TROLLEY BEAMS. THEREFORE TROLLEY BEAMS ARE NOT MENTIONED BELOW. IF YOUR APPLICATION REQUIRES TROLLEY BEAMS, EDIT THE BELOW SECTION ACCORDINGLY.

6. Each coil section shall be removable without disruption to other unit components or coils. Fasten coil assemblies with bolts or screws; per manufacturer's recommendations, (welds or rivets are not acceptable). Provide coil tracks in assembly frame for removal of coil assemblies from housing.
7. Provide an individual access panel for each (stacked) coil section, to allow removal of a coil section without disrupting operation of coil sections located above or below the section being serviced. Example: a 3 coil high by 2 coil wide assembly shall have 3 access panels provided per side, for a total of 6.
8. Extend coil connections to the outside of the air handling unit casing to allow field connections. Extend vents and drains to the outside of the casing only when there is inadequate space inside the air handler to install them in a location that permits operation, including connection of a garden hose.
9. Label coil inlet, outlet, vent and drain piping connections with labels applied outside the casing. Vent or drain valves located inside units shall have labels inside the unit.

DIFFUSER PLATES ARE NOT PREFERRED. IT IS THE ENGINEER'S RESPONSIBILITY TO CONSIDER POSSIBLE STRATIFICATION ISSUES. USE DIFFUSER PLATE ONLY WHEN OTHER SOLUTIONS ARE NOT ACCEPTABLE.

G. Diffuser Plate

1. If air velocity across the cooling coil varies by more than 15 percent, provide a perforated, aluminum, sectionally-removable diffuser plate immediately upstream of the cooling coil section (plus or minus 6 in.). Diffuser plate shall completely cover cooling coil section and shall be rigid, vibration, and deflection free.

THIS SECTION SPECIFIES BACKWARD OR AIR FOIL STYLE FANS WHICH ARE PREFERRED IN MOST CASES. HOWEVER ON SOME SMALL AIR HANDLERS A FORWARD CURVED FAN MAY BE A MORE APPROPRIATE CHOICE, IN WHICH CASE EDIT THE BELOW. ALSO CONSIDER H.2 BELOW: SAFETY CAGES MAY NOT BE NECESSARY OR PRACTICAL FOR SMALL UNITS.

H. Fans and Accessories

1. Provide fans and accessories as shown and scheduled on Drawings and as specified in Related Section. Fans shall be backward inclined or air foil type.

I. Trolley Beams

1. Provide fan sections with trolley beams where shown on the Drawings. Design and fabricate the unit structural members and housing to support the weight of the trolley beam fully loaded with the weight of the fan motor, trolley hoist, and chain. Trolley beams shall be centered on access doors or on removable component access panels, which shall be centered on fan motor or component. Beams shall be mounted to the ceiling and shall extend continuously from interior wall to interior wall. Trolley hoists and chain shall be provided "by others" in the future as needed.

J. Sound Attenuators

1. Provide sound attenuators where shown integral to air handling unit, as scheduled on Drawings and as specified in Related Section.

AIR HANDLERS ARE NOT SPECIFIED TO BE EQUIPPED WITH DISCONNECTS. DISCONNECTS ARE NOT TYPICALLY REQUIRED FOR FANS DRIVEN BY VFDS; SEE DESIGN GUIDELINE 220514 FOR MORE INFO. FOR FANS NOT DRIVEN BY VFDS, REQUIRE THE ELECTRICAL ENGINEER TO INDICATE A DISCONNECT. DISCONNECTS SHALL BE MOUNTED OUTSIDE FAN CASINGS.

2.7 ELECTRICAL AND TEMPERATURE CONTROL WIRING

1. Provide a junction box on the outside of the fan section casing for single point connection of external power wiring to each unit fan motor.
2. Provide EMT metal conduits and wiring between the junction boxes and the motor(s). Final connections to motors shall be 1/2 in. minimum flexible metal conduit with steel fittings.
3. For each unit section that has an access door, provide a minimum of one 120V vapor proof marine light with an LED lamp suitable for use in enclosed fixtures.
4. Provide a single light switch with red pilot light adjacent to the latch side of the fan section door. This switch shall activate all internal lights in the air handler. Pilot light shall be "on" when associated light fixture is "on". Provide one weatherproof, GFCI duplex convenience receptacle mounted centrally on the outside of unit, on the side with the most doors.
5. Provide a junction box on the outside of the unit for single point connection of external power wiring to the unit's lights and receptacle. Provide EMT conduit and wiring between the junction box, switches, associated lights and receptacle. Provide flexible conduit "whips" with wiring at section splits, for reconnection of the lighting circuit by the Electrical Contractor after sections are assembled.
6. Provide all electrical components in accordance with NFPA 70 (NEC) and Division 26 requirements. Indoor electrical enclosures shall be rated NEMA 1. Outdoor electrical enclosures shall be rated NEMA 3R.
7. Power and temperature control wiring shall be run in conduit.

- a. Run power and control wire in separate conduits.

2.8 SOURCE QUALITY CONTROL

- A. Assemble and factory test each unit prior to shipping. Correct deficiencies in unit performance at the factory prior to shipping. University representatives shall witness testing and shall be notified of factory testing dates at least four (4) weeks in advance. Associated travel expenses for witnessing tests shall be paid for by the University.
- B. Testing shall comply with ASHRAE Standard 111. Submit proposed test procedure to the University representative for approval, detailing methods, equipment, and techniques to be employed for each specific test. Equipment will not be considered approved until written approval of testing procedures is attained. Testing must also be in accordance with Quality Assurance Standards section.
- C. At the conclusion of factory testing, a formal written report of results shall be submitted to the University Representative for approval.
- D. Factory test each air handling unit as follows:
 - 1. Verify that the airflow rate is within the range of 100 percent to 110 percent of scheduled CFM requirements when operating at scheduled design total static pressure and fan brake horsepower.
 - 2. Airflow measuring devices shall be installed in ducts returning to or leaving the unit. These devices shall be installed per manufacturer's recommendations. External static pressure to the unit shall be simulated using a combination of ducts and dampers and must be equal to or greater than the scheduled external static pressure. Tests shall prove design airflow and static capability of the assembled unit.
 - 3. Perform leakage tests to validate that the unit casing leakage is less than 1/2 percent of the scheduled design airflow (CFM) at 10 in. w.c.
 - a. Positive Pressure Test: Duct openings in the positive pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
 - b. Negative Pressure Test: Duct openings in the negative pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
 - 4. Both the leakage and the airflow tests shall meet the required acceptance criterion without the use of temporary sealant at any permanent panel joints. Temporary sealing methods identical to those applied in field shall be used at the shipping splits to simulate "as installed" conditions.

5. Sound Test: System sound levels shall be measured at eight (8) octave bands at the scheduled design operating conditions. Airborne sound levels at openings shall be read in the test ductwork 5 ft. from openings. Transmitted sound levels shall be read 5 ft. from outside of fan sections or components, on all sides and on top.
 - a. Readings shall be taken at all outside, return, exhaust and supply air openings.
6. Amp draw, HP and RPM readings shall be measured for each motor at scheduled design operating conditions.

PART 3 - EXECUTION

3.1

3.1 INSTALLATION

- A. Use spreader bars with lifting cables and hoist sections from lifting lugs, to prevent cable damage to sections.
- B. Rig individual sections under direct supervision of Unit Manufacturer's Representative.
- C. Install on concrete housekeeping pad. Coordinate final pad size and location in field.
- D. When indicated, install units on steel supports. Coordinate final location and placement of steel supports and ductwork connections in field.
- E. Secure the unit to the housekeeping pad or steel supports with suitable anchors bolted through the unit's base rail. Prior to anchoring, level unit in all directions with stainless steel shims.
- F. Shipping splits requiring field reconnection shall be made under the direct supervision of unit Manufacturer's Representative. Provide labor to reconnect utilities, piping, conduits and sheet metal sections of the unit. Openings to ductwork and piping shall remain protected and covered until unit assembly. Immediately after unit assembly, restore all factory protection. Maintain protection after assembly until just prior to final acceptance by Owner.
- G. Make piping and duct connections, install filters and unit accessories, and complete all work required to place the unit into service. Connect vents and drains to non-ferrous coil headers with bronze or brass fittings.

MFR. START-UP SERVICE IS NOT GENERALLY NECESSARY EXCEPT FOR UNITS OF NEW DESIGN OR OF PARTICULAR COMPLEXITY. THEREFORE, THE PARAGRAPH BELOW SHOULD NORMALLY BE DELETED. IF START-UP SERVICES ARE REQUIRED, PROVIDE EXPANDED DETAIL REGARDING WHAT IS TO BE PERFORMED BY THE MFR.'S TECHNICIAN.

3.2 START-UP

- A. Provide a qualified service technician from the Manufacturer's staff to perform unit start-up. This start-up service shall be provided prior to commissioning activities, and prior to any temporary use.

3.3 TEMPORARY USE OF AIR HANDLING UNITS

- A. Thoroughly clean unit of all grease, dirt, dust, etc.
- B. Prior to placement into temporary service:
 - 1. Perform manufacturer's pre-start protocol.
 - 2. Perform commissioning activities.
- C. Perform all manufacturer's required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store log at unit during temporary use period and include log as part of the final O&M manual.
- D. While operating the air handler for temporary use, install a complete set of filters in the air handling unit of the same quality and efficiency as the specified permanent filters for the project.

BELOW PARAGRAPH REQUIRES MINIMUM MERV 8 FILTERS TO PROTECT DUCT WORK DURING CONSTRUCTION, WHICH MATCHES LEED REQUIREMENTS AND IS RECOMMENDED FOR NON-LEED PROJECTS AS WELL.

SOME SPECIALTY INSTALLATIONS (E.G. CLEAN ROOM OR CLEAN-ROOM-LIKE SPACES) MAY REQUIRE THAT TEMPORARY DUCTWORK FILTERS BE EQUIVALENT TO SECONDARY FILTER PERFORMANCE. IF THAT IS THE CASE, REVISE BELOW ACCORDINGLY.

- E. Provide temporary filters, minimum MERV 8, to protect all ductwork and building contents when unit is operated during construction. Filters shall have an equal or better performance rating than primary filters specified for permanent use in order to prevent construction dirt infiltration into the air handling unit systems.
- F. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.

3.4 FIELD QUALITY CONTROL

- A. Units shall undergo air and water balance and vibration testing per Related Section Testing, Adjusting and Balancing.
- B. Each unit shall be field tested. Deficiencies related to manufacture or installation shall be corrected without cost to Owner.
 - 1. The unit Manufacturer shall correct and pay for the repair of deficiencies found during testing, except for leaks found at unit section joints, which shall be the responsibility of the Contractor to repair.

BE AWARE THAT THE MANUFACTURER WILL HAVE PROVIDED A UNIT THAT PASSED THE FOLLOWING TEST PROCEDURE IN THE FACTORY. ASSUMING THE UNIT IS ACCEPTED ON SITE BY THE CONTRACTOR WITH NO SHIPPING DAMAGE, RESPONSIBILITY FOR ANY DEFICIENCIES FOUND DURING FIELD TESTING WILL LIKELY FALL TO THE INSTALLING CONTRACTOR.

- 2. Perform leakage tests after reassembly of unit sections to validate that the unit casing leakage is less than 1/2 percent of the scheduled design air flow (CFM) at 10 in. w.c.

- a. Positive Pressure Test: Duct openings in the positive pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
- b. Negative Pressure Test: Duct openings in the negative pressure section shall be sealed. The CFM of the test fan shall be read using an approved airflow measuring device. When the static pressure developed by the test fan reaches 10 in., the fan CFM shall be read and this CFM shall be considered the casing leakage.
- c. At the conclusion of field tests, a formal written report of results shall be submitted to the University Representative for approval.

INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

3.5 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.6 ADJUSTING, CLEANING, PROTECTION

- A. After unit has completed any temporary service and just prior to final acceptance by Owner, contractor shall:
 - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts, and perform manufacturer's pre-start protocol
 - 2. Install a new, complete set of filters.
 - 3. Perform all commissioning activities, even if previously performed to ready for temporary service.
 - 4. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight.
 - 5. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

MFR. TRAINING SERVICE IS NOT GENERALLY NECESSARY EXCEPT FOR UNITS OF NEW DESIGN OR OF PARTICULAR COMPLEXITY. THEREFORE, THE PARAGRAPHS BELOW SHOULD NORMALLY BE DELETED. IF TRAINING SERVICES ARE REQUIRED, PROVIDE EXPANDED DETAIL REGARDING WHAT IS TO BE COVERED DURING TRAINING. .

3.7 OWNER TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures, minimum of 2 hours or 1 hour per unit if multiple units were supplied. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.

- C. Schedule training with Owner through the Project Construction Manager with at least seven (7) days prior notice. Training and start up services are separate functions - training shall not be combined with startup services.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 237324 - SEMI-CUSTOM AIR HANDLING UNITS

END OF CONTENTS TABLE

DIVISION 23

SECTION 237324 - SEMI-CUSTOM AIR HANDLING UNITS

REVISED NAME FROM "MODULAR" TO "SEMI-CUSTOM" AIR HANDLING UNITS AT THE REQUEST OF THE HVAC/CONTROLS GROUP. D. KARLE 4/14/08.

REVISED TO REQUIRE CERTAIN PRODUCT DATA W/SUBMITTALS, AND AIR-TO-AIR HX SPEC., ALL PER MECH TECH TEAM. D. KARLE, 7/29/08.

MINOR IMPROVEMENTS TO ELECTRICAL AND TEMPERATURE CONTROL WIRING SECTION BY K. BIRRINGER AND D. KARLE, 7/1/09

REMOVED REFERENCE TO AHRI 410, WHICH IS COVERED IN 238216. D. KARLE FOR MECH TECH TEAM 9/11/09.

REVISED TO ELIMINATE SEALTITE AND FIBERGLASS LIGHT FIXTURES DUE TO NEC CODE CHANGE. CLARIFIED FILTER REQUIREMENTS DURING TEMPORARY USE. D. KARLE FOR MECH TECH TEAM, 3/26/10.

GENERAL IMPROVEMENT OF CONTENT ARRANGEMENT AND REVISION TO NEW FORMAT, MARCH 2011.

THERMAL CORP AND VENTROL ADDED AS APPROVED 3/26/13, PER HVAC MTT.

8/2015: ADDED SPEC EDITORS NOTE UNDER PART 1 REGARDING ENERGY WHEELS. D. KARLE PER HVAC MTT.

11/2015: ADDED INGENIA AS APPROVED MFR. D. KARLE PER HVAC MTT.

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Air handling units of semi-custom construction consisting of modular sections.

AIR HANDLERS COVERED BY THIS SPECIFICATION ARE NON-CUSTOM TYPE FOR LIGHT TO MEDIUM DUTY USE.

REVISE CAREFULLY IF SPECIFICATION IS TO BE USED FOR PREPURCHASE; TO SPECIFY WHO PROVIDES FILTERS FOR THE AIR HANDLER IF IT WILL BE USED FOR TEMPORARY SERVICE. IT IS SUGGESTED THAT THE AIR HANDLER SUPPLIER PROVIDE ONE SET OF FILTERS, AND THE MECHANICAL CONTRACTOR RUNNING THE UNIT DURING TEMPORARY SERVICE PROVIDE THE ADDITIONAL FILTER SETS, SINCE IT IS UNKNOWN HOW MANY FILTER SETS WILL BE REQUIRED DURING TEMPORARY OPERATION. THIS SECTION SPECIFIES FILTERS SUPPLIED IN THIS MANNER (PER PART 2, MFR. SUPPLIES FILTERS WITH UNIT. PER PART 3, UNIT MUST BE TURNED OVER WITH NEW FILTERS).

THIS SPEC CANNOT BE USED STAND-ALONE FOR AIR HANDLERS! THE RELATED SPEC SECTIONS LISTED IN PART 1 MUST BE INCLUDED IN THE

PROJECT SPEC BOOK TO PROVIDE THE COMPLETE REQUIREMENTS. HOWEVER, INFO IN THIS SECTION IS COMPLEMENTARY TO THOSE RELATED SECTIONS; THEREFORE DO NOT DELETE, FOR EXAMPLE INFO IN THIS SECTION REGARDING COILS, DRAIN PANS, FILTERS, ETC.

U-M HAS EXPERIENCED ONGOING ISSUES WITH LEAKAGE BETWEEN SUPPLY AND EXHAUST AIR STREAMS ON AIR HANDLERS EQUIPPED WITH ROTARY AIR-TO-AIR ENERGY RECOVERY WHEELS (HIGHER THAN PREDICTED BY MFR.S). THEREFORE IT IS GENERALLY RECOMMENDED THAT AIR HANDLERS EQUIPPED WITH THESE DEVICES BE SPECIFIED AS CUSTOM AIR HANDLERS SO THAT THE UNITS ARE FACTORY TESTED. IF SEMI-CUSTOM AIR HANDLERS ARE TO BE SPECIFIED WITH THESE DEVICES, THE DESIGNER SHOULD CONSIDER ADDING FACTORY TESTING (WHICH CAN BE COPIED FROM THE CUSTOM AHU SPEC) TO THIS SECTION.

1.2 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 220500: Common Work Results for Mechanical.
 - 2. Section 220513: Motors.
 - 3. Section 220548: Vibration Control
 - 4. Section 238216: Coils and Drain Pans
 - 5. Section 233400: Fans
 - 6. Section 234000: HVAC Air Cleaning Devices
 - 7. Section 233300: Air Duct Accessories and RGDs
 - 8. Section 230900: Mechanical Systems Control
 - 9. Section 230593: Testing, Adjusting, and Balancing.
 - 10. Division 26: Electrical.

1.3 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - 1. ANSI/AHRI Standard 430. Performance Rating of Central Station Air-Handling Units.
 - 2. AHRI Standard 260- Sound Rating of Ducted Air Moving and Conditioning Equipment.
 - 3. NFPA 70 National Electric Code.
 - 4. NFPA 90A: Standard for the Installation of Air-Conditioning and Ventilating Systems

1.4 DELIVERY, STORAGE, AND HANDLING

- A. Manufacturer shall provide shipping protection to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings shall be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.
- B. Support coil headers independently during transport to prevent potential damage from vibration.
- C. Restrain fans and other components to prevent damage during shipping.

1.5 SUBMITTALS

- A. For each unit, submit for approval, the following product data:
 - 1. Overall unit dimensions, weight, and center of gravity.
 - 2. Ductwork connections including sizes, locations, and methods of connecting to mating ductwork.
 - 3. Piping connections including size, material types, and dimensioned locations for each service.
 - 4. Detail methods of sealing inner and outer walls at locations of pipe penetrations.
 - 5. Locations and sizes of access doors.
 - 6. Details of access door handles, latching mechanisms, hinges, and vision panels.
 - 7. Locations of interior light fixtures and light switches.
 - 8. Locations of electric power convenience receptacles.
 - 9. Dimensions, weights and centers of gravity for each section when units will be shipped in multiple sections.
 - 10. Cabinet material, metal thickness, finishes, insulation and accessories.
 - 11. Details of vibration isolation bases including selections for vibration isolation springs.
 - 12. Details of fan discharge flexible duct connector where required.
 - 13. Details of motor and belt guards.
 - 14. Motor mfg., ratings, electrical characteristics, and motor accessories.
 - 15. Sound power level data per AHRI Standard 260.

REVISE WARRANTY PER PROJECT. LONGER WARRANTY PERIOD MAY BE APPROPRIATE FOR CERTAIN TYPES OF WORK. INCLUDE THIS ARTICLE IN EVERY SPECIFICATION SECTION.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:

1. Buffalo Air Handling.
2. TMI Custom Air Systems.
3. Nortek Air Solutions - Governair Division.
4. Mafna Air Conditioning, Inc.
5. Air Flow Equipment.
6. Daikin Applied
7. Thermal Corporation
8. Nortek Air Solutions - Ventrol Division
9. Ingenia
10. Jonson Controls Inc/York - Solution XTI (Indoor), Solution XTO (Outdoor)

2.2 GENERAL

- A. Provide factory fabricated, double-wall air handling units with components and equipment as scheduled and detailed on Drawings.
- B. Components shall be fabricated in major sections at the Manufacturer's factory and shall carry the Manufacturer's nameplate.
- C. Provide units of height, width, and length indicated, and that comply with project weight and spatial limitations.
 1. Weight, spatial, and dimensional limitations shall also apply to individual sections, including facilitate unit rigging and installation.
- D. Provide a minimum of four lifting lugs per separately shipped section, of adequate strength to allow rigging without damage.
- E. Manufacturer shall supply gasketing, sealant, and installation instructions.
- F. Manufacturer shall provide touch-up paint(s) for use after field assembly.
- G. Touch up all galvanized surfaces damaged from welding or other fabrication operations with zinc rich paint, minimum 65 percent metallic zinc by weight.

2.3 COMPONENTS- GENERAL REQUIREMENTS

- A. Provide all components integral to the air handling unit including, but not limited to, the following. These components shall comply with Related Sections and any additional requirements of this Section.

EDIT THESE ITEMS FOR EACH PROJECT

1. Motors
2. Vibration Isolation
3. Coils and Drain Pans
4. Fans and Accessories
5. Air Filters
6. Sheet Metal Accessories
7. Dampers (as specified in Controls section)
8. Energy Recovery Wheels/Heat Exchangers
9. Sound Attenuators

2.4 MANUFACTURING

- A. Casings shall be manufactured only after panel components (structural members, facing sheets and insulation) have been thoroughly cleaned of mill grease, dirt and oxidation.
 - 1. Interior and exterior of panel system shall be thoroughly protected from contamination from the manufacturing process through start-up procedures and acceptance.
 - 2. Internal components (fans, coils, air filter frames, equipment and piping) shall arrive from their respective manufacturing facilities free of grease and dirt.
- B. In general, products such as sealants and gaskets, used within the unit, shall be non-petroleum based products, with no outgassing characteristics.
- C. Equip, prepare, identify and match-mark individual shipping sections so that field reassembly and installation can be performed without reworking, interchanging, adjusting, springing, drilling new bolt holes, etc. All supplemental supplies necessary to assemble the unit shall be provided by the Manufacturer.

2.5 UNIT HOUSING

- A. Maximum Casing Leakage (inclusive of all components):
 - 1. Shall not exceed 1 percent of the scheduled design air flow at 6 in. wg positive or 4 in. wg negative static pressure, or:
 - 2. 1 percent of the scheduled design air flow at the scheduled casing pressure ratings, when such ratings are scheduled.
- B. Construction
 - 1. The unit shall be constructed of modules with a complete frame with removable side and bottom panels. Frame-less construction with removable panels for coil and fan access may also be supplied. For either type construction, removal of panels shall not affect the structural integrity of the unit.
 - 2. The unit shall be equipped with a base rail or similar support structure so that the bottom of the unit does not rest directly on the housekeeping pad or floor. The base rail/supports shall be designed to allow the unit to be leveled with shims and anchored to the pad or floor.
 - 3. Minimum wall panel thickness shall be 2 in.

IF CONDITIONS WARRANT, SELECT THE SPECIFIC CASING MATERIAL BY EDITING B.4, OTHERWISE THE MFG. MAY PROVIDE ANY OF THE 3 LISTED.

 - 4. Interior and exterior casing shall be G-90 galvanized steel, aluminum, stainless steel, or as scheduled.
 - 5. The casing shall be able to withstand up to 6 in. wg positive or 4 in. wg negative static pressure, or as scheduled.
 - 6. Maximum deflection of walls, floors, and roof shall be L/250 (L = span in inches.), under the following conditions:
 - a. Wall deflection maximums are at 6 in. wg positive or 4 in. wg negative static pressure, or at scheduled pressures. .
 - b. Floor deflection maximum: 150 lbs. /sq. ft.
 - c. Roof deflection maximum: 75 lbs/sq. ft. plus snow load
 - 7. Outdoor design conditions:
 - a. Minimum wind load: 120 mph.

- b. Minimum snow load: 50 lbs/sq ft or per code, whichever is greater.
- 8. Modules shall be factory-insulated. Insulate walls, roof, and entire bottom, including below drain pans. Insulation and insulation adhesive shall comply with NFPA-90A requirements for flame spread and smoke generation and be rated UL Class 1. Insulation adhesive shall be UL-listed.

SELECT EITHER SOLID (B.9) OR PERFORATED (B.10) INNER WALL. AVOID PERFORATED WALLS WHENEVER POSSIBLE.

- 9. Module panels shall be of double-wall construction to facilitate cleaning of the unit interior. The interior wall shall be solid. Fiberglass insulation shall be 3 lbs./cu.ft. density. Insulation thermal resistance R shall be a minimum of 8.33 ft²•h•°F/Btu.
 - 10. Module panels shall be of double wall construction, fabricated from solid wall at cooling coils and humidifiers with the balance of the inner wall perforated to enhance acoustical performance. Foam insulation shall not be used behind perforated panels. Configure perforation spacing and hole size to prevent insulation breakaway, flake off, or delamination when tested at 9,000 fpm, in accordance with UL Standard 181. Thermal resistance R shall be 8.33 ft²•h•°F/Btu.
- C. Ductwork Connections
- 1. Provide flanged connections with flanges extending a minimum of 2 in. past the outside wall of the unit.
- D. Roof
- 1. For units located inside, roof performance shall match all panel performance requirements.
 - 2. For units located outside, no penetrations shall be made through roof. Slope roof to prevent standing water.
- E. Paint
- 1. Prior to assembly, paint all non-galvanized ferrous metal parts with two coats of lead-free rust-inhibitive, alkyd-based primer paint.
 - 2. For exterior units, paint exterior surfaces with two coats of alkyd exterior enamel paint. Properly prepare all surfaces prior to painting according to paint manufacturer's instructions.
- F. Access Doors and Panels
- 1. Access doors and panels shall be of same construction as unit housing, including insulation.
 - 2. Doors shall be minimum 18 in. wide, 24 in. wide is preferred, or widths as indicated on drawings. Provide doors that are the full height of the unit, maximum 6ft. high.
 - 3. Each access door and panel shall be equipped with continuous gaskets and shall fit in the door frame in a manner to guarantee the unit's specified leakage criteria.

4. Indoor unit hinges and hardware shall be galvanized, stainless steel, aluminum, or fiberglass reinforced nylon (Klima-flex or similar). Outdoor unit hardware shall be stainless steel, aluminum, or fiberglass reinforced nylon (Klima-flex or similar). At least 2 handles per door, operable from either side, shall be provided.
5. Access doors in positive pressure sections shall open inward. Access doors in negative pressure sections shall open outward.

STRIKE THE FOLLOWING IF DOOR WINDOWS ARE NOT TO BE PROVIDED.

6. Unless otherwise noted, each door shall contain a safety glass window. Provide double pane non-fogging thermal windows downstream of cooling coils, single or double pane non-fogging type elsewhere. Each window shall be a minimum 6 in. by 6 in. properly sealed to prevent leakage and condensation, and be able to operate safely against the unit's positive and negative pressure capabilities.
7. Removable access panels shall be provided in unit sections where components contained are larger than the respective access module door opening.

G. Outside and exhaust air openings

1. Outside air and exhaust openings shall be furnished with 25 mesh, galvanized bird screen. Rain hood velocities shall not exceed 1000 FPM.

2.6 COMPONENTS

SELECT LOUVERS IN COORDINATION WITH ARCHITECT. ENSURE LOUVERS ARE NOT ALREADY SPECIFIED IN ARCH DIVISIONS. DELETE THE PARAGRAPH BELOW IF LOUVERS ARE SPECIFIED BY THE ARCHITECT.

A. Louvers

1. Provide louvers as shown and scheduled on drawings. Louver airstream shall not entrain water or snow.
2. Louvers shall be self-draining.

MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER. AVOID MIXING BOXES WHICH ALMOST ALWAYS RESULT IN STRATIFICATION (FREEZE STAT TRIPPING) PROBLEMS.

B. Mixing Box Section

1. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.

C. Face and Bypass Modules

1. Face and bypass modules shall be provided as shown on the drawings.
2. Bypass shall be the external type, routed to a factory fabricated opening located downstream of all coils. The pressure drop through the bypass shall be equal to the pressure drop through the coils.
3. Dampers shall be opposed blade at the coil and either opposed or parallel blade at the bypass. Dampers shall be mechanically linked together.

4. Damper construction shall be per the Related Section.

D. Dampers

1. Provide dampers as specified in Related Section Mechanical Systems Controls.
2. In addition to the requirements in Mechanical Systems Controls, dampers designated as smoke dampers shall be labeled in accordance with the latest editions of UL 555S.

E. Sound Attenuators

1. Provide sound attenuators where shown integral to air handling unit, as scheduled on Drawings and as specified in Related Section.

F. Filters

1. Provide filters and filter gauges of types as shown and scheduled on drawings and as specified in Related Section.

BLENDERS ARE NOT PREFERRED. MIXING OF OUTSIDE AIR AND RETURN AIR STREAMS SHOULD OCCUR OUTSIDE THE AIR HANDLER TO AVOID THE NEED FOR BLENDEES WHICH HAVE GENERALLY PROVEN TO BE INEFFECTIVE.

G. Blender Assembly

1. Blender assemblies shall be welded, rigid, vibration and deflection free, and adjustable; designed to impart a counter-rotational mixing to the air stream, producing a minimum standard deviation through a plane parallel with the blenders between entering air streams.
2. Mixing performance: Constant from 500 fpm to 2,500 fpm blender velocity.
3. Minimum mixing effectiveness: 80percent and +/- 5 deg F standard deviation when mixing 30percent outdoor air/70percent return air at 50 deg F inlet temperature differential. Capable of acceptable performance throughout entire operating range of unit, including system turndown.
4. Blender material shall be the same as the casing interior material.
5. Acceptable Manufacturers:
 - a. RM Products
 - b. Blender Products, Inc.

THE FOLLOWING SPECIFICATION FOR AN AIR TO AIR HEAT EXCHANGER (IN HIDDEN TEXT) IS PROVIDED FOR CONVENIENCE AND SHALL BE EDITED TO BE PROJECT SPECIFIC. "TURN ON" THIS TEXT IF REQUIRED.

H. Air-to-Air Heat Exchanger Section

1. Minimum capacities shall be as scheduled on the Drawings.
2. Heat exchanger shall be furnished as an integral part of the overall air-handling unit.
3. Heat exchanger shall be a cross-flow, fixed-plate exchanger with a diamond-shaped cross section. Plates shall be fabricated of aluminum and formed with profiles that maximize heat transfer and minimize pressure loss. Frames shall be constructed of galvanized steel and/or aluminum. Configuration shall allow for access and cleaning of each of the air pathways.

4. Furnish the heat exchanger with bypass dampers and a bypass air pathway to allow for the automatic prevention of frost formation on the plates. Provide dampers as specified in the Related Section "Mechanical Systems Controls".
5. Casing for the heat exchanger shall be constructed to the standards indicated elsewhere in this section for the overall air-handling unit. Provide baffle plates to seal and separate the two air streams from each other. Provide condensate drain pan(s) in compliance with Related Section, beneath the heat exchanger media.
6. Provide the air handling unit a total of 4 access sections at the inlet and discharge of each air path. Each access section shall be furnished with an access door.

I. Coils and drain pans

1. Provide preheat, energy recovery, heating, cooling coils and associated drain pans as shown and scheduled on Drawings and as specified in Related Sections.
2. Provide drain pans and drain connections for the following sections: cooling coils, humidifiers, and energy-recovery coils or wheels.
3. All coil assemblies shall be safed on top and bottom and at all coil splits.
4. Drain pans shall be sloped in a minimum of 2 planes to eliminate standing water and shall be stainless steel construction. Drain pans shall be constructed of adequate downstream length to collect any condensate that blows off the coil at air velocities up to the design air flow rate or 500 FPM, whichever is greater.
5. Insulate drains pans, including intermediate drain pans, to prevent sweating.
6. All coil assemblies shall be removable without disruption to other unit components or coils. Fasten coil assemblies with bolts or screws per manufacturer's recommendations (welds or rivets are not acceptable).
7. Extend coil connections, vents and drains to the outside of the air handling unit casing to allow field connections.
8. Label coil inlet, outlet, vent and drain piping connections with labels applied outside the casing.

J. Diffuser Modules:

1. A diffuser module shall be provided immediately downstream of the fan module on blow through units. The diffuser shall provide equal air distribution to components immediately downstream of the diffuser. Diffusers shall be made of G90 galvanized steel, stainless steel, or aluminum.

THIS SECTION SPECIFIES BACKWARD OR AIR FOIL STYLE FANS WHICH ARE PREFERRED IN MOST CASES. HOWEVER ON SOME SMALL AIR HANDLERS A FORWARD CURVED FAN MAY BE A MORE APPROPRIATE CHOICE, IN WHICH CASE EDIT THE BELOW.

K. Fans and Accessories

1. Provide fans and accessories as shown and scheduled on drawings and as specified in Related Section. Fans shall be backward inclined or air foil type.

2. Isolate the fan from the unit casing by flexible duct connection(s) and a spring isolation base

THIS SECTION REQUIRES ACCESS SECTIONS BE PROVIDED TO ALLOW BOTH UP AND DOWNSTREAM ACCESS TO EVERY MODULE COMPONENT. THE DESIGNER MUST ACCOMMODATE THESE ACCESS SECTIONS WHEN FITTING UNITS INTO THE AVAILABLE SPACE.

- L. Access/Inspection Sections: Modules shall include an access section complete with a double-wall door. Access sections shall be provided to allow up and down stream access to every module component.

CONSIDER MOISTURE ELIMINATORS WHEN LESS THAN IDEAL CONDITIONS EXIST AT OUTSIDE AIR INTAKES OR HUMIDIFIERS.

- M. Moisture Eliminator Module

1. A module consisting of a vertically mounted, maintenance-free moisture eliminator shall be provided. The moisture eliminator shall consist of "sine-wave" fins or stainless steel mesh for effective moisture removal.
2. Moisture eliminators shall be made of stainless steel or aluminum, of rigid construction, and be vibration and deflection free.

AIR HANDLERS ARE NOT SPECIFIED TO BE EQUIPPED WITH DISCONNECTS. DISCONNECTS ARE NOT TYPICALLY REQUIRED FOR FANS DRIVEN BY VFDS; SEE DESIGN GUIDELINE 220514 FOR MORE INFO. FOR FANS NOT DRIVEN BY VFD'S, REQUIRE THE ELECTRICAL ENGINEER TO INDICATE A DISCONNECT. DISCONNECTS SHALL BE MOUNTED OUTSIDE FAN CASINGS.

- N. Electrical and Temperature Control Wiring

1. Provide a junction box on the outside of the fan section casing for single point connection of external power wiring to each unit fan motor.
2. Provide EMT and flexible metal conduits and wiring between the junction boxes and the motor(s). Final connections to motors shall be 1/2" minimum flexible metal conduit with steel fittings.
3. For each unit section that has an access door, provide a minimum of one 120V vapor-proof marine light with an LED lamp suitable for use in enclosed fixtures.
4. Provide a single light switch with red pilot light adjacent to the latch side of the fan section door to control all of the unit's lights. Pilot light shall be "on" when associated light fixture is "on."
5. Provide a junction box on the outside of the unit for single point connection of external power wiring to the unit's lights. Provide EMT conduit and wiring between the junction box, switch, and associated lights. Provide flexible conduit "whips" with wiring at section splits, for reconnection of the lighting circuit by the Electrical Contractor after sections are assembled.
6. Provide all electrical components in accordance with NFPA 70 (NEC) and Division 26 requirements. Indoor electrical enclosures shall be rated NEMA 1. Electrical enclosures located outdoors shall have a NEMA 3R rating.

7. All electrical and temperature control wiring shall be run in conduit.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Use spreader bars with lifting cables and hoist sections from lifting lugs, to prevent cable damage to sections.
- B. Install on concrete housekeeping pad. Coordinate final pad size and location in field
- C. When indicated, install units on steel supports. Coordinate final location and placement of steel supports and ductwork connections in field
- D. Secure the unit to the floor or housekeeping pad with suitable anchors bolted through the unit's base rail or support feet. Prior to anchoring, level unit in all directions with stainless steel shims.
- E. Openings to ductwork and piping shall remain protected and covered until just prior to connection of utilities, or unit assembly. Immediately after unit assembly, restore all factory protection. Maintain protection after assembly until just prior to final acceptance by Owner.
- F. Make piping and duct connections, install filters and unit accessories, and complete all work required to place the unit into service

3.2 TEMPORARY USE OF AIR HANDLING UNITS

- A. Thoroughly clean unit of all grease, dirt, dust, etc.
- B. Prior to placement into temporary service:
 1. Perform manufacturer's pre-start protocol.
 2. Perform commissioning activities.
- C. Perform all manufacturer's required routine maintenance procedures during temporary service. Continuously maintain a log of such procedures. Store log at unit during temporary use period and include log as part of the final O&M manual.
- D. While operating the air handler for temporary use, install a complete set of filters in the air handling unit of the same quality and efficiency as the specified permanent filters for the project.

BELOW PARAGRAPH REQUIRES MINIMUM MERV 8 FILTERS TO PROTECT DUCT WORK DURING CONSTRUCTION, WHICH MATCHES LEED REQUIREMENTS AND IS RECOMMENDED FOR NON-LEED PROJECTS AS WELL.

SOME SPECIALTY INSTALLATIONS (E.G. CLEAN ROOM OR CLEAN-ROOM-LIKE SPACES) MAY REQUIRE THAT TEMPORARY DUCTWORK FILTERS BE EQUIVALENT TO SECONDARY FILTER PERFORMANCE. IF THAT IS THE CASE, REVISE BELOW ACCORDINGLY.

- E. Provide temporary filters, minimum MERV 8, to protect all ductwork and building contents when unit is operated during construction. Filters shall have an equal or better performance rating than primary filters specified for permanent use in order to prevent construction dirt infiltration into the air handling unit systems.
- F. Continuously maintain all filters and replace when pressure drop exceeds 1 inch w.c., or at manufacturer's recommended change-out pressure drop, whichever is lower.

3.3 FIELD QUALITY CONTROL

- A. Units shall undergo air and water balance and vibration testing per Related Section Testing, Adjusting and Balancing.

3.4 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.5 ADJUSTING, CLEANING, PROTECTION

- A. After unit has completed any temporary service and just prior to final acceptance by Owner, contractor shall:
 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts, and perform manufacturer's pre-start protocol
 2. Install a new, complete set of filters.
 3. Perform all commissioning activities, even if previously performed to ready for temporary service.
 4. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight.
 5. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238200 - TERMINAL HEATING UNITS (HOT WATER)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 221113: Piping Materials and Methods.
 - 2. Section 220523: Valves.
 - 3. Section 220513: Motors.
 - 4. Section 220719: Mechanical Systems Insulation.
 - 5. Section 232116: Hydronic Piping Specialties.
 - 6. Section 230900: Mechanical Systems Controls.
 - 7. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes
 - 1. Fan Powered
 - a. Unit Heaters.
 - b. Cabinet Heaters.
 - 2. Fin-tube Radiation.
 - 3. Flat-Pipe Panel Radiators

1.3 SUBMITTALS

- A. Product Data: Include manufacturer, catalog number, catalog illustrations, rated capacities, performance characteristics, weights, conductor insulation and jacket dimensions, component sizes, rough-in requirements, piping and wiring diagrams and details, materials of construction, accessories, operating and maintenance clearance requirements. Wiring diagrams shall be project specific, and differentiate between factory wiring and field wiring. Include shop drawings and fabrication drawings for equipment indicating piping connections, power and utility requirements, rigging, installation and support details and instructions. Include written sequence of operations for all controls. Additionally include:
- B. Submit the following product data for approval:
 - 1. Coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
 - 2. Air filter type, MERV rating and method of replacement.
 - 3. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, mounting or hanging method, and filter and fan motor removal method.

4. Details of motor including type, manufacturer and electrical characteristics.
 5. Wiring Diagrams: Power, disconnect switch, controls, transformer and fan speed control.
 6. Detailed information on fan speed control, including control signal interface.
 7. Octave band and A-weighted sound power data for each unit type at rated capacity, tested per AHRI Standard 350.
 8. Evidence of UL or ETL listing and labeling.
- C. Equipment schedule with the following information for each unit type:
1. Equipment tag.
 2. Model number.
 3. Manufacturer's size designation.
 4. Configuration (floor mount, wall mount, ceiling mount, recessed, suspended).
 5. Number of coils, number of rows for each coil, fin spacing for each coil, airflow rate and motor watts at each fan speed.
- D. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.
- E. Warranty Documentation: Submit warranty documentation according to requirements of Contract Documents.
- F. Fabrication and Shop Drawings
- G. Installation, Operation and Maintenance Manuals

1.4 COORDINATION

- A. Coordinate dimensions and arrangement of cabinet unit heaters and fin tube enclosures with building elements including floor finish, pipe entry location, and wall construction.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 2. National Fire Protection Association (NFPA):
 - a. 90A Standard for the Installation of Air Conditioning and Ventilating Systems.
 - b. National Electrical Code
 3. Underwriters Laboratories, Inc. (UL)
 4. AHRI 210 Standard for Unitary Air-Conditioning Equipment
 5. AHRI 410 Standard for Forced-Circulation Air-Cooling and Air-Heating Coils

6. AMCA Standard 99-0401, "Classification for Spark Resistant Construction".
7. ANSI/AMCA Standard 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data."

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- B. Shipping and Handling Requirements
- C. Packaging and Protection
- D. On-site Storage & Staging
- E. Packaging Waste Management

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 UNIT HEATERS (HOT WATER)

- A. Construct casing of minimum 20 gauge die-formed steel. Casing shall be corrosion resistant, electrostatically applied baked enamel finish. Paint finish shall be lead free and chromate free.
- B. Coil elements and headers are heavy wall drawn seamless copper tubing. Element tubes are brazed into extruded header junctions. Aluminum fins shall have drawn collars to assure permanent bond with expanded element tubes (and exact spacing. Copper tubes shall have minimum (.035") wall thickness. All Element Assemblies shall be submersion tested at factory at minimum 200 psig at 220°F. All coils shall be provided with a manual air vent fitting to allow for coil venting.
- C. Fans shall be aluminum blade, hub type, factory balanced.
- D. Provide hanging brackets to allow unit to be suspended from threaded rod.
- E. Fan guards shall be welded steel, zinc plated or painted, and meet CSA and OSHA requirements. Provide OSHA belt guards with belt driven fans.
- F. Provide unit mounted manual starter toggle switch with thermal overload protection for on/off control of fan.

NOTE TO SPEC WRITER. SELECT ANY REQUIRED FIELD INSTALLED ACCESSORIES BELOW.

- G. Provide the following accessories:
1. Provide adjustable horizontal and vertical discharge louvers for units with horizontal discharge.
 2. Provide an adjustable cone diffuser for projection units with vertical discharge.
 3. Provide remote mounted 115v thermostat
 4. Provide remote mounted 24v thermostat and unit mounted step down transformer.
 5. Provide wire thermostat guard.

NOTE TO SPEC WRITER PROVIDE EXPLOSION PROOF MOTOR BELOW IF REQUIRED.

- H. Provide explosion proof motor.
- I. Manufacturers: Dunham-Bush, McQuay, Modine, Reznor, Rittling, Sterling, Trane, Wing, Vulcan Radiator.

2.2 CABINET UNIT HEATERS (HOT WATER)

- A. Construct front panel of minimum 16 gauge steel and all other panels of minimum 18 gauge steel, fully welded construction. All panels shall be made rigid using formed channels or other strengthening method. Cabinets will be thermally insulated with minimum 1/2" thick closed cell insulation. Provide sound dampening insulation on all front panels. Unit chassis shall be minimum G-60 galvanized or A-40 galvanealed. Casing shall be primed and painted with baked on enamel or polyester powder coated standard finish. All unpainted steel shall be galvanized. Provide ample sized pockets on both sides of cabinet for piping and electrical connections.
- B. Base or legs: Form all vertical surfaces of solid sheet metal, including sides facing the air stream (facing the return air/air filter opening); open construction is not permissible.
- C. Provide closed cell insulation on all surfaces exposed to air stream.
- D. For all concealed and recessed horizontal cabinets with vertical air discharge, provide hinged access panel flush with front panel, with tamperproof fasteners and safety chain.
- E. Provide centrifugal, forward-curved, and double width aluminum fan wheels sized to meet scheduled airflow requirements. Fan housing shall be constructed of galvanized sheet metal. Fan assembly and motor shall be easily removed from unit.
- F. Motors shall be direct drive, ECM (electronically commutated motor) with manual speed adjustment, integral thermal overload protection with a maximum ambient operating temperature of 104 F and are permanently lubricated. Motors shall be capable of starting at 78 percent of rated voltage and operating at 90 percent of rated voltage on all speed settings. Motors shall be able to operate up to 10 percent over voltage.

- G. Provide heating coils as scheduled. Heating coils shall be suitable for 200 PSI working pressure with 220°F water. Copper tubes shall have minimum (.035") wall thickness. Coil tube and u-bends shall be copper. Aluminum fins shall be mechanically expanded to the copper tubes. Stub out connections shall be copper. All water coils shall be provided with a manual air vent fitting to allow for coil venting. Provide 1" throwaway pleated filters.
- H. Control sequence
- Coordinate controls requirements for cabinet unit heaters with the Mechanical Systems Controls Drawings and Specifications.

NOTE TO SPEC WRITER. SELECT ANY REQUIRED FIELD INSTALLED ACCESSORIES BELOW.

- I. Provide the following accessories:
1. Electrical Options
 - a. High Static Motor. Used to overcome up to 0.4"W.C. external static pressure.
 - b. Plug-In Motor. Allows removal of motor(s) or fan board without unwiring unit.
 - c. Disconnect Switch. On-Off DPST toggle switch to disconnect electric power (hot and neutral lines) to unit.
 - d. Unit Mounted Return Air Thermostat. Temperature sensing bulb is located in return air stream. Temperature set point range 55° to 90°F. Not for use with inverted air flow arrangements. Normally used with a control.
 2. Piping Options
 - a. 2, 3 & 4 Row High Capacity Coil, for use with water only.
 - b. Right Hand Piping, Left Hand Electrical.
 3. Access Door Options
 - a. Access Doors for Model WCC. Two doors per unit.
 - b. Front Panel Tamper Proof Fasteners with Tool.
 - c. Key Locks on Access Doors. Two locks per unit. Especially valuable for units located in public place, these key locks make unit controls tamperproof.
 - d. Key Locks on Front Panel. Two locks per unit. Especially located in public place, these key locks make unit controls tamperproof.
 4. Air Inlet Options
 - a. Aluminum Bar Grille. Grille replaces louvers. 12 gauge extruded aluminum.
 - b. Arrangement 9 (inverted) where it is located at the top inlet.
 5. Air Outlet Options
 - a. Aluminum Bar Grille. Grille replaces louvers. 12 gauge extruded aluminum.
 - b. Two Way Adjustable Air Deflector Louvers. Cannot be ordered with 2 Row High Capacity Coil.
 - c. 100% Air Outlet Duct Collar. Collar width is 1" and is located at top outlet or bottom outlet on inverted models. Model WCC only.
 6. Miscellaneous Options
 - a. Provide manufacturers color chart for custom color selection by architect.

- J. Manufacturers: Dunham-Bush, McQuay, Modine, Reznor, Rittling, Sterling, Trane, Vulcan Radiator.

2.3 FIN-TUBE RADIATION (HOT WATER)

- A. Provide fin-tube radiation type, size and capacity as scheduled.
- B. Heating Element:
 - 1. Seamless copper tubing mechanically expanded into the fins.
 - 2. Fins shall be constructed of aluminum.
 - 3. Tube ends shall be designed to accept standard domestic copper fittings.
 - 4. Fin-tube shall be rated for not less than 200 psi at 220 deg.
- C. Fin-Tube Enclosures:
 - 1. Provide seamless enclosure of type, style and length scheduled.
 - 2. Enclosure shall be constructed of 16 gauge steel, unless otherwise scheduled, with maximum 10'-0" long sections. Provide slip joint type connectors and clips, of 16 gauge, welded to panel, to minimize the appearance of joints on the exterior of the enclosures. Provide sponge air seal gasket on back of enclosure for wall mounted enclosures.
 - 3. Provide all required enclosure hangers and supports, minimum 16 gauge steel as required for proper installation. Provide stiffening angles where required for reinforcement at all enclosure joints. Provide fin-tube element support brackets, with ball bearing slide cradle, that allows for 2-1/2" lateral movement.
 - 4. Provide all required accessories, valve compartments, end caps, corner bends and end enclosures. Coordinate with construction documents to provide a complete system. Provide a removable section of the enclosure, not less than 12" long and not more than 24" long, at all valve locations for access.
 - 5. Enclosures shall be treated for corrosion resistance and painted with baked on enamel or polyester powder coated standard finish. All unpainted steel shall be galvanized.

Spec Editor Standard stamped grille implied, revised below options as required.

- 6. Provide stamped pencil proof stationary grilles on enclosures inlets and outlets. All access panels shall be tamperproof.
- 7. Provide manually operated damper with visible dial operator where indicated.
- 8. Provide manufacturers color chart for custom color selection by architect.
- D. Manufacturers: Dunham-Bush, Rittling, Slantfin, Sterling Radiator, Trane, Vulcan Radiator.

2.4 FLAT-PIPE PANEL RADIATORS

- A. Description: Provide steel panel radiator elements of lengths and in locations as indicated, and of capacities, style and having accessories as scheduled.

One-piece all-welded steel construction, consisting of flattened water tubes welded to headers at each end. Headers are square with 0.109" minimum wall thickness. Provide headers with supply/return connections of ½" NPT tapered thread (¾" when indicated). Provide header with 1/8" NPT tapered thread vent connection. Provide internal baffling where required for proper water flow. Provide lengths from 2'-0" to 20'-0" minimum in two inch even increments without the need for splicing.

- B. Pressure Rating:
STANDARD: Working pressure-56 PSI max, Test Pressure-74 PSI max
MEDIUM: Working pressure-85 PSI max, Test Pressure-110 PSI max
HIGH: Working pressure-128 PSI max, Test Pressure 184 PSI max
- C. Fins: When style is indicated as finned type the radiator shall include an integral heavy gauge (0.09" minimum) all-welded perforated top grille (omit for curved radiators) and steel corrugated fins spot-welded to the rear side of the water tubes. There shall be no less than 32 fins per foot. Fins shall start within 3" of the headers.
- D. Finish: Gloss powdered coat finish of 2 mils thickness minimum. Provide standard white unless custom color is indicated. Submit color sample.
- E. Warranty: 5 years
- F. Accessories: Provide pipe covers and end caps of same finish. Provide wall mount brackets or floor mount supports based on application.
- G. Manufacturers: Jaga, Runtal Radiator, Sterling, Vulcan Radiator

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Review and examine conditions affecting work. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Commissioning: Review and perform required commissioning activities in the pre-construction phases.

3.2 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
 2. Test unit operation with thermostat in all modes of operation.
 3. Remove and replace malfunctioning units and retest as specified above.

Engineer shall verify that the Mechanical Systems Controls SPECIFICATION DESCRIBES controls start-up for terminal units.

- B. Coordinate controls start-up for terminal units with the Mechanical Systems Controls Specifications.

3.3 HANGER AND SUPPORT INSTALLATION

- A. Comply with applicable SMACNA HVAC Duct Construction Standards and Hanger and Support construction standards, and applicable Division 23 Sections.
- B. Support TU's independently from adjacent ductwork. Ensure supports do not interfere with accessibility of other equipment, e.g., access to TU DDC control enclosure. Do not hang TUs from piping, other ducts or equipment.

3.4 TERMINAL UNIT INSTALLATION

- A. Install TUs in accordance with manufacturer recommendations, Contract Drawings, and reviewed submittals.
- B. Label unit according to the applicable detail.
- C. Position terminal unit, unit-mounted controller and reheat coil to comply with clearance requirements and for ease of maintenance.

3.5 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.6 SYSTEM START-UP

- A. After start-up and operation, coils, sensors and controllers shall be cleaned.

3.7 ADJUSTING, CLEANING, PROTECTION

- A. Protect TU's throughout the entire construction period, until Commissioning and Substantial Completion.

3.8 OWNER TRAINING

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic unit maintenance by demonstrating the following: location of control devices, removal of access panel, filter replacement, relay replacement, and motor replacement.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238216 - COILS AND DRAIN PANS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238216 - COILS AND DRAIN PANS

04/2011 - REVISED FORMAT AND TECHNICAL CONTENT - D. KARLE AND M. PLATT.

11/2015: ADDED VENTROL AS APPROVED MFR. D. KARLE FOR HVAC MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
1. Coils and drain pans for all purposes, unless specified in other specification sections as part of a manufactured unit or assembly.

1.3 SUBMITTALS

- A. Submit the following product data for approval, for each unit.:
1. Certified coil-performance ratings with all system operating conditions indicated.
 2. Coil performance data substantiated by computer generated output data.
 3. Coil materials of construction including headers, frames, and coil tracks, number of rows, fin spacing, fin types, and any heat transfer enhancements.
 4. Details of coil supports for stacked coils.
 5. Details and materials of cooling coil condensate collection drain pans and drain piping.
 6. Coil anti-corrosion coating material data sheets.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
1. AHRI Standard 410 Forced-Circulation Air Cooling and Air Heating Coils.

2. ANSI/ASHRAE Standard 62.1 Ventilation for Acceptable Indoor Air Quality.

1.5 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 1. Trane, a business of Ingersoll Rand
 2. York by Johnson Controls
 3. Daikin Applied
 4. Aerofin
 5. Marlo DRS Technologies, Inc.
 6. Modine - Heatcraft Coils
 7. Precision Coil
 8. USA Coil & Air
 9. Ventrol
 10. Coil Masters
 11. Great American Coils
 12. RAE Coils
 13. Super Radiator Coils

2.2 GENERAL COIL INFORMATION

- A. Coil Tubes: Copper, minimum 5/8 in. diameter, minimum 0.020 in. tube wall thickness.
- B. Coil Fins: Aluminum, plate type, minimum 0.0095 in. thickness.
- C. Coil Header and Connection Materials: Seamless copper with extruded tube holes to permit expansion and contraction without creating undue stress or strain. Copper connections.
- D. Coil Configuration: A maximum of 6 rows (8 rows for hospital projects) and a maximum of 10 fins per in.
- E. Brazed joints.
- F. Fins shall consist of corrugated aluminum plates with full fin collars for accurate spacing and maximum fin/tube contact. Fins shall have no openings punched on them to accumulate lint or dirt. Tubes mechanically expanded into fins to provide a continuous primary to secondary compression bond over the entire finned length for maximum heat transfer rates. Tubes that have been expanded through use of hydraulic methods are not acceptable.
- G. Casing and Tube Supports: Construct with bolt holes for mounting at approximately 8-in. centers. Minimum 16 gauge, reinforced flange type, constructed to support the coil properly without sagging, racking, or stressing coil tubes. Provide heavier gauge casings and additional reinforcement where required to properly support stacked coils.

- H. Coil manufacturer shall select the coil based on the most efficient coil circuiting. All coil circuits shall be of equal pressure drop. All coils shall be counter-flow configuration. Coils shall achieve uniform leaving air temperature across entire coil face. Use of internal restrictive devices to obtain turbulent flow is not acceptable. Coil performance shall be substantiated by computer generated output data.
- I. Circuit coils to facilitate air venting and draining when installed level and plumb, and for service without removing individual plugs from each tube. Provide coils with same end connections, unless indicated otherwise. Provide vent and drain connections on the coil header.
- J. Provide a foam strip seal located between casing channels and fins along top and bottom to prevent air bypass and water carryover.
- K. Factory label inlet, outlet, vent, and drain connections.
- L. Coil inlet, outlet, vent, and drain connections shall not penetrate drain pans. Configure coil and mounting arrangement accordingly.
- M. Provide anti-corrosion coating for coils mounted in corrosive air streams, such as those mounted in lab exhaust heat recovery systems. Provide a coating type that will protect against the specific corrosives in the air stream. Coil coating subject to Owner and Engineer review, approval, or modification.

2.3 WATER COILS

- A. Hot Water Coil Casings: Galvanized steel.
- B. Chilled Water Coil Casings: Stainless steel.
- C. Face velocities across chilled water coils shall not exceed 500 FPM.
- D. Connection Type:
 - 1. Sizes up to and including 2 in.: Soldered, screwed, or flanged type. Give consideration to equipment installation conditions when selecting connection type.
 - 2. Sizes greater than 2 in.: Flanged connections.
- E. Water Coil working pressure and temperature: 200 psig/220 deg. F.

2.4 DIRECT EXPANSION COILS

- A. Face velocities across DX coils shall not exceed 500 FPM.
- B. Dehydrate and seal with a dry nitrogen charge before shipment.
- C. Evaporator coil connections: Male sweat type.
- D. Liquid piping connections: Brass.
- E. Suction piping connections: Copper.
- F. Use interlaced tube configuration in VAV applications.
- G. Direct expansion coil working pressure: 300 psig.

2.5 STEAM COILS

NON-DISTRIBUTING TYPE STEAM COILS SHOULD ONLY BE USED FOR APPLICATIONS WELL ABOVE FREEZING AND ARE NOT SPECIFIED HERE. THEY ALSO CAN SUFFER FROM POOR CONTROLLABILITY IN LARGER SIZES. NOT GENERALLY RECOMMENDED EXCEPT FOR SMALL ABOVE-FREEZING TERMINAL UNIT TYPE APPLICATIONS.

FOR ANY HORIZONTAL TUBE STEAM COIL LONGER THAN 108" FINNED LENGTH, DISTRIBUTING TYPE ARE STRONGLY RECOMMENDED WITH SUPPLY CONNECTIONS AT BOTH ENDS OF THE COIL, TO ASSURE EVEN HEATING ACROSS THE COIL FACE.

- A. One row, steam distributing tube-in-tube type, with 1-in. diameter outside tubes and 5/8-in. diameter inside tubes; same or opposite end connections as required. Uniform leaving-air distribution temperature with maximum 4 deg. F temperature difference between leaving air from any lengthwise quadrant of coil area (based on nine or more equal area temperature readings in any given quadrant) and average leaving air temperature over entire coil face area. Die-form distributor tubes. Orifices shall discharge steam in the direction of condensate flow. Tubes shall be located concentrically within condensing tubes with corrosion resistant support clips. Provide steam deflectors opposite the supply connection, to prevent impingement of steam into tubes in connection area.

VERTICAL TUBE STEAM COILS FOR 100% OUTSIDE AIR APPLICATIONS (SPECIFIED BELOW) ARE LESS PRONE TO FREEZING AND ARE STRONGLY RECOMMENDED FOR SUCH APPLICATIONS FOR LARGE (> 48" LONG) COILS. HOWEVER DESIGNER MUST ASSURE THAT ADEQUATE VERTICAL SPACE IS AVAILABLE TO PROVIDE PROPER STEAM TRAP INLET HEIGHT. ALSO ASSURE SPACE IS ADEQUATE FOR STEAM CONNECTION TO THE COIL. A COMPROMISE OPTION IS HORIZONTAL 1" O.D. DISTRIBUTING TUBE TYPE WITH SUPPLY CONNECTIONS AT BOTH ENDS OF THE COIL.

1. 100 percent outside air steam coils with finned length greater than 48 inches: Provide vertical tubes; 1-in. diameter outside tubes and 5/8-in. diameter inside tubes.
- B. Steam coil working pressure and temperature: 100 psig/400 deg. F.

2.6 DRAIN PANS

- A. Provide a drain pan under each cooling coil, and where indicated. Provide intermediate drain pans at each level of stacked coils. Drain pans shall capture all condensate from coil assembly; including pipe header, pipe return bends, upstream run-off, and downstream carryover.
- B. Drain Pan Construction: 304 stainless steel, self-supporting, sloped in two directions minimum, leak-tight with welded seams. Design, fabricate and install to prevent standing water.
- C. For coils mounted in 100 percent outside air units, insulate the bottom of intermediate drains pans with 3/8-in.-thick flexible closed cell elastomeric insulation, with the upstream edge protected by a stainless steel angle.
- D. Provide rigidly supported, leak tight copper downcomer drains from each intermediate pan to pan below.

TWO OPTIONS EXIST FOR BOTTOM PAN - ABOVE FLOOR OR DEPRESSED-IN-FLOOR. ABOVE FLOOR OPTION IS PREFERRED DUE TO EASE OF CONSTRUCTION, VERIFICATION AND EVENTUAL REPLACEMENT, AND HIGHER DRAIN OUTLET. HOWEVER ABOVE FLOOR OPTION WILL TYPICALLY INCREASE UNIT HEIGHT BY 3 TO 6 INCHES. CHOOSE BETWEEN FOLLOWING OPTIONS CAREFULLY.

- E. Above Floor Bottom Pan: Minimum 16 gauge construction. Insulate between pan and floor with 1/2 in. thick flexible closed cell elastomeric insulation. Provide threaded outlet at pan low point.
- F. Flexible Closed Cell Elastomeric Drain Pan Insulation: Armacell-Armaflex or equivalent. Composite flame spread / smoke density not to exceed 25/50. Fully adhere to the pan bottom with insulation manufacturer's recommended adhesive.

2.7 SOURCE QUALITY CONTROL

- A. Factory test all coils.
- B. Proof test all water and steam coils to 300-psig minimum, and leak test to 200 psig, minimum.
- C. Proof test all direct expansion coils to 450 psig minimum, and leak test to 300 psig, minimum.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install coil assemblies in accordance with details, other specifications sections, approved submittals, and the coil manufacturer's installation requirements and recommendations.
- B. Install coils level and plumb.
- C. Use fin combs to restore bent fins to upright condition.
- D. Block (safe) gaps around coil casings to prevent air flow bypass. Use sheet metal matching the coil casing material, secured with sheet metal screws. Close minor gaps with gasketing and sealants. All safing to match adjacent construction.
- E. Clean coils using materials and methods recommended by manufacturers, to remove dust and debris

3.2 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23

SECTION 238219 - FLOOR MOUNTED FAN COIL UNITS (UN-DUCTED)

END OF CONTENTS TABLE

DIVISION 23

SECTION 238219 - FLOOR MOUNTED FAN COIL UNITS (UN-DUCTED)

REVISIONS:

FIRST EDITION MAY 2010, AEC MECH TECH TEAMS - HVAC/CONTROLS GROUP. DEVELOPED BASED ON THE NORTH QUAD RESIDENCE HALL FAN COIL SPECIFICATION. GENERALLY INTENDED FOR SMALL (< 1/2 HP) VERTICAL FAN COILS MOUNTED INSIDE THE ROOM WITH CHW AND HEATING COILS. COULD BE ADAPTED FOR OTHER TYPE IN-ROOM FAN COILS.

FAN COIL ROOM CONTROLLER (I.E. THERMOSTAT) AND CONTROL VALVES ARE SPECIFIED IN SECTION 230900 MECHANICAL SYSTEMS CONTROLS, AND NOT IN THIS SECTION. THIS SECTION COVERS ONLY THE FAN COIL CONTROL TRANSFORMER AND RELAY PACK.

NEW FORMAT DRAFT NOVEMBER 15, 2010. MANUFACTURERS UPDATED, FORMAT AND ORGANIZATION REVISED.

OCT 2015: ADDED PRICE AS APPROVED MFR. D. KARLE PER HVAC MTT.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Work Specified Elsewhere: Examine Drawings and other sections of the Specifications for requirements that affect and specify work under this section, in particular the following:
 - 1. Section 221113: Piping Materials and Methods.
 - 2. Section 220523: Valves.
 - 3. Section 220513: Motors.
 - 4. Section 220719: Mechanical Systems Insulation.
 - 5. Section 232116: Hydronic Piping Specialties.
 - 6. Section 230900: Mechanical Systems Controls.
 - 7. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes
 - 1. Floor-mounted fan-coil units, with controls provided in part or in entirety by the fan coil manufacturer, as specified.

REVISE THE ALTERNATES REQUIREMENTS AND THE CORRESPONDING INFORMATION IN PART 1 AND PART 2 BASED ON PROJECT REQUIREMENTS.

IF THERE ARE NO BID ALTERNATES, INDICATE "NONE." CONSIDER SPECIFYING ECM MOTORS AS AN ALTERNATE. CONSIDER SPECIFYING WELDED, RADIUS CORNERS ON FRONT AND SIDE EDGES OF TOP AS AN ALTERNATE. WELDED EDGES RESULT IN A MUCH MORE ATTRACTIVE AND DURABLE CABINET AND ARE PREFERRED BY U-M HOUSING.

1.3 ALTERNATES

- A. Bid Alternate No. 1: Furnish fan-coil units with pre-assembled hydronic piping package. Tubing, valves, fittings, instrumentation, supports and insulation as specified herein and as indicated on the Drawings.
1. Piping package shall be shipped from the manufacturer's factory connected to coil(s), secured and protected from damage during shipment.
 2. Piping package shall include the required control valves. Control valves shall be as specified in Section "Mechanical Systems Controls."

1.4 COORDINATION

- A. Coordinate dimensions and arrangement of fan coils with building elements including windowsill height, floor finish, pipe entry location, and wall construction.

REVISE SUBMITTALS AS REQUIRED. SAMPLE PARAGRAPHS UNDER 1.5 REQUIRE DELIVERY OF A SAMPLE FAN COIL WITH THE BID, AND IS WRITTEN ASSUMING THE FAN COILS WILL BE PREPURCHASED, AND THAT A PREPIPED FAN COIL WILL BE CONSIDERED AS AN ALTERNATE. SAMPLE UNIT SUBMITTAL IS HIGHLY RECOMMENDED FOR PROJECTS WITH A LARGE QUANTITY OF FAN COILS.

1.5 SUBMITTALS

- A. Submit the following product data for approval:
1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
 2. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
 3. Details of motor including type, manufacturer and electrical characteristics.
 4. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
 5. Control transformer-sizing calculations.
 6. Detailed information on fan control relay board.
 7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.
 8. Evidence of UL or ETL listing and labeling.
- B. Equipment schedule with the following information for each unit type:

1. Quantity of each type.
 2. Equipment tag.
 3. Model number.
 4. Manufacturer's size designation.
 5. Configuration (2-pipe or 4-pipe).
 6. Number of coils, number of rows for each coil, fin spacing for each coil, airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.
- D. Warranty Documentation: Submit warranty documentation according to requirements of Contract Documents.
- E. Detailed schedule with each fan coil tagged by room number, indicating unit style, heating and cooling capacity, left- or right-hand piping configuration, and 2-way or 3-way control valves.

THE FOLLOWING PARAGRAPHS SPECIFY CONDITIONS WHEN THE FAN COILS ARE PREPURCHASED, AND THAT A PREPIPED FAN COIL WILL BE CONSIDERED AS AN ALTERNATE. REQUIRE THAT A SAMPLE FAN COIL UNIT BE DELIVERED WITH THE BID AND IS WRITTEN ASSUMING. SAMPLE UNIT IS HIGHLY RECOMMENDED FOR PROJECTS WITH LARGE QUANTITIES OF FAN COILS.

- F. Samples: Submit sample fan coil unit with bid: One unit, Type FCU-XX, pre-piped, with factory-applied color finish, and factory-installed piping package:
1. Sample unit shall comply with these specifications in all respects.
 2. Configure piping for 2-way control valves with 3/4 inch nominal control valve body size.
 3. Provide Sample unit pre-piped with piping accessories and control valves, arranged per the drawing details. See "Factory-Provided and Installed Hydronic Piping Package" in Part 2.
 4. Piping shall be 3/4 inch nominal size. Pipe unit for 4-pipe configuration.
 5. Configure sample unit to allow the fan to operate at all three speeds after temporary power is provided.

1.6 DELIVERY, STORAGE AND HANDLING

- A. Mark each fan coil cabinet back with the scheduled room location.
- B. Mark the fan coil room locations on the outside of the shipping box.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.
- E. Ship each unit wrapped in a heavy plastic bag, packed in a corrugated cardboard shipping box.

REVISE MAINTENANCE MATERIAL SUBMITTALS TO SUIT PROJECT REQUIREMENTS. FILTERS AND TOUCH-UP PAINT ARE GENERALLY NOT REQUIRED FOR SMALL PROJECTS. REVIEW PART 3 REGARDING TEMPORARY USE OF FAN COILS DURING CONSTRUCTION AND FINAL FAN COIL TURN-OVER TO OWNER AND THE REQUIREMENTS FOR EXTRA FILTERS. REVISE

TOOLS IN PARA. D BASED ON THE QTY. OF FAN COILS. CONSIDER LISTING OTHER SPARE PARTS THAT MIGHT BE UNIQUE TO THE FAN COIL.

1.7 EXTRA STOCK MATERIALS

- A. Furnish extra materials described below that match installed products. Package with protective covering for storage. Affix labels describing contents.
- B. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fan-Coil-Unit Filters: Furnish start-up filter (installed in the shipped unit) and one spare filter for each filter installed.
 - 2. Touch-up paint: 48 fluid ounces total for each cabinet color, in spray cans.
 - 3. Tool or bit to remove the tamper-proof fasteners: total quantity of twenty.
- C. Extra materials, excluding start-up filters, are for the Owner's use, not for Contractor's use, during construction.
- D. Provide units built, tested, and installed in compliance with the latest edition of the following quality assurance standards, unless noted otherwise:
 - 1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
 - 2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.
 - 3. NFPA 70- National Electric Code.
 - 4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
 - 5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
 - 6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
 - 7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
 - 8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation
 - 9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
 - 10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
 - 11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
 - 12. Fan coils shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

REVISE WARRANTY PER PROJECT. TWO-YEAR WARRANTY MAY BE APPROPRIATE WHEN PURCHASING LARGE QUANTITIES OF FAN COILS.

- E. Promptly remedy any Work not in accordance with the Contract Documents, within a one-year period from the date of Substantial Completion, according to the Standard General Conditions and Supplemental General Conditions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Subject to compliance with all requirements, provide products from one of the following manufacturers:
1. Airtherm, Westfield, MA.
 2. Enviro-Tec by Johnson Controls, Largo, FL.
 3. International Environmental Corporation, Oklahoma City, OK.
 4. Price Industries

VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE FAN COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD HEIGHT UNITS MAY NOT FIT PROPERLY UNDER EXISTING WINDOWS/WINDOW SILLS.

LIST FAN COIL SOUND POWER LEVELS IN THE FAN COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR FAN COILS USED IN SLEEPING QUARTERS.

2.2 MANUFACTURED FAN COIL UNITS

- A. Factory fabricated Fan Coil Units: Built, tested, and rated in accordance with the Quality Assurance Standards referenced in this Section.
1. Mark the room location on the fan coil cabinet back.
- B. Capacities: As indicated in the equipment schedules.
- C. Dimensions: Maximum allowable dimensions as indicated on the Drawings. Maximum allowable height shall include the height of the leveling legs when adjusted to their minimum extension position.

2.3 FAN COIL UNIT CONSTRUCTION

- A. Chassis:
1. Construction: Heavy gauge, minimum G60 galvanized or A40 galvanized steel. Construct to eliminate racking.
 2. Provide a minimum of four leveling legs with minimum 1-inch adjustment.
 3. Provide framing members with a minimum of two 7/16 inch diameter minimum, wall-mounting holes and two floor-mounting holes. Provide additional holes if required for safe and secure mounting. Mounting holes to permit bolting to the wall and the floor with lag screws.
- B. Cabinet: Steel with baked-enamel or powder coat finish.
1. Tops: Steel, 18 gauge minimum thickness.
 2. Front and sides of cabinet: Steel, 16 gauge minimum thickness.

NOTE THAT THE PARAGRAPH BELOW IS FOR AN EXTERNAL (REMOTE) THERMOSTAT FOR THE FAN COIL. REVISE WHEN THE PROJECT REQUIRES A FAN COIL WITH DOORS TO ACCESS A FAN SPEED SWITCH OR THERMOSTAT CONTROL.

3. Cabinet tops: Sloped, seamless and continuous without access doors for temperature controls, fan speed switches, and other controls.
 4. Outlet grille: Pencil-proof and stamped into the top with all grille edges recessed into the casing and not projecting out of the casing.
 5. Cabinets and front panels shall have all edges turned over and all burrs removed. The finished product shall have no sharp edges.
 6. Front panel: Removable, with channel-formed edges and insulation on the entire interior face of the panel, and secured with tamper-resistant cam fasteners. Fasteners designed with a hexagonal socket for use with a common hex-head tool (allen wrench) shall not be acceptable.
 7. Extend the front access panel for the full width of the fan coil cabinet, included the piping pocket extension and electrical pocket.
 8. Provide an extension on the piping side of the cabinet unit. Extension shall result in an overall inside width of the piping pocket of not less than 17 inches. Extension shall be continuous with the front, top, sides, and bottom of the cabinet and shall not have an "add-on" configuration. Provide a cutout in the cabinet end to allow connecting piping to be routed into the piping pocket.
 9. Provide an electrical equipment pocket, on the side opposite of the piping pocket, with a minimum clear inside width of 8 inches.
 10. Base or legs: Form all vertical surfaces of solid sheet metal, including sides facing the air stream (facing the return air/air filter opening); open construction is not permissible.
 11. Apply insulation in the entire cabinet on the interior faces including the end pockets, sides, front, and top panel away from the coil section. Apply insulation to interior cabinet surfaces to insulate the conditioned air stream and to prevent sweating. Do not insulate chilled water/dual temperature piping inside the cabinet. Secure Insulation to cabinet with water-based, non-out-gassing adhesive providing 100 percent coverage of the cabinet interior surfaces.
- C. Finished Surfaces: Clean, phosphatize, and coat with a factory baked-on or powder-coat primer, and separately applied baked or powder coated finish paint. Final color shall be as selected from the manufacturer's standard color palette.
- D. Insulation: Coil and Cabinet: minimum 1/2-inch-thick closed-cell elastomeric foam complying with the following:
1. ASTM C 411 Standard Test.
 2. Attach with adhesive complying with ASTM C 916.
 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- E. Drain Pans: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.

1. Main drain pan (pan immediately below coil): Stainless steel, insulated.
 2. Auxiliary drain pan: Insulated molded plastic or stainless steel with threaded drain connection. Pan shall receive condensate from main drain pan. Provide large enough to capture condensate dripping from all chilled water and dual temperature piping located inside the fan coil cabinet.
 - a. Note: Do not insulate chilled water/dual temperature piping inside the cabinet.
- F. Filters: Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2
1. Disposable Type 1 inch pleated cotton-polyester media: 90 percent arrestance and 7 MERV.
 2. Replaceable through return air opening without removing access panel.

2.4 HYDRONIC COILS

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.
1. Factory test all coils as specified in the Source Quality Control article.
 2. Include manual air vent and drain connections accessible from the pipe access chase end of unit.
 3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.
 4. Provide coil piping connections extended into the piping pocket.

2.5 FAN AND MOTOR BOARD ASSEMBLY (BLOWER DECK) :

- A. Fan(s) and motor(s): Mount on a common, rigid, sheet metal panel, fully insulated and removable as an assembly for ease of maintenance. Assembly shall be removable and replaceable through the front access panel and shall not require the removal of side panels.
- B. Fan: Forward curved, double width, centrifugal; directly connected to motor. Galvanized steel or aluminum wheels; galvanized-steel fan scrolls.
- C. Motor: Three speed, single phase, permanent split capacitor (PSC) type with permanently lubricated bearings. Provide motor with resilient mounting and built-in overload protection with automatic reset.
- D. Wiring termination: Pre-wire motor to power/relay board with quick-disconnect plug connection.
- E. The maximum allowable fan and motor RMS velocity at the maximum fan speed shall not exceed 0.15 in. /sec. in the horizontal, vertical and axial directions. Fans may be field tested after installation by an independent third party. The manufacturer, without cost to the Owner, shall correct any fan/motor found to exceed these vibration limits.

NOTE THAT THE FOLLOWING ARTICLE IS WRITTEN FOR AN EXTERNAL (REMOTE) THERMOSTAT (ROOM CONTROLLER) USED FOR THE FAN COIL, SUPPLIED BY THE CONTROLS CONTRACTOR. EDIT AS REQUIRED IF PROJECT REQUIRES DIFFERENT CONTROLS,

2.6 FAN COIL CONTROLS AND ELECTRICAL CONNECTIONS

- A. Control devices and operational sequences are specified in Section "Mechanical System Control" and the Sequence of Operation indicated on the control drawings. Provide pre-wired controls that achieve the operational sequences and that are compatible with the remote thermostat (room controller) specified in Related Section "Mechanical Systems Control." Remote thermostat will be provided and wired to the fan coil by the controls contractor.
- B. Provide a three-speed fan relay control board pre-wired to the fan, and with connections for the low voltage remote thermostat. Coordinate with controls contractor and assure control relay board is compatible with remote thermostat. Relays shall be silent in operation.
- C. Provide 120/24 volt control transformer inside a separate protective cover, or with fully guarded wiring connections. Control transformer shall be a discrete device, not part of a circuit or relay board. Size transformer for control valve(s), thermostat, and fan relays, plus 20 percent of maximum load. Transformer shall be appropriately fused on both the line side and the load side.
- D. Mount all electrical devices secured to the chassis inside the chassis pocket opposite the piping pocket.
- E. Completely factory pre-wire disconnect switch, motor(s), control transformer, and relay board. Isolate all high voltage (120V) wiring from low voltage (24V) wiring via separate junction boxes and wireways.
 - 1. Provide 120V disconnect switch mounted on a junction box adequately sized to allow external "single point" high voltage power connection to the fan coil unit. Configure disconnect wiring to turn off all high and low voltage power in the fan coil.
 - 2. Provide a thermostat junction box to allow "single point" connection of thermostat wiring. Terminate control valve (when control valves provided by fan coil manufacturer), control transformer, and relay board wiring in the thermostat junction box. Provide a junction box of adequate size to allow controls contractor to terminate all thermostat connections, and control valve wiring when control valves are not provided by fan coil manufacturer, inside the box with wire nuts.
- F. Provide a project specific wiring diagram affixed to the inside of each fan coil cabinet.
- G. All electrical work shall comply with applicable Related Documents, Electrical Sections and Quality Assurance Standards.

2.7 FAN COIL UNIT WITH HYDRONIC PIPING PACKAGE - BASE BID AND ALTERNATE WORK

REVISE BELOW DEPENDING ON PROJECT REQUIREMENTS. FILL IN BID ALTERNATE NUMBER IN PARAGRAPH B OR EDIT, AS APPLICABLE:

- A. Base Bid Work: Factory-Provided and Installed Hydronic Piping Package is not provided.
 - 1. Provide coil piping connections protected with plastic end caps, ready for field connection.
 - 2. Provide threaded brass plugs in coil header air vent and drain connections.

- B. Alternate Work: Complete pre-assembled hydronic piping package under Bid Alternate No. X.
 - 1. Configure piping as indicated in the piping details.
 - 2. Tubing: Seamless copper tubing, Type L, soldered joints.
 - 3. Provide piping components including piping, valves, fittings, joints, instrumentation, as specified in Related Specification Sections. Do not provide components or products from component manufacturers that are not specified and listed in the Contract Documents.
 - 4. Include control valves as described in Related Specification Section. Valves shall be of pipe size and 2-way or 3-way configuration as indicated for specific fan coils. Engineer shall select Control valve Cv during submittal process. At the discretion of the Engineer, smaller valve body size may be selected at that time.
 - 5. Do not insulate chilled water and dual temperature piping. Arrange piping completely above the auxiliary drain pan as described under Drain Pans paragraph.
 - 6. Insulate hot water piping. Insulate any chilled water and dual temperature piping that cannot be located above the auxiliary drain pan.
 - 7. Insulate with closed cell elastomeric insulation per Related Specification Sections.
 - 8. Install piping to allow access to all piping components (drain connections, unions, etc.), arranged so that it is possible to remove the control valve body and actuator without removing any other component.
 - 9. Provide adequate and easily removable pipe hangers. Hangers shall rigidly support the pre-assembled piping package from the fan coil chassis, preventing damage during shipping and operation. Provide plastic coated hangers to prevent galvanic corrosion between hanger and piping components.
 - 10. Provide plastic end caps on the field connection points.

2.8 SOURCE QUALITY CONTROL

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.

- B. Assemble and factory test each unit prior to shipping. Pressure test coils and piping packages for leaks. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before fan-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install fan coil units level and plumb. Adjust leveling legs individually to the minimum height required to level units. Do not use leveling legs to align coil connections with field piping - adjust field piping instead.
- B. Bolt unit to blocking in wall after leveling. Bolt units to floor if inadequate wall support exists in the wall. Do not use toggle bolts or dry-wall anchors. Install bolts in every fan coil mounting hole.
- C. Install fan coil units to comply with Quality Assurance Standards and manufacturer's installation instructions.

3.3 CONNECTIONS AND INSULATION

- A. General piping installation requirements are specified in Related Work Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Install as follows:
 - 1. Connect hydronic and condensate drain piping to the unit.
 - 2. Install piping to allow access to all piping components (drain connections, unions, etc.), arranged so that it is possible to remove the control valve body and actuator without removing any other component.
 - 3. Provide adequate and easily removable pipe hangers to rigidly support piping within the fan coil. Provide plastic coated hangers to prevent galvanic corrosion between hanger and piping components.
 - 4. Arrange chilled water and dual temperature piping so that it is installed completely above the auxiliary drain pan, to capture any condensate dripping from the piping.
- B. Insulate condensate drain and hot water piping with closed cell elastomeric insulation per Related Specification Sections. Insulate any chilled water and dual temperature piping that cannot be located above the auxiliary drain pan.
 - 1. Insulate piping all the way to coil headers and drain pan connection.
 - 2. If fan coil unit is provided with pre-assembled hydronic piping package under the Alternate Work, provide insulated piping, as described in the Part 2 article. Insulate all field installed piping as described above.

- C. Connect wiring and ground equipment according to electrical requirements indicated in the Related Specification Sections.

3.4 CLEANING AND PROTECTING

- A. Protect units from damage, scratching, dirt and debris immediately after installation as follows:
 - 1. Wrap or cover entire cabinet with heavy plastic. Completely cover return air inlet. Secure plastic in place with tape.
 - 2. Cover entire cabinet with heavy cardboard secured in place. Utilize fan coil shipping box when possible. Mark top with large letters stating, "FRAGILE - DO NOT STAND."
 - 3. Use only tape that will not mar finishes. Clean and remove all tape and adhesive residue prior to starting units.
 - 4. Remove all protective materials immediately prior to starting each unit. Do not uncover any unit before all drywall taping and sanding has been completed in that area.

3.5 TEMPORARY USE PRIOR TO OCCUPANCY

- A. Start fan coil units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of fan coil units serving that area.
- C. Prior to starting each unit, remove front access cover and vacuum complete unit including coils, fan scrolls, drain pans, access sections, chassis, and cabinet.
- D. Perform manufacturer's pre-start protocol and commissioning activities immediately prior to placing into temporary service.
- E. Tape foam filter material over entire discharge grille.
- F. Install a complete set of temporary filters in the fan-coil unit equal to the quality and efficiency of the specified permanent filters. If the fan coil unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- G. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

3.6 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 - 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
 - 2. Test unit operation with thermostat in all modes of operation.
 - 3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.

4. Remove and replace malfunctioning units and retest as specified above.

ENGINEER SHALL VERIFY THAT THE MECHANICAL SYSTEMS CONTROLS SPECIFICATION DESCRIBES CONTROLS START-UP FOR FAN COIL UNITS.

- B. Coordinate controls start-up for fan coil units with the Mechanical Systems Controls Specifications.

3.7 COMMISSIONING

- A. Perform complete functional testing as required by the Commissioning Agent.
- B. Perform manufacturer's pre-start protocol and commissioning activities after unit has completed temporary service.

3.8 FINAL TURN-OVER TO OWNER

- A. Immediately prior to Substantial Completion, re-clean all fan-coil units. Remove front access cover and vacuum complete unit including coils, fan scrolls, drain pans, access sections, chassis, and cabinet. Clean and remove all tape and adhesive residue from cabinet.
- B. Straighten coil fins with a fin comb.
- C. Sand, prime coat, and touch-up all scratches with color-matched, factory-supplied touch-up paint. Where touch-up painting does not match adjacent, unblemished finish in either color or texture, field paint the entire cabinet surface exposed to view with factory-provided spray paint.
- D. After final cleaning and painting, install a new, clean set of air filters in each unit if units were used for Temporary Use.

REVISE TO COORDINATE WITH PART 1 SUBMITTALS IF SPARE FILTERS ARE REQUIRED.

- E. Provide spare filters to Owner.

3.9 OWNER TRAINING

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic fan-coil unit maintenance by demonstrating the following: location of control devices, removal of access panel, filter replacement, relay replacement, and motor replacement.

END OF SECTION 238219

BuildingName
The Description of the Project

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238220 - HORIZONTAL FAN COIL UNITS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238220 - HORIZONTAL FAN COIL UNITS

NEW SECTION: JUNE 2011.

FAN COILS IN THIS SPECIFICATION ARE LIMITED TO SINGLE PHASE UNITS OF LESS THAN 1/2 HP WITH DIRECT DRIVE FANS. COMPARED TO BLOWER COILS, FAN COILS TYPICALLY PROVIDE RELATIVELY LOW FAN STATIC PRESSURE AND ARE DESIGNED TO ACCOMMODATE MINIMAL OR NO ATTACHED DUCTWORK.

HORIZONTAL FAN COILS ARE AVAILABLE IN NUMEROUS CONFIGURATIONS AND WITH MULTIPLE OPTIONS; THIS SPECIFICATION IS THEREFORE NECESSARILY OUTLINE IN NATURE. EDIT SECTION CAREFULLY TO MAKE IT PROJECT SPECIFIC. SPECIFICATIONS FOR MFR. PROVIDED CONTROLS INCLUDING 3 SPEED FAN CONTROL (RELAY BOARD), FACTORY PIPING PACKAGES, DX COILS, CABINETS FOR FINISHED SPACE USE, AND INTEGRAL GRILLES/REGISTERS/DIFFUSERS ARE NOT INCLUDED AND MUST BE ADDED IF REQUIRED. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S AND OTHER SPEC. LANGUAGE THAT MAY BE USEFUL WHEN SPECIFYING HORIZONTAL FAN COILS.

ADDED NAILOR AS APPROVED PER HVAC MTT. D. KARLE APRIL 2018.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

SPEC EDITOR: CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:
1. Section 2220513: Motors.
 2. Section 220719: Mechanical Systems Insulation.
 3. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:
1. Horizontal fan-coil units with motors less than 1/2 HP, direct drive fans, and hydronic coils. Controls provided in part or in entirety by the fan coil manufacturer, as specified.

1.3 COORDINATION

- A. Coordinate dimensions and arrangement of fan coils with building elements including to maintain all maintenance clearances. Pay special attention to required electrical clearance.

1.4 SUBMITTALS

- A. Submit the following product data for approval:
 - 1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
 - 2. Piping connections including size, material types, and dimensioned locations for each service.
 - 3. Ductwork connections including sizes, locations, and methods of connections to mating ductwork.
 - 4. Locations of electric power connections.
 - 5. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
 - 6. Details of motor including type, manufacturer and electrical characteristics.
 - 7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.
 - 8. Evidence of UL or ETL listing and labeling.

SPEC EDITOR: UNHIDE THE BELOW HIDDEN TEXT IF DISCONNECT SWITCH, CONTROLS, TRANSFORMER, OR 3 SPEED FAN RELAY BOARD ARE TO BE PROVIDED BY THE FAN COIL MFR.

- 9. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
 - 10. Control transformer-sizing calculations.
 - 11. Detailed information on fan control relay board.
- B. Equipment schedule with the following information for each unit type:
 - 1. Equipment tag.
 - 2. Room number of thermostat location.
 - 3. Model number.
 - 4. Manufacturer's size designation.
 - 5. Configuration (2-pipe or 4-pipe).
 - 6. Number of coils, number of rows for each coil, fin spacing for each coil.
 - 7. Heating and cooling capacity.
 - 8. Airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Mark each fan coil cabinet with the room number where it is scheduled to be installed.

- B. Mark each fan coil shipping box with the room number where it is scheduled to be installed.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.
- E. Ship each unit wrapped in a heavy plastic bag, packed in a corrugated cardboard shipping box.

1.6 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
 - 2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.
 - 3. NFPA 70- National Electric Code.
 - 4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
 - 5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
 - 6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
 - 7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
 - 8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation.
 - 9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
 - 10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials.
 - 11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 12. Units shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:

1. Airtherm.
2. Enviro-Tec by Johnson Controls.
3. International Environmental Corporation.
4. Daikin Applied.
5. Nailor
6. Trane.

VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE FAN COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD SIZE UNITS MAY NOT FIT PROPERLY IN EXISTING FACILITIES.

LIST FAN COIL SOUND POWER LEVELS IN THE FAN COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR FAN COILS USED IN SOUND SENSITIVE AREAS.

THIS SPECIFICATION ASSUMES NONE OF THE FAN COIL CONTROLS ARE PROVIDED BY THE FAN COIL MFR. IF ANY CONTROLS ARE TO BE PROVIDED BY THE MFR. (3-SPEED RELAY BOARD, CONTROL TRANSFORMER, ETC.), EDIT THIS SPECIFICATION TO INCLUDE THOSE REQUIREMENTS. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S THAT MAY BE USEFUL WHEN SPECIFYING HORIZONTAL FAN COILS.

2.2 FAN COIL UNIT CONSTRUCTION

- A. Dimensions: Maximum allowable dimensions as indicated on the Drawings.
- B. Casing Construction:
 1. Construction: Minimum 18 gauge, G60 galvanized or A40 galvanized steel or as scheduled. Construct to eliminate racking.
 2. Access panels shall be fully insulated and attached with fasteners on at least two opposite sides. No coil or drain piping or electrical connections shall pass through any access panel.
 3. One inch duct collars if connected to ductwork.
- C. Insulation: Exterior panels and access panels: Foil faced minimum 1-inch-thick, 1-1/2 lb density fiberglass fire resistant insulation complying with the following:
 1. ASTM C 411 Standard Test.
 2. Attach with adhesive complying with ASTM C 916.
 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

2.3 HYDRONIC COILS

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.

1. Factory test all coils as specified in the Source Quality Control article.
2. Include manual air vent and drain connections.
3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.

2.4 DRAIN PANS

A. Condensate Drain Pan: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.

1. Drain pan: Stainless steel, insulated.
 - a. Located under cooling coil allowing the drain pan to be fully inspected and cleaned.
 - b. Slope to drain completely dry upon fan coil shutdown.

SPEC EDITOR: SELECT BELOW, ONE OF THE FOUR CODE REQUIRED METHODS OF PROTECTING AGAINST PRIMARY DRAIN PAN FAILURE AND SHOW DRAIN TERMINATION POINTS ON THE DRAWINGS. DELETE THE OTHER THREE OPTIONS.

2. Overflow drain pan connection: shall be on the same side and at a higher elevation than the primary drain pan connection.
3. Water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.
4. Auxiliary drain pan with drain connection.
5. Auxiliary drain pan with capped or no drain connection, with water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to auxiliary drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.

2.5 FILTERS

A. Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2

1. Disposable Type: 2-inch pleated cotton-polyester media: 90 percent arrestance and a MERV A rating of 8 (or as scheduled) when tested per Appendix J of ASHRAE 52.2.

SPEC EDITOR: SELECT BELOW, DIRECTION OF FILTER REMOVAL. WHEN SELECTING, CONSIDER THE OBSTRUCTIONS TO FILTER REMOVAL AT THE FAN COIL MOUNTING LOCATION.

2. Provide filters that are removable horizontally from the casing.
3. Provide filters that are removable vertically from the casing.

SPEC EDITOR: FAN COILS ARE RARELY BELT DRIVEN. IF YOUR PROJECT REQUIRES BELT DRIVE, STRONGLY CONSIDER USING THE BLOWER COIL SPEC. OTHERWISE, EDIT BELOW TO INCLUDE SPEC FOR BELT DRIVE AND REVISE THE MOTOR TYPE.

2.6 FAN AND MOTOR:

- A. Fan: Forward curved, double width, centrifugal, direct drive fan(s) mounted on removable fan deck or with easily removable fan and motor. Galvanized steel or aluminum wheels; galvanized-steel fan scrolls.
- B. Motor Wiring: Terminate wiring in a junction box, external to the unit casing for a single point connection.
- C. Provide a project specific wiring diagram affixed to the inside of each fan coil cabinet.

SPEC EDITOR: SELECT EITHER 3 SPEED PSC OR ECM MOTORS, BELOW.

SPEC EDITOR: ECM MOTORS AUTOMATICALLY ADJUST TO VARYING LOAD/STATIC PRESSURE (E.G. FILTER LOADING). SPEED IS TYPICALLY FACTORY SET BUT CAN BE RESET IN FIELD. ECM MOTORS ARE MORE ENERGY EFFICIENT AND ARE CLAIMED TO LAST LONGER THAN PSC MOTORS. THOUGH ECM MOTORS ARE GENERALLY PREFERRED, CAUTION MUST BE UTILIZED WHEN USING LARGE QUANTITIES OF SINGLE PHASE ECM MOTORS ON 3 PHASE CIRCUITS SINCE ECM GENERATED HARMONICS COULD OVERHEAT NEUTRAL CONDUCTORS, CONNECTORS, AND TRANSFORMERS. FOR HOSPITAL AND OTHER PROJECTS, ECM MOTOR LOCATION MUST BE CONSIDERED RELATIVE TO SENSITIVE ELECTRONIC EQUIPMENT, DUE TO POSSIBLE INTERFERENCE BY ECM GENERATED HARMONICS.

- D. Motor: In compliance with Related Section "Motors", permanent split capacitor (PSC) type, 3 speed/3 tap, sleeve bearings.
- E. Motor: In compliance with Related Section "Motors", electronically commutated motor (ECM). Designed for use with a single phase electrical input. Motor to be complete with and operated by a single phase integrated speed controller/inverter, speed adjustable manually or via external 0-10 VDC signal, built-in soft start/speed ramps, with permanently lubricated ball bearings.

2.7 SOURCE QUALITY CONTROL

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.
- B. Assemble and factory test each unit prior to shipping. Pressure test coils and piping packages for leaks. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine areas to receive fan-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before fan-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install fan coil units level and plumb and to comply with Quality Assurance Standards and manufacturer's installation instructions.

SPEC EDITOR: REGARDING THE BELOW PARAGRAPH: BE SURE TO SHOW OVERFLOW DRAIN ROUTED TO A CONSPICUOUS TERMINATION POINT, IF AN OVERFLOW DRAIN IS BEING USED.

3.3 CONNECTIONS

- A. General piping installation requirements are specified in Related Documents Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Connect hydronic, condensate drain, and overflow drain piping to the unit.

3.4 TEMPORARY USE PRIOR TO OCCUPANCY

- A. Start units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of units serving that area.
- C. Thoroughly clean unit of all grease, dirt, dust, etc.
- D. Prior to placement into temporary service:
 - 1. Perform manufacturer's pre-start protocol.
 - 2. Perform commissioning activities.
- E. Install a complete set of temporary filters in the unit equal to the quality and efficiency of the specified permanent filters. If the unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- F. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

3.5 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 - 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
 - 2. Test unit operation with thermostat in all modes of operation.
 - 3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.
 - 4. Remove and replace malfunctioning units and retest as specified above.

3.6 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section titled Commissioning and other requirements of the Contract Documents.

3.7 CLOSEOUT ACTIVITIES

- A. Perform all commissioning activities, even if previously performed to ready for temporary use.
- B. After unit has completed final commissioning and just prior to final acceptance by Owner:
 - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts.
 - 2. Install a new, complete set of filters.
 - 3. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight. Touch up damaged painted surfaces with manufacturer provided touch-up paint.

3.8 OWNER TRAINING

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic fan-coil unit maintenance by demonstrating the following: location of control devices, removal of access panels, filter replacement, and motor replacement.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)

SECTION 238221 - BLOWER COIL UNITS

END OF CONTENTS TABLE

CTION: JUNE 2011.

BLOWER COILS FOR THE PURPOSES OF THIS SPECIFICATION ARE UNITS OF GREATER THAN 1/2 HP (AND THEREFORE NORMALLY HAVE THREE PHASE MOTORS) USUALLY WITH BELT DRIVE FANS. BLOWER COILS TYPICALLY PROVIDE HIGHER AIR FLOWS AND FAN STATIC PRESSURES THAN ARE AVAILABLE FROM FAN COIL UNITS, IN A COMPACT PACKAGE. UPPER CFM LIMIT FOR STANDARD UNITS IS TYPICALLY 3000-4000 CFM.

BLOWER COILS ARE AVAILABLE IN NUMEROUS CONFIGURATIONS AND WITH MULTIPLE OPTIONS; THIS SPECIFICATION IS THEREFORE NECESSARILY OUTLINE IN NATURE. EDIT SECTION CAREFULLY TO MAKE IT PROJECT SPECIFIC. SPECIFICATIONS FOR MFR. PROVIDED CONTROLS, FACTORY PIPING PACKAGES, DX COILS, CABINETS FOR FINISHED SPACE USE, AND INTEGRAL GRILLES/REGISTERS/DIFFUSERS ARE NOT INCLUDED, AND MUST BE ADDED IF REQUIRED. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S AND OTHER SPEC. LANGUAGE WHICH MAY BE USEFUL WHEN SPECIFYING BLOWER COIL UNITS.

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238221 - BLOWER COIL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

***INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.***

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

CAREFULLY VERIFY, EDIT AND COORDINATE RELATED SECTIONS.

- B. Related Sections:
1. Section 220513: Motors.
 2. Section 220719: Mechanical Systems Insulation.
 3. Division 26: Electrical.

1.2 SUMMARY

- A. Section Includes:
1. Horizontal and vertical blower coil units with motors 1/2 HP and greater, and hydronic coils.

1.3 COORDINATION

- A. Coordinate dimensions and arrangement of blower coils with building elements including to maintain all maintenance clearances. Pay special attention to required electrical clearance.

1.4 SUBMITTALS

- A. Submit the following product data for approval:
1. Heating and cooling coil total and sensible heat transfer capacity, entering and leaving water temperatures, water flow rate, water pressure drop, and air pressure drop.
 2. Piping connections including size, material types, and dimensioned locations for each service.
 3. Ductwork connections including sizes, locations, and methods of connections to mating ductwork.
 4. Locations of electric power connections.
 5. Details of equipment assemblies indicating dimensions, weights, required clearances, component locations, and location and size of each field connection. Include cabinet construction details: panel gauge, removal method for access panel, cabinet mounting method, and filter and fan motor removal method.
 6. Details of motor including type, manufacturer and electrical characteristics.
 7. Octave band and A-weighted sound power data for each unit type at fan coil rated capacity, tested per AHRI Standard 350.

8. Evidence of UL or ETL listing and labeling.

UNHIDE THE BELOW HIDDEN TEXT IF DISCONNECT SWITCH, CONTROLS, TRANSFORMER, OR 3 SPEED FAN RELAY BOARD ARE TO BE PROVIDED BY THE FAN COIL MFR.

9. Wiring Diagrams: Power, disconnect switch, controls, transformer and three-speed fan control relays.
 10. Control transformer-sizing calculations.
 11. Detailed information on fan control relay board.
- B. Equipment schedule with the following information for each unit type:
1. Equipment tag.
 2. Room number of thermostat location.
 3. Model number.
 4. Manufacturer's size designation.
 5. Configuration (2-pipe or 4-pipe).
 6. Number of coils, number of rows per coil, fin spacing for each coil.
 7. Heating and cooling capacity.
 8. Airflow rate and motor watts at each fan speed.
- C. Maintenance schedules and repair part numbers and manufacturer of motors, coils, integral controls, relay board, control transformer, and air filters.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Mark each blower coil cabinet with the room number where it is scheduled to be installed.
- B. Mark each blower coil shipping box with the room number where it is scheduled to be installed.
- C. Support piping to prevent damage to pipe and coil headers during shipping.
- D. Restrain fans and other components to prevent damage during shipping.
- E. Shipping protection shall be provided by Manufacturer to insure that the interior and exterior of each unit is completely protected from dirt or weather. Duct and pipe openings must be covered with sealed sheet metal, plastic or other durable means to ensure unit cleanliness is maintained.

1.6 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. ANSI/AHRI 350 Sound Rating of Non-Ducted Indoor Air-Conditioning Equipment.
 2. ANSI/AHRI Standard 440: Performance Rating of Room Fan-Coils.

3. NFPA 70- National Electric Code.
4. NFPA 90A Installation of Air-Conditioning and Ventilating Systems.
5. ANSI/ASHRAE 62.1 Section 5 (Systems and Equipment) and Section 7 (Construction and Start-up).
6. ANSI/ASHRAE 90.1-2007 Energy Standards for Low Rise Buildings Except Low Rise Residential Buildings.
7. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation.
8. ASTM C411 Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation
9. ASTM C612 Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
10. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
11. ASTM A653 Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process
12. Units shall be Underwriters Laboratories (UL) or Intertek (ETL) listed.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers:
 1. Airtherm.
 2. Enviro-Tec by Johnson Controls.
 3. International Environmental Corporation.
 4. Daikin Applied.
 5. Trane.

VERIFY THE REQUIRED PROJECT SPECIFIC DIMENSIONS FOR THE BLOWER COILS AND SCHEDULE OR SPECIFY ACCORDINGLY. MANUFACTURER'S STANDARD HEIGHT UNITS MAY NOT FIT PROPERLY IN EXISTING FACILITIES.

LIST BLOWER COIL SOUND POWER LEVELS IN THE BLOWER COIL SCHEDULE OR IN THE SPECIFICATIONS. BE PARTICULARLY CAUTIOUS FOR BLOWER COILS USED IN SOUND SENSITIVE AREAS.

THIS SPECIFICATION ASSUMES NONE OF THE BLOWER COIL CONTROLS ARE PROVIDED BY THE BLOWER COIL MFR. IF ANY CONTROLS ARE TO BE PROVIDED BY THE MFR. (DISCONNECTS, CONTROL TRANSFORMER, ETC.), EDIT THIS SPECIFICATION TO INCLUDE THOSE REQUIREMENTS. U-M SPECIFICATION 238219 "FLOOR MOUNTED FAN COIL UNITS UNDUCTED" IS A GOOD RESOURCE FOR CONTROL SPEC.S WHICH MAY BE USEFUL WHEN SPECIFYING BLOWER COIL CONTROLS.

2.2 BLOWER COIL UNIT CONSTRUCTION

- A. Dimensions: Maximum allowable dimensions as indicated on the Drawings.
- B. Casing Construction:
 - 1. Construction: Minimum 18 gauge, G60 galvanized or A40 galvanized steel or as scheduled. Construct to eliminate racking.
 - 2. Access panels shall be fully insulated and attached with fasteners on at least two opposite sides. No coil or drain piping or electrical connections shall pass through any access panel.
 - 3. One inch duct collars if connected to ductwork.
- C. Insulation: Exterior panels and access panels: Foil faced minimum 1-inch-thick, 1-1/2 lb density fiberglass fire resistant insulation complying with the following:
 - 1. ASTM C 411 Standard Test.
 - 2. Attach with adhesive complying with ASTM C 916.
 - 3. Fire-Hazard classification, insulation and adhesive combined: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84.
 - 4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

2.3 HYDRONIC COILS

- A. Hydronic Coils: Copper tube, minimum 0.025 inch wall thickness, with mechanically bonded aluminum fins, maximum of 12 fins per inch, copper headers and copper connections; rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 degrees F.
 - 1. Factory test all coils as specified in the Source Quality Control article.
 - 2. Include manual air vent and drain connections.
 - 3. Chilled water and dual-temperature water coil casings, tracks, baffles, and supports shall be of stainless steel construction.

2.4 DRAIN PANS

- A. Condensate Drain Pan: Fabricate drain pans and drain connections to comply with ASHRAE 62.1.
 - 1. Drain pan: Stainless steel, insulated.
 - a. Locate under cooling coil allowing the drain pan to be fully inspected and cleaned.
 - b. Slope to drain completely dry upon fan coil shutdown.

SELECT BELOW, ONE OF THE FOUR CODE REQUIRED METHODS OF PROTECTING AGAINST PRIMARY DRAIN PAN FAILURE AND SHOW DRAIN TERMINATION POINTS ON THE DRAWINGS. DELETE THE OTHER THREE OPTIONS.

- 2. Overflow drain pan connection: shall be on the same side and at a higher elevation than the primary drain pan connection.

3. Water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.
4. Auxiliary drain pan with drain connection.
5. Auxiliary drain pan with capped or no drain connection, with a water-level detection device conforming to UL 508, factory wired to shut off the equipment prior to auxiliary drain pan overflow. With auxiliary contact to simultaneously signal owner's Building Automation System.

2.5 FILTERS

- A. Minimum arrestance according to ASHRAE 52.1, and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2.
 1. Disposable Type: 2 inch pleated cotton-polyester media: 90 percent arrestance and MERV A rating of 8 (or as scheduled) when tested per Appendix J of ASHRAE 52.2.

SELECT BELOW, DIRECTION OF FILTER REMOVAL. WHEN SELECTING, CONSIDER THE OBSTRUCTIONS TO FILTER REMOVAL AT THE BLOWER COIL MOUNTING LOCATION.

2. Provide filters that are removable horizontally from the casing.
3. Provide filters that are removable vertically from the casing.

IF MIXING DAMPERS ARE REQUIRED, INDICATE SUCH ON THE CONTRACT DRAWINGS.

2.6 INLET DAMPER MIXING SECTION

- A. Provide when indicated on Drawings.
- B. The outside and return airstreams shall be directed into each other in a mixing box by parallel blade damper assemblies oriented to facilitate mixing of the airstreams.
 1. Section shall be constructed of minimum 18 gauge galvanized steel.
 2. Two, steel, low leak parallel blade dampers in a heavy-gauge steel frame with extruded vinyl blade seals and flexible metal jamb seals.
 3. Provide extended drive rod for externally mounted actuator connection.
 4. Provide access panels for access to the section's internal components.

INDICATE THE FAN TYPE (FC, BI, INLET TYPE, ETC.) ON THE DRAWING SCHEDULES, OR ADD BELOW. FC IS TYPICAL. IF FAN IS DIRECT DRIVE, CONSIDER USING THE FAN COIL SPEC, OTHERWISE EDIT THE BELOW.

BELOW SECTION WILL ALLOW THE BLOWER COIL MFR. TO PROVIDE THEIR STANDARD QUALITY FANS AND DRIVES. FOR PROJECTS WITH LARGE QUANTITIES OF BLOWER COILS, CONSIDER EDITING THE BELOW TO SPECIFY HIGHER QUALITY FANS AND DRIVES. U-M SPEC SECTION 233400 "FANS" IS A RESOURCE FOR HIGH QUALITY FAN/DRIVE SPEC. LANGUAGE.

2.7 FAN AND MOTOR:

- A. Fan: Galvanized steel or aluminum wheels; galvanized-steel fan scrolls. Adjustable speed belt drive with motor mounted on an adjustable steel base plate.
- B. Motor: Provide motors in compliance with Related Section "Motors".
- C. Motor Wiring: Terminate wiring in a junction box, external to the unit casing.

2.8 SOURCE QUALITY CONTROL

- A. Factory test all coils with a minimum of 350 psig air pressure while submerged under water.
- B. Assemble and factory test each unit prior to shipping. Cycle controls and operate fan at all speeds to check for proper operation. Correct all deficiencies prior to shipping.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine areas to receive blower-coil units for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Examine rough-in construction for piping and electrical connections to verify actual locations before blower-coil-unit installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install blower coil units level and plumb and to comply with Quality Assurance Standards and manufacturer's installation instructions.

REGARDING THE BELOW PARAGRAPH: BE SURE TO SHOW OVERFLOW DRAIN ROUTED TO A CONSPICUOUS TERMINATION POINT, IF AN OVERFLOW DRAIN IS BEING USED.

3.3 CONNECTIONS

- A. General piping installation requirements are specified in other Related Documents Specification Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Connect hydronic, condensate drain, and overflow drain piping to the unit.

3.4 TEMPORARY USE PRIOR TO OCCUPANCY

- A. Start units for temporary use only with the express written permission of the Owner and compliance with all requirements of the Contract Documents.
- B. Complete all drywall taping, sanding and finishing in an area prior to any early use of units serving that area.

- C. Thoroughly clean unit of all grease, dirt, dust, etc.
- D. Prior to placement into temporary service:
 - 1. Perform manufacturer's pre-start protocol.
 - 2. Perform commissioning activities.
- E. Install a complete set of temporary filters in the unit equal to the quality and efficiency of the specified permanent filters. If the unit was equipped with pre-installed filters, they may be used for temporary service. Provide factory new, clean filters in units at final turn over to the Owner.
- F. During temporary service, perform all manufacturer's recommended and required routine maintenance procedures, including filter replacement at regular intervals, as required. Continuously maintain a log of all such procedures completed. Store log at unit during temporary use period and include log as part of the final Operation and Maintenance Manual.

3.5 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 - 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
 - 2. Test unit operation with thermostat in all modes of operation.
 - 3. Verify that drain pans collect all condensate and are properly sloped to drain so that no condensate is retained in the pans.
 - 4. Remove and replace malfunctioning units and retest as specified above.

3.6 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 1 Section titled Commissioning and other requirements of the Contract Documents.

3.7 CLOSEOUT ACTIVITIES

- A. Perform all commissioning activities, even if previously performed to ready for temporary use.
- B. After unit has completed final commissioning and just prior to final acceptance by Owner:
 - 1. Thoroughly clean unit of all grease, dirt, dust, etc., lubricate bearings, align and tighten belts.
 - 2. Install a new, complete set of filters.
 - 3. Touch up damaged galvanized surfaces with zinc rich paint, minimum 65 percent metallic zinc by weight. Touch up damaged painted surfaces with manufacturer provided touch-up paint

3.8 OWNER TRAINING

- A. In cooperation with the Commissioning Agent, train Owner's personnel on basic blower-coil unit maintenance by demonstrating the following: location of control devices, removal of access panels, filter replacement, and motor replacement.

SPECIFICATION DIVISION 23

NUMBER SECTION DESCRIPTION

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238245 - CHILLED BEAMS

END OF CONTENTS TABLE

DIVISION 23 HEATING, VENTILATING AND AIR CONDITIONING (HVAC)
SECTION 238245 - CHILLED BEAMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 221113: Piping Materials and Methods.
 - 2. Section 220523: Valves.
 - 3. Section 220719: Mechanical Systems Insulation.
 - 4. Section 232116: Hydronic Piping Specialties.
 - 5. Section 230900: Mechanical Systems Controls.
 - 6. Section 233100: HVAC Ducts and Casings.

1.2 SUMMARY

- A. Section Includes
 - 1. Passive Chilled Beams (Cooling and/or Heating)
 - 2. Active Chilled Beams (Cooling and/or Heating)

1.3 SUBMITTALS

- A. Product Data: Include manufacturer, catalog number, catalog illustrations, piping and details, materials of construction, accessories, operating and maintenance clearance requirements, dimensions, weights, rough-in requirements, component locations, component sizes, and location and size of each field connection. Include plenum gauge, grille gauge, grille removal method for access, mounting and hanging details, coil materials, tube size, tube wall thickness, fin gauge, and fin spacing.

Include octave band and A-weighted sound power data for each unit type at rated capacity.
- B. Equipment Schedule: Include each unit with the following information:
 - 1. Equipment tag.
 - 2. Room Number Location.
 - 3. Model number.
 - 4. Manufacturer's size designation.
 - 5. Configuration (floor mount, wall mount, ceiling mount, recessed, suspended).
 - 6. Coil total and sensible heat transfer capacity, entering and leaving water temperatures, fin spacing, water flow rate, and water pressure drop.
 - 7. Primary airflow volume, unit primary airflow pressure drop, induced airflow, primary airflow supply temperature, and room airflow supply temperature.
 - 8. Unit total and sensible cooling capacity.

- C. Maintenance schedules and repair part numbers.
- D. Warranty Documentation: Submit warranty documentation according to requirements of Contract Documents.
- E. Shop Drawings
- F. Installation, Operation and Maintenance Manuals

1.4 COORDINATION

- A. Coordinate dimensions and arrangement with building elements including ceiling construction, light fixtures, duct connections, pipe entry location, and wall construction.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the following quality assurance standards; latest editions, unless noted otherwise.
 - 1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 - 2. National Fire Protection Association (NFPA):
 - a. 90A Standard for the Installation of Air Conditioning and Ventilating Systems.
 - b. National Electrical Code
 - 3. Underwriters Laboratories, Inc. (UL)
 - 4. Standard 200: Methods of Testing Chilled Beams

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- B. Packaging and Protection: Ship in plastic wrap for protection and cap pipe connections with plastic caps.
- C. Identification: Ship each unit tagged with design/submittal tag number and installed room number.

1.7 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion unless indicated otherwise.

PART 2 - PRODUCTS

2.1 PASSIVE CHILLED BEAMS

- A. Provide Chilled Beam performance and characteristics per schedule on drawings.
- B. Description: The passive chilled beams shall utilize natural convection of room air across a water coil mounted within the unit to provide sensible cooling. The air shall be drawn from a ceiling cavity or the surrounding air in the occupied space, and pass through the coil and into the space below. A housing encloses the sides of the coil. Provide a return plenum if the unit is installed above the ceiling and air is drawn from the occupied space. Provide a grille to conceal the coil.
- C. Coil: Seamless Copper tube mechanically expanded into aluminum fins. Provide 0.5" minimum tube diameter with 0.016" minimum wall thickness. The fins shall be a minimum of 0.006" thick and spaced no closer than 12 FPI. Provide soldered tube joints. The coil connections shall be at one end upturned 90 degrees for vertical connection and be the same size as the tube ready for solder connection. The coil shall have a minimum working pressure of 150 psi and each coil factory tested at a minimum of 225 psi. Coil shall be removable from the room side.
- D. Housing: Galvanized or galvanized. 20 gauge thickness minimum. When exposed provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal.
- E. Grille: Perforated galvanized or galvanized. 20 gauge thickness minimum. Provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal. Grille shall be hinged and removable without special tools.
- F. Return Plenum: Provide an integrated return plenum. Plenum shall be galvanized or galvanized. 20 gauge thickness minimum. When exposed provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal.
- G. Trim: Provide a minimum of four hanging brackets to support the chilled beam with threaded rod or cable from above. Provide trim for lay-in ceiling grid or hard ceiling based on ceiling type.
- H. Manufacturers: Price, Dadanco, Krueger, Titus.

2.2 ACTIVE CHILLED BEAMS

- A. Description: Primary air is supplied to the chilled beam plenum and injected at a high velocity so that room air is induced across a water coil mounted within the unit to provide sensible cooling or heating. The induced air shall mix with primary air and shall be supplied into the space through integrated discharge slot(s). A housing encloses the sides of the coil. A plenum with nozzles form the supply plenum and discharge slots. A grille is provided to conceal the coil.

- B. Coil: Seamless Copper tube mechanically expanded into aluminum fins. Provide 0.5" minimum tube diameter with 0.016" minimum wall thickness. The fins shall be a minimum of 0.006" thick and spaced no closer than 12 FPI. Provide soldered tube joints. The coil connections shall be at one end upturned 90 degrees for vertical connection and be the same size as the tube ready for solder connection. The coil shall have a minimum working pressure of 150 psi and each coil factory tested at a minimum of 225 psi. Coil shall be removable from the room side.
- C. Housing: Galvanized or galvanized. 20 gauge thickness minimum. When exposed provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal.
- D. Grille: Perforated galvanized or galvanized. 20 gauge thickness minimum. Provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal. Grille shall be hinged and removable without special tools.
- E. Supply Plenum: Provide integrated supply plenum with top or side, oval or round, duct connections. Plenum shall be galvanized or galvanized. 20 gauge thickness minimum. When exposed provide polyester powder coat of standard white or custom color when indicated. Provide color selection with submittal. Provide pressure tap for measuring plenum pressure and flow curve on side of plenum. Seal plenum so there are no detectible leakage by hand at 1" sp.
- F. Trim: Provide a minimum of four hanging brackets to support the chilled beam with threaded rod or cable from above. Provide trim for lay-in ceiling grid or hard ceiling based on ceiling type. Provide coanda wings, 6 inch wide minimum, for open ceiling installations. Coanda wings shall be 20 gauge minimum galvanized or galvanized and coated to match the grille.
- G. Manufacturers: Price, Dadanco, Krueger, Titus.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Review and examine conditions affecting work. Proceed with installation only after unsatisfactory conditions have been corrected.
- B. Commissioning: Review and perform required commissioning activities in the pre-construction phases.

3.2 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections and prepare test reports:
 1. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
 2. Test unit operation with thermostat in all modes of operation.
 3. Remove and replace malfunctioning units and retest as specified above.

Engineer shall verify that the Mechanical Systems Controls SPECIFICATION DESCRIBES controls start-up for terminal units.

- B. Coordinate controls start-up for terminal units with the Mechanical Systems Controls Specifications.

3.3 HANGER AND SUPPORT INSTALLATION

- A. Comply with applicable SMACNA HVAC Duct Construction Standards and Hanger and Support construction standards, and applicable Division 23 Sections.
- B. Support Chilled Beam
- C. s independently from adjacent ductwork. Ensure supports do not interfere with accessibility of other equipment, e.g., access to Chilled Beam DDC control enclosure. Do not hang TUs from piping, other ducts or equipment.
- D. Support chilled beams from the structure above using cable designed for equipment support unless other indicated.
- E. Provide sway brace for chilled beams not in ceilings, hung with cable, and connected with flexible duct and pipe.

3.4 CHILLED BEAM INSTALLATION

- A. Install Chilled Beams in accordance with manufacturer recommendations, Contract Drawings, and reviewed submittals.
- B. Label unit according to the applicable detail.
- C. Position Chilled beams to comply with clearance requirements and for ease of maintenance.
- D. Install Chilled Beams using flexible pipe connections and flexible duct specified in other specification sections.

3.5 COMMISSIONING

- A. Perform the commissioning activities as outlined in the Division 01 Section Commissioning and other requirements of the Contract Documents.

3.6 SYSTEM START-UP

- A. After start-up and operation, sensors and controllers shall be cleaned.

3.7 ADJUSTING, CLEANING, PROTECTION

- A. Protect Chilled Beams throughout the entire construction period, until Commissioning and Substantial Completion.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

SPEC EDITOR: IN 1 AND 2 BELOW, SELECT PROPER SPEC SECTION NUMBER BY PROJECT. DELETE SUSTAINABLE DESIGN / LEED IF NOT APPLICABLE TO PROJECT. DELETE COMMISSIONING IF NOT APPLICABLE TO PROJECT.

- B. Related Sections:

1. Section 018113: Sustainable Design Requirements.
2. Section 019110/019100: Commissioning
3. Section 220500: Common Work Results for Mechanical
4. Section 221113: Piping Materials and Methods
5. Section 220523: Valves
6. Section 220553: Mechanical Identification
7. Section 220719: Mechanical Systems Insulation
8. Section 221119: Domestic Water Piping Specialties
9. Section 232216: Steam and Condensate Piping Specialties
10. Section 230900: Mechanical Systems Controls
11. Division 26: Electrical

1.2 SUMMARY

- A. Products specified in this section include the following:
1. Jacketed Steam Humidifiers
 2. Steam Injection Dispersion Panels
 3. Self-contained Electric Humidifiers
 4. Condensate Drain Coolers

1.3 SUBMITTALS

- A. Product Data: Include catalog illustrations, model, rated capacities, performance, weights, dimensions, component sizes, rough-in requirements, piping and wiring diagrams and details, materials of construction, accessories, operating and maintenance clearance requirements. Wiring diagrams shall be project specific, and differentiate between factory wiring and field wiring. Include shop drawings and fabrication drawings for equipment indicating piping connections, power and utility requirements, rigging, installation and support details and instructions. Include written sequence of operations for all controls.
- B. Provide information for the following:
 - 1. At conditions specific to the project:
 - a. Non-wetting (absorption) distance, assuming air downstream of the humidifier is 90% R.H. at 52°F
 - b. Air pressure drop across the humidifier array
 - c. For steam injection dispersion panels, required orientation of tubes in the duct.
 - 2. Strainers and steam traps
 - 3. Humidifier actuator and temperature switch
 - 4. Room and duct transmitters and proof of air flow switch
 - 5. Electrode type self-contained Electric humidifiers:
 - a. Published cylinder life based on incoming water conductivity
 - b. Published replacement pricing
 - 6. Condensate drain cooler
 - 7. Installation, operation, and maintenance manuals

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Underwriters Laboratories

1.5 DELIVERY, STORAGE AND HANDLING

- A. Ship all components in weather-proof wrap for storage outdoors. Protect control panels, pipe openings, and other sensitive components with heavy plastic or other durable means to ensure cleanliness and prevent damage during shipping and storage. Maintain protection during installation.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design and model numbers (where provided) are Dri-Steem. Subject to compliance with all requirements and matching the features of the Basis of Design and model numbers, provide products from any of the below manufacturers.

1. Armstrong
2. Spirax Sarco
3. Condair
4. Hermidifier
5. Dri-Steem
6. Pure

SPEC EDITOR: INSTALLATION REQUIREMENTS ARE SPECIFIC FOR EACH TYPE HUMIDIFIER, PARTICULARLY FOR STEAM INJECTION DISPERSION PANELS. CAREFULLY REVIEW MANUFACTURER'S LITERATURE TO ASSURE THAT THE TYPE YOU ARE SELECTING WILL WORK PROPERLY UNDER YOUR PROJECT CONDITIONS. MAKE SURE TO PROVIDE A DETAIL ON THE PROJECT DRAWINGS INDICATING INSTALLATION REQUIREMENTS SPECIFIC TO THE HUMIDIFIER(S) SELECTED.

SPEC EDITOR: BE SURE TO INDICATE THE REQUIRED NON-WETTING (ABSORPTION) DISTANCE FOR EACH HUMIDIFIER AND THE DUCT AIR PRESSURE DROP ON THE HUMIDIFIER SCHEDULE (PREFERRED) OR IN THIS SPECIFICATION. IT IS ALWAYS PREFERRED TO USE CENTRALLY GENERATED STEAM WHEN AVAILABLE. DISCUSS SPECIAL SITUATIONS THAT MAY REQUIRE USE OF STEAM TO STEAM ("CLEAN STEAM") HUMIDIFIERS OR GAS FIRED HUMIDIFIERS WITH THE DESIGN MANAGER.

2.2 JACKETED STEAM HUMIDIFIERS

A. Steam separator type that discharges dry steam into the air stream through a steam jacketed dispersion tube or manifolded dispersion tubes. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. Provide manifolded multiple dispersion tube type when required to meet the capacity requirements or the conditions at the mounting location, including the indicated non-wetting (absorption) distance. All components shall be rated for a minimum 100 PSIG steam working pressure.

B. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream.

C. Unless indicated otherwise, the air pressure loss across the humidifier array shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.

D. Provide type 304 stainless steel dispersion tubes, manifold and separator.

- E. Dispersion tubes shall be surrounded by a steam jacket and shall span the width of duct.
- F. Provide bronze or stainless steel, fail closed, electric steam control valve for operation with a modulating control signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.
- G. Provide an electric condensate temperature switch for interlocking with control valve. Switch shall be normally closed and shall prevent steam flow to dispersion tubes upon cold start or flooded condensate line.
- H. Steam traps shall be per Related Section, sized and provided by the humidifier manufacturer. Provide F & T or thermostatic traps that allow modulating steam control valve service.

SPEC EDITOR: DESIGNER SHOULD INDICATE IN THE HUMIDIFIER SCHEDULE IF THE HUMIDIFIER STEAM SUPPLY IS GENERATED BY RO/DI WATER

- I. Provide Type 316 stainless steel dispersion tubes, manifold, separator, and interconnecting piping; and stainless steel strainers, control valve and traps when fed by clean steam (steam generated with RO/DI water).

SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. DESIGNER SHOULD EVALUATE THE ENERGY PENALTY FROM INCREASED AIR PRESSURE DROP CAUSED BY INSULATED TUBES VERSUS THE ENERGY SAVED. THE ENERGY CODE REQUIRES THAT JACKET STEAM AUTOMATICALLY TURNS OFF WHEN HUMIDIFICATION IS NOT REQUIRED. THIS GENERALLY NEGATES MUCH OF THE BENEFIT OF INSULATED DISPERSION TUBES. DESIGNER SHOULD CONSIDER IF EACH HUMIDIFIER REQUIRES A JACKET STEAM CONTROL VALVE OR IF THE STEAM SUPPLY TO MULTIPLE JACKETS CAN BE TURNED OFF BY A COMMON CONTROL VALVE. A COMMON VALVE MAY BE POSSIBLE IF THE HUMIDIFIERS OPERATE AT THE SAME TIME SUPPLYING ZONES WITH THE SAME SETPOINT. ZONES WITH A UNIQUE SETPOINT SHOULD HAVE THEIR OWN JACKET STEAM CONTROL VALVE. NOTE THAT JACKET STEAM CONTROL VALVES SHOULD GENERALLY BE OPERATED BASED ON AN ACTUAL CALL FOR HUMIDITY, AS OPPOSED TO ON A SEASONAL BASIS.

- J. Dispersion tubes shall be insulated with 1/2" fiberglass, enclosed in a stainless steel wrapper.

2.3 STEAM INJECTION DISPERSION PANELS

SPEC EDITOR: FOR INSTALLATION IN AHU'S OR DUCTS AND WHERE AVAILABLE ABSORPTION DISTANCE IS VERY SMALL, 3' OR LESS.

SPEC EDITOR: WHEN ABSORPTION DISTANCES PERMIT, JACKETED TYPE HUMIDIFIERS, SPECIFIED IN THE ARTICLE ABOVE, ARE PREFERRED OVER STEAM INJECTION DISPERSION PANELS DUE TO LOWER INITIAL COST AND HIGHER RELIABILITY.

SPEC EDITOR: BASIS OF DESIGN FOR THIS SPEC IS DRI-STEEM LV/LH (TYPE A) AND DRISTEEM XV (TYPE B). LV OR LH CAN BE USED WITH PRESSURIZED OR NON-PRESSURIZED STEAM, CONDENSATE MUST DRAIN BY GRAVITY. XV CAN ONLY BE USED WITH PRESSURIZED STEAM, BUT CAN LIFT CONDENSATE. EDIT SPEC TO SELECT REQUIRED TYPE.

SPEC EDITOR: TYPE A HUMIDIFIER MUST BE MOUNTED HIGH ENOUGH TO ALLOW GRAVITY DRAINING OF CONDENSATE AND REQUIRES A DEEP PLUMBING TRAP (7"-10" DEEP) FOR CONDENSATE DISPOSAL, THEREFORE MAKE SURE MOUNTING LOCATION IS HIGH ENOUGH TO ACCOMMODATE SUCH A TRAP. TYPE B MAY BE SPECIFIED WHEN THE MOUNTING LOCATION IS TOO LOW TO ACCOMMODATE TYPE A, PROVIDED PRESSURIZED STEAM IS AVAILABLE.

SPEC EDITOR: BE SURE TO SCHEDULE THE NON-WETTING (ABSORPTION) DISTANCE AND THE DISPERSION PANEL DUCT AIR PRESSURE DROP ON THE HUMIDIFIER DRAWING SCHEDULE.

A. Ultra-sorb LV/HV Multi-tube style - TYPE A:

1. Multi-tube non-jacketed style humidifier for use with pressurized or non-pressurized steam and gravity draining of condensate. Each panel shall consist of a steam supply header/separator, a condensate collection header and a bank of closely spaced steam dispersion tubes spanning the distance between the two headers. Stainless steel construction. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. All components shall be rated for a minimum 100 PSIG steam working pressure.
2. Each steam tube outlet shall contain an orifice sized for its required steam capacity. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream.
3. Unless indicated otherwise, the air pressure loss across the humidifier array shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.
4. Provide horizontally or vertically oriented tubes as required for the specific location, considering the steam pressure available at that location.
5. Each packaged humidifier panel assembly of tubes and headers shall be contained within a galvanized metal casing to allow convenient duct mounting or to facilitate the stacking of and/or the end-to-end mounting of multiple panels in ducts or air handler casings. Provide multiple panels and all related accessories for the panels and installation, in order to achieve the specified capacities.
6. Provide type 304 stainless steel tubes and headers. All joints shall be heli-arc welded.
7. Provide bronze or stainless steel, fail closed, electric steam control valve for operation with a modulating control signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.

SPEC EDITOR: DESIGNER SHOULD INDICATE IN THE HUMIDIFIER SCHEDULE IF THE HUMIDIFIER STEAM SUPPLY IS GENERATED BY RO/DI WATER

8. Provide Type 316 stainless steel humidifier construction and stainless steel strainer and control valve when fed by clean steam (steam generated with RO/DI water).

SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. ENGINEER MUST EVALUATE IF HIGH-EFFICIENCY INSULATED TUBES ARE COST EFFECTIVE AND APPROPRIATE FOR THE PROJECT.

9. High-efficiency insulated tubes shall be used to substantially reduce dispersion-generated condensate and airstream heat gain. Tube insulation shall be 1/8" thick polyvinylidene fluoride insulation (PVDF).

B. Ultra-sorb XV Multi-tube Style - TYPE B:

1. Multi-tube non-jacketed style humidifier for use with pressurized steam, with integral heat exchanger to provide for condensate lifting. Each panel shall consist of a steam supply header/separator, a condensate collection header and a bank of closely spaced steam dispersion tubes spanning the distance between the two headers. Stainless steel construction. Humidifiers shall be complete with Y-type steam supply strainer, modulating steam control valve, condensate temperature switch and steam traps; all provided by the humidifier manufacturer. All components shall be rated for a minimum 100 PSIG steam working pressure.
2. Each steam tube outlet shall contain an orifice sized for its required steam capacity. The humidifier shall provide absorption characteristics that preclude wetting on any in-duct surfaces within the indicated absorption distance downstream of the humidifier while maintaining conditions of 90% (maximum) relative humidity at a minimum temperature of 52°F in the duct air stream
3. Unless indicated otherwise, air pressure loss across humidifier panel shall not exceed 0.10" W.C. at a duct air velocity of 1200 FPM.
4. Provide horizontally or vertically oriented tubes as required for the specific location, considering available steam pressure at that location.
5. Each packaged humidifier panel assembly of tubes and headers shall be contained within a galvanized metal casing to allow convenient duct mounting or to facilitate the stacking of and/or the end-to-end mounting of multiple panels in ducts or air handler casings. Provide multiple panels and all related accessories for the panels and installation, in order to achieve the specified capacities.
6. Provide type 304 stainless steel tubes and headers. All joints shall be heli-arc welded.
7. Provide bronze or stainless steel, fail closed, electric steam control valve for operation with a modulating control signal, minimum 13:1 rangeability and ANSI Class 5 Shutoff.
8. Provide an electric condensate temperature switch for interlocking with control valve. Switch shall be normally closed and shall prevent steam flow to dispersion tubes upon cold start or flooded condensate line.
9. Provide an integral steam heat exchanger with steam trap arranged to vaporize dispersion-tube-generated steam condensate and return pressurized condensate to a condensate return main.

SPEC EDITOR: THE REQUIREMENT FOR INSULATED TUBES IS CARRIED AS HIDDEN TEXT BELOW. ENGINEER MUST EVALUATE IF HIGH-EFFICIENCY

INSULATED TUBES ARE COST EFFECTIVE AND APPROPRIATE FOR THE PROJECT

10. High-efficiency insulated tubes shall be used to substantially reduce dispersion-generated condensate and airstream heat gain. Tube insulation shall be 1/8" thick polyvinylidene fluoride insulation (PVDF).

2.4 SELF-CONTAINED ELECTRIC HUMIDIFIERS

- A. Packaged wall mounted self-contained U.L. listed electric humidification unit providing all required steam generation equipment and controls, to provide atmospheric pressure steam generation. Provide either Steam Injection Distribution Panels for steam injection into ducts, or Blower Pack for direct space applications, as indicated.

SPEC EDITOR: SELECT EITHER ELECTRODE TYPE OR RESISTANCE HEATING ELEMENT TYPE, DELETE TYPE NOT USED. MAKE SURE SPEC OR DRAWINGS ALSO INDICATE THE REQUIRED STEAM INJECTION SYSTEM FOR USE WITH THE ELECTRIC HUMIDIFIER: EITHER STEAM INJECTION DISTRIBUTION PANELS OR BLOWER PACK.

SPEC EDITOR: ELECTRODE TYPE MUST USE TAP WATER, NOT RO/DI WATER. PLASTIC STEAM CYLINDERS ARE DISPOSABLE AND NEED TO BE CHANGED REGULARLY; EVEN WITH DISPOSABLE CYLINDERS THIS TYPE IS LESS RELIABLE THAN RESISTANCE TYPE SINCE DRAINS AND DRAIN VALVES CAN PLUG. ACCURACY OF CONTROL IS +/- 5%, NOT RECOMMENDED WHERE HIGH ACCURACY CONTROL IS DESIRED.

SPEC EDITOR: RESISTANCE HEATING ELEMENT TYPE USES RO/DI WATER AND PROVIDES BETTER CONTROL ACCURACY THAN ELECTRODE TYPE, TYPICALLY +/- 3% OR BETTER. CYLINDERS DO NOT NEED TO BE REPLACED; MORE RELIABLE THAN ELECTRODE TYPE WHEN RO/DI FEED WATER IS USED. CAPABLE OF OPERATION WITH TAP WATER (IF SPECIFIED THAT WAY, NOT SPECIFIED THAT WAY BELOW) BUT WILL RAPIDLY FOUL. CITY OF ANN ARBOR WATER CONDUCTIVITY WAS 500-700 MICRO-MHOS (UMHOS) (RECORDED DURING FY 2010-2011).

- B. Furnish electrode heating element type humidifier capable of boiling water at the required capacity with a minimum conductivity of 125 umho (micro-mho).
 1. Replaceable plastic steam cylinder.
 2. Controller shall monitor water conductivity and automatically drain and flush unit to reduce solids build-up and optimize humidifier performance.
 3. Published cylinder life based on incoming water conductivity.
 4. Published replacement pricing.
 5. Pre-notification of automatic shutdown at end of cylinder life
 6. Power to the heating elements shall be controlled through the actuation of contactors and solid state relays, to provide a control accuracy of +/- 5% RH or better.
- C. Furnish resistance heating element type humidifier capable of boiling water at the required capacity using reverse osmosis or de-ionized water (conductivity of 50 umho (micro-mho) or less).
 1. Serviceable stainless steel steam cylinder.

2. Controller shall automatically drain and flush unit to reduce solids build-up and optimize humidifier performance.
 3. Corrosion resistant heating elements.
 4. Water level control shall be provided by float switch or float valve located in a portion of the tank segregated from the main steam generating portion of the tank.
 5. Power to the heating elements shall be controlled through the actuation of contactors and solid state relays, to provide a control accuracy of +/- 3% RH or better.
- D. Over temperature safety switch to prevent heating element failure.
 - E. Water make-up system with inlet strainer, solenoid valve with flow regulator, and fill tee or cup with built-in air gap to prevent back siphoning
 - F. Solenoid operated automatic drain valve.
 - G. Bottom drain outlet. Large perforated strainer at drain outlet to prevent blockage of drain valve or drain lines
 - H. A system on/off switch with power indicator light, external to the humidifier enclosure.
 - I. Enclosure to be minimum 18 gauge steel and powder-coat painted to prevent against corrosion. The electrical and steam generating compartments shall be separate, but contained within the same cabinet to minimize field wiring. The cylinder access door shall be lockable with a key. A door interlock switch shall prevent humidifier operation when the access door is open.

SPEC EDITOR: DELETE BLOWER PACK PARAGRAPH BELOW IF A BLOWER PACK IS NOT REQUIRED. BLOWER PACKS ARE AVAILABLE THAT PRODUCE NO VISIBLE STREAM TRAIL, BUT TYPICALLY ONLY FOR LOW STEAMING CAPACITY HUMIDIFIERS. IF NO VISIBLE STEAM TRAIL IS DESIRED, MODIFY THE BELOW TO REQUIRE THAT FEATURE, AFTER VERIFYING THAT THE HUMIDIFIER MANUFACTURER CAN PROVIDE SUCH A BLOWER PACK FOR YOUR REQUIRED STEAM OUTPUT.

- J. Provide a fan blower pack to disperse steam directly into the room air. Blower pack shall be 120 VAC and shall be capable of being mounted integral to the top of the humidification unit, or remotely via interconnecting piping. Provide an air flow proving switch to prevent humidification when the blower fan is off.
- K. Controls
 1. Provide a UL listed and labeled microcomputer based controller with the following capabilities:
 - a. Control of humidity to within +/- 3% RH (resistance heating element type humidifiers) or +/- 5% RH of set point (electrode heating element type humidifiers).
 - b. Proportional/integral/derivative (PID) algorithms for humidifier control.
 - c. Integral 24 VDC power supply of adequate size to power controllers and all axillary devices (humidity transmitters, etc.)
 - d. LCD or LED display and integral controller keypad to allow adjustment of all humidifier settings, programming of alarms and viewing of alarm history.
 - e. High water sensor circuitry to prevent over filling.

- f. Integral drain water tempering feature. Drain water shall be automatically cooled to below 140°F before entering the drain.
 - 1) If unit cannot provide this feature, provide an external condensate drain cooler.
- g. Automatic drain and flush feature to reduce the concentration of conductive ions in the water and reduce mineral build-up.
- h. Automatic off-season shut-down [user adjustable, factory default set after 3 days of "no call"] to completely drain the tank(s) and automatically restart unit on call for humidity.
- i. External fan control: controller shall have the ability to cycle an external steam dispersion fan on and off in conjunction with a call for humidification.
- j. Fan control off-delay feature. When the humidifier unit controls an external fan, fan "off" is time delayed after steam output stops.
- k. A dry contact rated 10 amps at 24 VDC, which can be programmed to energize when any humidifier alarm condition occurs.
- l. Password protection. Controller adjustment shall only be enabled after a password is entered. It shall be possible to disable the password protection feature.
- m. For duct mounted humidifiers, controller shall limit duct humidity downstream of the humidifier to a user adjustable set point by modulating humidifier output, and prevent humidifier operation if duct air flow is not present.
- n. For space mounted humidifiers, controller shall prevent humidifier operation if air flow is not present at the blower pack fan.
- o. The controller shall monitor and display the following conditions, minimum:
 - 1) Space relative humidity
 - 2) Space relative humidity set point
 - 3) Space dew point
 - 4) Space dew point set point
 - 5) Duct relative humidity
 - 6) Duct high relative humidity limit set point
 - 7) Air flow status
 - 8) Tank temperature
 - 9) Tank level
 - 10) All units shall be displayed in inch-pounds.
- 2. Controller shall accept two wire 4-20mA input signals for space humidity, duct humidity, and room temperature.
- 3. Provide the following auxiliary devices for use with the humidifier controller:
 - a. 4-20 mA room humidity transmitter
 - b. 4-20 mA duct relative humidity transmitter (duct mounted humidifiers only)
 - c. Air flow proving switch
 - d. Auxiliary devices shall comply with Related Section Mechanical Systems Control, and be compatible with the humidifier controller.
- 4. Controller shall be capable of operation in ambient conditions of 32°F to 140°F and a humidity range of 5% to 95%, non-condensing.

5. The controller shall hold its software in non-volatile memory. On-line field modified data entries shall be stored in flash memory to prevent accidental loss of data due to power loss, voltage surge or spike. In the event of a complete power outage, all field and factory settings shall remain stored and shall automatically be restored when power is restored

SPEC EDITOR: THE BELOW FEATURE (IN HIDDEN TEXT) IS NOT AVAILABLE ON ALL BRANDS OR MODELS WITHIN A BRAND. IF YOUR PROJECT REQUIRES THIS FEATURE, RESEARCH AND SPECIFY SPECIFIC MFR.S AND MODELS THAT CAN PROVIDE IT.

6. Provide humidifier set point reset based on window glass temperature, to prevent condensation on windows. Provide control algorithm and 4-20 mA temperature transmitter with a RTD designed to be mounted on a window surface.

2.5 CONDENSATE DRAIN COOLER

- A. Provide a stainless steel drain cooler for condensate water being discharged. Provide a unit of size and volume adequate for handling the expected discharge from the humidification system.
- B. Drain cooler shall include a self-actuated thermostatically controlled water valve to control mixing.
- C. Drain cooler shall be capable of metering a sufficient amount of cold water into the mixing chamber to temper 212°F (100°C) water to a 140°F (60°C) max. discharge temperature
- D. Cooler dimensions must allow gravity flow of condensate to the waste discharge point based on the height of the humidifier's condensate discharge connection.
- E. Provide all mounting components and hardware required to properly support the drain cooler, independent of the humidifier unit.
- F. Provide a vacuum breaker in the unit to prevent backflow into the potable water systems.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Store units protected from weather, dirt, water, and construction debris.
- B. Examine roughing-in for equipment support, piping, and electrical connections to verify actual locations, sizes, and other conditions affecting equipment performance, maintenance, and operations. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install in strict compliance with manufacturer's installation instructions and Related Sections. Maintain manufacturer's recommended clearances for service and maintenance.

- B. Route steam line to humidifier by connecting to top of steam main (either straight up or at 45 degrees (preferred)). Provide a steam trap upstream of the humidifier if the top of steam main could not be tapped or if the distance between the steam main and the humidifier exceeds ten feet.
- C. Install separate devices furnished by manufacturer and not factory installed, including but not limited to control valve, steam traps, and temperature switch.
- D. Provide and install any manufacturer's accessory devices necessary or recommended to meet the particular needs of the humidifier installation.
- E. Install condensate drain coolers where indicated or required.
- F. Install to provide a minimum of ten feet of straight, unobstructed (no filters, turning vanes, etc.) duct downstream from the humidifier, unless a shorter non-wetting (absorption) distance upstream of such obstructions is indicated on the reviewed/approved submittal.
- G. Direction of steam injection relative to air flow is dependent on humidifier features and duct orientation. Review manufacturer's installation instructions carefully and install accordingly.
- H. Seal all duct penetrations made as a result of humidifier installation. Use sealant appropriate for service.

SPEC EDITOR: DELETE THE INSTALLATION INSTRUCTIONS FOR HUMIDIFIER TYPES THAT ARE NOT USED ON THE PROJECT.

- I. Jacketed Steam Humidifiers
 - 1. Install the humidifier's discharge steam trap to allow the condensate piping to drain by gravity. Do not lift condensate piping downstream of this steam trap.
- J. Steam Injection Dispersion Panels
 - 1. Dispersion panels are typically designed for a specific duct orientation (either horizontal or vertically oriented duct). Verify that the dispersion panel supplied is the correct model for the duct orientation at the humidifier mounting location.
 - 2. Rotate tubes to the correct orientation to inject steam into the air stream, typically perpendicular to the air stream.
 - 3. Install all required p-traps. Do not lift condensate discharging from p-traps

SPEC EDITOR: WHEN SELF CONTAINED ELECTRIC HUMIDIFIERS ARE USED, PROVIDE A DETAIL ON THE DRAWINGS INDICATING THE REQUIRED PIPING CONNECTIONS. HUMIDIFIER DRAINS MUST BE ROUTED TO A BUILDING FLOOR DRAIN VIA AN AIR GAP. THIS AIR GAP WILL BE A SOURCE OF FLASH STEAM AND SHOULD BE INSTALLED AT LOCATIONS WHERE THE FLASH STEAM WILL NOT CAUSE DAMAGE. INDICATE THE ROUTE OF THE STEAM VAPOR PIPING AND INDICATE IF HOSE OR PIPING IS TO BE UTILIZED. REVIEW MANUFACTURERS LITERATURE AND ASSURE VAPOR PIPING CAN BE INSTALLED TO MEET REQUIRED PITCH AND DRAINAGE REQUIREMENTS.

SPEC EDITOR: WHEN A FAN BLOWER PACK IS USED, THE DESIGNER MUST INDICATE A MOUNTING LOCATION THAT WILL PREVENT CONDENSATION OF THE VAPOR TRAIL ONTO ROOM SURFACES.

K. Self-Contained Electric Humidifiers

1. Mount humidifier and accessories at locations indicated on the drawings, maintaining manufacturers recommended service clearances.
2. Connect power to the humidifier. Comply with Division 26 requirements.
3. Install water supply and drain piping to each unit in compliance with manufacturer's recommendations, including pipe sizes.
 - a. Install an isolation valve, water hammer arrestor, and a strainer in the supply piping to the humidifier. Install the strainer between the isolation valve and the humidifier.
 - b. When plastic pipe is used for water supply piping, provide a minimum of 3 feet of stainless steel tubing for the last 3 feet of the supply piping before connecting to the unit.
 - c. Install unions at each supply and drain connection.
 - d. Install traps in supply and drain piping as recommended by the unit manufacturer.
 - e. All drain piping shall be type L copper pipe. When humidifiers are not installed in mechanical rooms or similar spaces that are typically inaccessible to occupants, insulate the tank/flush drain with ½" thick insulation per Related Section. Overflow drains do not require insulation.
4. Connect drain piping via an air gap fitting to the building drain. Prior to connecting to building drain, install a condensate drain cooler for units that are not equipped with an integral drain water tempering feature.
5. Install steam vapor hose or piping, as indicated, between steam dispersion device and humidifier.
 - a. Piping material shall be per Related Section.
 - b. When piping is used, install a union at the humidifier to allow humidifier removal.
 - c. Electrically ground the piping. Bond the ground to the humidifier cabinet ground.
 - d. When hose is used, use approved hose, fittings, and clamps obtained from the humidifier manufacturer.
 - e. Pitch steam vapor hose or piping to allow condensate to drain back into the humidifier.
 - f. Install steam condensate drains where required. Route such drains back to the humidifier tank fill connection in lieu of to a building drain where possible and when permitted by humidifier manufacturer.
 - 1) Where routed to building drains, provide condensate cooler and route drain through cooler before connection to building drain.
 - g. Insulate hose/piping per Related Section.
6. Install steam dispersion devices.
7. Install the fan blower pack when utilized.
 - a. Mount blower pack to prevent the discharged steam from condensing on nearby surfaces.
 - b. Install power to blower pack in compliance with Division 26 requirements.

- c. When mounted remote from the humidifier, install steam vapor hose or piping between humidifier and blower pack, pitched to allow condensate to drain back to humidifier. Install drain piping, complying with the same requirements indicated above for the humidifier drain piping.
8. Install separate devices furnished by manufacturer and not factory installed, including but not limited to, room humidity transmitter, proof of air flow switch, duct high limit humidity transmitter, and control wiring between fan blower pack and humidifier.
 - a. Install wiring in conformance with Related Section (Mechanical Systems Controls), utilizing approved contractors listed in that section.
9. Program the humidifier controller.

3.3 STARTUP

- A. Adhere to manufacturer's start-up instructions.
- B. Assure that actuators operate freely, close off steam tightly (no leaking steam discharges into the duct or space), and that the stem packing is not leaking. Verify proper steam trap operation.
- C. For dispersion panel types, check dispersion tubes for leaks at slip couplings while steam is being injected into the duct or space; repair any leaks.
- D. When provided as part of the humidifier package, verify that the air flow proving switch and duct high limit humidistat operate properly. Prime any p-traps and verify the operation of temperature switches, float switches, and similar devices specified or provided, prior to putting humidifier into operation.
- E. For self-contained electric humidifiers, adjust all control parameters as directed by the Commissioner and as appropriate for the project, and place into service. For projects without a Commissioner, consult the project engineer for direction regarding control parameter settings. Record all settings and include in the O&M manual.

3.4 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

SPEC EDITOR: TRAINING IS TYPICALLY ONLY REQUIRED FOR SELF CONTAINED ELECTRIC HUMIDIFIERS, FOR OTHER TYPES DELETE THE ARTICLE BELOW.

3.5 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.

1. Provide 2 hours of training minimum.

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 019100/019110 - Commissioning
 2. Section 017823 - Operation and Maintenance Manual
 3. Section 260513 - Medium, Low & Control Voltage Cables
 4. Section 260526 - Grounding and Bonding for Electrical
 5. Section 260533 - Electrical Materials and Methods

1.2 SUMMARY

- A. Provide all equipment, materials, labor and services necessary to furnish, install, test and turn over to the Owner the following electrical work as required by these specifications and as shown on the drawings, including all shop drawings, test reports, record drawings, operations and maintenance manuals, Owner training and incidental items necessary to complete the project in every respect.
- B. Participate in project coordination, scheduling and commissioning activities as specified in Division 01.

1.3 REFERENCES

- A. Provide equipment and materials that conform to the applicable standards of the following organizations:
1. American National Standards Institute (ANSI).
 2. Institute of Electrical and Electronic Engineers (IEEE).
 3. National Electrical Manufacturers Association (NEMA).
 4. National Fire Protection Association (NFPA).
 5. Telecommunications Industry Organization/Electronic Industries Alliance (TIA/EIA)
- B. All materials and equipment shall be listed and labeled by Underwriters Laboratories (UL), Electrical Testing Laboratories (ETL), MET Laboratories (MET), or the Canadian Standards Association (CSA).

C. Install equipment and materials in compliance with the following:

1. Michigan Electrical Code (MEC).
2. Michigan Building Code (MBC).
3. Michigan Mechanical Code (MMC).
4. Michigan Plumbing Code (MPC).
5. Americans with Disabilities Act (ADA).
6. State of Michigan DLEG Bureau of Fire Services.
7. Owner's Inspection Authorities.
8. Manufacturers' instructions.

1.4 DESIGN DOCUMENTS

- A. Contact the Owner's Representative about design questions and discrepancies between design documents before performing the work.
- B. Notify the Owner's Representative if existing code violations are uncovered that are not addressed in the design documents.

1.5 SUBMITTALS

- A. Submit for approval copies of shop drawings and product literature for the following equipment. Submittals shall include adequate information to prove that the systems, equipment and materials comply with the contract documents. Each copy of the submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked will be rejected.

DELETE ITEMS NOT PART OF THE PROJECT. ADD ITEMS AS NECESSARY.

1. Primary Equipment and Unit Substations.
 2. Generator and Uninterruptible Power Supply Systems.
 3. Distribution Transformers.
 4. Power Distribution, Lighting, and Receptacle Panels.
 5. Motor Control Centers, Starters and Motor Controls.
 6. Disconnect and Safety Switches.
 7. Lighting Contactors.
 8. Capacitors.
 9. Bus Ducts and Bus Duct Plugs.
 10. Wiring Devices.
 11. Transient Voltage Surge Suppressor Devices.
 12. Lighting Fixtures.
 13. Lighting Control Systems, Dimmer Systems and Switches.
 14. Timers and Time Switches.
 15. Fire Alarm Systems.
 16. Clocks and Clock Systems.
 17. Security and Card Access Control Systems.
 18. Sound Reinforcement Systems.
 19. Intercom and Public Address Systems.
 20. Closed Circuit TV Systems.
 21. Manholes and Duct Bank Spacers.
 22. Cable Trays.
 23. Conduits and Fittings.
 24. Cables, Wires and Terminations.
 25. Grounding Connections.
- B. Participate in the coordination drawing process and submit coordination drawings for approval in accordance with Division 01.

1.6 RECORD DOCUMENTS

- A. Submit record drawings in electronic format (AutoCAD or Microstation) for approval as specified in Division 01. Show the locations of equipment, light fixtures, switches, receptacles and junction boxes, riser information, the sizes of conduits and conductors, circuit numbers, and deviations from the design. Dimension the locations of buried, embedded and concealed primary and feeder conduits from permanent building features.

1.7 OPERATIONS AND MAINTENANCE MANUALS

- A. Submit for approval copies of operations and maintenance manuals as specified in Division 01 and the other Division 26, 27 and 28 sections. Each copy of the manuals shall be marked to indicate the specific models, sizes, types and options of the systems and equipment that were provided. Manuals not so marked will be rejected.

1.8 QUALITY ASSURANCE

- A. Electrical work shall be performed by licensed Journeyman or registered Apprentice Electricians. The number of Apprentices on a project shall not exceed the number of Journeymen. Electricians shall carry a copy of their license or registration while working on The Owner's projects.
- B. Contact the Owner's Code Inspection Department (734-764-2457) before starting the project to arrange for periodic inspections. Normal inspections will be performed at no cost to the Contractor, but the costs for repeat re-inspections of rejected work may be deducted from the Contractor's final payment.

1.9 SHIPPING, HANDLING AND STORAGE

- A. For deliveries of equipment to the Owner, notify the Owner's Representative of the deliveries 3 working days in advance. Deliveries shall occur on normal workdays between 8:00 AM and 2:00 PM. Deliveries that arrive without adequate notice may be rejected.
- B. Provide unloading and storage for Owner furnished equipment that is shipped to the project site.
- C. Pick up, transport and unload at the project site Owner furnished equipment that is stored in the Owner's warehouses.
- D. Provide packaging Waste management in accordance with Division 1.

1.10 WARRANTY

- A. Guarantee work for a period of one year from the date of the Owner's final acceptance of the project (Substantial Completion). A manufacturer's warranty beginning upon equipment receipt or startup shall be extended to one year from final project acceptance. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 SUBSTITUTIONS

- A. Provide equipment and materials from the manufacturers specified. Substitutions for specified products are acceptable only if proposed and approved in writing at the time of bid.

3.2 TEMPORARY SERVICE

DELETE NEXT SENTENCE IF THE PROJECT IS PAYING FOR THE ELECTRICITY. DELETE PARAGRAPH 1 BELOW IF THE UNIVERSITY IS PAYING FOR THE ELECTRICITY)

- A. Provide, maintain and remove all temporary lighting and power required to complete the project. If used reasonably, the Owner will pay for the electricity consumed.
 - 1. Provide an Owner approved watthour meter and box. Coordinate with the Plant High Voltage Shop (734 764-9445) and submit a Utilities Services Request for circuit energization.
- B. Provide ground fault protection on temporary feeders rated 200 amps and larger.
- C. Temporary feeders shall be limited to the following types:
 - 1. Conductors installed in raceways.
 - 2. NEC Type MC cable.
 - 3. Multi-conductor cable with an overall outer jacket (where inaccessible to the public and not subject to damage or abuse).
 - 4. NEC recognized hard usage cord or extra hard usage cord (where inaccessible to the public and not subject to damage or abuse).
- D. Install and support temporary wiring in accordance with the NEC requirements for permanent wiring.
- E. Label temporary power feeders every 25 feet maximum.
- F. Temporary wiring may either be copper or aluminum.

3.3 ELECTRICAL COORDINATION

- A. Participate in the project scheduling and coordination drawing activities specified in Division 01 of the project specifications.
- B. Coordinate power interruptions with the other disciplines in accordance with Division 01. Notify the Owner's Representative of power interruptions 3 working days in advance. Maintain power to all loads outside of the work area.
- C. Coordinate with the Plant Operations Call Center 10 working days in advance at (734) 647-2059:
 - 1. Before performing any work affecting primary power distribution circuits, unit substations or outdoor lighting.

2. Before performing any work affecting engine-generators, automatic transfer switches or variable speed drives.
 3. Before performing any work affecting fire alarm, security or card access control systems.
 4. Before performing any work affecting telecommunications ducts, manholes, rooms or circuits.
 5. Before performing any work affecting roofs.
- D. Notify OSEH at (734) 647-1143 before starting up engine-generators.

3.4 DEMOLITION

- A. Protect adjacent building services and materials indicated to remain. Install and maintain barriers to keep dirt, dust and noise from being transmitted to adjacent areas. Remove protection and barriers after demolition is completed.
- B. Remove all equipment and materials designated for demolition as follows:
1. Power wiring - remove back to the source or to the first junction box where the circuit continues on to remaining loads.
 2. Telecommunications wiring - remove from conduits and J-hooks back to cable trays or to the outer walls of the building entrance (BE) room or telecommunications rooms (TRs).
 - a. Cut and label wire ends "Abandoned" when abandoning sections of wires in cable trays and at BE and TR outer walls. Do not remove telecommunications wiring from cable trays, the BE or the TRs.
 - b. Coordinate for the Telecommunications Installation Contractor to remove abandoned wiring from cable trays and inside the BE and TRs.
 3. Conduits and boxes in walls and above permanent ceilings - abandon in place. Install blank cover plates on boxes.
 4. Conduits through floors and walls, and boxes in floors - remove completely. Patch and paint penetrations to match existing.
 5. Exposed and accessible conduits, wireways and boxes - remove completely. Patch and paint surfaces to match existing, and plug unused panel and junction box holes.
 6. Lighting fixtures and electrical equipment - remove and dispose of completely (unless designated for relocation).

3.5 LAMP AND BALLAST RECYCLING

- A. Recycle tubular fluorescent, compact fluorescent, HID, LED, induction and cold cathode lamps removed during demolition or replaced during construction. These six types of lamps shall not be disposed of as solid waste.

1. Package unbroken tubular fluorescent lamps in their original cardboard boxes, or contact OSEH Hazardous Materials Management at (734) 647-1142 and arrange to pick up U-lamp, 60 lamp, 100 lamp or 250 lamp boxes at the North Campus Transfer Facility located at 1655 Dean Road. Package unbroken compact fluorescent, HID, LED, induction and cold cathode lamps in appropriately sized corrugated cardboard boxes.
 - a. Use separate boxes for each type and physical size of lamp. Do not mix lamp types or sizes in the same box.
 - b. Fill the boxes as completely as possible.
 2. Obtain Universal Waste Labels from OSEH. Fill out and attach one label to each box.
 - a. Enter the building name, quantity of lamps, and the accumulation start date (date the box started to be filled).
 - b. Mark the appropriate check box to indicate the type and length of lamps.
 3. Tape the boxes closed on all sides.
 4. Sweep up any broken lamps and seal them in a heavy plastic bag. Place the plastic bag in a corrugated cardboard box and tape the box closed on all sides. Label the box to indicate the type and quantity of broken lamps inside. Notify OSEH of the broken lamps.
 5. Contact the OSEH Hazardous Materials Management at (734) 763-4568 and arrange to deliver the sealed and labeled boxes to the storage area at the Campus Safety Services Building located at 1239 Kipke Drive. Take care to avoid breaking the lamps. Position the boxes on their sides during transport. Do not stack anything on top of the boxes.
 6. If lamps inside a box become broken, seal the entire box in a heavy plastic bag. Copy the Universal Waste Label information onto a new label and attach the new label to the outside of the plastic bag.
 7. Place the boxes into the designated storage area. Position the boxes on their sides so that the labels are forward and visible. Do not stack the boxes more than three high (two high for 250 lamp boxes). OSEH will recycle the lamps at no cost to the Contractor.
- B. Recycle fluorescent, HID and cold cathode lighting ballasts removed during demolition. Recycle LED and induction lighting drivers removed during demolition. Lighting ballasts and drivers shall not be disposed of as solid waste.
1. Contact OSEH Hazardous Materials Management at (734) 763-4568 and arrange to pick up DOT approved 30 gallon steel drums and 5 gallon pails at the North Campus Transfer Facility located at 1655 Dean Road.
 2. Place the drums in an accessible location and on a hard surface so that OSEH can use a drum cart to pick them up later. Lawns, dirt piles, gravel drives, muddy areas and basements without elevators are not considered accessible locations.
 3. Wearing rubber gloves, deposit any leaking ballasts into the 5 gallon pails for separate handling. When finished, deposit the rubber gloves into the 5 gallon pails.

4. Deposit the non-leaking ballasts and drivers into the 30 gallon drums. Leave enough space at the top of the drums for installation of lids.
5. Obtain Universal Waste Labels from OSEH. Fill out and attach one label to each 5 gallon pail and each 30 gallon drum. Enter the building name, quantity of ballasts and drivers, and the accumulation start date (date the pail or drum started to be filled).
6. Contact OSEH at least 3 working days in advance to request pick-up of the pails and drums. OSEH will pick up and recycle the ballasts and drivers at no cost to the Contractor.
7. Do not deposit ballasts from other projects or any other refuse in the drums. All costs for disposing of foreign items found in the drums will be deducted from the Contractor's final payment.

3.6 RELOCATION

- A. Carefully remove, clean and restore items designated for relocation to a "like new" condition, and store them for reuse.

3.7 SALVAGE

- A. Equipment and materials removed during demolition, unless noted otherwise, shall become the property of the contractor with due consideration for all such removed equipment included in the bid price.

3.8 CLEANUP

- A. Remove and legally dispose of demolished items, rubbish and debris from the construction site daily, and at the completion of the work. Failure to do so may result in the cleanup being performed by others and all costs thereof being deducted from the Contractor's final payment.

3.9 EQUIPMENT PROTECTION

- A. Protect equipment and materials during shipment, storage and construction against damage and contamination.
- B. Items that become damaged or contaminated shall be restored to a "like new" condition or replaced at the Contractor's expense.

3.10 WORK PERFORMANCE

- A. Locate equipment as close as practical to the locations shown on the drawings. Should field conditions prevent the installation of equipment or materials as indicated on the drawings, make any deviations only with the prior approval of the Owner's Representative.
- B. Install and connect new work to existing work neatly and carefully. Existing work that is disturbed shall be repaired or replaced as necessary to restore it to its prior condition.

- C. Coordinate work with the other trades to ensure completion consistent with the project schedule. Do not unduly delay the startup, testing or turnover of project systems.
- D. Coordinate work with the other trades to ensure the NEC-required dedicated spaces above and working spaces around electrical equipment is provided, and to ensure access to equipment requiring calibration or maintenance. Working space and access shall be sufficient for an adult to perform maintenance safely without straddling or removing obstructions. Work that encroaches on working space or that impedes maintenance shall be relocated at the Contractor's expense.
- E. Coordinate work with the other trades to provide access doors to maintainable electrical equipment (including lighting fixture remote ballasts) located behind walls or above permanent ceilings.
- F. Prior to core drilling concrete floors, test for the presence of electrical conduits. Use an impulse induction type scanner capable of detecting both metallic conduits and copper wires in PVC conduits. Tracers that scan for energized cables or that scan for injected high frequency signals are not acceptable. Notify the Owner's Inspection Department prior to all tests. Prior to core drilling, arrange for the Owner's Representative to notify building occupants of the potential for an unscheduled power outage. Conduits damaged during core drilling shall be restored immediately at the Contractor's expense.

3.11 EQUIPMENT AND WIRING IDENTIFICATION AND COLOR CODING

- A. Provide nameplates indicating equipment names or numbers and power sources as specified in Section 260533.
- B. Paint fire alarm system and temperature controls system junction boxes and covers as specified in Section 260533.
- C. Mark junction box covers with the panel and breaker numbers of the circuits contained within as specified in Section 260533.
- D. Provide Arc-Flash labels at all substations, switchboards, panelboards, motor control devices, and other power equipment as specified in Section 260533.
- E. Color code and identify wiring in accordance with Section 260513.

3.12 FIELD QUALITY CONTROL

- A. Arrange for testing and commissioning of electrical systems, equipment and materials prior to final acceptance of the work. Acceptance tests and commissioning shall be performed as specified in Division 01 and the other Division 26, 27 and 28 sections, and in applicable codes, standards and manufacturers' instructions.
- B. Provide all test equipment, materials and labor necessary to perform the tests, and coordinate with the other trades for necessary services, such as scaffolding and the uncoupling of motors.
- C. Notify the Owner's Representative 3 working days in advance of tests. The Owner shall witness the tests unless the Owner's Representative waives such witnessing in writing.

- D. Notify manufacturers sufficiently in advance of tests for which the manufacturers should be present.
- E. Replace any equipment or materials found to be defective or found to be of lesser quality than that specified or shown on the drawings.
- F. Provide written test reports, signed and dated, for all tests prior to acceptance of the electrical equipment by the Owner.
- G. Provide the training specified in each specification section.

DIVISION 26 ELECTRICAL

SECTION 260513 - MEDIUM, LOW AND CONTROL VOLTAGE CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.

IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 260526 - Grounding and Bonding for Electrical
4. Section 260533 - Electrical Materials and Methods
5. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

EDIT THE SUMMARY TO MAKE IT PROJECT SPECIFIC.

- A. Furnish, install, terminate, splice (where permitted), test and label electrical cables and wires as shown.
1. Unless shown otherwise on the drawings, medium voltage cables, splices, terminations and labels will be provided by the U-M Plant High Voltage Shop.
 2. Unless shown otherwise on the drawings, telecommunications voice and data cables, terminations and labels will be provided by others.

1.3 REFERENCES

- A. Cables shall comply with the latest versions of the following codes and standards as applicable.
1. ANSI/NEMA WC 74/ICEA S-93-639, "5-46 kV Shielded Power Cable for Use in Transmission and Distribution of Electric Energy".
 2. ANSI/NEMA WC 70/ICEA S-95-658, "Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy".
 3. Michigan Electrical Code (MEC) which invokes NFPA 72, the National Electrical Code (NEC).

1.4 SUBMITTALS

- A. Medium Voltage Cables, Terminations, Splices and Labels: Submit for approval product literature identifying the following:
 - 1. Manufacturers' names, catalog numbers and illustrations.
 - 2. Weights and overall diameters.
 - 3. Conductor AWG sizes, materials, dimensions and stranding.
 - 4. Insulation NEC Type letters, materials, thicknesses, voltage ratings, temperature ratings, dry or wet location ratings and percent insulation levels.
 - 5. Shield types, materials, thicknesses and percent coverage.
 - 6. Jacket materials and thicknesses.
 - 7. Surface markings including special ratings, characteristics, approved uses and NRTL listings.
 - 8. Maximum allowable pulling tensions and side wall pressures.
 - 9. Minimum pulling and training bend radii.
 - 10. Lubrication requirements and lubricant compatibilities.
 - 11. Cold weather pulling limitations.
 - 12. Cable reel dimensions and weights.

- B. Cables 600 Volts and Below: Submit for approval product literature identifying the following (as applicable to each cable type):
 - 1. Manufacturers' names and catalog numbers.
 - 2. Conductor AWG sizes, materials, dimensions and stranding.
 - 3. Insulation NEC type letters, materials, voltage ratings, temperature ratings and dry or wet location ratings.
 - 4. Shield types, materials, thicknesses and percent coverage.
 - 5. Jacket materials and colors.
 - 6. Metallic sheath types and materials.
 - 7. Surface markings indicating special characteristics, special ratings, approved uses and UL listings.
 - 8. Crimp-type terminals for aluminum feeder cables (if permitted).

- C. Test Reports:
 - 1. Factory quality control test reports (medium voltage cables only).
 - 2. Written test reports, signed and dated, for specified field tests prior to acceptance of the cables by the Owner.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.

- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards, latest editions, unless noted otherwise.
 - 1. Cables: Applicable ANSI, ICEA, IEEE and NEMA standards.
 - 2. Cables, Terminations, Splices and Accessories: Listed, labeled and marked for intended use by Underwriters Laboratories (UL), Electrical Testing Laboratories (ETL), MET Laboratories (MET), or the Canadian Standards Association (CSA).

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Shipping and Handling Requirements: Store materials raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Seal cable ends from absorption of water. Protect materials from damage, dirt and debris at all times.

1.7 WARRANTY

- A. Provide a complete warranty for materials and labor for a minimum of one year from the date of Substantial Completion. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.

PART 2 - PRODUCTS

2.1 CABLE (MEDIUM VOLTAGE)

- A. Medium voltage cable shall be single conductor stranded copper, with ethylene propylene rubber (EPR) insulation rated 15kV, 105 degrees C, 133 percent insulation level, a 5-mil thick minimum tape shield with 12-1/2 percent minimum overlap, and a polyvinyl chloride (PVC) jacket approved for use in cable trays. The cable shall be suitable for use on a 13.2 kV, 3-phase, 3-wire, ungrounded, system. General Cable, Kerite, Okonite, or Prysmian.

2.2 CABLE (600 VOLTS AND BELOW)

- A. Secondary distribution and power cables for indoor use and for above ground outdoor use shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.

IF ALUMINUM FEEDER CABLES ARE PERMITTED, PROVIDE AN ALUMINUM CABLE AND CONDUIT SIZING CHART. PROVIDE U-M STANDARD DETAIL 26051301. IDENTIFY CIRCUITS WHERE ALUMINUM FEEDER CABLES ARE PROHIBITED BY THE EQUIPMENT MANUFACTURERS, SUCH AS FOR CHILLER AND ELEVATOR FEEDERS.

Where the drawings permit, indoor secondary feeder cables only may be single conductor stranded, Type AA-8000 Series aluminum, No. 1 AWG minimum, with NEC Types THHN or XHHW-2 insulation rated 90 degrees C, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, or Southwire. Terminations shall be Burndy or Thomas & Betts.

- 1. Aluminum cables may be used for indoor feeder circuits only, not for branch circuits or outdoor circuits.
- 2. Size conduits and device enclosure wiring gutters for the larger diameters and bend radii of aluminum cables.

3. Pre-train Electricians in aluminum cable preparation and termination.
 4. Terminate cables using crimp-type terminals in accordance with U-M Standard Detail 26051301. The die and crimp numbers shall be clearly visible after the lugs are crimped. Burndy or Thomas & Betts.
 5. Identify where aluminum conductor cables were installed on the project as-built drawings.
- B. Lighting cable for indoor use and for above ground outdoor use shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
 - C. Secondary distribution, power and lighting cable for underground use in conduit shall be single conductor stranded copper, No. 12 AWG minimum, with NEC Type XHHW insulation rated 90 degrees C in dry locations and 75 degrees C in wet locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
 - D. Control cable shall be single conductor stranded copper No. 14 AWG minimum, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified. Aetna Wire and Cable, Alan Wire, American Insulated Wire, Cerro Wire, Encore, General Cable, Republic Wire, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
 - E. Instrumentation, telecommunications, fire alarm, security, card access control, audio/visual and other special systems wire shall be in accordance with system manufacturer's recommendations, but shall not be less than 20 AWG. Conductors shall be stranded copper unless manufacturer's instructions require the use of solid conductor. Conductors or jackets shall be color coded as specified.
 - F. Manufactured wiring systems shall consist of multiple solid or stranded copper conductors as specified above, an insulated grounding conductor, a corrugated aluminum or galvanized steel jacket, and locking-type connectors from the same manufacturer and product line as the mating fixture connectors. Conductors shall be color coded as specified.
 - G. Type MC cable for power and lighting use shall consist of multiple stranded copper conductors as specified above, an insulated grounding conductor and a corrugated aluminum or galvanized steel jacket. Conductors shall be color coded as specified. AFC, Encore, Kaf-Tech, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.

- H. Type MC cable for fire alarm system use shall consist of multiple solid or stranded copper conductors sized in accordance with the fire alarm system manufacturer's instructions, with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, an insulated grounding conductor and a corrugated aluminum or galvanized steel jacket. Cable shall be plenum rated. Conductors and jacket shall be color coded as specified. AFC, Encore, Kaf-Tech, Rockbestos-Surprenant, Service Wire, Southwire or United Copper Industries.
- I. Type MI mineral-insulated cable shall be nickel-clad copper conductor, magnesium oxide insulated and copper alloy sheathed, rated 600 volts, with either factory installed terminations or field termination kits from the same manufacturer as the cable. Cable shall be UL labeled as 2 hour fire rated. Pentair Pyrotenax only.
- J. Grounding electrode conductors and equipment grounding conductors shall be single conductor stranded copper, No. 12 AWG minimum, bare where shown or with NEC Type THHN insulation rated 90 degrees C in dry and damp locations, 600 volts, color coded as specified.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

- A. Install cables and wires in raceways, except low voltage control, instrumentation, telecommunications, fire alarm, security, audio/visual and other power limited circuit wiring may be installed in J-hooks where shown on the drawings.
- B. Use cable lubricant when pulling medium voltage cables and secondary feeder cables. Avoid exceeding manufacturer's recommendations on pulling tensions, sidewall pressures and cable bend radii.
- C. Route cables in J-hooks, manufactured wiring systems and Type MC cable parallel to or perpendicular to building lines, and in a neat and workmanlike manner. Coil the excess and support independently of the ceiling grid system.
- D. Terminate Type MC cable with steel set screw connectors that have integral insulating bushings. Self-locking, twist-in type connectors are not acceptable.
- E. Install Type MI and other 2-hour fire rated cable in strict accordance with manufacturer's instructions on pulling, bending, raceways, additional supports, protection from moisture, and installation of field termination kits.
- F. Segregate wiring of different voltage levels. Except as follows, circuits operating at different voltages shall not share raceways.
 - 1. Power wiring to rooftop motors and rooftop receptacles may be routed together.
 - 2. Power and control wiring between variable speed drives and motor disconnect switches may be routed together.
 - 3. Class 1 power limited cables may share the same cable tray.

- G. Splice power cables with solderless compression butt splices or ring lugs. Terminate power cables including motor leads with solderless compression ring lugs. Splice branch circuit wiring, lighting wiring, and control and instrumentation wiring with wire nut connectors. Terminate control and instrumentation wiring with solderless compression ring or spade lugs. Compression splices and lugs shall be crimped with tools specifically designed for the terminations being crimped. Compression splices and lugs used with aluminum feeder cables shall be identified as accepting aluminum cables.
- H. If no color coding system exists for each indicated system function and voltage, color code circuits as follows:
1. Three Phase Power Over 600 Volts:
 - Phase X (A): Black
 - Phase Y (B): Red
 - Phase Z (C): Blue
 2. Three Phase Power 480/277 Volts:
 - Phase X (A): Brown
 - Phase Y (B): Orange
 - Phase Z (C): Yellow
 - Neutral: Gray
 - Ground: Green
 3. Three Phase Power 208/120 Volts:
 - Phase X (A): Black
 - Phase Y (B): Red
 - Phase Z (C): Blue
 - Neutral: White
 - Ground: Green
 4. Single Phase Power 240/120 Volts:
 - Phase X (A): Black
 - Phase Y (B): Red
 - Neutral: White
 - Ground: Green
 5. Fire Alarm Wiring:
 - Addressable Initiating Device: #18 Shielded Twisted Pair (STP) Red with Black Stripe.
 - Horn, Horn/Strobe or Controlled Output Positive (+) 24 VDC: #14 Stranded Red.
 - Horn, Horn/Strobe or Controlled Output Negative (-) 24 VDC: #14 Stranded Black.
 - Horn, Horn/Strobe or Controlled Output MC Cable Jacket (if MC cable is used): Red.
 - Speakers: #18 STP Red.
 - Clear Strobe Light Positive (+): #14 Stranded Yellow.
 - Clear Strobe Light Negative (-): #14 Stranded Blue.
 - Clear Strobe Light MC Cable Jacket (if MC cable is used): Red with Blue Stripe.
 - Amber Strobe Light Positive (+): #14 Stranded Yellow with Black Stripe.
 - Amber Strobe Light Negative (-): #14 Stranded Blue with Black Stripe.
 - Amber Strobe Light MC Cable Jacket (if MC cable is used): Red with Yellow Stripe.
 - NOTE: When clear and amber strobe lights are addressable and require only one pair of wires, color code the wires

and MC cable jacket as specified for the clear strobe light.

Panel Communications: #18 STP Red with Black Stripe.

Fireman's Telephone: #18 STP Red with Yellow Stripe.

6. Synchronized Clock Wiring:
 - Line: Black
 - Neutral: White
 - Clock Correction: Red
7. Control wires to light fixtures for light dimming shall be:
 - Hot control wire: Black with white stripe
 - Neutral control wire: White with Black stripe
8. Less Than 120 Volts: Use Industry Standard Methods

I. For University Hospital projects, color code circuits as follows:

1. Three Phase Power Over 600 Volts:
 - Phase X (A): Black
 - Phase Y (B): Red
 - Phase Z (C): Blue
2. Three Phase Power 480/277 Volts:
 - Phase X (A): Red
 - Phase Y (B): Blue
 - Phase Z (C): Black
 - Neutral: Gray
 - Ground: Green
3. Three Phase Power 208/120 Volts:
 - Phase X (A): Yellow
 - Phase Y (B): Orange
 - Phase Z (C): Brown
 - Neutral: White
 - Ground: Green
4. Control wires to light fixtures for light dimming shall be:
 - Hot control wire: Black with White Stripe
 - Neutral control wire: White with Black Stripe
5. Less Than 120 Volts: Use Industry Standard Methods

J. Provide home runs of No. 10 AWG wire for 20 amp branch circuits that exceed 150' in length.

K. Ground the shields of shielded instrumentation and control cables at one end only. The shields at the other end shall be insulated from ground.

L. Provide identification tags on all cables and conductors terminated in panels.

3.2 FIELD QUALITY CONTROL

A. Prior to any testing, perform visual inspections to verify the following:

1. Conductor and jacket color coding is correct.
2. Labeling is correct.
3. Electrical terminations have been properly tightened.
4. The cables are ready to be tested.

- B. Perform a continuity test, 2,500-volt DC Megger test, a DC high potential test, and a second 2,500-volt DC Megger test on medium voltage cables. The high potential test shall be performed at 45kV for new cable and at 30kV when new cable has been spliced to existing cable. Submit a test report.
- C. Perform a continuity check and a 1,000 volt DC Megger test on 600 volt power cables No. 4 AWG and larger.
 - 1. The Megger test shall be performed between each pair of conductors and from each conductor to ground.
 - 2. The Megger test shall be performed for 15 seconds or until the insulation resistance value stabilizes.
 - 3. The insulation resistance between conductors and from each conductor to ground shall be 100 megohms minimum in one minute or less. In addition, the lowest insulation resistance value shall not differ from the highest resistance value by more than 20 percent. But if the lowest value is above 1,000 megohms, the 20% balance requirement may be waived.
- D. Perform a continuity check on control and instrumentation wiring.

3.3 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL

SECTION 260526 - GROUNDING AND BONDING FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Provide grounding for all systems and equipment.

1.3 GROUNDING SYSTEM REQUIREMENTS

- A. Each ground rod shall have a maximum resistance to ground of 10 ohms before connection to the other ground rods. If reading is above 10-ohms, drive one extension. Further testing of that individual rod is not needed

FILL IN THE APPROPRIATE RESISTANCE VALUE BELOW. SPECIFY 2 OHMS FOR PRIMARY SERVICES OR 5 OHMS FOR SECONDARY SERVICES.

- B. The total grounding system with all connections completed shall have a maximum resistance to ground of _____ ohms.

1.4 CONNECTION REQUIREMENTS

- A. Provide exothermic weld type, or Burndy Hyground, ground connections for concealed, underground, and concrete encased ground connections, for ground connections to structural steel, connections between sections of the main ground bus and all connections to the substation room ground bus bars.
- B. Exposed ground connections (except connections to structural steel and substation room ground bus bars) may be made with copper or bronze compression ground fittings or bolted compression ring lugs.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID 260526 - - 1

- C. Provide exothermic weld type, or Burndy Hyground ground connections for splices and taps of grounding conductors No. 8 AWG and larger. Exposed splices and taps shall be taped.

PART 2 - PRODUCTS

2.1 GROUND RODS

- A. Unless shown otherwise, ground rods shall be 3/4" diameter by 10' long, copper clad steel. Ground rods shall be capable of being extended when additional length is required.

2.2 GROUNDING CONDUCTORS

- A. Grounding conductors for direct burial underground, for encasement in concrete, and for grounding of unit substations shall be No. 4/0 AWG minimum, bare, stranded copper.
- B. Grounding conductors for general use shall be stranded, copper conductor, sized in accordance with the NEC unless shown otherwise on the drawings, and insulated with green NEC Type THHN insulation rated 90 degrees C, 600 volts.

2.3 GROUND CONNECTIONS

- A. Ground connections shall be Burndy Hyground, Cadweld, Thermo-weld or Thomas & Betts Blackburn only.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

- A. Ground duct banks and manholes in accordance with Specification Section 260543.
- B. Ground the shields of medium voltage primary cables in accordance with Specification Section 261000, and the shields of shielded instrumentation and control cable in accordance with Specification Section 260513.
- C. Provide bare copper grounding conductors from duct banks, manholes, unit substations, primary switches, transformers, switchgear, panelboards, motor control centers and control panels to the building grounding system. Equipment rated above 480 volts or 600 amps shall be grounded by a minimum of two independent grounding conductors.
- D. Bond transformer, UPS system, central battery/inverter system, emergency generator, and separately derived electrical system neutrals to the building grounding system.
- E. Ground motors rated 460 volts and below by motor feeder equipment grounding conductors. Stranded copper grounding conductors connected to building steel shall also bond motors rated over 460 volts.

- F. Provide green insulated equipment grounding conductors in all service, feeder, and branch circuits for connection of load devices to the power source ground. Raceways shall not be used as equipment grounding conductors.
 - 1. Equipment grounding conductors shall not be daisy-chained.
 - 2. Bond equipment-grounding conductors in boxes and enclosures where the grounding conductors are terminated or spliced.
- G. Bond conduits, cable trays, wireways, surface raceways, boxes, and enclosures together, and to the building grounding system. Provide bonding bushings and bonding jumpers to bond conduits where they enter a box or enclosure.
- H. Ground the lightning protection system with separate ground rods. The building grounding system ground rods shall not be used. After completion of both systems, the lightning protection system shall be bonded to the building grounding system.
- I. Protect separately routed grounding conductors subject to damage or physical abuse by Schedule 40 PVC nonmetallic conduits. Grounding conductors shall not be routed in metallic conduits except when routed with phase conductors.

3.2 FIELD QUALITY CONTROL

- A. Test the grounding in accordance with Specification Section 260800, and submit a test report.
- B. When the total grounding system fails its test by having a higher resistance to ground than specified in Section 260800, contact the Project Electrical Engineer for corrective action.

3.3 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

SECTION 260533 - ELECTRICAL MATERIALS AND METHODS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL

SECTION 260533 - ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 260513 - Medium, Low & Control Voltage Cables
 - 2. Section 260526 - Grounding and Bonding for Electrical

1.2 SUMMARY

- A. Provide conduits, cable trays, surface raceways, boxes, fittings, and supports to form a complete, coordinated, and continuously grounded raceway system.

1.3 CONDUIT REQUIREMENTS

- A. Conduits indoors in general areas shall be electrical metallic tubing (EMT) with steel set screw fittings.
- B. Conduits indoors in hazardous areas, encased in concrete floor slabs or subjected to water, physical damage or abuse shall be galvanized rigid steel (RS) or intermediate metal conduit (IMC) with cast or malleable iron threaded fittings and bushings.
- C. Conduits indoors for primary power distribution circuits or for fire pump feeders shall be galvanized rigid steel or intermediate metal conduit with cast or malleable iron threaded fittings and bushings. Where the conduits are routed through the building, they shall be encased in 2 inches of concrete.
- D. Conduits outdoors shall be galvanized rigid steel or intermediate metal conduit with cast or malleable iron threaded fittings and bushings.
- E. Conduits encased in concrete underground shall be Type DB PVC with matching fittings.
- F. Conduits direct buried underground shall be Schedule 40 PVC with matching fittings.
- G. Conduits in parking structures, steam tunnels and near or in cooling towers shall be fiberglass-reinforced epoxy or Schedule 80 PVC with matching fittings. Exceptions to this requirement are tunnel segments inside building (i.e. mechanical rooms), or in heated rooms of parking structures. In these cases EMT may be used
- H. Final connections to recessed lighting fixtures and under-counter lights shall be 1/2" minimum flexible metallic conduit, manufactured wiring systems, or Type MC cable.

1. Manufactured wiring systems shall only be used above accessible ceilings.
 2. Terminate Type MC cable with steel set screw connectors that have integral insulating bushings. Self-locking, twist-in type fittings are not acceptable.
- I. Final connections to motors, transformers and equipment subject to vibration or removal for maintenance shall be 1/2" minimum liquid tight flexible metallic conduit with steel liquid tight fittings. Transformer connections may be non-liquid tight flexible metallic conduit in electrical rooms only.
 - J. Connections to recessed power receptacles, and light switches, in areas with accessible ceilings:
 1. In new partitions and walls, the final connections may be made with Type MC cable. Type MC cable, shall:
 - a. Be run to a box immediately above the accessible ceiling. The box size shall not exceed 4-11/16" square.
 - b. Conduit shall be used for the entire run, from this junction box, to the power source, load (lights), etc.
 - c. No more than three circuits may be run through any given junction box.
 - d. Secure the Type MC cables in the wall cavity.
 - e. Type MC cables shall be as short as possible.
 2. In existing partitions and walls where the surface is not being otherwise opened up, the final connections to new devices may be made using flexible metallic conduit or Type MC cable.
 - K. Connections to other recessed devices, (including communication outlet boxes, junction or pull boxes, etc.) shall be with standard conduit of the type appropriate for the wall construction.

1.4 CABLE TRAY REQUIREMENTS

- A. Power cable trays shall be aluminum ladder type of the sizes shown on the drawings.
- B. Telecommunications cable trays shall be aluminum ladder type or zinc plated steel wire mesh type of the sizes shown on the drawings.
- C. Center spline telecommunications cable tray may only be used where shown.
- D. Changes in cable tray direction or elevation shall be made using standard fittings from the same manufacturer as the cable tray.
- E. Barriers shall be installed in cable trays where shown to separate circuits of different voltage levels.

1.5 SURFACE RACEWAY REQUIREMENTS

- A. When conduits in finished areas cannot be concealed in walls or above ceilings, surface raceways may be used where shown. Boxes and fittings shall match and be from the same manufacturer as the raceways.

1.6 J-HOOKS

- A. Subject to the cable manufacturer's installation requirements, low voltage cables may be installed using J-hooks in rooms above accessible ceilings and in unfinished open ceiling areas. Do not use J-hooks in corridors, in finished open ceiling areas, above inaccessible ceilings or as a substitute for cable trays. Bridle rings shall not be used.

1.7 BOX REQUIREMENTS

- A. Provide sheet steel outlet boxes, extensions, and plaster rings for EMT, flexible metal conduit, and Type MC cable.
- B. Provide cast or malleable iron outlet boxes and covers for galvanized rigid steel conduits, intermediate metal conduits, and liquid tight flexible metal conduits.
- C. Boxes shall be sized for all conductors and devices to be contained within. Box extensions shall not be used to correct for undersized boxes. A single extension may be used as follows only if all free conductors extend at least 3 inches outside of the extension opening.
 - 1. On boxes being flush mounted in masonry walls.
 - 2. On existing boxes in walls that are being furred out.
 - 3. On existing boxes for connecting to an existing circuit.
 - 4. On fire alarm, security and clock system boxes where required by the system manufacturer's instructions.
- D. Plaster rings shall not be considered box extensions, but their capacities may be included in box fill calculations.

1.8 SUPPORT REQUIREMENTS

- A. Surface mounted equipment shall be secured to steel channels. The channels shall be attached with toggle bolts to hollow tile, block or similar surfaces, and attached with screws or bolts and expansion shields to solid masonry or concrete.

PART 2 - PRODUCTS

2.1 CONDUITS

- A. Electrical metallic tubing shall be thin wall steel tubing, electro-galvanized or hot dipped galvanized inside and outside. Fittings and bushings shall be galvanized steel set screw type with two screws per connection for sizes over 2".
- B. Galvanized rigid steel conduit and intermediate metal conduit shall be hot dipped galvanized inside and outside, in 10' lengths and threaded on both ends. Fittings and bushings shall be cast or malleable iron, and hot dipped galvanized inside and outside.
- C. PVC conduit and fittings shall be Type DB for encasement in concrete, Schedule 40 for direct burial, concealed and exposed work, and schedule 80 in parking structures. Fittings shall be of the same type and from the same manufacturer as the conduit. PVC conduit shall be UL Labeled for 90 degrees C cables. Cantex, Carlon, or National Pipe & Plastic.

- D. Fiberglass reinforced epoxy conduit shall be standard wall, iron pipe size, sunlight resistant, gray color, with matching push-fit fittings. FRE or Champion.
- E. Flexible metallic conduit shall be galvanized steel or aluminum. Fittings shall be of steel with cadmium or galvanized finish. Fittings shall be machine screw clamp type, single or two-piece. Self-locking, twist-in type fittings are not acceptable.
- F. Liquid tight flexible metallic conduit shall consist of a flexible, galvanized steel core, a continuous copper ground strip and a polyvinyl chloride jacket. Fittings shall be steel liquid tight grounding type from the same manufacturer as the conduit.

2.2 CABLE TRAYS

- A. Ladder type cable tray shall be aluminum, of the widths shown, with 4" rail height, 13/16" minimum rung width, and 9" maximum rung spacing. The tray with a 10' span shall be capable of sustaining a working load of 145 pounds per lineal foot with a load deflection of 1.0" when tested in accordance with NEMA VE 1. B-Line, Chalfant, Cope, Globetray, Husky, Legrand Cablofil, MonoSystems, or Thomas & Betts.
- B. Wire mesh cable tray shall be of high strength steel rods meeting the mechanical properties of ASTM A510, of the widths shown, and with a 4" load depth minimum. Cable tray shall be constructed of wires configured in a 2" x 4" grid pattern with wires welded at intersection points. The ends of the wire grid shall be bent up to form the sides of the tray. Cut ends at the top and end rails shall be free of sharp edges to prevent damage to the cables and injury to installers. The tray shall be zinc electro-plated or zinc galvanized after forming and welding. The tray with a 8' span shall be capable of sustaining a working load of 32 pounds minimum per lineal foot with a load deflection of 1.2" when tested in accordance with NEMA VE 1. B-Line, Basor Electric Inc, Chalfant, Cope, Legrand Cablofil, MonoSystems, MP Husky, or WBT only.
- C. Center spline cable tray shall be aluminum, of the width shown, with top mounted rungs, 3" load depth, 13/16" minimum rung width, and 9" maximum rung spacing. The tray with a 10' span shall be capable of sustaining a working load of 145 pounds per lineal foot with a load deflection of 1.0" when tested in accordance with NEMA VE1. B-Line, Legrand Cablofil, MonoSystems, or Thomas & Betts only.
- D. Tray fittings including horizontal and vertical bends, tees, crosses, reducers, splice plates, expansion joints and cable roll-outs shall be from the same manufacturer and of the same product line as the tray. Ladder and center spline tray bends, tees, crosses and reducers shall have a 13/16" minimum rung width, a 9" maximum rung spacing, and a 12" minimum bend radius.
- E. Tray fasteners shall be galvanized or zinc plated steel.

2.3 SURFACE RACEWAYS

- A. Where surface raceways are called for on the drawings, or when conduits in finished areas cannot be concealed in walls or above ceilings, provide surface raceways. Raceway boxes and fittings shall match and be from the same manufacturer as the surface raceway.
- B. Surface raceways shall consist of a base and cover, shall be sized for the number of conductors contained within, and shall be complete with all boxes, connectors, fittings, bushings, dividers and mounting hardware. For internal or external elbows, corners, or tees, provide raceway with 1-1/4" full-capacity bend radius.
- C. Surface raceways shall be 600 volt rated and in compliance with the applicable paragraphs of NEC Article 352.
- D. Surface raceways shall be non-flammable and UL labeled under UL 5 or UL 5A (as applicable).
- E. The completed surface raceway system shall be vandal resistant.
- F. Surface raceways shall accept receptacles, cover plates, telephone/data jacks and other standard wiring devices as specified elsewhere or shown on the drawings.
- G. Cover plates used for wiring devices and telephone/data jacks shall be of the overlapping type and shall therefore cover the cut ends of the raceway cover.
- H. Surface raceways shall be white (ivory, brown, gray) in color, have a scuff resistant finish, and be paintable. All components exposed to view shall be of the same color and shade.
- I. Barriers shall be provided when necessary to separate conductors of different voltages or services.
- J. Surface raceways shall be steel (plastic) as noted below:
 - 1. Metallic
 - a. Metallic raceways shall be of .040" thick (minimum) zinc plated or galvanized steel.
 - b. The acceptable levels of quality are as provided by:
 - 1) Wiremold 500 Series and 700 Series for smaller single channel raceway applications,
 - 2) Wiremold 3000 Series for larger single channel raceway applications, and
 - 3) Wiremold 4000 Series for larger multi-channel raceway applications.
 - c. Manufacturers include Hubbell, MonoSystems, Thomas and Betts, or Wiremold.
 - 2. Plastic
 - a. Plastic raceways shall be of a material meeting all of the requirements of UL 5A, (including flammability, resistivity, structural strength, etc.).
 - b. The acceptable levels of quality are as provided by:
 - 1) Panduit Series LDS5 and LDS7, Carlon Series 30 or Wiremold Series PN05 or PN10 for raceway applications when surface raceway replaces conduit in finished areas.
 - 2) Panduit LD Series, Carlon Series 30 or Wiremold Series PN05 for smaller single channel raceway applications.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

260533 - 5

- 3) Panduit Type T-70, Carlon Premiere or Wiremold Type 40N2 for larger single or multi-channel raceway applications.
- 4) Panduit Twin 70, Carlon Prestige or Wiremold Type 60N2 for larger multi-channel raceway applications.
- c. Manufacturers include Carlon, Hubbell, MonoSystems, Panduit or Wiremold.

2.4 J-HOOKS

- A. J-hooks shall be zinc electro-plated steel or plastic, UL Listed for use in plenum spaces, with a minimum of a 3/4 inch wide cable support area, and rated for use with Categories 5e and 6 UTP, fire alarm, security, temperature controls and similar low voltage cables. J-hooks shall include a retaining means for closing the hook so the cables do not fall out.

2.5 BOXES

- A. Boxes for fixtures, outlets, switches, equipment connections and wire pulling shall be
 - 1. Cast or formed from carbon steel sheets of commercial grade steel not less than 14-gauge,
 - 2. One-piece construction, zinc, or cadmium plated,
 - 3. Tapped for mounting plates and covers as required.
- B. Pull and junction boxes shall be
 - 1. Fabricated from galvanized or painted code gauge cold rolled carbon steel sheets.
 - 2. Welded construction with flat removable covers fastened to the box with machine screws.
 - 3. Seams and joints shall be closed and reinforced with flanges formed of the same material from which the box is constructed or by continuous welding which will provide equivalent strength to flange construction.
 - 4. Preferably not provided with 'knockouts'.
- C. Box covers shall be fastened in place by machine screws or hinges and latches. Self-tapping or sheet metal fasteners are not acceptable.

2.6 SUPPORTS

- A. Hangers and brackets shall be made of steel pipe, channel iron, angle iron or prefabricated steel channel. Prefabricated steel channel shall be by B-Line, Hilti, Powerstrut, or Unistrut.
- B. Anchors shall be lead shield anchors or plastic expansion anchors for small loads, and expansion or epoxy anchors for large loads. Powder-driven anchors shall not be used.

2.7 NAMEPLATES, LABELS AND DIRECTORIES

- A. Equipment nameplates shall be engraved .125 inch (1/8") thick laminated plastic, white, with black letters. The engraved letters shall be at least one quarter inch (1/4") high.

- B. Arc flash hazard warning labels shall be 3" by 5" minimum, white with a yellow, orange or red stripe header and black font, of ultraviolet and weather-resistant nylon, and adhesive backed.
- C. Receptacle and light switch plates shall be labeled using clear adhesive backed nylon or Mylar tape with black text permanently laminated to the tape.
- D. Panel directories shall be typed on supplied card stock with panel, or card stock similar in thickness and material as those supplied with the panels. Install supplied clear plastic cover, or one of like material.

PART 3 - EXECUTION

3.1 CONDUITS

- A. Size conduits in accordance with the NEC, but not less than the sizes shown on the drawings. Minimum power and control conduit size shall be 1/2". Minimum telecommunications conduit size shall be 1".
- B. Install concealed and exposed conduits and cable trays parallel to or at right angles to building lines. Conduits shall not be embedded in concrete slabs except where specifically shown. Install surface raceways as close to room corners or trim features as possible to make the surface raceways less obvious. Where conduits are routed over beams and under corrugated decking, conduits shall be offset 3" below the decking to avoid damage from future decking penetrations.
- C. Make directional changes in primary power distribution conduits above ground with sweeps and long radius elbows, and underground with 20' minimum radius bends.
- D. Conceal conduits wherever possible and practical. When conduits cannot be concealed in finished areas, use surface raceways with matching boxes from the same manufacturer as the raceways.
- E. Metal conduits, fittings, enclosures and raceways shall be mechanically joined together in a firm assembly to form a continuous electrical conductor providing effective electrical grounding continuity.
- F. Provide expansion fittings between adjacent buildings, at building expansion joints and in straight runs at the intervals specified in the manufacturer's instructions.
- G. Conduits entering panels located outdoors, in parking structures, in steam tunnels and on cooling towers shall enter from the sides, back, or bottom. Conduits shall not enter from the top.
- H. Separate raceways from un-insulated steam pipes, hot water pipes, and other hot surfaces by a minimum of 4" horizontally or 12" vertically. Separate raceways from ventilation ducts and insulated pipes so that they do not come into contact with each other.
- I. Low voltage signal circuits shall be separated or shielded from power circuits to prevent the induction of noise into the signal circuits.

- J. EMT entering sheet metal enclosures and outlet boxes shall be secured in place by a connector with a locknut. Rigid conduit shall be secured with locknut inside and outside and a bushing. Sufficient thread on the connector or conduit shall extend into the enclosure so that the bushing will butt tight into the connector or conduit. Bushings shall not be used as jamb nuts or in lieu of locknuts.
- K. Flexible metallic conduit to motors and similar equipment shall not exceed 3'-0" in length, and shall have adequate slack to absorb the maximum vibration. Flexible conduit connections to lighting fixtures shall not exceed 6'-0" in length.

3.2 CABLE TRAYS

- A. Install cable trays in accordance with NEMA VE 2 and manufacturer instructions. Install trays parallel to or at right angles to building lines. Provide a minimum of 12" working space above and 12" working space along one side for cable installation.
- B. Support cable trays with trapeze hangers spaced 10' maximum on center for ladder trays and 8' on center maximum for wire mesh trays. Center hung supports are not allowed.
- C. After cable installation, firestop cable tray penetrations in fire rated walls with intumescent fire protective bags, bricks, or sealant in accordance with the appropriate UL approved system.

3.3 SURFACE RACEWAYS

- A. Install surface raceways parallel or perpendicular to building lines.
- B. Locate surface raceways as close to room corners or vertical breaks in mid wall as is possible.
- C. Provide vertical surface raceways to feed cables from junction boxes above the ceiling to horizontal surface raceways. Exposed vertical conduits are not acceptable.

3.4 J-HOOKS

- A. Install cables in J-hooks as follows.
 - 1. Install cables parallel or perpendicular to building lines.
 - 2. Space J-hooks in accordance with the cable manufacturers' instructions, but not more than 5 feet apart and not more than 3 feet from both sides of a change in direction.
 - 3. Maintain a minimum separation of 2" from lighting ballasts, transformers, motors, power circuits and similar equipment.
 - 4. Anchor J-hooks to walls or suspend J-hooks using 1/4-inch minimum diameter threaded rod hangers. Do not support J-hooks from ceiling or equipment hangers. J-hooks shall not impede removal of accessible ceiling tiles.
 - 5. Load J-hooks to no more than the maximum fill stated in the J-hook manufacturer's instructions.
 - 6. Cables shall not sag more than 12 inches between J-hooks and shall not impede access to equipment requiring maintenance.
 - 7. Cables in open areas shall be a minimum of 10 feet A.F.F. and a maximum of 16 feet A.F.F.

8. Cables above accessible ceilings shall not touch the ceiling grid or tiles.
 9. Cables shall be protected from physical damage.
 10. Cables shall be completely accessible for replacement. Cables hidden above ductwork or other obstructions, and cables so high they cannot be reached safely while standing on a ladder shall be replaced with cables in new J-hooks located in a more accessible location.
- B. Provide conduit sleeves for cables penetrating walls. If cables in J-hooks penetrate a corridor wall from a room, and the distance from the corridor wall to the corridor cable tray is more than 18 inches, provide conduit stubs through the wall to the cable tray.
 - C. Contain cables inside J-hooks in accordance with the J-hook manufacturer's instructions so cables do not fall out, but so existing cables can be pulled out and new cables can be pulled in. Cables shall not be strapped to the J-hooks. Bond the conduit stubs to the cable tray.
 - D. Provide separate J-hooks for each cable system. Cables from one system shall not use the J-hooks of another system.
 - E. Color code J-hooks to indicate the system of the cables they contain:
 1. Telecommunications - silver or gray
 2. Fire alarm - red.
 3. Temperature controls - blue.
 4. Laboratory controls - white.
 5. Security & card access control - orange.
 6. Audio/visual - yellow.

3.5 MOUNTING HEIGHTS

- A. Except where shown otherwise, install equipment and devices at the following heights:
 1. Receptacles (Wall Mount): 18" A.F.F. to center
 2. Receptacles (Above Counter): 44" A.F.F. to center
 3. Receptacles (Unfinished Area): 44" A.F.F. to center
 4. Surface Raceway Receptacle Strips: 42" A.F.F. to bottom
 5. Light Switches: 44" A.F.F. to center
 6. Telephone Outlets (Wall Phone): 44" A.F.F. to center
 7. Telephone/Data Outlets: 18" A.F.F. to center
 8. Clocks: 88" A.F.F. to bottom
 9. Exit Signs: 88" A.F.F. to bottom
 10. Emergency Light Wall Packs: 88" A.F.F. to bottom
 11. Fire Alarm Pull Stations: 44" A.F.F. to center
 12. Fire Alarm Horn/Strobes and Speaker/Strobes: Entire strobe lens at a uniform height between 80" A.F.F. and 96" A.F.F.
 13. Card Readers (Wall Mount): 42" A.F.F. to center
 14. Card Readers (Pedestal Mount): 36" A.F.F. to center
 15. Door Actuator Pushbutton (Wall and Pedestal Mount): 36" A.F.F. to center
 16. Card Reader and Door Actuator Pushbutton (Stacked Vertically): Card Reader 42" A.F.F. to center and Pushbutton 36" A.F.F. to center
 17. Security System Controls: 44" A.F.F. to center
 18. Thermostats/HVAC Controls: 44" A.F.F. to center

19. Electrical Panels: 72" A.F.F. to top
20. Safety Switches/Motor Starters/Variable Frequency Drives: 72" A.F.F. to top (except top of handle shall not exceed 78" A.F.F.)
21. Motor Control Pushbuttons: 60" A.F.F. to center

3.6 SUPPORTS

- A. Provide 4" thick concrete housekeeping pads for floor-mounted equipment.
- B. Support all electrical items independently of supports provided by the other trades.
- C. Support conduits and boxes using steel conduit straps or 1/4-inch minimum diameter threaded rod hangers. Suspended ceiling hangers or hanger wire shall not be used.
- D. Support cable trays with support brackets or 3/8" diameter minimum threaded rod hangers at intervals not exceeding 10'-0" for ladder cable trays and 8'-0" for wire mesh cable trays. Additional supports shall be provided at tray fittings.
- E. Hangers shall be of sufficient strength that their deflection at mid span does not exceed 1/240 of the hanger span length after the cables are installed.
- F. Route flexible metallic conduit, manufactured wiring systems and Type MC cable parallel to or perpendicular to building lines, and in a neat and workmanlike manner. Coil the excess and support independently of the ceiling grid system.

3.7 PENETRATIONS, SLEEVES, AND FIRE SEALS

- A. Cut floor and wall penetrations neatly and to the minimum size required for installation of the equipment and raceways.
- B. Provide galvanized steel pipe sleeves for all conduits penetrating floors, exterior walls and roofs.
 1. Extend floor sleeves above the floor a minimum of 2 inches.
 2. Embed sleeves in new concrete or step-core concrete and grout sleeves into existing concrete with epoxy grout.
 3. Seal floor sleeves using fire-sealing systems approved by a Nationally Recognized Testing Laboratory.
 4. Seal exterior wall and roof penetrations water tight.
- C. Patch both sides of wall penetrations cut for electrical equipment and raceways to seal against the passage of air, sound and fire.
 1. Seal cable tray penetrations in fire rated walls using fire sealant bags approved by a Nationally Recognized Testing Laboratory.
 2. Seal conduit penetrations in fire rated walls using fire-sealing caulk approved by a Nationally Recognized Testing Laboratory.
 3. Seal conduit penetrations in non-rated walls using masonry materials that match the wall construction.
 4. Fire seal between recessed outlet boxes located on opposite sides of a fire rated wall if the box openings are over 16 square inches and the boxes are less than 24 inches apart.

3.8 EXPANSION FITTINGS

- A. Provide expansion fittings at all building expansion joints. Expansion fittings shall be bonded to the raceway on both sides.
- B. Provide expansion fittings, in accordance with manufacture recommendations, in all areas subject to swings in temperature of more than 15 degrees C.
- C. Install expansion fittings in all locations were expected expansion difference is 1/4", or more, between boxes.

3.9 IDENTIFICATION

- A. Provide nameplates and labels in accordance with Article 2.7.
 - 1. Laminated plastic labels shall be mechanically secured in place with sheet metal screws and/or bolts and nuts.
 - 2. Labels shall be neatly centered. Place labels in like positions on similar equipment.
- B. Color code wiring in accordance with Section 260513.
- C. Color code junction boxes and box covers of emergency and fire alarm circuits with red paint. Color code junction boxes and box covers of temperature control circuits with blue paint.
- D. Mark junction box covers in indelible ink with the panel and breaker numbers of the circuits contained within.
- E. Provide generic "Warning - Arc Flash Hazard" labels on equipment with an arc flash incident energy level exceeding 1.2 calories/square centimeter and likely to require examination, adjustment, servicing or maintenance while energized. This includes but is not limited to automatic transfer switches, switchboards, panelboards, transformers, storage batteries, battery chargers, inverters, control panels, variable speed drives, motor controllers, circuit breakers and disconnect switches. Provide labels for the line and load sides of fused disconnect switches and circuit breakers 800 amps and above, and for the primary and secondary sides of transformers.
 - 1. Contractor-provided labels are not required on primary switchgear or unit substations. U-M Plant Operations will provide device-specific labels on this equipment.
 - 2. Contractor-provided labels are not required on equipment that is factory labeled by the manufacturer.
 - 3. Center the labels horizontally and vertically on the outsides of panel doors, covers, etc. to ensure they are visible to maintenance personnel before the equipment is opened up.

3.10 FIELD QUALITY CONTROL

- A. Perform visual inspections to verify the following:
 - 1. The equipment is properly installed and anchored.
 - 2. The equipment is free from damage and defects.
 - 3. Electrical terminations have been properly tightened.
 - 4. The equipment has been thoroughly cleaned inside and outside.
 - 5. The equipment is properly labeled and labels are correct.

DIVISION 26 ELECTRICAL

SECTION 260543 - UNDERGROUND SERVICES FOR ELECTRICAL SYSTEMS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 260543 - UNDERGROUND SERVICES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

**INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.**

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 260513 - Medium, Low & Control Voltage Cables
 - 2. Section 260526 - Grounding and Bonding for Electrical
 - 3. Section 260533 - Electrical Materials and Methods

1.2 SUMMARY

- A. Provide concrete encased duct banks with manholes and pullholes for medium voltage primary cables and telecommunications/data cables. Provide direct buried ducts and handholes for secondary power cables and site lighting cables.

1.3 DUCT BANK REQUIREMENTS

- A. Ducts for concrete encased duct banks shall be Type DB PVC conduits with matching fittings except where galvanized rigid steel conduits and fittings are shown.
- B. Ducts for direct burial underground shall be Schedule 40 PVC with matching fittings.

1.4 MANHOLE REQUIREMENTS

- A. Manholes shall be precast or cast in place reinforced concrete. Primary manholes shall have inside dimensions of 10' wide by 10' long by 7' high. Communications manholes shall have inside dimensions of 6' wide by 12' long by 7' high.
- B. Manholes shall include a cast iron frame with cover, a hot dipped galvanized steel ladder, hot dipped galvanized pulling eyes embedded in the concrete walls opposite each duct entrance and in the floor beneath the cover, and a sealed indentation for use of a portable pump, offset to one side to clear pulling iron.
- C. Primary manholes shall contain a minimum of 2 vertical stanchions on each wall. The stanchions shall be Underground Devices CR-36.
- D. Primary manholes shall contain cable racks for routing cables between the duct openings. The racks shall be Underground Devices with 20" arms.

- E. Telecommunications manholes shall include: 14-"47 Hole" racks, 7 on each long wall, 16-"B" brackets, 4 in each corner, and 24-"S" brackets in side walls.

PART 2 - PRODUCTS

2.1 DUCTS

- A. PVC conduit and fittings for encasement in concrete shall be Type DB, UL Labeled for 90 degrees C cables. Carlon or Cantex.
- B. PVC conduit and fittings for direct burial, concealed and exposed use shall be Schedule 40, UL Labeled for 90°C cables. Carlon or Cantex.
- C. Galvanized rigid steel conduit shall be hot dipped galvanized inside and outside, in 10' lengths threaded on both ends. Allied, Republic Steel, Triangle PWC, Wheatland or Western Tube.
- D. Steel Casing pipe shall be non-spiral pipe and have a minimum yield strength of 35,000 psi. All joints shall be made leak-proof using full penetration, continuous welds. Welds shall be ground smooth outside and inside (except 22" diameter and less) to prevent conflict with the soil or pipe placement. Steel pipe shall meet the requirements of ASTM A53, Type E or S, Grade B.
 - 1. The following information shall be clearly marked on each length of pipe:
 - a. The pipe designation and class (e.g., A53, Type S, Grade B).
 - b. The name or trademark of the manufacturer.
 - c. Identification of the manufacturing plant.
 - d.
 - 2. All pipe furnished shall be subject to inspection on arrival at the job site. The purpose of the inspection shall be to cull and reject pipe that, independent of physical tests specified under the standard specifications designated herein, fails to conform to the requirements of these specifications.
 - 3.
 - 4. 3. Rejected pipe shall be plainly marked by the Inspector and immediately removed from the site of the work by the Contractor, without cost to The University of Michigan.

2.2 MARKER STRIP

- A. Marker strip shall be red plastic, 6" wide, and labeled to indicate type of service. Brady or Seaton.

PART 3 - EXECUTION

3.1 DUCT BANK INSTALLATION REQUIREMENTS

- A. Concrete encased and direct buried ducts (except site lighting ducts) shall be 4" minimum.

- B. Duct banks shall be supported on undisturbed soil or on piers extending down to undisturbed soil.
- C. Changes in duct bank direction shall be made with 10' minimum radius bends for telecommunications, and 20' minimum radius bends for power. Manufactured sweeps are preferred.
- D. Duct banks shall be sloped downward toward manholes and away from buildings a minimum of 6" per 100'. Duct banks shall not contain traps where water may accumulate.
- E. End bells shall be installed on primary duct ends where the ducts enter the manholes and buildings. End bells shall be firmly embedded in and flush with the inside surface of the wall.
- F. Pull a solid mandrel and a stiff bristled brush through each duct to clean them and insure the absence of kinks and flat spots. A minimum 3-1/4" diameter by 5" minimum long mandrel shall be used for 4" conduit and a minimum 4" diameter by 6" minimum long mandrel shall be used for 5" diameter conduit. The mandrel pull shall be witnessed by the Owner's Representative.
- G. Direct buried a 3" thick minimum concrete cover shall protect ducts over the entire length and width of the duct bank.
- H. Duct banks shall be marked with a 6" wide red plastic marker strip placed in the backfill approximately 12" above the entire length of the duct bank.
- I. All ducts installed by this project shall contain measuring-type pull tape, Greenlee No. 435 or similar. The tape shall be waterproof polyester or nylon, printed with length measurements every foot to indicate the length of the duct, and have a minimum breaking strength of 130 lbs. A minimum of 60" of excess is required at both ends.

3.2 MANHOLE INSTALLATION REQUIREMENTS

- A. Manholes shall be accessible by trucks, cable reel trailers and other cable pulling equipment.
- B. Underground ducts shall be permanently identified in the manholes and at both ends with numbered tags. Tagging requirements shall be obtained from the Owner's Electric Shop through the Owner's Representative.

3.3 GROUNDING

- A. Primary duct banks shall be grounded with a No. 4/0 AWG bare stranded copper ground wire that is run within the duct bank and is bonded and grounded at both ends. Conduit shall not be used as the ground conductor.

- B. Primary manholes shall be grounded with four ¾" diameter by 10' long ground rods, one driven inside or outside of the manhole at each corner. Connect the ground rods with a No. 4/0 AWG bare, stranded copper ground wire loop. A No. 2 AWG bare stranded copper pigtail from the ground wire loop shall be used to bond together and ground the manhole cover frame, ladder support bracket, concrete inserts, metallic cable racks, duct bank ground conductors, and the shields of any primary cables that are spliced in the manhole.

3.4 FIELD QUALITY CONTROL

- A. The University shall assign an agent to coordinate Quality Control associated with activities as outlined throughout Part 3, "Execution".
- B. Contractor shall assist with establishing the order, timing, and duration of the activities requiring Quality Control for inclusion in the Project Schedule.
- C. The electrical equipment and construction to be observed by the Quality Control Agent include the following:
 - 1. Manholes
 - 2. Spacers
 - 3. Grounding
 - 4. Bell Ends
 - 5. Concrete Pours
- D. Provide the Quality Control Agent with reports, lists, forms, plans and drawings described throughout Part 3, "Execution".
- E. During the Shop Drawing Submittal Process, submit one set of the Shop Drawings to the Quality Control Agent for Review. Return to the Quality Control Agent one set of the A/E reviewed and stamped Shop Drawings.
- F. Correct the incomplete and non-conforming items that are identified by the Quality Control Agent.

SPECIFICATION DIVISION 26

NUMBER SECTION DESCRIPTION

DIVISION 26 ELECTRICAL

SECTION 260800 - ELECTRICAL ACCEPTANCE TESTS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 260800 - ELECTRICAL ACCEPTANCE TESTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER
APPLICABLE TO THE PROJECT.*

- B. Related Sections:
1. Section 019100/019110 - Commissioning
 2. Section 017823 - Operation and Maintenance Manual

1.2 TESTS

- A. Perform the visual inspections, manual operations and tests on systems and equipment as described in Part 3, "Execution".
- B. Tests shall be performed and documented by an independent testing agency.

1.3 TEST REPORTS

- A. Provide written test reports, signed and dated, for all tests prior to acceptance of the tested equipment by the Owner. Test reports on Megger, dielectric absorption and high potential tests shall include the ambient temperature and relative humidity existing at the time of the tests.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 VISUAL INSPECTIONS

- A. Prior to any testing, perform visual inspections to verify the following:
1. The equipment is properly installed and anchored.
 2. The equipment is free from damage and defects.
 3. Shipping blocks and restraints have been removed.
 4. Electrical terminations have been properly tightened.
 5. The equipment has been properly aligned.
 6. The equipment has been properly lubricated.
 7. The ventilation louvers are open and unobstructed.

8. The equipment has been thoroughly cleaned inside and outside.
9. The equipment is properly labeled and labels are correct.
10. The equipment is ready to be tested.

3.2 MANUAL OPERATION

- A. Prior to any testing, mechanical devices shall be exercised or rotated manually to verify that they operate properly and freely.

3.3 PRIMARY CABLE TESTS

- A. Perform a continuity test, 2,500-volt DC Megger test, a DC high potential test, and a second 2,500-volt DC Megger test on primary cables. The high potential test shall be performed at 45kV for new cable and at 30kV when new cable has been spliced to existing cable.

3.4 POWER CABLE TESTS

- A. Perform a continuity check and a 1,000 volt DC Megger test on 600 volt power cables No. 4 AWG and larger.
 1. The Megger test shall be performed between each pair of conductors and from each conductor to ground.
 2. The Megger test shall be performed for 15 seconds or until the insulation resistance value stabilizes.
 3. The insulation resistance between conductors and from each conductor to ground shall be 100 megohms minimum in one minute or less. In addition, the lowest insulation resistance value shall not differ from the highest resistance value by more than 20 percent. But if the lowest value is above 1,000 megohms, the 20% balance requirement may be waived.

3.5 CONTROL CABLE TESTS

- A. Perform a continuity check on control and instrumentation wiring.

3.6 ENGINE-GENERATOR SYSTEM TESTS

- A. Perform a continuity check and 1,000 volt DC Megger test on the generator windings, generator circuit breaker, power circuit portions of the automatic transfer switch, and interconnecting power circuit wiring.
- B. Perform a continuity check on the control wiring.
- C. Calibrate the metering and time delay relays.
- D. Perform the normal start-up testing recommended by the engine-generator manufacturer.
- E. Perform a load bank test of overall system with a load bank rated at 100% preferred for a period of at least 120 minutes.
 1. Open normal power to transfer switch and observe proper operation of engine-generator and automatic transfer switch (throwing over to emergency power), noting engine-generator start, time delays and other appropriate variables.

2. Close normal power and observe proper transfer back to normal and proper shutdown of engine-generator, again noting time delays and other appropriate variables.
 3. Operate maintenance bypass switch to insure proper labeling and operation in all modes
- F. Test operation of all generator control and alarm connections to the Automatic Transfer Switches, remote annunciator(s), the Fire Command Center, the fire alarm system, the BAS system, and accessories under all conditions.

3.7 PRIMARY SWITCH TESTS

- A. Perform a continuity check, 2,500-volt DC Megger test, and a DC high potential test on primary switches. DC high potential tests shall be performed at 37kV on new and existing primary switches.

3.8 SUBSTATION TRANSFORMER TESTS

- A. Perform a DC Megger test and a turns-ratio test on unit substation transformers. The DC Megger test shall be performed at 2,500 volts on coils rated over 600 volts, and at 1,000 volts on coils rated 600 volts and below. The turns-ratio test shall be performed on each tap.
- B. Verify proper setting and operation of the fan control panel to insure it and the fans are operable and functional. Temperature-test the probes in each winding.

3.9 SECONDARY SWITCHGEAR TESTS

- A. Perform a continuity check and 1,000 volt DC Megger test on buses, and on main and feeder breakers.
- B. Perform a primary current injection test and a 'Ducter' (contact resistance) test on main breakers.
- C. Perform a 1,000-volt DC Megger test and a turns-ratio test on CT's and PT's.
- D. Calibrate the metering.

3.10 SERVICE, DISTRIBUTION AND MOTOR CONTROL EQUIPMENT TESTS

- A. Verify proper phasing of power circuits.
- B. Perform a 1,000-volt Megger test on buses, motor starters and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
- C. Perform a continuity check on control circuits and control panel internal wiring.
- D. Perform an operational test on the controls and alarms.
- E. Perform a continuity check and a 1,000-volt DC Megger test on 3 phase distribution and isolation transformers.

3.11 MOLDED CASE CIRCUIT BREAKERS (MCCB) TESTS

- A. MCCB's Rated 100 through 225 Amps (Units with fixed and electronic trip units)
 - 1. Perform insulation-resistance tests on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole. Removal of breakers from panelboards or enclosures is not required.
 - 2. Perform a contact/pole resistance (ducter) test. Removal of breakers from panelboards or enclosures is not required.
- B. MCCB's with Electronic Trip Units Rated 100 through 225 Amps
 - 1. Test functionality of the trip unit by means of secondary current injection (Long-time pickup and delay, Short-time pickup and delay, Ground-fault pickup and time delay, Instantaneous pickup). Removal of breakers from panelboards or enclosures is not required. Prior to any testing, verify that all circuit breaker trip units are set in accordance with the approved short circuit and coordination studies.
- C. MCCB's Rated 250 Amps and Above (Units with fixed and electronic trip units)
 - 1. Perform insulation-resistance tests on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole.
 - 2. Perform a contact/pole resistance (ducter) test.
 - 3. Test functionality of the trip unit by means of primary current injection (Long-time pickup and delay, Short-time pickup and delay, Ground-fault pickup and time delay, Instantaneous pickup). Prior to any testing, verify that all circuit breaker trip units are set in accordance with the approved short circuit and coordination studies.
- D. Breaker testing shall be performed prior to termination of associated feeder/branch conductors.
- E. Breaker testing shall be performed per NETA standards and in compliance with the recommendations contained in the manufacturers' published data. Testing shall be performed by a trained and certified ANSI/NETA technician.

INCLUDE PARAGRAPH 'F' IN SPECIFICATION SECTION AFTER EVALUATION OF POWER DISTRIBUTION SYSTEM AND COORDINATION WITH UM DESIGN MANAGER

- F. For expansion and renovation projects, existing breakers associated with the project shall be tested per the requirements above.

3.12 MOTOR TESTS

- A. Perform a 1,000-volt Megger test on 460 volt, 3 phase motors, and a 500 volt Megger test on 200 volt, 3 phase motors.
- B. "Bump" motors to verify proper direction of rotation.
- C. Run motors and check for vibration.

3.13 GROUNDING TESTS

- A. Measure the resistance to ground of each ground rod before connection to the other ground rods. The resistance shall not exceed 10 ohms.
- B. Measure the resistance to ground of the total ground system with all connections completed. The resistance shall not exceed 2 ohms for primary services or 5 ohms for secondary services.
- C. Tests of the resistance to ground shall be made using either the three point method or the fall-of-potential method.
- D. Perform a continuity check from equipment ground bus bars and ground lugs to the ground system.

3.14 FIRE ALARM SYSTEMS

- A. Perform testing in accordance with NFPA 72.

3.15 HEAT TRACING CABLES AND MATS

- A. Perform a continuity check, 500-volt DC Megger test and an operational test on heat tracing circuits prior to insulation of the pipe, tank, or gutter. Verify proper current draw and heating of the heat tracing.
- B. Perform an operational test on the alarms as applicable.

3.16 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

DIVISION 26 ELECTRICAL

SECTION 261000 - MEDIUM VOLTAGE ELECTRICAL DISTRIBUTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

1.2 PHASING

- A. The Owner's primary system phase rotation is A-B-C.
- B. Phase new installations X-Y-Z (or A-B-C) from top to bottom, front to back and left to right when viewed from the front. Phase existing installations to match the existing.

1.3 SPLICES AND TERMINATIONS

- A. The Owner's Electric Shop primary crew shall install medium voltage primary cable splices. Coordinate installation through the Owner's Representative. Splices shall be made with Raychem Type HVS heat shrink splice kits only. Connectors for straight splicing shall be of the two way, solderless, compression type.
- B. Medium voltage primary cable terminations shall be made with Raychem Type HVT heat shrink termination kits or 3M Company Quick Term cold shrink termination kits. Lugs for terminations shall be of the two-hole, solderless, compression type.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

- A. Pull primary cables in lengths not exceeding 500 feet. Avoid exceeding manufacturer's recommendations on pulling tension, sidewall pressures and cable bend radii. Train cables passing through manholes neatly in the same relative positions as in the duct bank, without crossing each other, and support them by porcelain insulators from the manhole cable racks.
- B. Ground the shields of primary cables at both ends. When primary cables are spliced in manholes, bond the cable shields at the splices to the manhole ground system.
- C. Identify the cable phases at all primary cable terminations. Identify phases in 1-1/2" high minimum letters painted on the cable supports or potheads wherever possible. When painting is not possible, identify phases in 1/2" high minimum letters on tags permanently attached to the cables.

3.2 FIELD QUALITY CONTROL

- A. Perform testing in accordance with Specification Section 260800, and submit a test report.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

 - 5. Section 260533 - Electrical Materials and Methods
 - 6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Provide an indoor, metal enclosed, unit substation assembly, configured as single-ended or double-ended as shown on the drawings, and consisting of primary section(s), transformer section(s), and secondary voltage distribution section(s). Provide associated controls and relays; do not provide PLC-based controls, micro-processor based human machine interfaces (HMI), or touch screen displays.
- B. The substation and its major assemblies shall be designed and shipped in sections to accommodate the restricted size and configuration of the delivery route through the building, and the size of the substation room.
- C. Deliver the unit substation, in one coordinated shipment, to the installing Contractor at the project site, on or before the week of _____. The project site is at _____, Ann Arbor MI 48109-2080.
- D. Coordinate final delivery date, time, and other details with installing Contractor (to be named) at least 3 business days in advance of delivery date. Under Manufacturer's supervision, the installing Contractor will unload, move into position, and install the overall unit substation.
- E. Provide supervision for the "breakdown" and "re-assembly" of the transformer section as needed to allow installation into the building.
- F. Before energization, provide a final inspection, testing, and written certification from the equipment supplier.
- G. Assist with substation start-up and commissioning activities.
- H. Provide a one-year minimum warranty from the date of acceptance by the University.
- I. The attached drawings are an integral part of these specifications. Carefully note the physical size of the unit, as well as shipping split and other physical restrictions noted on these drawings. Attached drawings include:
 - 1. Drawing _____
 - 2. Drawing _____
 - 3. Drawing _____

4. etc..

1.3 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 01 and other Division 26 specification sections apply to this section.

1.4 REFERENCES

- A. The unit substation shall comply with the following codes and standards as applicable:
 - 1. MV Load Interrupter Switchgear: ANSI C37.20.3 and 20.4, ANSI C37.22, NEMA SG-5, and NEMA SG-6.
 - 2. Secondary Substation Transformers: 10 CFR Part 431, ANSI C57, IEEE 100, NEMA 201 and 210, and UL 1562.
 - 3. LV Metal-Enclosed Switchgear Assemblies: ANSI-C37.20, NEMA SG-5, and UL 1558.
 - 4. Low-Voltage Power Circuit Breakers: ANSI-C37.13, NEMA SG-3.
 - 5. Circuit Breaker Trip Devices: ANSI-C37.17.
 - 6. National Electrical Code (NEC): NFPA 70.
- B. Where differences exist between various Codes and Standards, the ANSI and IEEE Standards shall govern.
- C. Each of the three main sections of the substation (primary switch section, transformer section, and secondary distribution section) shall be UL listed and shall bear a UL label.
- D. The secondary distribution section shall be labeled as suitable for use as service equipment unless the One Line Diagram defines the primary loop switches or primary transformer disconnect switch as the service equipment.

1.5 SUBMITTALS

- A. Submit for approval the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the University's project name and the University's full project number. Submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked will be rejected.
 - 1. Dimensioned substation plan and elevations with dimensions of the installation clearances, working clearances, conduit entry points, and base mounting points. Identify the substation front and the shipping sections.
 - 2. Size, weight, and movement restrictions for shipping sections. Affirm that shipping sections meet noted building size and movement restrictions.
 - 3. One line diagram including normal and fault ratings, phase rotations, and major component locations.
 - 4. Bill of material with Manufacturers' names and model numbers for major components.
 - 5. Enclosure details including paint color.
 - 6. Primary switch section submittals including:

- a. Dimensioned plan and elevations with bus and switch dimensions, switch handle dimensions, and phase and ground bus terminal locations and barriers.
 - b. One line diagram with bus, switch and fuse ratings, and interlock provisions.
 - c. Compartment details including front door and rear panel descriptions, sheet metal gauge, and painting details.
 - d. Terminal locations and details for phase and ground connections.
 - e. Phase-to-phase clearances and phase-to-ground clearances.
 - f. Bus bar details, connection methods, and materials.
 - g. Insulator and barrier details and materials.
 - h. Fuse and fuse holder descriptions.
 - i. Fuse time-current characteristic curves.
 - j. Nameplate engraving.
7. Transformer section submittals including:
- a. Dimensioned plan and elevations with tap, control power transformer, temperature monitor, fan and control power connection point locations, and phase, neutral and ground connection locations.
 - b. Enclosure details including removable panel descriptions, louver locations, control wiring routing, sheet metal gauge, and painting details.
 - c. Terminal locations and details for phase, neutral, and ground connections.
 - d. Coil conductor materials and construction.
 - e. Insulation materials.
 - f. Test data sheets for similar transformers with test data on load losses, no-load losses, and sound level.
 - g. Temperature control system description, including details on the control power transformer, fans, temperature monitor, temperature alarms, hinged panel for the monitor, and control power connection points.
 - h. Schematic and connection diagrams for the temperature control system.
 - i. Full size copy of the nameplate.
 - j. Coil-to-bus/line connection materials, supports, and details.
 - k. Bus bar and line termination connection and support details.
8. Secondary voltage distribution section submittals containing:
- a. Dimensioned plan and elevations with circuit breaker, control power transformer, and metering device locations, and phase, neutral, and ground bus terminal locations.
 - b. One line diagram with bus, circuit breaker, trip unit, metering device and fuse quantities and ratings, and interlock provisions.
 - c. Compartment details including front door and rear panel descriptions, sheet metal gauge, painting details, mimic bus details, and breaker lifting device description.
 - d. Terminal locations and details for phase, neutral, and ground connections.
 - e. Phase-to-phase clearances and phase-to-ground clearances.
 - f. Bus bar connection and support details and bus materials.
 - g. Insulator and barrier details and materials.
 - h. Circuit breaker, trip unit, and current sensor descriptions.
 - i. Trip unit time-current characteristic curves.

- j. Secondary metering description, including details on the current transformers, potential transformers, ammeter, voltmeter, watt-hour meter, and meter switches.
 - k. Schematic and connection diagrams for the secondary metering systems.
 - l. Nameplate engraving.
- B. Prior to acceptance of the substation by the University, submit for approval, copies of installation, operation, and maintenance manuals for the following equipment:
 - 1. Primary switches.
 - 2. Primary fuses.
 - 3. Transformer.
 - 4. Transformer temperature monitor, fans, and alarms.
 - 5. Circuit breakers and breaker lifting device.
 - 6. Circuit breaker trip units.
 - 7. Control power transformer.
 - 8. Electrical metering devices.

1.6 SHIPPING, HANDLING, AND STORAGE

- A. Protect the substation from weather and moisture condensation at all times.
- B. Provide temporary electric heaters in the transformer in accordance with Manufacturer's instructions until the substation is energized.
- C. Notify the University and University's installing Contractor (to be named) at least 3 working days in advance of delivery.
- D. Arrange for delivery of the substation at the noted site. The University's installing Contractor will unload, move, and install the unit substation under Manufacturer's direction.
- E. The transformer shall be constructed so it can be broken down in the field, if necessary, so it can be lowered through the access hatch, which measures _____ x _____ clear.
- F. The Manufacturer shall provide field service technicians, who will supervise the breakdown of the transformer, i.e. removing the enclosure and the secondary bus from the transformer assembly.
- G. The same technicians shall supervise the reassembly of the transformer at the final installation site.
- H. Ensure that all necessary extra bracing and tools required are in place, so, if necessary, the primary switches and secondary sections can be transported within the building, with their rear panel located at the bottom of transporting assembly.
- I. MANUFACTURER WARRANTIES OR CERTIFICATIONS SHALL NOT BE VOIDED BY THE DISASSEMBLY AND REASSEMBLY OF THE TRANSFORMER AND SWITCHGEAR SECTIONS.

1.7 EXTRA MATERIALS

- A. Deliver to the Owner the following extra materials matching the products installed, packaged with protective covering for storage, and identified with labels clearly describing the contents.
 - 1. Spare Fuses: Provide _____ for each size of:
 - a. Fused primary switch power fuses.
 - b. Potential circuit fuses.

- c. Control power fuses.
- 2. Spare Indicating Lights/Lenses: Six of each type installed.
- 3. Spare Kirk Keys: Two for each Kirk Key interlock.
- 4. Touch Up Paint: Three half pint containers or three spray cans of paint matching enclosure exterior finish.
- 5. Contact Lubricant: One container.

1.8 QUALITY ASSURANCE

- A. Perform standard industry tests on the substation prior to shipping.
- B. Provide copies of written test reports, signed and dated, for all factory and prototype tests.
- C. Provide a product certification, signed and dated by the substation Manufacturer, certifying that the substation complies with the specifications except as approved by the University in writing.

1.9 WARRANTY

- A. Guarantee work (parts and labor) for a period of one year from the date of the Owner's final acceptance of the project, Substantial Completion. A manufacturer's warranty beginning upon equipment receipt or startup shall be extended to one year from final project acceptance. A manufacturer's warranty in excess of one year shall remain in effect for its entire time period.
 - 1. Refer to Specification Section 011400 "Work Restrictions" for the Substantial Completion date.

PART 2 - PRODUCTS

2.1 UNIT SUBSTATION ASSEMBLY

- A. The following unit assemblers are approved when they use the components specified elsewhere in this specification:
 - 1. ABB (ASEA Brown Boveri); note that this does NOT include GE heritage products from the June 2018 acquisition
 - 2. Eaton
 - 3. Powell
- B. The listing of specific assemblers does not imply acceptance of their products that do not meet the specified ratings, features, and functions. Manufacturers listed are not relieved from meeting these specifications in their entirety.
- C. The unit substation shall be a front and rear accessible structure suitable for indoor installation, consisting of primary section(s), transformer section(s), and secondary voltage distribution section(s).
 - 1. The sections shall be constructed to allow for straightforward field assembly into a single structure.
 - 2. The sections shall be constructed of steel frames and heavy gauge steel panels sized to maintain required alignments and clearances at all times. The sections shall also be sufficiently rigid to restrict deformation from external forces and weights that may be applied during maintenance activities.

3. The sections shall be capable of withstanding the lifting, skidding, jacking or rolling (in any direction) actions needed to install the equipment. Factory-installed lifting eyes shall be provided on each section.
 4. The assembly shall have provisions for anchoring to steel leveling channels embedded in a concrete housekeeping pad.
- D. The substation shall be a front-aligned structure. Any variations in section depth shall be reflected on the rear side of the substation.
 - E. The overall length of the assembly (HV switches, transformer section and secondary voltage distribution section) shall not exceed _____ feet.
 - F. Buses and terminations shall be:
 1. Phased X-Y-Z (or A-B-C) from top to bottom, front to back, and left to right when viewed from the front.
 2. Bus bars, flexible connectors, jumpers, and terminations shall be copper.
 3. Bus bars, flexible connectors, jumpers, and terminations (except transformer winding terminals) shall be silver-plated before final assembly and shall be connected using two bolts minimum at each bus joint and insulator. Bolted connections shall use hex head bolts and split lock washers made of stainless steel or Grade 5 steel with clear zinc finish.
 - a. The NEMA specified minimum current-carrying cross sectional area of the bus shall not be compromised by the holes needed to make bus connections.
 - b. The overlap on bus connections shall be sufficient to ensure at least one bolt diameter distance from edge of bolt hole to edge of bus.
 - G. Phase-to-phase and phase-to-ground clearances within the substation shall reflect the specified BIL ratings.
 - H. Primary (medium voltage) insulators shall be porcelain or cycloaliphatic epoxy, sized to withstand the noted BIL and fault currents. When sizing the insulators, assume full load conditions and an ambient temperature of up to 40 degrees Celsius. The supports shall provide ANSI minimum creep distances between phases and ground.
 - I. Secondary (low voltage) insulators shall be porcelain, cycloaliphatic epoxy, or of high strength, moisture, track, and fire resistant glass polyester. Insulators shall be sized to withstand the noted BIL and fault currents, and rated for the maximum temperatures that would occur under design load and fault current conditions and an ambient temperature of up to 40 degrees Celsius.
 - J. Where glass polyester insulators are used, the cut edges shall be sealed to prevent moisture absorption.
 - K. Barriers shall be provided to enclose openings where electrical connections pass from one section to another.
 - L. Ventilation louvers shall be provided to dissipate the heat generated within each section. The louvers shall be located and guarded to minimize accidental contact with live parts.
 - M. The sections shall be painted with Manufacturer's standard gray finish that meets the applicable standards of UL and ANSI.

- N. The unit substation shall include a continuous 1/4" by 2", hard-drawn copper ground bus bar extending the full length across the entire unit substation bottom. In each section, (primary switch, transformer, and secondary distribution), the ground bus bar shall include a Burndy HyGround compression grounding lug suitable for a #4/0 AWG equipment grounding conductor. The ground bus bar shall be drilled and tapped at regular intervals for feeder and branch circuit grounding conductor terminals.
- O. The substation shall include engraved metal or laminated plastic nameplates on the front of each section indicating ratings of equipment and Manufacturer's shop order number for the equipment. The nameplates shall consist of black letters at least 1/4-inch high on a white background. The nameplates shall be affixed with machine screws.
- P. The substation shall include 1/2-inch wide minimum acrylic mimic bus affixed with machine screws. The mimic bus shall indicate switches, transformers, circuit breakers, fuses, SPD units, terminations, fire pump tap, and similar devices. The mimic bus color shall coordinate with the University one line diagrams. Typically green shall represent the 13.2 kV sections and red shall represent the 480 volt sections.
- Q. All lugs within the substation shall be of the long barrel, two-hole compression type as manufactured by T&B or Burndy. Mechanical lugs shall not be accepted.

2.2 PRIMARY SWITCH SECTION(S)

- A. Subject to compliance with these specifications, provide products from the following Manufacturers:
 - 1. Eaton
 - 2. Powercon
 - 3. Square D
- B. Each primary switch section shall consist of two metal enclosed, non-fused, load break, primary loop switches as shown on the drawings, and a metal enclosed, fused, load-break, transformer disconnect switch.
- C. Ratings
 - 1. Design Voltage: 15 kV, suitable for use on a 13.2 kV grounded system.
 - 2. Continuous Current and Interrupting Current: 600 amperes rms.
 - 3. Momentary Short Circuit Current and Fault Closing Current: 61,000 amperes asymmetrical at the system voltage, with system impedance X/R ratio of 15.
 - 4. Short Time (2 second) Current: 38,000 amperes symmetrical.
 - 5. Basic Impulse Level: 95 kV.
 - 6. Fuse Interrupting Capacity: 50,000 amperes symmetrical at the system voltage with a system impedance X/R ratio of 15.
- D. Bus and Compartment Requirements
 - 1. The phase bus bars shall be routed across the top of the compartments to eliminate unnecessary transition sections.
 - 2. The loop switches shall be arranged for top or bottom entry of the primary cables.
 - 3. The primary cable terminations shall be located on bus 'run-backs', near the vertical center of the compartments. A minimum of 30" of straight space shall exist above and below the terminations to facilitate installation of stress cones and to prevent bending of the primary cables to less than the minimum cable bend radius.

4. Provide side-to-side insulated cable supports above and below the 'run back' bus and connection points to relieve strain on the cable terminations.
5. Two-hole, long barrel, compression type lug terminals shall be provided in each loop switch to accept single conductor, 350 kcmil, copper, shielded cable with 15 kV, 133 percent EPR insulation.
6. The fused switch shall be cable-connected to the transformer section. Provide two-hole, long barrel, compression type lugs in the fused switch to accept the transformer primary connections.
7. The switch compartments shall be NEMA 1 rated.
8. The switch compartments shall contain hinged front doors for access to the switches and/or fuses, interlocked with the switch handles, and secured by three point latches. The hinges shall be concealed. The doors shall open a minimum of 90 degrees and be provided with door stays to prop the door open at 90 degrees. The latch handles shall include provisions for padlocking in the closed position.
9. The switches shall be provided with hinged rear doors for access to the rear cable termination areas. Rear doors shall be secured to the compartment frames with hex head machine screws and be provided with door stays to prop the door open at 90 degrees.
10. Provide heavy-duty grounding bails for all switches to accommodate portable grounding equipment.
11. In the loop switches, provide solid full height and width insulating barriers between the incoming cables section of the switch in the rear, and the energized switch and bus components toward the front portion of the switch. The primary cable terminations shall be the only energized components exposed to the rear of the compartments.
12. In the fused switch, provide a solid full height and width insulating barrier between the energized switch and bus components toward the front portion of the switch and a storage compartment in the rear. Provide a storage rack sized for storing 3 spare fuses in their original cartons inside the storage compartment created at the rear of the fused switch.
13. The bus shall be insulated or totally enclosed by barriers, and shall not be accessible normally from either the front or the rear of the switch.
14. Provide an 8" x 16" minimum high-impact viewing window on the front door of each switch that permits full viewing of the position of all three switch blades. The window shall be affixed with metal through-bolts or brackets, and shall not be more than 62" above the finished floor.
15. Provide a viewing window on the rear door of each loop switch to allow viewing of fault indicators on primary cables (fault indicators provided by Owner). The window shall be affixed approximately 18" above the bus run backs if the cable is top entry or 18" below if the cable is bottom entry. This location shall be clarified during the review of the submittal.
16. Provide a hinged grounded metal barrier bolted closed in front of every switch to prevent inadvertent contact with any live part, yet allow for a full-view inspection on the switch blade position.
17. Provide green OPEN and red CLOSED switch position indicators with the words "Open" and "Closed".
18. The primary switch shall be removable as a complete operational component.

E. Load Break Switches

1. The switches shall be fused or non-fused as shown on the drawings, gang operated, 3-pole, and 2-position.
2. The switches shall be bottom hinged.

3. In the fused switch, the fuses shall be de-energized when the switch is open. With the loop switches, it is realized that the blade may in some cases be energized even in the open position.
4. Switch blade materials shall be copper.
5. The switch mechanisms shall be quick make, quick break, and stored-energy type, providing quick operation independent of handle speed.
6. The switch mechanisms shall be direct coupled. Chain or cable drives are not acceptable, except if supplied as a complete unit (switch, operator, and enclosure) from Powercon ONLY.
7. Glass polyester phase barriers shall be provided for the full length of the switches and fuses for each pole. The barriers shall be easily removable, and shall allow for visual inspection of the switches and fuses with the barriers in place.
8. The switches and operators shall be rigidly supported entirely from the interior framework of the compartments.
9. The external manual operating handles shall include lock open and lock closed padlocking provisions for multiple padlocks. The handles shall not project more than 6 inches in front of the substation when the switches are in the open or closed position.
10. The fuses shall be located for easy removal and replacement from the front.
11. The fuses shall be separated from the switch and bus components by the minimum clearances specified by the fuse Manufacturer.
12. Mechanical interlocks shall prevent the opening of the compartment doors unless the switches are open, and to prevent the closing of the switches if the compartment doors are open.
13. Provide switch handle position switches within the front section of each switch for remote indication. Wire the position switches to a terminal block in the rear section of the switch and from there to the control cubicle.
14. A Kirk Key interlock shall prevent the opening or closing of the fused switch unless the secondary main breaker is open. The interlock shall be arranged so that the same key required for fused switch operation is held captive at the secondary main breaker unless the breaker is in the open position.

F. Primary Fuses

1. Primary fuses shall be of the current limiting type.
2. Fuses shall be Mersen (formerly Ferraz Shawmut) Type CL-14, GE Type EJO-1, or Eaton Type 15CLE.
3. The substation manufacturer shall provide "E" rating that is consistent with the coordination of the substation main and feeder circuit breakers as well as utility and fire pump disconnects, that the momentary and interrupting ratings of the substation are within acceptable limits, and that the fuses will operate within the damage curve of the supplied transformer.
4. U-M Primary Systems Engineer and Engineer-of-Record shall agree on rating or work with manufacturer to propose an alternate rating after review of the coordination study.
5. Provide a metal or laminated plastic nameplate on the front door of the fused switch indicating the fuse type, fuse rating, and the identification number of the time-current curve.

2.3 TRANSFORMER SECTION(S)

- A. Subject to compliance with these specifications, and the special shipping and installation requirements noted in Part 1 of these Specifications, provide products from the following Manufacturers:
1. ABB (ASEA Brown Boveri); note that this does NOT include GE heritage products from the June 2018 acquisition
 2. Eaton
 3. MGM
 4. Olsun
 5. Siemens
 6. Square D
- B. Each transformer section shall consist of a dry-type transformer with fans, temperature controls, and any transitions required to connect to the substation primary and secondary sections.
- C. Ratings
1. Type: Air self-cooled and fan cooled, ventilated, dry-type.
 - a. Capacity: ____/____/____ kVA, AA/AA/FA.
 - b. Phase: 3.
 - c. Frequency: 60 Hertz.
 - d. Primary Voltage: 13.2 kV, delta connected.
 - e. Secondary Voltage: ____/____ volts, 4 wire, wye connected, solidly grounded.
 - f. Withstand Rating: Suitable for a maximum available primary fault of 1000 MVA with a system impedance X/R ratio of 15.
 2. Insulation Class: 220 degrees C.
 3. Insulation Temperature Rise: 115 degrees C maximum rise above a 40 degrees C maximum ambient. The transformer shall be capable of carrying a minimum of 15 percent continuous overload without exceeding a 150 degrees C rise in a 40 degrees C maximum ambient.
 4. Insulation Basic Impulse Level:
 - a. 95 kV BIL on the 13.2 kV primary
 - b. 10 kV BIL on the secondary
 5. Impedance: 5.75 percent (from 5.32 to 6.18 percent) on the base rating of the transformer.
 6. Efficiency: In accordance with Federal requirements for energy efficient transformers contained in 10 CFR Part 431.
 7. Sound level: 3 dBA below NEMA standard when tested in accordance with NEMA TR-1.
 8. Harmonic Rating: None.
- D. Core Requirements
1. The core shall be constructed with three or four legs.
 2. The core shall consist of high grade, grain oriented, non-aging, high permeability silicon steel laminations with progressively stepped, rigidly clamped joints.
 3. The core's magnetic flux density shall be well below the saturation point.
 4. The core shall be grounded by use of a removable flexible ground strap between the core and ground bus.
- E. Coil Requirements
1. The coils shall be copper. Inter-phase connections shall be copper.
 2. The coils shall be wound with the secondary winding inside the primary winding.

3. Ventilating ducts shall provide proper cooling under all load conditions.

F. Assembly Requirements

1. The coils shall be rigidly clamped to the core to prevent movement during short circuit conditions.
2. The assembled core and coils shall be vacuum pressure impregnated (VPI) polyester, with clean insulating varnish, and then baked. Coils containing debris baked into the varnish are not acceptable.
3. The core and coils shall be mounted on vibration isolators to mechanically isolate them from the frame and enclosure for sound reasons. These isolators shall also electrically isolate the core and coils for testing purposes.

G. Taps

1. Provide five full capacity, 2.5 percent taps on the primary winding, two below and two above the nominal voltage tap of 13.2 kV.
2. Jumper cables between taps shall be supported to prevent whipping during a fault.

H. Primary and Secondary Connections

1. The primary connections shall be of the flexible cable type. These primary connections shall be supported and shall pass through the primary switch/transformer barrier through smooth grommets, insulated bushings.
2. The secondary connections shall be of the braced bus bar type, equipped with flexible straps for vibration isolation.
3. The primary connections shall accept a minimum of two-bolts and the secondary connections shall accept a minimum of four bolts.

I. Cooling Fans

1. Cooling fans shall be of the propeller type, direct drive, with 120 VAC, single phase, TEFC motors. The motor circuits shall be fused or thermally protected.
2. Power for the fans and controls shall come from a control power transformer in the secondary distribution section.
3. The transformer temperature shall be monitored and the cooling fans shall be controlled by a Qualitrol, Cimco, or Eaton TC-100 temperature monitor.
 - a. The temperature monitor shall be rated 120 volts and mounted flush on the front of the transformer, approximately 54" above the finished floor.
 - b. The temperature monitor shall be mounted on a hinged front plate of a flush mounted box. The electrical connections shall be accessible and the monitor shall be removable without de-energizing the transformer.
 - c. Wiring to the temperature monitor shall be routed and supported independently of the transformer enclosure so that enclosure panels can be removed without affecting the wiring.
 - d. The temperature monitor shall include three hot spot temperature sensors, one for each transformer phase.

- e. The temperature monitor shall start the fans at a temperature of 100 degrees C. It shall initiate an audible alarm, close an "alarm" contact and illuminate a red alarm LED at 135 degrees C. It shall close a breaker "trip" contact and illuminate a second red alarm LED at 175 degrees C. The temperature set points shall be adjustable. The contacts shall be Form C and wired out to a terminal strip inside the temperature monitor box and are to be left for future use.
 - f. The temperature monitor shall include an LED or LCD display to allow reading of the hot spot temperature in each phase, and the highest temperature seen on each phase since the last reset. A reset button shall be provided to reset the maximum readings.
 - g. The temperature monitor shall include LED's indicating "power on" and "fans running".
 - h. The temperature monitor shall include an RS-485 data port for future connection to a remote monitor.
 - i. The temperature monitor shall include a Hand - Auto control switch connected in parallel with the temperature monitor fan control contacts.
 - j. Power for the temperature monitor shall come from the control power transformer located within the secondary section.
 - k. Provide sufficient wire coiled up to extend between the temperature monitor and the control power transformer.
- J. A metal nameplate conforming to NEMA standards shall be mounted on the front of the transformer.

2.4 SECONDARY VOLTAGE DISTRIBUTION SECTION

- A. Subject to compliance with these specifications, provide products from the following Manufacturers:
 - 1. ABB (ASEA Brown Boveri); note that this does NOT include GE heritage products from the June 2018 acquisition
 - 2. Eaton
 - 3. Powell
- B. Single-ended unit substation secondary distribution section shall consist of two or more metal enclosed vertical stacks housing a main circuit breaker, feeder circuit breakers and circuit breaker spaces (as shown on the drawings), a control power transformer, a secondary metering compartment including CTs and PTs, and accessories.
- C. Double-ended unit substation secondary distribution section shall consist of five or more metal enclosed vertical stacks housing two main circuit breakers, tie circuit breakers, feeder circuit breakers and circuit breaker spaces (as shown on the drawings), circuit breaker controls, two control power transformers with transfer switch, two secondary metering compartments including CTs and PTs, and accessories.
- D. If required, provide a fire pump feeder breaker vertical section between the transformer section and secondary main breaker section. The fire pump feeder breaker section shall be completely barriered from the transformer and secondary sections and shall not contain any equipment except fire pump feeder breaker, and secondary metering CTs and PTs. The feeder breaker shall be equipped with an approved physical means to protect the breaker from being inadvertently tripped by a bystander. The compartment door shall be factory painted red. The section shall comply with all requirements of NEC Articles 230 and 695.

E. Ratings

1. Voltage: ____/____ volts, 4-wire, wye connected.
2. Current: _____ amps.
3. Phase: 3.
4. Frequency: 60 Hertz.
5. Insulation Basic Impulse Level: 10 kV BIL.
6. Bus Bracing: The assembly shall be rated to withstand mechanical forces exerted during short-circuit conditions when connected directly to a power source having available fault current ____,____ amperes symmetrical at rated voltage. The bus system shall have a minimum ANSI 4-cycle short-circuit withstand rating of 100,000 amperes symmetrical.
7. Circuit breakers shall have a minimum symmetrical interrupting capacity of 85,000 amperes.
8. To ensure a fully selective system, circuit breakers shall have 30 cycle short-time withstand ratings equal to their symmetrical interrupting ratings regardless of whether equipped with instantaneous trip protection or not.
9. For main and tie breakers, short time rating shall equal symmetrical rating of no less than 100,000 amperes.

F. Bus and Compartment Requirements

1. Vertical phase bus ratings for secondary feeder breaker sections shall be based on breaker cell frame size ratings, including spares and spaces.
2. Neutral bus shall be rated at 100 percent of the ampacity of the phase buses. The neutral bus shall be isolated from ground and the enclosure. The neutral bus shall be equipped with compression lugs for terminating circuit neutral conductors.
3. Blank compartments are not permitted. Spaces shall be fully bused, fitted with neutral current sensors rated to match the breaker frame sizes, and ready to accept future circuit breakers.
4. Provide a rear compartment barrier between the cable compartment and the main bus to protect against inadvertent contact with main or vertical bus bars.
5. Provide a metal barrier full height and depth between adjacent vertical structures in the cable compartment.
6. Compartments shall be arranged for top entry of the secondary cables, and shall include adequate space and support members for installing and supporting the feeder cables.
7. Circuit breaker compartments shall include hinged front doors secured by thumbscrews, three point latches, or single quarter-turn latches.
8. Enclosure shall include removable top panels secured to the compartment frames with hex head machine screws. The rear compartments shall be provided with full height doors secured with three point latches with a single quarter turn knob with provision for a padlock.

G. Circuit Breakers

1. Circuit breakers shall be individually mounted, draw out, metal enclosed, stored energy type, quick-make and quick-break air circuit breakers.
2. Tie breaker(s) shall be identical to the main breakers and shall be capable of being exchanged with either main breaker.
3. Main and tie breakers shall be electrically operated and charged. The feeder breakers shall be manually operated and charged.
4. Electrically operated breakers shall use a dedicated and removable charging motor that is included with the substation.

5. Electrically operated breakers shall be equipped with open and close push buttons remote from the breaker face, position indicating lights, and an amber trip indication light.
6. Breakers shall be equipped with removable arcing contacts and operation counters.
7. Breakers shall be rated for 100 percent continuous duty, with frame and trip ratings as shown on the drawings.
8. Breakers shall be capable of being manually racked into three positions; "connected", "test", and "disconnected". The breaker frames shall be grounded in all positions. Manually operated breakers shall be provided with position indicating lights and an amber trip indication light.
9. The circuit breaker door design shall be such that the following functions may be performed without the need to open the circuit breaker door: lever circuit breaker between positions, operate manual charging system, close and open circuit breaker, examine and adjust trip unit, and read circuit breaker rating nameplate.
10. A breaker shall be tripped open and the stored energy in the breaker mechanism shall be discharged as the breaker is moved into the disconnected position.
11. Breaker compartments shall be dead-front. Shutters shall close automatically as a breaker is racked into the test or disconnected position. Control contacts shall be 'made' when breaker is in test or connected positions.
12. Breakers shall have a minimum of two spare "Form C", isolated contacts brought out to an accessible terminal strip in the compartment. The contacts shall be rated 120 volts, 10 amperes, 60 Hz.
13. Each breaker shall be equipped with three phase current sensors, neutral current sensor, and a microprocessor-based trip unit.
 - a. Current sensors shall be rated to match the frame sizes of the breakers, except current sensors for 800 amp breakers with trip ratings less than 50 percent of their frame size.
 - b. Current sensors shall be rated for 100 percent continuous duty.
14. Where shown on the drawings, breakers shall be equipped with a shunt-trip device. The shunt trip device shall be a hinged armature device rated for operation at 120 volts AC. The shunt trip wiring shall be terminated on an accessible terminal strip in the breaker compartment.
15. Breakers shall be capable of being padlocked in the "open" position and in the racked out position.
16. A Kirk Key interlock shall be provided to prevent the operation of the fused primary switch unless the main breaker is open.
17. A Kirk Key interlock shall be provided to prevent operation of the tie breaker unless one of the main breakers is open. Electrical interlocks shall be provided if the substation is provided with automatic and manual controls for transfer.

H. Solid State Trip Units

1. Solid-state trip units shall be provided on all secondary main and feeder breakers. Units shall be rated as indicated on the drawings. Trip units shall be true RMS sensing. Trip units shall be magnitude and time adjustable, and shall include local and remote indication of the cause of a trip.
2. Trip units shall allow adjustment without breaker trip. Using the test kit to inject a signal to test a breaker can cause the breaker to trip.
3. Trip units shall be rated for 100 percent continuous duty.
4. Trip units shall provide the following ranges and functions as a minimum:

- a. Long time (L) current settings of at least 50-100 percent of the current sensor rating, divided into seven or more steps, and time delays of at least 2-22 seconds, at 600 percent of the long time current setting, divided into seven or more steps.
 - b. Short time (S) current settings of at least 250-1000 percent of the long time current setting, divided into seven or more steps, and time delays of at least 0.1-0.5 seconds, divided into seven or more steps, to include "flat response" and "I²T response" characteristics.
 - c. Instantaneous (I) settings of at least 200-1000 percent of current sensor rating. The instantaneous setting shall be provided on the feeder circuit breakers only. If it is provided on the main breaker, it shall be capable of being defeated.
 - d. Ground fault (G) current settings of 25-100 percent of current sensor rating, with a 1200 ampere maximum, divided in seven or more steps, with ground fault time delay settings of at least 0.1-0.5 seconds, divided into five or more steps, to include "flat response" and "I²T response" characteristics.
5. Additional functions:
- a. Trip units shall provide the ability to field-select either instantaneous, short time pick-up and delay, or both instantaneous and short time protective functions.
 - b. Trip units shall provide integral metering functions including an integral keypad and back-lit graphical display capable of displaying:
 - 1) voltage
 - 2) amperage
 - 3) power factor
 - 4) frequency
 - 5) watts
 - 6) volt-amperes
 - 7) crest factor
 - 8) ampere demand
 - 9) watt demand
 - 10) voltage and current unbalance
 - 11) fault current levels phase-phase, phase-neutral, and phase-ground
 - 12) time-stamped event logs
 - 13) trip logs
 - c. Trip units shall be equipped to provide alarms based on primary over-current, ground over-current, over ampere demand, over kW, over kW demand, over kVAR, over kVA, and phase sequence. The alarms shall have separate adjustable pick-up and delay settings.
 - d. Trip units shall be equipped to provide selective alarm and breaker tripping functions based on neutral over-current, current unbalance, under/over-voltage, voltage unbalance, and under/over-frequency.
 - e. Trip units shall be equipped to provide digital harmonic sampling capability through at least the 13th harmonic.

- f. The main and tie circuit breaker trip unit(s) only shall include technology to reduce arc flash incident energy during maintenance activities. This technology shall reduce the trip unit instantaneous trip value, arc flash incident level, and Personal Protection Equipment (PPE) level when enabled. This technology shall not compromise breaker phase protection even when enabled. When this technology is enabled and disabled, the recalibration of trip unit phase protection shall be accomplished without opening the circuit breaker door and exposing operators to energized parts.
 - 1) This technology shall reduce the arc flash incident energy during maintenance activities to a magnitude requiring PPE of Level 4 or less.
 - 2) This technology shall be enabled via a key lock switch located above the breaker door. An LED shall provide confirmation of protection and shall be blue in color.
- 6. Trip units shall have open protocol communication features (Modbus/TCP) including remote monitoring of power metering functions, remote open/close control of electrically operated breakers via communications, remote trip unit configuration, and remote alarming based on metered values.
- 7. Power for operating trip units shall be obtained from within the circuit breaker assembly itself, or by a separate control circuit connected to the secondary bus ahead of the secondary main breaker. The solid-state trip units shall have non-volatile memory to maintain all settings, trip indications, and fault data during a power outage. Batteries should not be required to maintain the memory. If batteries are required, the battery shall be capable of replacement without taking the breaker out of service.

I. Circuit Breaker Controls

- 1. For double-ended substations, provide main and tie circuit breaker controls to allow automatic or manual transfers of one or both secondary main buses to the opposite power source. When transferring or retransferring an energized bus to the opposite power source, the transfer shall be closed-transition. Circuit breaker tripping shall always be available, regardless of control logic. The close function on the main and tie breaker faces shall be included within the transfer logic and protection or protected from unintentional operation.
 - a. Provide an automatic-manual selector switch (43) to automatically or manually transfer one or both secondary main buses to the opposite power source.
 - b. Provide a breaker trip selector switch (10).
 - c. Provide a sync check relay (25).
 - d. Provide main breakers and tie breaker with relays as needed for the sequence of operations specified below. PLC-based systems shall not be provided. Provide relays for main breakers on line side of breaker with current limiting fuse protection. Provide disconnect point for test purposes to simulate undervoltage conditions.
 - 1) Provide sensors to detect low voltage on any phase of either secondary bus. The low voltage setpoint shall be field adjustable between 80% and 100% of nominal.
 - 2) Provide time delays to control the timing of breaker operation. Transfer time delays shall be field adjustable between 1 and 10 seconds. Retransfer time delays shall be field adjustable between 1 second and 30 minutes. Closed transitions shall be provided with no intentional delays.

- 3) Provide hand-reset lockout relays to prevent closing tie breaker under lockout conditions for either automatic or manual operation.
2. Sequence of Operations
- a. Normal Conditions
 - 1) Main breakers (52-A and 52-B) are closed.
 - 2) Tie breaker (52-T) is open.
 - b. Initial Start-Up
 - 1) Verify mode selector switch (43) is in the "MANUAL" position.
 - 2) Verify all transfer related circuit breakers are in the fully connected position in their cells.
 - 3) Open and close breakers (using breaker control switches) to obtain normal operating conditions (refer to normal conditions below).
 - 4) Place mode selector switch (43) in the "AUTOMATIC" position.
 - c. Interlocking
 - 1) During retransfer in automatic mode, or when the gear is in manual mode, both main and tie breakers may not be closed simultaneously unless buses A and B are synchronized. Interlocking is not active with one or more of the transfer breakers in the "TEST" or "DISCONNECT" position.
 - 2) Closing of main and tie breakers via the push buttons is permitted when mode selector switch (43) is in the "MANUAL" position only. Tripping of the main and tie breakers shall always be permitted.
 - d. Lock-out
 - 1) Overcurrent trip switch (OTS) on main and tie breakers are incorporated in the control scheme such that there will be no closure of any breaker onto a fault. The scheme cannot be defeated and is active at all times.
 - e. Sequence of automatic transfer operation
 - 1) Sequence A - Normal line or any single phase voltage at main 52-A drops below the 85% nominal line voltage.
 - a) Undervoltage relay (47-A) detects loss of voltage.
 - b) Time delay (62-A), adjustable from 1 to 10 seconds.
 - c) Main breaker 52-A opens.
 - d) Tie breaker 52-T closes.
 - 2) Sequence B - Normal line or any single phase voltage at main 52-B drops below 85% nominal line voltage.
 - a) Undervoltage relay (47-B) detects loss of voltage.
 - b) Time delay (62-B), adjustable from 1 to 10 seconds.
 - c) Main breaker 52-B opens.
 - d) Tie breaker 52-T closes.
 - 3) Sequence C - Normal line or any single phase voltage at both main breakers 52-A and 52-B drop below 85% nominal line voltage.
 - a) No action is taken.
 - 4) Sequence D - Where main breaker 52-A is closed, main breaker 52-B is open, the tie breaker 52-T is closed, line and each phase voltage at main breaker 52-B returns to 95% or more of nominal line voltage, and normal line or any single phase voltage at main 52-A drops below the 85% nominal line voltage.
 - a) Undervoltage relay (47-A) detects loss of voltage.
 - b) Time delay (62-A), adjustable from 1 to 10 seconds.
 - c) Main breaker 52-A opens.
 - d) Main breaker 52-B closes.

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

261100 - 17

- 5) Sequence E - Where main breaker 52-A is open, main breaker 52-B is closed, the tie breaker 52-T is closed, line and each phase voltage at main breaker 52-A returns to 95% or more of nominal line voltage, and normal line or any single phase voltage at main 52-B drops below the 85% nominal line voltage.
 - a) Undervoltage relay (47-B) detects loss of voltage.
 - b) Time delay (62-B), adjustable from 1 to 10 seconds.
 - c) Main breaker 52-B opens.
 - d) Main breaker 52-A closes.
- f. Sequence of automatic (closed transition) retransfer operation
 - 1) Sequence F - Line and each phase voltage at main breaker 52-A returns to 95% or more of nominal line voltage (following "Sequence A" or "Sequence D" above)
 - a) Undervoltage relay (47-A) detects normal voltage.
 - b) Time delay (2-A), adjustable 1 to 100 seconds.
 - c) Synchronization of main sources detected by sync check relay (25).
 - d) Main breaker 52-A closes.
 - e) Time delay (2-T), adjustable 5 to 30 cycles.
 - f) Tie breaker 52-T opens.
 - 2) Sequence G - Line and each phase voltage at main breaker 52-B returns to 95% or more of nominal line voltage (following "Sequence B" or "Sequence E" above)
 - a) Undervoltage relay (47-B) detects normal voltage.
 - b) Time delay (2-B), adjustable 1 to 100 seconds.
 - c) Synchronization of main sources detected by sync check relay (25).
 - d) Main breaker 52-B closes.
 - e) Time delay (2-T), adjustable 5 to 30 cycles.
 - f) Tie breaker 52-T opens.
- g. Manual interlock bypass operation
 - 1) Place mode selector switch (43) in the "MANUAL" position.
 - 2) Place breaker manual trip selector switch (10) in the "MAIN A", "MAIN B", or "TIE A-B" position.
 - 3) Open transfer breaker may be closed via breaker control switch when the remaining two transfer breakers are closed and buses A and B are synchronized.
 - 4) Time delay (2-T), adjustable 0.1 to 10 seconds. The breaker selected by the breaker trip selector switch (10) will open.

J. Control Power Transformer

1. Provide a control power transformer with primary and secondary fusing to supply power needed by the transformer temperature monitor, cooling fans, electrically operated breakers, and other equipment needing 120 volt control power. Place the transformer and fusing in a secondary compartment.
 - a. Locate the transformers and fusing in cubicles.
 - b. Connect one transformer ahead of each main breaker.
 - c. Provide a control power transfer circuit that automatically transfers the control circuit from one control power transformer to the other.
2. Provide a terminal block for the wiring connecting the control power transformer to the transformer temperature monitor and cooling fans.
3. Size the control power transformer to 125 percent of the anticipated maximum load (include the load of known future equipment when sizing).
4. 208Y/120-volt substations do not need dedicated control power transformers, but the circuit shall be fused regardless.

K. Secondary Metering

1. Metering equipment shall be mounted so the top of meters (or switches) is no greater than 68 inches above bottom of switchgear.
2. Instrument Transformers
 - a. Provide three potential transformers with a secondary voltage of 120 volts, a mechanical rating equal to the momentary rating of the circuit breakers, and an ANSI accuracy class of 0.3.
 - b. Potential transformer leads shall contain current limiting fuses. The fuses shall be accessible so that they can be maintained without shutting down the substation. 208Y/120 volt substations do not need potential transformers, but shall be fused regardless.
 - c. Provide three current transformers with a ratio that is equal to one-half of bus rating, a 5 ampere secondary, a service rating of 2.0, and an ANSI accuracy class of 0.3 or better. The current transformers shall be sized to carry, at rated accuracy, 133 percent of the burden of all equipment connected to them. The minimum burden rating shall be B0.5 (12.5 VA). Current transformers shall be capable of sustained primary current levels of 200 percent of nameplate rating.
 - d. Locate the current transformers before the main breaker to include measurement of fire pump tap current. Locate shorting terminal blocks adjacent to their current transformers.
 - 1) Current transformers shall be installed so that their nameplates are readable.
 - 2) Current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks located adjacent to the CTs before connecting to any other devices. Shorting screws with provisions for storage shall be provided. A second set of similar shorting terminal blocks shall be provided in the control compartment.
3. Ammeter and Voltmeter
 - a. The meters shall be 4.5 inch diameter or 6 inch square, flush or semi-flush, with 1 percent accuracy, anti-parallax 250 degree scales, and external zero adjustment.
 - b. The ammeter shall have a maximum reading equal to twice the rating of the current transformers and the full scale reading shall be equal to 10 Amps.
 - c. The voltmeter shall have a maximum reading of 240-volts on a 208-volt secondary, or 600-volts on a 480-volt secondary.
4. Instrument Switches
 - a. Instrument switches shall be of the rotary type with an "off" position between each "phase" position.
 - b. The voltmeter switch shall permit the reading of all phase-to-phase and phase-to-neutral voltages.
 - c. The ammeter switch shall permit the reading of all phase currents, and shall maintain current transformer secondary circuits closed at all times. It shall be rated for at least 10 amps.
 - d. The switches shall be mounted under their associated meter, and they shall include appropriate escutcheon plates.
5. Kilowatt-Hour Meter:

BuildingName

The Description of the Project

P00000000 0000 Issued for: BID

261100 - 19

- a. The kilowatt-hour meter shall be a transformer rated (minimum Class 10) polyphase electronic meter, ION8650 series as manufactured by Schneider Electric, complete with kWh energy and kW demand monitoring, drawout case, Ethernet port (10/100Base-T), RS-485 port, infrared port, 4 digital outputs, 3 digital inputs, 32MB memory, password protected; Schneider Electric catalog #S8650C4C0H6E1B0A.
6. Kilowatt-Hour Sub-Meter:
- a. Provide kilowatt-hour sub-meters for individual feeder breakers as shown on the drawings.
 - 1) Kilowatt-hour sub-meters shall be the same as the main kilowatt-hour meter. Ammeters, voltmeters and instrument switches are not required.
 - 2) Voltage signals shall be obtained from the main potential transformers.
 - 3) Current signals shall be obtained from separate current transformers located at the feeder cable connections. Provide three current transformers with a ratio equal to one-half the feeder breaker frame size, a 5 ampere secondary, a service rating of 2.0, an ANSI accuracy class of 0.3 or better, and a minimum burden rating of B0.5.
 - 4) Current transformer secondary leads shall first be connected to conveniently accessible shorting terminal blocks located adjacent to the CTs before connecting to any other devices. Shorting screws with provisions for storage shall be provided.
 - 5) Sub-meters shall be mounted adjacent to the main kilowatt-hour meter or in a remote panel suitable for Contractor mounting on a wall 60" above the finished floor.
7. Provide small wiring, fuse blocks and terminal blocks within the switchgear as required. Control components mounted within the assembly shall be suitably marked for identification corresponding to the appropriate designations on Manufacturer's wiring diagrams.
8. Provide front access to all circuit breaker secondary connection points for ease of trouble shooting and connection to external field connections without the need of removing the circuit breaker for access.
9. Provide a front or rear accessible, isolated vertical wireway for routing of factory and field wiring. Wireway covers shall be secured by thumbscrews, three point latches or single quarter-turn latches. Factory provisions shall be made for securing field wiring without the need for adhesive wire anchors.
10. All control wire shall be Type SIS. Wire bundles shall be secured with nylon ties and anchored to the assembly with the use of pre-punched wire lances or nylon non-adhesive anchors. Adhesive anchors shall not be used.
11. Control wires leaving the switchgear shall be provided with terminal blocks with suitable numbering strips and provisions for #10 AWG field connections. Each control wire shall be marked with its origin zone, wire name, and destination zone over the entire length of the wire using a UV-cured ink process.
12. Provide wire markers at each end of all control wiring. Plug-in terminal blocks shall be provided for all shipping split wires. Terminal connections to remote devices or sources shall be front accessible via doors above each circuit breaker or a wire trough in the cable compartment.

- L. Engraved laminated plastic nameplates shall be provided for breakers, the metering compartment, meters, instrument switches, fuse blocks, control power transformer, PT's, and CT's. Leave adequate space above kWh meters to permit the removal of the covers.
- M. The following accessories shall be provided:
 - 1. A top mounted, manually operated, breaker-lifting device including mounting rails.
 - 2. For NEMA 3R rated exterior unit substations with non walk-in enclosure, a portable breaker lifting device capable of working from the floor between any nearby obstructions and housekeeping pads.
 - 3. Circuit breaker test plug and cable(s) as needed to test the breakers.
 - 4. Meter test plug.
 - 5. Circuit breaker trip unit test device.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Installation and final testing of this unit substation shall be done under a separate contract, by the installing Contractor.
- B. All necessary hardware to secure the assembly in place shall be provided by the installing Contractor.
- C. The installing Contractor shall install all equipment per the Manufacturer's recommendations and the contract drawings.
- D. Install all equipment per the Manufacturer's recommendations and per contract drawings.
- E. Provide a 4-inch thick minimum concrete housekeeping pad with 1" chamfered edge for the substation. Size and shape the pad in accordance with the approved substation shop drawings. Pad shall not extend more than four inches beyond the substation footprint. Pad shall be level to within 1/8 inch per three feet or in accordance with Manufacturer's recommendations.
- F. Anchor the unit substation to the concrete housekeeping pad using concrete anchors.
- G. Install fuses and set the temperature monitor, and circuit breaker trip units in accordance with the short circuit and coordination studies, the Owner's directions, and the Manufacturer's instructions.
- H. Provide temporary heaters in accordance with the Manufacturer's instructions until the substation is energized.
- I. The substation sections shall be installed and checked in accordance with the Manufacturer's recommendations. This shall include, but not be limited to:
 - 1. Checking to ensure that the pad location is level to within 1/8 inch per three feet of distance in any direction.
 - 2. Checking to ensure that all bus bars are torqued to the Manufacturer's recommendations.
 - 3. Assembling all shipping sections, removing all shipping braces, and connecting all shipping split mechanical and electrical connections.
 - 4. Measuring and recording Megger readings phase-to-phase, phase-to-ground, and neutral-to-ground (four-wire systems only).
 - 5. Inspecting and installing all circuit breakers in their proper compartments.

- J. Adjust taps to deliver appropriate secondary voltage.
- K. Confirm operation of circuit breakers using primary current injection method.
- L. Measure primary and secondary voltages for proper tap settings.
- M. Megger primary and secondary windings.
- N. Assist the University's Plant High Voltage Shop and Commissioning Authority with substation testing, start-up, and commissioning activities.
- O. For each kilowatt-hour meter, provide a dedicated one-inch conduit with nylon pull string from the substation to the nearest voice/data cable tray or Telecommunication Room.
- P. For switch handle position switches, provide a dedicated one-inch conduit with nylon pull string from the substation to the nearest voice/data cable tray or Telecommunication Room.

3.2 FIELD QUALITY CONTROL

- A. The substation's Manufacturer shall provide the services of a qualified factory-trained Manufacturer's representative to assist the installing Contractor in the installation and start-up of the equipment specified under this section for a period of two working days.
- B. The substation's Manufacturer shall provide to the Owner a line item cost for each additional day of the factory-trained Manufacturer's representative services that may be required, for up to a total of seven days.
- C. The Manufacturer's Representative shall provide technical direction and assistance to the contractor in general assembly of the equipment, connections, and adjustments. The Manufacturer's Representative shall provide testing of the assembly and components.
- D. The Manufacturer shall provide to the installing contractor three copies of the Manufacturer's field start-up report and written certification that the equipment has been installed and assembled per Manufacturer's direction and is approved for energization.
- E. Provide the visual inspections, manual operations, and tests on systems and equipment described below. Tests shall be performed and documented by an independent testing agency.
- F. Provide written test reports, signed and dated, for all tests prior to acceptance of the unit substation by the Owner. Test reports on Megger (insulation resistance), dielectric absorption, high potential and ducter (contact resistance) tests shall include the ambient temperature and relative humidity existing at the time of the tests.
- G. Prior to any testing, perform visual inspections to verify the following:
 - 1. The equipment is completely and properly installed.
 - 2. The equipment is free from damage and defects.
 - 3. Shipping blocks and restraints have been removed.
 - 4. Electrical terminations have been properly tightened.
 - 5. The equipment has been properly aligned.
 - 6. The equipment has been properly lubricated.
 - 7. The ventilation louvers are open and unobstructed.
 - 8. The equipment is ready to be tested.
- H. Prior to any testing, exercise mechanical devices to verify they operate properly and freely.

- I. Prior to any testing, verify that all circuit breaker trip units are set in accordance with the approved short circuit and coordination studies.
- J. Perform a continuity check, 2,500-volt DC Megger test, and a DC high potential test on primary switches. DC high potential tests shall be performed at 37kV on new and existing primary switches.
- K. Perform a DC Megger test and a turns-ratio test on unit substation transformers. The DC Megger test shall be performed at 2,500 volts on coils rated over 600 volts, and at 1,000 volts on coils rated 600 volts and below. The turns-ratio test shall be performed on each tap.
- L. Verify proper setting and operation of the fan control panel to ensure it and the fans are operable and functional. Temperature-test the probes in each winding.
- M. Perform a continuity check and 1,000 volt DC Megger test on the secondary switchgear buses and on the main and feeder breakers.
- N. Perform a primary current injection test and a ducter (contact resistance) test on all breakers.
- O. Perform a 1,000-volt DC Megger test and a turns-ratio test on CT's and PT's.
- P. Calibrate the metering.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.4 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to conduct two training sessions.
- B. A Manufacturer's qualified representative shall conduct two training sessions. **These services have been purchased under the substation's pre-purchase agreement, by the University.**
- C. The installing Contractor shall arrange and coordinate the two training sessions, for up to fifteen Owner's Representatives. Each session shall last four hours and shall be conducted during normal workdays at a jobsite location determined by the owner. These training sessions shall take place two to four weeks AFTER the start-up of the new substation.
- D. Coordinate the training session topic(s) with the Owner's Representatives a minimum of two weeks prior to the session. Training topics may include basic substation maintenance and operation or may include detailed training on any of the substation components.

SPECIFICATION DIVISION 26

NUMBER SECTION DESCRIPTION

DIVISION 26 ELECTRICAL

SECTION 261102 - INSTALLATION OF PRE-PURCHASED UNIT SUBSTATIONS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL

SECTION 261102 - INSTALLATION OF PRE-PURCHASED UNIT SUBSTATIONS

PART 1 - GENERAL

1.1 SUMMARY

- A. The University of Michigan will pre-purchase an indoor, metal-clad, unit substation assembly consisting of primary voltage switch, transformer, and secondary voltage switchgear sections. The unit substation assembly shall be received, handled and properly stored, as needed and installed, tested and activated by this Contractor.

1.2 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 1 and other Division 26 specification sections apply to this section.

PART 2 - PRODUCTS

2.1 INSTALLATION HARDWARE

- A. All necessary hardware to secure the assembly in place shall be provided by the installing Contractor.

PART 3 - EXECUTION

3.1 FIELD QUALITY CONTROL

- A. The substation's Manufacturer is providing the services of a qualified factory-trained Manufacturer's representative to assist the installing Contractor in the installation and start-up of the equipment specified under this section for a period of two (2) working days.
- B. The substation's Manufacturer has provided to the Owner a line item cost for each additional day of the factory-trained Manufacturer's representative services that may be required, for up to a total of seven (7) days.
- C. The Manufacturer's representative shall provide technical direction and assistance to the contractor in general assembly of the equipment, connections and adjustments, and testing of the assembly and components contained herein.
- D. The installing Contractor shall provide three (3) copies of the Manufacturer's field start-up report.

3.2 INSTALLATION

- A. Accept delivery of new unit substation and, if necessary, store unit in a heated, secure building.
- B. Co-ordinate with the Owner's Representative for an independent inspection of the delivered substation assemblies. The University will hire and pay an independent agency to inspect the delivered substation sections and to verify that all specifications and drawing requirement of the pre-purchase package have been met.
- C. The same independent agency will perform the overall commissioning of the installed substation and all their services will be paid by the University. The installing contractor shall coordinate and facilitate the commissioning tasks.

EDIT AND/OR REMOVE PARAGRAPH, IF BREAK-DOWN IS NOT REQUIRED IN A PARTICULAR PROJECT.

- D. Under the direction of Manufacturer's field representative, break down the unit substation's transformer by removing the enclosure and the secondary bus from the transformer assembly. This is necessary to clear the existing low clearance of _____ inches vertically inside the building.

EDIT AND/OR REMOVE PARAGRAPH IF BREAK-DOWN IS NOT REQUIRED IN YOUR PARTICULAR PROJECT.

- E. The Manufacturer's field representative shall supervise the reassembly of the transformer at the final installation site.

EDIT AND/OR REMOVE PARAGRAPH IF TILTING OR LOW POINTS ARE NOT REQUIRED OR ARE NOT RELEVANT IN YOUR PARTICULAR PROJECT.

- F. Ensure that all necessary extra bracing and tools required are in place, so that the primary switches and secondary sections can be transported tilted as necessary, so they can pass under the low point of the travel path of _____ inches within the building.
- G. Remove secondary breakers from their compartments, before transporting secondary sections to the substation room.
- H. Re-install secondary breakers in their compartments, after installing secondary sections to the substation room.

EDIT AND/OR REMOVE PARAGRAPH IF THERE IS NO ROUTING DRAWING REQUIRED IN YOUR PARTICULAR PROJECT.

- I. Consult Drawings regarding the proposed routing of the unit substation.
- J. The Contractor shall install all equipment per the Manufacturer's recommendations and per contract drawings.

- K. Provide a 4 inch thick minimum concrete housekeeping pad for the substation. Size and shape the pad in accordance with the approved substation shop drawings. Pad shall not extend more than four (4) inches beyond the substation footprint. Pad shall include embedded steel leveling channels that are level to within 1/8 inch per three (3) feet. Leveling channels shall have a 1/8 inch reveal above the top of the concrete. The quantity, size and locations of leveling channels shall be in accordance with Manufacturer's recommendations.
- L. Anchor the unit substation to the concrete housekeeping pad using concrete anchors.
- M. Install fuses, set the temperature monitor, and circuit breaker trip units in accordance with the short circuit and coordination studies, the Owner's directions, and the Manufacturer's instructions.
- N. Provide temporary heaters in accordance with the Manufacturer's instructions until the substation is energized.
- O. Arrange for testing and setting of the unit substation devices in accordance with these specifications, applicable codes and standards, and Manufacturer's instructions. The University will supply breaker settings and transformer primary fuse size.
- P. The substation sections shall be installed and checked in accordance with the Manufacturer's recommendations. This shall include but not limited to:
 - 1. Checking to ensure that the pad location is level to within 1/8 inch per three feet of distance in any direction.
 - 2. Checking to ensure that all bus bars are torqued to the Manufacturer's recommendations.
 - 3. Assembling all shipping sections, removing all shipping braces and connecting all shipping split mechanical and electrical connections.
 - 4. Measuring and recording Megger readings phase-to-phase, phase-to-ground, and neutral-to-ground (four wire systems only).
 - 5. Inspecting and installing all circuit breakers in their proper compartments.
- Q. Adjust taps to deliver appropriate secondary voltage.
- R. Confirm operation using primary current injection method.
- S. Measure primary and secondary voltages for proper tap settings.
- T. Megger primary and secondary windings.
- U. Assist the University's Plant High Voltage Shop and Commissioning Authority with substation testing, start-up and commissioning activities.

3.3 MANUFACTURER'S CERTIFICATION

- A. A qualified factory-trained Manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the Manufacturer's recommendations. **These services have been purchased under the substation's pre-purchase agreement, by the University.**

- B. Provide three (3) copies of the Manufacturer's representative's certification.

3.4 TRAINING

- A. A Manufacturer's qualified representative shall conduct two training sessions. **These services have been purchased under the substation's pre-purchase agreement, by the University.**
- B. The installing Contractor shall arrange and coordinate the two training sessions, for up to fifteen (15) Owner's Representatives. Each session shall last 4 hours and shall be conducted during normal workdays at a jobsite location determined by the owner. These training sessions shall take place BEFORE the start-up of the new substation.
 - 1. One training program shall be of the "start-up" type and shall include instructions on the assembly, including primary equipment, transformer, and secondary equipment. All circuit breakers, protective devices and other major components shall be included.
 - 2. A second training program shall be focused on the maintenance of the unit substation, including primary equipment, transformer, and secondary equipment. All circuit breakers, protective devices and other major components shall be included.

3.5 PRIOR TO SHIPPING

- A. Approximately 7 days prior to shipment of the unit substation components, the local representative of the manufacturer shall meet with the U-M design manager (electrical engineer), as well as other designated U-M stakeholders at the U-M A&E office complex. The purpose of the meeting will be to participate in a conference telephone call to the factories where the substation components are being assembled. The local representative shall coordinate with the factories to ensure that an authorized and qualified factory representative is available (at all sites) who will be able to discuss in detail the U-M assembly. Items such as shop drawing comments, etc. shall be discussed and verified during the telephone conference calls. Under no circumstance may the components be shipped prior to the telephone verifications.

PART 2 - PRODUCTS

2.1 POWER AND DISTRIBUTION PANELBOARDS - FUSIBLE SWITCH TYPE

- A. Power and distribution panelboards shall be of the voltage and amperage shown, 3 phase, 4 wire, 200,000 amps AIC, dead front, fusible switch type, with main fused switch or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface trim. Provide switches and Class R dual element fuses as shown. Eaton Pow-R-Line 4F, Siemens P4 or P5, or Square D QMB.

1. Blank switch positions shall be fully bused and ready to accept future switches.
2. Bus and switch terminals shall be identified as accepting copper and aluminum cables.
3. Enclosure shall be sized to provide adequate conduit knockout space and gutter wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.

4. Door shall have concealed hinge, flush handle, lock, with 2 keys and panel directory frame. All panel locks shall be keyed alike.

2.2 POWER AND DISTRIBUTION PANELBOARDS - CIRCUIT BREAKER TYPE

- A. Power and distribution panelboards shall be of the voltage and amperage shown, 3 phase, 4 wire, 50,000 amps AIC minimum, dead front, circuit breaker type, with main circuit breaker or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface trim. Provide circuit breakers as shown. Eaton Pow-R-Line 4B, Siemens P4 or P5, or Square D I-Line.
 1. Blank circuit breaker spaces shall be fully bused and ready to accept future circuit breakers.
 2. Bus and circuit breaker terminals shall be identified as accepting copper and aluminum cables.
 3. Enclosure shall be sized to provide adequate conduit knockout space and gutter wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.
 4. Door shall have concealed hinge, flush handle, lock with 2 keys, and panel directory frame. All panel locks shall be keyed alike.

2.3 LIGHTING AND RECEPTACLE PANELS

- A. Lighting and receptacle panels shall be of the voltage, amperage and number of positions shown, 3 phase, 4 wire, 22,000 amps AIC minimum unless shown otherwise, circuit breaker type, with main circuit breaker or main lugs only as shown, copper bus, fully rated neutral and ground bars, NEMA Type 1 enclosure and surface or flush trim as shown. In main circuit breaker panels, the main circuit breaker shall be separate from and not mounted in feeder breaker positions. Load center type panels are not acceptable. Provide circuit breakers as shown. Eaton Pow-R-Line 1 or 2, Siemens P1 or P2, or Square D NF or NQOD.
 1. Bus and circuit breaker terminals shall be identified as accepting copper and aluminum cables.
 2. Enclosure shall be sized to provide adequate conduit knockout space and wire bending space for future conduits and cables. When aluminum feeder cables are being used, oversize the enclosure for aluminum cables. Enclosures that are too small to accommodate future conduits and cables or aluminum cables (when used) shall be replaced at the Contractor's expense.

3. Front cover shall be factory manufactured, UL/NRTL listed, one-piece, hinged "door-in-door" type with: Interior hinged door with hand-operated latch or latches as required to provide access to circuit breaker operating handles only; not energized parts. Outer hinged door to provide access to the entire closure including the dead front and all wiring gutters. Outer door shall be kept securely closed with factory bolts, screws, clips or other fasteners to the panel box, requiring a tool for entry; hand operated latches are not acceptable. Both inner and outdoor doors shall open left to right. Include one-piece, removable, inner dead front cover, independent of the panelboard cover. Door shall have concealed hinge, flush handle, lock with 2 keys and panel directory frame. All panel locks shall be keyed alike.

2.4 CIRCUIT BREAKERS

- A. Circuit breakers shall be molded case, bolt-on, quick make and quick break, thermal-magnetic type with trip indication, and shall be from the same manufacturer as the panel in which they are installed. Circuit breaker terminals shall be identified as accepting copper and aluminum cables. Eaton, Siemens, or Square D.
 1. Circuit breakers for power and distribution panelboards shall have a minimum interrupting rating of 35,000 amps RMS at 240 volts AC or 25,000 amps RMS at 480 volts AC.
 2. Circuit breakers for lighting and receptacle panelboards shall have a minimum interrupting rating of 22,000 amps RMS at 240 volts AC or 25,000 amps RMS at 480 volts AC.
 3. Circuit breakers used for switching fluorescent lighting or for protecting air conditioning compressors shall be so listed.
 4. Circuit breakers used for feeding electrical heat tracing shall include ground fault equipment protection rated to trip at 30 ma.

2.5 DISTRIBUTION TRANSFORMERS

- A. Distribution transformers shall be 480-208Y/120 volts, of the kVA and K rating shown, dry type, with copper or aluminum windings, a 220 degrees C insulation system, and designed for a maximum temperature rise at full load of 115 degrees C above a 40 degrees C ambient. Terminals shall be identified as accepting copper and aluminum cables. Transformers shall have a sound rating 3 dB below NEMA standard (42 dB for 10-50 kVA, 47 dB for 51-150 kVA, 52 dB for 151-300 kVA and 57 dB for 301-500 kVA rated transformers), and shall be equipped with four taps, two 2-1/2 percent above and two 2-1/2 percent below nominal. Acme, Cutler Hammer/Westinghouse, Hevi-Duty, MGM, Olsun, Siemens, or Square D.

2.6 FUSES

- A. Fuses for general use shall be rated 250 or 600 volts as required, Class R, dual element type with a 200,000 amp AIC interrupting rating. Bussmann, Gould Shawmut, or Littelfuse.

PART 3 - PART 3 EXECUTION

3.1 INSTALLATION

- A. Provide No. 10 AWG wire to NEMA Type 6-20R receptacles serving freezers, window air conditioners, or other large appliances.
- B. Where shown on the drawings, provide a separate neutral conductor for each single-phase branch circuit. The neutrals of these single-phase circuits shall not be shared or daisy-chained.
- C. Color code circuit breakers and disconnect switches of fire alarm systems and emergency circuits with red paint. Provide lock-on clips on the circuit breaker handles.
- D. Provide nameplates in accordance with Section 260500.
- E. Provide a detailed typed directory for all new and modified panelboards.

3.2 FIELD QUALITY CONTROL

- A. Prior to any testing, perform visual inspections to verify the following:
 - 1. The equipment is properly installed and anchored.
 - 2. The equipment is free from damage and defects.
 - 3. Electrical terminations have been properly tightened.
 - 4. The ventilation louvers are open and unobstructed.
 - 5. The equipment has been thoroughly cleaned inside and outside.
 - 6. The equipment is properly labeled and labels are correct.
 - 7. The equipment is ready to be tested.
- B. Perform the following testing and submit a test report.
 - 1. Verify proper phasing of power circuits.
 - 2. Perform a 1,000-volt Megger test on buses and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
 - 3. Perform a continuity check on control circuits and control panel internal wiring.
 - 4. Perform an operational test on the controls and alarms.
 - 5. Perform a continuity check and a 1,000-volt DC Megger test on 3 phase distribution and isolation transformers.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

SPECIFICATION DIVISION 26

NUMBER SECTION DESCRIPTION

DIVISION 26 ELECTRICAL

SECTION 262726 - WIRING DEVICES

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 262726 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 017823 - Operation and Maintenance Manual
 - 2. Section 019100/019110 - Commissioning
 - 3. Section 260513 - Medium, Low & Control Voltage Cables
 - 4. Section 260526 - Grounding and Bonding for Electrical
 - 5. Section 260533 - Electrical Materials and Methods
 - 6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Section Includes:
 - 1. Lighting switches, occupancy sensors, and low voltage, stand-alone, room lighting controllers.
 - 2. Receptacles.
 - 3. Device cover plates.
 - 4. Receptacle strips and power poles.
 - 5. Floor boxes and floor poke-through devices.
 - 6. Pin and sleeve connectors.

1.3 SUBMITTALS

- A. Product Data: Include manufacturers, catalog illustrations, models, rated capacities, dimensions, rough-in requirements, wiring diagrams, shop drawings, and materials of construction. Wiring diagrams shall be project specific and differentiate between factory wiring and field wiring. Provide written sequences of operation for all controls, including a list of room numbers for each typical control sequence. Sequences of operation shall include all scenarios pertaining to normal, emergency, and egress modes.
- B. Installation, Operation, and Maintenance Manuals

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards, latest editions, of all NEMA and UL standards applicable to each type of wiring device.

1.5 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LINE VOLTAGE LIGHTING CONTROLS

- A. Toggle Switches
 - 1. Toggle switches shall be rated 120/277 volts, 20-amperes, single-pole, double-pole, 3-way or 4-way as shown, heavy-duty, back and side wired, with white handles. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour.
- B. Dimmer Switches
 - 1. Dimmer switches shall be rated for the types of lamps being controlled, 1,000 watts minimum, specification grade, heavy-duty, with white slider or knob and radio noise filter, and suitable for use in a single gang box. Leviton, Lithonia, or Lutron.
- C. Occupancy Sensors
 - 1. Wall mounted occupancy sensors shall be rated 600 watts minimum, 180 degrees coverage minimum, 300 sq. ft. coverage minimum, infrared type, heavy-duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", integral manual override switches, and suitable for mounting in single gang wall mounted boxes. Sensors with triac power switching devices are not acceptable. Cooper Controls, Hubbell, Leviton, Lutron, Sensor Switch, Tork, or WattStopper.
 - 2. Ceiling mounted occupancy sensors shall be rated 1,000 watts minimum, 180-360 degrees coverage as required, 1,000 sq. ft. coverage minimum, infrared type, heavy-duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling mounted boxes. Sensors shall utilize a low voltage power supply and control circuits, and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Cooper Controls, Hubbell, Leviton, Lutron, Sensor Switch, Tork, or WattStopper.

3. Dual technology microphonic/PIR occupancy sensors shall be rated 1,000 watts minimum, 180-360 degrees coverage as required, 1,000 sq. ft. coverage minimum, and combination microphonic/infrared type. The microphonic component shall be acoustically passive and "listen" for sounds indicating occupant motion. The overall occupancy sensor shall be heavy-duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling or wall mounted boxes. Sensors shall utilize low voltage power supply and control circuits and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Sensor Switch.
4. Dual technology ultrasonic/PIR occupancy sensors shall be rated 1,000 watts minimum, 180-360 degrees coverage as required, 1,000 sq. ft. minimum coverage, and combination ultrasonic/infrared type. The ultrasonic component shall operate at 32 kHz minimum and be compatible with hearing aids. The overall occupancy sensor shall be heavy-duty, white color, with SCR power switching devices, adjustable range or sensitivity, adjustable time delay between 5-30 minutes minimum, adjustable setting of manual or auto "on", and suitable for mounting in ceiling or wall mounted boxes. Sensors shall utilize low voltage power supply and control circuits and be interlocked with the switch circuit for local control. Sensors with triac power switching devices are not acceptable. Cooper Controls, Hubbell, Leviton, Lutron, Tork, or WattStopper.

2.2 LOW VOLTAGE, STAND-ALONE, ROOM LIGHTING CONTROL SYSTEM

A. Room Controller

1. Room controller shall be fully functional, plug-and-play, out-of-the-box. Factory or field program room controller to the sequence of operation provided on the drawings. The controller shall not require specialized tools, software, networks, or manufacturer technicians to program or re-program.
2. The room controller shall be stand-alone and not require a building network, PC or server, fire walls, internet, cloud, or other implements to operate.
3. The room controller shall be plenum-rated and operate on 120VAC or 277VAC, 60 Hz input and shall include knockouts for direct conduit connection.
4. The room controller(s) shall be capable of controlling 1 to 3 lighting zones as shown on drawings, with non-proprietary fluorescent ballast or LED driver loads, 16 amps total load. Inputs to the room controller shall be wired (no wireless) and accommodate 0-10V dimmer switches, occupancy sensors, and daylight photocells where indicated. 0-10V wiring shall be RJ45 CAT5/CAT5e cables or Class 1/Class 2 circuiting.

5. Where central emergency power is provided via generator or inverter, provide room controller with emergency power line in and out connections, normal power circuit monitoring, test button or testing function, and UL924 listing. A loss of normal power shall force designated emergency lighting to 100% illumination.
6. Room controller shall be AcuityControls nLight nPP16 series, Cooper RC3 series, Hubbell NXRC series, or Legrand Wattstopper LMRC series. UL924 devices shall be AcuityControls nPP16-ER series, Cooper RC3DE series, or Hubbell NXRC-UL924-UNV series. Alternative UL924 devices may include Cooper CEPC or Legrand Wattstopper ELCU-200 series.

B. Low Voltage Wall Switches

1. Wall switches shall be fully compatible plug-and-play with the local room controller, rated 24VDC, Class 2, and shall utilize CAT5/CAT5e cables. Provide wall switch configurations as indicated on the drawings, able to accommodate up to four channels with on, off, and dimming of each channel. Provide white finish for buttons and cover.
2. AcuityControls nLight nPODM series, Cooper RC series, Hubbell NXSW series, or Legrand Wattstopper LM series.

C. Sensors

1. All sensor types shall be fully compatible, plug-and-play with the local room controller, rated 24VDC, and shall utilize RJ45 CAT5/CAT5e cables or Class 1/Class 2 circuiting.
2. Infrared Wall Switch: Infrared wall switch shall have 180 degree coverage, with small motion range of 20 feet minimum. Push-button programmable with adjustable time delays. Provide dimming control where indicated on drawings. Provide white finish for buttons and cover. AcuityControls nLight nWSX-LV series, Cooper ONW-P-1001-SP with OCC-RJ45 series, or Legrand Wattstopper LMPW-101 series.
3. Ceiling Mounted Infrared Occupancy Sensor: Infrared sensor shall have 360 degree coverage, with small motion range of 12 feet minimum (nominal 300 sqft). Adjustable push-button settings for time delays. Provide auxiliary low voltage relay with dry contact output for HVAC controls. Provide white finish. AcuityControls nLight nCM series, Cooper OAC-P series, Hubbell NXOS-IR series with RJ45 adapter, or Legrand Wattstopper LMPC-100 with LMRL-100 series.
4. Ceiling Mounted Dual Technology Occupancy Sensor: Infrared/Microphonics or Infrared/Ultrasonic sensor shall have 360 degree coverage, with large motion range of 24 feet minimum (nominal 1,800 sqft). The ultrasonic component shall operate at 32 kHz minimum and not interfere with hearing aids. Adjustable push-button settings for time delays. Provide auxiliary low voltage relay with dry contact output for HVAC controls. Provide white finish. AcuityControls nLight nCM-PDT series, Cooper OAC-DT series, Hubbell NXOS-DT series with RJ45 adapter, or Legrand Wattstopper LMDC-100 with LMRL-100 series.

5. Ceiling Mounted Daylight Harvesting Photocell: Photocell shall provide automatic dimming; manual override or dimming level adjustment shall be possible at the wall switch. Provide adjustable push-button settings for set-points. Provide white finish. AcuityControls nLight nCM-ADCX series, Cooper DSRC series, Hubbell NXDS series with RJ45 adapter, or Legrand Wattstopper LMLS-400 series.

2.3 DUPLEX RECEPTACLES

- A. Duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire, NEMA Type 5-20R, heavy duty, back and side wired, grounding type with nylon or Lexan bodies. Except where shown otherwise, normal power receptacles shall have white faces, emergency power receptacles shall have red faces, and "special power" receptacles shall have gray faces. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour 5362.

2.4 GFCI AND AFCI DUPLEX RECEPTACLES

- A. Ground-fault circuit interrupter (GFCI) duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire straight blade type with nylon or Lexan bodies and white faces. GFCI receptacles shall comply with UL 498 and UL 943 and have a blinking light that indicates the GFCI has malfunctioned and no longer provides protection. GFCI receptacles shall trip when ground currents exceed 5 ma, and shall trip in 25 milliseconds maximum. GFCI receptacles shall have an advanced microcontroller that isolates true ground fault conditions from building noise, transient events, and harmonics. Receptacles shall have an interrupting rating of 2,000 amps and shall lock out (off) when the protection system fails. Hubbell with CLAD technology, Legrand Radiant 2097 series, or equivalent by Arrow Hart (Cooper), Bryant, Leviton, or Pass & Seymour.
- B. Arc-fault circuit interrupter (AFCI) duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire straight blade type with nylon or Lexan bodies and white faces. AFCI receptacles shall recognize characteristics unique to an arcing fault and trip when an arc fault is detected. Receptacles shall have an interrupting rating of 2,000 amps and shall lock out (off) when the protection system fails. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour.

2.5 TVSS AND TAMPER-RESISTANT DUPLEX RECEPTACLES

- A. TVSS and tamper-resistant duplex receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire straight blade type with nylon or Lexan bodies and white faces. TVSS receptacles shall clamp at 330 volts or less, and shall have visual indication of the failure of their protective circuitry. Tamper-resistant receptacles shall require the simultaneous insertion of both line and neutral plug blades before power is applied to the receptacle contacts. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour.

2.6 USB CHARGER DUPLEX RECEPTACLES

- A. USB charger duplex receptacles shall be rated 125 volts, 20 amps, with two 2-pole, 3-wire, tamper-resistant receptacles and two USB Type A charger ports. Receptacles shall be NEMA Type 5-20R, heavy-duty, back and side wired or pigtail wired, grounding type with nylon or Lexan bodies and white faces. USB ports shall be 5 volts DC, 3.1 amps minimum combined total, compatible with USB Type 2.0 and 3.0 devices. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour.

2.7 SPECIAL PLUGS AND RECEPTACLES

- A. Special plugs and receptacles including twist-lock devices shall be of the voltage, amperage, number of poles, number of wires, configuration, and NEMA Type shown, heavy-duty, with nylon or Lexan bodies and white or gray faces. Arrow Hart (Cooper), Bryant, Hubbell, Leviton, or Pass & Seymour. Provide the required quantity of mating plugs when shown on the drawings.

2.8 DEVICE COVER PLATES

- A. Except where unique cover plates are required (wall box dimmers, occupancy sensors, surface raceways, etc.), cover plates for devices shall be of high quality Type 302 stainless steel unless otherwise indicated.

2.9 RECEPTACLE STRIPS

- A. Surface mounted receptacle strips shall consist of white color surface wireways containing matching receptacles of the types shown. Receptacles shall be heavy duty, specification grade, and shall be grounded by a separate green ground conductor. The receptacles shall be spaced and circuited as shown.

2.10 POWER POLES

- A. Power poles shall be white color painted steel unless shown otherwise, with an internal barrier to separate power wiring from telecommunications wiring. Poles shall utilize a Velcro pad at the bottom for attachment to carpeting or tile, and an adjustable T-bar assembly with trim plate for attachment to the ceiling. Receptacles shall be rated 125 volts, 20 amps, 2-pole, 3-wire, NEMA Type 5-20R, heavy-duty, white color, and shall be grounded by a separate green ground conductor. Hubbell, Steelcase, or Wiremold.

2.11 FLOOR BOXES

- A. Floor boxes shall be of the flush, multi-service type, UL listed for fire resistance. Boxes shall be of stamped, galvanized steel, fully adjustable, with a minimum capacity of 80 [50, 30] cubic inches, split into 2 [3] compartments of equal capacity by removable partitions. Boxes shall include polycarbonate [brass] gasketed and watertight covers with integral carpet flanges, dual locking flip lids on the power side and four concentric breakouts on the telecommunications side. FSR, Hubbell, or Wiremold.

2.12 FLOOR POKE-THROUGH DEVICES

- A. Floor poke-through devices shall be of the flush type, with two duplex 20A power receptacles and two telecom outlets. Unit shall include two blank inserts for unused telecom openings and the "Communication Adapter" for connecting two 1/2" conduits to the assembly. Flange shall be of brushed brass finish. Unit shall be UL listed for fire resistance. Wiremold RC9 Series or Hubbell PT9 Series.

2.13 PIN AND SLEEVE CONNECTORS

- A. Pin and sleeve connectors shall comply with IEC Standard 309. They shall consist of nylon housings with integral locking rings and cord grips that are color coded by voltage. Pins and sleeves shall be sized, arranged, and keyed to prevent incorrect assembly. Pins or sleeves shall be staggered so that the ground conductor mates first, the neutral conductor mates second, and the energized conductors mate last. Provide integral safety switch interlocks where shown. Crouse-Hinds, Hubbell, Leviton, or Pass & Seymour.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Provide hospital-grade receptacles in patient care areas.
- B. Except where necessary to match existing receptacles, install receptacles with their ground slots below or to the left of the line and neutral slots.
- C. Provide a minimum No. 10 AWG wire to NEMA Type 6-20R receptacles serving freezers, window air conditioners, or other large appliances.
- D. For each new 120 volt or 277 volt branch circuit, provide a dedicated neutral. Neutrals of branch circuits shall not be shared or daisy-chained.
- E. Receptacles installed in surface raceways being fed by multiple circuits, shall have adjacent receptacles from alternate circuits.
- F. Provide GFCI receptacles or GFCI-protected branch circuits for new and existing 120 volt duplex receptacles located outdoors, in garages, on rooftops, in toilet rooms, in unfinished basements, in kitchens, and within 6 feet of water sources including sinks, cup sinks, fume hood sinks, faucets, and hose bibs. Provide GFCI receptacles for water coolers and vending machines. Standard receptacles protected by an upstream GFCI receptacle or a GFCI circuit breaker are not acceptable.
- G. Provide AFCI receptacles or AFCI-protected branch circuits for new and existing 120 volt duplex receptacles located in dwelling unit common rooms, dining rooms, living rooms, bedrooms, closets, hallways, and similar rooms or areas. Standard receptacles protected by an upstream AFCI receptacle are acceptable only when shown on the drawings.

- H. Provide tamper-resistant receptacles for new and existing 120 volt duplex receptacles located in dwelling units, guest rooms, guest suites, child care facilities, and locations indicated in NEC 406.12.
- I. Provide waterproof enclosures for receptacles located outdoors or when designated "waterproof" in special indoor applications. Enclosures shall remain watertight even while in use. Cantex, Carlon, Leviton, or TayMac Corporation.
- J. Provide a nametag on each cover plate of new and existing light switches and receptacles identifying the panel and circuit number feeding the device. Trace the existing circuits using an electronic circuit tracer if necessary. Nametags shall consist of black text permanently laminated to adhesive backed clear nylon or Mylar tape. Brother P-Touch. Embossed plastic tape labels are not acceptable.
- K. Color code junction boxes and box covers of emergency circuits with red paint.
- L. Mark junction box covers in indelible ink with the panel and breaker numbers of the circuits contained within.
- M. Set occupancy sensors as follows:
 - 1. Classrooms, labs: Set for "50% auto on" and timer off for 20 minutes.
 - 2. Offices: Set for "manual on" and timer off for 20 minutes.
 - 3. Storage rooms, janitor closets, telecommunication rooms, copy rooms, kitchenettes: Set for "50% auto on" and timer off for 5 minutes.
 - 4. Toilet rooms and locker rooms: Set for "100% auto on" and timer off for 10 minutes.
 - 5. Corridors: Set for "100% auto on" and timer off for 20 minutes.
- N. For low-voltage, stand-alone, room lighting control systems, wire systems per approved manufacturer shop drawings. Where systems are not factory programmed, provide field programming in accordance with the project drawings, details, and sequence of operations. Provide all necessary accessories and wiring for a fully functional system.
- O. Mount power packs and low-voltage, stand-alone, room lighting control systems within the room's accessible ceiling space, adjacent to the room entrance. Where there is no accessible ceiling, provide a ceiling access panel.

3.2 FIELD QUALITY CONTROL

- A. Perform testing in accordance with Specification Section 260800 and submit a test report.

3.3 COMMISSIONING

- A. Perform commissioning activities in accordance with Related Sections.

NUMBER SECTION DESCRIPTION

DIVISION 26 ELECTRICAL

SECTION 262900 - MOTOR CONTROLS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 262900 - MOTOR CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO
BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.*

*IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER
APPLICABLE TO THE PROJECT.*

- B. Related Sections:

1. Section 019100/019110 - Commissioning
2. Section 017823 - Operation and Maintenance Manual
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Install the following equipment furnished by others.
1. Variable speed drives and variable speed motor controllers.
 2. Motor controls that are shipped loose with packaged mechanical systems.
- B. Provide the following equipment as shown.
1. Motor starters
 2. Motor control centers (MCC's)
 3. Disconnect switches
 4. Motor control devices
 5. Power factor correction capacitors

1.3 REFERENCES

- A. Provide motor controls in conformance with NEMA Standard ICS 2, "Standards for Industrial Control Devices, Controllers and Assemblies."
- B. Provide MCC's in conformance with UL Standard 845, "Motor Control Centers."

- C. Install MCC's in accordance with NEMA Standard ICS 2.3, "Instructions for the Handling, Installation, Operation, and Maintenance of MCC's".

1.4 SUBMITTALS

- A. Submit shop drawings for each MCC including dimensioned plans and elevations and component lists. Show ratings, including short time and short-circuit current ratings, and horizontal and vertical bus ampacities.
- B. Submit schedule of features, characteristics, ratings, and factory settings of individual MCC units.
- C. Submit interconnecting wiring diagrams of individual MCC units pertinent to the class and type specified for the MCC.
- D. Submit schematic diagram of each type of controller unit indicated.

1.5 MOTOR CONTROL REQUIREMENTS

- A. Motor starters and MCC's shall include motor short circuit and overload protection, and a motor disconnecting means as shown.
- B. Reduced voltage or soft starters shall be provided for motors over 100 horsepower as shown.

1.6 POWER FACTOR CORRECTION CAPACITORS

- A. Provide power factor correction capacitors for constant speed motors 50 horsepower and above. For two speed motors, provide capacitors for the low speed winding only.
 - 1. Do not provide power factor correction capacitors for motors controlled by variable speed drives, variable speed motor controllers, or electronic soft starters.
 - 2. Size capacitors to correct their motor full load power factors to at least 90 percent but not more than 96 percent.

PART 2 - PRODUCTS

2.1 MEDIUM VOLTAGE MOTOR STARTERS

INSERT CODE GAUGE NEMA TYPE 1, NEMA TYPE 3R OR OTHER ENCLOSURE TYPE IN THE BLANKS BELOW AS APPLICABLE.

- A. Medium voltage motor starters shall be rated 5kV, of the fused disconnect switch, vacuum breaker contactor type, with 3 motor feeder CT's and overload relays, "hand-off-auto" selector switch, red "run" pilot light, 120 volt fused control transformer, 2 N.O. and 2 N.C. auxiliary contacts, and code gauge NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Allen-Bradley, Eaton, GE, Siemens or Square D. Provide current limiting, medium voltage fuses sized in accordance with the motor nameplates.

2.2 COMBINATION MOTOR STARTERS

MODIFY PARAGRAPH BELOW TO INDICATE NUMBER AND TYPES OF CONTACTS REQUIRED.

- A. Combination motor starters shall be of the voltage and NEMA type shown, horsepower rated for the motors shown, 3 pole, fusible disconnect switch type, with "hand-off-auto" selector switch, red "run" pilot light, 120 volt control transformer with 3 amp maximum fuses, 2 N.O. and 2 N.C. auxiliary contacts, and a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Provide fuse rejection kits, Class R dual element fuses and overload heaters sized in accordance with the motor nameplate. Allen-Bradley, Eaton, GE, Siemens or Square D.

2.3 MANUAL MOTOR STARTERS

- A. Manual motor starters shall be of the voltage shown, horsepower rated for the motors shown, single-pole, double-pole or three-pole as shown, single throw, toggle operated. Terminals shall be identified as accepting copper and aluminum cables. Provide a red "run" pilot light, motor overload heater(s), padlock provision and a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Allen-Bradley, Eaton, GE, Siemens or Square D.

2.4 MOTOR CONTROL CENTERS

- A. Manufacturers: Subject to compliance with requirements, provide products by Allen-Bradley, Eaton, General Electric, Siemens, or Square D.
- B. Wiring Classification: Class I, Type A, as defined in NEMA ICS 2. Bus and switch terminals shall be identified as accepting copper and aluminum cables.
- C. Enclosure: Freestanding modular steel cabinets, NEMA Type 1.
- D. Compartments: Modular, with individual doors with concealed hinges and quick-captive screw fasteners.
- E. Interchangeability: Construct compartments so it is possible to remove units without opening adjacent doors, disconnecting adjacent compartments, or disturbing the operation of other units in the control center. Units requiring the same size compartment shall be interchangeable, and compartments shall be constructed to permit ready rearrangement of units.
- F. Wiring Gutters: Provide each vertical section of structure with horizontal and vertical wiring gutters for wiring to each unit compartment in each section. When aluminum feeder cables are being used, oversize the wiring gutters for aluminum cables. Provide supports to hold wiring rigidly in place.
- G. Short-Circuit Current Rating for Each Section shall be 22,000-amperes rms, symmetrical amperes.

- H. Bus Ampacity Ratings: Confirm ampere ratings 600 amperes for horizontal and 300 amperes for the vertical main buses. Install bus and bus accessories, as needed, to install additional starters in the future in locations currently marked (or shown) as 'spaces'.
- I. Horizontal Bus Arrangement: Extend main phase and ground buses with same capacity the entire length of the MCC, with provision for future extension at select either one end or both ends both ends by means of bolt holes and captive bus splice sections or approved equivalent.
- J. Short-Circuit Withstand Rating: Same as short-circuit current rating of section.
- K. Motor Controller Units: Combination controller units as specified in "Combination Starters" above; of types and with features, ratings, and circuit assignments as indicated. Provide units with full-voltage, across-the-line, magnetic controllers up to and including Size 3 installed on drawout mountings with connectors that automatically line up and connect with vertical section buses while being racked into their normal energized positions. Units shall have short-circuit current ratings, equal to or greater than, the short-circuit current rating of the MCC section.
- L. Overcurrent Protective Devices: Provide types of devices with features, ratings, and circuit assignments indicated, as specified in "Combination Starters" above. Individual feeder tap units through 225 ampere rating shall be installed on drawout mountings with connectors that automatically line up and connect with vertical section buses while being racked into their normal energized positions.
- M. Spaces and Blank Units: Compartments fully bussed and equipped with guide rails or equivalent, ready for insertion of drawout units.
- N. Spare Units: Provide type, sizes, and ratings as indicated, and install in compartments indicated "spare."
- O. Identification Products: Provide nameplates as specified in Section 260500, "Basic Electrical Materials and Methods."
- P. Finishes: Manufacturer's standard finish suitable for the environment in which installed.

2.5 DISCONNECT SWITCHES

- A. Disconnect switches shall be of the voltage and amperage shown, horsepower rated for motor applications, fusible or non-fusible as shown, 3 pole, NEMA Type HD heavy duty, in a NEMA Type 1 enclosure indoors or NEMA Type 3R enclosure outdoors. Terminals shall be identified as accepting copper and aluminum cables. Provide fuse rejection kits and Class R dual element fuses in fusible disconnect switches. Provide early break auxiliary contacts in motor disconnect switches used with variable frequency drives. Disconnect switches shall be lockable in the open and closed positions. Allen-Bradley, Eaton, GE, Siemens or Square D.

2.6 MOTOR CONTROL CIRCUIT DEVICES

- A. Motor control circuit devices shall be heavy duty, rated for operation at 120 volts AC, and contained in a NEMA Type 1 enclosure indoors or a NEMA Type 3R enclosure outdoors. Pilot lights shall be "push-to-test" transformer type. Allen-Bradley, Eaton, GE, Siemens or Square D.

2.7 POWER FACTOR CORRECTION CAPACITORS

- A. Power factor correction capacitors shall be unitized with metallized electrodes, polypropylene dielectric, biodegradable fluid, pressure activated circuit interrupters, and shall be self-healing. Capacitors shall be equipped with discharge resistors, replaceable current limiting fuses, and blown fuse indicators. Terminals shall be identified as accepting copper and aluminum cables. Eaton, General Electric, Myron Zucker, Siemens, Square D.
 - 1. When MCC's are provided, locate the power factor correction capacitors within the MCC structures.
 - 2. Label each capacitor as "Power Factor Correction Capacitor" and indicate the load served and the capacitor KVA rating.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

- A. Anchor MCC assemblies to steel channel sills arranged and sized in accordance with manufacturer's recommendations. Attach by tack welding or bolting. Level and grout sills flush with MCC mounting surfaces. Provide 4-inch high concrete housekeeping pads where indicated.
- B. Tighten MCC bus joint bolts and electrical connector and terminal bolts in accordance with manufacturer's installation instructions and torque-tightening values. Where manufacturer's torque values are not stated, use those specified in UL 486A and UL 486B.
- C. Motor starter hand-off-auto switches shall be wired so that in the "hand" position, the motor runs independently of automatic start/stop controls. Only the safety and modulating controls shall remain active. In the "auto" position, all start/stop controls shall be active.
- D. High temperature detectors (firestats), smoke detectors, low temperature detectors (freezestats), flow switches and other safety controls shall be energized and operational whenever the equipment they protect is operating.
- E. Motor starters shall be wired so that the motors automatically restart after a power disruption. Time delay relays shall be provided for large pumps and fans so that they can coast down before restarting after a momentary outage, and to prevent all of the large motors from restarting simultaneously.
- F. Motor controls installed below piping or in areas with fire protection sprinklers shall be protected by drip shields.

- G. Connect power factor correction capacitors between the motor starter contacts and the overload relays.

3.2 FIELD QUALITY CONTROL

- A. Prior to any testing, perform visual inspections to verify the following:
 - 1. The equipment is properly installed and anchored.
 - 2. The equipment is free from damage and defects.
 - 3. Shipping blocks and restraints have been removed.
 - 4. Electrical terminations have been properly tightened.
 - 5. The equipment has been properly aligned.
 - 6. The equipment has been properly lubricated.
 - 7. The ventilation louvers are open and unobstructed.
 - 8. The equipment has been thoroughly cleaned inside and outside.
 - 9. The equipment is properly labeled and labels are correct.
 - 10. The equipment is ready to be tested.
- B. Perform the following testing and submit a test report.
 - 1. Verify proper phasing of power circuits.
 - 2. Perform a 1,000-volt Megger test on buses, motor starters and disconnect switches. This test may be combined with the power cable Megger test by testing the equipment and terminated cables together.
 - 3. Perform a continuity check on motor control circuits and control panel internal wiring.
 - 4. Perform an operational test on the controls and alarms.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

DELETE THE FOLLOWING SECTION UNLESS THE PROJECT INCLUDES UNUSUAL MOTOR CONTROLS UNFAMILIAR TO MAINTENANCE ELECTRICIANS.

3.4 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

REVISE THE TRAINING REQUIREMENTS BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities. Provide 2 hours of training minimum.

DIVISION 26 ELECTRICAL

SECTION 263000 - ENGINE-GENERATOR SYSTEM

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 263000 - ENGINE-GENERATOR SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

*IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER.
DELETE 3 IF NO FIRE PUMP CONNECTIONS ARE INVOLVED.*

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 213113 - Fire Pumps
4. Section 231123 - Facility Natural Gas Piping
5. Section 235100 - Breechings, Chimneys and Stacks
6. Section 260513 - Medium, Low & Control Voltage Cables
7. Section 260526 - Grounding and Bonding for Electrical
8. Section 260533 - Electrical Materials and Methods
9. Section 260800 - Electrical Acceptance Tests

*SHOW THE GENERATOR RATINGS, AUTOMATIC TRANSFER SWITCH RATINGS
AND TYPES (OPEN TRANSITION, CLOSED TRANSITION OR SOFT LOADING),
CONTROL CIRCUITS AND ALARMS ON THE ONE LINE, RISER AND SCHEMATIC
DIAGRAMS.*

1.2 SUMMARY

- A. Section Includes:

EDIT TO MAKE PARAGRAPHS PROJECT-SPECIFIC.

1. Packaged natural gas fueled engine-generator sets for emergency and/or standby power supply, rated as defined below and as shown on the Drawings.
2. Open transition, closed transition and/or soft-loading automatic transfer switches (ATSS) with full maintenance bypasses, rated as defined below and as shown on the Drawings.
3. Accessories as defined below.

- B. Work Not Included:

EDIT TO MAKE PARAGRAPHS PROJECT-SPECIFIC.

1. Natural gas piping from the utility gas regulator including a gas line isolation valve at the engine-generator, except the gas strainer, secondary regulator, gas pressure gauge and solenoid valve shall be provided with the engine-generator.

2. Exhaust system from the engine silencer to its discharge point, except the rain cap shall be provided with the engine-generator.

1.3 SUBMITTALS

- A. Manufacturer name and model number of major components.
- B. Shop Drawings including overall plan and elevation of major components with dimensions. Indicate the required installation and maintenance access clearances, conduit entry points, and cable termination point details.
- C. Details for weatherproof enclosure including maintenance access details and dimensions, fluid check and drain details and acoustic performance details.
- D. Battery and charger details, model numbers and interconnection details.
- E. Remote annunciator panels, points monitored, wiring requirements, and spare contacts available to other monitoring systems.
- F. Size, weight, and movement restrictions of shipping sections.
- G. Diagrams and data noting normal load, sustainable fault current during faults downstream, and emergency ratings of the system.
 1. Generator impedance data.
 2. Generator thermal damage curve.
 3. Generator breaker time-current characteristic curves.
- H. Computer simulations showing the anticipated voltage and frequency dips during the specified step loading sequence.
- I. Fuel supply flow requirements including volumetric flow rate and pressure to achieve 100 percent full load in the specified time.
- J. Projected sound level of system measured at 7 meters (23 feet) in front of the radiator. Include the load bank's sound contribution if a load bank is adjacent to the generator.
- K. Exhaust gas temperatures at full load.
- L. Complete wiring diagrams specific to this project, including control wiring between the engine-generator, automatic transfer switches, load bank, remote start and stop switches, remote annunciators, ATS position indicating lights and outputs to the Building Automation System.
- M. Automatic Transfer Switches
 1. Manufacturer and model
 2. Overall physical sizes, weights, environmental constraints.
 3. Voltage ratings, ampere ratings, number of poles.
 4. Full power schematic including maintenance bypass assembly.
 5. Affirmation that ATS is UL listed for this application.
- N. Certified reports of source quality control and factory tests prior to engine-generator delivery.
 1. Certification of engine compliance to the current Environmental Protection Agency (EPA) emissions standards.
 2. Certifications of compliance with NFPA 110 for a Level 1 system, and with UL 2200.

3. Certification of compliance with transient and voltage dip responses and steady state voltage and frequency stability.
 4. Test reports, signed and dated, for all factory and prototype tests.
- O. Installation, Operation and Maintenance (O&M) manuals per Related Sections.
 - P. Commissioning reports and documentation per Related Sections.
 - Q. Warranty Documentation.

1.4 DELIVERY, STORAGE AND HANDLING

- A. Protect the engine-generator, automatic transfer switches and accessories from the weather, moisture condensation, dirt and debris at all times. Do not stage equipment on the ground.
- B. Deliver engine-generator, automatic transfer switches and accessories adequately packaged for lifting, skidding, or rolling into final position, according to manufacturer's instructions.

1.5 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, factory certified and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. EPA emissions standards for stationary internal combustion engines.
 2. IEEE C2, "National Electrical Safety Code".
 3. IEEE Standard 446, "IEEE Recommended Practice for Emergency and Standby Power Systems for Commercial and Industrial Applications".
 4. NEMA Standard ICS 10, "AC Automatic Transfer Switches".
 5. NEMA Standard MG 1, "Motors and Generators".
 6. NFPA 70, "National Electrical Code".
 7. NFPA 110, "Emergency and Standby Power Systems".
 8. UL 1008, "Standard for Automatic Transfer Switches".
 9. UL 2200, "Standard for Stationary Engine Generator Assemblies".
- C. Perform manufacturer's standard quality assurance testing on the engine-generator system prior to shipping.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.
 1. Return a call for service within 24 hours, and provide a repair person on site within 48 hours after the call.

PART 2 - PRODUCTS

EDIT 2.1 TO MAKE IT PROJECT-SPECIFIC.

2.1 MANUFACTURERS

- A. Engine-Generator Manufacturers: Subject to compliance with all requirements, provide generators from one of the following manufacturers:
 - 1. Caterpillar.
 - 2. Cummins Power Generation.
 - 3. Generac Industrial Power.
 - 4. Kohler Co.
- B. Open and Closed Transition Automatic Transfer Switch Manufacturers: Subject to compliance with all requirements, provide ATSS from one of the following manufacturers:
 - 1. ASCO.
 - 2. Cummins.
 - 3. Eaton.
 - 4. GE Zenith.
 - 5. Kohler.
- C. Soft Loading Automatic Transfer Switch Manufacturers: Subject to compliance with all requirements, provide ATSS from one of the following manufacturers:
 - 1. ASCO.
 - 2. Eaton.
 - 3. Kohler.

DELETE PARAGRAPH D IF LOAD BANK IS NOT REQUIRED.

- D. Load Bank Manufacturers: Subject to compliance with all requirements, provide load banks from one of the following manufacturers:
 - 1. Avtron.
 - 2. Sephco.
 - 3. Simplex.

2.2 ENGINE-GENERATOR ASSEMBLY

- A. The system including all components shall be NFPA 110 Level 1 compliant, UL 2200 labeled, and rated for operation in a Seismic Category B area at an elevation up to 1,000 feet above sea level.

EDIT B TO SPECIFY GENERATOR STEP LOADING SEQUENCE. LIST THE STEPS, LOADS IN EACH STEP, AND RELATIVE PRIORITY OF EACH STEP.

- B. The system shall be rated to provide power in four steps while complying with the specified transient and steady state voltage and frequency requirements:
 - 1. 20 kW emergency power in 10 seconds to life safety loads and high rise elevators.
 - 2. 150 kW required standby power in 30 seconds to mechanical system motor loads.
 - 3. 100 kW required standby power in 45 seconds to fire pump.

4. 100 kW optional standby power in 60 seconds to laboratory equipment including computer servers and freezers.

EDIT FOR PROJECT CONDITIONS. SELECT ONE OF THE FOLLOWING TWO GENERATOR ENCLOSURE PARAGRAPHS.

- C. Configure the engine-generator for outdoor installation in an enclosure. Outdoor temperatures range from minus 22 degrees F to 104 degrees F (minus 30 degrees to 40 degrees C), with condensing conditions, rain, snow or ice all being possible.
- D. Configure the engine-generator for indoor installation in a room supplied with combustion and ventilation air directly from the outside. Outdoor air temperatures range from minus 22 degrees F to 104 degrees F (minus 30 degrees to 40 degrees C) and humidity may be condensing.
- E. Mount the engine-generator with vibration isolators on a welded steel base, to permit suitable mounting on any level surface.
- F. Provide engraved metal or laminated plastic nameplates indicating ratings of equipment and Manufacturer's shop order number for the equipment. Laminated plastic nameplates shall consist of black letters at least 1/4" high on a white background. The nameplates shall be affixed with machine screws.

2.3 ENGINE

- A. Provide a natural gas fueled, liquid cooled, naturally or blower aspirated engine of 4-cycle design, sized as required to meet the specified generator kW output continuous rating.
- B. The engine shall be factory certified as compliant with the current EPA emissions standards. When the engine is not factory certified as compliant with EPA emissions standards, provide an EPA compliant capable engine. Provide the services of an independent testing agency to perform the first field certification.
- C. Provide controls to allow emergency load pickup in 10 seconds or less, with recovery time of less than 3.5 seconds, a voltage dip of less than 39.5%, and a frequency dip of less than 1.5 Hz.
- D. The engine-generator shall produce full rated output at a gas pressure of 10"-20" inches of water column.
- E. Provide a unit mounted radiator, fan, engine-driven coolant pump, and closed coolant recovery system with the following.
 1. Coolant solution of 50 percent ethylene-glycol antifreeze and 50 percent water.
 2. A sight glass in which the coolant level can easily be observed.
 3. A reclamation bottle to contain coolant overflow.
 4. Coolant fill and oil fill drain points that are easily accessible for maintenance without the use of a pump and hoses.
 5. A radiator designed to allow safe full load operation in minus 22 degrees to 104 degree F ambient temperature conditions.
 6. A duct flange on the radiator outlet.
 7. A fan guard for personnel safety.
- F. Provide an intake air filter with replaceable element.

1. Provide an electronic isochronous governor with speed sensing to maintain generator output frequency within 0.5 percent from no load to full load during steady state conditions, and within 5 percent during a 50 percent step load increase or decrease.
- G. When required to achieve full rated output at 104 degrees F ambient air temperature, provide an aftercooler to cool the combustion air. The aftercooler shall be equipped with the same accessories as the radiator.
- H. Provide a starter battery system to serve the engine-generator and automatic transfer switches, including:
1. Lead acid storage batteries, battery rack and all cables and connections. Size the battery for the range of ambient conditions and to meet the power requirements of the engine-generator and automatic transfer switches after eight cyclic attempts to start the engine.
 2. A remotely mounted battery charger with a solid state voltage regulator in a separate enclosure suitable for wall mounting near the batteries.
 3. Remote 2-wire starting utilizing a solenoid shift electric starter.
- I. Provide an engine-driven positive displacement lube oil pump to supply full pressure lubrication. Provide a replaceable, easily accessible oil filter with internal bypass.
- J. Provide an engine fuel system designed for operation on natural gas having a BTU content of 1000 BTU per cubic foot. Include a gas strainer, secondary gas regulator, gas pressure gauge downstream of the regulator, gas solenoid valve, flexible gas line, and all necessary piping, installed at the point of manufacturing, and terminating at a single pipe opening external to the mounting base.
- K. Provide sensing elements for oil pressure, coolant temperature, coolant level, overcrank, and overspeed. Connect these sensors to the control panel using a wiring harness with wire numbering at each end of the harness for easy identification. Provide each connection with a molded rubber boot to protect the connection from corrosion. Provide all wiring in flexible conduit with wiring and conduit rated for the application.

EDIT THE VOLTAGE OF JACKET HEATER TO MATCH ELECTRICAL SYSTEM DESIGN.

- L. Provide an engine mounted, thermostatically controlled, 208 Volt or 120 Volt, single phase, coolant jacket heater to aid in quick starting.

EDIT THE DBA VALUE TO MATCH THE SOUND STUDY. SEE DG 263000.

- M. Provide a silencer rated for a minimum sound attenuation of 35 dB when measured 7 meters from its discharge opening. Mount the silencer and connect to the exhaust stack using a flexible, seamless, stainless steel exhaust connection. Provide a hinged, flapper style rain cap. A stack termination that deflects exhaust horizontally, including an inverted cone style cap is not acceptable. Properly size all components to assure operation without excessive backpressure.

- N. Silencer shall be selected and sized by engine manufacturer and designed with an exhaust piping system that will not exceed manufacturer's engine backflow pressures.
- O. Provide a catalytic converter when necessary to meet EPA emissions standards. The catalytic converter may be separate from or integral to the silencer. It shall include a hatch or port for changing of the catalyst.
- P. Provide a manual blow-down ball valve no more than 78 inches above the floor in a pipe tapped into the low point of the exhaust system. Pipe the discharge to a bucket on the floor.

2.4 GENERATOR

- A. Provide a 4-pole, 3-phase, 4-wire, ungrounded wye, brushless 60 Hz alternator with a 2/3 pitch and fully linked amortisseur windings, rated as indicated on the Drawings. Mount and directly connect the generator to the engine shaft to ensure permanent alignment. Extend all phase and neutral leads into a connection panel.
- B. Generator shall include an integral brushless permanent magnet exciter.
- C. Generator and exciter shall have Class H insulation rated for a temperature rise of 105 degrees C over a 40 degrees C ambient.
- D. Provide a solid-state voltage regulator, separate from the exciter, to control output voltage within 1.0 percent from no load to full load during steady state conditions, and within 20 percent during a 50 percent step load increase or decrease. Upon a 50 percent step load increase, the voltage shall recover to steady state within 3.0 seconds.
 - 1. If a heavy load dips the output frequency, the voltage regulator shall have a voltage droop of 4 volts/hertz to maximize motor starting capability. The frequency at which the droop operation begins shall be adjustable, allowing the generator to be properly matched to the load characteristics and ensuring optimum system performance.
 - 2. Provide a limiting circuit in the voltage regulator to prevent output voltage surges in excess of 110 percent of rated voltage during generator set operation.
 - 3. Provide capability of the voltage regulator to shut down on a loss of the sensing signal, to prevent an overvoltage condition from occurring. A voltage regulator that can go into a full field condition is unacceptable.
 - 4. Provide LED lights on the voltage regulator to indicate proper sensing and operation.
 - 5. Provide a minimum of plus or minus 10 percent voltage adjustment from the rated value.
 - 6. At no load the generator's harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for any single harmonic. The Telephone Influence Factor as determined according to NEMA MG 1 shall not exceed 50 percent.

7. For a 3 phase bolted fault at the output terminals, the generator shall produce a minimum of 250 percent of rated full load current for not less than 10 seconds, with no damage to the engine-generator.
- E. Provide a connection panel that is an integral part of the generator to allow the Contractor a convenient location to make electrical output connections. Panel shall be NEMA 1. The panel shall include phase and isolated neutral connection bars suitable to accept Owner's 2 hole compression lugs. Provide a NEMA standard 2 hole compression lug sized for No 4/0 AWG cable for bonding of the engine-generator.
 - F. Provide UL listed, 100 percent rated, generator main circuit breakers with adjustable long time, short time and instantaneous trip settings, rated as shown on the drawings. A system utilizing a manual reset generator field circuit breaker with current transformer is not acceptable. Locate the circuit breakers in the generator connection panel. Provide barriers between emergency and standby power circuit breakers.
- DELETE THE NEXT PARAGRAPH IF THE SYSTEM DOES NOT INCLUDE A SOFT LOADING AUTOMATIC TRANSFER SWITCH.**
- G. Provide a DC-operated shunt trip coil on each generator main circuit breaker, with coils rated at the engine starter battery system voltage. Mounting level shall be accessible from adjacent grade.

2.5 CONTROLS

- A. Provide an NFPA 110 Level 1 compliant engine-generator control panel in a NEMA 1 enclosure, shock mounted to the engine-generator set by the manufacturer. The top of the panel shall be no more than 78 inches above the finished floor.
- B. Provide a fused low voltage control circuit to power the controls.
- C. Provide the following analog or digital indicators and controls as required by NFPA 110 for a Level 1 system. The AC voltmeter, AC ammeter and frequency meter shall be three separate indicators, not part of a scrollable digital display.
 1. AC voltmeter.
 2. AC ammeter.
 3. Frequency meter.
 4. Voltmeter and ammeter phase-selector switches.
 5. DC voltmeter (battery charging voltage).
 6. Generator voltage adjustment.
 7. Engine cool-down timer.
 8. Non-resettable engine run-time meter.
 9. Engine coolant temperature gauge.
 10. Engine lubricating-oil pressure gauge.
 11. Complete engine start-stop control, which starts the engine upon a contact closure and stops the engine upon a contact opening.
 12. Cyclic cranking limiter to open the starting circuit after eight attempts if the engine has not started within that time.

13. 3-position RUN/OFF/AUTOMATIC selector switch. The engine-generator annunciator shall monitor this switch and provide a "Generator Trouble" alarm when the switch is not in AUTOMATIC.
 14. "Generator Running" and "Generator Trouble" output contacts for connection to the Building Automation System DDC panel.
- D. Provide a solid state annunciator complying with NFPA 110 on the control panel, complete with individual alarm lights, a common audible alarm with reset switch, and one common "Generator Trouble" output contact indicating the following engine and generator conditions:
1. Engine-generator system providing power.
 2. Overcrank shutdown.
 3. High coolant temperature shutdown.
 4. Low lube oil pressure shutdown.
 5. Overspeed shutdown.
 6. Loss of coolant shutdown.
 7. Overvoltage shutdown.
 8. Low coolant temperature alarm.
 9. High coolant temperature pre-alarm.
 10. Low coolant level pre-alarm.
 11. High battery voltage alarm.
 12. Low battery voltage alarm.
 13. Battery charger failure.
 14. Control switch not in Automatic alarm.
 15. Lamp test.
- E. Provide a remote manual stop station with a red mushroom head pushbutton and a clear plastic hinged cover in accordance with NFPA 110. The stop station shall be waterproof and suitable for wall mounting outdoors. Locate stop station remotely from the engine generator control panel and the engine generator enclosure where directed by the Owner.

2.6 ENGINE-GENERATOR ACCESSORIES

DELETE A FOR AN INDOOR INSTALLATION. OUTDOORS, EDIT A.1 BY DELETING THE FLOOR REQUIREMENT IF THE ENGINE-GENERATOR WILL SIT ON A CONCRETE HOUSEKEEPING PAD.

- A. Provide a weather-tight protective enclosure for the engine-generator set as follows:
1. Provide a heavy gauge steel enclosure constructed with corner posts. Provide a solid steel floor. Coat the enclosure with electrostatic applied zinc and finish with baked enamel paint on all interior and exterior surfaces.
- EDIT OR DELETE A.2 TO COMPLY WITH THE SOUND STUDY. DELETE THE FLOOR REQUIREMENT IF THE ENGINE-GENERATOR WILL SIT ON A CONCRETE HOUSEKEEPING PAD.*
2. Provide a sound attenuating type enclosure including louvers, with sound insulated walls, roof, floor and doors, which achieves a maximum of 70 dBA at 7 meters.
 3. Provide bird screens and filters arranged to permit air circulation while excluding exterior dust, birds, rodents and the insertion of foreign objects.

4. Locate the silencer and catalytic converter inside the enclosure.
5. Provide large, easily opened doors on the enclosure to allow access to the engine, generator, radiator and aftercooler caps, all normally accessed maintenance points including oil and coolant fill, drain and filter points, and the control panel. Provide each door with stainless steel lockable hardware with identical keys. Padlocks are not acceptable.
6. Construct the enclosure of sufficient structural integrity to resist deformation and denting by people climbing on it and rugged enough to be vandal resistant. Comply with the Michigan Building Code requirements for wind loads.

DELETE 7 ON UNITS 300 KW OR LESS.

7. Provide the enclosure with 120 Volt dust and moisture resistant, low temperature, interior fluorescent lighting, a light switch, and two 120 Volt GFCI duplex receptacles.

DELETE B IF A GENERATOR-BACKED 208Y/120 VOLT RECEPTACLE PANEL IS AVAILABLE NEAR BY.

- B. Provide a 208Y/120 Volt, 60 amp minimum, 3 phase, main lugs only load center panel with circuit breakers to feed the battery charger, coolant jacket heater, motorized ventilation dampers, lights and receptacles. Mount the load center panel where shown on the Drawings.
- C. Provide a remote annunciator panel to monitor alarm and trouble conditions at the engine-generator, batteries, and battery charger. The annunciator shall be in a NEMA 1 enclosure suitable for flush or surface mounting on a wall.
 1. Provide an "Engine-generator providing power" alarm light in the annunciator.
 2. Provide the same alarm lights contained on the engine-generator control panel annunciator.

2.7 AUTOMATIC TRANSFER SWITCHES

EDIT A TO MAKE IT PROJECT SPECIFIC. STATE EACH ATS VOLTAGE RATING, CURRENT RATING AND NUMBER OF POLES ON THE DRAWINGS.

- A. Provide open-transition, closed-transition and/or soft-loading automatic transfer switches (ATSs) with full maintenance manual bypass isolation, UL 1008 listed, rated and with the number of poles indicated on the Drawings.
 1. Open-transition ATSs shall perform an open transition (break-before-make) transfer from the normal to the emergency source and a break-before-make re-transfer back to the normal source. A sync-check relay shall normally delay re-transfer (when both sources are available) until both sources are close to being in synchronization.
 - a. Open-transition ATSs only shall provide a re-transfer pre-signal to elevators operating on emergency power.
 - b. The pre-signal shall be a dry contact closure at an adjustable time of 1 to 10 seconds before re-transfer.

2. Closed-transition ATSS shall perform a closed-transition (make-before-break) transfer from the normal to the emergency source and a closed transition re-transfer back to the normal source, thus eliminating a momentary interruption of power to the loads. A sync-check relay shall normally delay transfer and re-transfer (when both sources are available) until both sources are close to being in synchronization.
3. Soft-loading ATSS shall provide the same modes of operation as the closed-transition ATSS and include paralleling and protective control equipment to permit the following additional modes:
 - a. Soft Load Transfer Mode: Allows the ATS load to be completely isolated from the utility using a programmed soft load transfer / re-transfer sequence to or from the engine-generator.
 - b. Maintained Parallel Base Load: Establishes and maintains a safe parallel connection of the engine-generator with the normal source until a local or remote signal terminates this condition. The engine-generator shall operate at the base load level set by the Owner on the control panel.
 - c. In the event either source connected to the load becomes unacceptable while in any operating mode, the soft load ATS shall automatically isolate the emergency and normal sources and revert to operation as an open transition ATS.

INSERT THE WORST CASE ATS 1.5 OR 3 CYCLE CLOSE ON AND WITHSTAND RMS SYMMETRICAL SHORT CIRCUIT CURRENT RATING REQUIRED BASED UPON USING ANY UPSTREAM CIRCUIT BREAKERS.

- B. ATSS shall be rated to close on and withstand, and UL 1008 tested and labeled with a 1.5 or 3 cycle rating of [insert] amps minimum RMS symmetrical short circuit current when used with any upstream circuit breakers. ATSS not UL 1008 tested and labeled with 1.5 or 3 cycle ratings, or that have series or specific upstream breaker ratings only, are not acceptable.
- C. Four pole ATSS shall include fully rated, overlapping neutral contacts. The normal power and emergency power neutrals shall only be connected together during transfer and re-transfer operations, and only for 100 milliseconds or less.
- D. ATSS shall contain readily accessible terminal blocks for connection of external wiring.
- E. ATSS shall include a full maintenance bypass and isolation switch section to allow either the normal or the emergency source to directly feed the load while totally isolating all components in the automatic transfer switch compartment from power except from the 120 Volt control power.
 1. Bypass isolation switches shall be rated the same as the automatic transfer switches.
 2. Bypass isolation switches shall include closed transition (make before break) contacts to avoid power interruptions during transfer and re-transfer.
 3. Provide manual operators with operating handles capable of being used without opening the enclosure door.

- F. ATSS shall be electrically operated and mechanically held with a solenoid operated, momentarily energized electrical operator.
- G. ATSS shall be positively locked and unaffected by momentary outages, so that contact pressure is maintained at a constant value.
- H. Main switch contacts shall be of silver composition. ATSS rated 600 amperes and above shall have front removable and replaceable contacts, and main contacts shall be protected by separate arcing contacts.
- I. Inspection of contacts shall be possible from the front without disassembly of operating linkages and without disconnection of power conductors.
- J. ATSS shall be housed in NEMA 1 enclosures with a hinged front door secured by a latch. The door shall open a minimum of 90 degrees. The latch handle shall include provisions for locking in the closed position.
- K. Provide a control panel with sensing and control logic directed by a built-in microprocessor.
 - 1. Mount the control panel on the front door of the ATS enclosure. Connect the control panel to the transfer switch with an interconnecting wiring harness. Include a keyed disconnect plug with the harness to enable the control panel to be disconnected from the transfer switch for maintenance.
 - 2. Provide sensing and control logic on printed circuit boards. Provide industrial grade plug-in type interfacing relays with dust covers.
 - 3. Provide monitoring of voltage of each phase of the normal and emergency sources. Provide voltage sensing with pickup voltage adjustable from 85 percent to 100 percent of nominal dropout, adjustable from 75 percent to 98 percent of pickup setting, and independent frequency sensing with pickup adjustable from 90 percent to 100 percent of nominal.
 - 4. Provide a repetitive accuracy of all settings within plus or minus 2 percent over an operating temperature range of minus 22 degrees F to 104 degrees F.
 - 5. Provide voltage and frequency settings that are field programmable in 1 percent increments.
 - 6. Provide a time delay on transfer to emergency power, adjustable from 0 to 5 minutes for controlled timing of transfer of loads to emergency.
 - 7. Provide a time delay on re-transfer to normal power, adjustable from 0 to 30 minutes. Provide an automatic bypass of this time delay if the emergency source fails and the normal source is acceptable.
 - 8. Provide momentary-type test switches to simulate a normal source failure.
 - 9. Provide terminals for two remote controlling contacts; one that signals the ATS to transfer to emergency and the other to inhibit transfer to emergency and/or re-transfer to normal.
 - 10. Provide auxiliary contacts rated 10 amps, 250 VAC, consisting of two contacts that are closed when the ATS is connected to the normal source and two contacts that are closed when the ATS is connected to the emergency source. Wire these contacts to terminals for connection to external wiring.

11. Provide indicating lights for the presence of normal power and presence of emergency power; one showing ATS is connected to the normal source (green) and another to indicate when the ATS is connected to the emergency source (red).

L. Provide one ATS with a system exerciser for automatic exercising and testing of the engine-generator and ATSS. Include the following features.

1. An engine start time clock capable of being programmed for time of day, day of the week, week of the month, months of the year, and duration of the exercising.
2. Time clock shall automatically adjust, resetting itself for changes between Standard Time and Daylight Savings Time.
3. Controls to enable and disable the transfer of the ATSS during engine exercising.

EDIT THIS ARTICLE PER DESIGN GUIDELINE SBA-J FOR A HIGH RISE BUILDING OR A BUILDING WITH SMOKE CONTROLS IF THE BUILDING HAS MULTIPLE GENERATORS. DELETE THIS ARTICLE IF THE BUILDING IS NOT A HIGH RISE AND IF IT DOES NOT HAVE SMOKE CONTROLS.

M. Provide engine-generator and ATS manual start and transfer features for installation in the Fire Command Center as required by the Michigan Building Code.

1. Provide one two-position, "Auto-Run" selector switch with one contact per ATS to manually initiate an engine-generator start and ATS transfer. In the "Auto" position, each ATS shall be in normal stand-by mode. In the "Run" position, each ATS shall simulate a loss of normal power. This shall cause each ATS to start the generator(s) and transfer to generator power when its generator is ready.
2. Provide a green "normal power" and a red "generator power" indicating light for each ATS to indicate the position of the ATS. Label each pair of lights to indicate the generator and ATS equipment numbers and the types of loads connected to the ATS.

DELETE 3 WHEN EXISTING ATSS ARE BEING CONNECTED TO THE SYSTEM.

3. In lieu of providing one "Auto-Run" selector switch and multiple green and red indicating lights, one ATS remote annunciator may be provided. The annunciator shall be from the same manufacturer as the ATSS. It shall include means to manually start the engine-generator and transfer all ATSS, and a green "normal power" and a red "generator power" position indicating light for each ATS.

DELETE THIS ARTICLE IF NOT APPLICABLE. IF A LOAD BANK IS TO BE PROVIDED, SHOW ON THE PLAN DRAWINGS THE DIRECTION OF EXHAUST AIR FLOW.

2.8 LOAD BANK

A. Provide a self-contained resistive load bank suitable for permanent installation outdoors. The load bank shall be rated for 100 percent of generator output at unity power factor, and shall include the following:

1. A weather protective, thermostatically controlled heated housing for contactors and other control components.
2. A heavy-duty blower with integral blower motor.

EDIT 3 TO INDICATE THE DIRECTION OF AIR EXHAUST.

3. Fixed louvers on exhaust openings capable of exhausting air upward as shown on the Drawings.
4. Corrosion resistant chromium alloy wire resistors.
5. Branch circuit fusing on all load steps.
6. 480V - 120V control power transformer.
7. Load dump circuit to disconnect the load bank automatically upon loss of normal utility power.
8. Remote control panel integral to the load bank enclosure and including the following:
 - a. Control power on-off switch.
 - b. Control power light.
 - c. Blower power light.
 - d. Air failure light.
 - e. Master load on-off switch.
 - f. Load step on-off switches.
 - g. Digital multi-function meter displaying instantaneous voltage, current, power or frequency for all 3 phases.

DELETE THIS ARTICLE IF LOAD BANK IS BEING PROVIDED.

2.9 LOAD CONNECTION BOX

- A. Provide a generator output circuit breaker or generator bus tap located in a connection box for connection of cables to a portable load bank. Size the circuit breaker or bus tap for 100 percent full load current of the generator. Box shall have a grommeted opening sized for the cables and a cover capable of being closed while the cables are connected.

2.10 SOURCE QUALITY CONTROL

- A. Before shipment of the equipment, factory test the engine-generator under rated load and power factor for performance and proper functioning of controls and interfacing circuits. Tests shall include:
 1. Proper operation of controls, indicators and safety shutdowns.
 2. Single step load pick-up per NFPA 110.
 3. Compliance with the specified transient and steady state voltage and frequency requirements.
 4. Provide a certified factory test report.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Maintain Code and manufacturer defined working clearance around the generator and automatic transfer switches.

SHOW ON THE PLAN DRAWINGS THE ORIENTATION OF ENGINE-GENERATOR.

- B. Install engine-generator on grillage or concrete housekeeping pad as shown with sound isolation pads or springs between mounting surface and generator.
- C. Install and orient exhaust pipe rain flapper cap with hinge toward the southwest.
- D. Set timers, overcurrent protective devices, and other items needing to be set in accordance with the design documents and manufacturer's directions.

3.2 CONNECTIONS TO REMOTE EQUIPMENT

DELETE ITEMS THAT DO NOT APPLY.

- A. Install the following remote equipment where shown on the Drawings and connect them with wire in conduit to the engine-generator system.
 - 1. Engine-generator emergency stop station.
 - 2. Engine-generator remote annunciator.
 - 3. Engine-generator remote "auto-run" switch and ATS status indicators in Fire Command Center.
 - 4. Load bank.
- B. Provide control circuits from the ATSS and fire pump controller to start the engine-generator.
- C. Provide control circuits from the engine-generator and ATSS to BAS to provide "generator running", "generator trouble", and ATS "on generator power" alarms.
- D. Provide control circuits from the soft-loading ATS to its normal power and generator power feeder breaker shunt trip coils. Utilize engine-generator starter battery power to energize the coils.
- E. Provide 120 Volt control and miscellaneous power to engine-generator and automatic transfer switch auxiliaries to insure proper operation. Update panel directories and install labels indicating the sources on the auxiliary equipment.

3.3 SYSTEM STARTUP

- A. Coordinate with the Plant Operations Call Center at (734) 647-2059 before starting up or testing engine-generators or automatic transfer switches.
- B. Notify OSEH at (734) 647-1143 before starting up engine-generators.
- C. Prior to any testing, perform visual inspections to verify the following:
 - 1. The equipment is completely and properly installed.
 - 2. The equipment is free from damage and defects.
 - 3. Shipping blocks and restraints have been removed.
 - 4. Electrical terminations have been properly tightened.
 - 5. The equipment has been properly aligned.
 - 6. The equipment has been properly lubricated.
 - 7. The ventilation louvers are open and unobstructed.
 - 8. The equipment is ready to be tested.

- D. Perform a continuity check and 1,000 Volt DC Megger test on the generator windings, generator circuit breakers, power circuit portions of the automatic transfer switch, and interconnecting power circuit wiring.
- E. Perform a continuity check on the control wiring.
- F. Calibrate the metering and time delay relays.
- G. Provide a factory-trained technician to check and perform an initial startup of the engine-generator and automatic transfer switches.
- H. The manufacturer's representative shall provide a certificate in writing that the equipment installation and operation meets their requirements and the project design criteria.

3.4 ENGINE-GENERATOR SYSTEM FIELD TESTING

- A. Perform a load bank test of the overall system using a resistive load bank or soft-loading automatic transfer switch rated at 100 percent of generator full load for at least 120 minutes.
- B. Test the completed engine-generator system in accordance with NFPA 110 and Manufacturer's written instructions.
 - 1. Open normal power to each automatic transfer switch and observe proper operation of engine-generator and automatic transfer switch (throwing over to emergency power), noting engine-generator start, time delays and other appropriate variables.
 - 2. Restore normal power and observe proper transfer back to normal power and proper shutdown of engine-generator, again noting time delays and other appropriate variables.
 - 3. Operate maintenance bypass switch to ensure proper operation in all modes.
 - 4. Demonstrate each automatic transfer switch in each mode of operation.
 - 5. Demonstrate the automatic test function.
- C. Test the operation of engine-generator control and alarm connections to the automatic transfer switches, remote annunciator, Fire Command Center, BAS system and accessories under all operating conditions.

DELETE D IF THE ENGINE-GENERATOR BEING PROVIDED IS FACTORY CERTIFIED AS COMPLIANT WITH EPA EMISSIONS STANDARDS.

- D. When the engine is not factory certified as compliant with EPA emissions standards, make all modifications and adjustments necessary to obtain field certification.

3.5 COMMISSIONING

- A. Perform the commissioning activities per Related Sections.

3.6 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT

PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING

- B. Provide the Owner's personnel with training on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures of the engine-generator, automatic transfer switches and accessories. Do not conduct training until after start up and commissioning is completed. Provide training documents and the approved Operations and Maintenance manuals to the Owner at least two weeks prior to the training to allow sufficient time for review.
1. Provide a minimum of 4 hours of training on the engine-generator.
 2. Provide a minimum of 4 hours of training on the automatic transfer switches.

END OF SECTION 263000

DIVISION 26 ELECTRICAL
SECTION 263323 - CENTRAL BATTERY INVERTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.
- B. Related Sections include the following:
 - 1. Division 26 Section "Electrical General Requirements."

1.2 SUMMARY

- A. This Section includes fast-transfer central battery inverters.

1.3 DEFINITIONS

- A. LCD: Liquid-crystal display.
- B. LED: Light-emitting diode.
- C. UPS: Uninterruptible power supply.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Electrical ratings, including the following:
 - a. Capacity to provide power during failure of normal ac.
 - b. Inverter voltage regulation and total harmonic distortion of output current.
 - c. Rectifier data.
 - d. Transfer time of transfer switch.
 - e. Data for specified optional features.
 - 2. Transfer switch.
 - 3. Inverter.
 - 4. Battery charger.
 - 5. Batteries.
 - 6. Battery monitoring.
 - 7. Manufacturer's anchorage and base recommendations.
 - 8. Physical Size
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, components, and location and identification of each field connection. Show access, workspace, and clearance requirements; details of control panels; and battery arrangement.
 - 1. Wiring Diagrams: Detail internal and interconnecting wiring; and power, signal, and control wiring.
 - 2. Elevation and details of control and indication displays.
 - 3. Output distribution section.
- C. Qualification Data: For testing agency.
- D. Source quality-control test reports.

- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For central battery inverter equipment to include in emergency, operation, and maintenance manuals specified in Division 1.
- G. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of central battery inverter system. Refer to Division 1 Section "Product Requirements."
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Central Battery Inverter System: UL 924 listed.
- E. Comply with NFPA 70 and NFPA 101.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in fully enclosed vehicles.
- B. Store equipment in spaces having environments controlled within manufacturers' written instructions for ambient temperature and humidity conditions for nonoperating equipment.

1.7 SPACE RESTRICTIONS

- A. The central battery inverter with battery cabinet should be no larger than **xx**"D x **yy**"W x **zz**"H.

1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace batteries that fail in materials or workmanship within specified warranty period. Special warranty, applying to batteries only, applies to materials only, on a prorated basis, for period specified.
- B. Warranty Period: Include the following warranty periods, from date of Substantial Completion.
 - 1. Standard, Valve-Regulated, Recombinant, Lead-Calcium Batteries:
 - a. Full Warranty: One year.
 - b. Pro Rata: Nine years.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Chloride Systems.
 2. Controlled Power Company.
 3. Cooper Industries, Inc.; Sure-Lites Division.
 4. Dual-Lite.
 5. Lithonia Lighting; Emergency Lighting Systems.
 6. Myers Power Products, Inc.
 7. Staco Energy Products, Inc.

2.2 INVERTER PERFORMANCE REQUIREMENTS

- A. Ratings: Provide rated KVA output, input voltage and output voltage as indicated (~~XX~~ KVA, ~~XXXV-XP~~H input, ~~XXXV-XP~~H output). Fast-Transfer Central Battery Inverters: Automatically sense loss of normal ac supply and use a solid-state switch to transfer loads. Transfer in 0.004 second or less from normal supply to battery-inverter supply.
1. Operation: Unit supplies power to output circuits from a single, external, normal supply source. Unit automatically transfers load from normal source to internal battery/inverter source. Retransfer to normal is automatic when normal power is restored.
- B. Maximum Acoustical Noise: 50 dB, "A" weighting, emanating from any component under any condition of normal operation, measured 39 inches from nearest surface of component enclosure.

2.3 SERVICE CONDITIONS

- A. Environmental Conditions: Inverter system shall be capable of operating continuously in the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
1. Ambient Temperature for Electronic Components: 32 to 98 deg F.
 2. Relative Humidity: 0 to 95 percent, noncondensing.
 3. Altitude: Sea level to 4000 feet.

2.4 INVERTERS

- A. Description: Solid-state type, with the following operational features:
1. Automatically regulate output voltage to within plus or minus 5 percent.
 2. Automatically regulate output frequency to within plus or minus 1 Hz, from no load to full load at unit power factor over the operating range of battery voltage.
 3. Output Voltage Waveform of Unit: Sine wave with maximum 10 percent THD throughout battery operating-voltage range, from no load to full load.

4. Output power rating: Rated in kVA at unity power factor, and shall be able to supply the rated kW from .5 lagging to .5 leading.
5. Output Protection: Current-limiting and short-circuit protection.
6. Brownout Protection: Produces rated power without draining batteries when input voltage is down to 75 percent of normal.

2.5 BATTERY CHARGER

- A. Description: Solid-state, automatically maintaining batteries in fully charged condition when normal power is available, with LED indicators for "float" and "high-charge" modes.

2.6 BATTERIES

- A. Description: Standard, valve-regulated, recombinant, lead-calcium hot swappable batteries. Supply and maintain total load for a minimum period of **XX** hours, without the voltage applied to the load falling below 87% of normal. Provide mid-string disconnects to minimize DC arc flash potential.

2.7 ENCLOSURES

- A. NEMA 250, Type 1 steel cabinets with access to components through hinged doors with flush tumbler lock and latch.
- B. Finish: Manufacturer's standard baked-enamel finish over corrosion-resistant prime treatment.

2.8 CONTROL AND INDICATION

- A. Description: Group displays, indications, and basic system controls on common control panel on front of central battery inverter enclosure.
- B. Minimum displays, indicating devices, and controls shall include those in lists below. Provide sensors, transducers, terminals, relays, and wiring required to support listed items. Alarms shall include an audible signal and a visual display. Form C dry contacts shall be provided for "general trouble" and "on battery" remote monitoring.
- C. Indications: Labeled LED.
 1. Quantitative Indications:
 - a. Input voltage, each phase, line to line.
 - b. Input current, each phase, line to line.
 - c. System output voltage, each phase, line to line.
 - d. System output current, each phase.
 - e. System output frequency.
 - f. DC bus voltage.
 - g. Battery current and direction (charge/discharge).
 - h. Elapsed time-discharging battery.
 2. Basic Status Condition Indications:
 - a. Normal operation.
 - b. Load-on bypass.
 - c. Load-on battery.

- d. Inverter off.
- e. Alarm condition exists.
- 3. Alarm Indications:
 - a. Battery system alarm.
 - b. Control power failure.
 - c. Fan failure.
 - d. Overload.
 - e. Battery-charging control faulty.
 - f. Input overvoltage or undervoltage.
 - g. Approaching end of battery operation.
 - h. Battery undervoltage shutdown.
 - i. Inverter fuse blown.
 - j. Inverter transformer overtemperature.
 - k. Inverter overtemperature.
 - l. Static bypass transfer switch overtemperature.
 - m. Inverter power supply fault.
 - n. Inverter output overvoltage or undervoltage.
 - o. System overload shutdown.
 - p. Inverter output contactor open.
 - q. Inverter current limit.
- 4. Controls:
 - a. Inverter on-off.
 - b. Start.
 - c. Battery test.
 - d. Alarm silence/reset.
 - e. Output-voltage adjustment.
 - f. Maintenance bypass.

D. Include the following minimum array:

- 1. Ready, normal-power on light.
- 2. Charge light.
- 3. Inverter supply load light.
- 4. Battery voltmeter.
- 5. AC output voltmeter with an accuracy within 2 percent of full scale.
- 6. Load ammeter.
- 7. Test switch to simulate ac failure.

E. Enclosure: Steel, with hinged lockable doors, suitable for **wall/floor** mounting. Manufacturer's standard corrosion-resistant finish.

2.9 SOURCE QUALITY CONTROL

A. Factory test complete inverter system, including battery, before shipment. Include the following:

- 1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.
- 2. Full-load test.
- 3. Transient-load response test.
- 4. Overload test.
- 5. Power failure test.

B. Observation of Test: Give 14 days' advance notice of tests and provide access for Owner's representative to observe tests at Owner's option.

- C. Report test results. Include the following data:
 - 1. Description of input source and output loads used. Describe actions required to simulate source load variation and various operating conditions and malfunctions.
 - 2. List of indications, parameter values, and system responses considered satisfactory for each test action. Include tabulation of actual observations during test.
 - 3. List of instruments and equipment used in factory tests.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance.
 - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment will be installed before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install system components and anchor to concrete base according to manufacturer's recommendations and seismic codes as applicable.
- B. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and NFPA 70.

3.3 CONNECTION

- A. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams, unless otherwise indicated.
- B. Ground equipment according to Division 26 Section "Grounding and Bonding."
- C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 IDENTIFICATION

- A. Identify equipment and components according to Division 26 Section "Electrical Materials and Methods."

3.5 FIELD QUALITY CONTROL

- A. After central battery inverters are installed and electrical circuitry has been energized, test for compliance with requirements.
- B. Testing: Perform the following field quality-control testing according to manufacturer's written instructions and as listed below, to demonstrate condition and performance of each component of central battery inverter system:
 - 1. Inspect interiors of enclosures for integrity of mechanical and electrical connections, component type and labeling verification, and ratings of installed components.
 - 2. Test manual and automatic operational features and system protective and alarm functions.
 - 3. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Sections 7.18 and 7.22.2. Certify compliance with test parameters.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field- assembled components and equipment installation, including electrical connections. Report results in writing. Coordinate with Owner's commissioning agent.
- D. Remove malfunctioning units, replace with new units, and retest as specified above.
- E. Report results in writing.

3.6 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
- B. Verify that central battery inverter is installed and connected according to the Contract Documents.
- C. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements in Division 26 Sections.
- D. Complete installation and startup checks according to manufacturer's written instructions.

3.7 ADJUSTING AND CLEANING

- A. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- B. Install new filters in each equipment cabinet within 14 days from date of Substantial Completion.

END OF SECTION 263323

DIVISION 26 ELECTRICAL
SECTION 263353 - STATIC UNINTERRUPTIBLE POWER SUPPLY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.
- B. Related Sections include the following:
 - 1. Division 26 Section "Electrical General Requirements."
 - 2. Division 26 Section "Electrical Materials and Methods."

1.2 SUMMARY

- A. This Section includes continuous duty, solid state Uninterruptible Power Supplies (UPS). The UPS shall contain a full rated input rectifier/boost converter, output converter, and 10 percent battery charging circuit. The system shall also contain a continuous duty bypass static switch, internal mechanical bypass, external bypass, removable hot swap battery plant, and LCD interface display. All programming and miscellaneous components for a fully operational system shall be available as part of the UPS.

1.3 DEFINITIONS

- A. LCD: Liquid-crystal display.
- B. LED: Light-emitting diode.
- C. UPS: Uninterruptible power supply.

1.4 SUBMITTALS

- A. Product Data: For the following:
 - 1. Electrical ratings, including the following:
 - a. Capacity to provide power during failure of normal ac.
 - b. Inverter voltage regulation and total harmonic distortion of output current.
 - c. Rectifier data.
 - d. Data for specified optional features.
 - 2. Transfer switch.
 - 3. Inverter.
 - 4. Battery charger.
 - 5. Batteries.
 - 6. Battery monitoring.
 - 7. Manufacturer's anchorage and base recommendations.
 - 8. Physical Size
- B. Shop Drawings: Detail equipment assemblies and indicate dimensions, weights, components, and location and identification of each field connection. Show access, workspace, and clearance requirements; details of control panels; and battery arrangement.

1. Wiring Diagrams: Detail internal and interconnecting wiring; and power, signal, and control wiring.
 2. Elevation and details of control and indication displays.
 3. Output distribution section.
- C. Qualification Data: For testing agency.
- D. Source quality-control test reports.
- E. Field quality-control test reports.
- F. Operation and Maintenance Data: For UPS equipment to include in emergency, operation, and maintenance manuals specified in Division 1.
- G. Warranties: Special warranties specified in this Section.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
- B. Product Options: Drawings indicate size, profiles, and dimensional requirements of UPS system. Refer to Division 1 Section "Product Requirements."
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- D. Compliance with ANSI C62.41 (IEEE 587)
- E. The UPS, and associated equipment, shall be UL listed and labeled, per UL Standard 1778, and shall be CSA certified.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in fully enclosed vehicles.
- B. Store equipment in spaces having environments controlled within manufacturers' written instructions for ambient temperature and humidity conditions for nonoperating equipment.

1.7 SPACE RESTRICTIONS

- A. The UPS should be no larger than **xx**"D x **yy**"W x **zz**"H and weigh no more than **xx** lbs.

1.8 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace batteries that fail in materials or workmanship within specified warranty period. Special warranty, applying to batteries only, applies to materials only, on a prorated basis, for period specified.

- B. Warranty Period: Include the following warranty periods, from date of Substantial Completion.
 - 1. Standard, Valve-Regulated, Recombinant, Lead-Calcium Batteries:
 - a. Full Warranty: One year.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. APC.
 - 2. Best.
 - 3. Controlled Power.
 - 4. Liebert.
 - 5. MGE.
 - 6. Mitsubishi.
 - 7. Toshiba.
 - 8. Eaton.

2.2 UPS PERFORMANCE REQUIREMENTS

- A. Ratings: Provide rated KVA output, input voltage and output voltage as indicated (~~XX~~ KVA, ~~XXXV~~-~~XPH~~ input, ~~XXXV~~-~~XPH~~ output). Automatically sense loss of normal ac supply and use a solid-state switch to transfer loads in an uninterruptible manner.
 - 1. Operation: Unit supplies power to output circuits from a single, external, normal supply source. Unit automatically transfers load from normal source to internal battery/inverter source. Retransfer to normal is automatic when normal power is restored.
- B. Maximum Acoustical Noise: 50 dB, "A" weighting, emanating from any component under any condition of normal operation, measured 39 inches from nearest surface of component enclosure.

2.3 SERVICE CONDITIONS

- A. Environmental Conditions: UPS system shall be capable of operating continuously in the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
 - 1. Ambient Temperature for Electronic Components: 32 to 104 deg F.
 - 2. Relative Humidity: 0 to 95 percent, noncondensing.
 - 3. Altitude: Sea level to 4000 feet.

2.4 UPS

- A. Description: Solid-state type, with the following operational features:
 - 1. Automatically regulate output voltage to within plus or minus 5 percent.

2. Automatically regulate output frequency to within plus or minus 1 Hz, from no load to full load at unit power factor over the operating range of battery voltage.
3. Output Voltage Waveform of Unit: Sine wave with maximum 10 percent THD throughout battery operating-voltage range, from no load to full load.
4. Output power rating: Rated in kVA at unity power factor, and shall be able to supply the rated kW from .5 lagging to .5 leading.
5. Output Protection: Current-limiting and short-circuit protection.
6. Brownout Protection: Produces rated power without draining batteries when input voltage is down to 75 percent of normal.
7. The input power converters of the system shall constantly control the power imported from the mains input of the system, to provide the necessary UPS power for precise regulation of the DC bus voltage, battery charging, and main inverter regulated output power.
8. The input current THD shall be held to 5 percent or less at full system load, while providing conditioned power to the critical load bus, and charging the batteries under steady state operating conditions. This shall be true while supporting loads of both a linear and non-linear type.

2.5 BATTERY CHARGER

- A. Description: Solid-state, automatically maintaining batteries in fully charged condition when normal power is available, with LED indicators for "float" and "high-charge" modes. The battery charging shall keep the DC bus float voltage of +/- 1 percent.

2.6 BATTERIES

- A. Description: Standard, valve-regulated, recombinant, lead-calcium hot swappable maintenance free batteries. Supply and maintain total load for a minimum period of XX minutes, without the voltage applied to the load falling below 87% of normal. Provide mid-string disconnects to minimize DC arc flash potential.

2.7 ENCLOSURES

- A. NEMA 250, Type 1 steel cabinets with access to components through hinged doors with flush tumbler lock and latch.
- B. Finish: Manufacturer's standard baked-enamel finish over corrosion-resistant prime treatment.

2.8 CONTROL AND INDICATION

- A. Description: Group displays, indications, and basic system controls on common control panel on front of UPS enclosure.

- B. Minimum displays, indicating devices, and controls shall include those in lists below. Provide sensors, transducers, terminals, relays, and wiring required to support listed items. Alarms shall include an audible signal and a visual display. Form C dry contacts shall be provided for "general trouble" and "on battery" remote monitoring.
- C. Indications: Labeled LED.
 - 1. Quantitative Indications:
 - a. Input voltage, each phase, line to line.
 - b. Input current, each phase, line to line.
 - c. System output voltage, each phase, line to line.
 - d. System output current, each phase.
 - e. System output frequency.
 - f. DC bus voltage.
 - g. Battery current and direction (charge/discharge).
 - h. Elapsed time-discharging battery.
 - 2. Basic Status Condition Indications:
 - a. Normal operation.
 - b. Load-on bypass.
 - c. Load-on battery.
 - d. UPS off.
 - e. Alarm condition exists.
 - 3. Alarm Indications:
 - a. Battery system alarm.
 - b. Control power failure.
 - c. Fan failure.
 - d. Overload.
 - e. Battery-charging control faulty.
 - f. Input overvoltage or undervoltage.
 - g. Approaching end of battery operation.
 - h. Battery undervoltage shutdown.
 - i. UPS fuse blown.
 - j. UPS transformer overtemperature.
 - k. UPS overtemperature.
 - l. Transfer switch overtemperature.
 - m. UPS power supply fault.
 - n. UPS output overvoltage or undervoltage.
 - o. System overload shutdown.
 - p. UPS output contactor open.
 - q. UPS current limit.
 - 4. Controls:
 - a. UPS on-off.
 - b. Start.
 - c. Battery test.
 - d. Alarm silence/reset.
 - e. Output-voltage adjustment.
 - f. Maintenance bypass.
- D. Include the following minimum array:
 - 1. Ready, normal-power on light.
 - 2. Charge light.
 - 3. UPS supply load light.
 - 4. Battery voltmeter.
 - 5. AC output voltmeter with an accuracy within 2 percent of full scale.
 - 6. Load ammeter.

7. Test switch to simulate ac failure.

- E. Enclosure: Steel, with hinged lockable doors, suitable for **wall/floor** mounting. Manufacturer's standard corrosion-resistant finish.

2.9 SOURCE QUALITY CONTROL

- A. Factory test complete UPS system, including battery, before shipment. Include the following:
1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.
 2. Full-load test.
 3. Transient-load response test.
 4. Overload test.
 5. Power failure test.
 6. Alarm points test.
- B. Observation of Test: Give 14 days' advance notice of tests and provide access for Owner's representative to observe tests at Owner's option.
- C. Report test results. Include the following data:
1. Description of input source and output loads used. Describe actions required to simulate source load variation and various operating conditions and malfunctions.
 2. List of indications, parameter values, and system responses considered satisfactory for each test action. Include tabulation of actual observations during test.
 3. List of instruments and equipment used in factory tests.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance.
1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment will be installed before installation begins.
- B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install system components and anchor to concrete base according to manufacturer's recommendations and seismic codes as applicable.
- B. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and NFPA 70.

3.3 CONNECTION

- A. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams, unless otherwise indicated.
- B. Ground equipment according to Division 26 Section "Grounding and Bonding."
- C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.4 IDENTIFICATION

- A. Identify equipment and components according to Division 26 Section "Electrical Materials and Methods."

3.5 FIELD QUALITY CONTROL

- A. After UPS is installed and electrical circuitry has been energized, test for compliance with requirements.
- B. Testing: Perform the following field quality-control testing according to manufacturer's written instructions and as listed below, to demonstrate condition and performance of each component of the UPS system:
 - 1. Inspect interiors of enclosures for integrity of mechanical and electrical connections, component type and labeling verification, and ratings of installed components.
 - 2. Test manual and automatic operational features and system protective and alarm functions.
 - 3. Perform each electrical test and visual and mechanical inspection stated in NETA ATS, Sections 7.18 and 7.22.2. Certify compliance with test parameters.
 - 4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including electrical connections. Report results in writing. Coordinate with Owner's commissioning agent.
- D. Remove malfunctioning units, replace with new units, and retest as specified above.
- E. Report results in writing.

3.6 STARTUP SERVICE AND TRAINING

- A. Engage a factory-authorized service representative to perform startup service.
- B. Verify that UPS is installed and connected according to the Contract Documents.
- C. Verify that electrical wiring installation complies with manufacturer's submittal and installation requirements in Division 26 Sections.

- D. Complete installation and startup checks according to manufacturer's written instructions.
- E. Provide Owner training on UPS equipment.

3.7 ADJUSTING AND CLEANING

- A. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- B. Install new filters in each equipment cabinet within 14 days from date of Substantial Completion.

SECTION 264313 - SURGE PROTECTION FOR LOW-VOLTAGE ELECTRICAL POWER
CIRCUITS

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL

SECTION 264313 - SURGE PROTECTION FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

VERIFY ALL RATINGS, DIMENSIONS AND REQUIREMENTS SPECIFIED TO BE AS SHOWN ON THE DRAWINGS ARE CLEARLY SHOWN ON THE DRAWINGS.

IN 1 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 019100/019110 - Commissioning
2. Section 017823 - Operation and Maintenance Manual
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests
7. Section 262000 - Low Voltage Electrical Distribution

1.2 SUMMARY

- A. Section includes field-mounted SPDs for low-voltage (120 to 600 V) power distribution and control equipment. Unless shown otherwise on the drawings, SPDs shall be side-mounted. Integrally mounted SPDs are not generally acceptable unless approved by the Owner.

1.3 SUBMITTALS

- A. Product Data: The submittals shall include data on rated capacities, operating characteristics, electrical characteristics, dimensions, and furnished specialties and accessories.
- B. Copy of UL Category Code VZCA certification, as a minimum, listing the tested values for VPRs, Inominal ratings, MCOVs, type designations, OCPD requirements, model numbers, system voltages, and modes of protection.
- C. Installation, Operation, and Maintenance Manuals.

1.4 QUALITY ASSURANCE

- A. Listed or labeled by Underwriters Laboratories (UL) or an approved Nationally Recognized Testing Laboratory (NRTL).

- B. Surge Protective Devices shall comply with UL 1449, Standard for Surge Protective Devices 3rd Edition or later.

1.5 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of five years from the date of substantial completion.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Provide external side-mount SPDs as shown on the drawings or as required to satisfy relevant code requirements and to provide a complete installation.
- B. SPDs with Accessories shall be listed and labeled as defined in NFPA 70 and marked for intended location and application.
- C. SPDs shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 1449, Type 2.
- D. Unit Operating Voltage - Refer to drawings for operating voltage and unit configuration.
- E. SPDs shall be non-modular. SPDs containing items such as single-mode replaceable modules, replaceable fuses, or replaceable batteries shall not be accepted. SPDs requiring user intervention to test the unit via a diagnostic test kit or similar device shall not be accepted.
- F. Service Conditions: The Surge Protective Devices shall be rated for continuous operation under the following conditions unless otherwise indicated:
 - 1. Maximum Continuous Operating Voltage: Not less than 115 percent of nominal system operating voltage.
 - 2. Short-circuit Current Rating: Equal or exceed 100 kA
 - 3. Operating Temperature: 30 to 120 deg F.
 - 4. Humidity: 0 to 85 percent, noncondensing.
- G. SPDs shall have the following features and accessories:
 - 1. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
 - 2. Indicator light display for power and protection status.

RETAIN THE FOLLOWING PARAGRAPH FOR SPECIAL APPLICATIONS WHERE INTEGRATION WITH BUILDING AUTOMATION IS REQUIRED.

- 3. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device.

RETAIN THE FOLLOWING PARAGRAPH FOR SPECIAL APPLICATIONS WHERE ELECTROMAGNETIC AND RADIO-FREQUENCY INTERFERENCE FILTERS IS REQUIRED TO IMPROVE POWER QUALITY TO SENSITIVE EQUIPMENT.

- 4. Comply with UL 1283.

AUDIBLE ALARMS ARE NOT GENERALLY DESIRABLE FOR UNIVERSITY APPLICATIONS. THE FOLLOWING PARAGRAPH MAY BE EDITED FOR SPECIAL INSTANCES WHERE AN ALARM MAY BE DESIRABLE TO PROVIDE IMMEDIATE INDICATION OF PROTECTIVE DEVICE FAILURE.

- 5. No audible alarm. If an alarm is provided, provide a means of disabling audible output.

RETAIN THE FOLLOWING PARAGRAPH FOR SPECIAL APPLICATIONS WHERE SURGE COUNTER IS DESIRED TO PROVIDE AN INDICATION OF POWER QUALITY. NOTE THAT SURGE COUNTERS ARE NOT TESTED OR DEFINED BY THE UL STANDARD AND CAN PROVIDE ONLY A QUALITATIVE METRIC OF EXPOSURE TO SURGE.

- 6. Surge Counter.

- H. Nominal Discharge Current (Inominal) Rating: 20 kA.

PEAK SURGE CURRENT LARGELY DETERMINES THE LONGEVITY OF PROTECTIVE DEVICE FUNCTION WHEN SUBJECTED TO REPEATED SURGES. AT DOWNSTREAM PANELBOARDS, 50KA IS APPROPRIATE. AREAS CONSIDERED SUBJECT TO HIGHER SURGE RISK MAY BE RATED FOR UP TO 300KA. IEEE GUIDANCE IS PROVIDE BELOW FOR VARIOUS PROTECTION LOCATIONS FOR LOW RISK LOCATIONS

SURGE CURRENT CAPACITY BASED ON ANSI / IEEE C62.41 LOCATION CATEGORY

<u>CAT</u>	<u>APPLICATION</u>	<u>PER PHASE</u>	<u>PER MODE</u>
C	SERVICE ENTRY	200KA	100KA
B	DIST. PANEL	120KA	60KA
A	PANELBOARDS	50KA	25KA

- I. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than [40 kA, 120 kA, 200kA]. The peak surge current rating shall be the arithmetic sum of the ratings of the individual MOVs in a given mode.

- J. Protection Modes - The SPD shall protect all modes of the electrical system being utilized.

- K. Protection modes and UL 1449 VPR for grounded wye circuits with three-phase, four-wire circuits shall not exceed the following:

- 1. Line to Neutral
 - a. 1200 V for 480Y/277 V
 - b. 700 V for 208Y/120 V
- 2. Line to Ground:
 - a. 1200 V for 480Y/277 V
 - b. 1000 V for 208Y/120 V
- 3. Line to Line:
 - a. 2000 V for 480Y/277 V
 - b. 1200 V for 208Y/120 V

- L. Protection modes and UL 1449 VPR for 240/120 V, single-phase, three-wire circuits shall not exceed the following:

1. Line to Neutral: 700 V.
2. Line to Ground: 1000 V.
3. Line to Line: 1000 V.

2.2 ENCLOSURES

- A. Indoor Enclosures: NEMA 250, Type 1.
- B. Indoor or Outdoor Enclosures: NEMA 250, Type 1, Type 4, or Type 4X.

2.3 CONDUCTORS AND CABLES

- A. Power wiring shall be the same size as the SPD leads and shall comply with Section 260513 "Medium, Low & Control Voltage Cables."

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

RETAIN THE FIRST PARAGRAPH FOR APPLICATIONS WHERE THE SPD IS CLOSE-COUPLED TO A PANELBOARD. RETAIN THE FOLLOWING PARAGRAPH WHERE THE SPD MAY BE ATTACHED AT POINT-OF-USE EQUIPMENT OR SWITCHING EQUIPMENT.

- A. Install an OCPD or disconnect as required to comply with the UL listing of the SPD.
- B. Provide a circuit breaker of the manufacturer's recommended size as a dedicated disconnecting means for SPD phase connections unless otherwise indicated.
- C. Install SPDs with conductors between suppressor and points of attachment as short and straight as possible, and adjust circuit-breaker positions to achieve shortest and straightest leads. Do not splice and extend SPD leads unless specifically permitted by manufacturer. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground.
- D. Use compression connectors and splices only. Wire nuts are unacceptable.
- E. Do not perform insulation-resistance tests of the distribution wiring equipment with SPDs installed. Disconnect SPDs before conducting insulation-resistance tests and reconnect them immediately after the testing is over.
- F. Energize SPDs after power system has been energized, stabilized, and tested.

3.2 FIELD QUALITY CONTROL

- A. Prior to any testing, perform visual inspections to verify the following:

1. The equipment is properly installed and supported.
2. The equipment is free from damage and defects.
3. Shipping blocks and restraints have been removed.
4. The electrical wiring installation complies with manufacturer's written installation requirements.
5. The electrical terminations have been properly tightened.
6. The equipment has been properly aligned.
7. The equipment has been thoroughly cleaned.
8. The equipment is properly labeled and labels are correct.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.4 DEMONSTRATION

- A. Train Owner's maintenance personnel to operate and maintain SPDs.

DIVISION 26 ELECTRICAL

SECTION 265100 - INTERIOR LIGHTING

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 265100 - INTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 017823 - Operation and Maintenance Manual
 - 2. Section 019100/019110 - Commissioning
 - 3. Section 260513 - Medium, Low & Control Voltage Cables
 - 4. Section 260526 - Grounding and Bonding for Electrical
 - 5. Section 260533 - Electrical Materials and Methods
 - 6. Section 260800 - Electrical Acceptance Tests

1.2 DEFINITIONS

- A. Night Lights: Light fixtures that are wired to the unswitched leg of the circuit. Night lights are not to be confused with emergency lights, which have a second source of power and may be switched.

1.3 SUBMITTALS

- A. Product Data: Arrange in order of luminaire designation. The submittals shall include data on features, ratings, listings, certifications, accessories, finishes, dimensions, emergency components, photometric data, and luminaire efficiency data.
- B. Installation, Operation, and Maintenance Manuals.

1.4 QUALITY ASSURANCE

- A. Lighting fixtures shall be of specification grade and listed or labeled by Underwriters Laboratories (UL) or an approved Nationally Recognized Testing Laboratory (NRTL).
- B. LED fixtures shall comply with the following:
 - 1. UL Standard 8750 "Light Emitting Diode Equipment for Use in Lighting Products", IES Standard LM-79 "Electrical and Photometric Measurements of Solid-State Lighting Products", IES Standard LM-80 "Measuring Lumen Maintenance of LED Light Sources", and IES Standard TM-21 "Projecting Long Term Lumen Maintenance of LED Light Sources".
 - 2. ANSI C78.377 "Specifications for the Chromaticity of Solid State Lighting Products" with LEDs binned within a maximum three-step MacAdam Ellipse to ensure color consistency amongst luminaries of the same type.

1.5 WARRANTY

- A. For non-LED lighting fixtures and components, provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.
- B. For LED fixtures, lamps, drivers, and components, provide a complete warranty for parts and labor for a minimum of five years from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 LIGHTING FIXTURES

- A. Provide lighting fixtures in accordance with the Fixture Schedule.
 - 1. Provide only LED fixtures with a DesignLights Consortium (DLC) listing, a U.S. Department of Energy (DOE) "LED Lighting Facts" label, or a U.S. Environmental Protection Agency (EPA) ENERGY STAR label, which have demonstrated third-party testing verification.
- B. Recessed lighting fixtures shall be thermally protected.
- C. LED fixtures shall be modular and allow for separate replacement of LED lamps and drivers. User serviceable LED lamps and drivers shall be replaceable from the room side.
- D. Dimmable LED fixtures shall have either a 0-10 volt, 3-wire dimming driver, or a two-step (50%-100%) line voltage, two switch controlled dimming driver, as shown on the drawings.

2.2 LAMPS

- A. Except where T5 or T5HO lamps are shown in the Fixture Schedule, tubular fluorescent lamps shall be T8, straight tube, rapid-start, multi-phosphor type with a medium bi-pin base, average rated life of 24,000 hours minimum, 3,000 initial lumens, and 2,820 mean lumens. Fluorescent lamps shall have a correlated color temperature of 3500 degrees K and a CRI of 85 minimum. Lamps shall be designed to pass the Federal TCLP test in effect at the time of manufacture. U-tube lamps shall not be used. GE Ecolux, Osram/Sylvania Ecologic, or Philips Alto only.
- B. Compact fluorescent lamps shall be 4 pin, 13 watt minimum with a color temperature of 3500 degrees K, a CRI of 80 minimum, end-of-life protection, and suitable for use with electronic ballasts. Self-ballasted compact fluorescent lamps are not acceptable except for retrofitting existing incandescent fixtures. Osram/Sylvania, GE, or Philips only.
- C. Induction lamps shall have a color temperature of 3500 degrees K and a CRI of 80 minimum.
- D. LED lamps shall have a color temperature of 3500 degrees K, a CRI of 80 minimum, and a lumen maintenance L70 rating of 50,000 hours minimum.

- E. Retrofit LED lamps shall comply with NEMA SSL 4 "SSL Retrofit Lamps: Suggested Minimum Performance Requirements".
- F. High intensity discharge (H.I.D.) lamps shall conform to their applicable ANSI codes.
- G. Incandescent lamps shall be rated 120 volts and shall have a life of 2,000 hours minimum. Standard "A" Type lamps shall be inside frosted.

2.3 BALLASTS AND DRIVERS

- A. Except where indicated otherwise, fluorescent fixtures with multiple T8 or T5 lamps shall have two ballasts or a two-step (50%-100%) dimming ballast to accommodate dual switching. Fluorescent fixtures with multiple compact fluorescent lamps may have one ballast.
- B. Fluorescent ballasts shall be of the electronic, programmed rapid-start, series-circuited, and completely solid-state. Ballasts shall be rated for the specific lamps they are supplying, shall have a maximum crest factor of 1.6, a maximum current total harmonic distortion of 10 percent, a minimum starting temperature of 0 degrees F, and a sound rating of "A". Ballasts for T8 and T5 lamps shall be Osram/Sylvania Quicktronic Professional, Advance Optanium, or Universal Accustart only. Ballasts for compact fluorescent lamps shall be the fixture manufacturer's standard electronic type.
- C. Fluorescent dimming ballasts shall be electronic, comply with the other requirements for electronic ballasts, be capable of smoothly and consistently dimming the lamps from full output to 10 percent or less output, and maintain a cathode voltage between 3 to 4 volts. A low voltage slide switch that is compatible with the ballast shall control light level. Osram/Sylvania Quicktronic, Lightolier, or Lutron only.
- D. LED drivers shall be electronic-type, labeled as compliant with radio frequency interference (RFI) requirements of FCC Title 47 Part 15, and comply with NEMA SSL 1 "Electronic Drivers for LED Devices, Arrays, or Systems". LED drivers shall have a sound rating of "A", have a minimum efficiency of 85%, and be rated for a THD of less than 20 percent at all input voltages.
- E. Dimmable LED drivers shall be 0-10V type. Dimmable LED drivers shall be capable of dimming without LED strobing or flicker across their full dimming range.
- F. H.I.D. ballasts shall conform to their applicable ANSI codes. H.I.D. ballasts for use indoors in finished areas shall be of the quietest type available or shall be mounted remote from the fixtures.
- G. Ballasts and drivers shall be rated for the ambient temperatures in which they are located. Outdoor fixtures shall be equipped with ballasts or drivers rated for reliable starting to -20 degrees F. Indoor fixtures located in areas with direct sunlight or above normal ambient temperatures shall have ballasts or drivers rated at 65 degrees C minimum.

- H. Individually fused ballasts and drivers shall have their fuses accessible from outside of the fixture chassis.
- I. Induction lamp drivers shall be electronic and comply with radio frequency interference (RFI) requirements of FCC Title 47 Part 15 and be rated for a total harmonic distortion (THD) of less than 20 percent at all input voltages.

2.4 EMERGENCY LIGHTING

- A. Emergency lighting shall consist of normal lighting fixtures with generator or battery-inverter system backup, emergency lighting fixtures with individual battery backup, or sealed beam emergency lighting units in accordance with the Fixture Schedule.
 - 1. Battery-backed fluorescent emergency lighting fixtures shall consist of a fluorescent fixture with one or more lamps connected either to a battery pack and charger mounted remote from the fixture, or to an emergency power ballast mounted internal to the fixture. Minimum light output shall be 1100 lumens. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of fixture operation. The charger shall be solid-state and provide overload, short circuit, brownout and low battery voltage protection. The battery and charger shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The fixture shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The fixture shall not contain an audible alarm.
 - a. Remote mounted battery packs and chargers: Chloride, Dual-Lite, Emergi-Lite, Exide Lightguard, Lightalarms, Lithonia or Sure-Lites.
 - b. Emergency power ballasts: Bodine or Lithonia
 - 2. Battery-backed LED emergency lighting fixtures shall consist of a normal LED fixture with some or all of the LEDs connected to a battery and charger. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of fixture operation. The charger shall be solid-state and provide overload, short circuit, brownout and low battery voltage protection. The battery and charger shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The fixture shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The fixture shall not contain an audible alarm.

3. Sealed beam emergency lighting units shall consist of sealed beam LED lamps connected to an internally mounted battery and charger. The battery shall be nickel cadmium and sized for a minimum of 90 minutes of battery operation. The charger shall be solid-state and provide overload, short circuit, brownout and low battery voltage protection. The unit shall be suitable for wall or ceiling mounting as required. It shall include self-diagnostic and self-exercising circuitry to exercise and test itself for 5 minutes every month and for 30 minutes every 6 months. The unit shall include a test/monitor module with LED status indicating lights mounted so as to be visible to the public. The unit shall not contain an audible alarm.

2.5 EXIT SIGNS

- A. Exit signs shall be of the LED type. Fluorescent, electro luminescent light panel, or self-powered luminous signs shall not be used. Chloride, Dual-Lite, Emergi-Lite, Exide Lightguard, Lightalarms, Lithonia, LSI Industries, Morelite, Prescolite, or Sure-Lites.
 1. LED's shall be wired in parallel to prevent multi-lamp failure, and shall be concealed within the sign by a clear panel and red optical diffuser. Power consumption shall not exceed 2 watts per face.
 2. Exit signs shall have white die cast aluminum or polycarbonate housings with universal mounting brackets; brushed aluminum stencil faces with red letters and multi-directional knockout arrows.
 3. Exit signs shall be provided with emergency battery packs and battery chargers when required. Batteries shall be maintenance-free nickel cadmium, and shall be mounted within the signs.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

- A. Support recessed troffers independently of the ceiling grid system by using two safety wires minimum on diagonally opposite corners of the fixtures. Support recessed downlights by using safety wires or by rigidly attaching the fixtures to the building structure or ceiling grid system. Removable T-bar clips shall not be used to attach fixtures to the ceiling grid system.
- B. Install fixtures level, with no gaps between adjacent fixtures or between fixtures and surrounding surfaces. Lenses, reflectors, and trims of fixtures shall be properly and uniformly aligned.
- C. Where fixtures are shown with dual switches, control all inner lamps with one switch and all outer lamps with the other switch. Where dimming or occupancy sensor-controlled fixtures are shown, control the fixtures in accordance with the appropriate wiring diagram or manufacturer's instructions.

- D. Connect night light fixtures and emergency lighting fixtures to the hot (unswitched) side of lighting circuits.
- E. Provide an individual feed with ground conductor from a junction box to each lighting fixture. Lighting fixtures shall not be daisy-chained.
- F. Drops to recessed fixtures may be flexible metallic conduit, or manufactured wiring systems may be used where accessible. Fixtures shall be provided with sufficient length to permit removal and lowering of the fixtures 12" below the ceiling.
- G. Provide green grounding conductors back to the panel ground for lighting circuits. Raceways shall not be used as grounding conductors.
- H. Fixtures shall have their exterior labels removed and shall be thoroughly cleaned. Burned out lamps shall be replaced.
- I. Locate emergency lighting remote battery packs and remote test/monitor modules identically so their status indicating lights are visible to the public and they form a straight line when viewed from the end of the corridor or room. Where a suspended ceiling exists, center the status indicating lights in adjacent ceiling tiles.
- J. Mount sealed beam emergency lighting units where shown and aim their lamps to light the egress path as uniformly as possible.
- K. When emergency lighting fixtures contain audible alarms, disable the alarms in accordance with manufacturer's instructions.

3.2 FIELD QUALITY CONTROL

- A. A visual inspection shall be performed to verify cleanliness and alignment of the fixtures. Misalignment and light leaks shall be corrected, and rattles due to ventilation system vibration shall be eliminated.
- B. Perform an operational test to verify that all fixtures illuminate properly, dimming systems dim properly (i.e. no flicker), and lighting zones are switched according to the drawings.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.4 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.
- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing, and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
 - 1. Provide 2 hours of on-site training minimum.

NUMBER SECTION DESCRIPTION

DIVISION 26 ELECTRICAL

SECTION 265600 - EXTERIOR LIGHTING

END OF CONTENTS TABLE

DIVISION 26 ELECTRICAL
SECTION 265600 - EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:
1. Section 017823 - Operation and Maintenance Manual
 2. Section 019100/019110 - Commissioning
 3. Section 260513 - Medium, Low & Control Voltage Cables
 4. Section 260526 - Grounding and Bonding for Electrical
 5. Section 260533 - Electrical Materials and Methods
 6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

VERIFY THE LIGHTING DRAWINGS CONTAIN ALL APPLICABLE LIGHTING FIXTURE SCHEDULES AND STANDARD DETAILS.

- A. Section Includes:
1. Provide all equipment and materials required for pedestrian (security), roadway, and parking lot outdoor lighting as shown on the Drawings.
- B. Prior to construction activities, contact the Owner's Utilities Power & Lighting Shop at 734-647-2049 to coordinate project parameters.
- C. Refer to the fixture schedule and details on the Drawings for information on the fixtures, poles, and accessories.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Contact MISS DIG at 1-800-482-7171 or 811 before performing any excavation work.
- B. Provide barricades around open holes and trenches. Provide temporary bridges over trenches cut through major sidewalk routes. Major sidewalk routes shall not be closed to pedestrian traffic.
- C. Contact the Owner's Electrical Inspectors at 734-764-2457 for inspections before backfilling excavations and before energizing circuits.

- D. For maintenance or repairs to existing lighting systems, contact Utilities Power & Lighting Shop at 734-647-2049.

1.4 SUBMITTALS

- A. Lighting equipment specifications and manufacturer cut sheets, including:
 - 1. Luminaire types, descriptions, dimensions, optics, materials, finishes, and photometric data.
 - 2. Pole or mounting support descriptions, dimensions, materials, and finishes.
 - 3. For each luminaire, lamp type, lamp wattage, delivered lumen output, color temperature, color rendering index, and related life.
- B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
- C. Submit marked up as-built drawings showing the actual locations of lighting poles, sleeves and junction boxes, circuit numbers for all loads, and all deviations from the design. Dimension the locations of sleeve ends, conduits, and junction boxes from a permanent building or landscape feature.

1.5 QUALITY ASSURANCE

INCLUDE PARAGRAPHS A AND B IN EVERY SPECIFICATION SECTION. EDIT THE REFERENCE STANDARDS FOR PROJECT REQUIREMENTS.

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. IEEE C2, National Electrical Safety Code.
 - 2. NFPA 70; National Electrical Code.
 - 3. MDOT Standard Specifications for Construction.
 - 4. AASHTO, American Association of State Highway and Transportation Officials
 - 5. Aluminum Association Standards.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.6 WARRANTY

- A. Provide a complete parts and labor warranty for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PEDESTRIAN LIGHTING

A. Fixtures

FOR EXTERIOR APPLICATIONS, THE UNIVERSITY IS TRANSITIONING TO LED LIGHTING ONLY. PROVIDE LED FIXTURES FOR NEW OR RENOVATED INSTALLATIONS. REQUEST DESIGN MANAGER APPROVAL BEFORE DESIGNING WITH METAL HALIDE, FLUORESCENT, OR OTHER NON-LED SOURCES.

1. Fixtures shall be Philips Lumec "New Westminster" (NW) Series only.
2. Fixtures shall be of the round globe type, suitable for mounting singly or in multiples on round, tapered aluminum poles.
3. Globes shall be 20-inch diameter and made of clear acrylic with a partially obscure, non-diffusing finish.
4. The lower half of each globe shall be guarded by a cast aluminum, 6-spoke basket that supports a 2-inch-wide horizontal aluminum band around the luminous center of the globe.
5. Fixtures shall be equipped with an electronic driver with a high power factor of 90% minimum. The driver shall have an ambient temperature operating range from minus 40 degrees F to 130 degrees F. The driver output shall provide protection from short circuits, voltage overload, and current overload. The driver shall have a nominal life of 100,000 hours. The LED source and driver shall be wired with a polarized quick disconnect plug to permit removal for maintenance.
6. Fixtures shall be equipped with 4000 degrees K LED lamps, having a nominal output of 6,020 delivered lumens for single globe fixtures, or 4,090 delivered lumens for each globe in a multiple-globe fixture, and an L70 nominal life of 70,000 hours. Lamps shall be Philips Lumileds Luxeon R only.

B. Poles

1. Poles shall be of the round, tapered, aluminum type. Pole height shall be in accordance with the Lighting Fixture Schedule.
2. Poles shall be of one-piece construction with a 0.120-inch minimum wall thickness, a 5-inch diameter at the base, and a 4-inch diameter maximum at the top. Any longitudinal welds shall be ground flush and unnoticeable.
3. Poles shall include a base plate 5/8-inch minimum thick. The base plate shall be continuously welded both top and bottom (or inside and outside) to the pole base.
4. Pole base plates shall have four slots suitable for installing over four 3/4-inch diameter anchor bolts set in a 9-1/2 inch diameter bolt circle pattern.
5. Poles shall include a reinforced 2-inch by 4-1/2-inch handhole located in the base. The handhole shall include a gasketed cover plate that is firmly held in place by two 1/4"-20 stainless steel cap screws. Provide an internal ground lug, which shall be located on the handhole side of the pole.
6. Poles shall be mechanically cleaned and painted with a black polyester powder coat outside to match the light fixtures.
7. Each pole shall include a one-piece, decorative, cast aluminum base bolt cover painted to match the pole.

8. The poles shall be from the same supplier as the lighting fixtures.
- C. Anchor bolts for pedestrian lighting fixtures shall be 3/4-inch diameter by 20 inches long with a 3-inch "L", fully hot dip galvanized steel having a yield strength of 36,000 psi, each with two hot dip galvanized fender washers and hex nuts.
- D. Wall-mounted
 1. Fixtures shall be similar to above, Philips Lumec "New Westminster" NW-M Series only.
- E. Column mounted fixture bases shall be fabricated from aluminum pipes and plates in accordance with the Drawings, and they shall be painted to match the lighting fixtures.

PART 2 -

2.1

2.2 ROADWAY AND PARKING LOT LIGHTING

A. Fixtures

COORDINATE ALL ROADWAY AND PARKING LOT LIGHTING FIXTURE PROJECTS WITH THE DESIGN MANAGER AND PROJECT TEAM, WHICH MAY INCLUDE UTILITIES POWER & LIGHTING, PARKING & TRANSPORTATION SERVICES, EXTERIOR ELEMENTS DESIGN REVIEW, AS WELL AS THE PROJECT'S FUNDING UNIT (I.E. ATHLETICS, HOUSING, HOSPITAL). AT THE TIME OF THIS PUBLICATION, LITHONIA DSX1 IS PROPOSED FOR PARKING LOT APPLICATIONS AND AMERICAN ELECTRIC LIGHTING AUTOBAHN ATB2 SERIES FOR COBRAHEAD APPLICATIONS.

1. Fixtures shall be Lithonia Lighting DSX1 Series only. Fixtures shall be low-profile type with LED lamps, suitable for mounting singly or in pairs on round, tapered, aluminum poles. Unless noted otherwise in the Fixture Schedule, the fixtures shall have Type III Medium light distribution.
2. Fixture housings shall have a gullwing profile, nominally 33 inches long by 13 inches wide by 7 inches high. The housings shall be single-piece, die-cast aluminum with integral heat sink fins.
3. Fixtures shall be equipped with an electronic driver with a power factor greater than 90 percent, THD less than 20 percent, and an expected life of 100,000 hours. Electronic drivers shall have an easily serviceable 10kV surge protection device. Provide a locking-type, 7-pin plug, in compliance with ANSI C136.41, to permit removal for maintenance. Provide a shorting cap.
4. Light engines shall consist of high-efficacy LED lamps with precision-molded acrylic lenses and rated at 4000 degrees K and a minimum of 70 CRI. The optics shall have zero uplight component. The light engines shall be modular for ease of maintenance and future light engine upgrades. Fixtures on 30'-0" poles shall have a nominal delivered lumen output of 20,000. The lumen maintenance factor shall be 0.88 minimum at 100,000 hours (tested per LM-80-08 and projected per TM-21-11).
5. The finish shall be a black, zinc-infused thermoset powder coat finish, with a minimum 3 mils thickness.

6. Fixture housings shall mount directly to poles with integral arms.
7. Fixtures shall be UL 1572 Listed as suitable for wet locations and shall be rated for -40 degree F minimum ambient temperature.

B. Poles

1. Provide tapered aluminum poles as follows:
 - a. For 12 foot tall poles, Valmont Model 1108-30506T4L or Acuity RTA-12-8J-DMXX-DART-ABL-AB36-0-FULL-GALV.
 - b. For 20 foot tall poles, Valmont Model 1908-40705T4 or Acuity RTA-20-8J-DMXX-DART-ABL-AB36-0-FULL-GALV.
 - c. For 25 foot tall poles, Valmont Model 2408-45806T4 or Acuity RTA-25-8J-DMXX-DART-ABL-AB36-0-FULL-GALV.
 - d. For 30 foot tall poles, Valmont Model 2908-45808T4 or Acuity RTA-30-8J-DMXX-DART-SPCL-TAPER-ABL-AB36-0-FULL-GALV.
2. Poles shall be of the round, tapered, aluminum type. Poles shall be of seamless, one-piece construction with a uniform taper of approximately 0.14 inches per foot from base to top. The poles shall be of the heights shown on the Drawings.
3. Poles shall be 6063 alloy aluminum, 0.250-inches thick, and heat treated to achieve a T6 temper, having a yield strength of 50,000 psi minimum and an ultimate tensile strength of 65,000 psi minimum.
4. Poles shall be rated for a continuous wind of 80 MPH plus a gust factor of 1.3 per AASHTO, an Effective Projected Area (EPA) of 20.0 minimum, and a fixture load of 400 pounds minimum.
5. Poles shall include a base plate of A356 alloy aluminum, 1-inch minimum thick, and heat treated to achieve a T6 temper, having a minimum yield strength of 36,000 psi. Base plate shall be continuously welded both top and bottom (or inside and outside) to the base of the pole.
6. Pole base plates shall have four slots suitable for installing over four 1-inch diameter anchor bolts set in an 11-inch diameter bolt circle pattern.
7. Poles shall include a reinforced 4-inch by 6-inch handhole located in the base. The handhole shall include a gasketed cover plate that is firmly held in place by two 1/4"-20 stainless steel cap screws. Provide an internal ground lug, which shall be located on the handhole side of the pole.
8. Poles shall be mechanically cleaned, and either plastic resin coated or polyester powder coated inside over their entire length. Poles shall be painted with a black polyester powder coat outside to match the specified light fixtures.
9. Each pole shall be provided with a 5/16 inch-18 tapped provision for a ground connector.

- C. Anchor bolts for roadway and parking lot lighting shall be 1-inch diameter by 36-inches long with a 4-inch "L", fully hot dipped galvanized steel having a yield strength of 36,000 psi. Each bolt shall be provided with two hot dipped galvanized fender washers and hex nuts.

- D. Provide Valmont Base Cover, "Dart Square - 2T" Model or equivalent by Acuity, made of A356 alloy aluminum and finished to match the pole. The cover shall be a single unit, installed in two pieces, covering all four nuts and the base plate. Pieces shall be held together and anchored to the pole base with stainless steel set screws.

2.3 BANNER ARMS

- A. Banner arms shall be provided by the banner supplier and are not the responsibility of the pole supplier.
- B. Banner arms shall be 6061 cast aluminum, heat treated to a T6 temper, welded to the arm base plate. Banner arm length (banner width) shall be 24 inches maximum for pedestrian light poles and 30 inches maximum for roadway light poles as indicated in the University Banner Guidelines.
 - 1. Top banner arms for pedestrian light poles shall be Valmont "BannerSaver" Model, break-away type with self-restoring feature. The break-away/self-restoring hardware shall be welded directly to the arm base plate.
 - 2. Top banner arms for roadway light poles shall be either Valmont non-break-away type or Valmont "BannerSaver" Model, break-away type with self-restoring feature. The non-break-away arm, or the break-away/self-restoring hardware, shall be welded directly to the arm base plate.
 - 3. Bottom banner arms for all poles shall be Valmont "BannerSaver" Model, break-away type with self-restoring feature. The break-away/self-restoring hardware shall be welded directly to the base plate.
 - 4. Banner arm base plates shall be anchored to the poles with adjustable aluminum compression straps or aluminum clamps, finished to match the poles. Arms and straps/clamps shall be removable without any damage to the pole or to its finish. Drilling of any holes for banner arm or hardware attachment is not allowed.
 - 5. End caps for banner arms shall be A356 alloy aluminum, standard type, attached to the arm per manufacturer's standards.
 - 6. Mounting heights of the bottom arms shall be 13 feet clear above the pole base on street light poles, and 6 feet 8 inches minimum clear above grade on pedestrian light poles.

2.4 CONCRETE

- A. Concrete for lighting pole and emergency telephone kiosk bases shall be 6 bag minimum mix, with aggregate not exceeding 3/4 inch, 3,000 psi minimum compressive strength after 28 days, air content minimum 5 percent and maximum 7 percent.

2.5 RACEWAYS

- A. Conduits indoor, in general areas, shall be electrical metallic tubing (EMT) with steel set screw fittings.
- B. Conduits outdoors (except where galvanized rigid steel is shown on the drawings) shall be Schedule 40 PVC with matching fittings, UL Labeled for use with 90 degrees C cables. Acceptable manufacturers:

1. Cantex.
 2. Carlon
 3. National Pipe & Plastic.
- C. Sleeves for underground outdoor lighting and irrigation installations shall be 6" Schedule 40 PVC, UL Labeled for use with 90 degrees C cables. Acceptable manufacturers:
1. Cantex.
 2. Carlon.
 3. National Pipe & Plastic.
- D. Junction boxes shall be pre-cast polymer concrete or polymer foam, heavy-duty rated, one size larger than required by the NEC, bottomless, with a single piece cover engraved "UM Outside Lighting" and attached with pentahead stainless steel bolts. Provide metal barriers in junction boxes containing circuits of two different voltages or containing both power and telephone circuits. Acceptable manufacturers:
1. Carson-Brooks.
 2. CDR Systems.
 3. Quazite.
- E. Marking tape shall be plastic, vinyl, or Mylar, 6-inches wide, red for electrical power circuits and orange for telephone circuits, and labeled to indicate the type of circuit buried below.

2.6 WIRING

- A. Wire and cable for general indoor use shall be single conductor stranded copper with Type THHN insulation rated 90 degrees C, 600 volts.
- B. Wire for use outdoors shall be single conductor stranded copper with Type XHHW insulation rated 90 degrees C in dry locations and 75 degrees C in wet locations, 600 volts.

2.7 TERMINATIONS

- A. Connectors for splicing and terminating lighting conductors within in-grade boxes shall be Homac 3 RAB4 or RAB6 "Flood-Seals" only.
- B. Connectors for terminating lighting conductors in poles shall be ILSCO UTILCO SLC4-01-L terminal blocks with ILSCO UTILCO No. R6131 boots.
- C. Connectors for terminating lighting conductors in column and wall mounted fixture bases only shall be copper split bolt connectors with full tin-plating. Blackburn 1HPW for No. 3 AWG wire and 4HPW for No. 6 or No.8 AWG ground wire.

2.8 FUSING

- A. Fuse holders for lighting fixtures shall be Eaton Bussmann TRON No. HEB-AA in-line, waterproof fuse holders rated 300 volts and 30 amps.
- B. Fuses for lighting fixtures (unless shown otherwise on the Drawings) shall be Eaton Bussmann No. KTK-5, rated 5 amps.

2.9 CONTROLS

DDC CONTROL IS THE PREFERRED METHOD OF CONTROL; TIE TO LOCAL BUILDING DDC PANEL. WHERE LOCAL DDC CONTROL IS NOT AVAILABLE, CONSIDER SINGLE PHOTOCCELL WITH CONTACTOR CONTROL, OR POSSIBLY ADJACENT BUILDING DDC CONTROL PANEL. STAND-ALONE TIME CLOCKS ARE NOT ALLOWED.

- A. Lighting contactors shall be of the voltage and amperage shown, 3-pole, fused disconnect switch type, electrically-held, with a hand-off-auto switch and a 120 volt control power transformer. Lighting contactors located indoors shall be installed in NEMA 1 enclosures, and lighting contactors located outdoors shall be installed in NEMA 3R stainless steel enclosures with pad-lockable doors. Schneider Electric (Square D) Class 8903 only.

2.10 CIRCUIT REQUIREMENTS

- A. Unless shown otherwise on the Drawings, provide circuits as follows:
 - 1. Feed parking lot lighting, pedestrian lighting, roadway lighting, emergency telephone kiosks, illuminated signs, and parking lot electric gates and meters all from separate circuits.
 - 2. Feed pedestrian lighting on opposite sides of a roadway or sidewalk from separate circuits.
 - 3. Feed pedestrian, roadway, and parking lot lighting at 277 volts from a 480Y/277 volt, three-phase circuit. Feed emergency telephone kiosks, illuminated signs, and parking lot electric gates and meters at 120 volts.
 - 4. Pedestrian and roadway lighting circuits shall consist of four No.4 AWG conductors plus a No. 8 AWG ground conductor in a 1-1/4" conduit.
 - 5. Emergency telephone kiosk, illuminated sign, and parking lot electric gate and meter power circuits shall consist of two No. 8 AWG and one No. 8 AWG ground conductors in a 1" conduit.
 - 6. Telecommunications conduits to emergency telephone kiosks and parking lot electric gates and meters shall be 1-1/2" minimum and shall include a nylon pull string.
- B. Provide a means for expanding the outdoor lighting circuits. Stub out a spare 1-1/4" conduit from each pole base indicated by "STUB SPARE C" on the plan drawings.

2.11 CONTROL REQUIREMENTS

- A. Switch the outdoor lighting with lighting contactors where shown. Lighting contactors shall be controlled by normally closed contacts of a Building Automation System DDC control panel (the preferred option whenever DDC is available), or a photocell when DDC is not available. The control circuit shall be wired to energize the lighting upon a failure of the DDC control panel or photocell. Contact the Owner's Utilities Power & Lighting Shop (734-647-2049) to coordinate connection to a DDC control panel.
- B. Where specified in the Lighting Fixture Schedule, provide a photocell on top of each fixture housing.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Remove existing pole bases and associated circuiting completely when demolishing existing lighting. Direct buried wiring or underground conduit may be abandoned in place, unless shown otherwise.
- B. Where sidewalk sections must be removed for installation of outdoor lighting, remove the sidewalk sections completely from joint to joint.
- C. Where asphalt must be removed for installation of outdoor lighting, saw cut the asphalt in two, straight, parallel lines, with clean edges.

3.2 EXCAVATION AND BACKFILL

- A. Excavate and maintain trenches according to applicable Safety and Code requirements. Protect existing features.
- B. Backfill excavated trenches in accordance with the drawings. Excavated materials may be used to backfill the trench only if the backfill is sand or suitable soil that conforms to Section 312000 Earth Moving backfill material requirements and that is free of rocks and debris over 3/4 inch. Dispose of unsuitable material, clay or rocky excavated material, and replace with MDOT Class II sand.
- C. Mark sleeves and conduits for their entire length with a marking tape buried 12 inches above the top of the sleeve or conduit.
- D. Backfill excavated trenches in 6-inch layers and mechanically compact to 98 percent compaction.
- E. Backfill and mechanically compact holes left by demolished pole bases with MDOT Class II sand or clean dirt to a depth of 6 inches below grade. Backfill the last 6 inches with topsoil.

3.3 SLEEVE INSTALLATION

- A. Sleeves shall be buried at a minimum depth of 24 inches to their top. Sleeves shall extend a minimum of 12 inches beyond the pavement they pass under.
- B. Sleeves shall be taped closed at both ends with duct tape.
- C. Sleeve ends shall be marked with steel stakes, pipes, or conduits that are 3-feet long minimum, driven vertically down at the sleeve ends to a depth of 6 inches below grade to their top.
- D. Where lighting and irrigation sleeves are installed adjacent to each other, maintain a minimum of 2 feet between them.

3.4 CONDUIT INSTALLATION

- A. Conduit bends shall not be smaller than the radius of standard manufactured elbows, with a minimum bend radius of 12 inches.
- B. Install conduits parallel to or at right angles to building lines and site features.

- C. Locate underground conduits as close to curbs and sidewalks as possible to avoid interference with future landscaping.
- D. Where conduits cannot be installed at a minimum depth of 24 inches, install rigid steel conduits or pour concrete over the conduits in accordance with the NEC.

3.5 JUNCTION BOX INSTALLATION

- A. Keep the number of junction boxes to a minimum. Make splices in pole bases wherever possible.
- B. Locate junction boxes in mulched areas wherever possible. The top of the junction box shall be level with the existing grade.
- C. Install junction boxes on a base of pea gravel or MDOT Class II sand at least 1-foot deep.

3.6 FIXTURE AND POLE INSTALLATION

- A. Locate fixture bases on centerlines where centerlines are shown on the Drawings. Install fixtures shown on the Drawings in a straight line.
- B. Align pole with handhole away from the sidewalk.
- C. Install poles using 2 hot dip galvanized fender washers and 2 hex head nuts on each anchor bolt so that poles can be leveled. Poles shall be plumb. The center band of pedestrian lighting fixtures shall be level.
- D. Align pedestrian lighting fixtures so that one spoke of the globe basket is perpendicular to the street, sidewalk, or wall.
- E. Provide adequate slack in the pole conductors so that the conductors to the luminaire can be pulled out of the handhole for maintenance. Provide terminal blocks, in-line fuse holders, and wire nuts in accordance with pole wiring details on Drawings.

3.7 GROUNDING

- A. Provide a 5/8-inch minimum diameter copper-clad ground rod, 8-inch minimum length, for each light fixture pole.
- B. Provide exothermic weld type ground connections or acorn clamps for concealed, underground, and concrete-encased ground connections, and for splices and taps of ground conductors.
- C. Provide No. 10 AWG green insulated grounding conductors in lighting fixture poles.

3.8 CONCRETE WORK

- A. Install light pole and emergency telephone kiosk concrete bases according to details. Provide specified concrete mix.
- B. Exposed portions of light pole and emergency telephone kiosk concrete bases shall be free of voids and honeycombs.
- C. Provide a uniform, 1-inch, 45-degree chamfer on all light pole and emergency telephone kiosk concrete bases.

3.9 ADJUSTING, CLEANING, PROTECTION

- A. Restore concrete sidewalks and asphalt in accordance with the applicable Division 02 and 03 Sections.
- B. Restore lawn areas to Owner's satisfaction, according to the Lawn Repair Section and the Contract Documents. Contact UM Grounds Services at 734-763-5539 to reseed holes in lawn areas.

3.10 FIELD QUALITY CONTROL

- A. Outdoor Lighting Work will be inspected by Owner. Contact the U-M Code Inspection Department at 734-764-2457 before pouring concrete, backfilling excavations, and energizing circuits to arrange for inspections.

3.11 COMMISSIONING

- A. Perform commissioning activities per Related Sections.

DELETE THE FOLLOWING SECTION UNLESS THE PROJECT INCLUDES UNUSUAL LIGHTING UNFAMILIAR TO MAINTENANCE ELECTRICIANS.

3.12 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING

- B. Train Owner's maintenance personnel on equipment operation, troubleshooting, servicing, and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel.
 - 1. Provide training of 1 hour minimum.

SPECIFICATION DIVISION 27

NUMBER SECTION DESCRIPTION

DIVISION 27 COMMUNICATIONS

SECTION 272000 - VOICE AND DATA COMMUNICATIONS

END OF CONTENTS TABLE

DIVISION 27 COMMUNICATIONS
SECTION 272000 - VOICE AND DATA COMMUNICATIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

IN B.2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manuals.
2. Section 019100/019110 - Commissioning.
3. Section 260513 - Medium, Low & Control Voltage Cables.
4. Section 260526 - Grounding and Bonding for Electrical.
5. Section 260533 - Electrical Materials and Methods.
6. Section 260543 - Underground Services for Electrical Systems.

1.2 SCOPE OF WORK

- A. Section Includes:

1. Communications underground ducts, manholes, cable trays, conduits, floor sleeves, J-hooks, surface raceways, outlet boxes and cable pull strings as shown on the drawings.
2. Lighting, power and grounding in Building Entrance (BE) rooms and Telecommunications Rooms (TRs) as shown.

- B. Work Not Included:

1. Communications backboards, equipment racks, equipment, cable ladders, cable managers, cables, terminations, jacks and outlet cover plates will be provided by others.

1.3 DEFINITIONS

- A. The Building Entrance room (BE) is the main termination point for interconnecting cables external to the building with cables internal to the building. In addition, the BE may house communications equipment and electronic equipment of other systems. A BE may also serve as a combination BE and TR and serve local telecommunication work outlets.
- B. Telecommunications Rooms (TRs) are distribution and termination rooms that serve the telecommunication work outlets in the immediate area. TRs may house communications equipment and electronic equipment of other systems.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers referenced in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. ANSI/TIA/EIA-568-C Commercial Building Standards for Telecommunications Cabling Standards.
 - 2. ANSI/TIA/EIA-569-C Commercial Building Standards for Telecommunications Pathways and Spaces.
 - 3. ANSI/TIA/EIA-607-B Commercial Building Grounding and Bonding Requirements for Telecommunications.

BELOW IS U-M STANDARD WARRANTY LANGUAGE. ALL WARRANTIES ARE TO START FROM THE DATE OF SUBSTANTIAL COMPLETION. DO NOT USE TERMS LIKE "UPON OWNER ACCEPTANCE" OR "18 MONTHS FROM SHIPMENT OR 1 YEAR FROM STARTUP, WHICHEVER OCCURS FIRST", ETC.

1.5 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

- A. Communications pathways, lighting, power and grounding shall be in accordance with the Related Sections.
- B. Equipment rack power strips shall be 125 volt, 20 amp, 3 wire, single circuit type with 10 NEMA 5-20R single receptacle outlets on 6" centers, Wiremold #V24GB506.

PART 3 - EXECUTION

3.1 RACEWAY INSTALLATION REQUIREMENTS

VERIFY THE MINIMUM CONDUIT SIZE TO FEED OUTLET BOXES. SOME OWNERS MAY WANT A DIFFERENT MINIMUM SIZE. IF SO, CHANGE THE BELOW SIZES ACCORDINGLY, BUT THE 1-1/4" TO A SURFACE RACEWAY SHALL REMAIN UNCHANGED.

- A. Minimum conduit size shall be 1" for serving one outlet box. Daisy chaining of outlet boxes is unacceptable. Instead, multiple outlets may be served from an appropriately sized junction box. The conduit feeding the junction box shall be sized as follows:
 - 1. 1-1/4" for serving two outlet boxes.
 - 2. 1-1/2" for serving three outlet boxes.
 - 3. 1-1/4" for serving up to three outlets in a surface raceway.

- B. Communications ducts and conduits entering the building from the outside shall transition to galvanized rigid steel conduit or intermediate metal conduit at the building wall, and shall continue as galvanized rigid steel conduit or intermediate metal conduit until entering the BE room or TR. Maximum conduit length to meet Code shall be 50'. Notify the Project Manager if this length is exceeded.
- C. Riser conduits and sleeves connecting BE rooms and TRs shall be 4". Install conduits and sleeves as close as possible to the walls, at the locations shown. Stub up floor conduits and sleeves 4" AFF. Stub wall conduits and sleeves 4" into the room, and cable trays 6" into the room.
- D. When conduits are needed to bypass a large interference in a cable tray run, the cross sectional area of the conduits shall equal or exceed the cross sectional area of the cable tray. These bypass conduits shall have sweeps and bends as noted below, and shall be braced well to allow pulling of communication cables.
- E. Conduit bends and offsets shall be made with sweeps or manufactured elbows. Conduits shall not have more than the equivalent of 2 ninety-degree bends between pull points. Pull boxes shall not be used to make directional changes. Provide pull boxes in straight sections of conduit only.
- F. Provide insulated bushings on both ends of conduits.
- G. Provide double gang sheet metal outlet boxes 2-1/8" deep, and provide double gang plaster rings.
- H. Bond the entire raceway system together and connect it to the ground system.
- I. Provide nylon pull strings in conduits and sleeves. Label pull strings with room number and wall (N, S, E, or W) of the outlet.

3.2 BE ROOM AND TR REQUIREMENTS

- A. Provide ceiling-hung lighting with a wall switch at the door.
- B. Provide power to HVAC equipment.

COORDINATE WITH ITSComm AND EDIT THE CIRCUIT REQUIREMENTS ACCORDINGLY.

- C. Provide dedicated 120 volt, 20 ampere circuits to duplex receptacles 48" AFF and 10' apart on the plywood backboards. Plywood backboards are by others.
- D. Provide dedicated 120 volt, 30 ampere circuits to NEMA L5-30R receptacles and provide dedicated 120 volt, 20 ampere circuits to power strips on the telecom equipment racks. See Standard Detail 27200003.
- E. In rooms with DAS equipment plywood backboards, provide two dedicated 120 volt, 20 ampere circuits to quad receptacles on each DAS backboard.
- F. Provide one 120 volt, 20 ampere normal power circuit to a duplex receptacle on the wall near the door.
- G. Coordinate all receptacle locations with ITSComm.

- H. Provide a 1" wide x 12" long x 1/4" thick copper ground bus bar where shown. Connect it to the unit substation room ground bus bar and to the ground bus bars in the receptacle panels feeding the telecom room receptacles. Ground cables shall be No. 6 AWG green insulated, stranded, copper. The resistance to building ground shall be 1 ohm maximum.

3.3 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

SECTION 275313 - CLOCK SYSTEMS

END OF CONTENTS TABLE

DIVISION 27 COMMUNICATIONS
SECTION 275313 - CLOCK SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.
- B. Related Sections:

IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- C. Related Sections:
 - 1. Section 018113 - Sustainable Design Requirements
 - 2. Section 019100/019110 - Commissioning
 - 3. Section 017823 - Operation and Maintenance Manual
 - 4. Section 260513 - Medium, Low & Control Voltage Cables
 - 5. Section 260526 - Grounding and Bonding for Electrical
 - 6. Section 260533 - Electrical Materials and Methods
 - 7. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Provide all equipment, materials, labor and services necessary to furnish, install, test and turn over to the Owner the following electrical work as required by these specifications and as shown on the drawings.
 - 1. GPS Wireless Clocks
 - 2. GPS Signal Transmitters
- B. Participate in project coordination and scheduling activities when required by Division 01 and in project commissioning activities when required by Section 019100/019110.

1.3 SUBMITTALS

- A. Product Data Sheets.
- B. Installation, Operation and Maintenance Manuals.
- C. Warranty Documentation.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. Reference Standards: UL.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver clocks adequately packaged to prevent damage during shipment, staging and installation.
- B. Protect clocks during shipping and while onsite from the weather, moisture condensation, dirt and debris at all times. Store clocks raised up on pallets or other supports until ready for installation.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers: Primex Wireless Inc.

2.2 CLOCKS

REVISE THE FOLLOWING PARAGRAPHS TO MAKE THEM PROJECT SPECIFIC.

VERIFY WITH ENGINEER THAT DRAWINGS DIFFERENTIATE 120 VOLT POWERED FROM BATTERY POWERED, SINGLE FACE FROM DOUBLE FACE.

- A. Clocks shall be single face wall mounted or double face edge mounted, 120 volt powered or battery powered, GPS signal synchronized, wireless, analog clocks as indicated on Drawings.
- B. Clocks shall be 12.5 inch nominal diameter with white face, black polycarbonate frame, polycarbonate lens, standard black numerals, and sweep second hand.
- C. Clocks shall include a GPS signal receiver to synchronize wirelessly with GPS time at least every two hours, and shall include an internal oscillator to maintain time within plus or minus 0.2 seconds between synchronizations. Clocks shall maintain accurate time despite the temporary loss of GPS signal. Clocks shall automatically adjust for Daylight Savings Time.

- D. Single face, 120 volt powered clocks shall surface mount to the wall over a NEMA 5-20R simplex receptacle in a single-gang, flush mounted outlet box. Clock shall mount with a clock lock hanger which requires a sequence of movements to install and remove the clock.
 - 1. Acceptable Manufacturer: Primex Model 14306.
- E. Double face, 120 volt powered clocks shall mount edgewise to the wall with a bracket that completely covers a NEMA 5-20R simplex receptacle in a single-gang, flush mounted outlet box.
 - 1. Acceptable Manufacturer: Primex Model 14330.
- F. Single face, battery powered clocks shall surface mount to the wall over a clock lock hanger which requires a sequence of movements to install and remove the clock.
 - 1. Acceptable Manufacturer: Primex Model 14155.

2.3 GPS SIGNAL TRANSMITTERS

- A. GPS wireless signal transmitters shall receive and rebroadcast GPS signals throughout the building.
- B. GPS wireless signal transmitters shall be 120 volt powered, have an internal antenna, and produce a 1 watt GPS signal output compatible with the GPS clocks.
 - 1. Acceptable Manufacturer: Primex Model 14000.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

- A. Examine areas, substrates, and conditions, for compliance with requirements for installation and other conditions affecting performance of the units.
- B. Proceed with installation only after unsatisfactory conditions have been corrected. Commencement of the work constitutes acceptance of the existing conditions.

3.2 INSTALLATION

- A. Install clocks at the locations and heights shown on the drawings.
- B. Install clocks plumb, level and tight against the wall using the clock-lock hanging method and suitable fasteners as recommended by the clock manufacturer. Initiate clock operation in accordance with manufacturer's instructions.
- C. Due to GPS signal saturation on campus, do not install GPS signal transmitter. Instead, turn the GPS signal transmitter over to the UM Radio Shop and commence building clock startup and commissioning activities. If the building clocks are not synchronizing with an existing GPS signal, then contact the UM Radio Shop for installation of the new GPS signal transmitter.

3.3 FIELD QUALITY CONTROL

- A. Test units prior to putting into service to the extent required by the Manufacturer and the Commissioning Authority.

3.4 TEMPORARY SERVICE

- A. Start units for temporary use only with the expressed written permission of the Project Manager and in compliance with all requirements of the Contract Documents.
- B. Test units prior to putting into temporary service to the extent required by the Manufacturer and the Commissioning Authority.
- C. Perform all required routine maintenance procedures during temporary service.

3.5 STARTUP

- A. Conduct final inspection and testing of equipment and systems according to the manufacturer's requirements, and verify the system meets the project design criteria.
- B. Thoroughly clean units of all grease, dirt, dust, etc.

3.6 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests
8. Section 281600 - Security Systems

1.2 SUMMARY

- A. This section refers to new work and work that will be performed to modify existing systems. The Security Contractor shall provide all equipment, materials, labor, and services necessary to furnish, install, connect, activate, and test a complete Access Control and Monitoring System. All materials, equipment fabrication, installation, and tests shall conform to applicable Codes and authorities having jurisdiction. Access Control and Monitoring System shall include, but is not limited to, the following:
1. Provide a complete Access Control and Monitoring System. A complete system is defined as all conduit, raceways, junction boxes, cables, card readers, controllers, alarm contacts, and programming needed to achieve a complete and functional system connected to the existing University central system. Also included are all required power supplies, power filtering, mounts, housings, equipment stands, and interfaces to existing equipment.

2. The Access Control and Monitoring System shall be an expansion of the existing University of Michigan campus wide Software House system. Work includes adding system panels, card readers, and associated access control devices in locations identified on Drawings.
3. Provide all 120VAC power wiring and low-voltage work to the system and all necessary components.
4. Coordinate system requirements with the University of Michigan's project management team.
5. Establish system communication with the Access Control System Server and panels via the Owner's LAN/WAN network.
6. Provide system administrative support throughout the installation process to meet the specific needs of the project scope of work.
7. Furnish and any install required interface relays, materials, and cabling to the fire alarm control panel.
8. Coordinate with the Owner's Representative and the U-M key office to provide installation, testing, adjustment, and initial programming for all equipment.
9. Provide written documentation and instructions for system as installed.

1.3 RELATED SECTIONS

- A. Section 281600 articles including, but not limited to:
 1. References
 2. Quality Assurance
 3. Submittals
 4. Warranty
 5. Record Documents
 6. Commissioning / Acceptance Testing
 7. Training

1.4 QUALITY ASSURANCE

- A. Pre-programming conference: Prior to programming new doors in Owner's existing access control systems, conduct conference at Project Site to be attended by Owner's Representative, security contractor, Architect, and representatives from Owner's key office.
- B. Qualified Installers:
 1. Cabling Concepts (Tim Grady, 248-363-4200)
 2. i2G Systems (248-979-4451, 248-977-1220)
 3. JCI (John Keith, 248-427-5050)
 4. Siemens (Chris Tingley, 734-456-3800 main, 734-386-6741 cell)

PART 2 - PRODUCTS

2.1 ACCESS CONTROL PRODUCTS

- A. System Specifications

1. Manufacturer's catalog and system numbers of equipment listed in this specification indicate type, quality, and functions of the equipment required, and represent the minimum acceptable standards. Provide all compatible parts for the submitted system. The Access Control system work shall integrate with Owner's existing Software House C-Cure 9000 system.

2.2 ACCESS CONTROL EQUIPMENT

- A. Access Control panels shall be Software House iStar Ultra G2 SE Series only. Access Control panels shall include, at a minimum, the following:
 1. I/O boards, and power supplies for DC locks with battery back-up sufficient to maintain full operation of monitoring junctions for a minimum of 4 hours, plus a minimum of 25 lock activations in the event of power failure.
 2. Interfacing relays between Access Controller Panel (ACP) outputs and locks being controlled.
 3. Sufficient input boards to accept all monitored points on the Access Control System and sufficient output boards to accept all outputs on the Access Control System. All input and output boards shall include 20% extra points for future connections to the system.
 4. Reed tamper switches.
 5. Output contacts that open on AC power failure and low battery conditions from power supplies. Low battery monitoring must be unique to each power supply.
- B. Card Readers (CR)
 1. Provide one reader at each new card reader access control door opening noted on the Drawings:
 - a. Consult with UM Key Office on specific card reader make/model design currently available~~Multi-technology reader: Software House - RM2L-4000-UM.~~
 2. Mount readers on shallow depth double-gang electrical boxes.
 3. Provide manufacturer's standard thermostatically controlled heater for exterior installations powered from power supply located at access control panel assembly.
 4. Provide reed tamper switch.

INCLUDE BELOW FOR DOORS WITH EXIT DEVICES OR ELECTRIC STRIKES. DOORS WITH ELECTROMECHANICAL MORTISE LOCKSETS HAVE INTEGRAL DSM. COORDINATE SELECTION WITH ARCHITECT.
- C. Door Switch Monitor (DSM)
 1. Provide low-voltage magnetic position sensor with SPDT switch. Utilize recessed door monitors wherever possible.
 - a. Recessed door monitors: ABS plastic enclosure. Provide GE/Sentrol 1078 series switch.
 - b. Surface mounted door monitor: Anodized alloy housing with stainless steel armored cable. Provide GE/Sentrol 2500 series switch.
 - c. Overhead door monitor: Heavy-duty anodized aluminum housing with stainless steel armored cable. Provide GE/Sentrol 2202 series switch.

- d. Connect Door Switch Monitor (DSM) to the RM/Reader input number 1.

D. Access Control Cards

1. Existing University of Michigan identification cards will be utilized. NIC.

**INCLUDE BELOW FOR ELECTRIC STRIKE DOORS ONLY.
ELECTROMECHANICAL MORTISE LOCKSETS AND EXIT DEVICES HAVE
INTEGRAL RTE FUNCTION. COORDINATE WITH ARCHITECT.**

E. Request-to-Exit (RTE) Motion Sensors

1. Request to exit motion sensors: Bosch DS-150 series or equal by Software House. Light gray or black color to match adjacent finishes.
2. Relay output will be connected to the RM/Reader input number.
3. Power for RTE from the power supply at the panel.
4. Mount device on ceiling or door frame. Exact location will depend on existing conditions and the required coverage area. Unless noted otherwise on Drawings, conceal wireways and junction box.

F. Lockdown button

1. Safety Technology International (STI) Stopper Station Blue Indoor Only Flush or Surface Momentary (Illuminated) Stopper Station with "LOCKDOWN" Label Model number SS2425LD-EN

G. Power Supplies and accessories

1. Power supplies at panel assembly:
 - a. Lock / heater power: Provide 24VDC power supplies for all electrically controlled door locks and reader heating elements. (Lock power will be wired back to the power source at the panel. Do not use the RM/Reader output relay for the electric locking device.) Power supplies shall permit simultaneous continuous-duty activation of all door locks and reader heating elements, with an additional minimum 30% capacity on each supply. Provide battery back-up sufficient for 25 activations for all DC locks. A single power supply may be used for two doors when the power supply is located near both doors.
 - 1) Manufacturer: Securitron BPS-24-10.
 - 2) At existing panel assemblies modified to connect new doors but maintain existing capacity, provide additional power supply capacity to serve new doors.
 - b. Access control panel power: Provide battery backed power supply.
 - 1) Securitron AQS1216-16C2 Software House approved power supply.
 - c. Reader heat: Provide low-voltage power supplies for all reader heating elements. Provide Class 2 Energy-Limiting Plug-in type transformer with internal slow-blow fuse and UL Listing.
 - 1) Hammond BPE2E, or approved equivalent.

PART 3 - EXECUTION

3.1 SYSTEM INTERRUPTIONS

- A. Coordinate with the U-M Fire Protection Shop (734-647-2046) and UMHC Facility Command Center (734-936-4000) before performing any work affecting an existing fire alarm system. Operating, programming, modifying, or impairing an existing system without approval of the U-M Fire Protection Shop and UMHC Facility Command Center is strictly prohibited.
- B. Coordinate with the U-M Key Office (734-764-3481) before performing any work affecting existing electrically controlled doors, existing control panels, or other access control components.
- C. Coordinate door hardware installation with panel work, system programming, Owner's Representative and Owner's key office such that each door is fully operational with 24 hours of hardware modifications.

3.2 PROGRAMMING

- A. Special coordination is required with the U-M Key Office regarding programming requirements. Meet with Owner representatives and submit proposed labels for all input and output points for review and comment. Software labels shall be consistent between various integrated systems. Refer to 281600.
- B. Program automatic door unlock, time specifications, and access levels as directed by the Owner.

3.3 INSTALLATION

- A. All electrical power work, conduit work, and wire pulling shall be by licensed electricians, and all card reader installation and interconnection work shall be Tyco Software House CCure 9000 certified technicians.
- B. Provide all wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Method and routing of any exposed raceways or wiring shall be approved by the owner prior to installation.
- D. Wiring shall be grouped and harnessed to facilitate access to all equipment, as well as maintenance and replacement of equipment.
- E. All cable shall be labeled at origin and termination, referencing to a master legend schedule shown on submittal drawings. Labeling and any splice locations shall be noted on Record Drawings.
- F. Provide 120V receptacle outlets dedicated to the reader heating elements.
- G. For all card readers, provide 1#14 AWG minimum THHN green stranded wire from the card reader to the nearest earth ground.

3.4 WIRE AND CABLE PRODUCTS

- A. Wire and Cable Specifications

1. Security Contractor shall follow the manufacturers' recommendation for cabling or the minimum requirements of the Specifications, whichever provides for the most stringent requirements.
2. Cables are to be shielded as necessary to preclude any outside noise or interference from entering the cable and degrading system performance. All cables shall be UL Listed, and appropriate for the application.
3. Coordinate with the Owner's IT department connections to off-site monitoring.
4. Cables run underground, under slab, or in slab shall be installed in conduit and rated for direct-burial application. Cables exposed to weather shall be rated for that use.
5. Mixing of low-voltage cables with telephone/data cables is not permitted.
6. All cables shall be run in unbroken lengths of 1,000 feet or less. No coaxial or power cables less than 1,000 feet shall be spliced. When cable cannot be run in unbroken lengths due to cable spool limitations, coax splices shall be made in junction boxes with crimp-type BNC connectors, power cable splices shall be made using solder and tape. For coaxial cable, the center conductor tip shall be a crimp-on style; the ferrule shall be a hexagonal crimp with a minimum ferrule length of 3/8 inch. All splices and junction boxes shall be clearly marked on the "As-Built" Record Drawings.
7. The use of all screw type connectors i.e. snap caps, wire nuts, and the "twist and tape" method are prohibited.
8. All 24VAC power cabling shall be of stranded construction. Terminal strips and fork spade lugs shall be utilized for all terminations.
9. Wiring shall be grouped, bundled, harnessed, and dressed neatly to facilitate access to all equipment, as well as maintenance and replacement of equipment.
10. All cable shall be labeled at origin and termination, referencing to a master legend schedule as shown on "As-Built" Record Drawings. Labeling and any splice locations shall be noted on "As-Built" Record Drawings. All labels shall be done using machine generated cable tags in the "flagged" position. Hand written labels are not acceptable.

3.5 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.6 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
 - 1. Provide 2 hours of training minimum.

DIVISION 28 ELECTRONIC SAFETY AND SECURITY
SECTION 281600 - SECURITY SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

*INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION.
EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.*

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections including the Related Sections listed below, apply to this Section.

IN 1 AND 2 BELOW, DELETE SUSTAINABLE DESIGN IF NOT APPLICABLE TO THE PROJECT. SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT.

- B. Related Sections:

1. Section 018113 - Sustainable Design Requirements
2. Section 019100/019110 - Commissioning
3. Section 017823 - Operation and Maintenance Manual
4. Section 260513 - Medium, Low & Control Voltage Cables
5. Section 260526 - Grounding and Bonding for Electrical
6. Section 260533 - Electrical Materials and Methods
7. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. This Specification contains a combination of prescriptive and performance requirements. The Contractor is responsible for fully implementing the functions described in the Specifications and shown on the Drawings. This will require the Contractor to perform substantial work selecting system components, integrating system functions, and integrating new components with the existing campus wide security system and with equipment provided and installed by other Sections.
- B. Security Contractor shall provide all materials, equipment, fabrication, installation and tests in compliance with applicable Codes and Authorities Having Jurisdiction.
- C. Provide all necessary components of an Access Control and Monitoring System (ACMS) as described in the Specifications and as indicated on the Drawings.
- D. Provide a complete system which is defined as all labor and materials required to complete the Work described herein and as indicated on the Drawings. Security Contractor shall provide all hardware, and programming for installation, connection and operation of the new equipment required to provide a fully functional system that integrates with the existing Campus Wide Security System.

- E. Products, equipment, materials, systems, assemblies, and accessories as specified herein define the minimum standards. Documents do not undertake to show or list every item to be provided. Items not shown or listed but are clearly necessary for proper installation, operation and functioning of the equipment and systems shall be provided, installed, tested and certified at no additional cost to the owner.
- F. Provide installation, testing, adjustment, configuration and initial programming for all equipment and systems.
- G. Provide training to the Owner's Representatives in the overall system layout, operation, and programming. Training will consist of review of on-site review of O&M manuals and record drawings.
- H. Provide any interface relays, materials, enclosures, cabling, programming and testing required to interface Access Control
- I. Provide any interface relays, materials, enclosures, cabling, programming and testing that may be required to interface with the Fire Alarm Control Panel (FACP).

1.3 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the Division 01
- C. Applicable Division 28 specification sections as follows:
 - 1. Section 260500: "Basic Electrical Requirements"
 - 2. Section 260533: "Basic Electrical Materials and Methods"
 - 3. Section 260513: "Cables and Wiring"
 - 4. Section 262726: "Wiring Devices"
 - 5. Section 262000: "Service and Secondary Distribution"
 - 6. Section 260526: "Grounding"
 - 7. Section 281300: "Access Control and Monitoring Systems"
 - 8. Section 260800: "Electrical Acceptance Tests"

1.4 SECURITY CONTRACTOR REQUIREMENTS

- A. The Security Contractor shall be responsible for coordinating the installation of all building electronic security devices specified in referenced Sections. Security Contractor shall meet the following minimum qualifications:
 - 1. Possess all applicable Contractors' licenses.
 - 2. Provide supervision by a person who has successfully installed similar systems by the same equipment manufacturers at three locations.
- B. Perform all work in accordance with acknowledged industry and professional standards and practices, existing building conditions, and as specified herein.

- C. Maintain a competent supervisor and supporting technical personnel, acceptable to the Owner, during the entire installation. A personnel change of the supervisor during the Project shall not be acceptable without prior written approval from the Owner's Representative.
- D. Provide all required cables, cable support materials, conduit, backboxes, connectors, mounting hardware and trim materials for a completely functional/operational system.
- E. Provide 120VAC power, conduit, and wiring per Division 26 requirements from existing power panels as directed by Owner.
- F. Coordinate with the Owner's Representatives regarding connection of the new system components to the Owner's Campus Security System via the Owner's LAN and WAN networks. IP addresses and or DHCP naming conventions will be provided by Owner.

1.5 REFERENCES

- A. Published specifications, standards, tests, codes, or recommended standards of trade, industry, or governmental organizations apply to work in these Sections, including:
 - 1. ADA - Americans with Disabilities Act
 - 2. ASCII - American Standard Code for Information Interchange
 - 3. ASTM - American Society for Testing and Materials
 - 4. EIA - Electronic Industry Association
 - 5. IBC - International Building Code
 - 6. NEMA - National Electrical Manufacturers' Association
 - 7. NFPA - National Fire Protection Association with University of Michigan amendments
 - 8. NEC - National Electrical Code
 - 9. UL - Underwriters Laboratories, Inc.
 - 10. UL 294 - Access Control Systems,
 - 11. UL 1076 - Proprietary Burglar Alarm Systems,
 - 12. UL 1037 - Anti Theft Alarms and Devices
- B. Electronic devices radiating "RF" energy shall comply with Federal Communication Commission regulations, particularly Part 15, and shall meet minimum Class "B". Provide FCC certificate numbers indicating that products have been approved by the FCC.

1.6 QUALITY ASSURANCE

- A. Where applicable, all equipment supplied by the Contractor shall be UL listed or listed by some other nationally recognized testing laboratory approved by the Owner.
- B. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.
- C. All items of a given type shall be the products of the same manufacturer.
- D. All items shall be of the latest technology; no discontinued models or products are acceptable.
- E. No 'beta' products will be accepted.

- F. Security Contractor shall be capable of performing service or maintenance work on the specified systems. Security Contractor's lead technician shall be factory-certified by the security system(s) manufacturer(s).
- G. Security Contractor must be a SoftwareHouse authorized reseller. Security Contractor shall have installed the system bid for this project in at least two projects of similar size and scope.
- H. The Security Contractor shall maintain a local office staffed with factory trained technicians and adequately equipped to provide preventative and emergency service.
- I. Security Contractor shall possess all required licenses and permits.
- J. The Manufacturer, or their Authorized Representative, shall confirm that within 100 miles of the Project site there is an established agency which: Stocks a full complement of parts. Offers service during normal working hours as well as (24 hour/7 days a week) emergency service on all equipment to be furnished. Will supply parts and service without delay and at reasonable cost.
- K. In the event of a discrepancy between the Specifications and the Drawings, whichever is more stringent or calls for the highest quantity or quality of materials has precedence. Specifications and Drawings are complementary and what is required by one is as binding as if required by all.

1.7 SUBMITTALS

- A. Submittals shall be provided for review and acceptance by the Owner's Representative prior to commencement of the work.
- B. All security system submittals shall be complete and in a similar format for ease of review. The Owner reserves the right to reject any submittals determined to be incomplete.
- C. The Security Contractor should not consider the Owner's review of submittals to be exhaustive or complete in every detail. Approval of submittals, including substitutions, indicates only the acceptance of intent to comply with the general design or method of construction and quality as specified. The functional requirements, operations, arrangements, and quantities must comply with the Contract Documents unless changes are specifically approved in writing. Submittal approval does not relieve the Security Contractor of responsibility for errors or omissions in dimensions, details, and sizes or for coordinating items with actual building conditions.
- D. Work provided without approved submittals is done at the Security Contractor's risk and may be changed at no cost to the Owner.
- E. Equipment Submittals shall include:
 - 1. Bill of Material for all new equipment.
 - 2. Manufacturer's name, brand name, and catalog number with UL listing identified.

3. Written approval from each manufacturer affirming that Security Contractor is certified and approved for systems installation and service for all systems in this Section.
4. Service information, including address of nearest representative
5. Note: When a cut sheet is supplied that shows multiple items, clearly identify the specified parts being used including any optional items.

F. Installation Submittals shall include:

1. To scale drawings in AutoCAD DWG format.
2. Elevation and mounting details showing all modules and components.
3. Point-to-point, and termination drawings for all work showing all devices and each conductor identified. "Typical" drawings will not be accepted.
4. Battery calculations for all batteries.
5. Voltage-drop calculations are required for all lock circuits.

G. Programming Submittals shall include

1. Device names and descriptions,
2. Complete written sequence of operations for all functions of the system.

1.8 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Replace, at no expense to Owner, equipment and material damaged during storage and installation as directed by the Owner's representative.
- B. Products delivered to the job site shall be protected from water, dust, dirt, and foreign matter. All equipment shall be protected from water, dents, bumps, and scratching.

1.9 WARRANTY

- A. Security Contractor and manufacturer guarantee installation, equipment, and all parts and labor for one year from written notification of acceptance. Security Contractor is required to submit a Service Level Agreement for the performance of warranty work, including response time, exceptions to warranty coverage, and the process to initiate warranty service call(s).
- B. All warranty and service work shall be performed by personnel who have been trained and certified by equipment manufacturers and are experienced in the operation and maintenance of the installed systems.
- C. The following Service Level Agreement identifies the expectations to be included in project.
 1. Service Hours: Normal hours for service are Monday through Friday, 8:00 a.m. to 5:00 p.m., excluding recognized national holidays. Service calls commencing within these time frames, through to completion of the service call, will not be considered after-hours calls and will not be subject to premium rates.

2. Response Time - Normal Service: Service requests will be transmitted to the Security Contractor both by phone and e-mail. Service requests will be tagged as either Normal or Emergency. Normal requests for service transmitted to the Security Contractor prior to 10:00 a.m. Monday through Friday will be responded to by an on-site technician the same business day. Normal requests transmitted to the vendor after 10:00 a.m. will be responded to by an on-site technician by 12:00 p.m. the following business day.
 3. Response Time - Emergency Service: Emergency service requests will be responded to by an on-site technician within 4 hours, regardless of the time of day transmitted or the day of week. Emergency service calls will be reimbursed to the Security Contractor at an additional fifty percent (50%) of his standard service rate.
 4. Service Expectation: The Owner expects the Security Contractor to respond with a technician suitably trained and equipped to return the system to complete operation during the duration of the service call. Dispatching additional personnel, delivery of additional parts or return calls to correct the originally identified problem will not expose the Owner to additional charges. The service team will not leave the Owner's site without either returning the system to full operation or providing a documented acceptable explanation as to why the call cannot be completed. Technicians remaining on-site to complete calls after 5:00 p.m. will not expose the Owner to premium time charges.
 5. Warranty service shall include the replacement of all parts and or components as required to restore normal system operation. In the event that system parts or components must be removed for repair the Security Contractor shall furnish and install temporary parts and or components as required to keep the system fully operational.
- D. Owner's Responsibilities: Owner will allow unhindered access for the service technicians to areas where they will perform their work, and will promptly provide escorts if technicians need to work in areas where an Owner escort is required. Owner will provide power and telephone access for the technician to operate test equipment and power tools, and to allow the technician to communicate with their office or equipment manufacturers.
- E. The Owner reserves the right to expand or add to the system during the warranty period using firm(s) other than the Security Contractor for such expansion without affecting the Security Contractor's responsibilities, provided that the expansion is done by a firm which is an authorized dealer or agent for the equipment or system being expanded.
- F. Provide written notice to the Owner documenting any work performed during the warranty period.

PART 2 - PRODUCTS

2.1 SECURITY SYSTEMS PRODUCTS

- A. Refer to individual security system Sections for product details.

PART 3 - EXECUTION

3.1 REQUIREMENTS

- A. Coordinate all work including schedule and integration of work with other trades.
- B. Coordinate work with Owner's Representatives for all network connections.
- C. All systems shall be complete and operational in all respects.
- D. Provide installation of all wiring, raceway, conduit, and approved wireways for Division 28 work. Provide connection of power to security systems as required.
- E. Wiring in wet or damp locations, including all underground conduits, shall be rated for wet applications.
- F. Security Contractor shall consult manufacturer's recommendations for cabling and conduit and use whichever is greater in size, quality, quantity, gauge, shielding and number of conductors at no additional cost to the Owner. All cables will be provided by the Security Contractor.
- G. All security equipment in public areas shall be installed utilizing tamper proof mounting hardware. Provide a minimum of 2 driver bits or hand tools for each type of security fastener to the Owner. The standard type of security screw shall be a star configuration with a security center piece.
- H. Cables are to be protected from excessive tension, abrasion, or damaging bends or kinks during installation. Care shall be taken not to bend, crush or kink cables.
- I. Cables shall be combed straight and formed in a neat and orderly manner. Tie wraps are to be used for cable management, not support. Use tie wraps of the appropriate size and type. Do not over-tighten tie wraps.
- J. Provide service loops at each termination point so devices can be dismantled for service and inspection.
- K. Provide bracing for all equipment, including equipment racks and consoles.
- L. Refer to individual security system Sections for additional installation requirements.

3.2 RECORD DOCUMENTS

- A. As Built Drawings
 - 1. Maintain a complete set of prints of Contract Drawings of the work forming a part of the security systems. As work is installed, carefully draw on prints, in colored pencil, actual location of work including depth of underground runs, if any, with dimensions from permanent structures. Wiring diagrams and details shall be included.

2. Upon completion of the Project, transfer this information to reproducible Drawings and updated CAD (AutoCAD DWG files) disks, and submit to the Owner, along with hand marked field record set.
3. The Security Contractor shall provide three bound sets of drawings and two CDRoms with all AutoCAD drawing files and corresponding PDF files.
4. Record Drawings shall include:
 - a. Complete wiring diagrams for all components, including cable types and quantities, routings, floor plans indicating device locations, room numbers, conduit sizes.
 - b. Complete elevation, mounting, and point-to-point and termination drawings for all devices. "Typical" drawings will not be accepted.
 - c. A Master Legend/Spreadsheet on the drawings that identifies all devices, device location on the drawings, wire label verbiage, panel termination points and detail numbers. Each spreadsheet will be specific to the control panel. The legend/spreadsheet will also be place in each control panel for service support and termination assistance. For work in existing panels, provide information noted above for all additions and modifications.
 - d. A complete written sequence of operations for all functions as installed and programmed for each system.
 - e. A complete list of all equipment installed organized by building.

B. Operations and Maintenance Manuals

1. Provide operations and maintenance manuals Division 01 requirements and as follows
2. Operations:
 - a. The operations section shall contain complete guidance and procedures for operation of the system and each subsystem including all required actions at each operator position, step by step instructions for system start-up and execution of all system functions and commands.
 - b. Operation section shall include the following information:
 - 1) Detailed descriptions including step by step procedures for initialization, recovery and re start for each system.
 - 2) Complete operational descriptions for each system including all functions and features.
 - 3) Detailed descriptions for all programming and data base entry functions including step by step procedures, screen illustrations and flow charts.
 - 4) Copies of manufacturer operation manuals and instructions.
3. Maintenance
 - a. The maintenance section shall contain complete guidance and procedures for routine maintenance of the system and each subsystem including manufacturer recommendations for preventative maintenance.

- b. Maintenance section shall include the following information:
 - 1) The names, addresses and contact information for each manufacturer, local manufacturer representative and all subcontractors that performed work or furnished material for the project.
 - 2) Detailed descriptions of all user performed maintenance on all system components including inspection, periodic preventative maintenance, fault diagnosis and replacement of all modules.
 - 3) A summary of all TCP/IP addresses used and which system component they are associated with.
 - 4) Manufacturer data specification sheets for each piece of equipment, device and system.
 - 5) Manufacturer service and installation manuals for each piece of equipment, device and system.
 - 6) Manufacturer warranty certificates.
 - 7) Reduced copy of as built drawings.

3.3 COMMISSIONING/ACCEPTANCE TESTING

- A. Perform Commissioning activities per Related Sections above.
- B. There are two distinct types of tests for which the Security Contractor is responsible:
 - 1. The first type is the Pre-Functional Performance Test. These tests ensure that all equipment, wiring, and systems are installed in accordance with the Specifications, Drawings, and manufacturers' requirements.
 - 2. The second type of test is the Substantial Completion Test. These tests ensure that all equipment and systems operate in accordance with design intent. These are dynamic tests, and test the systems through all possible modes of operation.
- C. Perform systems tests using personnel who have attended a manufacturer's training school for installation and testing of the systems as described above. Perform testing with the test instruments as required by the manufacturer; testing by means other than the manufacturer's procedures will not be acceptable unless agreed to by the Owner's Representative.
- D. Upon completion of the installation of the security systems, the Contractor shall submit to the Owner Pre-Functional Performance Test reports including, but not limited to, the following information:
 - 1. A complete list of all equipment installed, including serial numbers of major components.
 - 2. Certification that all equipment is properly installed and functional, and it conforms with Contract Specifications and Drawings.
 - 3. Test reports of all new and existing inputs and outputs, devices, and equipment.
 - 4. Test technician's name, company, and dates of test.

- E. Following review of the Pre-Functional Performance Test report by the University of Michigan project team, the Contractor shall schedule a substantial completion test with the University of Michigan projects team. A Substantial Completion Test shall include performance tests of each device, switch, control unit, power supply, battery standby unit, monitor panel, controller, and all other equipment and material required by the Contract. Tests will only be conducted at completed buildings, partial testing of buildings will not be performed by the University of Michigan project team. Owner will provide testing document.
- F. At a minimum, perform tests to demonstrate that:
 - 1. All systems are free from grounding and open circuits.
 - 2. Each alarm-initiating device consistently functions as specified and produces the specified alarm actions.
 - 3. An abnormal condition of any circuit or device required to be electrically supervised will result in activating the specified trouble or tamper alarm signal.
 - 4. Doors lock and unlock at programmed times and allow access upon activation from a valid card.
 - 5. The system is operable under specified trouble conditions.
 - 6. All software functions properly as specified, and all equipment is fully programmed. The Security Contractor shall be responsible for programming system English-language descriptors as specified by the Owner's representative.
 - 7. System Record Drawings correspond with actual installation.
- G. Final commissioning by Owner is required for final acceptance. Final commissioning is to be scheduled simultaneous with punch list.
- H. If retesting is required due to Security Contractor equipment failure, incorrect programming, omission, or error, the Security Contractor shall correct the problem, retest, and state in writing the system is ready for the Owner to witness a demonstration.

3.4 TRAINING

- A. Provide a qualified service technician from the Manufacturer's staff to provide training.

REVISE TRAINING REQUIREMENTS IN THE ARTICLE BELOW TO BE PROJECT SPECIFIC. SAMPLE TRAINING LANGUAGE IS PROVIDED, EDIT TO SUIT PRODUCT OR SYSTEM, INCLUDING DURATION. TRAINING IS NOT REQUIRED UNLESS THE PRODUCT OR SYSTEM IS COMPLEX, UNIQUE, OR NEW TO THE U-M PLANT MAINTENANCE DEPARTMENT. BECAUSE OF THE COST INVOLVED IN TRAINING DO NOT INDISCRIMINATELY SPECIFY TRAINING

- B. Train Owner's maintenance personnel on equipment operation, start-up and shutdown, trouble-shooting, servicing and preventative maintenance procedures. Review the data contained in the Operating and Maintenance Manuals with Owner's personnel. Training shall occur separate from startup activities.
 - 1. Provide 2 hours of training minimum.

SECTION 283100 - FIRE DETECTION AND ALARM SYSTEM

END OF CONTENTS TABLE

DIVISION 28 ELECTRONIC SAFETY AND SECURITY
SECTION 283100 - FIRE DETECTION AND ALARM SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 017823 - Operation and Maintenance Manual
 - 2. Section 019100/019110 - Commissioning
 - 3. Section 260513 - Medium, Low & Control Voltage Cables
 - 4. Section 260526 - Grounding and Bonding for Electrical
 - 5. Section 260533 - Electrical Materials and Methods
 - 6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

- A. Provide all equipment, devices, appliances, wiring, and materials necessary for a complete and expandable fire detection and alarm system which adheres to applicable codes, standards, and University of Michigan requirements.
- B. Coordinate with and provide submittals to the Michigan Bureau of Fire Services, Ann Arbor Fire Department, U-M Fire Marshal, and FM Global as required.
- C. Maintain the existing fire alarm system in service while the new work is installed, tested and made operational.
- D. Provide a new fire alarm system with the following features:
 - 1. A main fire alarm control panel (FACP).
 - 2. Node and notification appliance circuit (NAC) panels.
 - 3. Automatic and manual initiating devices.
 - 4. Audible and visual notification appliances.
 - 5. Control inputs and outputs to ventilation systems.
 - 6. Control outputs to each elevator controller to initiate elevator recall.
 - 7. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
 - 8. Alarm, supervisory, trouble, fire pump running and maintenance alert outputs to the MOSCAD or MC-Edge RTU alarm transmitter.
 - 9. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
 - 10. System programming in accordance with the system's sequence of operation.
- E. Renovate the existing fire alarm system by providing the following as appropriate for the project's scope:
 - 1. A pre-renovation test of the existing system to document the condition of the system before it is changed.
 - 2. A main fire alarm control panel (FACP).

3. Node and notification appliance circuit (NAC) panels.
 4. Automatic and manual initiating devices.
 5. Audible and visual notification appliances.
 6. Control inputs and outputs to ventilation systems.
 7. Control outputs to each elevator controller to initiate elevator recall.
 8. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
 9. Alarm, supervisory, trouble, fire pump running and maintenance alert outputs to the MOSCAD or MC-Edge RTU alarm transmitter.
 10. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
 11. System programming as required to incorporate changes to the system's sequence of operation.
- F. Provide the following additional work where shown on the drawings:
1. Remote annunciators.
 2. A smoke control system control panel.
 3. Status monitoring of other building life safety systems.
 4. Control outputs to automatically control smoke control system equipment.
 5. Status lights indicating the current status of smoke control system equipment.
 6. Control switches to manually override the automatic control outputs to smoke control system equipment.
 7. Control outputs to interrupt power to electrically operated access control door hardware devices.
 8. Non-battery backed power to door hold-open devices.
 9. Emergency voice/alarm communications.
 10. Building-wide mass notification system.
 11. Remote microphone cabinets.
 12. Fire Department telephone communications.
- G. The following work is not included unless shown otherwise:
1. Smoke and heat detectors that actuate a fire suppression system.
 2. Electrically operated door hardware devices.
 3. Power to electrically operated door hardware devices.
 4. Door hold-open devices.

1.3 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the other Division 28 specification sections, including the following, apply to this section.
1. Section 260533, "Basic Electrical Materials and Methods".
 2. Section 260513, "Cables and Wires".
 3. Section 262000, "Service and Secondary Distribution".
 4. Section 260526, "Grounding".
 5. Section 260800, "Electrical Acceptance Tests".

1.4 REFERENCES

- A. Comply with the current versions of the following codes and standards as applicable:
1. ANSI/IEEE C2, "National Electrical Safety Code".
 2. MBC, "Michigan Building Code".
 3. MEC, "Michigan Electrical Code".
 4. "Michigan Elevator Code"
 5. MMC, "Michigan Mechanical Code".
 6. "Michigan Rehabilitation Code".
 7. "Michigan Residential Code".
 8. NFPA 13, "Standard for the Installation of Sprinkler Systems".
 9. NFPA 20, "Standard for the Installation of Centrifugal Fire Pumps".
 10. NFPA 72, "National Fire Alarm Code", clarified as follows:
 - a. Smoke and heat detectors shall not be required above suspended ceilings.
 - b. Horns or speakers shall not be installed in elevator machine rooms. Horns, speakers, or strobes shall not be installed in elevator cars.
 - c. Fire alarm system shall not shut down power to the elevators upon sprinkler water flow.
 - d. Optional smoke detectors in rooms with beam pockets shall be spaced as shown on the plan drawings.
 11. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems".
 12. UL 217, "Single and Multiple Station Smoke Detectors".
 13. UL 268, "Smoke Detectors for Fire Protective Signaling Systems".
 14. UL 268A, "Smoke Detectors for Duct Applications".
 15. UL 464, "Audible Signal Appliances".
 16. UL 521, "Heat Detectors for Fire Protective Signaling Systems".
 17. UL 864, "Control Units for Fire Protective Signaling Systems".
 18. UL 1480, "Speakers for Fire Protective Signaling Systems".
 19. UL 1971, "Signaling Devices for the Hearing Impaired".
- B. For classroom, in-patient medical, and Housing projects, comply with the applicable sections of NFPA 101, "Life Safety Code" as adopted and amended by the Michigan Bureau of Fire Services.
- C. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, comply with the NFPA 72 requirements related to survivability from attack by fire.
1. Designate each notification appliance circuit to serve no more than one notification zone.
 2. Protect power supply and notification appliance circuits from fire until they enter the notification zone they serve.
 3. Monitor the integrity of audible and visual notification appliance power supplies, audio generators, amplifiers and circuits.
 4. Monitor the integrity of Fire Department telephone communications circuits.

1.5 SYSTEM DESIGN REQUIREMENTS

- A. The system shall be device addressable and power limited.

- B. Provide a fire alarm control panel with the following:
 - 1. Digital display.
 - 2. Multiple pushbutton keypad.
 - 3. LED status indicating lights.
 - 4. Audible status signals.
 - 5. Output relays.
 - 6. Battery charger and batteries.
 - 7. RS-232 communications card.
- C. Evaluate and document the appropriate signaling line circuit class designation.
 - 1. In general, provide Class B signaling line circuits except where an applicable code requires a different circuit class.
 - 2. Provide sufficient spare capacity on each signaling line circuit for an additional 25 percent of initiating and control devices.
- D. Evaluate and document the appropriate notification appliance circuit class designation.
 - 1. In general, provide Class B notification appliance circuits except where an applicable code requires a different circuit class.
 - 2. Size the control panel power supplies, amplifiers, and batteries for 25 percent spare capacity calculated with 40 ma horn loads, 1 watt speaker loads, and 150 ma strobe light loads.
 - 3. Provide sufficient spare capacity on each notification appliance circuit for an additional 25 percent of notification appliances.
- E. The system shall supervise the following circuits and components:
 - 1. Initiating device circuits.
 - 2. Signaling line circuits.
 - 3. Notification appliance circuits.
 - 4. Addressable initiating and control devices.
 - 5. Control output wiring.
 - 6. Auxiliary control switches.
 - 7. System node panels, NAC panels, remote annunciators, and remote microphone panels.
 - 8. Primary power supply.
 - 9. Secondary power supply.
- F. The system shall be capable of being programmed by the Owner on site to accommodate expansion or sequence of operation changes.
- G. Provide 120 volts AC primary power to the system from a dedicated emergency power branch circuit.
- H. Provide a control panel battery charger capable of fully charging a 200 amp-hour battery within 24 hours.
- I. Provide sufficient secondary power battery capacity to operate the entire system (except the door hold-open devices) upon the loss of primary power for a period of 24 hours in a normal supervisory mode followed by 5 minutes of evacuation alarm operation.

1. When emergency voice/alarm communications is provided, provide sufficient battery capacity for 24 hours of operation in a normal supervisory mode followed by 15 minutes of voice/alarm operation.
 2. The system shall automatically transfer to and from the secondary power batteries upon an interruption of primary power without initiating a nuisance alarm.
 3. The system shall delay initiating a trouble condition for two seconds upon a transfer to or from primary power to avoid nuisance trouble conditions during emergency generator testing.
- J. Provide smoke and heat detectors as required by code and as shown, including the following.
1. Provide smoke detectors in each elevator lobby, in each elevator machine/control room, and at the top of each elevator shaft to initiate elevator recall.
 2. Provide two heat detectors, one in front and one behind, each unit substation transformer.
 3. Provide a smoke detector in each mechanical, electrical, telecommunications, trash collection, and recycling room.
 4. Provide smoke detectors in residence hall corridors, each sleeping room, and immediately outside each sleeping room that is located within a suite or apartment.
 5. Provide duct smoke detectors where required by code. When not in plain view or when more than 10 feet above the floor, provide duct detector remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.
- K. Provide sufficient audible notification appliances to achieve a sound level of 15 dBA above ambient sound level, but not less than 60 dBA nor more than 110 dBA in all occupiable spaces. The sound level in mechanical rooms shall be not less than 90 dBA, and in sleeping rooms shall be not less than 75 dBA measured at pillow level. The sound shall be a three-pulse temporal pattern evacuation tone.
1. In rodent rooms, the sound shall be a slow whoop or warble with a peak frequency below 500 Hz.
 2. Do not provide horns or speakers in exit stair enclosures.
 3. Do not provide horns or speakers in elevator machine rooms or in elevator cars.
 4. Provide a speaker in each sleeping room and a sounder base in each sleeping room smoke detector. The speaker shall provide the general alarm and the sounder base shall alarm upon smoke within the room.
- L. Provide visual notification appliances in accordance with the intensity and spacing requirements of NFPA 72.
1. Provide strobes in all public areas including multi-person offices.
 2. Do not provide strobes in exit stair enclosures or in animal rooms.
 3. Combine horns or speakers with strobes when both are required at the same location.
 4. Synchronize strobes when more than two appliances are in any point of view and are less than 55 feet apart.

5. Provide strobes in elevator machine rooms. Do not provide strobes in elevator cars.
 6. Provide strobes in accessible sleeping rooms and in living spaces of accessible suites or apartments.
 7. Provide strobes in mechanical rooms and other areas that have an average ambient noise level exceeding 95 dBA.
- M. Provide a waterproof horn/strobe or speaker/strobe with waterproof back box on the exterior of the building between 8 and 12 feet above each fire department connection. Audible sound shall be 90 dBA minimum at 10' and visual intensity shall be 110 candelas. Program this device to alarm upon sprinkler system water flow only, and to cease operation upon termination of water flow.
- N. Provide individually addressable monitor modules to monitor non-addressable initiating devices and status contacts of other systems.
1. Monitor modules shall use Class B initiating device circuits to monitor the initiating devices and status contacts.
 2. When interconnecting with an existing fire alarm system control panel, provide monitor modules as required.
 - a. New and existing control panels shall function as a single system.
 - b. All control panels shall be capable of being reset simultaneously from a single location.
- O. Provide panel auxiliary relay contacts and individually addressable control module contacts, including the required panel control logic programming, to interface with control circuits of other systems and equipment.
1. Provide normally closed duct smoke detector contacts to shut down ventilation systems.
 2. Provide three control module output contacts for each elevator to control elevator recall.
 3. Provide normally closed auxiliary relay or control module contacts to release electrically held door locks and door hold-opens, and to disable electrically operated door proximity sensors.
 4. When interconnecting with an existing fire alarm system control panel, provide control modules as required.
 - a. New and existing control panels shall function as a single system.
 - b. All control panels shall be capable of being reset simultaneously from a single location.
- P. Provide a smoke control system panel.
1. Provide normally open auxiliary relay or control module contacts to automatically control smoke control system equipment.
 2. Provide smoke control panel On/Off/Auto switches with "On" and "Off" or "Open" and "Closed" LED indicators for overriding the normally open contacts that control smoke control system equipment.
 - a. In the Auto position, the contacts shall operate in accordance with the fire alarm system program. In the Off position, the contacts shall remain open. In the On position, the contacts shall close to test the controlled equipment.

- b. The LED indicators shall indicate the status of the controlled equipment in accordance with the MMC.
 - c. Turning any switch out of the Auto position shall initiate a system trouble condition.
- Q. Assign each initiating device and control module a unique device address. Label each device with its unique address using a clear adhesive backed nylon or Mylar tape with black text. Install the label on the base of any device with a removable or replaceable head.
- R. Develop a custom location label for each initiating device and control module that describes the type, floor, room number and exact location of the device.
 - 1. If the device is in a corridor or similar large space, state device is by Room XXX.
 - 2. If room numbers are not available, provide compass directions and references to unique building features.
- S. Provide transient voltage surge suppression for the system.

1.6 SYSTEM PERFORMANCE REQUIREMENTS

- A. Under normal conditions, the control panel digital display shall display a "SYSTEM NORMAL" message and the current time and date.
- B. Should an abnormal condition be detected, the appropriate alarm, supervisory, or trouble panel LED shall flash and the appropriate panel audible signal shall sound.
- C. The appropriate panel alarm, supervisory, trouble, or supervisory maintenance alert output relay contact shall close and send a signal through the MOSCAD or MC-Edge RTU alarm transmitter to the Division of Public Safety and Security (DPSS).
- D. The fire alarm control panel shall manage all input and output signals through software programming and hardware configuration. In addition to managing and supervising the fire alarm devices, the control panel shall be configured to trigger a supervisory condition when the fire pump runs.
- E. The panel shall display the following information relative to the abnormal condition:
 - 1. Custom location label (40 characters minimum).
 - 2. Type of initiating device.
 - 3. Type of abnormal condition (alarm, supervisory or trouble).
- F. If the abnormal condition is an alarm, the following actions shall occur:
 - 1. Audible notification appliances shall sound throughout the building.
 - 2. Visible notification appliances shall flash throughout the building.
 - 3. Control outputs to mechanical systems and elevator controllers shall perform their programmed functions.
 - 4. Control outputs shall interrupt power to electrically operated door hardware devices.
 - 5. Power to door hold-open devices shall de-energize.

- G. Pressing the appropriate Acknowledge pushbutton shall acknowledge the alarm, supervisory or trouble condition unless the system is in the silence inhibit mode. Once acknowledged, the appropriate LED shall latch on and the panel audible signal shall be silenced.
- H. If the abnormal condition is an alarm, pressing the Silence pushbutton shall silence the audible notification appliances and stop the visual notification appliances from flashing.
- I. Upon a subsequent abnormal condition from another device, the appropriate panel LED shall flash, the panel audible signal shall again pulse and the panel display shall show the new abnormal condition.
- J. After all of the points have been acknowledged and silenced, the LED's shall glow steady and the panel audible signals shall be silenced. The total number of alarms, supervisory, and trouble conditions shall be displayed along with a prompt to review each list chronologically. The end of the list shall be indicated.
- K. Pressing the System Reset pushbutton shall return the system to its normal state if the abnormal conditions have been remedied.
 - 1. The display shall step the user through the reset process with simple English language messages. Messages including "IN PROCESS", "RESET COMPLETED", and "SYSTEM NORMAL" shall provide operator assurance of the sequential steps as they occur.
 - 2. The ventilation system motors shall restart sequentially.
 - 3. The outputs to control circuits of other systems and equipment shall return to normal.
 - 4. When interconnecting with an existing fire alarm system control panel, resetting shall not require the simultaneous operation of reset pushbuttons or switches on multiple control panels, or the disconnection of wiring.
- L. Should an abnormal condition continue to exist, the system shall remain in an abnormal state. The system control relays shall not reset. The panel LED's shall remain on. The display shall indicate the total number of alarm, supervisory and trouble conditions present in the system along with a prompting to review the points. These points shall not require acknowledgment if they were previously acknowledged.
- M. Should a trouble condition continue to exist, the trouble audible signal shall resound at preprogrammed time intervals to act as a reminder that the fire alarm system is not 100 percent operational. Both the time interval and the trouble audible signal shall be programmable to suit the Owner's application.
- N. Should the Alarm Silence Inhibit function be active, the System Reset pushbutton shall be ignored and a "RESET INHIBITED" message shall be displayed for a short time to indicate that action was not taken. For operator assurance, a "RESET NO LONGER INHIBITED" message shall be displayed when the inhibit function times out.

1.7 ITEMIZED QUOTATION

- A. Submit with your bid an itemized cost breakdown listing all major component costs, labor costs (including subcontractor labor and material costs), and engineering costs, for base bid and for each alternate, for the entire fire alarm system scope of work. When requested, provide an itemized breakdown to the Owner post-bid for review and approval.

1.8 SUBMITTALS

- A. Submit for approval copies of the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the project name and number. Submittals shall be marked to indicate the specific models, sizes, types, and options being provided. Submittals not so marked and incomplete submittals will be rejected.
 - 1. Plan drawings showing the locations (with room names and numbers) of the system components, including any adjustments in the quantities and locations of initiating devices and notification appliances to meet code requirements.
 - 2. Riser diagram showing system components, interconnecting wiring and connections to other building systems and equipment.
 - 3. Wiring diagrams showing manufacturer and field connections at component terminals, complete with conductor color codes and wire numbers.
 - 4. System configuration list showing inputs, outputs, device addresses and custom location labels, device configurations and program logic.
 - 5. Bill of materials.
 - 6. Catalog pages showing system components.
 - 7. System battery sizing calculations.
 - 8. Power supply, amplifier and circuit sizing calculations.
 - 9. Door hold-open power supply sizing calculations.

1.9 EXTRA MATERIALS

- A. Provide to the Owner the following extra materials matching the products installed, packaged in protective coverings for storage, and identified with labels clearly describing the contents. Provide 1 percent of the installed amount of each with a minimum of one of each.
 - 1. Fuses: Each size and type used in the system.
 - 2. Manual Pull Stations.
 - 3. Detector Bases.
 - 4. Detector Heads: Each type used in the system.
 - 5. Addressable Monitor and Control Modules: Each type used in the system.
 - 6. Notification Appliances: Each size and type used in the system.
 - 7. Output Relays.
- B. Provide one data cable for connecting a lap top computer to the fire alarm control panel's RS-232 communications card so that the Owner can perform panel programming.

1.10 RECORD DOCUMENTS

- A. Submit four copies of record drawings showing the locations of fire alarm panels, devices and appliances, the locations of end-of-line resistors and junction boxes, the addresses of addressable devices, the tap settings of audible notification appliances, the intensity ratings of visual notification appliances, the sizes of conduits and conductors, circuit numbers, and deviations from the design.
- B. Submit four printed copies of the final system configuration list showing inputs, outputs, addresses, custom location labels, device configurations, and program logic.
- C. Provide an electronic file storage device (USB drive, SD card, etc.) containing the following final system software:
 - 1. The master program generic to the model of system being provided.
 - 2. The building specific program containing the unique information for the system being provided.
 - 3. A software license and the system passwords required by the Owner to perform programming changes.

1.11 OPERATIONS AND MAINTENANCE MANUALS

- A. Submit for approval four copies of operations and maintenance manuals for the specified system and equipment prior to startup. The manuals shall be the same manuals used by the Manufacturer's field service technicians. The manuals shall be marked to indicate the specific models, sizes, types and options that were provided. Manuals not so marked will be rejected.

1.12 QUALITY ASSURANCE

- A. The fire alarm system shall be the standard product of a single fire alarm system manufacturer who has been producing this type of equipment for at least 10 years, and has a fully equipped service organization within 150 miles of the Owner. Each component shall display the manufacturer's name.
- B. Each fire alarm system component shall be listed under the appropriate standard of Underwriters Laboratories and shall bear a UL label.
- C. The fire alarm system shall be UL labeled as a system and approved by FM Global.
- D. For classroom, in-patient medical, and Housing projects, the fire alarm system shall also be approved by the State of Michigan Bureau of Fire Services.
 - 1. Submit shop drawings to the Michigan Bureau of Fire Services for approval.
 - 2. Arrange for a Michigan Bureau of Fire Services Inspector to inspect the system installation and testing.
 - 3. Submit to the Owner a copy of the FS-12A Form submitted to the Michigan Bureau of Fire Services.
- E. The fire alarm system shall comply with the requirements of the National Fire Alarm Code, the Owner's Inspection Authorities and with the Manufacturer's instructions.

1.13 WARRANTY

- A. Provide a complete parts and labor warranty for twelve months from the date of final acceptance of the system by the Owner.
- B. Provide a telephone response to Owner's questions within 4 hours and on-site assistance within 24 hours.
- C. Permit Owner's Fire Alarm Technicians to perform temporary bypasses and emergency repairs on the system without voiding the warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers and Models:
 - 1. EST Model EST-3.
 - 2. Honeywell Model XLS3000.
 - 3. SimplexGrinnell Model 4100 Series.
 - 4. National Time & Signal Model On-Point.
 - 5. Notifier ONYX 3030 Series.
 - 6. Siemens Model XLS.

2.2 SYSTEM COMMUNICATIONS

- A. The fire alarm control panel shall communicate with each addressable initiating and control device individually via shielded twisted pair signaling line circuits. EST SIGA-Loop or SimplexGrinnell MAPNET II or IDNET.
- B. Each signaling line circuit shall be capable of accessing up to 127/250 addressable devices.
- C. Each signaling line circuit shall allow up to 10,000 feet of wire length to the furthest addressable device.
- D. Communications shall use a broadcast polling protocol to allow t-tapping of the circuit except where Class A wiring is required. T-taps shall be limited to 64 per loop.
- E. Communications shall be completely digital and shall include parity data bit error checking routines for address codes and check sum routines for the data transmission protocol.
- F. Each device shall be uniquely identified by a device address.
- G. There shall be no limit to the number of initiating devices which may be activated simultaneously.
- H. Each device shall be individually annunciated at the panel. Annunciation shall include the following conditions for each device.
 - 1. Alarm, supervisory or trouble condition.
 - 2. Open, short or ground.
 - 3. Device failure or incorrect device installed.

2.3 FIRE ALARM CONTROL PANEL

- A. The fire alarm control panel shall be modular with solid state, microprocessor based electronics.

- B. The panel shall display only those primary controls and displays essential to operation during a fire alarm condition.
- C. The panel shall include a LCD digital display, with a minimum of 80 characters.
 - 1. The display shall be backlit for enhanced readability. It shall not be lit during an AC power failure unless an alarm condition occurs or there is keypad activity.
 - 2. The display shall support both upper and lower case letters. Lower case letters shall be used for soft key titles and for prompting the user. Uppercase letters shall be used for system status information. A cursor shall be visible when entering information.
- D. A panel audible signal shall sound during alarm, supervisory, or trouble conditions. This audible signal shall sound differently during each condition to distinguish one condition from another. The audible signal shall also sound differently during each key press to provide audible feedback (chirp) indicating that the key has been pressed properly.
- E. The system program shall be stored in a non-volatile flash EPROM memory within the panel. Loss of primary and secondary power shall not erase the program stored in memory.
 - 1. The program shall be capable of selective input/output control functions.
 - 2. The program shall enable initiating devices to be individually configured on site to provide either alarm and trouble, supervisory and trouble, alarm only, supervisory only, trouble only, current limited alarm, no alarm, normally closed device monitoring, a non-latching circuit or an alarm verification circuit.
 - 3. The program shall enable initiating devices to be disabled or enabled individually.
- F. The panel or the field devices shall determine the alarm decision for each detector by comparing the detector value to stored values.
 - 1. The panel shall automatically maintain a constant smoke obscuration sensitivity in percent of smoke obscuration format for each detector.
 - 2. The panel shall maintain a moving average of each smoke detector's smoke chamber value to automatically compensate for dust and dirty conditions that could affect detection operation.
 - 3. The smoke obscuration sensitivity shall be adjustable to within 0.3 percent of either limit of the UL window (0.5 percent to 4.0 percent) to compensate for any environment.
 - 4. When a detector's average value reaches a predetermined value, a "MAINTENANCE ALERT" condition shall be audibly and visually indicated at the panel. The LED on the detector base shall glow steady giving a visible indication at the detector location. If a dirty detector is left unattended and its average value increases to a second predetermined value, a "TROUBLE" condition shall be indicated at the panel. To prevent nuisance alarms, these dirty conditions shall in no way decrease the amount of smoke obscuration necessary for system activation.

5. The panel shall continuously perform an automatic self-test routine on each detector which shall functionally check detector electronics and ensure the accuracy of the obscuration values being transmitted to the panel. Any detector that fails this test shall indicate a "SELF TEST ABNORMAL" or "TROUBLE" condition at the panel.
6. Each detector shall be scanned by the panel for its type identification to prevent inadvertent substitution of another detector type. The panel shall operate with the installed device but shall initiate a "WRONG DEVICE" or "TROUBLE" condition until the proper type is installed or the programmed detector type is changed.
7. An operator at the panel, having a proper access level, shall have the ability to manually access the following information for each detector.
 - a. Device type.
 - b. Device status.
 - c. Present average value.
 - d. Peak detection values.
 - e. Present sensitivity selected.
 - f. Detector range (normal, dirty, etc.).
8. An operator at the panel, having a proper access level, shall have the ability to perform the following for each detector:
 - a. Enable or disable the point.
 - b. Clear peak detection values.
 - c. Clear verification tally.
 - d. Control a detector's relay driver output.
9. The panel shall be programmable to automatically change the sensitivity settings of each detector based on time-of-day and day-of-week (for example, to be more sensitive during unoccupied periods and less sensitive during occupied periods). There shall be seven sensitivity settings available for each detector.
10. The panel shall be programmable for a pre-alarm or two-stage function. This function allows an indication to occur when, for example, a detector with a 3 percent set point reaches a threshold of 1.5 percent smoke obscuration.
11. Smoke detectors shall be provided with the ability for alarm verification. When in alarm verification mode, only a verified alarm shall initiate the alarm sequence operation.
 - a. The activation of a smoke detector shall initiate an alarm verification operation whereby the panel resets the activated detector and waits for a second alarm activation. If, within an adjustable time delay, a second alarm is reported from the same or any other smoke detector, the system shall process the alarm. If no second alarm occurs within the time delay, the system shall resume normal operation.
 - b. The alarm verification shall operate only on smoke detector alarms. Other activated initiating devices shall be processed immediately. The alarm verification operation shall be selectable by device.
 - c. The panel shall have the capability to display the number of times a device has gone into a verification mode.

BuildingName

The Description of the Project

P0000000 0000 Issued for: BID 283100 - - 13

- d. Detectors in alarm verification mode shall have the ability of being divided into different groups whereby any two activations from a group shall cause the panel to follow its programmed alarm sequence.
- G. The panel shall have four pass code controlled access levels. Pass codes shall be entered using the panel key pad.
- 1. To maintain security when entering a pass code, the digits entered shall not be displayed.
 - 2. When a correct pass code is entered, an "ACCESS GRANTED" message shall be displayed. The access level shall be in effect until the keypad is inactive for 10 minutes or the operator logs out.
 - 3. Should an invalid code be entered, the operator shall be notified with a message and shall be allowed up to two more chances to enter a valid code. After three unsuccessful tries, an "ACCESS DENIED" message shall be displayed.
 - 4. Access to a level shall only allow the operator to perform actions within that level and actions of lower levels, not actions of higher levels.
 - 5. Access levels shall be associated with the following functions:
 - a. Alarm silence.
 - b. System reset.
 - c. Set time and date.
 - d. On/Off/Auto control selection.
 - e. Manual control.
 - f. Disable and enable circuits and devices.
 - g. Clear historical logs.
 - h. Walk test.
 - i. Change alarm verification.
 - j. Change detector sensitivity.
 - k. Function keys.
 - 6. An access level shall also be associated with acknowledge keys. If the operator presses an Acknowledge key with insufficient access, an error message shall be displayed. The points on the log shall scroll with each key press, but the points shall not be acknowledged.
- H. The panel shall have the ability to store a minimum of 300 events in an alarm log plus a minimum of 300 events in a separate trouble log. These events shall be stored in a battery protected random access memory. Real time and date shall accompany history event recordings.
- I. The panel shall supervise subordinate module LED's for burnout or disarrangement. Should a problem occur, the panel shall display the module and LED location numbers to facilitate location of that LED.
- J. The panel shall have function keys programmed as follows for disabling and enabling circuits or groups of devices for maintenance or testing purposes. While circuits or devices are disabled, the panel shall indicate "TROUBLE".
- 1. F1: Disable smoke detectors by floor.
 - 2. F2: Disable duct smoke detectors.
 - 3. F3: Disable sprinkler system flow switches.
 - 4. F4: Disable horns/strobes or speakers/strobes by floor.
 - 5. F5: Disable beam detectors.
 - 6. F6: Disable smoke detector sounder bases.
 - 7. F7: Disable hood suppression systems.

- 8. F8: Disable elevator recall.
- K. The system shall be capable of being walk tested by one person.
 - 1. The activation of an initiating device under test shall be silently logged as an alarm or supervisory condition in the historical log. The panel shall automatically reset itself after logging the abnormal condition.
 - 2. The momentary disconnection of an initiating device or notification appliance shall be silently logged as a trouble condition in the historical log. The panel shall automatically reset itself after logging the trouble condition.
 - 3. The walk test sequence shall have the ability to activate the notification appliances for a maximum of 2 seconds upon the activation of an initiating device under test. If this option is selected, any momentary opening of the initiating device circuit or a notification appliance circuit shall cause the notification appliances to sound for 4 seconds to indicate the trouble condition.
 - 4. Should the walk test mode be on for an inappropriate amount of time, the panel shall automatically revert to normal mode.
 - 5. Should an abnormal condition occur from an active point not in walk test mode, the system shall perform its standard programmed alarm, supervisory or trouble sequences.
- L. The panel enclosure shall be equipped with opaque door panels and locks providing security from tampering.

2.4 NODE AND NAC PANELS

- A. Node and NAC panels shall be modular with solid state, microprocessor based electronics, operator interfaces, power supplies, audio generators, amplifiers, battery chargers and batteries as required. All components shall be supervised.

2.5 BATTERIES

- A. Batteries shall be lead calcium and supervised so that a failure produces a "TROUBLE" signal.

2.6 REMOTE ANNUNCIATOR

- A. The remote annunciator shall duplicate the backlit LCD display; the alarm acknowledge, supervisory acknowledge, trouble acknowledge, alarm silence, and system reset pushbuttons; the alarm, supervisory, and trouble audible signals; the alarm, supervisory, trouble, and power "on" LED's; and the programmable function keys of the fire alarm control panel. A key "enable" switch or door lock, keyed to match the fire alarm control panel door lock, shall permit activating or deactivating the controls.
- B. A remote microphone shall be included when the fire alarm system includes emergency voice/alarm communications, along with the same pushbuttons as the fire alarm control panel for selecting pre-recorded voice messages, and the same controls to choose total building or selected areas communications.

2.7 ADDRESSABLE SPOT DETECTOR BASES

- A. Spot detector mounting bases shall be individually addressable, suitable for two wire operation, with a twist-lock head locking feature a DIP switch or electronic addressing means, and an LED that provides power "on", alarm and trouble indications. The bases shall be listed for ceiling and wall mounting. Removal of the detector head shall cause a trouble condition at the panel.
- B. Where shown, the bases shall include an auxiliary relay that is controlled from the panel.
- C. In sleeping rooms, the base shall include a piezoelectric sounder that is controlled from the panel.
- D. In corridors outside of sleeping rooms, the base with its head shall be protected by a vandal-resistant cage.
- E. In corridors, locker rooms, and meeting rooms of athletic facilities, the base with its head shall be protected by a vandal-resistant cage.
- F. When bases are not in plain view, bases shall be connected to remote alarm indicators mounted in plain view at 48 inches above the floor.

2.8 MULTISENSOR SMOKE DETECTOR HEADS

- A. Multi-sensor type smoke detector heads shall include sampling and reference ionization chambers with a single radioactive source, a photoelectric sensor and a programmable heat detector. The detectors shall support at least four levels of sensitivity selectable at the panel and 360 degree smoke entry.

2.9 PHOTOELECTRIC SMOKE DETECTOR HEADS

- A. Photoelectric type smoke detector heads shall include a pulsed LED light source and a silicon photodiode receiver, at least seven levels of sensitivity selectable at the panel, an integral insect screen and 360 degree smoke entry. This type of detector shall be installed in all duct detectors.

2.10 HEAT DETECTOR HEADS

- A. Heat detector heads shall include combination rate-of-rise and rate compensated fixed temperature sensing, two levels of rate-of-rise sensitivity selectable at the panel, and an independent 135 degrees F fixed temperature set point. Heat detector heads shall be self-restoring.
- B. Heat detector heads for steam tunnels, cage wash areas and dish machine areas shall have a 135 degrees F fixed temperature set point and shall be self-restoring.

2.11 DUCT DETECTORS

- A. Duct detectors shall be individually addressable and consist of a housing, sampling tubes, a baffle and a detachable detector head. Duct detectors shall include an alarm LED, a local test switch, and an auxiliary SPDT relay for ventilation system control. Duct detectors shall be resettable by actuating the panel reset pushbutton. The sampling tubes shall be capable of being cleaned through the housing cover.
- B. The detector heads shall be photoelectric as specified above, but shall be capable of accepting ionization detector heads.
- C. When not in plain view, duct detectors shall include remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.

2.12 BEAM DETECTORS

- A. Photoelectric projected beam detectors shall be individually addressable and consist of separate transmitter and receiver units capable of long range coverage of up to 350 feet. Beam detectors shall include alarm and trouble dry auxiliary contacts, and normal, alarm and trouble LED status indicators. Beam detectors shall include internal bore sights, automatic calibration, six sensitivity settings, automatic compensation for temperature and lens contamination, and a trouble indication upon either a total obscuration or an obscuration of 50 percent of the alarm set point. Beam detectors shall be suitable for four wire operation utilizing 24 volt DC power from the panel, and resettable by actuating the panel reset pushbutton.

2.13 MANUAL PULL STATIONS

- A. Manual pull stations shall be individually addressable, suitable for two wire operation, with a high impact red Lexan body and raised white lettering. Stations shall include an ADA compliant single action operating mechanism with a mechanical latch to hold an operated station open until reset.
- B. Reset shall be accomplished through use of a key common to the panel or a small flat-blade screwdriver. Stations which use allen wrenches or special tools to reset are not acceptable. The point of reset shall be front accessible so stations with tamper-resistant covers can be reset easily.

2.14 MONITOR MODULES

- A. Monitor modules for individual two wire contact monitoring shall be individually addressable, suitable for two wire operation, with a DIP switch or electronic addressing means, and a programmable latch feature for monitoring momentary contacts. Monitor modules shall monitor a single normally open dry contact using a Class B, Style B, initiating device circuit.

- B. Monitor modules for zone or four wire device monitoring shall be individually addressable, suitable for four wire operation utilizing 24 volt DC power from the panel, and with a DIP switch or electronic addressing means. Zone monitor modules shall monitor multiple normally open dry contacts using a Class B, Style B, two wire initiating device circuit, or monitor a four wire device using a Class B, Style D, four wire initiating device circuit.

2.15 CONTROL MODULES

- A. Control modules shall be individually addressable with DIP switches or electronic addressing means. Control modules shall provide either one normally open and one normally closed contact or a Form C contact per digital output. Control modules may have more than one digital output per module if each output has a unique address. Contacts shall be rated 0.5 amps at 120 volts AC or 2 amps at 28 volts DC resistive and shall be controlled by the panel.

2.16 HORNS

- A. Horns shall be electronic, rated 24 volts DC, with a piezoelectric driver set to produce a three-pulse temporal pattern evacuation tone with a sound level of 101 dBA at 10 feet, a red, semi-flush body capable of wall or ceiling mounting.
- B. Horns in rodent rooms shall be set to generate a slow whoop or warble sound with a peak frequency below 500 Hz. Horns shall be of heavy-duty industrial construction and shall be UL listed for indoor and outdoor applications. EST Model 5530MD-24AW only.

2.17 SPEAKERS

- A. Speakers shall be rated 125 to 12,000 Hertz, include four taps rated at from 1/4 to 2 watts, produce a sound level of 82 dBA at 10 feet when set at the 1/2 watt tap, and with a semi-flush body capable of wall or ceiling mounting..
- B. Speakers for locations with high ambient noise may be high efficiency horns rated 500 to 6,000 Hertz minimum, 10 watts minimum, include four or more taps, produce a sound level of 106 dBA minimum at 1 meter when set at the 1 watt tap, and be capable of wall or ceiling mounting.

2.18 STROBES

- A. Strobes shall be rated 15, 30, 60, 75, 110, or 177 candela as shown for proper illuminance, with a 1 Hertz flash rate, Xenon flash tube, white body, clear Lexan lens with red "FIRE" or international fire symbol lettering, capable of being synchronized, and capable of wall or ceiling mounting.

2.19 COMBINATION HORN/STROBES AND SPEAKER/STROBES

- A. Combination horn/strobes and speaker/strobes shall consist of the horns, speakers and strobes specified above, but combined on a single mounting plate. Combination units used outdoors and in wet areas shall be waterproof and mounted to waterproof back boxes.

2.20 DOOR HOLD-OPEN POWER SUPPLY

- A. The door hold-open power supply shall produce 24 volts DC of sufficient amperage to provide 0.4 amps of current to every door hold-open device being controlled. The power supply shall be supervised and capable of withstanding the inrush current that will occur when the door hold-open devices are energized.
- B. The output of the power supply shall be distributed by individually fused circuits. Fuse each circuit at 5 amps.
- C. The power supply shall release the held open doors upon a fire alarm or an AC power failure.

2.21 EMERGENCY VOICE/ALARM COMMUNICATIONS

- A. Emergency voice/alarm communications shall include audio control modules for evacuation tone and voice message generation, controls to choose total building or selected areas communications, audio amplifiers, a local microphone, and a remote microphone at each remote annunciator. All of the components except for the remote microphones shall be located in or adjacent to the fire alarm control panel.
- B. The audio control module default mode shall provide for automatic total building fire alarm evacuation. The evacuation tone shall consist of a three-pulse temporal pattern followed by a pre-recorded fire alarm voice message. At the end of each voice message, the evacuation tone shall resume. The evacuation tone and voice message shall sound alternately until the alarm silence pushbutton at the fire alarm control panel or remote annunciator has been pressed. Audio tones and voice messages shall be digitally transmitted between nodes.
- C. The audio control modules shall provide for manual total building or selected area live voice communications. Upon keying of the local or a remote microphone, a three second continuous alert tone shall sound over the speakers indicating a live voice message will occur.
- D. The evacuation and alert tones shall be digitally generated by programmable software so that changes can be made without component rewiring. The pre-recorded voice messages shall be stored digitally in non-volatile EPROM memory.
- E. The evacuation tone for rodent rooms only shall be produced by a separate audio control module and amplifier that generate a slow whoop or warble sound with a peak frequency below the hearing range of rodents (i.e. 500 Hz).
- F. Audio amplifiers shall have a frequency response of 125 Hz to 12,000 Hz minimum.
- G. Microphones shall be of a hand-held, push-to-talk, noise-canceling type with a frequency range of 200 Hz to 4000 Hz and a self-winding five foot coiled cable. An LED shall indicate the microphone push-to-talk pushbutton has been pressed and the speaker circuits are ready for transmission.
- H. Remote microphones shall be enclosed in remote annunciator cabinets with lockable doors.

1. Remote microphones shall duplicate the manual voice transmission capability of the local microphone at the fire alarm control panel. The fire alarm control panel microphone shall have priority over any remote microphones.
 2. The remote microphone cabinets shall include controls for total building or selected areas communications.
- I. Should a Fire Department telephone communication system be provided, the telephones system shall be capable of being patched to the emergency voice/alarm communications system and controlled at the fire command center.

2.22 FIRE DEPARTMENT TELEPHONE COMMUNICATIONS

- A. Fire Department telephone communications shall consist of a minimum of eight dedicated communications circuits between a fire command center communications panel and remotely located emergency telephone jacks, a master telephone handset and five pluggable telephone handsets.
- B. The communications panel shall include a master telephone controller for processing of two-way communications. This module shall include a circuit selector switch and "Call" and "Trouble" LED indicators for each circuit, an audible device for call and trouble signaling, a trouble silence switch with ring-back, and an LED trouble indicator. Circuit supervision modules shall be included to electrically supervise for shorts, opens, and grounds of circuit wiring.
- C. The system shall be capable of handling single or simultaneous conversations with all telephones connected into the system. The circuits shall be so designed to prevent static, hum, or other interferences to clear, intelligible two-way conversations. The communications shall be transported digitally between devices.
- D. The act of plugging a handset into an emergency telephone jack shall cause the appropriate circuit indicator LED to flash and a distinctive audible device to sound at the communications panel. The subsequent picking up of the master telephone and selection of the proper circuit shall silence the pulsing sound, cause the circuit indicator LED to latch on, and couple the remote telephone to the master telephone. Two or more telephones shall be capable of being connected into an active conversation at the discretion of the operator.
- E. Attempting to use a subsequent telephone on the same circuit shall not cause the pulsing sound to activate if any two-way communications are already established. Any new circuits activated shall, however, cause their circuit indicator LED's to flash until acknowledged.
- F. Unplugging the handsets in use and returning the related circuit selector switches to the normal position shall cause the restoration of normal supervisory functions. If any remote telephone remains plugged in, the appropriate circuit indicator LED shall flash and the pulsing sound shall resume at the communications panel.
- G. The master telephone handset shall be recessed within a protective enclosure at the communications panel.

- H. A single line circuit shall be provided to a jack in each stairwell at each floor, in each elevator car, in each elevator lobby, at each area of refuge, at the emergency generator location and at the fire pump location. Emergency telephone jacks shall be mounted on a stainless steel single gang plate engraved with the words "Fire Emergency Telephone".
- I. Furnish an emergency telephone jack for installation in each elevator car. Wiring from the elevator controls to each elevator car and installation of the jacks will be provided by the elevator contractor.
- J. Provide five pluggable emergency telephone handsets with self-winding five foot cords within a storage cabinet mounted at the fire command center. Key the cabinet to match the fire alarm control panel.

2.23 ADD ALTERNATE FOR BUILDING-WIDE MASS NOTIFICATION

- A. If the Add Alternate is accepted, add any necessary equipment, initiating devices, notification appliances, conduit, wiring, programming, and appurtenances to the base fire alarm system scope of work to incorporate building-wide mass notification into the fire alarm system.
 - 1. Comply fully with National Fire Alarm Code NFPA 72 emergency communications systems requirements including Annex and Supplement requirements.
 - 2. The system and its components shall be UL listed.
 - 3. Provide speakers for audible notification appliances in lieu of horns if the base fire alarm system scope of work specifies horns. Provide sufficient speakers to meet NFPA 72 voice intelligibility requirements.
 - 4. Provide clear lens strobe lights with the lettering "ALERT" on the housing for visual notification appliances in lieu of providing the base bid clear lens strobe lights with the lettering "FIRE" on the housing.
 - 5. Provide the following additional features in the main fire alarm control panel and in each remote fire alarm annunciator panel.
 - a. Emergency voice/alarm communications and a microphone for DPSS and OSEH Fire Marshal use if not required by the base bid scope of work.
 - b. The ability to generate a building-wide three second continuous alert tone. This alert tone shall be significantly different from the fire alarm system's three-pulse temporal pattern evacuation tone.
 - c. A minimum of 8 pushbuttons to initiate the strobe lights and the building-wide evacuation or alert tone followed by a unique pre-recorded voice message.
 - 1) Actuation of any pushbutton shall override any fire alarm notification and instead initiate the strobe lights and the building-wide evacuation or alert tone over the fire alarm system speakers. The associated pre-recorded voice message shall alternate with the tone.
 - 2) Alarm and supervisory signals shall be sent through MOSCAD or MC-Edge RTU to DPSS.

- 3) At any time during the alert, actuation of any microphone shall permit building-wide live voice announcements to be made. If at any time a remote annunciator panel microphone is keyed simultaneously with the main fire alarm control panel microphone, the main fire alarm control panel microphone shall have priority.
 - 4) The strobe lights shall continue to flash and the tone and pre-recorded voice message shall continue to sound until the fire alarm system is reset.
- d. The tone and pre-recorded voice message shall be as follows for each pushbutton:
- 1) Alert tone alternating with "Your attention please - A tornado warning has been issued. Take shelter in this building now. Remain calm and do not run. Take shelter now."
 - 2) Alert tone alternating with "Your attention please - An armed intruder has been reported in this area. Lockdown now."
 - 3) Alert tone alternating with "Your attention please - An active shooter has been reported in this area. Lockdown now."
 - 4) Evacuation tone alternating with "Your attention please - An emergency has occurred. Evacuate the building now. Remain calm and do not run. Evacuate now."
 - 5) Alert tone alternating with "Your attention please - An emergency has occurred. Please remain in place until further notice. Please remain where you are."
 - 6) Alert tone alternating with "Your attention please - This is an all clear. The emergency has been resolved. Resume normal operations."
 - 7) Alert tone alternating with "Your attention please - This is a test of the building mass notification system. This is only a test."
 - 8) (Spare for project-specific use.)
6. Provide a remote microphone cabinet with microphone for Facility Manager use at the location shown on the drawings. The cabinet shall include the following features:
- a. Provide a minimum of 8 pushbuttons. These pushbuttons shall be identical to those in the main fire alarm panel and in each remote fire alarm annunciator panel. Each pushbutton shall be capable of initiating the building-wide evacuation or alert tone followed by the same unique pre-recorded voice message.
 - 1) Actuation of any pushbutton shall override any fire alarm notification and instead initiate the strobe lights and the building-wide tone over the fire alarm system speakers. The associated pre-recorded voice message shall alternate with the tone.
 - 2) Alarm and supervisory signals shall be sent through MOSCAD or MC-Edge RTU to DPSS.

- 3) At any time during the alert, actuation of the facility manager's microphone shall permit building-wide live voice announcements to be made. If at any time the facility manager's microphone is keyed simultaneously with the main fire alarm control panel or any remote fire alarm annunciator panel microphone, the fire alarm panel microphone(s) shall have priority.
 - 4) The strobe lights shall continue to flash and the tone and pre-recorded voice message shall continue to sound until the fire alarm system is reset.
- b. Provide a uniquely keyed cabinet door lock and special facility manager keys so a fire alarm panel key or a special facility manager key can access this cabinet, but a facility manager's key cannot access the other fire alarm panels.
7. Provide the capability inside the main fire alarm control panel to add a future interface module or circuit card. This interface shall permit DPSS to actuate the strobe lights, actuate the building-wide evacuation or alert tone, actuate any of the pre-recorded voice messages, and make live voice announcements from a head end device located at one or more DPSS remote locations. This capability shall include:
 - a. Physical space inside the fire alarm control panel.
 - b. Power supply capacity.
 - c. Battery capacity.
 - d. Means to plug the interface into the fire alarm control panel circuitry.
 8. Provide system interconnecting raceways, wiring and routing in compliance with the system "survivability" requirements contained in NFPA 72.

PART 3 - EXECUTION

3.1 SYSTEM INTERRUPTIONS

- A. Coordinate with the U-M Fire Protection Shop (734-647-2046) before performing any work affecting an existing fire alarm system. Operating, programming, modifying, or impairing an existing system without approval of the U-M Fire Protection Shop is strictly prohibited.
- B. When renovating a fire alarm system, test the system to document its condition before changes are made. Maintain operation of fire alarm system devices outside of the work area.
- C. When replacing a fire alarm system, maintain operation of the existing system until acceptance of the new system. If operation of the existing system cannot be maintained and the building is occupied, provide a 24 hour/day fire watch until the new system is accepted.
 1. Notify the U-M Fire Protection Shop (734-647-2046), the U-M DPSS (734-763-1131), the U-M Fire Marshal (734-647-1143), and the Michigan Bureau of Fire Services (if applicable) when a fire watch is being performed.

2. Perform the fire watch in accordance with U-M Fire Marshal and Michigan Bureau of Fire Services requirements.
- D. Coordinate with the U-M Key Office (734-764-3481) before performing any work affecting existing electrically controlled doors.

3.2 INSTALLATION

- A. Provide wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- B. Provide wiring in conduit or provide fire alarm-rated MC cables in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Provide wiring and raceways as follows and in accordance with Sections 260533 and 260513 and Manufacturer's instructions.
 1. Concealed in walls, exposed on walls up to 8' AFF, and above non-accessible ceilings - provide wiring in conduit.
 2. Above accessible ceilings and above 8' AFF in unfinished spaces - provide open wiring in J-hooks. Provide conduit sleeves where open wiring penetrates walls and floors.
- D. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, protect power supply and notification appliance circuits from attack by fire until they enter the notification zone they serve. Provide 2-hour rated cable assemblies or protect circuits in 2-hour rated shafts, enclosures or sprinklered stairwells in accordance with Sections 260533 and 260513.
- E. Circuits may be T-tapped only where shown on the manufacturer's wiring diagrams.
- F. Provide waterproof back boxes with gaskets for devices and appliances installed outdoors or in wet or wash-down areas.
- G. Paint fire alarm junction boxes, covers and fittings red or provide red conduit throughout, except fire alarm raceways exposed in finished areas may be painted to match wall color.
- H. Modifications to fire alarm control panels, node panels, NAC panels and remote annunciator panels shall be made by a Manufacturer's Representative.
- I. Final connections to the fire alarm system components and system programming shall be performed by Fire Alarm Technicians with NICET Level II or higher certification.
- J. Label fire alarm panels with the room numbers, electrical panel numbers, and circuit breaker numbers feeding them.
- K. Paint the handles of circuit breakers feeding fire alarm panels red, and install handle locks.
- L. Smoke and heat detectors shall not be installed until after construction clean-up is completed.
 1. When renovating an existing system, remove and store existing detectors during construction activities.
 2. Detectors installed prior to construction clean-up shall be cleaned by the manufacturer or replaced.

3.3 TESTING

- A. Demonstrate complete operation of the fire alarm system in accordance with NFPA 72, NFPA 101 (classroom, in-patient medical, and Housing projects only), the Michigan Building Code, and Manufacturer's instructions. Notify the Owner's Representative 3 working days in advance of the test.
 - 1. The test shall be witnessed by a U-M Fire Marshal, a U-M Electrical Inspector, and the U-M Fire Protection Shop.
 - 2. Especially on fire alarm renovation projects, the U-M Fire Protection Shop may participate in or direct the testing activities.
 - 3. On classroom, in-patient medical, and Housing projects, also include an Inspector from the Michigan Bureau of Fire Services.
- B. Submit a signed and dated NFPA 72 test report to the Electrical Inspector prior to acceptance of the fire alarm system by the Owner.
- C. On classroom, in-patient medical, and Housing projects, also submit a signed and dated FS-12A Form to the Michigan Bureau of Fire Services.

3.4 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.5 TRAINING

- A. Provide the Owner's Fire Alarm Technicians with classroom training on the operation and maintenance of this model of system. This training shall be by the Manufacturer and shall be the same training as given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received operations and maintenance training from the manufacturer on this model of system, this training requirement will be waived.
- B. Provide the Owner's Fire Alarm Technicians with classroom training on the programming of this model of system. This training shall be by the Manufacturer and shall be the same training given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received programming training on this model of system, this training requirement will be waived.
- C. Train the Owner's Fire Alarm Technicians on unfamiliar components installed in this system.
- D. Walk the Owner's Fire Alarm Technicians through the building and identify the locations of fire alarm devices hidden from plain view.
- E. Train DPSS, Housing Security if applicable, and the U-M Fire Marshal on the basic operation of the system, including how to acknowledge audible notification appliances after an alarm.
- F. Train DPSS, Housing Security if applicable, and the U-M Fire Marshal on how to override the smoke control systems, on how to use the emergency voice/alarm communications, and on how to use the Fire Department telephone communications systems. Invite representatives from the Ann Arbor Fire Department to this training.

- G. Train the Facility Manager on how to use the emergency voice/alarm communications system, and how to use the mass notification system if provided.

DIVISION 28 ELECTRONIC SAFETY AND SECURITY

SECTION 283102 - FIRE DETECTION AND ALARM SYSTEM (HOSPITAL PROJECTS)

END OF CONTENTS TABLE

DIVISION 28 ELECTRONIC SAFETY AND SECURITY
SECTION 283102 - FIRE DETECTION AND ALARM SYSTEM (HOSPITAL PROJECTS)

DELETE FROM AND ADD TO THIS SECTION TO MAKE IT PROJECT SPECIFIC. HIDDEN TEXT DIRECTIONS INDICATE SOME BUT NOT ALL OF THE REQUIRED EDITING. DELETE THE HIDDEN TEXT DIRECTIONS BEFORE PRINTING FOR PUBLICATION.

VERIFY THE TYPES, QUANTITIES AND LOCATIONS OF FIRE ALARM COMPONENTS SHOWN ON PLAN DRAWINGS COMPLY WITH THE SYSTEM DESIGN REQUIREMENTS BELOW. REFER TO THE UMHC DESIGN GUIDELINES FOR SPECIAL REQUIREMENTS THAT MAY NEED TO BE ADDED.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

IN 2 BELOW, SELECT PROPER COMMISSIONING SPEC SECTION NUMBER APPLICABLE TO THE PROJECT OR DELETE IF Cx IS NOT REQUIRED.

- B. Related Sections:

1. Section 017823 - Operation and Maintenance Manual
2. Section 019100/019110 - Commissioning
3. Section 260513 - Medium, Low & Control Voltage Cables
4. Section 260526 - Grounding and Bonding for Electrical
5. Section 260533 - Electrical Materials and Methods
6. Section 260800 - Electrical Acceptance Tests

1.2 SUMMARY

DUPLICATE PARAGRAPH 1.2.A IN THE GENERAL NOTES ON THE FIRST SHEET OF THE ELECTRICAL DRAWINGS.

- A. The project delivery method for fire detection and alarm systems shall be by design-build. This specification section and accompanying drawings establish the minimum requirements and boundary for the design-build scope of work. Provide all equipment, devices, appliances, wiring and materials necessary for a complete and expandable system which adheres to applicable codes, standards and University of Michigan requirements.
1. The quantities, locations, types, conditions and manufacture of existing fire alarm equipment, devices and appliances shown are for information only and shall be field verified.

2. The quantities, locations and types of new fire alarm equipment, devices and appliances shown are minimum requirements. Provide all additional equipment, devices, appliances, materials and labor required to meet applicable codes.
3. Coordinate with and provide submittals to the Michigan Bureau of Fire Services, Ann Arbor Fire Department, U-M Fire Marshal and FM Global as required. Coordinate room occupancy and space utilization with the building's Facility Manager.

IF THE BUILDING WILL REMAIN OCCUPIED DURING THIS WORK, INCLUDE THE FOLLOWING PARAGRAPH.

4. Maintain the existing fire alarm system in service while the new work is installed, tested and made operational.

ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.2.B AND THE NON-APPLICABLE PARAGRAPHS OF 1.2.C.

B. Provide a new fire alarm system with the following features:

1. A main fire alarm control panel (FACP).
2. Node and notification appliance circuit (NAC) panels.
3. Automatic and manual initiating devices.
4. Audible and visual notification appliances.
5. Control inputs and outputs to ventilation systems.
6. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.
7. Alarm, supervisory, trouble, fire pump running and maintenance alerts outputs including addresses and locations of initiating devices to the University of Michigan Hospitals and Health Centers (UMHHC) Facility Command Center (UHFCC) located in University Hospital Building Room 1A203.
8. Remote alarm silence and remote emergency voice/alarm communications capability from the UHFCC.
9. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
10. System programming in accordance with the system's sequence of operation.
11. System programming and testing required for the system to communicate with the operator interfaces in UHFCC.

ON PROJECTS PROVIDING A NEW FIRE ALARM SYSTEM, DELETE ALL OF 1.2.C.

C. Renovate the existing fire alarm system by providing the following:

1. A pre-renovation test of the existing system to document the condition of the system before it is changed.
2. A main fire alarm control panel (FACP).
3. Node and notification appliance circuit (NAC) panels.
4. Automatic and manual initiating devices.
5. Audible and visual notification appliances.
6. Control inputs and outputs to ventilation systems.
7. Status monitoring of fire pump controllers, sprinkler flow switches, and sprinkler valve tamper switches.

8. Alarm, supervisory, trouble, fire pump running and maintenance alerts outputs including addresses and locations of initiating devices to the University of Michigan Hospitals and Health Centers (UMHHC) Facility Command Center (UHFCC) located in University Hospital Building Room 1A203.
9. Remote alarm silence and remote emergency voice/alarm communications capability from the UHFCC.
10. Raceways, junction boxes, wiring and accessories as shown on the drawings and as required for a complete and operable system.
11. System programming as required to incorporate changes to the system's sequence of operation.

EDIT 1.2.D AND E TO MAKE THEM PROJECT-SPECIFIC.

- D. Provide the following additional work where shown on the drawings:
 1. Remote annunciators.
 2. Control outputs to smoke control system devices.
 3. Status lights indicating the current status of smoke control system devices.
 4. Auxiliary controls to manually override the control outputs to smoke control system devices.
 5. Control outputs to interrupt power to electrically operated access control door hardware devices.
 6. Non-battery backed power to door hold-open devices.
 7. Emergency voice/alarm communications.
 8. Remote microphone cabinets.
 9. Fire Department telephone communications.
- E. The following work is not included unless shown otherwise:
 1. Smoke and heat detectors that initiate an elevator recall.
 2. Smoke and heat detectors that actuate a fire suppression system.
 3. Electrically operated door hardware devices.
 4. Power to electrically operated door hardware devices.
 5. Door hold-open devices.

1.3 RELATED SECTIONS

- A. The drawings and the general provisions of the contract, including the current edition of the University of Michigan Standard General Conditions, apply to this section.
- B. The applicable requirements of the other Division 26 specification sections, including the following, apply to this section.
 1. Section 260500, "Basic Electrical Materials and Methods".
 2. Section 260513, "Cables and Wires".
 3. Section 262700, "Service and Secondary Distribution".
 4. Section 260526, "Grounding".
 5. Section 260800, "Electrical Acceptance Tests".

1.4 REFERENCES

- A. Comply with the current versions of the following codes and standards as applicable:
 1. ANSI/IEEE C2, "National Electrical Safety Code".

2. MBC, "Michigan Building Code".
 3. MEC, "Michigan Electrical Code".
 4. MMC, "Michigan Mechanical Code".
 5. "Michigan Rehabilitation Code".
 6. "Michigan Residential Code".
 7. NFPA 13, "Standard for the Installation of Sprinkler Systems".
 8. NFPA 20, "Standard for the Installation of Centrifugal Fire Pumps".
 9. NFPA 72, "National Fire Alarm Code", except as follows:
 - a. Smoke detectors that initiate an elevator recall shall not be connected to the fire alarm system.
 - b. Smoke and heat detectors shall not be required above suspended ceilings.
 - c. Horns or speakers shall not be installed in elevator machine rooms. Horns shall not be installed in elevator cars.
 - d. Fire alarm system shall not shut down power to the elevators.
 - e. Optional smoke detectors in rooms with beam pockets should be spaced as shown on the plan drawings.
 10. NFPA 90A, "Standard for the Installation of Air Conditioning and Ventilating Systems".
 11. UL 217, "Single and Multiple Station Smoke Detectors".
 12. UL 268, "Smoke Detectors for Fire Protective Signaling Systems".
 13. UL 268A, "Smoke Detectors for Duct Applications".
 14. UL 464, "Audible Signal Appliances".
 15. UL 521, "Heat Detectors for Fire Protective Signaling Systems".
 16. UL 864, "Control Units for Fire Protective Signaling Systems".
 17. UL 1480, "Speakers for Fire Protective Signaling Systems".
 18. UL 1971, "Signaling Devices for the Hearing Impaired".
- B. For classroom, in-patient medical and Housing projects, comply with the applicable sections of NFPA 101, "Life Safety Code" as adopted and amended by the Michigan Bureau of Fire Services.
- C. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, comply with the NFPA 72 requirements related to survivability from attack by fire.
1. Designate each notification appliance circuit to serve no more than one notification zone.
 2. Protect power supply and notification appliance circuits from fire until they enter the notification zone they serve.
 3. Monitor the integrity of audible and visual notification appliance power supplies, audio generators, amplifiers and circuits.
 4. Monitor the integrity of Fire Department telephone communications circuits.

1.5 SYSTEM DESIGN REQUIREMENTS

- A. The system shall be power limited.
- B. Provide a fire alarm control panel with the following:
 1. Digital display.

2. Multiple pushbutton keypad.
 3. LED status indicating lights.
 4. Audible status signals.
 5. Output relays.
 6. Battery charger and batteries.
 7. RS-232 communications card.
- C. Provide Class B, Style 3, signaling line circuits.
1. Provide sufficient spare capacity on each signaling line circuit for an additional 25 percent of initiating and control devices.
- D. Provide Class B, Style Y, notification appliance circuits.
1. Size the control panel power supplies, amplifiers and batteries for 25 percent spare capacity calculated with 40 ma horn loads, 1 watt speaker loads and 150 ma strobe light loads.
 2. Provide sufficient spare capacity on each notification appliance circuit for an additional 25 percent of notification appliances.
- E. The system shall supervise the following circuits and components:
1. Initiating device circuits.
 2. Signaling line circuits.
 3. Notification appliance circuits.
 4. Addressable initiating and control devices.
 5. Control output wiring.
 6. Auxiliary control switches.
 7. System node panels, NAC panels, remote annunciators and remote microphone panels.
 8. Primary power supply.
 9. Secondary power supply.
- F. The system shall be capable of being programmed by the Owner on site to accommodate expansion or sequence of operation changes.
- G. Provide 120 volts AC primary power to the system from a dedicated emergency power branch circuit.
- H. Provide a control panel battery charger capable of fully charging a 200 amp-hour battery within 24 hours.
- I. Provide sufficient secondary power battery capacity to operate the entire system (except the door hold-open devices) upon the loss of primary power for a period of 24 hours in a normal supervisory mode followed by 5 minutes of evacuation alarm operation.
1. When emergency voice/alarm communications is provided, provide sufficient battery capacity for 24 hours of operation in a normal supervisory mode followed by 15 minutes of voice/alarm operation.
 2. The system shall automatically transfer to and from the secondary power batteries upon an interruption of primary power without initiating a nuisance alarm.
 3. The system shall delay initiating a trouble condition for two seconds upon a transfer to or from primary power to avoid nuisance trouble conditions during emergency generator testing.

- J. Provide smoke and heat detectors as required by code and as shown, including the following.
1. Provide smoke detectors in each elevator lobby and in each elevator machine room to duplicate the elevator recall detectors provided as part of the elevator system. Do not provide smoke or heat detectors in elevator shafts.
 2. Provide two heat detectors, one in front and one behind, each unit substation transformer.
 3. Provide smoke detectors in each mechanical, electrical, telecommunications, trash collection and recycling room.
 4. Provide smoke detectors in residence hall corridors, each sleeping room, and immediately outside each sleeping room located within a suite or apartment.
 5. Provide duct smoke detectors where required by code. When not in plain view or more than 10 feet above the floor, provide duct detector remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.
- K. Provide sufficient audible notification appliances to achieve a sound level of 15 dBA above ambient sound level, but not less than 60 dBA nor more than 110 dBA. The sound level in mechanical rooms shall be not less than 90 dBA, and in sleeping rooms shall be not less than 75 dBA measured at pillow level. The sound shall be a temporal code three slow whoop or pulsed evacuation signal.
1. In rodent rooms, the sound shall be a slow whoop or warble with a peak frequency below 500 Hz.
 2. Do not provide horns or speakers in exit stair enclosures.
 3. Do not provide horns or speakers in elevator machine rooms or in elevator cars.
 4. Provide a speaker in each sleeping room and a sounder base in each sleeping room smoke detector. The speaker shall provide the general alarm and the sounder base shall alarm upon smoke in the room.
- L. Provide visual notification appliances in accordance with the intensity and spacing requirements of NFPA 72.
1. Provide strobes in all public areas including multi-person offices, but not in exit stair enclosures and animal rooms.
 2. Combine horns or speakers with strobes when both are required at the same location.
 3. Synchronize strobes when more than two appliances are in any point of view and are less than 55 feet apart.
 4. Provide strobes in elevator machine rooms.
 5. Provide strobes in accessible sleeping rooms and in living spaces of accessible suites or apartments.
 6. Provide strobes in mechanical rooms and other areas that have an average ambient noise level exceeding 60 dBA.

DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.

- M. Provide a waterproof horn/strobe or speaker/strobe with waterproof back box on the exterior of the building between 8 and 12 feet above the fire department connection. Audible sound shall be 90 dBA minimum at 10' and visual intensity shall be 110 candela. Program this device to alarm upon sprinkler system water flow only, and to cease operation upon termination of water flow.

- N. Provide individually addressable monitor modules to monitor non-addressable initiating devices and status contacts of other systems.
 - 1. Monitor modules shall use Class B, Style B initiating device circuits to monitor the initiating devices and status contacts.
 - 2. When interconnecting with an existing fire alarm system control panel, provide monitor modules as required so new and existing control panels function as a single system.
- O. Provide panel auxiliary relay contacts and individually addressable control module contacts to interface with control circuits of other systems and equipment.
 - 1. Provide normally closed duct smoke detector contacts to shut down ventilation systems.
 - 2. Provide normally open auxiliary relay or control module contacts to start smoke control systems.
 - 3. Provide normally closed auxiliary relay or control module contacts to release electrically held door locks and door hold-opens, and to disable electrically operated door proximity sensors.
 - 4. When interconnecting with an existing fire alarm system control panel, provide control modules as required so new and existing control panels function as a single system.
- P. Provide control panel On/Off/Auto switches with "On" and "Off" or "Open" and "Closed" LED indicators for overriding the normally open contacts that start smoke control systems.
 - 1. In the Auto position, the contacts shall operate in accordance with the fire alarm system program. In the Off position, the contacts shall remain open. In the On position, the contacts shall close to test the controlled equipment.
 - 2. The LED indicators shall indicate the status of the controlled equipment in accordance with the MMC.
 - 3. Turning any switch out of the Auto position shall initiate a system trouble condition.
- Q. Assign each initiating device a unique device address.
- R. Develop a custom location label for each initiating device that describes the type, floor, room number and exact location of the device.
 - 1. If the device is in a corridor or similar large space, state device is by Room (NAME/NUMBER).
 - 2. If room numbers are not available, provide compass directions and references to unique building features.
- S. Provide transient voltage surge suppression for the system.

1.6 SYSTEM PERFORMANCE REQUIREMENTS

- A. Under normal conditions, the control panel digital display shall display a "SYSTEM NORMAL" message and the current time and date.
- B. Should an abnormal condition be detected, the appropriate alarm, supervisory, or trouble panel LED shall flash and the appropriate panel audible signal shall sound.

- C. The appropriate panel alarm, supervisory, trouble or supervisory maintenance alert outputs including addresses and locations of initiating devices shall be sent via fiber-optic cable (by others) for viewing at the University Hospital Facility Command Center (UHFCC).
- D. The fire alarm control panel shall manage all input and output signals through software programming and hardware configuration. In addition to managing and supervising the fire alarm devices, the control panel shall be configured to trigger an alarm when the fire pump runs.
- E. The panel shall display the following information relative to the abnormal condition:
 - 1. Custom location label (40 characters minimum).
 - 2. Type of initiating device.
 - 3. Type of abnormal condition (alarm, supervisory or trouble).
- F. If the abnormal condition is an alarm, the following actions shall occur:
 - 1. Audible notification appliances shall sound throughout the building.
 - 2. Visible notification appliances shall flash throughout the building.
 - 3. Control outputs to mechanical systems shall perform their programmed functions.
 - 4. Control outputs shall interrupt power to electrically operated door hardware devices.
 - 5. Power to door hold-open devices shall de-energize.
- G. Pressing the appropriate Acknowledge pushbutton shall acknowledge the alarm, supervisory or trouble condition unless the system is in the silence inhibit mode. Once acknowledged, the appropriate LED shall latch on and the panel audible signal shall be silenced.
- H. If the abnormal condition is an alarm, pressing the Silence pushbutton shall silence the audible notification appliances and stop the visual notification appliances from flashing.
- I. In addition to the Acknowledge and Silence pushbuttons available on the fire alarm control panel, the fire alarm system head end equipment in the UHFCC shall be capable of acknowledging and silencing the system remotely.
- J. Upon a subsequent abnormal condition from another device, the appropriate panel LED shall flash, the panel audible signal shall again pulse and the panel display shall show the new abnormal condition.
- K. After all of the points have been acknowledged and silenced, the LED's shall glow steady and the panel audible signals shall be silenced. The total number of alarms, supervisory, and trouble conditions shall be displayed along with a prompt to review each list chronologically. The end of the list shall be indicated.
- L. Pressing the System Reset pushbutton shall return the system to its normal state if the abnormal conditions have been remedied.

1. The display shall step the user through the reset process with simple English language messages. Messages including "IN PROCESS", "RESET COMPLETED", and "SYSTEM NORMAL" shall provide operator assurance of the sequential steps as they occur.
 2. The ventilation system motors shall restart sequentially.
 3. The outputs to control circuits of other systems and equipment shall return to normal.
 4. When interconnecting with an existing fire alarm system control panel, resetting shall not require the simultaneous operation of reset pushbuttons or switches on multiple control panels, or the disconnection of wiring.
- M. Should an abnormal condition continue to exist, the system shall remain in an abnormal state. The system control relays shall not reset. The panel LED's shall remain on. The display shall indicate the total number of alarm, supervisory and trouble conditions present in the system along with a prompting to review the points. These points shall not require acknowledgment if they were previously acknowledged.
- N. Should a trouble condition continue to exist, the trouble audible signal shall resound at preprogrammed time intervals to act as a reminder that the fire alarm system is not 100 percent operational. Both the time interval and the trouble audible signal shall be programmable to suit the Owner's application.
- O. Should the Alarm Silence Inhibit function be active, the System Reset pushbutton shall be ignored and a "RESET INHIBITED" message shall be displayed for a short time to indicate that action was not taken. For operator assurance, a "RESET NO LONGER INHIBITED" message shall be displayed when the inhibit function times out.

1.7 ITEMIZED QUOTATION

- A. Submit with your bid an itemized cost breakdown listing all major component costs, labor costs (including subcontractor labor and material costs), and engineering costs, for base bid and for each alternate, for the entire fire alarm system scope of work. When requested, provide an itemized breakdown to the Owner post-bid for review and approval.

1.8 SUBMITTALS

- A. Submit for approval copies of the following shop drawings and product literature. Shop drawings shall contain title blocks identifying the project name and number. Submittals shall be marked to indicate the specific models, sizes, types and options being provided. Submittals not so marked and incomplete submittals will be rejected.
1. Plan drawings showing the locations (with room numbers) of the system components, including any adjustments in the quantities and locations of initiating devices and notification appliances to meet code requirements.
 2. Riser diagram showing system components, interconnecting wiring and connections to other building systems and equipment.

3. Wiring diagrams showing manufacturer and field connections at component terminals, complete with conductor color codes and wire numbers.
4. System configuration list showing inputs, outputs, device addresses and custom location labels, device configurations and program logic.
5. Bill of materials.
6. Catalog pages showing system components.
7. System battery sizing calculations.
8. Power supply, amplifier and circuit sizing calculations.
9. Door hold-open power supply sizing calculations.

ON FIRE ALARM RENOVATION PROJECTS, DELETE ALL OF 1.9.

1.9 EXTRA MATERIALS

- A. Provide to the Owner the following extra materials matching the products installed, packaged in protective coverings for storage, and identified with labels clearly describing the contents. Provide 1 percent of the installed amount of each with a minimum of one of each.
 1. Fuses: Each size and type used in the system.
 2. Manual Pull Stations.
 3. Detector Bases.
 4. Detector Heads: Each type used in the system.
 5. Addressable Monitor and Control Modules: Each type used in the system.
 6. Notification Appliances: Each size and type used in the system.
 7. Output Relays.
- B. Provide one data cable for connecting a lap top computer to the fire alarm control panel's RS-232 communications card so that the Owner can perform panel programming.

1.10 RECORD DOCUMENTS

- A. Submit four copies of record drawings showing the locations of fire alarm devices and appliances, the locations of end-of-line resistors and junction boxes, the addresses of addressable devices, the tap settings of audible notification appliances, the intensity ratings of visual notification appliances, the sizes of conduits and conductors, circuit numbers, and deviations from the design.
- B. Submit four printed copies of the final system configuration list showing inputs, outputs, addresses, custom location labels, device configurations and program logic.
- C. Submit electronic, Windows based files with the following final system software:
 1. The master program generic to the model of system being provided.
 2. The building specific program containing the unique information for the system being provided.
 3. A software license and the system passwords required by the Owner to perform programming changes.

1.11 OPERATIONS AND MAINTENANCE MANUALS

- A. Submit for approval four copies of operations and maintenance manuals for the specified system and equipment prior to startup. The manuals shall be the same manuals used by the Manufacturer's field service technicians. The manuals shall be marked to indicate the specific models, sizes, types and options that were provided. Manuals not so marked will be rejected.

1.12 QUALITY ASSURANCE

- A. The fire alarm system shall be the standard product of a single fire alarm system manufacturer who has been producing this type of equipment for at least 10 years, and has a fully equipped service organization within 150 miles of the Owner. Each component shall display the manufacturer's name.
- B. Each fire alarm system component shall be listed under the appropriate standard of Underwriters Laboratories and shall bear a UL label.
- C. The fire alarm system shall be UL labeled as a system and approved by FM Global.

DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.

- D. For classroom, in-patient medical and Housing projects, the fire alarm system shall also be approved by the State of Michigan Bureau of Fire Services.
 - 1. Submit shop drawings to the Michigan Bureau of Fire Services for approval.
 - 2. Arrange for a Michigan Bureau of Fire Services Inspector to inspect the system installation and testing.
 - 3. Submit to the Owner a copy of the FS-12A Form submitted to the Michigan Bureau of Fire Services.
- E. The fire alarm system shall comply with the requirements of the National Fire Alarm Code, the Owner's Inspection Authorities and with the Manufacturer's instructions.

1.13 WARRANTY

- A. Provide a complete parts and labor warranty for twelve months from the date of final acceptance of the system by the Owner.
- B. Provide a telephone response to Owner's questions within 4 hours and on-site assistance within 24 hours.
- C. Permit Owner's Fire Alarm Technicians to perform temporary bypasses and emergency repairs on the system without voiding the warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Acceptable Manufacturers and Models:
 - 1. EST Model EST-3 represented by Riverside Integrated Systems.
 - 2. Honeywell Model XLS3000.
 - 3. SimplexGrinnell Model 4100 Series.

2.2 SYSTEM COMMUNICATIONS

- A. The fire alarm control panel shall communicate with each addressable initiating and control device individually via shielded twisted pair signaling line circuits. EST SIGA-Loop, Honeywell Eclipse or FlashScan, or SimplexGrinnell MAPNET II or IDNET.
- B. Each signaling line circuit shall be capable of accessing up to 127/250 addressable devices.
- C. Each signaling line circuit shall allow up to 10,000 feet of wire length to the furthest addressable device.
- D. Communications shall use a broadcast polling protocol to allow tapping of the circuit except where Class A wiring is required. T-taps shall be limited to 64 per loop.
- E. Communications shall be completely digital and shall include parity data bit error checking routines for address codes and check sum routines for the data transmission protocol.
- F. Each device shall be uniquely identified by a device address.
- G. There shall be no limit to the number of initiating devices which may be activated simultaneously.
- H. Each device shall be individually annunciated at the panel. Annunciation shall include the following conditions for each device.
- I. Alarm, supervisory or trouble condition.
 - 1. Open, short or ground.
 - 2. Device failure or incorrect device installed.

2.3 FIRE ALARM CONTROL PANEL

- A. The fire alarm control panel shall be modular with solid state, microprocessor based electronics. EST 3, Honeywell XLS3000, or SimplexGrinnell 4100 Series.
- B. The panel shall display only those primary controls and displays essential to operation during a fire alarm condition.
- C. The panel shall include a LCD digital display, with a minimum of 80 characters.
 - 1. The display shall be backlit for enhanced readability. It shall not be lit during an AC power failure unless an alarm condition occurs or there is keypad activity.

2. The display shall support both upper and lower case letters. Lower case letters shall be used for soft key titles and for prompting the user. Uppercase letters shall be used for system status information. A cursor shall be visible when entering information.
- D. A panel audible signal shall sound during alarm, supervisory or trouble conditions. This audible signal shall sound differently during each condition to distinguish one condition from another. The audible signal shall also sound differently during each key press to provide audible feedback (chirp) indicating that the key has been pressed properly.
- E. The system program shall be stored in a non-volatile flash EPROM memory within the panel. Loss of primary and secondary power shall not erase the program stored in memory.
1. The program shall be capable of selective input/output control functions based upon AND'ing, OR'ing, NOT'ing, timing and special coded operations.
 2. The program shall enable initiating devices to be individually configured on site to provide either alarm and trouble, supervisory and trouble, alarm only, supervisory only, trouble only, current limited alarm, no alarm, normally closed device monitoring, a non-latching circuit or an alarm verification circuit.
 3. The program shall enable initiating devices to be disabled or enabled individually.
- F. The panel or the field devices shall determine the alarm decision for each detector by comparing the detector value to stored values.
1. The panel shall automatically maintain a constant smoke obscuration sensitivity in percent of smoke obscuration format for each detector.
 2. The panel shall maintain a moving average of each smoke detector's smoke chamber value to automatically compensate for dust and dirty conditions that could affect detection operation.
 3. The smoke obscuration sensitivity shall be adjustable to within 0.3 percent of either limit of the UL window (0.5 percent to 4.0 percent) to compensate for any environment.
 4. When a detector's average value reaches a predetermined value, a "MAINTENANCE ALERT" condition shall be audibly and visually indicated at the panel. The LED on the detector base shall glow steady giving a visible indication at the detector location. If a dirty detector is left unattended and its average value increases to a second predetermined value, a "TROUBLE" condition shall be indicated at the panel. To prevent nuisance alarms, these dirty conditions shall in no way decrease the amount of smoke obscuration necessary for system activation.
 5. The panel shall continuously perform an automatic self-test routine on each detector which shall functionally check detector electronics and ensure the accuracy of the obscuration values being transmitted to the panel. Any detector that fails this test shall indicate a "SELF TEST ABNORMAL" or "TROUBLE" condition at the panel.

6. Each detector shall be scanned by the panel for its type identification to prevent inadvertent substitution of another detector type. The panel shall operate with the installed device but shall initiate a "WRONG DEVICE" or "TROUBLE" condition until the proper type is installed or the programmed detector type is changed.
 7. An operator at the panel, having a proper access level, shall have the ability to manually access the following information for each detector.
 - a. Device type.
 - b. Device status.
 - c. Present average value.
 - d. Peak detection values.
 - e. Present sensitivity selected.
 - f. Detector range (normal, dirty, etc.).
 8. An operator at the panel, having a proper access level, shall have the ability to perform the following for each detector:
 - a. Enable or disable the point.
 - b. Clear peak detection values.
 - c. Clear verification tally.
 - d. Control a detector's relay driver output.
 9. The panel shall be programmable to automatically change the sensitivity settings of each detector based on time-of-day and day-of-week (for example, to be more sensitive during unoccupied periods and less sensitive during occupied periods). There shall be seven sensitivity settings available for each detector.
 10. The panel shall be programmable for a pre-alarm or two-stage function. This function allows an indication to occur when, for example, a detector with a 3 percent set point reaches a threshold of 1.5 percent smoke obscuration.
 11. Smoke detectors shall be provided with the ability for alarm verification. When in alarm verification mode, only a verified alarm shall initiate the alarm sequence operation.
 - a. The activation of a smoke detector shall initiate an alarm verification operation whereby the panel resets the activated detector and waits for a second alarm activation. If, within an adjustable time delay, a second alarm is reported from the same or any other smoke detector, the system shall process the alarm. If no second alarm occurs within the time delay, the system shall resume normal operation.
 - b. The alarm verification shall operate only on smoke detector alarms. Other activated initiating devices shall be processed immediately. The alarm verification operation shall be selectable by device.
 - c. The panel shall have the capability to display the number of times a device has gone into a verification mode.
 - d. Detectors in alarm verification mode shall have the ability of being divided into different groups whereby any two activations from a group shall cause the panel to follow its programmed alarm sequence.
- G. The panel shall have four pass code controlled access levels. Pass codes shall be entered using the panel key pad.
1. To maintain security when entering a pass code, the digits entered shall not be displayed.

2. When a correct pass code is entered, an "ACCESS GRANTED" message shall be displayed. The access level shall be in effect until the keypad is inactive for 10 minutes or the operator logs out.
 3. Should an invalid code be entered, the operator shall be notified with a message and shall be allowed up to two more chances to enter a valid code. After three unsuccessful tries, an "ACCESS DENIED" message shall be displayed.
 4. Access to a level shall only allow the operator to perform actions within that level and actions of lower levels, not actions of higher levels.
 5. Access levels shall be associated with the following functions:
 - a. Alarm silence.
 - b. System reset.
 - c. Set time and date.
 - d. On/Off/Auto control selection.
 - e. Manual control.
 - f. Disable and enable circuits and devices.
 - g. Clear historical logs.
 - h. Walk test.
 - i. Change alarm verification.
 - j. Change detector sensitivity.
 - k. Function keys.
 6. An access level shall also be associated with acknowledge keys. If the operator presses an Acknowledge key with insufficient access, an error message shall be displayed. The points on the log shall scroll with each key press, but the points shall not be acknowledged.
- H. The panel shall have the ability to store a minimum of 300 events in an alarm log plus a minimum of 300 events in a separate trouble log. These events shall be stored in a battery protected random access memory. Real time and date shall accompany history event recordings.
- I. The panel shall supervise subordinate module LED's for burnout or disarrangement. Should a problem occur, the panel shall display the module and LED location numbers to facilitate location of that LED.
- J. The panel shall have function keys programmed as follows for disabling and enabling circuits or groups of devices for maintenance or testing purposes. While circuits or devices are disabled, the panel shall indicate "TROUBLE".

DELETE THE FUNCTION KEYS THAT DON'T APPLY TO THIS PROJECT. DO NOT RENUMBER THE REMAINING FUNCTION KEYS.

1. F1: Disable smoke detectors by floor.
 2. F2: Disable duct smoke detectors.
 3. F3: Disable sprinkler system flow switches.
 4. F4: Disable horns/strobes or speakers/strobes by floor.
 5. F5: Disable beam detectors.
 6. F6: Disable smoke detector sounder bases.
 7. F7: Disable hood suppression systems.
- K. The system shall be capable of being walk tested by one person.

1. The activation of an initiating device under test shall be silently logged as an alarm or supervisory condition in the historical log. The panel shall automatically reset itself after logging the abnormal condition.
 2. The momentary disconnection of an initiating device or notification appliance shall be silently logged as a trouble condition in the historical log. The panel shall automatically reset itself after logging the trouble condition.
 3. The walk test sequence shall have the ability to activate the notification appliances for a maximum of 2 seconds upon the activation of an initiating device under test. If this option is selected, any momentary opening of the initiating device circuit or a notification appliance circuit shall cause the notification appliances to sound for 4 seconds to indicate the trouble condition.
 4. Should the walk test mode be on for an inappropriate amount of time, the panel shall automatically revert to normal mode.
 5. Should an abnormal condition occur from an active point not in walk test mode, the system shall perform its standard programmed alarm, supervisory or trouble sequences.
- L. The panel enclosure shall be equipped with locks and transparent door panels providing freedom from tampering yet allowing full view of the various lights and controls.

2.4 NODE AND NAC PANELS

- A. Node and NAC panels shall be modular with solid state, microprocessor based electronics, operator interfaces, power supplies, audio generators, amplifiers, battery chargers and batteries as required. All components shall be supervised. EST 3, Honeywell XLS3000, or SimplexGrinnell V4100.

2.5 BATTERIES

- A. Batteries shall be lead calcium and supervised so that a failure produces a "TROUBLE" signal.

2.6 REMOTE ANNUNCIATOR

- A. The remote annunciator shall duplicate the backlit LCD display; the alarm acknowledge, supervisory acknowledge, trouble acknowledge, alarm silence, and system reset pushbuttons; the alarm, supervisory, and trouble audible signals; the alarm, supervisory, trouble, and power "on" LED's; and the programmable function keys of the fire alarm control panel. A key "enable" switch or door lock, keyed to match the fire alarm control panel door lock, shall permit activating or deactivating the controls. EST 3-ANN, Honeywell XLS-NCA, or SimplexGrinnell 4603-9101.
- B. A remote microphone shall be included when the fire alarm system includes emergency voice/alarm communications, along with the same pushbuttons as the fire alarm control panel for selecting pre-recorded voice messages, and the same controls to choose total building or selected areas communications.

2.7 ADDRESSABLE SPOT DETECTOR BASES

- A. Spot detector mounting bases shall be individually addressable, suitable for two wire operation, with a twist-lock head locking feature a DIP switch or electronic addressing means, and an LED that provides power "on", alarm and trouble indications. The bases shall be listed for ceiling and wall mounting. Removal of the detector head shall cause a trouble condition at the panel. EST SIGA-SB, Honeywell 14507371-001, or SimplexGrinnell 4098-9792.
- B. Where shown, the bases shall include an auxiliary relay that is controlled from the panel. EST SIGA-RB, Honeywell B244RB, or SimplexGrinnell 4098-9791 base with 2098-9737 relay.
- C. In sleeping rooms, the base shall include a piezoelectric sounder that is controlled from the panel. EST SIGA-AB4, Honeywell B501BHT, or SimplexGrinnell 4098-9794.
- D. When bases are not in plain view, bases shall be connected to remote alarm indicators mounted in plain view at 48 inches above the floor.

2.8 MULTISENSOR SMOKE DETECTOR HEADS

- A. Multi-sensor type smoke detector heads shall include sampling and reference ionization chambers with a single radioactive source, a photoelectric sensor and a programmable heat detector. The detectors shall support at least four levels of sensitivity selectable at the panel and 360 degree smoke entry. EST SIGA-IPHS, Honeywell TC806B1084, or SimplexGrinnell 4098-9754.

2.9 PHOTOELECTRIC SMOKE DETECTOR HEADS

- A. Photoelectric type smoke detector heads shall include a pulsed LED light source and a silicon photodiode receiver, at least seven levels of sensitivity selectable at the panel, an integral insect screen and 360 degree smoke entry. This type of detector shall be installed in all duct detectors. EST SIGA-PS or SIGA-SD, Honeywell TC806B1076, or SimplexGrinnell 4098-9714.

2.10 HEAT DETECTOR HEADS

- A. Heat detector heads shall include combination rate-of-rise and rate compensated fixed temperature sensing, two levels of rate-of-rise sensitivity selectable at the panel, and an independent 135 degrees F fixed temperature set point. Heat detector heads shall be self-restoring. EST SIGA-HRS, Honeywell TC808B1066, or SimplexGrinnell 4098-9733.
- B. Heat detector heads for steam tunnels, cage wash areas and dish machine areas shall have a 135 degrees F fixed temperature set point and shall be self-restoring. EST SIGA-HFS, Honeywell TC808B1041 or SimplexGrinnell 4098-9733.

2.11 DUCT DETECTORS

- A. Duct detectors shall be individually addressable and consist of a housing, sampling tubes, a baffle and a detachable detector head. Duct detectors shall include an alarm LED, a local test switch, and an auxiliary SPDT relay for ventilation system control. Duct detectors shall be resettable by actuating the panel reset pushbutton. The sampling tubes shall be capable of being cleaned through the housing cover. EST SIGA-SD DH100ACLP, Honeywell TC806D1056, SimplexGrinnell 4098-9756, or System Sensor BK-DH100ACLP.
- B. The detector heads shall be photoelectric as specified above, but shall be capable of accepting ionization detector heads.
- C. When not in plain view, duct detectors shall include remote alarm indicators and test switches mounted in plain view at 48 inches above the floor.

2.12 BEAM DETECTORS

- A. Photoelectric projected beam detectors shall be individually addressable and consist of separate transmitter and receiver units capable of long range coverage of up to 350 feet. Beam detectors shall include alarm and trouble dry auxiliary contacts, and normal, alarm and trouble LED status indicators. Beam detectors shall include internal bore sights, automatic calibration, six sensitivity settings, automatic compensation for temperature and lens contamination, and a trouble indication upon either a total obscuration or an obscuration of 50 percent of the alarm set point. Beam detectors shall be suitable for four wire operation utilizing 24 volt DC power from the panel, and resettable by actuating the panel reset pushbutton. EST EC50R, Honeywell TC847A1004, or SimplexGrinnell Fire Ray Series.

2.13 MANUAL PULL STATIONS

- A. Manual pull stations shall be individually addressable, suitable for two wire operation, with a high impact red Lexan body and raised white lettering. Stations shall include an ADA compliant single action operating mechanism with a mechanical latch to hold an operated station open until reset. EST SIGA-270, Honeywell S464G1007, or SimplexGrinnell 4099-9001.
- B. Reset shall be accomplished through use of a key common to the panel or a small flat-blade screwdriver. Stations which use allen wrenches or special tools to reset are not acceptable. The point of reset shall be front accessible so stations with tamper-resistant covers can be reset easily.

2.14 MONITOR MODULES

- A. Monitor modules for individual two wire contact monitoring shall be individually addressable, suitable for two wire operation, with a DIP switch or electronic addressing means, and a programmable latch feature for monitoring momentary contacts. Monitor modules shall monitor a single normally open dry contact using a Class B, Style B, initiating device circuit. EST SIGA-CT1 or SIGA-CT2, Honeywell TC809A1059, or SimplexGrinnell 4090-9001.
- B. Monitor modules for zone or four wire device monitoring shall be individually addressable, suitable for four wire operation utilizing 24 volt DC power from the panel, and with a DIP switch or electronic addressing means. Zone monitor modules shall monitor multiple normally open dry contacts using a Class B, Style B, two wire initiating device circuit, or monitor a four wire device using a Class B, Style D, four wire initiating device circuit. EST SIGA-UM, Honeywell TC809, or SimplexGrinnell 2190-9156 or 4090-9101.

2.15 CONTROL MODULES

- A. Control modules shall be individually addressable, with a DIP switch or electronic addressing means. Control modules shall provide a Form C contact rated .5 amps at 120 volts AC or 2 amps at 28 volts DC resistive that are controlled by the panel. EST SIGA-CR, Honeywell TC801N1013, or SimplexGrinnell 4090-9002.

2.16 HORNS

- A. Horns shall be electronic, rated 24 volts DC, with a piezoelectric driver set to produce a slow whoop sound level of 101 dBA at 10 feet, with a red, semi-flush body capable of wall or ceiling mounting. EST 757-1A or Genesis Series, Honeywell HR, or SimplexGrinnell 4901-9820.

DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.

- B. Horns in rodent rooms shall be set to generate a slow whoop or warble sound with a peak frequency below 500 Hz. Horns shall be of heavy-duty industrial construction and shall be UL listed for indoor and outdoor applications. EST Model 5530MD-24AW.

2.17 SPEAKERS

- A. Speakers shall be rated 125 to 12,000 Hertz, include four taps rated at from 1/4 to 2 watts, produce a sound level of 82 dBA at 10 feet when set at the 1/2 watt tap, and with a semi-flush body capable of wall or ceiling mounting. EST 757-1A-S25W or Genesis Series, Honeywell SP, or SimplexGrinnell 4902-9703 (wall mount) or 4902-9721 (ceiling mount).
- B. Speakers for locations with high ambient noise may be high efficiency horns rated 500 to 6,000 Hertz minimum, 10 watts minimum, include four or more taps, produce a sound level of 106 dBA minimum at 1 meter when set at the 1 watt tap, and be capable of wall or ceiling mounting. EST/GE HPSA15, Honeywell/GE HPSA15, or SimplexGrinnell EA0012 ABS.

2.18 STROBES

- A. Strobes shall be rated 15, 30, 60, 75, 110 or 177 candela as shown for proper illuminance, with a 1 Hertz flash rate, Xenon flash tube, white body, clear Lexan lens with red "FIRE" or international fire symbol lettering, capable of being synchronized, and capable of wall or ceiling mounting. EST Genesis Series, Honeywell SR/SCR, or SimplexGrinnell 4906 Series.

2.19 COMBINATION HORN/STROBES AND SPEAKER/STROBES

- A. Combination horn/strobes and speaker/strobes shall consist of the horns, speakers and strobes specified above, but combined on a single mounting plate. Combination units used outdoors and in wet areas shall be waterproof and mounted to waterproof back boxes. EST Genesis Series, Honeywell SpectrAlert Advance Series, or SimplexGrinnell 4906 Series.

2.20 DOOR HOLD-OPEN POWER SUPPLY

- A. The door hold-open power supply shall produce 24 volts DC of sufficient amperage to provide 0.4 amps of current to every door hold-open device being controlled. The power supply shall be supervised and capable of withstanding the inrush current that will occur when the door hold-open devices are energized.
- B. The output of the power supply shall be distributed by individually fused circuits. Fuse each circuit at 5 amps.
- C. The power supply shall release the held open doors upon a fire alarm or an AC power failure.

2.21 EMERGENCY VOICE/ALARM COMMUNICATIONS

- A. Emergency voice/alarm communications shall include audio control modules for alarm tone and voice message generation, a minimum of six pushbuttons for selecting pre-recorded voice messages, controls to choose total building or selected areas communications, audio amplifiers, a local microphone, and remote microphones in remote annunciators and cabinets. All of the components except for the remote microphones shall be located in or adjacent to the fire alarm control panel.
- B. The audio control module default mode shall provide for automatic total building fire alarm evacuation. The audible evacuation alarm signal shall consist of three slow whoop alarm tones followed by a fire alarm voice evacuation message. At the end of each voice evacuation message, the alarm tones shall resume. The alarm tones and voice evacuation message shall sound alternately until the alarm silence pushbutton at the fire alarm control panel or remote annunciator has been pressed. All audio signals and messages shall be digitally transmitted between nodes.
- C. The audio control modules shall provide for manual total building or selected area pre-recorded voice message generation by pushing a pre-recorded voice message pushbutton. One pushbutton shall initiate the fire alarm voice evacuation message, and the other pushbuttons shall initiate Owner-defined pre-recorded voice messages.

- D. The audio control modules shall provide for manual total building or selected areas communications. Upon keying of the microphone, a three second continuous alert tone shall sound over the speakers indicating a voice message will occur.
- E. The alarm tones shall be digitally generated by programmable software so that changes can be made without component rewiring. The voice messages shall be stored digitally in non-volatile EPROM memory.

DELETE THE FOLLOWING PARAGRAPH IF NOT APPLICABLE.

- F. The alarm tone for rodent rooms only shall be produced by a separate audio control module and amplifier that generate a slow whoop or warble sound with a peak frequency below the hearing range of rodents (i.e. 500 Hz).
- G. Audio amplifiers shall have a frequency response of 125 Hz to 12,000 Hz minimum.
- H. Microphones shall be of a hand-held, push-to-talk, noise-canceling type with a frequency range of 200 Hz to 4000 Hz and a self-winding five foot coiled cable. An LED shall indicate the microphone push-to-talk pushbutton has been pressed and the speaker circuits are ready for transmission.
- I. Remote microphones shall be enclosed in remote annunciator cabinets or wall-mounted cabinets as shown on the plan drawings, with the same pushbuttons for selecting pre-recorded voice messages, and lockable doors. Remote microphones shall duplicate the manual voice transmission capability of the local microphone at the fire alarm control panel. The fire alarm control panel microphone shall have priority over any remote microphones.

The remote microphone in a remote annunciator cabinet shall provide for total building or selected areas communications.

The remote microphone and cabinet at the fire alarm system head end equipment in the UHFCC shall provide for total building or selected areas communications.

- J. Should a Fire Department telephone communication system be provided, the telephones system shall be capable of being patched to the emergency voice/alarm communications system. Manual operation shall be controlled at the fire command center.

2.22 FIRE DEPARTMENT TELEPHONE COMMUNICATIONS

- A. Fire Department telephone communications shall consist of a minimum of eight dedicated communications circuits between a fire command center communications panel and remotely located emergency telephone jacks, a master telephone handset and five pluggable telephone handsets.

- B. The communications panel shall include a master telephone controller for processing of two-way communications. This module shall include a circuit selector switch and "Call" and "Trouble" LED indicators for each circuit, an audible device for call and trouble signaling, a trouble silence switch with ring-back, and an LED trouble indicator. Circuit supervision modules shall be included to electrically supervise for shorts, opens, and grounds of circuit wiring.
- C. The system shall be capable of handling single or simultaneous conversations with all telephones connected into the system. The circuits shall be so designed to prevent static, hum, or other interferences to clear, intelligible two-way conversations. The communications shall be transported digitally between devices.
- D. The act of plugging a handset into an emergency telephone jack shall cause the appropriate circuit indicator LED to flash and a distinctive audible device to sound at the communications panel. The subsequent picking up of the master telephone and selection of the proper circuit shall silence the pulsing sound, cause the circuit indicator LED to latch on, and couple the remote telephone to the master telephone. Two or more telephones shall be capable of being connected into an active conversation at the discretion of the operator.
- E. Attempting to use a subsequent telephone on the same circuit shall not cause the pulsing sound to activate if any two-way communications are already established. Any new circuits activated shall, however, cause their circuit indicator LED's to flash until acknowledged.
- F. Unplugging the handsets in use and returning the related circuit selector switches to the normal position shall cause the restoration of normal supervisory functions. If any remote telephone remains plugged in, the appropriate circuit indicator LED shall flash and the pulsing sound shall resume at the communications panel.
- G. The master telephone handset shall be recessed within a protective enclosure at the communications panel.
- H. A single line circuit shall be provided to a jack in each stairwell at each floor, in each elevator car, in each elevator lobby, at each area of refuge, at the emergency generator(s) and at the fire pump location. Emergency telephone jacks shall be mounted on a stainless steel single gang plate engraved with the words "Fire Emergency Telephone".
- I. Furnish an emergency telephone jack for installation in each elevator car. Wiring from the elevator controls to each elevator car and installation of the jacks will be provided by the elevator contractor.
- J. Provide five pluggable emergency telephone handsets with self-winding five foot cords within a storage cabinet mounted at the fire command center. Key the cabinet to match the fire alarm control panel.

PART 3 - EXECUTION

3.1 SYSTEM INTERRUPTIONS

- A. Coordinate with the UMHHC Facility Command Center (734-936-4000) before performing any work affecting an existing fire alarm system. Operating, programming, modifying or impairing an existing system without approval of the UMHHC Facility Command Center is strictly prohibited.
- B. When renovating a fire alarm system, test the system to document its condition before changes are made. Maintain operation of fire alarm system devices outside of the work area.
- C. When replacing a fire alarm system, maintain operation of the existing system until acceptance of the new system. If operation of the existing system cannot be maintained and the building is occupied, provide a 24 hour/day fire watch until the new system is accepted.

3.2 INSTALLATION

FOR NEW FIRE ALARM PROJECTS, SELECT ONE OF THE FOLLOWING THREE PARAGRAPHS (A, B OR C) AS DIRECTED BY THE PROJECT MANAGER. FOR FIRE ALARM RENOVATION PROJECTS, SELECT THE PARAGRAPH THAT MATCHES THE EXISTING INSTALLATION.

- A. Provide wiring in conduit in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- B. Provide wiring in conduit or provide fire alarm-rated MC cables in accordance with Sections 260533 and 260513, and Manufacturer's instructions.
- C. Provide wiring and raceways as follows and in accordance with Sections 260533 and 260513 and Manufacturer's instructions.
 - 1. Concealed in walls, exposed on walls up to 8' AFF, and above non-accessible ceilings - provide wiring in conduit.
 - 2. Above accessible ceilings and above 8' AFF in unfinished spaces - provide open wiring in J-hooks. Provide conduit sleeves where open wiring penetrates walls and floors.
- D. For systems that provide partial evacuation or relocation of occupants rather than full evacuation, protect power supply and notification appliance circuits from attack by fire until they enter the notification zone they serve. Provide 2-hour rated cable assemblies or protect circuits in 2-hour rated shafts, enclosures or sprinklered stairwells in accordance with Sections 260533 and 260513.
- E. Circuits may be T-tapped only where shown on the manufacturer's wiring diagrams.
- F. Provide waterproof back boxes with gaskets for devices and appliances installed outdoors or in wet or wash-down areas.
- G. Paint fire alarm junction boxes, covers and fittings red or provide red conduit throughout, except fire alarm raceways exposed in finished areas may be painted to match wall color.

- H. Modifications to fire alarm control panels, node panels, NAC panels and remote annunciator panels shall be made by a Manufacturer's Representative.
- I. Final connections to the fire alarm system components and system programming shall be performed by Fire Alarm Technicians with NICET Level II or higher certification.
- J. Label fire alarm panels with the room numbers, electrical panel numbers and circuit breaker numbers feeding them.
- K. Paint the handles of circuit breakers feeding fire alarm panels red, and install handle locks.
- L. Smoke and heat detectors shall not be installed until after construction clean-up is completed.
 - 1. When renovating an existing system, remove and store existing detectors during construction activities.
 - 2. Detectors installed prior to construction clean-up shall be cleaned by the manufacturer or replaced.

3.3 TESTING

- A. Demonstrate complete operation of the fire alarm system in accordance with NFPA 72, NFPA 101 (classroom, in-patient medical and Housing projects only), the Michigan Building Code, and Manufacturer's instructions. Notify the Owner's Representative 3 working days in advance of the test.
 - 1. The test shall be witnessed by a U-M OSEH Fire Inspector, a U-M Electrical Inspector, and the U-M Fire Protection Shop.
 - 2. Especially on fire alarm renovation projects, the U-M Fire Protection Shop may participate in or direct the testing activities.
 - 3. On classroom, in-patient medical and housing projects, also include an Inspector from the Michigan Bureau of Fire Services.
- B. Submit a signed and dated NFPA 72 test report to the Electrical Inspector prior to acceptance of the fire alarm system by the Owner.
- C. On classroom, in-patient medical and Housing projects, also submit a signed and dated FS-12A Form to the Michigan Bureau of Fire Services.

3.4 COMMISSIONING

- A. Perform Commissioning activities per Related Sections above.

3.5 TRAINING

DELETE A AND B IF IT IS KNOWN IN ADVANCE THAT THIS TRAINING HAS ALREADY OCCURRED.

- A. Provide the Owner's Fire Alarm Technicians with classroom training on the operation and maintenance of this model of system. This training shall be by the Manufacturer and shall be the same training as given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received operations and maintenance training from the manufacturer on this model of system, this training requirement will be waived.
- B. Provide the Owner's Fire Alarm Technicians with classroom training on the programming of this model of system. This training shall be by the Manufacturer and shall be the same training given to the Manufacturer's field service technicians. The University will pay the travel costs to the Manufacturer's training site. If the Owner's Technicians have already received programming training on this model of system, this training requirement will be waived.
- C. Train the Owner's Fire Alarm Technicians on unfamiliar components installed in this system.
- D. Walk the Owner's Fire Alarm Technicians through the building and identify the locations of fire alarm devices hidden from plain view.
- E. Train UMHHC Security and the OSEH Fire Inspectors on the basic operation of the system, including how to acknowledge audible notification appliances after an alarm.

DELETE THE FOLLOWING TWO PARAGRAPHS WHEN EMERGENCY VOICE/ALARM COMMUNICATIONS IS NOT INCLUDED.

- F. Train UMHHC Security and the OSEH Fire Inspectors on how to override the smoke control systems, on how to use the emergency voice/alarm communications, and on how to use the Fire Department telephone communications systems. Invite representatives from the Ann Arbor Fire Department to this training.
- G. Train the Facility Manager on how to use the emergency voice/alarm communications system.

DIVISION 31 EARTHWORK

SECTION 312000 - EARTH MOVING

END OF CONTENTS TABLE

DIVISION 31 EARTHWORK
SECTION 312000 - EARTH MOVING

THIS SECTION IS FOR VERY LIMITED EXCAVATION AND BACKFILL PROJECTS. FOR BUILDING ADDITIONS AND OTHER SIGNIFICANT STRUCTURES, USE THE AIA MASTERSPEC SECTION OF SAME NUMBER AND NAME.

2/07 - SUBBASE COMPACTION CHANGED TO FROM 95% TO 98%

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the following:
1. Preparing sub-grades for slabs-on-grade and walks.
 2. Excavating.
 3. Drainage and moisture-control fill course for slabs-on-grade.
 4. Sub-base course for walks.
 5. Subsurface drainage backfill for walls and trenches.
 6. Excavating and backfilling trenches within building lines.
 7. Excavating and backfilling for underground mechanical and electrical utilities and appurtenances.

1.2 DEFINITIONS

- A. Unauthorized excavation consists of removing materials beyond indicated sub-grade elevations or dimensions without direction by the Architect. Unauthorized excavation, as well as remedial work directed by the Architect, shall be at the Contractor's expense.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

- A. General: Provide approved borrow soil materials from off-site when sufficient approved soil materials are not available from excavations.
- B. Satisfactory Soil Materials: ASTM D 2487 soil classification groups GW, GP, GM, SW, SP, and SM; free of rock or gravel larger than 2 inches in any dimension, debris, waste, frozen materials, vegetation and other deleterious matter.
- C. Unsatisfactory Soil Materials: ASTM D 2487 soil classification groups GC, SC, ML, MH, CL, CH, OL, OH, and PT.
- D. Backfill Materials: Satisfactory soil materials.
- E. Sub-base Material: MDOT Class II; washed, graded sand, ASTM C 136, with 100 percent passing a 3-inch sieve, not less than 60 percent passing a 1-inch sieve, and not more than 30 percent passing a No. 100 sieve.

- F. Drainage Fill: Washed, evenly graded mixture of crushed stone, or crushed or uncrushed gravel, ASTM D 448, coarse aggregate grading size 57, with 100 percent passing a 1-1/2-inch sieve and not more than 5 percent passing a No. 8 sieve.
- G. Filtering Material: Evenly graded mixture of natural or crushed gravel or crushed stone and natural sand, with 100 percent passing a 1-1/2-inch sieve and 0 to 5 percent passing a No. 50 sieve.
- H. Impervious Fill: Clayey gravel and sand mixture capable of compacting to a dense state.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and adjacent plant materials from damage caused by earthwork operations.

3.2 EXCAVATION

- A. Excavate to indicated elevations and dimensions within a tolerance of plus or minus 0.10 foot.
 - 1. Excavations for Footings: Do not disturb bottom of excavation. Excavate by hand to final grade just before placing concrete reinforcement. Trim bottoms to required lines and grades to leave solid base to receive other work.
 - 2. Excavation for Walks: Excavate surfaces under walks to indicated cross sections, elevations, and grades.
 - 3. Excavation for Utility Trenches: Excavate trenches to indicated slopes, lines, depths, and invert elevations.
 - a. Excavate trenches to uniform widths to provide a working clearance on each side of pipe or conduit.
 - b. Trench Bottoms: Excavate and shape trench bottoms to provide uniform bearing and support of pipes and conduit.

ALWAYS INCLUDE NEXT TWO PARAGRAPHS FOR PROJECTS REQUIRING EXCAVATION.

- B. During Work activities if suspect contaminated soil, groundwater, or other unknown material is encountered contact both University of Michigan Construction Management Representative and UM OSEH Hazardous Materials and Remediation Services Program (phone no. 743-763-6973) immediately. Suspect contaminated soil may exhibit chemical or unusual odors, staining, unusual coloring, and/or contain man-made debris. Suspect contaminated groundwater may exhibit chemical or unusual odors, unusual coloring, and/or sheen.
- C. Immediately cease all excavation, dewatering, transport, or disturbance of the suspect material until given direction by University of Michigan Construction Management Representative.
- D. Fill unauthorized excavation under foundations by extending indicated bottom elevation of concrete foundation or footing to excavation bottom.

3.3 UTILITY TRENCH BACKFILL

- A. Place and compact initial backfill of satisfactory soil material or sub-base material, free of particles larger than 1 inch, to a height of 12 inches over the utility pipe or conduit.
- B. Coordinate backfilling with utilities testing.
- C. Place and compact final backfill of satisfactory soil material to final sub-grade.

INCLUDE BELOW FOR BACKFILLING AT FOOTING DRAINS.

3.4 SUBSURFACE DRAINAGE BACKFILL

- A. Drainage Backfill: Place and compact drainage backfill of filtering material over subsurface drain, in width indicated, to within 12 inches of final sub-grade. Overlay drainage backfill with one layer of filter fabric, overlapping edges at least 6 inches.
- B. Impervious Fill: Place and compact impervious fill material over drainage backfill to final sub-grade.

3.5 COMPACTION

- A. Place backfill materials in layers not more than 8 inches in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches in loose depth for material compacted by hand-operated tampers.
- B. Place backfill materials evenly on all sides of structures to required elevations. Place backfill and fill uniformly along the full length of each structure.
- C. Compact soil to not less than 95 percent maximum dry density according to ASTM D 1557.

3.6 SUBBASE COURSE

- A. Under walks, place sub-base course material on prepared sub-grades.
 - 1. Compact sub-base course at optimum moisture content to required grades, lines, cross sections and thickness to not less than 98 percent of ASTM D 4254 relative density.
 - 2. When thickness of compacted sub-base course exceeds 6 inches, place materials in equal layers, with no layer more than 6 inches thick or less than 3 inches thick when compacted.

3.7 DRAINAGE FILL

- A. Under slabs-on-grade, place drainage fill course on prepared sub-grade.
 - 1. Compact drainage fill to the required cross sections and thickness.
 - 2. When compacted thickness of drainage fill exceeds 6 inches thick place materials in equal layers, with no layer more than 6 inches thick; less than 3 inches thick when compacted.

3.8 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off the Owner's property.

END OF SECTION 312000

P00000000 0000

SPECIFICATION DIVISION 31

NUMBER SECTION DESCRIPTION

DIVISION 31 EARTHWORK

SECTION 312323 - FILL

END OF CONTENTS TABLE

DIVISION 31 EARTHWORK
SECTION 312323 - FILL

PART 1 - GENERAL

THIS SECTION SPECIFIES ENGINEERED COMPACTED GRANULAR FILL MATERIAL. USE ONLY WHEN FILL MUST BE ENGINEERED, NOT FOR ORDINARY BELOW-SLAB USE.

1.1 SUMMARY

- A. Extent of engineered granular fill indicated on drawings.
- B. Type of engineered granular fill is compacted sand and gravel, installed in layers and tested for compliance with requirements.

1.2 QUALITY ASSURANCE

- A. Employ an approved Geotechnical Testing Laboratory to evaluate and confirm compaction effort by testing for moisture content, and density of materials in place. For each 6 inch lift, test 6 locations at intervals not exceeding 25 feet. Immediately obtain test results, and re-compact and re-test areas not conforming to specified compaction requirements prior to placing additional fill materials.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Comply with the following Michigan Department of Transportation "1984 Standard Specifications for Construction" Section 8.02.06 for Granular Material Class I:
 - 1. Sieve Analysis: ASTM C 136
 - 2. Total Percent Passing - Dry Weights:
 - a. For 2-inch: 100 percent.
 - b. For 1/2-inch: 45-85 percent.
 - c. For No. 4: 20-85 percent.
 - d. For No. 30: 5-3 percent.
 - 3. Percent Loss by Washing - Dry Weights: ASTM C 117; 0-5 percent.
- B. Provide Granular Materials consisting of one, or any combination of, the following:
 - 1. Sand; gravel; crushed stone; foundry sand; iron blast-furnace slag; reverberatory-furnace slag.
 - 2. Provide foundry sand free of combustible materials and containing negligible quantities of iron.
- C. The following materials are not permitted:
 - 1. Cementitious shale.
 - 2. Crushed concrete.

PART 3 - EXECUTION

3.1 PLACEMENT AND COMPACTION

- A. Place fill materials in layers not exceeding 6 inches and compacted with portable pneumatic tampers and vibratory compactors to not less than 95 percent of maximum dry density as determined in accordance with ASTM D 1557 (modified Proctor).

DIVISION 31 EARTHWORK

SECTION 312326 - FLOWABLE FILL

END OF CONTENTS TABLE

DIVISION 31 EARTHWORK
SECTION 312326 - FLOWABLE FILL

PART 1 - GENERAL

THIS SECTION SPECIFIES A PUMPABLE CONCRETE GROUT MATERIAL WITH LIMITED SHRINKAGE - USED IN SPECIAL CIRCUMSTANCES ONLY.

1.1 SUMMARY

- A. Work Included: Class A Compacted Fill as indicated on drawings.
 - 1. In addition, install embedded items furnished under Division 05 Section "Metal Fabrication".

1.2 SUBMITTALS

- A. Submittals: In addition to product data, submit proposed mix design, including slump and weight data; and copy of laboratory test report showing strengths achieved and expected curing time.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Manufacturer: Provide materials manufactured by the following:
 - 1. Flo-Fill Co., 1008 Scheurmann St., Essexville, Mi 48732; phone no. (517)-893-1493.
 - a. "Flo-Fill" compacted, class A, fill; complying with the following:
 - 2. Fly Ash: approximately 1950 pounds per cubic yard.
 - 3. Portland cement: approximately 85 pounds per cubic yard.
 - a. Water: 60 to 70 gallons per cubic yard.
 - 4. Minimum Cured Strength: 6000 pounds per square foot.
 - 5. Dry Weight: 60 to 70 pounds per cubic foot.

2.2 MIXING

- A. Mix material on site in strict accordance with manufacturer's instructions.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Placing: Pump mixture into place in fluid state to eliminate compaction effort. Spread and level to grades indicated on drawings.
- B. Curing: Cure by drying for a minimum of 7 calendar days before placing additional construction over fill material.

DIVISION 31 EARTHWORK

SECTION 312500 - SOIL EROSION AND SEDIMENTATION CONTROLS

END OF CONTENTS TABLE

DIVISION 31 EARTHWORK

SECTION 312500 - SOIL EROSION AND SEDIMENTATION CONTROLS

AUGUST, 2005 - UPDATED TO REFLECT CURRENT REQUIREMENTS OF UM OSEH.

DUE TO REGULATORY REQUIREMENTS, DO NOT EDIT THIS SECTION OTHER THAN WHERE INDICATED BY COMMENTARY.

CONSULT WITH OSEH ON ALL PROJECTS FOR WHICH SOIL EROSION AND SEDIMENTATION CONTROL MIGHT BE REQUIRED IN ORDER TO DETERMINE IF THE PROJECT DOES REQUIRE SESC AND TO DETERMINE APPROPRIATE SESC MEASURES FOR THE PROJECT. IF THE PROJECT QUALIFIES FOR SESC, SUBMIT A PROJECT NOTIFICATION FORM TO OSEH. FORM CAN BE DOWNLOADED FROM WEB SITE WWW.OSEH.UMICH.EDU/SESCAPPA.PDF

IF THIS SECTION IS INCLUDED IN THE SPECIFICATIONS, ALSO INCLUDE ACCOMPANYING SOIL EROSION AND SEDIMENTATION CONTROLS SUPPLEMENTAL CONDITIONS IN THE FRONT END DOCUMENTS.

PART 1 - GENERAL

1.1 SUMMARY

- A. This section includes conducting earthwork and earth change activity operations in a manner to protect Waters of the State (of Michigan), storm drains, and adjacent properties from soil erosion and sedimentation.

1.2 DEFINITIONS

- A. "[Waters of the State](#)" includes the Great Lakes and their connecting waters, lakes, ponds and streams which may or may not be serving as a County drain as defined by the drain code; or any other body of water that has definite banks, a bed and visible evidence of a continued flow or continued occurrence of water or wetlands regulated under Part 303.

1.3 SUBMITTALS

- A. Submit product information for materials proposed for use.

1.4 QUALITY CONTROL

- A. Requirements of Regulatory Agencies: For earth changes, comply with the following:

DELETE BELOW IF SITE IS LESS THAN ONE ACRE AND MORE THAN 500 FEET FROM WATERS OF THE STATE.

- 1. Part 91, Soil Erosion and Sedimentation Control (SESC) of the Natural Resource & Environmental Protection Act, [1994 PA 451, as amended \(Part 91\)](#).

ALWAYS INCLUDE BELOW.

- 2. The University of Michigan [Soil Erosion & Sedimentation Control Procedures](#).

1.5 INSPECTIONS

The U-M Department of Environment, Health and Safety (EHS) or their designee, who have received a MDEQ SESC certificate of training, will inspect sites weekly during construction activities and within 24 hours of a significant rain event (for sites 1 acre or more in size) to ensure compliance with the U-M SESC Procedures and Part 91 SESC Regulations. These inspections will continue from the beginning of earthwork until the site is stabilized.

1.6 PERFORMANCE REQUIREMENTS

- A. Implement the soil erosion and sedimentation control plan including required maintenance during construction and final removal as directed in the plans, and as needed per site conditions and as required by site inspections by U-M EHS.
- B. Control runoff, soil erosion, and sedimentation. No sediment should leave the site.
- C. Prevent wind erosion. No visible emissions (dust) should leave the site.

- D. Comply with U-M [Soil Erosion and Sedimentation Control Procedures](#).

1.7 REFERENCES

- A. [Southeast Michigan Council of Governments Low Impact Development Manual](#)

PART 2 - MATERIALS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 GENERAL

- A. Where the following events result in the need for additional or modified soil erosion and sedimentation control installations to meet the objective of the referenced procedures, provide remedial installations on a timely basis.

- 1. Unanticipated alterations to the construction schedule.
- 2. Unanticipated site conditions except Acts of God such as a tornado or fire.

- B. Install temporary erosion and sedimentation control measures prior to or upon commencement to earthwork activities.

- 1. Install an entrance anti-tracking pad with a minimum of 50 feet in length. A geotextile filter fabric should be placed under 6 inches of limestone aggregate.
- 2. Install temporary inlet protection at all adjacent and down-gradient storm water inlets, catch basins and manholes that may be impacted.

BELOW IS ONE EXAMPLE OF A PERIMETER BARRIER. MODIFY TO SUIT PROJECT.

- 3. Install silt fence with stakes on the side down gradient from the disturbed area. Toe in six inches of the fencing material.
- 4. Place stockpiles and other spoil piles away from the drainage system to minimize sediment transport. Keep as few stockpiles as possible during the course of the project. If the stockpile and/or spoil pile must remain on-site overnight, or if the weather conditions indicate the chance for precipitation,
 - a. cover the pile with water repellent material to prevent erosion or
 - b. install silt fencing or appropriate sedimentation barrier around the base of the pile to prevent transport of sediment to the storm water system and wet the pile as needed to prevent wind erosion, or
 - c. apply other control methods as appropriate to the site.
- 5. Where runoff enters the existing storm water system, protect the storm system from sedimentation.
 - a. Temporary inlet protection must prevent the release of sediment and allow for proper drainage.
 - 1) Use of burlap is not acceptable as a SESC measure.
 - 2) If filter fabric is used on drains, ensure the filter fabric is placed over (not under) the storm grates to facilitate maintenance (cleaning) of the controls.

- 3) If high storm water flows are expected, use silt sacks in lieu of filter fabric for drain protection. Based on site conditions select regular or high flow silt sacks as appropriate.
- C. Utilize a water truck as needed for dust control.
 - D. Utilize a sweeping machine to remove sediment tracked onto the pavement on a daily basis at minimum. Use sweeper more frequently as dictated by site conditions and/or as recommended by U-M EHS Inspector.
 - E. Maintain erosion and sedimentation controls on a daily basis until the contract has been completed and accepted. Maintenance shall include:
 1. Repair of damaged installations.
 2. Replacement of lost soil erosion & sedimentation control measures.
 3. Periodic removal of collected silt and sedimentation as required or directed to maintain effectiveness of the silt traps, filters and basins.
 - F. Correct non-conforming soil erosion and sedimentation control measures on a timely basis, within 24 hours if Waters of the State are being impacted or could be impacted, or within 5 days if not impacting Waters of the State.
 - G. Complete permanent soil erosion control measures for all slopes, channels, ditches, or any disturbed land area within 5 calendar days after final grading or the final earth change has been completed. Maintain temporary control measures until permanent soil erosion control measures are in place and the area is stabilized.

3.2 CLEAN UP

- A. Remove temporary erosion control measures after permanent soil erosion measures are in place and the area is stabilized, unless ordered by the U-M EHS Inspector to remain in place. Care shall be taken during removal to prevent soil erosion and sedimentation.

DIVISION 32 EXTERIOR IMPROVEMENTS

SECTION 329210 - LAWN REPAIR

END OF CONTENTS TABLE

DIVISION 32 EXTERIOR IMPROVEMENTS
SECTION 329210 - LAWN REPAIR

THIS SECTION SPECIFIES LAWN REPAIR FOR DUMPSTER AND TRUCK TIRE DAMAGE. REFER MORE EXTENSIVE LAWN WORK TO LANDSCAPE ARCHITECT.

2/07 - ADDED NOTE TO REQUIRE 4" MIN. TOPSOIL

PART 1 - GENERAL

1.1 SUMMARY

- A. Extent of lawn repair includes areas damaged by construction operations, including movement of heavy equipment, dumpster locations and similar operations.
- B. Types of lawn repair include the following:
 - 1. Grading and fine raking.
 - 2. Seeding.
 - 3. Mulching.

1.2 SUBMITTALS

- A. Product data or certificates of conformance indicating that products used comply with requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Seed: Fresh, clean, dry, new-crop seed composed of varieties, in equal proportions, tested for minimum percentages by weight of purity and germination as follows:
 - 1. Baron Kentucky Bluegrass; 98% purity; 80% germ.
 - 2. Nugget Kentucky Bluegrass; 98% purity; 90% germ.
 - 3. Touchdown Kentucky Bluegrass; 98% purity; 90% germ.
 - 4. Pennlawn Red Fescue; 98% purity; 90% germ.
 - 5. Manhattan Ryegrass; 97% purity; 90% germ.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Thoroughly loosen and grade soil to true lines, free from unsightly variation, lumps, ridges and depressions. Remove sticks, stones, roots and other objectionable material over 1 inch in any dimension that might interfere with the formation of a finely pulverized seed bed.
- B. Level displaced soil around perimeter of ruts and depressions.

- C. Distribute topsoil on damaged lawn areas in quantity sufficient to provide repaired areas that are level and uniform with adjacent undisturbed lawn areas.
- D. Spread, cultivate and lightly compact a minimum of 4" topsoil to prevent future settlement; drag and grade to finished grade.

3.2 APPLICATION

- A. Rake seed uniformly to an average depth of 1/4 inch, and at a rate of 2.3 lb. per 1000 sq. ft. Lightly roll the seed bed to provide good moisture contact between the seed and soil.
- B. Mulch seeded areas with straw.
- C. Water thoroughly and immediately with a fine mist until straw is compacted and soil is soaked to a depth of 3 inches.

SECTION 331100 - WATER DISTRIBUTION PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section includes water-distribution piping and related components outside the building for [water main] [domestic water service leads] [fire service leads].[Edit for project specific.](#)

1.3 DEFINITIONS

[Retain abbreviations that remain after this Section has been edited.](#)

- A. AASHTO: American Association of State and Highway Transportation Officials.
- B. ACI: American Concrete Institute.
- C. ANSI: American National Standards Institute.
- D. ASTM: American Society for Testing and Materials.
- E. AWWA: American Water Works Association.
- F. HDPE: High Density Polyethylene.
- G. MDEQ: Michigan Department of Environmental Quality.
- H. MDOT: Michigan Department of Transportation.
- I. NSF: National Sanitation Foundation.
- J. OSHA: Occupational Safety and Health Administration.
- K. PPM: Parts Per Million.
- L. PSI: Pounds per Square Inch.
- M. SDR: Standard Dimension Ratio.
- N. UL: Underwriters Laboratory.
- O. UM: University of Michigan.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: Detail precast concrete manhole assemblies and indicate dimensions, method of field assembly, and components.
- C. Manufacturer Certification: All pipe and material furnished shall be accompanied by the manufacturer's certification.

Building Name

Description of the Project

P0000000 Issued for:[BID] [BID&CONSTRUCTION][DATE] 331100 - 2

D. Cut sheets for Contractor layout and staking locations.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control test reports.

1.6 QUALITY ASSURANCE

Retain and edit first paragraph and subparagraphs below if not applicable.

A. Regulatory Requirements:

1. Comply with requirements of the City of Ann Arbor, MDEQ, and U-M.
2. Comply with standards of authorities having jurisdiction for potable-water-service piping, including materials, installation, testing, and disinfection.
3. Comply with standards of authorities having jurisdiction for fire-suppression water-service piping, including materials, hose threads, installation, and testing.

B. NFPA Compliance: Comply with NFPA 24 for materials, installations, tests, flushing, and valve and hydrant supervision for fire-service-main piping for fire suppression.

C. NSF Compliance:

Delete first subparagraph below if NSF 14 is not applicable.

1. Comply with NSF 14 for plastic potable-water-service piping.
2. Comply with NSF 61 Annex G for materials for water-service piping and specialties for domestic water.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Preparation for Transport: Prepare valves, including fire hydrants, according to the following:

1. Ensure that valves are dry and internally protected against rust and corrosion.
2. Protect valves against damage to threaded ends and flange faces.
3. Set valves in best position for handling. Set valves closed to prevent rattling.

B. During Storage: Use precautions for valves, including fire hydrants, according to the following:

1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground

Building Name

Description of the Project

P0000000 Issued for:[BID] [BID&CONSTRUCTION][DATE] 331100 - 3

or pavement in watertight enclosures when outdoor storage is necessary.

- C. Handling: Use sling to handle valves and fire hydrants if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.
- D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.
- E. Protect stored piping from moisture and dirt. Elevate above grade. Protect flanges, fittings, and specialties from moisture and dirt.
- F. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.
- G. Product Inspection: All materials furnished shall be subject to inspection on arrival at the job site by the Owner or Owner's agent. The purpose of the inspection shall be to cull and reject products that, independent of physical tests specified under the standard specifications designated herein, fail to conform to the requirements of these specifications. Materials shall be subject to rejection on account of any of the following:
 - 1. Variation in any dimension exceeding the permissible variations given in the material specifications. Pipe in all cases shall be full diameter.
 - 2. Fractures or cracks passing through the barrel or socket.
 - 3. Chips or fractures on the interior of the pipe exceeding two inches in length, one inch in width, or depth more than $\frac{1}{4}$ of the thickness of the wall.
 - 4. Blisters that are either broken, exceed three inches in diameter, or project more than $\frac{1}{8}$ inch above the surrounding surface of the pipe.
 - 5. Variation of more than $\frac{1}{16}$ inch per lineal foot in alignment of pipe intended to be straight.
- H. Rejected materials shall be clearly marked by the Inspector and immediately removed from the site of work by the Contractor, without cost to the Owner.

1.8 PROJECT CONDITIONS

Retain this Article if interruption of existing water-distribution service is required.

- A. Interruption of Existing Water-Distribution Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water-distribution service according to requirements indicated:

1. Notify Owner no fewer than five working days in advance of proposed interruption of service. Coordination of a building system water shutdown requires a minimum of ten working days.
2. Do not proceed with interruption of water-distribution service without Owner's written permission.

1.9 COORDINATION

Edit this Article to suit Project if new water-distribution piping will connect to other on-site water-distribution piping.

- A. Coordinate inspection with City of Ann Arbor or with authority having jurisdiction and with Owner's representative.
- B. Coordinate water main testing and connection to existing water main with the City of Ann Arbor or authority having jurisdiction.
- C. Coordinate service shutdowns with Owner's representative for impacted facilities.
- D. Contractor shall **not** turn valves - coordinate with City of Ann Arbor or the authority having jurisdiction, and with University of Michigan Utilities.
- E. Coordinate water service installation with the City of Ann Arbor or authority having jurisdiction.
 1. For two-inch copper service or smaller, City of Ann Arbor Field Operations shall tap the water main and supply and install the proposed water service from the main to the curb box. Contractor shall supply and install the water service from the curb box to the building.

PART 2 - PRODUCTS

Note that the City of Ann Arbor current approved manufacturers and products are to be referenced. The City's standard specification book may be outdated. Work with AEC to specify manufactures and products.

2.1 DUCTILE-IRON PIPE AND FITTINGS

- A. Mechanical-Joint Piping:
 1. Pipe: AWWA C151, thickness class 52.
 - a. All pipe shall have standard thickness cement mortar lining and asphaltic seal coat in accordance with ANSI/AWWA C104/A21.4 and coated outside with asphaltic coating in accordance with ANSI/AWWA C151/A21.51.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) Pipe designation and class.
 - 2) Name and trademark of the manufacturer.
 - 3) Country of origin. American steel only.
 - 4) Year the pipe was produced.

Building Name

Description of the Project

P0000000 Issued for:[BID] [BID&CONSTRUCTION][DATE] 331100 - 5

2. Mechanical Fittings: AWWA C111, for joint restraint system and bolts.
 - a. Mega lug joint restraint system by EBAA Iron Sales, Inc.
 - b. Bolts shall be high strength, low alloy steel bolts only.
 - c. The following information shall be clearly marked on each fitting:
 - 1) Pressure rating of the fitting.
 - 2) Nominal diameters of the opening.
 - 3) Name and trademark of the manufacturer.
 - 4) Country of origin. American steel only.
 - 5) Number of degrees or fraction of the circle on all bends.
 - 6) Ductile iron fittings shall have the letters "DI" cast on them.
 3. Gaskets: AWWA C111, rubber, of shape matching pipe and fittings.
 - a. Lubricants used shall be supplied, or recommended, by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 4. Polyethylene wrap per ANSI/AWWA C105/A21.5
- B. Push-on-Joint Piping:
1. Pipe: AWWA C151, thickness class 52. Pipe beneath railroads shall be thickness class 56.
 - a. All pipe shall have standard thickness cement mortar lining and asphaltic seal coat in accordance with ANSI/AWWA C104/A21.4 and coated outside with asphaltic coating in accordance with ANSI/AWWA C151/A21.51.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) Pipe designation and class.
 - 2) Name and trademark of the manufacturer.
 - 3) Country of Origin. American steel only
 - 4) Year the pipe was produced.
 2. Standard Fittings: AWWA C110, ductile iron.
 - a. All pipe fittings shall have standard thickness cement mortar lining and asphaltic seal coat in accordance with ANSI/AWWA C104/A21.4 and coated outside with asphaltic coating in accordance with ANSI/AWWA C151/A21.51.
 - b. Push-on Joints to be used unless otherwise noted.
 - c. Restrained Joints
 - 1) TR-Flex restrained joint by U.S. Pipe.
 - 2) Lok-Ring joint by American Ductile Iron Pipe.
 - 3) Or Engineer approved equal.
 - d. The following information shall be clearly marked on each fitting:
 - 1) Pressure rating of the fitting.
 - 2) Nominal diameters of the openings.
 - 3) Name and trademark of the manufacturer.
 - 4) Country of origin. American steel only.
 - 5) Number of degrees or fraction of the circle on all bends.
 - 6) Ductile iron fittings shall have the letters "DI" cast on them.
 3. Gaskets: AWWA C111, rubber, of shape matching pipe and fittings.
 - a. Restrained Joints
 - 1) Fast-Grip by American Pipe.

Building Name

Description of the Project

- 2) Field-Lok by U.S. Pipe.
- 3) Or Engineer approved equal.
- b. Lubricants used shall be supplied, or recommended, by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
- 4. Polyethylene wrap per ANSI/AWWA C105/A21.5
- C. Domestic Water Service:
 - 1. Pipe: ASTM B88, Type K Copper.
 - a. For 2 inch and smaller water services. Larger water services shall utilize ductile iron pipe covered above.
 - 2. Fittings: ANSI B16.22, wrought copper.
 - a. Minimize joints. Joints shall be flare connection or brazed.
 - b. All fittings shall be lead free.

2.2 HDPE PIPE AND FITTINGS

- A. HDPE Pipe, AASHTO/ASTM M294/F892, AWWA C906 meeting ANSI/NSF Standard 14, SDR 7.0 corrugated with integrally formed smooth interior.
 - 1. N-12 pipe by Advanced Drainage Systems, Inc. (ADS).
 - 2. Titeline by Hancor.
 - 3. Or Engineer approved equal.
 - 4. AWWA C906 and NSF 14 identifications shall appear on exterior wall print line.
- B. HDPE Joints, ASTM D3212, ANSI/NSF Standard 14, watertight joints using watertight sleeves.
 - 1. Sleeves shall have an indentation in the center to ensure proper positioning of the pipe.
 - 2. Sleeves shall be factory installed on one end of the pipe with a factory installed gasket on the other end.
 - 3. Joints for pipe between 21" and 24" may also use silt tight joints using split coupling bands and geotextile fabric.
- C. Gaskets, ASTM F477, solid cross section rubber manufacturer to fit the pipe and fittings.
- D. Lubricant used in making up joints shall be supplied, or recommended, by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.

2.3 CORROSION-PROTECTION/PIPING ENCASEMENT

- A. Polyethylene wrap for Underground Metal Piping:
 - 1. Standards: ANSI C105 and AWWA A21.5.
 - 2. Color: Black

Note to Designer:
 Include Steel Casing Pipe specification, as necessary.

- B. Steel Casing Pipe
 - 1. Standards: ASTM A 53, Type E or S, Grade B.

2. Material: Steel casing pipe shall meet the following schedule of thickness based on nominal diameter of casing pipe:

<u>Nominal Diameter of Casing Pipe (inches)</u>	<u>Minimum Wall Thickness (inches)</u>
Under 14	0.250
14, 16, and 18	0.312
20 and 22	0.375
24, 26, 28, and 30	0.500
32 and 34	0.563
36, 38, 40, 42, and 48	0.625
3. Identification: The following information shall be clearly marked on each length of pipe.
 - a. The pipe designation and class.
 - b. The name or trademark of the manufacturer.
 - c. Identification of the manufacturing plant.

2.4 VALVES

- A. Gate Valves, certified by UL or NSF for use in a potable water system and shall meet current City of Ann Arbor Material Standards, or authority having jurisdiction:
 1. Resilient seat non-rising stem push-on.
 2. Two-inch square operating nut.
 3. Right-hand open.
 4. Joints meeting ANSI/AWWA C111/A21.11.
 5. Gate valve shall be of the following models, unless otherwise noted in the City of Ann Arbor Division III Material Standards:
 - a. Series 300 and T300 NRS Double Disc Gate Valve by Waterous.
 - b. A-2380 Series by Mueller.
 - c. Series A by East Jordan Iron Works.
 - d. AWWA 571X by Kennedy.
 - e. Or Engineer approved equal.
 6. 16 inch and larger gate valves shall be furnished with 3 inch valved by-pass, right-hand open.
 7. 20 inch and larger gate valves shall be furnished with bronze rollers, tracks and scrapers, having enclosed beveling gearing, and shall be installed horizontally. Gearing shall consist of cut tooth cast steel gears with rolled bronze pinion shafts having a minimum mechanical advantage ratio of 2 to 1.
 - a. List 14 AWWA Gate valve by Eddy - Iowa Division or James B. Clow & Sons, Inc.
- B. Butterfly Valves, AWWA C504-74, certified by UL or NSF for use in a potable water system and shall meet the current City of Ann Arbor material standards, or authority having jurisdiction:
 1. Two-inch square operating nut.
 2. Right-hand open.
 3. Butterfly valve shall be of the following models, unless otherwise noted in the City of Ann Arbor Division III Material Standards:
 - a. Groundhog by Henry Pratt.
 - b. Lineseal III by Mueller.
 - c. Or Engineer approved equal.

Building Name

Description of the Project

- C. Tapping Sleeve and Valves, rated for a minimum 250 psi working pressure, certified by UL or NSF for use in a potable water system and shall meet the current City of Ann Arbor material standards, or authority having jurisdiction.
 - 1. Sleeve shall meet current City of Ann Arbor Material Standards or authority having jurisdiction:
 - a. F-5205 by Clow.
 - b. H-615 by Mueller.
 - c. Series 800 by Waterous
 - d. Or Engineer approved equal
 - 2. Tapping Valve and shall meet the current City of Ann Arbor material standards, or authority having jurisdiction.
 - a. Double-disk type, of the same manufacturer as the sleeve.
 - b. NRS with 2-inch square operating nut.
 - c. Right-hand open.
 - d. Mechanical joint outlet.

- D. Gate Valve Box shall meet the current City of Ann Arbor material standards, or authority having jurisdiction:
 - 1. Buffalo type, Size D, screw type, 3-piece, 5-1/4-inch shaft.
 - a. #6 base for valves 8 inches or less.
 - b. #8 base for valves 10 or 12 inches.
 - c. Valve standards for valves 16 inches or larger shall be coordinated with the City of Ann Arbor.
 - 2. Casting cover shall be labelled "Water" in raised lettering.
 - 3. Tyler 6860 or Engineer approved equal.

- E. Curb Boxes shall meet the current City of Ann Arbor material standards, or authority having jurisdiction:
 - 1. Buffalo type, Size 95E, screw type, 2-piece, 2-1/2-inch shaft, extendable from 4-1/2 feet to 6 feet.
 - 2. Curb boxes shall meet the current City of Ann Arbor Division III Material Standards and shall be the following unless otherwise noted by the City of Ann Arbor:
 - a. H-10350 by Mueller.
 - b. 6500 by Tyler
 - c. B-2000 by Bibby Ste. Croix
 - d. Or Engineer approved equal.

Edit to meet current City of Ann Arbor products or authority having jurisdiction. U-M water main material for pipes greater than 2" shall be CL 52 DI.

2.5 FIRE HYDRANTS

- A. Fire Hydrant, ANSI/AWWA C111/A21.11:
 - 1. 6-inch mechanical joint pipe connection.
 - 2. Two 2-1/2-inch National Standard hose connections.
 - 3. One 3-1/2 inch Ann Arbor Standard pumper connection.
 - a. 7-1/2 threads per inch.
 - b. 4.05 inch outside diameter.
 - 4. 3/8-inch pentagon operating and cap nuts.
 - a. 1-3/8-inch point-to-flat at top.
 - b. 1-7/16-inch point-to-flat at base.

Building Name

Description of the Project

P0000000 Issued for:[BID] [BID&CONSTRUCTION][DATE] 331100 - 9

5. Left-hand open.
6. Breakable flange construction.
7. No barrel drain.
8. Color: Red.
9. Depth of bury: 6 feet.
10. Fire hydrant shall meet the current City of Ann Arbor material standards, or authority having jurisdiction:
 - a. Model 5-BR 250 by East Jordan Iron Works.

2.6 MANHOLES

Retain this Article if vaults are required and are not specified in Section 033000 "Cast-in-Place Concrete" or Section 033053 "Miscellaneous Cast-in-Place Concrete."

A. Standard Precast Concrete Manholes:

1. Description: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
4. Base Section: 8-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section; with separate base slab or base section with integral floor.
5. Riser Sections: 4-inch minimum thickness, of length to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type as indicated; with top of cone of size that matches grade rings.
7. Joint Gaskets: ASTM C 443, rubber O-ring gasket. Joints pointed with mortar after installation, both inside and outside of the manhole.
8. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection. Neoprene rubber shall meet ASTM C 443 and have a minimum thickness of 3/8 inch. Pipe clamps shall be of corrosion-resistant steel. Pipe connectors shall be one of the following:
 - a. Flexible neoprene rubber boot securely clamped into a core-drilled pipe port. Pipe ports shall be core-drilled at the point of manhole manufacture and shall be accurately located within 1/2 inch of proposed sewer centerline.
 - b. Self-adjusting mechanical pipe to manhole seal providing resilient flexible and infiltration-proof joint.
 - c. Flexible rubber wedge firmly secured against a rubber gasket cast into the manhole.
 - d. Engineer approved equal.
9. Steps: ASTM C 478 injection molded copolymer, polypropylene, encapsulating a 1/2 inch grade 60 steel reinforcing bar with an impact resistance of 300 ft-lbs and a pull out force resistance of 1500 lbs; Cast or anchor steps into sidewalls at 15-inch intervals. Step depth shall a minimum of 6 inches.
10. Grade Rings: 2-inch Reinforced-concrete rings, 2-inch minimum and 6-inch maximum height, with diameter matching manhole frame and cover.

11. Aggregate Base: Structure shall be placed on a minimum of 4 inches of 21AA limestone bedding.
12. Manholes shall be used for housing gate valves, only as called for on the plans.

B. Manhole Frames and Covers:

1. Description: East Jordan Iron Works, 1040 with type "C" lid or Engineer approved equal. Include indented top design with lettering cast into cover, using wording equivalent to "WATER".
2. Material: ASTM A 48, Class No. 30, gray iron unless otherwise indicated.

PART 3 - EXECUTION

3.1 EARTHWORK

- A. Refer to Section 312000 "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of water main. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Excavate trench according to OSHA guidelines and backfill the trench as indicated in the City of Ann Arbor utility trench details or as directed by the Engineer.

Note to Designer:

Water main connection shall be coordinated with the water supplier having jurisdiction. In some cases, this may not be City of Ann Arbor.

- C. Water-Main Connection: Coordinate with City of Ann Arbor or authority having jurisdiction and Owner's representative for connections to existing water main.
1. Owner shall be notified 5 working days prior to any proposed interruption of service. Coordination of a building system shutdown requires a minimum of 10 working days' notice.
 2. Dry Tap:
 - a. Contractor shall coordinate with the Owner for water main gate valve shutdowns. Contractor shall not turn valves.
 - b. Contractor shall provide means for maintaining the site of the tap in the dry in the event that existing water main valves provide a poor shutdown.
 - c. All pipe, fittings, and appurtenances necessary to complete the water main connection shall be on site prior to excavation for the connection.
 - d. No water main shutdown will take place after 12:00pm, unless expressly granted by the Owner.

Building Name

Description of the Project

P0000000 Issued for:[BID] [BID&CONSTRUCTION][DATE] 331100 -

3. Wet Tap:
 - a. Prior to the installation of a tapping sleeve, the section of pipe to be tapped shall be cleaned of all foreign material and wire brushed to a smooth surface.
 - b. The tapping sleeve shall be installed per manufacturer's guidelines.
 - c. All pipe materials and appurtenances shall be disinfected with a strong chlorine solution prior to installation.
 - d. Tap assembly shall be tested using the test plug tap in the sleeve with the valve closed, or by placing a tapped plug on the outlet of the valve with the valve open. The assembly shall be pressurized to 150 psi and hold the pressure for fifteen minutes.
4. Water Service Tap:
 - a. 2" copper water service lead or smaller will be performed by the City of Ann Arbor's Field Operations Unit who will supply and install copper from the water main to the curb box. The Owner will be responsible for the copper lead from the curb box to the building.
 - b. Greater than 2" water service and for ductile iron water service, Contractor shall tap the main and supply and install the proposed water service from the main to the building. Coordinate inspection with City of Ann Arbor or with authority having jurisdiction.

Retain paragraph a.) above if tap is made by utility company; retain Paragraph b.) above if tap is made by Contractor.

- D. Setting Joints: Mechanical means shall be used for pulling home all rubber-gasketed pipe regardless of trench condition where manual means will not result in pushing and holding the pipe home.
 1. When trench box or liner is used, the Contractor shall provide and use a cable to pull the joints home and hold them in position.
 2. When work is performed in wet trenches or trenches with running sand, the Contractor shall ensure that the interior of the pipe remains clean and dry.

Retain first paragraph and subparagraphs below for tapping of pipe with connections NPS 2 (DN 50) and smaller.

- E. Permissible Deflection at Joints, the deflections shall not exceed the following amounts:

Size of Pipe Radius of Curve	Joint Angle	Deflection in 18 feet	Approx.
<u>(Inches)</u>	<u>(Degrees)</u>	<u>(Inches)</u>	<u>(Feet)</u>
4	5	19	205
6	5	19	205

8	5	19	205
10	5	19	205
12	5	19	205
16	3	11	340
20	3	11	340
24	3	11	340

F. Cutting Water Main Pipe:

1. Flame or torch cutting of water main pipe is not allowed.
2. Pipe shall be cut in a manner that will not damage the pipe or cement lining of the pipe and shall provide a clean and 90 degree cut.

G. Abandoning Water Main:

1. Cut the end of the main in accordance with the section above.
2. Work with U-M Project Manager for City approved method of pipe abandonment and appurtenance removal.
3. Break down existing water structures, remove manhole casting and cover, grade rings, and top 4 feet of structure. Backfill remainder of the structure with MDOT class II sand.

H. Anchorage for Water Main Fittings and Appurtenances:

1. All plugs, caps, tees, hydrants, and bends shall be provided with a Class A concrete reaction backing (thrust block). Thrust block shall be placed between unexcavated solid ground and the fitting to be anchored.
 - a. Thrust block shall be placed such that the pipe and fittings are accessible for repairs, which shall include protection of any bolts from direct contact with the concrete.
 - b. Metal harnesses of tie rods or clamps may not be used instead of thrust block.
 - c. Friction clamps or set-screw type retainer glands will not be allowed for thrust restraint.
 - d. Restrained joint gaskets rated for 350 psi are required for vertical bends.

3.3 MANHOLE INSTALLATION

- A. General: Install manholes complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Install FRP manholes according to manufacturer's written instructions.

- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 3 inches above finished surface elsewhere unless otherwise indicated.

Retain paragraph below only if specified in "Manholes" Article.

- E. Install manhole-cover inserts in frame and immediately below cover.

3.4 WATER MAIN TESTING

- A. Contractor shall coordinate all work around water main testing. Any additional time required to obtain a passing result in any of the water test will not be considered sufficient cause for an extension of time.
- B. The water main shall be disinfected and tested by the Contractor in the presence of the Public Services Director in accordance with the requirements below. The Contractor shall furnish all piping, pumps, gauges and other materials and equipment required to carry out the tests using water from the City's water mains. Any hoses which are needed to direct water from blow-offs and/or hydrants during water main testing and flushing shall be supplied by the Contractor. The City shall furnish and install one-inch corporation stops at all necessary locations, at the expense of the Contractor. The tapping of water mains, the installation of all corporations stops, and the operation of valves and hydrants is reserved for City personnel. The Contractor is required to assist in valve and hydrant operation, however. The Contractor shall give the City 48 hour's prior notice of intent and desire to test water mains. If the Contractor so desires, the Public Services Department - Engineering Division will (when personnel and equipment are available) perform disinfecting and pressure testing for the Contractor at the Contractor's expense.
- C. Connections to the existing water main shall not be made until the new water main has been successfully pressure tested and has passed bacteriological testing. Final connections shall be coordinated with the Engineer. The Contractor shall coordinate all water system shutdowns with Owner's Representative and the City of Ann Arbor.
- D. Construction Sequence, the normal sequence and time requirements for testing are as follows:

<u>Isolated (Gapped) Water Main</u>	<u>Connected Water Main</u>
1. Fill Main	1. Flush and Swab*
2. Pressure Test	2. Chlorinate
3. Connect One End of Main	3. Wait 24 hours
4. Flush and Swab*	4. Flush**
5. Chlorinate	5. Wait 24 hours

- | | |
|-----------------------------|------------------------------------|
| 6. Wait 24 hours | 6. Bacteriological |
| 7. Flush** | 7. Wait 24 hours |
| 8. Wait 24 hours | 8. Bacteriological |
| 9. Bacteriological samples | 9. Wait 48 hours |
| 10. Wait 24 hours | 10. Pressure Test, if samples pass |
| 11. Bacteriological samples | 11. Flush* |
| 12. Wait 48 hours | 12. Wait 24 hours |
| 13. Make Final Connections | 13. Bacteriological |
| | 14. Wait 24 hours |
| | 15. Bacteriological |
| | 16. Wait 48 hours |
| | 17. Make Final Connections |

* Collect flush water in operable storm water retention/detention facility.

** Discharge flush water into approved sanitary sewer.

E. Hydrostatic (Pressure Test):

1. Maximum length for testing is 1,500 feet.
2. Slowly fill main and pump pressure to 150 psi. Test pressure shall be maintained between 145-155 psi.
3. Testing Period - 3 hours.
4. Water shall be chlorinated to 25 ppm.
5. If leakage exceeds maximum allowable leakage, as specified below, the joints shall be carefully inspected and any that are found to be leaking shall be removed and replaced at no cost to the Owner.
6. The following chart shows the maximum allowable leakage:

Maximum Allowable Leakage per 100 Joints at 150 psi Avg. Test Pressure								
Pipe Diameter (inches)	4	6	8	10	12	16	20	
Leakage (gallons/hr)	0.66	0.99	1.32	1.66	1.99	2.65	3.31	

F. Flushing and Swabbing:

1. The following swabs are approved for use:
 - a. Girard Aqua Swab (AS) 2 lbs/cf density swab polly-pig.
 - b. Or Engineer approved equal.
2. Water main shall be flushed such that the polly-pig is pushed from end to end of the proposed water main.

G. Chlorination, disinfected in accordance with AWWA C65I "Disinfecting Water Mains" and as specified herein:

1. Water shall be chlorinated to a minimum residual 50 ppm with commercial liquid chlorine solution (sodium hypochlorite).
2. Duration shall be 24 hours with a remaining free available chlorine residual of at least 25 ppm. If less than 25 ppm residual is shown at the end of the 24 hour period, additional chlorine shall be added until a minimum 25 ppm residual is maintained for 24 hours.
3. After passing result, the chlorinated water shall be removed from the water main and disposed of into an existing, owner approved, sanitary sewer main.
4. The minimum recommended dosage of sodium hypochlorite is as follows (based on 10% available chlorine)
Recommended Minimum Chlorine Dosage to Disinfect 100 L.F. of Pipe

Pipe Diameter (inches)	10% Chlorine Solution (gallons)
6	0.153
8	0.272
10	0.426
12	0.613
16	1.090
20	1.703
24	2.452

H. Bacteriological Testing:

1. City of Ann Arbor will take samples to verify chlorine content meets specifications and for bacteriological testing.
2. 24 hours must elapse between flushing of the main and the first sample taken.
3. 48 hours are required to obtain test results for each sample.

3.5 IDENTIFICATION

Note to designer: Verify with U-M Civil and/or Design Manager if tracer wire will be necessary. HDPE water main requires tracer wire.

- A. Install continuous underground tracer wire during backfilling of trench for underground water main.

Delete paragraph above if metallic water-service piping without electrically insulated fittings will be used.

SPECIFICATION DIVISION 33
NUMBER SECTION DESCRIPTION
DIVISION 33 SANITARY SEWER UTILITIES
SECTION 333100 - SANITARY SEWER

END OF CONTENTS TABLE

Notes to Designer –

- Delete this cover sheet when including in specifications. Add Division 33, section 333100 to the title sheet.
- Directional drilling is not covered in this master specification.
- SDR26 material is to be used as a minimum on all U-M projects.

DIVISION 33 SANITARY SEWER UTILITIES

SECTION 333100 - SANITARY SEWER

Revise this Section by deleting and inserting text to meet Project-specific requirements.

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This section includes the furnishing and installation of exterior sanitary sewer system. If there is a facility service lead, this exterior sanitary sewer specification for the service lead is applicable starting at five feet outside the building. *There should be a cleanout 5' outside the building either on the mechanical plans or on the civil plans and is the transition point from building plumbing to site civil sanitary.*
- B. Section Includes: *Update/add items to this specification to be project specific.*
 - 1. Pipe and fittings.
 - 2. Cleanouts.
 - 3. Manholes.

1.3 DEFINITIONS

Retain definition(s) remaining after this Section has been edited.

- A. FRP: Fiberglass-reinforced plastic.
- B. PVC: Polyvinyl chloride
- C. ACI: American Concrete Institute
- D. ASTM: American Society for Testing and Materials
- E. AWWA: American Water Works Association
- F. AASHTO: American Association of State and Highway Transportation Officials
- G. SDR: Standard Dimension Ratio

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings: For manholes and castings. Include plans, elevations, sections, details, and frames and covers.

**BUILDING NAME
DESCRIPTION OF THE PROJECT**

- C. Manufacturer Certification: All pipe furnished shall be accompanied by the manufacturer's certificate of test showing conformity with the Specifications. Each certificate shall identify a specific lot number, quantity of pipe, and show actual test results for the lot furnished. These certificates shall be submitted to the Inspector at the time of unloading. Coordinate unloading with Inspector.
- D. Cut sheets for Contractor layout and staking locations.
- E. Mandrel details and certification.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports regarding elevation of pipe.
- B. Testing reports, passed tests upon completion of testing.

1.6 DELIVERY, STORAGE, AND HANDLING

Retain first paragraph below for PVC,SDR piping.

- A. Do not store plastic manholes, pipe, and fittings in direct sunlight.
- B. Protect pipe, pipe fittings, and seals from dirt and damage.
- C. Handle manholes according to manufacturer's written rigging instructions.

1.7 PROJECT CONDITIONS

Retain A. below if interruption of existing sanitary sewerage service is required.

- A. Interruption of Existing Sanitary Sewerage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
 - 1. Notify Owner no fewer than five working days in advance of proposed interruption of service. Coordination of a building system shutdown requires a minimum of 10 working days.
 - 2. Do not proceed with interruption of service without Owner's written permission.
- B. Product Inspection: All materials furnished shall be subject to inspection on arrival at the job site by the Owner. The purpose of the inspection shall be to cull and reject products that, independent of physical tests specified under the standard specifications designated herein, fail to conform to the requirements of these specifications. Materials shall be subject to rejection on account of any of the following:
 - 1. Variation in any dimension exceeding the permissible variations given in the material specifications. Pipe in all cases shall be full diameter.
 - 2. Fractures or cracks passing through the barrel or socket.

**BUILDING NAME
DESCRIPTION OF THE PROJECT**

3. Chips or fractures on the interior of the pipe exceeding two inches in length, one inch in width, or depth more than ¼ of the thickness of the wall.
4. Blisters that are either broken, exceed three inches in diameter, or project more than 1/8 inches above the surrounding surface of the pipe.
5. Variation of more than 1/16 inch per lineal foot in alignment of pipe intended to be straight.

C. Rejected materials shall be clearly marked by the Inspector and immediately removed from the site of work by the Contractor, without cost to the Owner.

PART 2 - PRODUCTS

If using more than one type of material and joining method, identify various materials on Drawings and show points of transition from one material to another.

2.1 PVC PIPE AND FITTINGS

A. PVC Gravity Sewer Piping:

1. Pipe: ASTM D 3034-83, SDR 26 wall thickness, PVC gravity sewer pipe with integral bell-and-spigot ends and with integral ASTM D 3212-81, elastomeric seals for gasketed joints.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) Manufacturer's name or trademark.
 - 2) Nominal pipe size.
 - 3) The PVC cell classification.
 - 4) The legend.
 - 5) The designation "Specification D 3034".
2. Fittings: ASTM D 3034-83, SDR 26 wall thickness, PVC gravity sewer pipe with integral bell-and-spigot ends and with integral ASTM D 3212-81, elastomeric seals for gasketed joints.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 - b. The following information shall be clearly marked on each fitting
 - 1) Manufacturer's name or trademark.
 - 2) Nominal size.
 - 3) The material designation "PVC".

BUILDING NAME
DESCRIPTION OF THE PROJECT

- 4) "PSM".
- 5) The designation "Specification D 3034".

B. PVC Gravity Sewer Service Leads, Risers and Fittings:

1. Pipe: ASTM D 3034, SDR 26 PVC pipe with bell-and-spigot ends for gasketed joints.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) The pipe designation and class.
 - 2) The name or trademark of the manufacturer.
 - 3) Identification of the manufacturing plant.
 - 4) Testing lot number.
2. Fittings: ASTM D 3034-83, SDR 35 PVC pipe with bell ends.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
3. Gaskets: ASTM D 3212, elastomeric seals.
4. Adapters: For use when connecting pipe with pipe of other material or manufacturer. The nominal I.D. of adaptors shall be manufactured for that specific purpose and shall be the same size as the nominal diameter of pipe connected thereto.
 - a. Adaptor shall be "CB" gasketed sewer saddle by Romac Industries, Inc. or Engineer approved equal.

2.2 CLEANOUTS

A. PVC Cleanouts:

1. Pipe: ASTM D 3034-83, SDR 26 wall thickness, PVC gravity sewer pipe with bell-and-spigot ends and with integral ASTM D 3212-81, elastomeric seals for gasketed joints.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) Manufacturer's name or trademark.
 - 2) Nominal pipe size.
 - 3) The PVC cell classification.
 - 4) The legend.
 - 5) The designation "Specification D 3034".
2. Casting: Neenah R-7506-D, EJCO 1574 or Engineer approved equal.
 - a. Casting shall be stamped with "Sanitary"

BUILDING NAME
DESCRIPTION OF THE PROJECT

3. Fittings: ASTM D 3034-83, SDR 26 wall thickness, PVC gravity sewer pipe with bell-and-spigot ends and with integral ASTM D 3212-81, elastomeric seals for gasketed joints.
 - a. Lubricant used shall be supplied by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.
 - b. The following information shall be clearly marked on each fitting
 - 1) Manufacturer's name or trademark.
 - 2) Nominal size.
 - 3) The material designation "PVC".
 - 4) "PSM".
 - 5) The designation "Specification D 3034".

2.3 MANHOLES

A. Standard Precast Concrete Manholes:

1. Description: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
2. Diameter: 48 inches minimum unless otherwise indicated.
3. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent flotation.
4. Base Section: 8-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section; with separate base slab or base section with integral floor.
5. Riser Sections: 4-inch minimum thickness, of length to provide depth indicated.
6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type as indicated; with top of cone of size that matches grade rings.
7. Joint Gaskets: ASTM C 443, rubber O-ring gasket. Joints pointed with mortar after installation, both inside and outside of the manhole.
8. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection. Neoprene rubber shall meet ASTM C 443 and have a minimum thickness of 3/8 inch. Pipe clamps shall be of corrosion-resistant steel. Pipe connectors shall be one of the following:
 - a. Flexible neoprene rubber boot securely clamped into a core-drilled pipe port. Pipe ports shall be core-drilled at the point of manhole manufacture and shall be accurately located within 1/2 inch of proposed sewer centerline.
 - b. Self-adjusting mechanical pipe to manhole seal providing resilient flexible and infiltration-proof joint.
 - c. Flexible rubber wedge firmly secured against a rubber gasket cast into the manhole.
 - d. Engineer approved equal.
9. Steps: ASTM C 478 injection molded copolymer, polypropylene, encapsulating a 1/2 inch grade 60 steel reinforcing bar with an impact resistance of 300 ft-lbs and a pull out force resistance of 1500 lbs; Cast or anchor steps into sidewalls at 15-inch intervals. Step depth shall a minimum of 6 inches.

BUILDING NAME
DESCRIPTION OF THE PROJECT

10. Grade Rings: 2-inch Reinforced-concrete rings, 2-inch minimum and 6-inch maximum height, with diameter matching manhole frame and cover. Install all MH's with grade rings to accommodate future adjustment in elevation.
11. Flow Channel: Construct flow channel the full diameter of the incoming and outgoing pipe with class A concrete.
12. Aggregate Base: Structure shall be placed on a minimum of 4 inches of 21AA limestone bedding.
13. Ground water monitor: In areas where ground water is known to exist and sewer is to be air tested, the Contractor shall install a ½ inch diameter, 10-inch-long pipe nipple through the manhole wall above one of the sewer lines entering the manhole. The pipe nipple shall be capped for use in air testing.

B. Manhole Frames and Covers:

1. Description: East Jordan Company, 1040-WT heavy duty or Engineer approved equal. Include indented top design with lettering cast into cover, using wording equivalent to "SANITARY SEWER."
2. Material: ASTM A 48, Class No. 30, gray iron unless otherwise indicated.

2.4 CONCRETE

A. General: Cast-in-place concrete complying with ACI 318 and the following:

1. Cement: ASTM C 150, Type II.
2. Fine Aggregate: ASTM C 33, sand.
3. Coarse Aggregate: ASTM C 33, crushed gravel.
4. Water: Potable.

B. Portland Cement Design Mix: The following are the grades of concrete recognized for use with sanitary sewers:

1. Class A concrete.
 - a. 564 lbs cement (6 sacks) per cubic yard of concrete.
 - b. Minimum 28-day compressive strength of 3,500 psi, conforming to MDOT Sec 7.01, Grade 35P.
 - c. Air content shall be between 5-7%
 - d. Water-cement ratio may not exceed 0.45 for air entrained concrete and 0.50 for non-air entrained concrete.
2. Class X concrete.
 - a. 282 lbs cement (3 sacks) per cubic yard of concrete.
 - b. Minimum 28-day compressive strength of 1,000 psi.

C. Cement mortar shall consist of one-part Type II Portland cement, two parts fine aggregate, and sufficient water to produce a workable mix.

D. Steel Reinforcement

1. Reinforcing Fabric: ASTM A 185/A 185M, steel, welded wire fabric, plain.
2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

BUILDING NAME
DESCRIPTION OF THE PROJECT

- E. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.
 - 1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
 - a. Invert Slope: 1 percent minimum through manhole.
 - 2. Benches: Concrete, sloped to drain into channel.
 - a. Slope: 8 percent.

PART 3 - EXECUTION

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling are specified in Section 312000 "Earth Moving."

3.2 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground sanitary sewer piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.
- C. Install manholes for changes in direction unless fittings are indicated. Use fittings for branch connections unless direct tap into existing sewer is indicated.
- D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.
- E. Install gravity-flow, non-pressure, drainage piping according to the following:

Revise first subparagraphs below to suit Project.

- 1. Install piping pitched down in direction of flow, at the slope indicated on the drawings. Each pipe, as laid, shall be checked by the Contractor. A variation of ¼ inch from plan grade will be deemed sufficient reason to reject the work and require Contractor re-lay the pipe, at no cost to the Owner.

BUILDING NAME
DESCRIPTION OF THE PROJECT

2. Install piping with 5-foot minimum cover or depth as indicated on the drawings.
3. Install ductile-iron, gravity sewer piping according to ASTM A 746.
4. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.

F. Install force-main, pressure piping according to the following: **Retain paragraph if force main work.**

1. Install piping with restrained joints at tee fittings and at horizontal and vertical changes in direction. Use corrosion-resistant rods, pipe or fitting manufacturer's proprietary restraint system, or cast-in-place-concrete supports or anchors.
2. Install piping with 5-foot minimum cover or as indicated on the drawings.
3. Install ductile-iron pressure piping according to AWWA C600 or AWWA M41.
4. Install ductile-iron special fittings according to AWWA C600.

G. Maintain dry trench during sewer and manhole construction by pumping, as necessary.

H. Clear interior of piping and manholes of dirt and superfluous material as work progresses. Maintain swab or drag in piping, and pull past each joint as it is completed. Place plug in end of incomplete piping at end of day and when work stops.

3.3 **MANHOLE INSTALLATION**

- A. General: Install manholes complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Install FRP manholes according to manufacturer's written instructions.
- D. Form continuous concrete channels and benches between inlets and outlet.
- E. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 3 inches above finished surface elsewhere unless otherwise indicated.

Retain paragraph below only if specified in "Manholes" Article.

- F. Install manhole-cover inserts in frame and immediately below cover.
- G. Manholes shall be placed at every change in grade, direction and pipe size as well as at junctions of sewers.
- H. All sewer connections, outside of sewer service leads, shall occur at a manhole.

**BUILDING NAME
DESCRIPTION OF THE PROJECT**

- I. Install outside drop manhole connections whenever a sewer enters a manhole at an invert elevation of more than 24 inches above the manhole invert elevation. Outside drop connections shall be sized at least one half the size of the incoming sewer or next larger size, but in no cases not less than 8 inches in diameter. [The City of Ann Arbor does not permit inside drop connections.](#)
- J. Place cast-in-place concrete according to ACI 318.

3.4 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade. Install piping so cleanouts open in direction of flow in sewer pipe.
- B. Set cleanout frames and covers in earth 3 inches above surrounding grade. If in pavement, set cleanout frames and covers at pavement elevation.

3.5 CONNECTIONS

- A. Make connections to existing piping and underground manholes.
 - 1. All connections, unless specifically noted otherwise, shall occur at a manhole. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch overlap with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 2. Make branch connections from side into existing piping. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
 - 3. Make branch connections from side into existing piping, NPS 21 or larger, or to underground manholes by cutting opening into existing unit large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall unless otherwise indicated. On outside of pipe or manhole wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
 - a. Use concrete that will attain a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.
 - b. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
 - 4. Protect existing piping and manholes to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

3.6 CLOSING ABANDONED SANITARY SEWER SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to

BUILDING NAME
DESCRIPTION OF THE PROJECT

withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:

1. Close open ends of piping with at least 8-inch thick, brick masonry bulkheads.
2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.

B. Abandoned Manholes: Excavate around manhole as required and use either procedure below:

1. Remove manhole and close open ends of remaining piping.
2. Remove top of manhole down to at least 36 inches below final grade. Break the bottom of the manhole. Fill with class II sand up to roadway cross section or 4 inches where outside of pavement influence. Fill the remainder with the typical or required roadway section where in the roadway and with 4 inches of top soil and seed where outside of the pavement influence.

C. Backfill to grade according to Section 312000 "Earth Moving."

3.7 IDENTIFICATION

A. Comply with requirements in Section 31200 "Earth Moving" for underground utility identification devices. Arrange for installation of green warning tapes directly over piping and at outside edges of underground manholes.

1. Use detectable warning tape over ferrous piping.
2. Use detectable warning tape over nonferrous piping and over edges of underground manholes.
3. All sanitary sewer shall be locatable. Use tracer wire if

3.8 FIELD QUALITY CONTROL

A. All sanitary sewers, including leads, 36 inches and smaller shall be air tested by the Contractor, documented by the Contractor provided to the Owner, and witnessed by Owner's representative. (Required by U-M) All sanitary sewers greater than 36 inches shall be infiltration or exfiltration tested by the Contractor, documented by the Contractor provided to Owner, and witnessed by authority having jurisdiction. The authority having jurisdiction will decide whether infiltration or exfiltration testing is performed based upon ground water conditions.

All sewers, except 4-inch and 6-inch leads, shall be television inspected by the Contractor. Television inspection shall follow current MDOT procedures. (Required by U-M)

All PVC sanitary sewer main shall be mandrel tested (Required by U-M).

1. Submit separate report for each system inspection.
2. Defects requiring correction include the following:

BUILDING NAME
DESCRIPTION OF THE PROJECT

- a. Alignment: Less than full diameter of inside of pipe is visible between structures.
 - b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
 - c. Damage: Crushed, broken, cracked, or otherwise damaged piping.
 - d. Infiltration: Water leakage into piping.
 - e. Exfiltration: Water leakage from or around piping.
- 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
 - 4. Reinspect and repeat procedure until results are satisfactory.
- B. Mandrel Test: Test sanitary sewerage according to the requirements of the following:

- 1. Mandrel shall be commercially produced, nine fin mandrel with the following labelled on the mandrel:
 - a. Pipe diameter intended for.
 - b. Percent deflection accounted for.
 - c. ASTM or AASHTO standard stamp.
- 2. Mandrel test shall take place a minimum of 30 days after installation of the sewer.
- 3. Mandrel shall be pulled from manhole to manhole for each section of pipe installed.
 - a. Passing freely through each section of pipe shall indicate a satisfactory result.
 - b. Failure to freely pass through any section of pipe will require that section be exposed, examined and corrective actions taken, as necessary.
- 4. The mandrel shall meet the following schedule of sizing:

<u>Pipe I.D.</u>	PVC Mandrel O.D.
8"	7.28"
10"	9.08"
12"	10.79"
15"	13.20"
18"	N/A
24"	N/A

- 5. Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Ground water level shall be determined by removing the cap from the previously installed pipe nipple, blowing air through the pipe into the ground, connecting a clear plastic tube to the pipe. The tube should be vertical and a measurement of the height in feet of water above the pipe centerline shall be taken. The height in feet shall be divided by 2.31 to establish the pressure (in psig) that will be considered to be the average ground water back pressure.

BUILDING NAME
DESCRIPTION OF THE PROJECT

- b. The following is the sequence and time requirements for air testing:
- 1) Each end of the pipe shall be plugged with pneumatic plugs capable of holding line pressure. There shall be three hose connections to the pneumatic plug with one being used for inflation, one used for continuously reading the air pressure in the line, and the third used for introducing low pressure air into the sealed line.
 - 2) Low pressure will be introduced into the sealed line until the internal air pressure reaches 4.0 psig greater than the average back pressure of any ground water pressure that may be above the pipe. At least two minutes shall be allowed for the air pressure to stabilize. After the stabilization period, the pressurization hose shall be disconnected to prevent air from entering or escaping from the line. There shall be a pressure gauge for reading the internal pressure of the line being tested. The gauge shall be capable of showing pressure as low as 0 psig up to no greater than 20 psig. In the 0-10 psig range the gauge shall be both calibrated and accurate to one-tenth of one pound. The 0-10 psig portion of the gauge dial shall cover at least one-half of the complete dial range. This gauge shall have a tee fitting to allow simultaneous pressure reading by Owner gauge.
 - 3) The time requirement for the pressure to decrease from 3.5 to 2.5 psig (greater than the average back pressure of any ground water that may be over the pipe) shall not be less than the time given in the following table:

Pipe (Inches)	PVC & DIP SEWERS	
	Holding Time (Seconds)	Minimum Holding Time (min:sec)
4	0.380 x L	3:46
6	0.854 x L	5:40
8	1.520 x L	7:34
10	2.374 x L	9:26
12	3.418 x L	11:20
15	5.342 x L	14:10
18	7.692 x L	17:00
21	10.470 x L	19:50
24	13.674 x L	22:40
30	21.366 x L	28:20
36	30.768 x L	34:00

6. Infiltration Test, if required: Contractor shall test infiltration in all sewers larger than 36 inch or as required by the Authority Having Jurisdiction.

BUILDING NAME
DESCRIPTION OF THE PROJECT

- a. Temporary weirs shall be placed, within manholes, at either ends of the sewer being tested. Test shall not exceed 1,200 feet.
 - 1) Allowable infiltration shall not be more than 200 gallons per inch of pipe diameter per mile of sewer per 24 hours, including manholes.
 - 2) If allowable limit of infiltration is exceeded on any test section, the Contractor shall reconstruct or repair the defective portion of the sewer and re-test.
 - 3) Visible leaks shall be repaired regardless the results of the infiltration test.

- 7. Exfiltration Test, if required: Contractor test either exfiltration or infiltration in all sewers larger than 36 inches or as required by the Authority having jurisdiction.
 - a. Standpipe method will be used from manhole to manhole for each length of pipe.
 - 1) Hydrostatic head of 10 feet to the sewer's average centerline elevation will be required with adjustments for external submergence due to water in the trench.
 - 2) Owner will establish time durations and procedures for each test.
 - 3) Maximum allowable exfiltration rate will be 200 gallons per inch of pipe diameter per mile of sewer per 24 hours including manholes.
 - 4) Contractor shall pump all water out of the downstream manhole to a storm sewer at the completion of the test.

- 8. Television Inspection: Contractor shall perform a preliminary television inspection prior to acceptance of sewers and prior to any building connection being made.
 - a. All sewer lines shall be thoroughly cleaned prior to television inspection.
 - b. Inverts of sewer shall be wetted by pouring clean water in the upstream manhole until it appears in the downstream manhole.
 - c. The camera shall be connected to a video monitor and recorder.
 - d. The camera shall pass from manhole to manhole of each pipe section installed.
 - e. Television inspection deemed satisfactory if no visible defects, including but not limited to, dips or low spots, high spots, errors in horizontal or vertical alignment, joint offsets, leaks, cracks, or debris are present.

- C. Any defects in the sewer shall constitute repairs be made.

- D. Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

3.9 CLEANING

- A. Clean dirt and superfluous material from interior of piping.

DESCRIPTION OF THE PROJECT

P00000000 Issued for: [BID][BID & CONSTRUCTION] 334100 - 1

DIVISION 33 UTILITIES

SECTION 334100 - STORM UTILITY DRAINAGE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section consists of exterior storm sewer piping and includes:
 - 1. Pipe and fittings.
 - 2. Backwater valves
 - 3. Cleanouts
 - 4. Manholes and catch basins.
 - 5. Channel
 - 6. Pipe outlets.

1.3 DEFINITIONS

- A. ACI: American Concrete Institute.
- B. ANSI: American National Standards Institute.
- C. ASTM: American Society of Testing and Materials.
- D. AASHTO: American Association of State and Highway Transportation Officials.
- E. MDOT: Michigan Department of Transportation.
- F. OSHA: Occupational Safety and Health Administration.
- G. PSI: Pounds per Square Inch.
- H. SDR: Standard Dimension Ratio.
- I. U-M: University of Michigan.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Shop Drawings:

BUILDING NAME
DESCRIPTION OF THE PROJECT

1. Manholes: base sections, riser sections, eccentric and concentric conical top sections, flat slab tops, grade rings with notarized certificating indicating compliance with ASTM C478.
 2. [Catch basins] [storm water inlets] [and] [dry wells]. Include plans, elevations, sections, details, frames, covers, and grates.
 3. Storm Water Detention Structures: Include plans, elevations, sections, details, inlet and outletelevations, structures, design calculations, material certifications.
 4. Storm water management structures and systems, including but not limited to water quality units, infiltration structures
 5. Pipe connections to manholes, catchbasins, structures.
 6. Manhole frame and cover and catch basin frame and grate with notarized certificate indicating compliance with the specified ASTM standard and Class designation
 7. Adjustable weir plates and fasteners.
- C. Manufacturer Certification: All pipe furnished shall be accompanied by the manufacturer's certification.
- D. Manufacturer's Performance Certification that shows hydrodynamic separator unit is capable of achieving the specified removal efficiencies per plan and specs.
- E. Cut sheets for Contractor layout and staking locations.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.
- B. Storm water management - site specific feature installation checklists, signed and approved by the engineer/Owner site representative

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic manholes, pipe, and fittings in direct sunlight.
- B. Protect pipe, pipe fittings, and seals from dirt and damage.
- C. Handle manholes according to manufacturer's written rigging instructions.
- D. Handle [catch basins] [and] [storm water inlets] according to manufacturer's written rigging instructions.

1.7 PROJECT CONDITIONS

- A. Interruption of Existing Storm Drainage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:

BUILDING NAME
DESCRIPTION OF THE PROJECT

1. Notify [**Construction Manager**] [**Owner**] no fewer than [**two**] <Insert number> days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without [**Construction Manager's**] [**Owner's**] written permission.

PART 2 - PRODUCTS

2.1 STEEL PIPE AND FITTINGS

- A. Corrugated-Steel Pipe and Fittings: ASTM A 760/A 760M, Type I with fittings of similar form and construction as pipe.
 1. Special-Joint Bands: Corrugated steel with O-ring seals.
 2. Standard-Joint Bands: Corrugated steel.
 3. Coating: [**Aluminum**] [**Zinc**].

2.2 HDPE PIPE AND FITTINGS

- A. Storm sewer specified as high density polyethylene (HDPE) shall meet the requirements of AASHTO M294.
- B. The pipe shall be corrugated with an integrally formed smooth interior. Joints shall be gasketed water tight joints using water tight sleeves. Sleeves shall be factory installed on one end of the pipe with a factory installed gasket on the opposite end of the pipe.

2.3 CONCRETE PIPE AND FITTINGS

- A. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76, [**Class II-**] [**Class VI**].
 1. Integral bell-and-spigot ends and gasketed joints with ASTM C 443, rubber O-ring gaskets.
 2. Elliptical pipe shall conform to ASTM C 507.
 3. Cement shall conform to ASTM C 150 for types I and II.
 4. Outside joints shall be provided with cement mortar collar. Inside joints of sewers larger than 36 inches in diameter shall also have the inside joint pointed with mortar.
 5. Lubricants used in joints shall be supplied by the pipe manufacturer and joints shall be coupled in accordance with the manufacturer's requirements.
 6. The following information shall be clearly marked on each length of pipe:
 - a. The pipe designation and class.
 - b. The name or trademark of the manufacturer.

BUILDING NAME
DESCRIPTION OF THE PROJECT

- c. Identification of the manufacturing plant.
- d. The date of manufacture.
- e. Testing lot number or testing lab stamp.
- f. Reinforced concrete pipe with elliptical reinforcement shall be clearly marked on the inside and the outside opposite walls along the minor axes of the elliptical reinforcing.

2.4 BACKWATER VALVES

- 1. Manufacturers: Subject to compliance with requirements, [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:

2.5 CLEANOUTS

A. Cleanouts:

- 1. Manufacturers: Subject to compliance with requirements, [**provide products by one of the following**] [**available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**]:
- 2. Product: Subject to compliance with requirements, provide [**product indicated on Drawings**] <Insert manufacturer's name; product name or designation> or comparable product by one of the following:
 - a.
 - b. <Insert manufacturer's name>.
- 3. Casting: Neenah R-7506-D, EJCO 1574 or Engineer approved equal. Casting shall be stamped with "Storm".

2.6 MANHOLES AND CATCH BASINS Standard Precast Concrete Manholes:

- 1. Description: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints.
- 2. Diameter: 48 inches minimum unless otherwise indicated.
- 3. Ballast: Increase thickness of precast concrete sections or add concrete to base section as required to prevent flotation.
- 4. Base Section: 8-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section, and separate base slab or base section with integral floor.
- 5. Riser Sections: 4-inch minimum thickness, and lengths to provide depth indicated.
- 6. Top Section: Eccentric-cone type unless concentric-cone or flat-slab-top type is indicated, and top of cone of size that matches grade rings.
- 7. Joint Sealant: ASTM C 443, rubber O-ring gasket, joints pointed with mortar after installation both inside and outside of the manhole.
- 8. Resilient Pipe Connectors: ASTM C 923, cast or fitted into manhole walls, for each pipe connection. Neoprene rubber shall

BUILDING NAME
DESCRIPTION OF THE PROJECT

meet ASTM C 443 and have a minimum thickness of 3/8 inch. Pipe clamps shall be of corrosion-resistant steel. Pipe connectors shall be one of the following:

- a. Flexible neoprene rubber boot securely clamped into a core-drilled pipe port. Pipe ports shall be core-drilled at the point of manhole manufacture and shall be accurately located within ½ inch of proposed sewer centerline.
 - b. Self-adjusting mechanical pipe to manhole seal providing resilient flexible and infiltration-proof joint.
 - c. Flexible rubber wedge firmly secured against a rubber gasket cast into the manhole.
 - d. Engineer approved equal.
9. Steps: ASTM C 478 injection molded copolymer, polypropylene, encapsulating a ½ inch grade 60 steel reinforcing bar with an impact resistance of 300 ft-lbs and a pull out force resistance of 1500 lbs; cast or anchor steps into sidewalls at 15-inch intervals. Step depth shall be a minimum of 6 inches.
 10. Cut pipe so that it does not extend more than 2" into the manhole and patch water tight inside and outside of pipe insert location.
 11. Grade Rings: 2-inch reinforced concrete rings or ASTM C 55 grade N-I concrete bricks, 2-inch minimum and 6-inch maximum height, with diameter matching manhole frame and cover. Interior and exterior of the grade rings and brick shall be pointed with mortar to seal the joints.
 12. Aggregate Base: Structure shall be placed on a minimum of 6 inches of 21AA stone bedding.

B. Manhole Frames and Covers:

1. Description: Include indented top design with lettering cast into cover, using wording equivalent to "STORM SEWER" and cast environmental message "DUMP NO WASTE, DRAINS TO WATERWAYS" Use the following manufacturers and models for each structure type:
 - a. Storm Manhole
 - 1) Frame
 - a) NEENAH NF-16422310 HS-25 loading
 - b) East Jordan Company, EJCO heavy duty frame for 1040 cover, minimum HS20 loading
 - 2) Solid Cover
 - a) Neenah, R-1642T474, no vent holes, enviro notice
 - b) East Jordan Company, EJCO 1040, Type A1, enviro notice
 - 3) ADA compliant grate
 - a) Neenah NF-23703010, Type "Q" grate, enviro notice
 - b) East Jordan Company, EJCO 1040 type M3, enviro notice
 - 4) Grate, Non ADA compliant
 - a) Neenah, NF-23703005 Type "Q" grate, enviro notice
 - b) East Jordan Company, EJCO 1040 Type M2, enviro notice
 - 5) Beehive
 - a) Neenah, NF-25610011 beehive grate, enviro notice
 - b) East Jordan Company, EJCO 1040, Type 02, enviro notice
 - b. Storm Catch Basin

BUILDING NAME
DESCRIPTION OF THE PROJECT

- 1) 7210, Type M1 grate by East Jordan Company, enviro message
 - 2) R-3281-A, Type C grate by Neenah, enviro message.
 - 3) Or Engineer approved equal.
2. Material: ASTM A 48, Class No. 30, gray iron unless otherwise indicated.

2.7 CHANNEL

- A. General: Cast-in-place concrete according to ACI 318 and the following:
1. Cement: ASTM C 150, Type II.
 2. Fine Aggregate: ASTM C 33, sand.
 3. Coarse Aggregate: ASTM C 33, crushed gravel.
 4. Water: Potable.
- B. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.
1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
 - a. Invert Slope: 1 percent through manhole.
- C. Ballast and Pipe Supports: Portland cement design mix, 4000 psi minimum, with 0.58 maximum water/cementitious materials ratio.
1. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (420 MPa) deformed steel.

2.8 PIPE OUTLETS

- A. Head Walls: Cast-in-place reinforced concrete, with apron and tapered sides.
- Riprap Basins: Broken, irregularly sized and shaped, graded stone according to Design detail, or large limestone or river rock boulders. Crushed concrete will not be accepted for rip rap. **EXECUTION**

3.1 EARTHWORK

- A. Excavation, trenching, and backfilling are specified in Section 312000 "Earth Moving."

BUILDING NAME
DESCRIPTION OF THE PROJECT

3.2 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground storm drainage piping. Location and arrangement of piping layout take into account design considerations. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.
- B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.
- C. Install manholes for changes in direction and grade.
- D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited unless deliberate storm water management design.
- E. Install gravity-flow, nonpressure drainage piping according to the following:
 - 1. Install piping pitched down in direction of flow.
 - 2. Install piping with manufacturer recommended minimum cover or as indicated on the drawings.
 - 3. Install corrugated steel piping according to ASTM A 798/A 798M.
 - 4. Install corrugated aluminum piping according to ASTM B 788/B 788M.
 - 5. Install ABS sewer piping according to ASTM D 2321 and ASTM F 1668.
 - 6. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.
 - 7. Install reinforced-concrete sewer piping according to ASTM C 1479 and ACPA's "Concrete Pipe Installation Manual."

3.3 PIPE JOINT CONSTRUCTION

- A. Join gravity-flow, nonpressure drainage piping according to the following:
 - 1. Join corrugated steel sewer piping according to ASTM A 798/A 798M.
 - 2. Join corrugated aluminum sewer piping according to ASTM B 788/B 788M.
 - 3. Join ABS sewer piping according to ASTM D 2321 and ASTM D 2751 for elastomeric-seal joints.
 - 4. Join PVC cellular-core piping according to ASTM D 2321 and ASTM F 891 for solvent-cemented joints.
 - 5. Join PVC sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasketed joints.

BUILDING NAME
DESCRIPTION OF THE PROJECT

6. Join reinforced-concrete sewer piping according to ACPA's "Concrete Pipe Installation Manual" for rubber-gasketed joints.
7. Join dissimilar pipe materials with nonpressure-type flexible couplings.

3.4 BACKWATER VALVE INSTALLATION

- A. Install horizontal-type backwater valves in piping where indicated.
- B. Install combination horizontal and manual gate-valve type in piping and in manholes where indicated.
- C. Install terminal-type backwater valves on end of piping and in manholes where indicated.

3.5 CLEANOUT INSTALLATION

- A. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade. Use cast-iron soil pipe fittings in sewer pipes at branches for cleanouts and cast-iron soil pipe for riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in sewer pipe.
- B. Set cleanout frames and covers in earth in cast-in-place concrete block, 6" deep. Set with tops [1 inch (25 mm)] {flush}<Insert dimension> above surrounding earth grade.
- C. Set cleanout frames and covers in concrete pavement and roads with tops flush with pavement surface.

3.6 MANHOLE AND CATCH BASIN INSTALLATION

- A. General: Install manholes, complete with appurtenances and accessories indicated.
- B. Install precast concrete manhole sections with sealants according to ASTM C 891.
- C. Where specific manhole construction is not indicated, follow manhole manufacturer's written instructions.
- D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops 3 inches above finished surface elsewhere unless otherwise indicated.
- E. Manholes shall be placed at every change in grade, direction and pipe size as well as at junctions of sewers.
- F. All sewer connections shall occur at a manhole.
- G. Install aggregate base beneath structure prior to placement of structure.

BUILDING NAME
DESCRIPTION OF THE PROJECT

3.7 CONCRETE PLACEMENT

- A. Place cast-in-place concrete according to ACI 318.

3.8 CONNECTIONS

- A. Connect nonpressure, gravity-flow drainage piping from building with cleanout outside of building.
- B. Make connections to existing piping and underground manholes.
 - 1. Make connections to underground manholes and structures by cutting into existing unit and creating an opening large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall unless otherwise indicated. On outside of pipe, manhole, or structure wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
 - a. Use concrete that will attain a minimum 28-day compressive strength of 3000 psi unless otherwise indicated.
 - b. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
 - 2. Protect existing piping, manholes, and structures to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.
 - 3. Use nonpressure-type flexible couplings where required to join gravity-flow, nonpressure sewer piping unless otherwise indicated.
 - a. [Unshielded] [Shielded] flexible couplings for same or minor difference OD pipes.
 - b. Unshielded, increaser/reducer-pattern, flexible couplings for pipes with different OD.
 - c. Ring-type flexible couplings for piping of different sizes where annular space between smaller piping's OD and larger piping's ID permits installation.

3.9 Riprap

- A. Follow the details and MDOT guidelines for riprap installation, including a minimum depth of 16" or whichever is more stringent.
- B. Provide geotextile liner under the riprap with seams overlapped a minimum of two feet and ends staked.
- C. Crushed concrete is not to be used as Riprap.

3.10 CLOSING ABANDONED STORM DRAINAGE SYSTEMS

- A. Abandoned Piping: Close open ends of abandoned underground piping indicated to remain in place. Include closures strong enough to

BUILDING NAME
DESCRIPTION OF THE PROJECT

withstand hydrostatic and earth pressures that may result after ends of abandoned piping have been closed. Use either procedure below:

1. Close open ends of piping with at least [~~8-inch-~~ (203-mm-)] <Insert dimension> thick, brick masonry bulkheads or Grade S3 concrete.
 2. Close open ends of piping with threaded metal caps, plastic plugs, or other acceptable methods suitable for size and type of material being closed. Do not use wood plugs.
 3. Fill abandoned pipe with flowable fill
- B. Abandoned Manholes and Structures: Excavate around manholes and structures as required and use one procedure below:
1. Remove entire abandoned structure unless noted to leave in place on the plans. Remove manhole or structure and close open ends of remaining piping.
 2. If indicated to abandon structure in place, remove top of manhole or structure down to at least **36 inches** below final grade. Fill to within roadway cross section with class II sand. Fill remainder with the roadway or restoration cross section.
- C. Backfill to grade according to Section 312000 "Earth Moving."

3.11 FIELD QUALITY CONTROL

- A. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.
1. Submit separate reports for each system inspection.
 2. Defects requiring correction include the following:
 - a. Alignment: Less than full diameter of inside of pipe is visible between structures.
 - b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
 - c. Damage: Crushed, broken, cracked, or otherwise damaged piping.
 - d. Infiltration: Water leakage into piping.
 - e. Exfiltration: Water leakage from or around piping.
 3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
 4. Re-inspect and repeat procedure until results are satisfactory.
- B. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
1. Do not enclose, cover, or put into service before inspection and approval.
 2. Test completed piping systems according to requirements of authorities having jurisdiction.

BUILDING NAME
DESCRIPTION OF THE PROJECT

3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
4. Submit separate report for each test.
5. Gravity-Flow Storm Drainage Piping: Test according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
 - a. Exception: Piping with soil tight joints unless required by authorities having jurisdiction.

C. Mandrel Testing

1. All PVC and HDPE storm sewers shall be mandrel tested for deflection by the Contractor.
2. The mandrel shall be a commercially produced, nine fin mandrel, with the pipe diameter, percent deflection and applicable ASTM or ASHTO standard fins.
3. The testing is to take place after the sewers have been in place for a minimum of 30 days. Allow time for corrective action.
4. The mandrel shall be pulled from structure to structure. Any portion of the pipe through which the mandrel passes freely shall be deemed to have passed the mandrel test. Sections of pipe through which the mandrel does not pass freely shall be exposed and examined and corrected.
5. The mandrel is to be construction in accordance with the following table.

Pipe ID	HDPE Mandrel O.D.	SDR PVC Mandrel O.D.
8"	7.54"	7.28"
10"	9.41"	N/A
12"	11.54"	N/A
15"	14.27"	N/A
18"	17.24"	N/A
24"	23.18"	N/A

D. Television Inspection

1. Television inspection shall follow MDOT and City of Ann Arbor Requirements. Television inspection is not required for extensions of existing catch basin leads less than 20 feet. Allow time for corrective action.
2. All sewer lines shall be thoroughly cleaned prior to television inspection.
3. Television inspection shall consist of wetting the invert of the section by pouring clean water in the upstream manhole until it appears in the downstream manhole, and then, after the water has stopped flowing, passing a camera through the section.
4. The camera shall be connected to a monitor and video tape recorder. The tape shall indicate the date, the section tested and the actual distance from the beginning manhole to each tee or wye, and each visible defect. The tape shall be furnished to the Owner's representative.

E. Sewer Repairs

1. If a sewer repair is required as a result of damaged during construction operations or fails mandrel or television inspection, the Contractor shall expose the sewer pipe and perform the required correction(s).

BUILDING NAME
DESCRIPTION OF THE PROJECT

2. If the repair is required due to the pipe being out of alignment or off grade, the pipe shall be adjusted so as to be placed in proper alignment and grade. Dense graded aggregate material shall be carefully placed under the haunches of the realigned pipe and compacted by the use of a tee bar.
3. If the pipe cannot be satisfactorily realigned or an open joint reset; or if the pipe is cracked, broken, or permanently deflected, the affected pipe shall be removed and replaced with the same pipe material. The pipe to be removed is to be sawed on each side of the damaged section in a neat and workmanlike manner without damage to the adjacent pipe. The replacement pipe section shall fit flush to the remaining pipe at each end. These sawed joints shall be coupled using a Fernco flexible coupling and stainless steel ring. These joints shall be encased to the pipe centerline with concrete one foot on either side of the flexible coupling.

3.12 CLEANING

- A. Clean interior of piping of dirt and superfluous materials. Flush with water.

3.13 STORM WATER MANAGEMENT CHECKLISTS

- A. Storm water management construction and observation checklists for project specific items are to be completed by the contractor throughout the construction process, observed by the engineer of record, and provided to the Owner/Construction Manager.
- B. Storm water management check lists
 1. Permeable pavement
 2. Bioretention
 3. Infiltration basin
 4. Infiltration trench

BUILDING NAME
DESCRIPTION OF THE PROJECT

Permeable pavement construction & observation checklist			
Project:			
Location:			
Contractor			
Engineer			
Construction Sequence	Contractor initial/date	Engineer initial/date for completion & compliance	Comments
1. Pre-Construction			
Pre-construction meeting			
Runoff diverted			
Soil permeability verified			
Groundwater elevation verified (if within 3 feet of infiltration elevation)			
Project benchmark established			
Pavement location staked out and roped off			
Temporary erosion and sediment control established			
2. Excavation			
Size and location per plans			
Side slopes stable			
Verify with engineer regarding any soil layer depth adjustments required due to encountered vs. specified soil type and permeability			
Stockpile location not adjacent to excavation area and stabilized with vegetation and/ or silt fence			
3. Geotextile			
Fabric Meets specifications			
Sedimentation/silt is removed from area prior to placement of geotextile			

BUILDING NAME
DESCRIPTION OF THE PROJECT

SESC measures are maintained to avoid sedimentation/silt getting into permeable pavement area			
Placement and downslope overlap (typically 2') conform to specifications and drawings			
Sides of excavation covered with geotextile			
No tears or holes			
Minimal wrinkles, pulled taught and staked			
4. Drain pipe/Overflow drain pipe			
Size, perforations, locations, slope, and outfalls meet specifications and drawings			
Elevation of overflow pipes correct			
Cleanouts installed per plan			
Pipe ends are protected from sediment until connected to outlet			
Interior of pipe clean and pipe tested			
5. Aggregate base course			
SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved/sieve analysis meets specifications			
Arrives on site to meet approved material submittal, for example, no excessive fines, washed, etc.			
Laid or spread (not dumped) with a front - loader to avoid aggregate separation			

BUILDING NAME
DESCRIPTION OF THE PROJECT

Thickness, placement, and compaction meet specifications and drawings			
6. Aggregate choke course			
SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved/sieve analysis meets specifications			
Arrives on site to meet approved material submittal, for example, no excessive fines, washed, etc.			
Laid or spread (not dumped) with a front - loader to avoid aggregate separation			
Thickness, placement, and compaction meet specifications and drawings			
7. Edge Constraints			
Edge constraint curb elevation, placement, and materials meet specifications and drawings			
8. Porous concrete pavement			
SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved			
pre-task meeting for porous concrete with certified installer			
Thickness, elevation and slope conforms to plans and specs			
9. Aggregate setting bed			

BUILDING NAME
DESCRIPTION OF THE PROJECT

SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved			
Thickness, elevation and slope conforms to plans and specs			
10. Permeable interlocking concrete pavers			
SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved			
Meets ASTM standards, as applicable			
Elevations, slope, laying pattern, joint spacing, placement and compaction meet specifications			
11. Jointing sand			
SESC measures are maintained to avoid sedimentation/silt permeable pavement area			
Submittal approved			
Material, installation and compaction meets plans and specs			

BUILDING NAME
DESCRIPTION OF THE PROJECT

Bioretention - construction & observation checklist			
Project:			
Location:			
Contractor			
Engineer:			
Construction Sequence	Contractor initial/date	Engineer initial /date for completion and observed compliance	comments
1. Pre-Construction			
Pre-construction meeting			
Runoff diverted			
Facility area cleared			
Soil tested for permeability			
Project benchmark near site			
Facility location staked and temporarily fenced to prevent traffic/storage compaction			
Temporary erosion and sediment protection properly installed			
2. Excavation			
Lateral slopes within design range and verified by field survey shots			
Soils not compacted during excavation			
Longitudinal slopes within design range and verified by field survey shots			
Stockpile location not adjacent to excavation area and stabilized with vegetation and/ or silt fence			
3. Structural Components			
Stone diaphragm installed per plans, with clean stone, and with approved submittals			
Outlets installed per plans with approved submittals			
Overflow drain pipe and cleanouts installed to grade and clean			
Pretreatment devices and inlets installed per plans with approved submittals			

BUILDING NAME
DESCRIPTION OF THE PROJECT

Soil bed composition and texture conforms to plans and specifications			
Geotextile (if specified) conforms to plans and installed per specifications			
4. Vegetation and soil			
Complies with planting specs			
Topsoil submittals, including soil analysis, approved and meets plans/specs			
Topsoil arriving on site verified it complies with specs in composition and placement, for example, (allowable clay content not exceeded)			
Soil properly stabilized for permanent erosion control			
5. Final Inspection			
Dimensions per plans			
Pre-treatment operational			
Inlet/outlet operational			
Soil/ filter bed permeability verified			
Effective stand of vegetation stabilized			
Construction generated sediments removed			
Contributing watershed stabilized before flow is diverted to the practice			

BUILDING NAME
DESCRIPTION OF THE PROJECT

SPECIFICATION DIVISION 33

NUMBER SECTION DESCRIPTION

DIVISION 33 UTILITIES

SECTION 336100 - Hydronic Utilities

END OF CONTENTS TABLE

DIVISION 22
SECTION 336100 - Hydronic Utilities

REVISIONS:
NOVEMBER 2018 NEW SPECIFICATION SECTION. THIS SPECIFICATION IS OWNED AND MAINTAINED BY THE U-M STEAM AND HYDRONICS MECHANICAL TECHNICAL TEAM.

THIS SPEC DOES NOT INCLUDE DETAILED TRENCHING REQUIREMENTS. ASSURE THAT THE PROJECT SPECIFICATIONS INCLUDE A RELATED SECTION 312000 "EARTH MOVING" OR EQUIVALENT, PROVIDING DETAILED TRENCHING, COMPACTING, AND BACKFILLING REQUIREMENTS. IF THE SECTION NUMBER IS DIFFERENT THAN 312000, REVISE 1.1.B AND 3.2.A BELOW.

GENERAL

1.1 RELATED DOCUMENTS

INCLUDE PARAGRAPH 1.1.A AND B IN EVERY SPECIFICATION SECTION. EDIT RELATED SECTIONS 1.1.B TO MAKE IT PROJECT SPECIFIC.

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 1 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections
 - 1. Section 220500 - Common Work Results for Mechanical
 - 2. Section 221113 - Piping Materials and Methods (only as specifically referenced in this section)
 - 3. Section 312000 - Earth Moving

1.2 SUMMARY

- A. This section specifies piping materials and installation methods for underground hydronic piping including:
 - 1. Chilled water piping and valves: ductile iron system

ADD TO LIST AS REQUIRED TO BE PROJECT SPECIFIC; REVISE THE SPECIFICATION TO COVER ANY ADDED SYSTEMS.

1.3 REFERENCES

REVISE DEFINITIONS TO BE PROJECT SPECIFIC.

- A. Definitions
 - 1. AASHTO: American Association of State and Highway Transportation Officials.
 - 2. ACI: American Concrete Institute.
 - 3. ANSI: American National Standards Institute.
 - 4. ASTM: American Society for Testing and Materials.
 - 5. AWWA: American Water Works Association.
 - 6. HDPE: High Density Polyethylene.

7. MDOT: Michigan Department of Transportation.
8. OSHA: Occupational Safety and Health Administration.
9. PPM: Parts Per Million.
10. PSI: Pounds per Square Inch.
11. SDR: Standard Dimension Ratio.
12. UL: Underwriters Laboratory.

1.4 SUBMITTALS

- A. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, rough-in requirements, materials of construction, and operating and maintenance clearance requirements. Additionally include:
 1. Provide a piping material schedule that indicates, by service, pipe material, pipe manufacturer, fitting type and manufacturer, joint type and manufacturer.
 2. Provide a valve schedule that indicates, by service, valve material, model, manufacturer, and installation location.
 3. Manufacturer Certification: Mill certifications indicating country of origin and compliance to AWWA/ASTM/ANSI/NSF and other required compliance standards verified by independent third party based in the United States.
 4. Layout and staking locations including invert elevations of piping, and locations or valves, fittings and joints.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports for testing activities described in Part 3.

1.6 QUALITY ASSURANCE:

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 1. AWWA C600 Standard for Installation of Ductile-Iron Water Mains and their Appurtances
 2. AWWA C606 Grooved and Shouldered Joints.
- C. Comply with the requirements of City of Ann Arbor and MDOT that regulate this work relative to other underground utilities and roadways.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Store piping materials and accessories raised off the floor or ground on pallets and protected with coverings to prevent damage or contamination due to weather and construction activities. Deliver piping with factory-applied end caps. If not factory applied, install field caps or equivalent protection. Maintain caps installed at all times until just prior to assembly, and recap open pipe ends at the conclusion of each work day. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.
- B. Product Inspection: All materials furnished shall be subject to inspection on arrival at the job site by the Owner or Owner's agent. The purpose of the inspection shall be to cull and reject products that, independent of physical tests specified under the standard specifications designated herein, fail to conform to the requirements of these specifications. Materials shall be subject to rejection on account of any of the following:
 - 1. Variation in any dimension exceeding the permissible variations given in the material specifications. Pipe in all cases shall be full diameter.
 - 2. Fractures or cracks passing through the barrel or socket.
 - 3. Chips or fractures on the interior of the pipe exceeding two inches in length, one inch in width, or depth more than $\frac{1}{4}$ of the thickness of the wall.
 - 4. Blisters that are either broken, exceed three inches in diameter, or project more than $\frac{1}{8}$ inch above the surrounding surface of the pipe.
 - 5. Variation of more than $\frac{1}{16}$ inch per lineal foot in alignment of pipe intended to be straight.

Rejected materials shall be clearly marked by the Inspector and immediately removed from the site of work by the Contractor, without cost to the Owner.

1.8 COORDINATION

- A. Coordinate inspection with the authority having jurisdiction and with Owner's representative.
- B. Coordinate connections to existing services/service shutdowns with Owner's representative for impacted facilities. At the beginning of the project provide a construction plan outlining all major construction activities including the proposed dates and durations of service shutdowns, service connections, and sidewalk/roadway interruptions.
- C. Contractor shall not turn valves - coordinate with University of Michigan Utilities.

1.9 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL PIPING REQUIREMENTS:

- A. All piping materials shall be compatible for temperature, pressure and service.
- B. All wetted seals shall be made from materials that are immune from chloramine degradation.

2.2 DUCTILE IRON PIPE AND FITTINGS FOR CHILLED WATER SERVICE

- A. General Requirements
 - 1. Provide the following type components:
 - a. Pipe: Ductile iron pipe with mechanically restrained push-on style joints between pipe sections.
 - b. Fittings: Tees, elbows, and other fittings to allow directional changes: Flanged, mechanically restrained.
 - c. Valves: Gate valves, flanged, mechanically restrained.
 - d. Polyethylene encasement, all ductile iron pipe and fittings.
 - B. Pipe:
 - 1. Ductile iron pipe, 350 PSI minimum working pressure, Class 52, AWWA C151/A21.51, standard thickness cement mortar lining complying to AWWA C104/A21.4, asphaltic coated outside in accordance with ANSI/AWWA C151/A21.51. Pipe beneath railroads shall be thickness class 56.
 - a. Provide ductile iron pipe manufactured in the United States of America.
 - b. The following information shall be clearly marked on each length of pipe:
 - 1) Size
 - 2) Pipe designation and class.
 - 3) Marked DI or Ductile Iron
 - 4) Name and trademark of the manufacturer
 - 5) Country of origin
 - 6) Year produced
 - c. Certification of country of origin shall be provided upon delivery.
 - 2. Restrained push-on style joints, designed to provide a minimum of 3 degrees deflection after assembly.
 - a. "TR-Flex" restrained joint by U.S. Pipe.
 - b. "Mega Lug" joint restraint system by EBAA Iron Sales, Inc., Series 1700. Restraint ring, bolts, nuts, and all other parts with MEGA-BOND restraint coating system.
 - 3. Where ductile iron pipe transitions to other pipe materials upon entering a building, terminate the ductile iron pipe with a factory threaded and a screw-on, machine tightened, ductile iron flange that complies with ANSI/AWWA C115, similar to that available from American Ductile Iron Pipe and US Pipe. Flanges shall be designed to mate with Class 250 flanges.
- C. Fittings:

1. Flanged, ductile iron AWWA C110/A21.10, rated working pressure 350 psi, standard thickness cement mortar lining complying to AWWA C104/A21.4, asphaltic coated outside in accordance with ANSI/AWWA C151/A21.51.
 - a. Provide ductile iron fittings manufactured in the United States of America.
 - b. The following information shall be clearly marked on each fitting:
 - 1) Size
 - 2) Pressure rating
 - 3) Number of degrees or fraction of the circle on all bends
 - 4) Marked DI or Ductile Iron
 - 5) Name and trademark of the manufacturer
 - 6) Country of origin
 - 7) Year produced
 - c. Certification of country of origin shall be provided upon delivery.
2. Mechanically Restrained Joints (including at valves)
 - a. AWWA C111 compliant joint restraint system and bolts.
 - b. Provide "Mega Lug" joint restraint system by EBAA Iron Sales, Inc., Series 1100. Gland, bolts, nuts, and all other parts with MEGA-BOND restraint coating system.

D. Gaskets:

1. AWWA C111/A21.11, SBR rubber, of shape matching pipe and fittings.
 - a. Lubricants used shall be supplied, or recommended, by the pipe manufacturer and the joints shall be coupled in accordance with manufacturer's requirements.

E. Polyethylene Encasement

1. Thickness and wrapping per ANSI/AWWA C105/A21.5

2.3 STEEL CASING PIPE

A. Provide steel casing pipe where indicated.

B. Steel Casing Pipe

1. ASTM A 53, Type E or S, Grade B steel pipe.
2. Material: Steel casing pipe shall meet the following schedule of thickness based on nominal diameter of casing pipe:

<u>Nominal Diameter of Casing Pipe (inches)</u>	<u>Minimum Wall Thickness (inches)</u>
Under 14	0.250
14, 16, and 18	0.312
20 and 22	0.375
24, 26, 28, and 30	0.500
32 and 34	0.563
36, 38, 40, 42, and 48	0.625
3. Identification: The following information shall be clearly marked on each length of pipe.
 - a. The pipe designation and class.
 - b. The name or trademark of the manufacturer.
 - c. Identification of the manufacturing plant.

2.4 VALVES (CHILLED WATER)

- A. Provide gate valves unless otherwise indicated.
- B. Gate Valves:
 - 1. Resilient seat non-rising stem, flanged.
 - 2. Two-inch square operating nut.
 - 3. Left-hand open.
 - 4. Joints meeting ANSI/AWWA C111/A21.11.
 - 5. Gate valve shall be of the following models:
 - a. Series 300 and T300 NRS Double Disc Gate Valve by Waterous.
 - b. A-2380 Series by Mueller.
 - c. Series A by East Jordan Iron Works.
 - d. AWWA 571X by Kennedy.
- C. Gate Valve Box
 - 1. Tyler 6860, Buffalo type, Size D, screw type, 3-piece, 5-1/4-inch shaft.
 - a. #6 base for valves 8 inches or less.
 - b. #8 base for valves 10 or 12 inches.
 - 2. Casting cover shall be labelled "Chilled Water" in raised lettering (available from East Jordan Iron Works)

PART 3 - EXECUTION

3.1 PIPING INSTALLATION

- A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of the piping. Install piping as indicated. If adjustment is needed due to field conditions, obtain the approval of the Owner's engineer before proceeding.
- B. Install pipe, fittings, joint restraints, and accessories per manufacturer's written instructions and AWWA C600.
- C. Main Connections: Coordinate with the Owner's representative for connections to existing mains.
 - 1. Owner shall be notified 10 working days prior to any proposed interruption of service or building system shutdown.
 - a. Contractor shall coordinate with the Owner for main valve shutdowns. Contractor shall not turn valves.
 - b. Contractor shall provide means for maintaining the site dry in the event the existing valves provide a poor shutdown.
 - c. All pipe, fittings, and appurtenances necessary to complete the main connection shall be on site prior to excavation for the connection.
 - d. No water main shutdown will take place after 12:00 PM unless expressly granted by the Owner.
- D. Cutting Water Main Pipe:
 - 1. Flame or torch cutting of water main pipe is not allowed.

2. Pipe shall be cut in a manner that will not damage the pipe or cement lining of the pipe and shall provide a clean and 90 degree cut.
- E. Install pipe components and joining systems in accordance with the manufacturer's installation instructions.
 - F. All flushing water, system water (including any drained from existing systems), blow down water, or other fluids or materials discharged or produced as part of the work shall be disposed of in accordance with State of Michigan and local regulations. Contact the Owner's representative, Nick Vanderkolk (nevander@umich.edu), for an analysis of water in existing systems to be drained. If fluids have a pH between 5.0 and 10.0 and meet the requirements of City of Ann Arbor Sewer Use Ordinance, they may be discharged to the sanitary sewer. If the water does not meet the sewer discharge limits, contact U-M Environment, Health and Safety (EHS) Hazmat at 763-4568 for proper disposal requirements. City of Ann Arbor Sewer Use Limitations (Chapter 28 Sewage and Sewage Disposal, subsection 2:43.1. Prohibited Discharges.) can be found at:
 1. <http://www.municode.com/resources/gateway.asp?pid=11782&sid=22>
 2. or by contacting U-M EHS - Environmental Protection & Permitting Program at 936-1920.
 - G. Installed piping shall be free from sagging and low spots.
 - H. Provide fittings and specialties necessary to properly interconnect all items, whether or not shown in detail.
 - I. Piping shall remain protected and capped until just prior to connection. Immediately after assembly, restore all protection and cap unprotected ends to prevent dust, gases, moisture, other debris and vermin from entering the piping system.
 - J. Clean and swab-out all piping before installation.
 - K. Lay out pipe lines straight, plumb and in true alignment. Offset as required to avoid interference with other work. Lay out all pipes and establish their levels from bench marks.
 - L. Do not conceal piping until it has been inspected, tested, cleaned, and approved.
 - M. Lubricate flange bolts and install with hardened flat washers. Use a torque wrench to tighten restraint bolts (when required by the mfr.) and flange bolts to the gasket manufacturer's recommended torque.
 - N. Locate groups of pipe parallel to each other, spaced to permit servicing of valves and accessories.

3.2 EARTHWORK AND TRENCHING

- A. Refer to Section 312000 "Earth Moving" for excavating, trenching, and backfilling.

USE BELOW SECTIONS ONLY IF NOT COVERED IN ANOTHER DIVISION.

- B. All trenching and backfilling required for the proper installation of the work shall be done as prescribed in other Divisions.

- C. Excavate trenches so that pipe can be installed at proper depth. Lay pipe on a firm bed bearing its full length except at the bell. Where piping is installed in backfilled areas, provide machine tamping and be responsible for any settling at, or rupture to the piping work. Keep trenches water free and dry during bedding, laying and jointing through use of de-watering pumps and similar means. After the joints are made, place sufficient backfill along each side of pipe to offset conditions that might tend to move the pipe off line and grade.
- D. Backfill only after pipes have been tested, inspected and approved.
- E. Piping encountered in excavating, (if shown on the drawings or not), shall be supported and protected from damage. If utility lines are encountered, notify the Owner's Representative and do not disturb the lines unless directed. If existing utility lines are damaged during excavations, immediately repair the lines at no cost to the Owner.
- F. No installation of pipe or accessories shall be made in filled or disturbed earth until it has been compacted as directed.
- G. Restore street pavements, curbs and sidewalks disturbed in the performance of this work.
- H. Where indicated on drawings the work is to be installed by tunneling. In all other locations, excavations shall be done by the open trench method and to the depths and widths as may be necessary. All material excavated shall be deposited on the sides of the trenches and beyond the reach of trench collapse/slides.
- I. Provide shoring, bracing or sheet piling necessary to maintain the banks of the excavations or tunnels. Take same out as the work is backfilled. Shoring must prevent any movement of the trench banks and strains on the piping and utility lines.

3.3 PROTECTION AGAINST FREEZING:

- A. During construction, protect all piping and accessories from freezing.

3.4 INTERSECTING BASEMENT WALLS OR PENETRATING FLOORS

- A. Piping below grade, intersecting basement walls or penetrating floors, shall be run through a sleeve seal system as described in Related Section 221113.
 - 1. Size sleeves and select sleeve seal links per sleeve seal manufacturer's recommendations.
 - 2. Install sleeves and seals per manufacture's recommendations. Center sleeve water stops at midpoint of wall/floor thickness. Provide temporary support to avoid sleeve collapse during pours.
- B. Record as-built sketches and dimensions prior to backfilling.

3.5 HYDROSTATIC PRESSURE TESTING

- A. Develop a plan for pressure testing the piping system. Submit the plan to the Owner's Representative for approval prior to completion of the piping.

- B. Coordinate the testing. Additional time required to obtain a passing result will not be considered sufficient cause for an extension of schedule or increase in cost.
- C. Furnish all piping, pumps, gauges and other materials and equipment required to carry out the tests.
- D. Connections to the existing main shall not be made until the new piping main has been cleaned and successfully pressure tested and written approval has been obtained from the Owner's Representative.
- E. Hydrostatic Acceptance Pressure Test:
 - 1. Test new systems only, from point of connection to the existing systems. Perform initial tests and correct deficiencies prior to requesting acceptance test.
 - 2. Perform acceptance pressure tests in the presence of the authorities having jurisdiction. Acceptance tests must be satisfactorily completed before piping is concealed.
 - 3. Components shall be removed or isolated during testing if damage may occur due to test pressure and/or test media.
 - 4. Acceptance leak testing shall include a test against each new shutoff valve. Arrange testing to allow visual confirmation of zero leakage across each valve.
 - 5. Slowly fill the main and pump the pressure to 150 psi. Test pressure shall be maintained between 145-155 psi during the entire test.
 - 6. Testing Period - 2 hours with zero visual leakage.
 - 7. For each system tested, provide a certificate testifying that the system was satisfactorily tested and passed, using owner furnished forms.

3.6 FLUSHING AND CLEANING OF PIPING

- A. Develop a plan for Owner's approval. Submit the plan prior to completion of piping. In cases of large bore pipe, the Owner may approve a visual means of inspecting for cleanliness if the Contractor can demonstrate an effective method for doing so. Provide all temporary and permanent piping, equipment, and materials necessary to complete flushing and cleaning.
- B. Prior to flushing, swab/pig out underground piping to remove all particulate.
- C. Prior to pigging and flushing, temporarily remove, isolate or bypass dirt sensitive equipment and devices.
- D. Prior to opening to the existing system, flush all piping with city water for a minimum of one hour, until water runs clear. Water supply shall be equivalent to piping being flushed. Drain all low points. Refill with clean city water. Obtain Owner's permission in writing prior to opening to the existing system.

TUNNEL PROJECTS

END OF CONTENTS TABLE

DIVISION 01 GENERAL REQUIREMENTS

SECTION 336200 - PROJECT QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) FOR TUNNEL PROJECTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 013100 - Project Management and Coordination.
 - 2. Section 013300 - Submittal Procedures.
 - 3. Section 017823 - Operation and Maintenance Manuals.
 - 4. Section 336330 - Utility Tunnels - Steam & Condensate Distribution Systems
- C. Testing, QA/QC, operation and maintenance manual, and Owner training requirements referenced in the other Technical Specification Sections apply to this Section.

1.2 SUMMARY

- A. Contractor shall coordinate with and support all QA/QC activities required for the project. Contractor shall be responsible for their portion of the work as part of the overall system QA/QC process. The QA/QC activities will be coordinated by the University's QA/QC Authority. Perform the QA/QC activities as outlined in Part 3, "Execution".
- B. Perform QA/QC activities on the following:
 - 1. Division 33: Systems and equipment include, but are not limited to:
 - a. Tunnel piping, valves, expansion joints, and loops.
 - b. Steam and condensate systems.

1.3 SUBMITTALS

- A. Provide the QA/QC Authority with the lists, forms, drawings, plans, reports, and manuals described in Part 3, "Execution".

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) ACTIVITIES

- A. Attend QA/QC meetings which shall be conducted as part of the project's regular construction meetings.

- B. The QA/QC Authority will maintain a QA/QC Manual. The General Contractor shall obtain all documentation related to the QA/QC effort, and submit same to the QA/QC Authority for approval.
1. The QA/QC Manual will be used to store documents produced during the QA/QC process.
 2. Each Contractor shall provide their own contact information and a complete list of trade contractor, major manufacturer and major supplier contact information for inclusion in the QA/QC Manual.
 3. The Contractor shall assist the Owner's QA/QC Authority in performing all QA/QC activities required on this project. The types of activities performed by QA/QC Authority include but are not limited to:
 - a. Pre-Weld Inspections
 - b. Post Weld Inspections.
 - c. Anchor Bolt Inspections
 - d. Expansion Joint Inspections.
 - e. Guide Alignment Inspections.
 4. Contractor shall provide one copy of the following documents to the QA/QC Authority for inclusion in the QA/QC Manual:
 - a. Manufacturers' factory test reports.
 - b. Field inspection and test reports.
 - c. Complete Travelers Package.
 - d. Weld Maps.
 - e. Mill & Welder Certifications.
 - f. Tests required by other specification sections.
- C. During the shop drawing submittal process, Contractor shall submit one set of shop drawings for all systems and system components included in the QA/QC process to the QA/QC Authority for review.
1. Submit the shop drawings at the same time they are submitted to the A/E for review.
- D. Provide advance notification of the following activities:
1. At least 2 weeks advance notice of weld x-rays. The QA/QC Authority must witness x-ray tests.
 2. At least 2 weeks advance notice of pipe flushing and cleaning. The QA/QC Authority must witness flushing and cleaning.
 3. Coordinate and schedule all required QA/QC system inspections, include but are not limited to:
 - a. welds, alignments, etc. with QA/QC agent.

SECTION 336313 - UNDERGROUND STEAM AND CONDENSATE DISTRIBUTION PIPING

END OF CONTENTS TABLE

DIVISION 33 UTILITIES

SECTION 336313 - UNDERGROUND STEAM AND CONDENSATE DISTRIBUTION PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 017823 - Operation and Maintenance Manuals
 - 2. Section 019100/019110 - Commissioning
 - 3. Section 336200 - QA/QC for Tunnel Projects
 - 4. Section 336330 Utility Tunnels - Steam & Condensate Distribution Systems

1.2 SCOPE OF WORK

- A. Provide an engineered high temperature, pre-insulated conduit system for direct-buried steam and condensate piping, using Aerogel insulation technology as detailed in the drawings and specified here.
- B. Provide separate pre-insulated conduit system for each piping system type as detailed in the drawings and specified here. Multi-piping systems in common conduit are not permitted without prior approval by U of M Utilities Department.
- C. The conduit system shall be a combination of testable, drainable and dryable type conduit system, suitable for all ground water and soil conditions, site classification A (Federal Construction Guide Specification 02695).
- D. The systems shall be furnished in numbered, cut-to-length factory-assembled pieces, based on certified field dimensions. Anchor, guide, oversized elbow, tee, expansion loop and similar project-specific components shall be furnished such that all field welds are straight butt weld type.

1.3 MANUFACTURER'S FIELD INSTALLATION INSTRUCTOR:

- A. Manufacturer's trained representative who is technically qualified to determine whether or not the installation is being made in accordance with the manufacturer's recommendation shall be present during critical periods (see paragraph 3.1) of installation and test of the system. On completion of the installation, the contractor shall deliver to the owner a certificate from the manufacturer stating that the installation has been made in accordance with the manufacturer's recommendations.

1.4 SUBMITTALS AND GUARANTEES

- A. The supplier shall provide written temperature performance certification for the insulation from the insulation manufacturer and an independent testing agency report that the insulation to be provided for the casing meets the requirements specified.
- B. Final stress model shall be submitted to the Owner in electronic format compatible with CAEPIPE or an approved equal.
- C. Submit third-party gradation test report (ASTM C 136) for pipe trench backfill material.
- D. Submit concrete mix design for anchor blocks.
- E. Product Data: Insulation materials, thickness and performance characteristics.
- F. Layout Drawings indicating sizes of each piece as it will be delivered to the job site. Supplier will deliver all straight pipe in no larger than 40 foot lengths.
- G. All piping shall be certified to be non-magnetized by manufacturer prior to assembly and shipping, and if necessary de-gaussed to remove any magnetic field.
- H. Details:
 - 1. Oversized elbows.
 - 2. Supports and guides.
 - 3. Wall penetrations.
 - 4. Cathodic protection.
- I. Special Submittal: After fabrication and prior to conduit piping system delivery, submit certification that:
 - 1. All factory welds have been 100% x-ray inspected and passed.
 - 2. All factory joints have been air-tested inspected and passed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Provide direct-buried high temperature piping conduit system by one of the following manufacturers:
 - 1. Rovanco Insul-800 Elite
 - 2. Ultra-Therm Systems by Perma-Pipe/Ricwil
 - 3. Thermacor

2.2 PERFORMANCE REQUIREMENTS

- A. Each piping system layout as shown in the drawings shall be analyzed by the supplier for stresses and movements and the results submitted confirming code compliances with ANSI B31.1 latest edition. The calculations shall be stamped and sealed by a registered professional engineer. For the purposes of stress calculations the steam temperature used shall be 450F for the low pressure steam piping and 250F for low pressure condensate piping.

- B. Temperature gradient calculations shall be made for each system to be provided to indicate the temperature at the annular air space within the conduit and to confirm the conduit temperature is less than 340F or the rated temperature of the conduit insulation, whichever is less. For the purposes of this calculation assume fluid temperatures as scheduled, burial depth as indicated on Drawings, soil conductivity of 15 BTU-inch/HR/sq.ft.F, soil temperature of 55F, and flowable-fill conductivity of 3.3 BTU-inch/HR/sq.ft.F. For the purpose of temperature gradient calculations use temperature corresponding to steam temperature with 10F superheat with an up to an 8-hour excursion of 450F for both LPS.

2.3 CONDUIT:

- A. All conduit straight lengths shall be welded smooth wall of not less than 10 gauge wall thickness black steel for pipe sizes up to 26", 6 gauge up to 36", 4 gauge up to 42" conforming to ASTM A-211, A-139, A-134 and A-135. Conduit shall be tested at the factory to ensure air and watertight welds prior to any fabrication or application of the fiberglass cladding. The steel conduit shall be cleaned and made free of all loose scale and mill coatings by shot blasting to clean, bright metal, and care shall be taken to maintain the surfaces free of oil and grease before application of coatings.
- B. Conduit field joints shall consist of 10-gauge steel suitably rust proofed and in cylindrical form with a single horizontal split and shall be field welded over adjacent units after pipe insulation. After hydro tests, all exposed joints shall be covered in the field with insulation to match factory insulation and outer jacket.
- C. The conduit system shall be capable of withstanding H-20 Highway loading at a burial depth of 24" to the top of the conduit from grade. The conduit gauge thickness and outer jacket thickness shall be increased, if required, to meet this requirement.
- D. Inner Pipe Supports: All pipes shall be aligned and supported within the casing with galvanized steel supports on centers approximately 10'-0". The carrier pipe shall not bear directly on the steel support. The support shall be designed to permit drainage and free air passage. All pipes passing through supports shall be insulated.
- E. Inner Conduit Casing Insulation: High-temp polyisocyanurate insulation applied to the inner conduit casing shall have the following properties.
 - 1. Minimum Density-2.0 pcf per ASTM D 1622
 - 2. Closed Cell Content-90% per ASTM D 2856
 - 3. Compressive Strength-30 PSI per ASTM D 1621
 - 4. K factor:
 - Initial @ 75°F Mean Temperature..... 1.130
 - @ 200°F Mean Temperature..... 0.235
 - Aged @ 400°F for 28 days..... 0.220
 - @ 400°F service temperature and 75° Amb..... 0.240
 - Dimensional Stability-% change per ASTM 2126
 - 400°F Exposure of 2" cube foam sample:
 - 1 Day + 1.3% length +0.1% Volume
 - 7 Day + 2.3% length -2.3% Volume

450°F Exposure of 2" cube foam sample:
1 Day + 10.31% length +14.6% Volume
7 Day + 7.1% length +1.5% Volume

2.4 SERVICE (CARRIER) PIPE MATERIAL:

- A. Steam piping shall be A106/A53, Grade B, Schedule 40 black steel piping.
- B. Condensate piping shall be Type 316 stainless steel, Schedule 40 piping.
- C. All joints within conduits shall be welded.
- D. All pipes within shop assembled conduit lengths shall be single length seamless, without butt joints or couplings.

2.5 SERVICE (CARRIER) PIPE INSULATION:

- A. Steam and condensate piping within the conduit shall be insulated with Aero-Gel Pyrogel XT-E insulation. Pyrogel high temperature insulation blanket of silica Aerogel, reinforced with a non-woven, glass fiber batting. Sectional insulation shall be banded on pipe with aluminum banding on 18" center. Insulation thickness shall be as specified or recommended by system supplier.
- B. The insulation integrity shall be maintained (insulation shall not separate and expose bare pipe when the pipe expands) when the pipe expands to maintain the annular air temperature to less than 340F. This may be accomplished with overlapping insulation or other means at the joints. Provide details as to how this is accomplished with the shop drawings.
- C. Insulation thicknesses shall be as indicated on the drawings.
- D. A minimum of 3/4" air space is required as calculated between the nominal OD of the carrier pipe insulation and the ID of the conduit.

2.6 INSULATION AND JACKET:

- A. Insulation shall be capable of handling intermittent temperature spikes to 450F for 8-12 hours. Insulation shall completely fill the annular space between the conduit and outer jacket. Quality assurance procedures for the insulation shall include either infrared or X-ray inspection of the entire length to ensure there are no insulation voids.
- B. The exterior protective jacket shall be heavyweight, seamless, minimum .175 mils thickness high impact, polyethylene conforming to ASTM D1248 & D3350. Field joints shall be insulated with mineral wool on carrier and half shells of high temperature polyisocyanurate foam for outer insulation. The outer polyethylene joint shall be certified EN489, Rhinojoint by Rovanco or equal.
- C. All field joints must be air-tested in a way that the polyethylene is not drilled into. Air test from the side of joint is recommended. The Contractor shall log each joint and present the test log to the owner at time of final test No FRP jacket or electrofusion casing joints is allowed.

- D. Perform a visual inspection of the conduit to ensure no damage (penetration of jacket and puncture of foam).
- 2.7 MOISTURE BARRIER END SEALS:**
- A. Moisture barrier end seals shall be factory applied, sealed to the jacket and carrier pipe. End seals shall be certified as having passed a 20-foot head pressure test. End seals shall be mastic completely sealing the exposed end of the insulation. Field applied end seals shall be installed at each field cut to the piping before continuing with the installation.
- 2.8 PIPE SUPPORT AND GUIDES:**
- A. Piping shall be suitably spaced and supported in conduit by specially designed full-round insulating support-guides which permit the pipe to expand or contract without stress or wear to the pipe or insulation as well as provide for drainage and free air circulation.
- 2.9 EXPANSION LOOPS, ELLS AND TEES:**
- A. Ells, expansion loops and tees shall be prefabricated in the factory, meeting all the requirements specified for the conduits. They shall be oversized as required to accommodate the calculated pipe movements.
- 2.10 END AND GLAND SEALS:**
- A. Terminal ends of conduits inside manholes, pits or buildings shall be equipped with end seals consisting of a steel bulkhead plate welded to the conduit and carrier pipe if there is an anchor within five feet of the end seal. Where there is no anchor within five feet of a terminal end, conduits shall be equipped with gland seals consisting of a high temp gasket and follower plate. End seals or gland seals shall be made of 1/2 inch steel plate with drain and vent openings on the vertical center line of the mounting plate.
- 2.11 ANCHORS:**
- A. Provide anchors as recommended by conduit supplier and as indicated on the Drawings. Anchors shall be pre-fabricated onto the piping units and shall be equipped with drain and vent openings at the top and bottom of the anchor plate. Anchor plates shall be made of minimum 1/2 inch steel plates.
 - B. At the anchor, the anchor plate and conduit shall be sealed watertight with Raychem Dirax, Canuse GT-65 wrap, or as approved by the system manufacturer.
- 2.12 ANCHOR BLOCKS**
- A. Anchor block shall be per plan detail.

2.13 PIPE TRENCH BACKFILL

- A. Clean, granular backfill should be tamped in place so as to assure a stable surface. No rock should be used within 24" of the pipe. Top of pipe grade shall not be less than 24" to meet H-20 Highway loading. Backfill shall be in accordance with ASTM C136-Standard Test Method.

PART 3 - EXECUTION

3.1 GENERAL:

- A. The complete piping system installation shall be made in accordance with plans, specifications, and manufacturers' installation instructions.
- B. A fully qualified and certified manufacturer's representative shall be present during the installation of the underground steam and condensate distribution system. Crucial periods of installation shall be defined as periods which include work on one or more of the following types of work:
 - 1. Inspection upon unloading
 - 2. Inspection of trench prior to laying conduit
 - 3. Inspection of concrete anchor blocks prior to cold springing (if applicable).
 - 4. Cold springing (if applicable).
 - 5. Welding.
 - 6. Hydrostatic Test of all service line
 - 7. Field joint closure work
 - 8. Air test of conduit
 - 9. Repair of any coating patch work
 - 10. Holiday test of conduit coating
 - 11. Initial backfill up to 10" above top of conduit casing

3.2 CERTIFICATION:

- A. Upon satisfactory completion of the installation, the conduit manufacturer shall provide the installing contractor with certification that the materials have been installed in accordance with conduit manufacturer's approved brochure, plans and specifications. Certification shall include dates of each field test and a pass/fail indication.

3.3 FIELD TESTS:

- A. All welds will be 100% X-ray inspected and passed.
- B. The inner pipes of this system shall be hydrostatically tested to 1-1/2 times the rated pressure of the line or 90 lbs., whichever is higher. If a leak is found, it shall be repaired and the test repeated. The outer casing shall be tested with air at 15 psig and a soap solution shall be applied to field joints to locate leaks. If leaks occur, they shall be repaired and the test repeated. After the conduit air test has been approved, all field joints shall be insulated and sealed by the contractor.

SECTION 336320 - UTILITY TUNNELS - DOMESTIC HOT WATER DISTRIBUTION
SYSTEMS

END OF CONTENTS TABLE

DIVISION 33 UTILITIES

SECTION 336320 - UTILITY TUNNELS - DOMESTIC HOT WATER DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.

1.2 SUMMARY

- A. This Section includes all utility tunnel domestic hot water distribution systems, including but not limited to:
1. Domestic Hot Water Supply and Return Systems
 2. Domestic Hot Water Piping System Insulation
 3. Hangers, Supports and Anchors
 4. Valves
 5. Domestic Hot Water Specialties
 6. Expansion Joints
 7. Thermometers and Gauges

1.3 SUBMITTALS

- A. Shop Drawings Submit the following project specific items for approval in compliance with Division 1:
1. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, roughin requirements, materials of construction, and operating and maintenance clearance requirements.
 2. Provide a piping material schedule that indicates, service, pipe material, pipe manufacturer, fitting type and manufacturer, joint type and manufacturer.
 3. Solder and brazing material data sheets.
 4. Grooved fittings, couplings, and accessories data sheets.
 5. Provide data sheets for all products listed in this section including flanges, gaskets, unions, hangers, di-electric protection method, thermal hanger shield inserts, di-electric fittings, flexible metal hose, flexible connectors, and seal sleeve systems.
 6. Submit all submittals for a given system or component at the same time.
- B. Installation, Operation and Maintenance Manuals
- C. Source Quality Control Submittals
- D. Warranty Documentation
- E. As-Built Drawings
- F. Test Reports
- G. Contractor submit the following for A/E review and approval:

1. Type and model for all manufactured pipe support components, including building attachments, hangers, insulation saddles and shields, expansion joints, anchors.
2. Locations of anchors, expansion bends and joints.
3. Locations of building attachments where deemed necessary.

H. Details and supporting calculation of additional supports.

1.4 QUALITY ASSURANCE

- A. **Manufacturers and Products:** The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. **Reference Standards:** Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
1. National Sanitation Foundation NSF/ANSI-61 (potable drinking water) and NSF-61 Annex G (listed as $\leq 0.25\%$ weighted average lead content) (and/or NSF/ANSI-372) and Annex F.
 2. U.S Safe Drinking Water Act.
- C. **Qualifications**
1. Manufacturers
 2. Suppliers
 3. Fabricators
 4. Installers / Applicators / Erectors
 5. Testing Agencies
 6. Licensed Professionals

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PIPE SYSTEM

- A. Domestic Hot Water Pipe - (DHWS & DHWR):
1. For tunnel applications:
 - a. Piping: Type L copper, hard drawn, ASTM B88.
 - b. Fittings: Wrought Copper, ANSI B16.22
 - c. Joints: Soldered through 2"; Piping 2-1/2" through 6" shall be grooved joints.

2.2 PIPE JOINTS:

- A. Soldered Joints: ASTM B32; Alloy Sb5, (95% Tin, 5% Antimony, maximum 0.20% Lead). When recommended by the component manufacturer, use manufacturer's recommended flux. Unless noted otherwise, joints may be screwed or flanged to suit valves and equipment. Manufacturers: Engelehard "Silverbrite 100", Harris "Bridgit"
- B. Flanged Joints:
1. Select flange and gasket materials to suit service of piping and to comply with the respective B31.9 piping standard.
 2. For copper pipe, provide Class 150 flat face ANSI B16.24 cast bronze flanges, brazed to the copper tube.
 - a. Alternative: Copper companion flange by CTS Fabrication USA rated 450 PSI minimum working pressure from -66°F to 272°F. ANSI B16.5 compliant, powder coated, with an EPDM insulator adhered to the plate steel flange protruding inside of the flange to prevent contact with the copper companion flange adapter. Flange adapter shall be manufactured to ASME B16.22, brazed to the copper tube.
 3. Gaskets shall conform to respective ANSI Standards, A21.11, B16.20, B16.21. Flange gaskets for domestic hot water shall be 100% PTFE Garlock Blue-Gard Style 3000 ring type gaskets or comparable. Full face gaskets allowed only when BOTH flanges are full face. Butterfly valves with removable seat screw heads that would interfere with the metal strip winding shall be installed with Garlock Style 9850 gaskets on the seat screw head side.
 4. Flange Bolts and Nuts: Provide ASTM A193 B7 bolts and studs with ASTM A194 grade 2H heavy hex nuts.
- C. Grooved Joints - for Copper Piping, maximum pipe size 8": Rolled grooves, peroxide cured EPDM gaskets, ductile iron housing (ASTM A 532 or A 536), wrought copper (ASTM B 75, ANSI B16.22) or cast bronze fittings, rated for minimum 300 psi working pressure at 250°F, when used with grooves that comply with AWWA C606. Grooved system/components shall provide rigid installation. UL and UPC approved. Utilize manufacturer's recommended gasket lubricant. Brazed Class 150 ANSI B16.24 cast bronze flanges (or copper companion flange by CTS Fabrication USA) must be used at any component requiring a flanged connection. Clamp-on branch outlets are prohibited. Exact gasket material and style shall be as recommended by the coupling manufacturer for the service, and NSF/ANSI-61 Annex G and NSF/ANSI-372 listed when used for potable water. On potable water service, provide non-standard gasket styles that close off and isolate gasket cavities from the water in the pipe. The manufacturer of the couplings and the fittings shall be the same. The same grooved component manufacturer shall be provided for the entire scope of the work, for each system.
- D. Manufacturers: Victaulic Style 607. Other coupling manufacturers will be considered for approval as owner option, provided they comply with all the above.

2.3 FLEXIBLE METAL HOSE CONNECTORS

- A. For copper piping systems, (up to 2" in size) use copper construction braided hoses. Manufacturers: Anaconda, Flex Hose Co., Flexonics, Mason, Metraflex.

- B. For sizes 2½" above, all stainless steel with an inner corrugated hose made of type 316 stainless steel and outer braid made of 316 stainless steel, with stainless steel flanges. Dual floating flanges only. Fixed flanges are not acceptable.

All wetted parts shall be stainless steel. Approved Manufacturers: Metraflex, Flexonics, Masonly, Twin City Hose.

- C. Provide flange union with dielectric gasket and bolt sleeves. On copper pipe, a stainless steel companion flange with a fully floating powder coated steel flange, fitted with a neoprene insulator, as manufactured by CTS Fabrication USA, may be used.

2.4 EXPANSION JOINTS

A. General

1. Expansion joints sizes 2" and smaller shall have screw threads or sweat ends. Joints 2-1/2" and larger shall have 150 pound ASA standard flange ends unless indicated otherwise.
2. All bellows joints shall be pre-set at the factory and "held" with removable metal clips or strips tack welded across the flanges.
3. Provide guides of the type indicated at locations indicated in the plans. And if not shown of the drawing, per published manufacture recommendations.
4. For pipe 2-1/2 inch and larger: Provide flange union with dielectric gasket and bolt sleeves. On copper pipe, a copper companion flange with a fully floating powder coated stainless steel flange, fitted with a neoprene insulator, as manufactured by CTS Fabrication USA, may be used.

B. Bellows Expansion Joints (Controlled Flexing Type):

1. Expansion joints shall be multiple 316 stainless steel bellows with mated neck rings.
2. Bellows shall be welded with minimum number of longitudinal seams and no circumferential seams.
3. The joints shall be single or double with center anchor base where indicated and scheduled, with Van Stone flanges and with internal sleeves (joints are to be insulated).
4. The joints shall be rated for 125 lbs. operating pressure and 250 degree F maximum operating temperature.

2.5 VALVES

A. General:

1. All valves shall have seats, stem seals and disc materials compatible with intended fluid, temperature, pressure and service.
2. All EPDM shall be peroxide cured. All wetted seals shall be made from materials that are immune from chloramine degradation.
3. Valves in contact with domestic (potable) water shall be "lead free" NSF/ANSI-61 Annex G (and/or NSF/ANSI-372) labeled.

4. Valves shall be repack-able under pressure whether open or closed.
5. Unless noted otherwise, valves shall be rated for a minimum working pressure of 150 psi and minimum 210° F working temperature.
6. Unless noted otherwise, all butterfly valves shall be full lug construction, suitable for bi-directional dead end service, and have open position memory stop.
7. Manually operated butterfly valves less than 4" shall be lever operated
8. Manually operated butterfly valves 2-1/2" and larger shall have enclosed worm gear operators with position indicators.
9. Gear operated valves shall be provided with self-locking gears. The actuator mounting bracket shall be rigidly dowel pinned to the body to absorb torque loads and shall be centered by machined register between bracket and body.
10. Valve actuator handle size shall be provided with manufacturers approved smallest available handle diameter to prevent obstruction of tunnel corridor.
11. Provide extended valve stems for insulated piping.
12. Valves shall be same size as piping unless otherwise indicated.

B. Valve Schedule:

1. Isolation through 2": Ball Valve
2. Isolation 2 1/2" and larger: High Performance Butterfly Valve, All stainless steel.
3. Check: Silent Check for all sizes.
4. Balancing: Automatic Balancing Valve.

C. Ball Valve:

1. Two-piece, full port, bronze body, stainless steel ball and stem, Teflon seat, plastic coated lever handle and locking devices where noted in drawings.
2. Manufacturers: Watts, Nibco, Apollo, Milwaukee, Hammond, Grinnell (Grinnell permitted only where grooved connections permitted).

D. High Performance Butterfly Valve:

1. Full lug, high performance type, 316 stainless steel body, 316 stainless steel disc, stainless steel shaft and bearing, (all wetted parts stainless steel) PTFE seat, Teflon stem packing. Rated for 150 psi, 250 degrees F.
2. Manufacturers: Jomar T-100-SS and S-100-SS, Jamesbury series 300, Grinnell 3700-6 and 3700SJ-6, Watts series B-6000, Nibco, Apollo, Pegler, Crane, Milwaukee, American Valve, Hammond

E. Butterfly Valve - Grooved:

1. Grooved ductile iron body, suitable for installation with grooved piping, EPDM coated steel disc and shaft, stainless steel hub bearing, EPDM seat, Teflon stem packing. Rated for 300 psi, 230 degrees F. Manufacturer: Victaulic Vic-300

2. Grooved Nylon coated ductile iron body, EPDM coated ductile iron disc, stainless steel shaft, bronze shaft bearing. MSS SP-67 Manufacturer: Grinnell Gruvlock Series 7700.
3. Grooved butterfly valves may be used only within grooved piping systems and only when specifically noted as permitted on the project drawings. Otherwise, high performance butterfly valves shall be provided, including grooved piping systems.

F. Drain Valve:

1. General Service: Ball valve with 3/4-inch hose threaded end fitting and cap.

2.6 AUTOMATIC FLOW CONTROL VALVES:

- A. Body: Inline design manufactured out of series 300 stainless steel; nickel plated union nut for ease of installation and serviceability
- B. End Connections: Threaded inlet and outlet with the outlet connection being union style
- C. Automatic Flow Cartridge
- D. Body: series 300 stainless steel wear surface, CNC machined piston and cylinder; Spring: stainless steel; Calibration: Integral, adjustable, factory set, threaded locking nut to calibrate spring compression for design flow performance, field tamper resistant; Pressure Range: Operates within 2 - 32 PSI or 5 - 60 PSI. Selection is dependent upon pump head requirements; Accuracy: Factory pre set flow +/-5% over defined pressure differential range or spring range as defined by manufacturer and determined by pump head calculations.
- E. Maximum Operating Temperature: 180 F; Commercial Hot Water rating
- F. Cold Working Pressure Rating: 400 PSIG
- G. Factory Testing/Performance: 100% spring test of all flow control cartridges at the factory to verify performance; Leak Test each valve at 100 psi under water
- H. Certifications: Valve shall be NSF 61-G certified for use in Commercial and Domestic Hot Water; Manufacturer shall supply documented proof of actual NSF 61-G certification as part of the submittal package and valve itself must be stamped with NSF 61-G certification seal.
- I. Manufacturer: FDI Model ICSS or Owner-approved equal

2.7 PIPE HANGERS, SUPPORTS AND ANCHORS:

- A. General
 1. Provide pipe hangers, supports and accessories for the proper support of all piping.
 2. Pipe hangers, supports and accessories shall be sized to allow uninterrupted pipe insulation thickness.

- B. Provide adjustable type pipe hangers, supports and accessories for the proper support of all piping. See details on drawings for requirements. Figure and model numbers specified on drawings are for Anvil International, and Pipe Shields Inc. Equivalent products by Carpenter & Paterson, Cooper B-line and PHD Manufacturing are also acceptable. Continuous threaded rod shall be used for intermediate attachments.
- C. Dielectric protection for hangers and supports: Where copper piping is supported with steel hangers and supports, dielectric protection must be provided. Use one of the following means as applicable:
 - 1. Coated hangers (copper or plastic coating)
 - 2. Insulation inserts
 - 3. Cushion clamps
 - 4. Other as approved by Engineer.
- D. Equipment
 - 1. Guides and Slides
 - a. Only use manufactured guides - site built guides are not acceptable unless otherwise approved by Utilities
 - b. 1/2" Thick graphite on both upper and lower assemblies
 - c. Graphite to have a compressive strength of 2000 psi
 - d. Temperature range of -20 degrees F to 750 degrees F
 - e. Epoxy boned to steel assemblies to withstand 350 degrees F
 - f. Guides to allow a maximum of 1/16" lateral movement
 - g. Designed to accommodate pipe insulation
 - 2. Anchors
 - a. Anchors shall be engineered and detail on drawing to meet specific needs of that pipe section.
 - b. Manufactures: Anvil, ATS

2.8 DIELECTRIC FITTINGS:

- A. For pipe 2 inch and less: Provide brass coupling. (Dielectric unions are not acceptable).
- B. For pipe 2-1/2 inch and larger: Provide flange union with dielectric gasket and bolt sleeves. On copper pipe, a copper companion flange with a fully floating powder coated steel flange, fitted with a neoprene insulator, as manufactured by CTS Fabrication USA, may be used.

2.9 THERMOMETERS AND PRESSURE GAUGES:

- A. Thermometers
 - 1. Industrial Glass Thermometer: Adjustable angle, scale to be 9" long with white aluminum back and black graduation, aluminum or polyester casing, red appearing liquid tube, glass window. Stem for air duct shall be 12" long with protective aluminum slotted bulb guard and mounting flange.
 - 2. Stem for piping shall be 3-1/2" long aluminum, brass or stainless steel stem to match specified thermometer well. Adjust stem length for insulation extension.
 - 3. Range and accuracy: (+/-) 1 scale div. Except where otherwise noted, select range for maximum precision for system served:

Service	Range (deg.F)
---------	---------------

- | Domestic Hot Water | 30-180 |
4. These devices shall be installed through a reduced Tee - 6" x 3/4" and with a male sweat to FPT fitting (copper or bronze) Pulled tee-'s are not acceptable.
 5. Manufacturers: Ashcroft, H. O. Trerice, Marsh, Weksler.

B. Thermometer Wells:

1. Stainless steel, with neck extension for insulated piping, with cap and chain fastened to well. 3/4"NPT, 2 1/2" insertion length, and 3 1/2" extension length.

C. Pressure Gauges

1. Provide all pressure gauges with 4 1/2" clear glass window, cast aluminum, stainless steel or polypropylene case, black on white face, stainless steel wetted parts, brass 1/2" MPT socket, 1% full scale accuracy complying with ASME/ANSI B40-1 Grade 1A. Provide coil siphon (pigtail) configuration installed on steam pipes.
2. Gauge pressure range shall be twice normal operating pressure.
3. Manufacture: Ashcroft, Trerice

2.10 INSULATION

A. General:

1. Domestic hot water piping including butterfly valves conveying fluids at temperatures above 110F (Hot Service).
NOTE: VALVES TO BE INSULATED AFTER SUCCESSFUL HYDROTEST.
2. All insulation materials shall be asbestos free.
3. Flame spread classification (ASTM E84, NFPA 255): No greater than value listed.
4. Smoke density classification (ASTM E84, NFPA 255): No greater than value listed.

B. Piping Insulation Fiberglass

1. Fiberglass insulation with factory-applied vapor barrier jacket with self-sealing laps. ASTM C547 Class 1 insulation. Vapor barrier jacket: laminated white Kraft paper, aluminum foil, glass fiber reinforcement.
2. Approved Manufacturers: Johns-Manville, Knauf, Owens/Corning.
3. Required thickness: Fiberglass Piping Insulation Thickness Table

Piping Fluid	System	Temp Range (°F)	Nominal Pipe Size (inches)				
			<1.0"	1.0"	1.5"-4.0"	6"	8" & above
Domestic Hot Water		Any	1.5	1.5	2.0	2.0	2.0

C. Aluminum Jacketing

1. Jacketing shall be 0.016-inch thick stucco embossed aluminum complete with integrally bonded polycraft moisture barrier held in place with aluminum screws; elbow covers to be prefabricated.

2. Fasten jacketing with aluminum screws at a minimum 6-inch spacing. .
 3. Acceptable manufacturers:
 - a. Childers; Ell-Jacs; or Approved equal
 4. Joint sealant shall be aluminum pigmented butyl polymer.
 5. Acceptable products are as follows:
 - a. Foster Div., Amchem Product Inc., "Elastolar Sealant, Aluminum 95-44", Childers "Chil-Joint CP-70" or Approved equal
- D. Piping Insulation Specialties
1. Expansion Joints Insulation: Expansion joints shall be insulated with prefabricated insulation blankets, installed in a manner to allow for the repacking of the joints without removing blanket. Hold blankets in place with permanently attached Velcro fasteners.
 2. Removable Insulation Jackets: Where indicated on drawings, provide removable insulation jackets with ceramic impregnated fiberglass or Aerogel High Temperature insulation, flexible fabric jacket and velcro fasteners.
 3. Manufacturer: ESI - Q Master; Insulation Technologies Inc.

PART 3 - EXECUTION

3.1 GENERAL PIPING INSTALLATION REQUIREMENTS:

- A. Work shall be done in accordance with applicable ordinances and codes. Arrange for inspections.
- B. Install pipe components and joining systems in accordance with the manufacturer's installation instructions.
- C. Provide capped hose end ball type drain valves at all low and high points to allow proper draining and venting of the system during future maintenance operations.
- D. All branch connections shall have a three valve configuration to allow flexibility in directing flow in the future.
- E. Provide fittings and specialties necessary to properly interconnect all items, whether or not shown in detail.
- F. Piping shall remain protected and capped until just prior to connection. Immediately after assembly, restore all protection and cap unprotected ends to prevent odors, dust, moisture, and other debris from entering the piping system.
- G. Locate groups of pipe parallel to each other, spaced to permit applying insulation and servicing of valves.
- H. Install piping at least 3 inches clear of electrical conduit. Do not install pipe within the National Electrical Code (NEC) working space zone of electrical equipment/panels.

3.2 FLUSHING AND CLEANING OF PIPING:

- A. Flush the following piping systems:
- B. Domestic Hot Water (flush only)

- C. Develop plan for flushing and cleaning piping. Submit plan for approval prior to completion of piping. Provide all temporary and permanent piping, equipment, materials necessary to complete flushing and cleaning.
- D. Flushing for new piping: Flush all piping with cold water (or fire protection system where approved by owner) for a minimum of one hour, until water runs clear. Water supply shall be equivalent to piping to be flushed. Use (2) 2-1/2" fire hose connections for piping 3" and larger. Drain all low points.

3.3 PIPING SYSTEMS PRESSURE TESTING

A. General

- 1. Test new systems only, from point of connection to the existing systems. Perform initial tests and correct deficiencies prior to requesting acceptance test.
- 2. Perform acceptance pressure tests in the presence of the owner representative.

B. Acceptance Pressure Testing:

- 1. Perform acceptance pressure testing
- 2. In accordance with the following table:

Piping System	Hydro Test Pressure
Domestic Hot Water	125 psig

- 3. Remake leaking gasket joints with new flange bolting. Where welded joints fail, submit proposed method of repair for approval by the Owner's representative and authorities having jurisdiction.
- 4. For each system tested, provide a certificate testifying that the system was satisfactorily tested and passed, using owner furnished forms.

3.4 INSTALLATION OF PIPE HANGERS AND SUPPORTS:

- A. Arrange pipe hangers and supports to permit proper pitch of piping, free to move with pipe expansion, installed at proper intervals. Hangers shall be located near or at changes in piping direction and concentrated loads. Valves, strainers, in line pumps and other heavy equipment shall be supported independent of the pipes. After systems have been installed and filled adjust hangers and supports to evenly distribute weight, and maintain proper pitch. Refer to drawings for pipe hanger and support details.
- B. Horizontal Piping Hanger Spacing: Space hangers in compliance with schedule on drawings and applicable codes, or per MSS SP-89, which ever results in shortest spacing.

3.5 THERMOMETERS AND PRESSURE GAUGES:

- A. Thermometers and pressure gauges shall be installed through a reduced Tee - 6" x 3/4" and with a male sweat to FPT fitting (copper or bronze) Pulled tee-'s are not acceptable.

3.6 INSULATION INSTALLATION

- A. All systems shall be tested and approved before being insulated.
- B. The insulation shall be applied over clean, dry surface.
- C. Insulate all valves, expansion joints, flanges, couplings and fittings. Valve, expansion joint, and flange insulation shall be provided with removable and re-installable jackets, regardless if missing on drawings. Removable insulation jackets shall overlap adjacent pipe insulation, a minimum of 4", on both sides. Removable blankets are required, even if not detailed in construction drawings.
- D. Insulation jackets to maintain outer temperature at or below 120 Degrees F.
- E. Full lengths of insulation shall be used except at end of straight sections and as required to accommodate fittings. Insulation shall be applied with the joints tightly fitted together. Cracks or voids shall be filled with insulation. Manufacturer's recommended installation procedures shall be strictly adhered to.
- F. The edges and seams at all visible locations shall be finished in a neat and workmanlike manner.

3.7 SLIDES, GUIDES, AND ROLLERS

- A. All piping systems designed to accommodate thermal expansion movement shall be mounted on rollers or slides.
- B. Provide at all expansion loops and joints:
- C. As indicated on the Drawings.
- D. As required to maintain alignment.
- E. In accordance with Expansion Joint Manufacturer's Association recommendations

3.8 PIPE RESTRAINTS

- A. Provide adequate pipe restraints for all expansion or contraction of piping due to temperature change:
- B. Including, but not limited to, that indicated on the Drawings.
- C. As instructed by Engineer.
- D. At locations to prevent stresses from exceeding those permitted by ANSI B31 and to prevent transfer of loading and stresses to connected equipment.

3.9 VALVE INSTALLATION

- A. General: Install valves such that operator is completely operable, and the valve position indicator is discernible from the floor.
- B. Domestic hot water flanged valves shall be installed with Garlock Blue-Gard Style 3000 ring type gaskets or comparable. Full face gaskets allowed only when BOTH flanges are full face."

NUMBER SECTION DESCRIPTION

DIVISION 33 UTILITIES

SECTION 336330 - UTILITY TUNNELS - STEAM & CONDENSATE DISTRIBUTION
SYSTEMS

END OF CONTENTS TABLE

DIVISION 33 UTILITIES

SECTION 336330 - UTILITY TUNNELS - STEAM & CONDENSATE DISTRIBUTION SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, Standard General and Supplementary General Conditions, Division 01 Specification Sections, and other applicable Specification Sections, in particular the Related Sections listed below, apply to this Section.
- B. Related Sections:
 - 1. Section 017823 - Operation and Maintenance Manuals
 - 2. Section 09110 - Tunnels - Quality Assurance & Quality Control

1.2 SUMMARY

- A. This Section includes all utility tunnel steam and condensate distribution systems, including but not limited to:
 - 1. Low pressure steam and condensate systems (nominal 5 to 15 psig)
 - 2. High pressure steam and condensate systems (nominal 60 psig)
 - 3. Pumped condensate Piping System Insulation
 - 4. Hangers, Supports and Anchors
 - 5. Valves
 - 6. Condensate Recovery/Return Units
 - a. Electric Pumped
 - b. Mechanical Pressure Powered Pumps
 - 7. Pressure Reducing Valves and Stations
 - 8. Expansion Joints
 - 9. Steam & Condensate Specialties
 - a. Strainers for Trap Stations and PRV Stations
 - b. Inverted Bucket Traps
 - 10. Thermometers and Gauges
 - 11. Steam and Condensate Meters

1.3 SUBMITTALS

- A. Shop Drawings Submit the following project specific items for approval in compliance with Division 1:
 - 1. Product Data: Include manufacturer, catalog illustrations, model, rated capacities, performance, dimensions, component sizes, roughin requirements, materials of construction, and operating and maintenance clearance requirements.
 - 2. Provide data sheets for all products listed in this section including flanges, gaskets, unions, hangers, di-electric protection method, thermal hanger shield inserts, di-electric fittings, flexible metal hose, flexible connectors, and seal sleeve systems.
 - 3. Submit all submittals for a given system or component at the same time.
- B. Installation, Operation and Maintenance Manuals

- C. Test and Evaluation Reports
- D. Source Quality Control Submittals
- E. Site Quality Control Submittals
- F. Certificates
- G. Manufacturer Reports
- H. Special Procedure Submittals
- I. Qualification Statements
- J. Delegated Design Submittals
- K. Warranty Documentation
- L. Record Documentation
- M. As-Built Drawings
- N. Test Reports
- O. Travelers Turnover Documents - Refer to Part 3.4.

1.4 QUALITY ASSURANCE

- A. Manufacturers and Products: The products and manufacturers specified in this Section establish the standard of quality for the Work. Subject to compliance with all requirements, provide specified products from the manufacturers named in Part 2.
- B. Reference Standards: Products in this section shall be built, tested, and installed in compliance with the specified quality assurance standards; latest editions, unless noted otherwise.
 - 1. All piping, unless noted otherwise, shall comply with ANSI Standard B31.9 - Building Service Piping.
 - 2. All steam piping above 15 psig, and all steam condensate piping shall comply with ANSI Standard B31.1 - Power Piping.
 - 3. Mill certifications indicating country of origin and compliance to ASTM/ANSI/NSF and other required compliance standards verified by independent third party based in the United States, shall be promptly provided whenever requested.
- C. Qualifications
 - 1. Manufacturers
 - 2. Suppliers
 - 3. Fabricators
 - 4. Installers / Applicators / Erectors
 - 5. Testing Agencies
 - 6. Licensed Professionals

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Store materials and equipment raised off the floor on pallets and protected with coverings to prevent damage due to weather and construction activities. Store in areas that prevent damage due to freezing and extreme temperatures or sunlight. Arrange coverings to provide air circulation to avoid damage from condensation or chemical build-up. Protect from damage, dirt and debris at all times.

1.6 WARRANTY

- A. Provide a complete warranty for parts and labor for a minimum of one year from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PIPE SYSTEM

- A. Steam Pipe - (HPS & LPS):
 - 1. For piping through 2":
 - a. Pipe: Black Steel, Schedule 80s/Extra-Heavy ASTM A53, seamless, Grade B.
 - b. Fittings: Extra-heavy weight, Forged steel, ASTM A181, ANSI B16.11.
 - 2. Joints: Screwed.
 - a.
 - 3. For piping 2-1/2" or larger:
 - a. Pipe: Black Steel, Schedule 40s/Standard, ASTM A53, ERW, grade B.
 - b. Fittings: Schedule 40s/Standard (STD), long radius (1.5 radius), butt welded, black steel, ASTM A234 WPB
 - c. Joints: Butt welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.
- B. Steam Condensate Pipe (gravity or pumped):
 - 1. For piping through 2":
 - a. Pipe: Black Steel, Schedule 80s/Extra-Heavy ASTM A53, seamless, Grade B.
 - b. Fittings: X-heavy weight, Forged steel, ASTM A181, ANSI B16.11.
 - c. Joints: Screwed.
 - 2.
 - 3. For piping 2-1/2" or larger:
 - a. Pipe: Black Steel, Schedule 80s/Extra-Strong (XS), ASTM A53, seamless, Grade B.
 - b. Fittings: Extra-Strong, long radius (1.5 radius), butt welded, black steel, ASTM A234 WPB
 - c. Joints: Butt welded. Flanged ASTM A181, 150#, forged steel at valves, and equipment.
- C. Joints:
 - 1. Screwed Joints: Tapered thread, ASME B1.20.1, joined with compatible compound or sealant tape applied to male thread only.
 - 2.
 - 3. Welded Joints: Comply with Section II, Part C, ASME Boiler and Pressure Vessel Code for welding materials appropriate for the wall thickness and chemical analysis of the pipe being welded. Pipe and fittings shall be beveled and butt welded.
 - 4.
 - 5. Flanged Joints:
 - a. Provide 150# raised forged steel flanges conforming to ANSI B16.5.

- b. Flanges must conform to ASTM A105/ASME SA105.
 - c. Comply with the respective ASME B31.1 or B31.9 piping standard.
6. Gaskets shall conform to respective ANSI Standards B16.20, B16.21. Gaskets in steam and condensate lines shall be "FLEXALLIC", 316L Style CGI - Flexible Graphite Filler (SEL) or "Garlock" Flexseal Spiral Wound Gasket with graphite filler. Spiral wound gaskets will incorporate an inner and outer ring. Gasket faces shall be anti-seized prior to installation.
 7. Flange Bolts and Nuts: Provide ASTM A193 B7 bolts and studs with ASTM A194 grade 2H heavy hex nuts. Apply anti-seize compound to threads prior to installation.

2.2 INSULATION

A. General:

1. Steam and Condensate piping including butterfly valves conveying fluids at temperatures above 110F (Hot Service).
NOTE: VALVES TO BE INSULATED AFTER SUCCESSFUL HYDROTEST.
2. All insulation materials shall be asbestos free.
3. Flame spread classification (ASTM E84, NFPA 255): No greater than value listed.
4. Smoke density classification (ASTM E84, NFPA 255): No greater than value listed.

B. Piping Insulation Fiberglass

1. Fiberglass insulation with factory-applied vapor barrier jacket with self-sealing laps. ASTM C547 Class 1 insulation. Vapor barrier jacket: laminated white Kraft paper, aluminum foil, glass fiber reinforcement.
2. Approved Manufacturers: Johns-Manville, Knauf, Owens/Corning.
3. Required thickness:

C. Fiberglass Piping Insulation Thickness Table

Piping System Fluid	Temp Range (°F)	Nominal Pipe Size (inches)				
		<1.0 "	1.0"	1.5"-4.0"	6"	8" & above
High Pressure Steam (HPS) (60# & above)	251 - 350	3.0	4.0	4.5	4.5	4.5

Condensate	Any	1.5	1.5	2.0	2.0	2.0

D. Pipe Insulation High Temperature Aerogel

1. Material: Flexible Silica Aerogel blanket suitable for applications up to 1,200 °F (650°C).
2. Compliant to ASTM C1728, Type 3, Grade 1A.
3. Density: 10-15 lb/ft³.
4. Meets ASTM E84 Smoke/Flame Index.

5. Hold each layer of Aerogel insulation in place with staples, tape, or wire. Use minimum of 4 loops of 18-gauge stainless steel wire per 5-foot length for final layer. Twist and press the ends of the wire into the insulation to prevent projections.
6. Approved Manufacturers: Aspen Pyrogel XTE, Armacell - Armagel-HT
7. Required thickness:

E. Aerogel Piping Insulation Thickness Table (mm)

Piping Fluid	System	Temp Range (°F)	Nominal Pipe Size (inches)				
			<1.0"	1.0"	1.5"-4.0"	6"	8" & above
High Pressure Steam (HPS) (60# & above)		251 - 350	30	30	40	50	50
Low Pressure Steam (LPS) (0-15#)		201 - 250	20	25	40	40	40
Condensate		Any	15	15	20	20	20

F. Aluminum Jacketing

1. Jacketing shall be 0.016-inch thick stucco embossed aluminum complete with integrally bonded polycraft moisture barrier held in place with aluminum screws; elbow covers to be prefabricated.
2. Fasten jacketing with aluminum screws at a minimum 6-inch spacing.
3. Acceptable manufacturers:
 - a. Childers; Ell-Jacs; or Approved equal
4. Joint sealant shall be aluminum pigmented butyl polymer.
5. Acceptable products are as follows:
 - a. Foster Div., Amchem Product Inc., "Elastolar Sealant, Aluminum 95-44", Childers "Chil-Joint CP-70" or Approved equal

G. Piping Insulation Specialties

1. Expansion Joints Insulation: Expansion joints shall be insulated with prefabricated insulation blankets, installed in a manner to allow for the repacking of the joints without removing blanket. Hold blankets in place with permanently attached Velcro fasteners.
2. Removable Insulation Jackets: Where indicated on drawings, provide removable insulation jackets with ceramic impregnated fiberglass or Aerogel High Temperature insulation, flexible fabric jacket and velcro fasteners.
3. Manufacturer: ESI - Q Master; Insulation Technologies Inc.

2.3 HANGERS, SUPPORTS AND ANCHORS (BOTH STEAM AND CONDENSATE):

A. General

1. Provide pipe hangers, supports and accessories for the proper support of all piping.

2. Pipe hangers, supports and accessories shall be sized to allow uninterrupted pipe insulation thickness.

B. Equipment

1. Slides
 - a. Only use manufactured guides - site built guides are not acceptable unless otherwise approved by Utilities
 - b. 1/2" Thick graphite on both upper and lower assemblies
 - c. Graphite to have a compressive strength of 2000 psi
 - d. Temperature range of -20 degrees F to 750 degrees F
 - e. Epoxy boned to steel assemblies to withstand 350 degrees F
 - f. Designed to accommodate axial and/or lateral movement of the pipe system
 - g. Designed to accommodate pipe insulation
2. Guides
 - a. Only use manufactured guides - site built guides are not acceptable unless otherwise approved by Utilities
 - b. 1/2" Thick graphite on both upper and lower assemblies
 - c. Graphite to have a compressive strength of 2000 psi
 - d. Temperature range of -20 degrees F to 750 degrees F
 - e. Epoxy boned to steel assemblies to withstand 350 degrees F
 - f. Guides to allow a maximum of 1/16" lateral movement
 - g. Designed to accommodate pipe insulation
3. Anchors
 - a. Anchors shall be engineered and detail on drawing to meet specific needs of that pipe section.
 - b. Manufactures: Anvil, ATS

2.4 VALVES

A. General

1. Valves shall be repack-able under pressure whether open or closed.
2. Unless noted otherwise, valves shall be rated for a minimum of 125#WSP (working steam pressure)/ 250# WOG (cold water, oil, gas).
3. Unless noted otherwise, all butterfly valves shall be full lug construction, suitable for bi-directional dead end service, and have open position memory stop.
4. Manually operated butterfly valves less than 4" shall be lever operated
5. Manually operated butterfly valves 2-1/2" and larger shall have enclosed worm gear operators with position indicators.
6. Gear operated valves shall be provided with self-locking gears. The actuator mounting bracket shall be rigidly dowel pinned to the body to absorb torque loads and shall be centered by machined register between bracket and body.
7. Valve actuator handle size shall be provided with manufacturers approved smallest available handle diameter to prevent obstruction of tunnel corridor.
8. Provide extended valve stems for insulated piping.
9. Valves shall be same size as piping unless otherwise indicated.

- B. Steam and Condensate Valves 2" or Smaller (through 60 psig)
 - 1. Gate Valve - Forged steel body with stainless steel trim
 - 2. ANSI Class 150 OS&Y Bolted Bonnet ASTM A 105 steel body, 13 Chrome Trim, hard-faced seats, graphite packing.
 - 3. Valves shall have threaded connection
 - 4. Manufactures:
 - 5. Crane Co.; Crane Valve Group; Crane Valves.
 - 6. Vogt.
 - 7. Stockholm
 - 8. Smith

- C. Steam Valves 2-1/2" or Larger (through 60 psig) - Metal to Metal Seated Butterfly Valves
 - 1. Lug style with 150# flange connection in accordance with the latest edition of ASME B16.5, Body Length according to API 609 Table 2 (A).
 - 2. ASTM A216 Gr. WCB Cast Carbon Steel Body
 - 3. 316 Solid One Piece Stainless Steel Disc
 - 4. Body Mounted ASTM A240 Tp. 316
 - 5. Ti/Graphite Stainless Steel Seal Ring
 - 6. A564 H1150D Stainless Steel Shaft
 - 7. ASTM A439 Tp. D2 Ni-Resist Body
 - 8. Bushing with Integral Graphite Bearing Protectors; Flexible Graphite Gaskets; Die Formed Flexible Graphite
 - 9. Packing; ASTM F738 C1 C3 Stainless Steel Studs; ASTM F836 C1 A4 Stainless Steel Nuts
 - 10. Tapped Holes for Lifting Eyebolts
 - 11. Leak Tested to API 598
 - 12. Manufacturers: Adams WAK-A9, Crane Flowseal MS, ABZ Extreme 6000 Series, Weir Tricentric, Zwick Tri-Con, Vanessa Series 30,000.

- D. Condensate valves 2-1/2" and larger (through 60 psig)
 - 1. Lug style with 150# flange connection in accordance with the latest edition of ASME B16.5, Body Length according to API 609 Table 2 (A).
 - 2. ASTM A216 Gr. WCB Cast Carbon Steel Body with stainless disc
 - 3. High performance butterfly valve, RTFE seated
 - 4. Adjustable packing gland with Teflon/SS packing seal
 - 5. Manufacture: Jamesbury Series 800, Nibco High Performance Butterfly Valve

- E. Check Valves
 - 1. Steam Trap Assemblies:
 - a. 316 stainless steel body, trim and spring; Vitron seat material; Class 150; and Inconel spring.
 - b. Manufacturer: "The Connector" by Check-All Mfg. Company,

2.5 CONDENSATE RETURN UNITS

- A. Electric - Single-Stage, Centrifugal Pumps With Elevated Receiver
 - 1. General
 - a. Provide packaged condensate return unit of size and capacity indicated.

- b. Factory-fabricated, packaged, electric-driven pumps; with receiver, pumps, controls, 150# flanged connections and accessories suitable for operation with steam condensate.
 - c. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70.
 - d. ASME Compliance: Fabricate and label steam condensate receivers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 - e. Configuration: Duplex floor-mounted pump with elevated receiver, float switches, and connecting piping; rated to pump 212 deg F steam condensate.
2. Receiver:
- a. Mounted on fabricated-steel supports.
 - b. Cast iron or Welded steel 1/4" minimum.
 - c. Externally adjustable float switches.
 - d. Water-level gage and dial thermometer.
 - e. Pressure gage at pump discharge.
 - f. Bronze isolation valves between receiver and pumps.
 - g. Lifting eyebolts.
 - h. Inlet cascade baffle and convex heads.
 - i. Cast-iron inlet strainer with self-cleaning bronze screen, dirt pocket, and cleanout plug on receiver inlet.
3. Pumps:
- a. Centrifugal, close coupled.
 - b. Permanently aligned.
 - c. Bronze fitted with enclosed bronze impellers.
 - d. Replaceable bronze case rings.
 - e. `Stainless-steel shafts.
 - f. Mechanical seals rated at 250 deg F.
 - g. Mounted on base below receiver.
 - h. Rated to operate with a minimum of 2 feet (6 kPa) of NPSH.
4. Automatic Flow Control Valves for electric condensate return pumps:
- a. The flow cartridge must be non-clogging single orifice design shall include no metal-to-metal contact, no segmented ports, no rolling diaphragm, and incorporate a tapered profile flow nozzle and metering disk controlled by a pressure compensating spring.
 - b. The flow cartridge shall be a single assembly, constructed with stainless steel moving parts and be accessible without removing the valve from the piping. Flow cartridges constructed with composite or rubber materials are not acceptable.
 - c. The flow cartridge shall be factory flow tested and calibrated to maintain accuracy of $\pm 5\%$; the accuracy shall be maintained over standard operating range of 2 - 45 PSID. Cartridges that prevent flow above the maximum operating range are not acceptable.
 - d. The flow cartridge shall be clearly inscribed with the designed manufactured flow rate and must match pump design.

- e. Valves 1 ½" and smaller shall be a forged brass Y-pattern body and valves 2" - 2½" shall be a cast brass y-pattern body with integrated ball valve, pressure/temperature test ports
 - f. Valves 2½" and larger shall be a wafer style cast iron body with pressure and temperature test plugs across the flow cartridge
 - g. Approved Manufacturers:
Nexus Valve, Inc. or Approved Equal
5. Control Panel:
- a. Factory wired between pumps and float switches, for single external electrical connection.
 - b. Provide fused, control-power transformer.
 - c. NEMA 250, [Type 1] [Type 3] [Type 12] enclosure with hinged door and grounding lug, mounted on pump.
 - d. Motor controller for each pump.
 - e. Electrical pump alternator to operate pumps in lead-lag sequence and allow both pumps to operate on receiver high level.
 - f. Manual lead-lag control to override electrical pump alternator and manually select the lead pump.
 - g. Momentary-contact "TEST" push button on cover for each pump.
 - h. Numbered terminal strip.
 - i. Disconnect switch.
 - j. Approved Manufactures:
Spirax Sarco, Armstrong, Bell & Gossett

B. Mechanical - Pressure Powered (HPA) Condensate Recovery Unit

1. General

- a. Provide packaged preassembled unit, mounted on steel frame, of size and capacity indicated.
 - b. Provide complete compressed air powered unit with receiver and accessories suitable for operation with 212 deg F steam condensate.
 - c. ASME Compliance: Fabricate and label steam condensate receivers to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 - d. Configuration: Floor mounted package Construction
 - e. Receiver: Cast iron or Welded steel 1/4" minimum.
 - f. Mechanical Pump: Welded steel body.
 - g. Stainless steel float valve.
 - h. Stainless steel check valves on motive inlet, outlet and vent. Stainless steel wye-strainer and screen.
 - i. Stainless steel isolation valves on motive inlet, outlet and vent.
2. Manufacture: Spirax Sarco APT10 Vented Pump Package, Armstrong

2.6 PRESSURE REDUCING VALVES AND STATIONS

A. General

1. Regulators shall be single seated, flanged, ANSI 125 lb.; cast iron body, stainless steel diaphragm, Seco metal disc, stainless steel stem, and carbon steel main spring. Valves shall be normally closed type and designed for dead end service. Steam velocity through the valve shall be limited to 7,000 fpm.

B. Trip Stop PRV Station

1. Two stage PRV station where indicated and as scheduled on drawings. Each station shall consist of steam pressure reducing valves, strainers, relief valves, isolation gate valves, globe style bypass valves, pressure gauges etc. as detailed
2. Provide muffling orifice required to limit sound level to 85 dba, 3 feet from the valve.

C. Approved Manufacturers:

Armstrong, Leslie, Spirax-Sarco, Spence.

2.7 EXPANSION JOINTS - STEAM AND CONDENSATE (UP TO 60 PSIG)

A. General

1. Conform to the standards of ASME B31.1
2. Conform to the standards of the Expansion Joint Manufacturers Association and shall be pressure rated for 60 PSI for low pressure systems and for 175 PSI for high pressure systems.
3. Expansion joints sizes 2" and smaller: NPT screwed connection
4. Joints 2-1/2" and larger: Provide 150# raised forged steel flanges conforming to ANSI B16.5.
5. Traverse distances as indicated on drawings
6. Provide guides as per manufactures recommendations.

B. External Pressurized Bellows Joints

1. Expansion joints shall be externally pressurized, externally/internally guided type, with Vanstone flange on one end.
2. Shall have drain, drip and vent port with an NPT connections.
3. Entire joint suitable for 450 F. minimum operating temperature, and traverse as scheduled.
4. Provide an internal integral limit stop to limit travel to traverse plus one half-inch minimum over travel.
5. All bellows joints shall be pre-set at the factory and "held" with removable metal clips or strips tack welded across the flanges.
6. Housing shall be standard wall pipe; two-ply testable bellows shall be laminated 304 stainless steel.
7. Acceptable Manufacturers: Hyspan, US Bellows

C. Slip Joints

1. Internally and externally guided steel slip, chrome plated to reduce corrosion, ground to reduce friction.
2. Guides shall be non-ferrous, non-corroding, low friction, designed to prevent scoring or binding of the slip.
3. Flanged ends.
4. Limit stop to prevent slip disengagement if pipe anchor fails.

5. All slip type expansion joints to be pre-compressed 1", to compensate for pipe contraction.
6. Semi plastic, self-lubricating, injectable packing contained between sealing rings.
7. Injection devices to allow addition of packing under full line pressure.
8. Acceptable Manufacturers: Advanced Thermal Systems, Inc., Hyspan, Metroflex.

D. Ball Joints

1. Ball joints to incorporate packing cylinders to permit injection of packing under full line pressure.
2. Flexible ball joints shall be constructed of alloys as appropriate for the service intended. Where so indicated, the ball joint shall be designed for packing injection under full line pressure to contain leakage. Joint ends shall be threaded (to 50 mm 2 inches only), grooved, flanged or beveled for welding as indicated or required and shall be capable of absorbing a minimum of 15-degree angular flex and 360-degree rotation. Balls and sockets shall be of equivalent material as the adjoining pipeline. Exterior spherical surface of carbon steel balls shall be plated with 0.0508 mm 2 mils of hard chrome conforming to ASTM B650. Ball type joints shall be designed and constructed in accordance with ASME B31.1 and ASME BPVC SEC VIII D1, where applicable. Flanges where required shall conform to ASME B16.5. Gaskets and compression seals shall be compatible with the service intended.
3. Approved Manufacturers:
Advanced Thermal Systems, Inc., Hyspan.

2.8 SPECIALTIES:

A. Strainers - Trap Stations

1. Strainers shall be same size as piping, with screwed connections and cast steel bodies. Screen shall be made of 304SS with a maximum of 20 mesh openings. Screen free area shall be a minimum of twice the internal cross sectional area of the piping where installed. Pressure rating shall be that of piping system.
2. Provide a forged steel threaded gate valve on the strainer blow down port with plug.
3. Strainers shall place on their side so that condensate is not trapped in the strainer
4. Approved Manufacturers: Armstrong, Anvil International, Mueller, Spirax-Sarco or approved equal

B. Strainers - PRV Stations

1. Provide strainer approved for installation with the Pressure reducing valve. Strainers shall place on their side so that condensate is not trapped in the strainer

C. Inverted Bucket Trap

1. The trap shall be of the inverted bucket type, designed for use with a 360° universal connector. The entire trap body shall be fabricated from thin wall drawn stainless steel for enhanced freeze resistance. The trap shall be capable of continuous air venting at steam temperature. The trap shall employ a simple free-floating valve mechanism with no fixed pivots and no valve or bucket guides. The discharge valve shall be so attached to the valve lever that it is free to rotate for even wear distribution, and the valve and seat of the trap shall be lapped together as a matched set to insure tight shutoff. Traps shall be self-priming, with orifice size selected for the capacity required by the application, and suitable for system working pressures
2. Trap size and orifice size shall be equal to or as scheduled on the drawings:
 - a. HPS - Armstrong Model 2010 Part# - C5324-1 w/ #38 orifice.
 - b. LPS - Armstrong Model 2010 Part# - C5324-5 w/ 5/32" orifice.
3. Traps stations to incorporated upstream and downstream inline check valves to prevent loss of trap prime in varying conditions.
4. Provide inline stainless steel check valve, Armstrong CVI; Spirax Sarco AE 36A or equal.
5. Manufacturers: Armstrong Series 2000, Spirax-Sarco UIB30, Watson Mc Daniels USIB450

D. Condensate Flash Tank

1. Provide condensate flash tank of size and with openings as shown on drawings. Tank shall be ASME constructed and stamped for 125 PSIG.
2. Manufacturers: Cemline, Spirax-Sarco, Wessels, Watson Mc Daniels.

2.9 THERMOMETERS AND GAUGES:

A. Dial Thermometers

1. Thermometers shall be bimetal type, adjustable angle, 5-inch stainless steel hermetic sealed case, external adjustment, 1/2-inch NPT connection, and 6-inch stem length.
2. Thermometers for use on steam lines shall have a range 50 degrees F to 500 degrees F.
3. Thermometers shall be Ashcroft 50-EI-60-E-060; or equal by Trerice.
4. A 316 stainless steel Thermowell with 2-inch lagging extension shall be Ashcroft socket weld type; or equal by Trerice.

B. Pressure Gauge

1. Provide all pressure gauges with 4 1/2" clear glass window, cast aluminum, stainless steel or polypropylene case, black on white face, stainless steel wetted parts, brass 1/2" MPT socket, 1% full scale accuracy complying with ASME/ANSI B40-1 Grade 1A. Provide coil siphon (pigtail) configuration installed on steam pipes.

2. Gauge pressure range shall be twice normal operating pressure.
3. Manufacture: Ashcroft, Trerice

2.10 UTILITIES STEAM AND CONDENSATE (LIQUID) METERS, SENSORS, TRANSDUCERS, COMPONENTS AND INSTALLATION REQUIREMENTS:

- A. General Requirements - Controls Contractor:
- B. Contractor to contact UM Utilities for assistance in meter selections and design requirements.
- C. Provide conduit and wiring to power all 120 VAC control accessories such as flow meters, and data acquisition panels. Feed this power from A DEDICATED 120V, 20 AMP CIRCUIT. Power connection for each device shall be installed with a lockable local service disconnect. Electrical power requirements to be coordinated with electrical drawings.
 1. For U-M Utility's energy metering, install U-M furnished data acquisition panel. Provide conduit and wiring from meters and transmitters to utility data acquisition panels. Provide communication wiring to utility data acquisition panels. Terminations inside panels by U-M.
 2. Ethernet connection of Utility Meters to host computer. Connection to host computer via trunk connection to a communications closet, or local Ethernet data port, and as indicated on the drawings.
 3. Flow meter transmitters/displays shall be mounted 4 to 6 Feet above finished floor. They shall be located at the DDC panel array or other acceptable location within the Maximum available cable length.
 4. Utilities metering cabling shall not be spliced.
 5. NOTE: ALL METER COMPONENTS, INCLUDING SENSORS, SHALL BE MOUNTED IN ACCESSIBLE LOCATIONS. ALL SERVICABLE POINTS SHALL HAVE ADEQUATE CLEARANCES FROM OBSTRUCTIONS AND SAFETY CONCERNS, ie. UNINSULATED STEAM LINES.
- D. Wiring and Conduits:
 1. Wire and cable shall be pulled from device to Utilities Data Acquisition Panel with 3'-0" spare coiled at the panel. All wire and cable shall be labeled and tagged 4 inches down from the point at which the wire enters the cabinet with the corresponding equipment name.
 2. All wiring carrying voltages greater than 24 volts shall be run in conduit.
 3. All wiring carrying voltages 24 volts nominal or less shall be run in conduit.
 4. Conduits shall be sized on a maximum fill of 40% capacity.
 5. Three separate conduit systems shall be provided:
 - a) DO/DI and AO/AI wiring.
 - b) 120 VAC CONTROL WIRING.
 - c) Ethernet communication
 6. Data transmission cabling and equipment grounding procedures shall meet the latest FCC guidelines for electromagnetic field generation.

7. All control wiring sizes and types shall meet the equipment manufacturer's recommendations.
8. All control wiring shall have insulation rated for 300 volts minimum, and be installed per NEC requirements.

E. Steam (Vapor) Flowmeters (Vortex-shedding type):

1. This application is for buildings that utilize steam for direct humidification and the service is ≤ 6 " pipe size. This is a steam recharge revenue meter.
2. The meter system shall consist of a primary flow sensor and transmitter. The flow sensor body and wetted parts shall be stainless steel, and shall be flanged and suitable for the service rating. The meter shall be installed with all necessary grounding components and gaskets per manufacturer's instructions. The transmitter shall be provided with a remote mounting bracket and cable, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. Both outputs to be powered from meter, not an external source. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching and Hart capable. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit electronics shall have noise immunity. Unit shall have the capability to maintain flow total in non-volatile memory. The primary flow sensor and transmitter shall be mounted in accessible locations. The flowmeter shall be provided with a 1-year warranty and application non-degradation performance guarantee. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - a. Temperature range shall be -40 to $+750^{\circ}\text{F}$.
 - b. Accuracy shall be 1.0% of rate and 0.1% of full scale.
 - c. Repeatability shall be 0.15% of flow rate.
 - d. Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - e. Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - f. Meter shall be equipped with a temperature and pressure compensation feature.
3. Provide a phenolic tag for each transmitter to identify service and Meter ID number (i.e. Building Number, VOR-1, etc.).
4. Approved Manufacturers:
 - a. Rosemount (8800 Series or Equivalent)
 - b. Krohne (4200 Series or Equivalent)
 - c. ABB (FSV430 or Equivalent)
- 5.

F. Steam (Vapor) Flow Meters (Differential-pressure type):

1. This application is for buildings that utilize steam for process loads or direct humidification where condensate is not returned and the service is > 6" pipe size. This is a steam recharge revenue meter.
2. The meter system shall consist of a differential pressure primary flow element, a differential pressure transmitter (or transmitters), and a flow monitor/computer. The flow sensor body and wetted parts shall be stainless steel, and shall be equipped with 150-lb. flanges. The transmitter(s) and flow computer shall be provided with a remote mounting bracket and cable, integral LCD display, and NEMA 4X housing. Flow computer shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow signal and a pulsed output signal for totalization. Both outputs to be powered from meter, not an external source. Unit electronics shall have noise immunity. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching. Unit shall have the capability to maintain flow total in nonvolatile memory. The flow meter and transmitter as a unit shall have the following minimum characteristics:
 - a. Temperature range shall be -40 to +750°F.
 - b. Accuracy shall be 1.0% of rate or better and 0.1% of full scale with a 10:1 turndown.
 - c. Repeatability shall be 0.15% of flow rate.
 - d. Each meter shall be factory calibrated for the specified flow range prior to shipment and specific performance test data shall be furnished with the meter.
 - e. Meter range shall accommodate the minimum and maximum expected flow for the steam pressure at the installed location.
 - f. Meter shall be equipped with a temperature and pressure compensation feature.
 - g. V-cone horizontal pilot lines shall be pitched back to steam lines and shall not trap condensate.
3. Provide a phenolic tag for each meter to identify service and meter ID number (i.e. Building Number, STM-1, etc.).
4. Approved Manufacturers: McCrometer (V-cone-style meter)

G. Liquid Flow Meters: (Vortex Type):

1. This optional meter application is for buildings requiring condensate recharge revenue metering.
2. The meter system shall consist of a primary flow sensor and transmitter.
3. The flow sensor shall be equipped with 150-lb. flanges.
4. The meter system shall be installed with all necessary grounding components to bond flanges together and gaskets per manufacturer's instructions.
5. The flow meter shall be manufactured by an ISO9001 certified company.
6. The meter shall be sized appropriately for the range of flow for the system.
7. **Meter size larger than 1.5" will need to be approved by utilities representative.**

8. The flowmeter shall have no moving parts and must be a vortex shedding type utilizing the Von Karman effect to measure volumetric flow.
 9. The flowmeter design must be a cantilevered beam dual piezoelectric crystal configuration that is non-wetted all welded and fully isolated, and provides immunity to common mode noise and pipe vibration.
 10. The flowmeter shall have no internal cavities that can clog causing the meter to lose functionality.
 11. f. The flowmeter shall have a process temperature rating of 500F (260C), with option up to 750F (400C).
 12. The flow sensor shall be hydrotested at 1.5 times the cold work pressure for 10 minutes.
 13. The flow sensor shall have all wetted parts made of 316SS.
 14. The flow sensor shall have options for fully integrated velocity, temperature, and pressure sensors for calculating volumetric flow, density, energy, and mass flow readings from a single point of installation in the pipe.
 15. The optional multivariable sensors shall be embedded near the velocity measurement point and shall be fully enclosed within the flow meter.
 16. The transmitter shall be capable of being provided with a remote mounting bracket, cable up to 100 feet, integral LCD display, NEMA 4X housing, shall indicate flow rate and totalized flow, shall have an isolated 2-wire 4-20 mA linear output flow rate signal, and shall have a pulsed output signal for totalization. Both outputs to be powered from meter, not an external source. The electronics calculated variables shall be available in the options of HART, Modbus RTU, Modbus TCP-IP, BACnet MS/TP or BACnet/IP without the need of an external gateway. The transmitter shall be capable of being field calibrated and reprogrammed from the outside housing via magnetic probe or security protected integral keypad menu switching and Hart capable. Unit electronics shall have noise immunity. The primary flow sensor and transmitter shall be mounted in accessible locations. Unit shall have the capability to maintain flow total in non-volatile memory.
 17. The flowmeter and transmitter as a unit shall have the following minimum characteristics:
 - a. Accuracy:
 - 1) Volumetric Flow: +/-0.7% of rate (liquids)
 - 2) Mass Flow: +/-1.0% of rate (liquids),
 - 3) Optional Temperature: +/-2.0 deg F
 - 4) Optional Pressure: +/- 0.3% of full scale
 18. Provide a phenolic tag for each transmitter to identify service and meter ID number (i.e. Building Number, MAG-X, etc.)
 19. Approved Manufacturers:
 - 1) Rosemount 8800 or equivalent
 - 2) Krohne 4200 or equivalent
 - 3) Azbil/Vortek M24 or equivalent
- H. Steam/Liquid Differential Pressure Transducers:
1. This application is used when remote steam or water pressure measurement is required.

2. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 200% of the normal differential pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transducer.
3. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 2% of the span stated above throughout a minimum of a 10:1 turndown. Turndown ratio shall be based on the actual differential span.
4. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer and all wetted parts shall be inert in the presence of up to a 40% concentration of ethylene or polypropylene glycol in water.
5. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
6. Span and zero shall be individually adjustable.
7. Shall be 2-wire and 4-20 mA output.
8. Approved manufacturers: Rosemount/Emerson; ABB; Siemens
- 9.

I. Steam/Liquid Differential Pressure Transducers (Flow Only):

1. This application is used when remote steam or water flow measurement is required.
2. Each differential pressure transducer shall be selected and calibrated for operations between 0 and 125% of the normal differential pressure and up to 150-psig line pressure. The calibration point shall be rounded upward to the nearest 10 inches WC (for spans less than 200" WC) or to the nearest 5 psi for larger spans. Calibration date shall be included on an embossed tag attached to each transmitter.
3. The accuracy, including linearity, hysteresis and repeatability, of the transducer for measuring differential pressure shall be better than 0.25% of the span stated above throughout a minimum of a 6:1 10:1 turndown. Turndown ratio shall be based on the actual flow span.
4. The transducer shall not be damaged by pressures of up to 500 psig on either side of the transducer.
5. Provide a drain valve for each side of the pressure chamber. Furnish and install mounting brackets appropriate for the installation location.
6. Span and zero shall be individually adjustable.
7. Shall be 2-wire and 4-20mA output.
8. Approved manufacturers:
 - 1) Rosemount/Fischer
 - 2) ABB
 - 3) Siemens

J. Components:

1. Three Valve Manifolds for Liquid Pressure Transducers:
 - a. Provide a three-valve manifold for each transducer. Pressures of up to 500 psig shall not damage the manifold.

- b. The manifold shall be designed for direct mounting on the transducer it serves and utilizes three needle valves to provide zeroing, blocking and normal service modes.
- c. Approved Manufacturers:
 - 1) D/A Manufacturing
 - 2)
- 2. Indication Gauges for Steam/Liquid Pressure Transducers:
 - a. Each transducer shall come with an indicating gauge that reads in inches WC for pressure sensing. The gauge shall be analog differential pressure type piped in parallel to the transducer.
 - b. The analog pressure gauge shall be selected and calibrated for the same span as the transducer it serves.
 - c. The accuracy, including linearity, hysteresis and repeatability of the gauge for measuring differential pressure shall be better than 1% of the span stated above throughout its span. Calibration data shall be included on an embossed tag attached to each gauge.
 - d. The gauge shall not be damaged by pressures of up to 500 psig on either side of the gauge.
 - e. Scale shall be a minimum of 4.5" diameter. Furnish and install two bleed fittings for each gauge and mounting brackets appropriate for the installation location.
 - f. Gauges shall be field mounted. Provide a phenolic identification tag for each gauge and indicator.
 - g. Approved manufacturers:
 - 1) Ashcroft
 - 2) Trerice
 - 3) Dwyer

PART 3 - EXECUTION

3.1 GENERAL PIPING INSTALLATION REQUIREMENTS:

- A. Work shall be done in accordance with applicable ordinances and codes. Arrange for inspections.
- B. Install pipe components and joining systems in accordance with the manufacturer's installation instructions.
- C. Install trap stations at all low points in the steam system and install drains at all low points in the condensate system.
- D. Branch connections from horizontal steam main shall be done in such a manner as to not trap condensate and/or permit proper drainage of condensate.
- E. All branch connections shall have a three valve configuration to allow flexibility in directing flow in the future.
- F. Provide fittings and specialties necessary to properly interconnect all items, whether or not shown in detail.

- G. Piping shall remain protected and capped until just prior to connection. Immediately after assembly, restore all protection and cap unprotected ends to prevent odors, dust, moisture, and other debris from entering the piping system.
- H. Use eccentric reducing fittings to increase or decrease pipe sizes. Bushings are not acceptable. Orient reducers to prevent trapping of condensate.
- I. Bolts for the expansion joints are not to be tightened until a representative from Utilities verifies proper alignment.
- J. Use a torque wrench to tighten flange bolts to the gasket manufacturer's recommended torque.
- K. Locate groups of pipe parallel to each other, spaced to permit applying insulation and servicing of valves.
- L. Install piping at least 3 inches clear of electrical conduit. Do not install pipe within the National Electrical Code (NEC) working space zone of electrical equipment/panels.
- M. Pitch piping as follows, but not less than required by code:
 - 1. Steam piping down in direction of flow at 1/16" per foot

3.2 FLUSHING AND CLEANING OF PIPING:

- A. Flush the following piping systems:
- B. Steam and Condensate (flush only)
- C. Develop plan for flushing and cleaning piping. Submit plan for approval prior to completion of piping. Provide all temporary and permanent piping, equipment, materials necessary to complete flushing and cleaning.
- D. Install steam traps after steam system has been flushed or install fine mesh construction strainers at inlet to traps and all other equipment. Install fine mesh construction element in permanent strainers. During flushing and cleaning, remove and clean strainers periodically. At completion of final flush, install clean permanent strainers, remove construction strainers.
- E. Flushing for new piping: Flush all piping with cold water (or fire protection system where approved by owner) for a minimum of one hour, until water runs clear. Water supply shall be equivalent to piping to be flushed. Use (2) 2-1/2" fire hose connections for piping 3" and larger. Drain all low points.
- F. Where removal of the post flush water from tunnel is not feasible, steam blow down of system is allowable, if pre-approved by owner. Coordinate all steam blow down activities with Utilities group.

3.3 PIPING SYSTEMS PRESSURE TESTING

- A. General
 - 1. Test new systems only, from point of connection to the existing systems. Perform initial tests and correct deficiencies prior to requesting acceptance test.
 - 2. Perform acceptance pressure tests in the presence of the owner representative.

B. Acceptance Pressure Testing:

1. Perform acceptance pressure testing
2. In accordance with the following table:

Piping System	Hydro Test Pressure
High/Low Pressure Steam (HPS/LPS) (up to 60#)	125 psig
Low Pressure Condensate (LPC)	125 psig
Pumped Condensate (PC)	125 psig

3. Remake leaking gasket joints with new flange bolting. Where welded joints fail, submit proposed method of repair for approval by the Owner's representative and authorities having jurisdiction.
4. For each system tested, provide a certificate testifying that the system was satisfactorily tested and passed, using owner furnished forms.

3.4 WELDING GENERAL:

- A. All welding shall be performed by registered welders qualified to perform welding operations in accordance with the National Certified Pipe Welding Bureau's procedures and standards, ASME Code Standards and the HPACCNA Standard Manual of Welding.
- B. Submit a certified copy of "Record of Pipefitter Welder Performance Qualification Test" of any employees who will be doing welding on this project.
- C. Mitered turns will not be allowed. Turns shall be made with factory-made ASME B16.9 long radius wrought steel butt welding fittings.
- D. Except where prohibited by the Reference Standards, code, or ordinance, branch take-offs with manufactured formed nipples will be permitted provided nipple size is at least two pipe sizes smaller than the main size. Formed nipples shall be Bonney Forge "Weldolets", "Threadolets", "Sockolets". In all other cases, use factory-made ASME B16.9 wrought steel buttwelding tee fittings.
- E. Shop welded pipe assemblies shall have all welds plainly stamped by the welding operator for inspection by the Engineer before installation.
- F. SPECIAL WELDING REQUIREMENTS
 1. Welding Procedure Specifications (WPS) and the related Welder Qualification Record (WQR) as described in ASME/B31.1/AWS codes shall be submitted for approval by owner prior to beginning work. Copies of these documents are to be included in the turnover documents at project completion.
 2. Welding on piping and components may be done using automatic welding techniques, except where not practical as an application due to location (Weld procedure documents must be approved and verified per weld specifications).
 3. The two welding surfaces shall be clean, and prepared to standards for weld process to be utilized and match accordingly.
 4. Preparation of the weld end shall be performed by manual grinding, machining, torch cutting, or automatic beveling processes.

5. The machining faces, free from notches or other method shall leave the pipe or tube weld end with smooth irregularities.
6. The weld ends of the pipe or tube shall be clean and free of oils, dirt, or any other material that will adversely affect the specified weld processes.
7. No welding shall be done when the surfaces to be welded are wet.
8. The minimum base metal temperature shall not be less than 70 degrees F prior to welding. Preheating or post weld heating of weld joint shall be per weld process specified and in accordance with standard practices.
9. The welding equipment shall be set up by the contractor and approved by the owner.
10. At the start of each day and after any lengthy shut-down period, weld process equipment shall be checked and determined as to fitness for duty status.
11. All openings shall be kept sealed at all times with plastic caps or in sealed bags as warranted per conditions of work site.
12. Pipe, fitting ends and flange faces shall be protected from damage in handling, installation, and storage.
13. During handling and storage, other than work on tables, spools shall be on cribbing or racks in a protected and segregated area.
14. The welder shall ensure that all equipment associated with the welding process operates properly.

G. Welding Materials:

1. Welding electrodes to be used shall be of materials approved per weld process utilized. U of M reserves the right to remove any welding electrodes they feel have not been stored or handled properly.
2. The welding electrode shall be new and replaced if compromised. All electrodes shall be stored per standards for electrode (per manufacturer or code).
3. If any tool or component is suspected of having elements that may contaminate the weld process, the material shall be replaced and the tool shall be cleaned per an acceptable cleaning process.
4. Tools used for weld joint preparation, fabrication, and installation shall be of materials compatible with the approved weld process.

H. Identification:

1. All welds are to be labeled by number using an electro-engraver, metal stamp, indelible marker, or paint stick. The ID shall be in close proximity to the weld (outside the heat affected zone) and applied after the weld has cooled to ambient temperature.
2. The weld identification used shall be traceable to a weld track document, (provide within the turnover documents), that will show the weld procedure, welder identification, base material, and grade joined and that the weld was inspected on OD and ID. Log is to identify the type of inspection used and weld inspection status.
3. The contractor shall maintain within the turnover documents a weld map showing the location of all weld joints and noting which weld procedure was utilized for each joint.

4. The weld identification log shall be maintained by the contractor and contain cross reference information to fabrication drawings.
- I. Weld Inspection:
- J. Examine all welds by physical method. Include the cost of examining 5% of welds (but a minimum of 2 welds) to be selected at random by the Owner, by approved graphic method similar to gamma ray process.
- K. The radiographic examination shall be by technicians of a reputable company regularly engaged in this type of work and skilled in the use of interpretation of results of this type of examination.
- L. The process shall provide visual proof at the site and such proof on photographs with reports which shall become the property of the Owner and will be included in the final Contract Documents.
- M. The report on the interpretation of the radiographic examination shall state whether or not the quality of the welding is suitable for the service for which the piping was designed.
- N. Welds examined by the above process shall be identified by a number and service symbol and shall be stamped into pipe adjacent to weld at the time of examination
- O. Failure to pass this test shall be cause for the rejection of the weld and authority to examine an additional weld. Rejected welds shall be repaired by an approved method and proven satisfactory by radiographic examination.
- P. If a second weld proves unsatisfactory by the radiographic examination, all welds shall be X-Rayed. Any welds proved unacceptable shall be repaired and X-Rayed again at no additional expense to the Owner.
- Q. The following weld defects are examples for which re-welding may be attempted. In accordance with ASME, AWS, or U of M specifications. Rewelding may be attempted one time only.
- a. Incomplete penetration, (lack of penetration)
 - b. Incomplete Fusion, (lack of fusion)
 - c. Unconsumed tack welds that can be inspected.
 - d. Visible porosity
 - e. Visible slag inclusions
- R. Note: All re-welds shall overlap or consume the original weld.
- a. All welds with irreparable defects or welds that have had one repair attempt and still found to have defect, shall be considered a reject and removed including the heat-affected zone.
- S. All welds shall meet Acceptance Criteria for weld processes approved per specifications.
- T. Pipe sections adjacent to rejected welds may be reused after the weld and heat affected zone is cut off. The heat affected zone shall be considered to extend to the limit of the discoloration of the weld. Fittings shall not be reused. The contractor shall assume all costs to replace said welds.

- U. All fabrication assembly dimensions shall be in accordance with the project approved drawings.
- V. If a weld is cut out, the replacement weld shall have the same weld identification number plus an alphabetic suffix (a, b, c, etc.). A new weld checklist shall be completed for the replacement weld.
- W. If an accepted weld must be cut out for any reason such as piping revision or rejection of associated welds, then the check list for the weld shall be marked void. The new shall be tested same as previous welds and fall under the same visual and NDE formats as described previously.
- X. All "fit ups" for weld joints for piping and components shall be visually inspected and logged per ASME B31.1 standards and included in Turn Over Document.
- Y. Owner may examine welds at structural supports and pipe attachment assemblies at their discretion.
- Z. All welded joints shall be visually inspected by representative for overall system compliance. The contractor shall provide a log document for their record retention. This log shall be part of the Turn Over Documents.
- AA. Testing:
- BB. After completion of welds and prior to turnover, the piping system shall be tested per specifications of project.
- CC. Contractor shall maintain a record of all pressure testing performed and include a testing report in the Turn Over Documents.
- DD. Turnover Documents (Traveler):
- EE. Material Test Reports
- FF. Heat Number Summary
- GG. Other MTRs
- HH. Purchase Orders
- II. Material Requisitions
- JJ. Packing Slips
- KK. Material Receiving Reports
- LL. Material Examination Log
- MM. Nonconformance Reports
- NN. Weld Coupon Log
- OO. Welding Procedure
- PP. Welder Certification
- QQ. Welding Machine ID
- RR. 9.14 Quality Control Pre-Testing & Passivation Check List
- SS. Component alignment and "fit up" documents

- TT. Proof of non-magnetic properties of piping and/or fittings, or any component that may affect the weld process approved for the project.
- UU. Test Reports
- VV. Weld Log
- WW. Fabrication Drawings showing each weld location and ID of welder
- XX. Drawings

3.5 INSTALLATION OF PIPE HANGERS AND SUPPORTS:

- A. Arrange pipe hangers and supports to permit proper pitch of piping, free to move with pipe expansion, installed at proper intervals. Hangers shall be located near or at changes in piping direction and concentrated loads. Valves, strainers, in line pumps and other heavy equipment shall be supported independent of the pipes. After systems have been installed and filled adjust hangers and supports to evenly distribute weight, and maintain proper pitch. Refer to drawings for pipe hanger and support details.
- B. Horizontal Piping Hanger Spacing: Space hangers in compliance with schedule on drawings and applicable codes, or per MSS SP-89, which ever results in shortest spacing.

3.6 INSTALLATION OF STRAINERS:

- A. Provide Y-strainers in steam and condensate piping preceding control valves, traps, pumps, pressure regulating valves and elsewhere as shown on drawings.

3.7 INSULATION INSTALLATION

- A. All systems shall be tested and approved before being insulated.
- B. The insulation shall be applied over clean, dry surface.
- C. Insulate all valves, expansion joints, flanges, couplings and fittings. Valve, expansion joint, and flange insulation shall be provided with removable and re-installable jackets, regardless if missing on drawings. Removable blanks are required, even if not detailed in construction drawings.
- D. Insulation jackets to maintain outer temperature at or below 120 Degrees F.
- E. Full lengths of insulation shall be used except at end of straight sections and as required to accommodate fittings. Insulation shall be applied with the joints tightly fitted together. Cracks or voids shall be filled with insulation. Manufacturer's recommended installation procedures shall be strictly adhered to.
- F. The edges and seams at all visible locations shall be finished in a neat and workmanlike manner.

3.8 HANGER AND SUPPORT APPLICATIONS

- A. General Requirements:

- B. The selection of pipe hangers and supports shall be based on the overall design concept of the piping system and any special requirements which may be called for in these Specifications or as indicated on the Drawings. The support systems shall provide for, and control, the free or intended movement of the piping including its movement in relation to that of the connected equipment. They shall prevent excess stress resulting from the transfer of weight being introduced into the pipe or connected equipment.
- C. The selection of hangers and supports shall be made to provide the piping system with the degree of control that its operating characteristics require.
- D. The selection of hangers or supports will take into consideration the combined weight of the supported systems, including system contents and test water.
- E. Select and install hangers and supports to allow controlled thermal and seismic movement of piping system, to permit freedom of movement between pipe anchors, and facilitate action of expansion joints, expansion loops, expansion bends and similar units.
- F. The spans in MSS SP-58 do not apply where concentrated weights, such as valves or heavy fittings, or where changes in direction of the piping occur between hangers.
- G. Select all hangers and supports rated for the maximum potential loading with pipe full.
- H. Select hangers for cold (less than 50 degrees F) piping service for installation over the insulation.
- I. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Specification sections.

3.9 HANGER AND SUPPORT INSTALLATION

- A. Pipe Hanger and Support Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.
- B. General:
- C. Adjust all components as required for proper operation and required pipe slope.
- D. Double nut all support rods at hangers.
- E. Location and Routing:
 - a. Install Piping as Indicated:
 - 1) On the Drawings.
 - 2) On the reviewed Shop Drawings.
 - b. Secure Engineer's approval for all pipe routing changes.
- F. Coordinate with other trades for placement of concrete attachments prior to concrete pouring.
- G. Install all items in accordance with Manufacturer's instructions.
- H. Support at Valves: Provide additional supports at all valves in piping 4-inch and larger.

- I. Vertical Risers:
- J. Support independently from adjacent hangers on horizontal piping.
- K. Horizontal Runs:
- L. General:
 - a. Provide adequate supports for the loads with a factor of safety of at least 5 (400 pounds minimum).
 - b. Support spacing not to exceed MSS SP-58, or the requirements for seismic restraint, whichever is more stringent.
 - c. Hanger rod diameter shall not be less than the requirements of MSS SP-58, or the requirements for seismic restraint, whichever is more stringent.

3.10 SLIDES, GUIDES, AND ROLLERS

- A. All piping systems designed to accommodate thermal expansion movement shall be mounted on rollers or slides.
- B. Provide at all expansion loops and joints:
- C. As indicated on the Drawings.
- D. As required to maintain alignment.
- E. In accordance with Expansion Joint Manufacturer's Association recommendations

3.11 PIPE RESTRAINTS

- A. Provide adequate pipe restraints for all expansion or contraction of piping due to temperature change:
- B. Including, but not limited to, that indicated on the Drawings.
- C. As instructed by Engineer.
- D. At locations to prevent stresses from exceeding those permitted by ANSI B31 and to prevent transfer of loading and stresses to connected equipment.

3.12 INSULATION PROTECTION

- A. Provide Protection Saddle:
- B. Equal to insulation thickness.
- C. At each hanger.
- D. For all insulated piping systems where longitudinal expansion exceeds 1-inch per 100 feet.

3.13 PAINTING

- A. Touchup: Cleaning and touchup of painting of field welds, bolted connections and abraded areas of shop paint on miscellaneous metal are specified in Division 09 - Finishes.
- B. Galvanized Surfaces: Clean welds, bolted connections and abraded areas. Apply galvanizing repair paint to comply with ASTM A780.

3.14 CONSTRUCTION WASTE

- A. Construction Waste Management: Refer to Division 01 requirements applicable to all trades.

3.15 VALVE INSTALLATION

- A. General: Install valves such that operator is completely operable, and the valve position indicator is discernible from the floor.
- B. Install warm-up valves, drains and piping configuration, as shown on plans, for all 8" or larger isolation valves.
- C. When indicated on plans relocate position of the packing ports for access. (Not at 6 o'clock)

3.16 INSTALLATION OF EXPANSION JOINTS

- A. The installations shall be in strict accordance with manufacturer's instructions.
- B. For each expansion joint, record the initial position, final position and actual movement of the joint and include in Turnover Documents.
- C. Expansion joint will be shipped at a preset ambient temperature. If the ambient temperature at the time of installation is colder or hotter, then adjust the travel of the expansion joint as required.
- D. All bellows joints in steam and condensate system shall be pre-set at the factory and "held" with removable metal clips or strips tack welded across the flanges.

3.17 INSTALLATION OF STEAM AND CONDENSATE SYSTEM:

- A. Drip and Trap Installation:
- B. At end of steam mains, at the end of horizontal runs, prior to control valves (where condensate will collect behind control valve when closed), at low points (where steam pipe rises in direction of flow), at intervals of no less than 300 feet for continuous pipe, and where noted on the drawings, provide drip leg.
- C. No steam traps shall directly discharge to a condensate return main.
- D. All high pressure traps shall discharge to a flash recovery vessel.
- E. Trap size to be selected from schedule on drawings.
- F. Bypass and Drain Installation:
- G. Provide bypass and drain connection for steam valves 8" and larger, Comply with MSS SP-45 bypass and drain connections.
- H. Flash Tank Installation:
- I. Install as detailed and per manufacturer's recommendation.
- J. Thermometers and Gauges Installation

- K. Install and orient wells and thermometers so thermometer can be read from the floor. Thermometer Wells: For piping 2" and below, install in piping tee where thermometers are indicated, in vertical position. For piping below 2 1/2" and above, "weldolets" may be used. Fill well with oil or graphite and secure cap.
- L. Install pressure gauges with 1/2" isolation ball valve. Where needle valves are specified as a substitute for glycerin filled in Part 2, install the needle valve between the ball valve and the gauge. Locate gauges to be readable from the floor preferably at eye level. Mount gauges securely to prevent excessive vibration, adjust needle valve to dampen pulsations. Install syphon tubes for steam pressure gauges, connected after the isolation ball valve. Do not install pressure gauges on bottom of piping.
- M. Adjust faces of meters and gauges to proper angle for best visibility.
- N. Clean meters and gauges. Replace cracked and broken windows. Touch up scratches.
- O. Install in the following locations and elsewhere as indicated:
 - a. As shown on the project drawings.
 - b. At inlet and outlet of each pressure-reducing valve.
 - c. After every tunnel isolation valve that isolates more than 100 lineal feet of steam or condensate pipe.
- P. Installation Of Test Plugs
- Q. Test Plugs: Install in piping tee where indicated, located on pipe at most readable position. Secure cap.
- R. Pressure Powered Condensate Pumps:**
- S. Do not install pumping traps on housekeeping pads (housekeeping pads reduce the filling head to the pump). Install the pump at the lowest possible point below the equipment that is being drained. University of Houston Master Construction Specifications Insert Project Name AE Project Number: Steam and Steam Condensate Specialties 23 22 30 - 13 Revision Date: 1/29/2016 2. Where specified, provide an inlet condensate receiver. The receiver shall be an ASME vessel as shown on the Drawings. Install and support the receiver above the pumping trap unit. Route all condensate to be drain to the top on the receiver. The receiver shall be vented to atmosphere and shall also be supplied with a drain connection and drain valve. 3. The pumping trap body shall be provided with a gauge glass assembly. 4. When motive gas pressure is greater than 20 psig over the required discharge head, provide a PRV assembly to regulate motive gas pressure. The PRV assembly shall include an inlet block valve, y-strainer, PRV and pressure gauge assembly. When motive gas is steam, install a drip trap assembly upstream of the PRV. When motive gas is air or nitrogen, provide a spring loaded check valve downstream of the PRV. 5. Route the exhaust vent pipe of the pumping trap, and the receiver vent (when receiver is installed), to an atmospheric vent line, or, it may be routed 8 to 10 feet up and piped back down a minimum of 6 inches. Install a drain valve and drain line off the pumping trap unit and route to the nearest floor drain.

3.18 QUALITY ASSURANCE/ QUALITY CONTROL (QA/QC)

- A. Perform QA/QC activities in accordance with Related Sections.

Preferred List of Manufacturers (PML) contains specific manufacturers that are acceptable for use on U of M projects This section is divided by CSI number. When the A/E uses U-M Master Specifications for a project, adding manufacturers from the PML as approved manufacturers in the specification is optional.

For University of Michigan Hospitals and Health Centers (UMHHC) funded projects, click here for a list of [Preferred Manufacturers Lists](#) specific to work at UMHHC.

DESIGN GUIDELINE 8.1 **SUBSTITUTIONS**

(Formerly Owner's Option)

General

The University requires that specific vendor's products be used to assure job quality through reliability, ease of maintenance, manufacturers proven maintenance and warranty support, control of stock and value. This process is controlled by disallowing the Contractor from making substitutions for specified products. The Contractor is typically permitted to propose Owner's Options (voluntary alternates) at the time of bid only. It is unusual for the University to consider a substitution after bids have been awarded and during the construction phase.

Related Documents

[Project Manual, Instructions to Bidders](#)

Preferred Manufacturers List (PML)

Specifications

Include language explicitly prohibiting substitutions.

Do not use the phrase "or equal" after any specific vendor's product identification in the specification sections or on the drawings (including details).

For all specification sections that are included in the PML, restrict product selections to those manufacturers listed in the PML. Where none are listed, select manufacturers utilizing the criteria in the "General" paragraph of this document. The University encourages the largest number of PML listed manufacturers be included in the specification. However, if there are concerns with a particular manufacturer, it is not required they be included, provided a minimum of three are listed as approved in the specification. If it is believed manufacturers other than those listed in the PML should be considered, discuss this issue with the Design Manager prior to release of the construction documents.

DESIGN GUIDELINE 8.2

ARCHITECTURAL PREFERRED MANUFACTURERS LIST

General

This list is a compilation of products approved for use on University of Michigan projects. Where specific manufacturers or products are listed for a given building element, limit selection to the products listed. When, in your opinion, an unlisted product should be considered for inclusion in a project, consult with the Design Manager. Do not substitute this list for your professional judgment concerning appropriate products and materials.

Where specific products are not listed for a given building element (i.e. curtain walls), base the selection of manufacturers, types, styles, or models on your professional judgment. Wherever possible, select the products of at least 3 manufacturers. Avoid the use of open ended "or equal" statements.

This list is updated as needed.

8.2 ARCHITECTURAL PML

Preferred Manufacturers

Section 075316 - Chlorosulfonate-Polyethylene (CSPE) Roofing

- Carlisle SynTec Systems
- Stevens Roofing Systems, Dow Building Solutions.

Section 075323 - Ethylene-Propylene-Diene-Monomer (EPDM)

EPDM Systems:

- Carlisle SynTec Systems, Carlisle Corporation
- Firestone RubberGard EPDM Roofing Systems, Firestone Building Products Co.
- Genflex Roofing Systems, GenCorp. Polymer Products, Building Systems Div.
- Johns Manville Roofing Systems, Johns Manville Corp.
- Versiguard Roofing Systems, Versico Incorporated.

Division 8 (applies to sections 08410, 08520, 08911) - Aluminum Fluoropolymer Coatings

- PPG Industries.
- Valspar Corp.
- Akzo Nobel.

Section 084113 - Aluminum Framed Entrances and Storefronts

Entrances, Doors and Storefront Systems:

- EFCO Corp., a Pella company.
- Kawneer North America; an Alcoa company
- Oldcastle Building Envelope.
- Tubelite Company, Inc.
- Wausau Window and Wall Systems

Flush Panel FRP Doors (Doors only, not framing):

- Commercial Door Systems
- Kawneer North America; an Alcoa companyRebco, Inc.

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- Special-Lite, Inc.

Section 084413 - Glazed Aluminum Curtain Wall

- EFCO, Corp.; a Pella company.
- Graham Architectural Products
- Harmon, Inc.
- Kawneer North America; an Alcoa company.
- Oldcastle Building Envelope.
- Wausau Window and Wall Systems.

Section 085113 - Aluminum Windows

Architectural Grade Windows (subject to availability of project-applicable products):

- Graham Architectural Products
- Kawneer North America; an Alcoa company.
- Wausau Window and Wall Systems.

Section 087100 - Door Hardware

Butt Hinges:

- Hager Companies
- Ives, Allegion
- McKinney Products Company
- Stanley

Continuous Geared Hinges:

- Hager Companies
- Ives, Allegion
- Pemko
- Select Products Limited

Locksets (mechanical and electrified):

- Corbin RusswinML2200

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- Sargent 8200 Series
- Schlage L Series

Electric Strike:

- Von Duprin 6000 Series
- HES 1006, 9400 and 9600 Series

Small Format Interchangeable Cores (SFIC):

In existing buildings, match existing core type for ease of keying.

- Best Coremax 7 pin SFIC
- Medeco Keymark 7 pin SFIC
- Schlage Everest 7 pin SFIC

Exit Devices (mechanical and electrified):

- Sargent
- Von Duprin

Digital Locks (Standalone battery operated, not connected to campus access control system):

- Schlage only
 - Keypad type (programmable at door without additional hardware/software): CO-100-MS-70-KP
 - Keypad type type (programmable at door with additional hardware/software): CO-200-MS-70-KP
 - Mag stripe card reader (programmable at door with additional hardware/software): CO-200-MS-70-MSK

Closers: specify arm specific closers; do not specify closers with multiple arms

- LCN 4000 Series only
- Sargent 281 Series with heavy duty arm

Overhead Holders and Stops:

- Concealed heavy duty type by any BHMA member

Local Exit Alarms (not connected to fire alarm or campus access control systems):

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- Detex

Flush Bolts (Automatic, Constant Latching and Manual):

- Door Controls International (DCI)
- Ives
- Rockwood

Flatgoods: Any BHMA member

Weatherstripping /Thresholds: Any BHMA member

Concealed Power Transfer:

- Securitron
- Von Duprin

Section 088000 - Glazing

Primary Glass:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Pilkington North America, Inc.
- PPG Industries, Inc.

Laminated Glass:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Oldcastle Glass Group.
- Viracon, Inc.

Insulating Glass Units:

- AGC Flat Glass North America
- Guardian Industries Corp.
- Oldcastle Glass Group.
- Viracon, Inc.

Fire-Rated Glazing:

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- AGC Glass Company. Pyrosafe
- Nippon Electric Glass Co., Ltd. Firelite
- Pilkington Group, Pyrostop.
- Vetrotech Saint-Gobain USA.

Section 102113 - Toilet Compartments

- All American Metal Corp.
- ASI/ Global Toilet Partitions
- Bradley Corporation; Mills Partitions.
- Flush-Metal Partitions LLC.
- Hadrian Manufacturing, Inc.

Section 102800 - Toilet and Bath Accessories

- American Specialties, Inc. (ASI).
- Bobrick Washroom Equipment, Inc.
- Bradley Corp.
- Elcoma Metal Fabricating (grab bars and shower seats only).
- Gamco, a division of Bobrick Washroom Equipment (except for shower seats and counter mounted soap dispensers).
- Koala Kare Products (baby changing stations only), a division of Bobrick Washroom Equipment.

Note: Toilet paper dispensers, paper towel dispensers (roll-type), and wall mounted soap dispensers are provided by UM, but installed by the Contractor. Coordinate with Design Manager.

Section 115313 - Laboratory Chemical Fume Hoods

Chemical Fume Hoods: All types except reduced face velocity

- Air Master Systems Corp.
- BMC Laboratory Cabinets & Fume Hoods
- Hamilton Scientific
- Kewaunee Scientific Corp.
- Labconco Corp.
- Mott Manufacturing Ltd.

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

Chemical Fume Hoods: Reduced face velocity

- Kewaunee Scientific Corp.; Supreme Air LV
- Labconco Corp. ; Protector XStream

Base Cabinets for Fume Hoods: Refer to approved laboratory casework manufacturers list.

Section 123553 - Laboratory Casework

Metal Casework; associated distributors:

- Air Master Systems Corp.
- BMC Laboratory Cabinets & Fume Hoods,; RD Landstra Associates.
- Jamestown Metal Products; Farnell Contracting
- Kewaunee Scientific Equip. Corp.; Farnell Equipment Co.
- Laboratory Design & Supply, Inc.
- Mott Manufacturing, Ltd.; Detroit Technical Equipment Company

Flammable Storage: Produced in accordance with NFPA 30 and FM or UL labeled.

Wood Casework; associated distributors:

- Kewaunee Scientific Equip. Corp.; Farnell Equipment Co.
- Laboratory Design & Supply, Inc. (Flush overlay only; lipped overlay not available)
- Mid Canada Millwork
- Mott Manufacturing, Ltd.; Detroit Technical Equipment Company
- Conditional Approval: The following manufacturers are new to the PML and are approved for use on small projects (estimated casework cost less than \$100,000):
 - CIFLab L-Line (lipped overlay) and E-line (full overlay); Stonecreek Interior Systems, LLC
 - Diversified Casework; RD Landstra Associates.

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- Wood-Metal Industries; Divisions of Wood-Mode; Farnell Contracting

Epoxy Resin Tops and Sinks:

- Kemresin (Kewaunee Scientific Corp.)
- Durcon, Inc.
- Epoxyn; Epoxyn Products

Stainless Steel Sinks and Tops:

- Elkay Co.
- Just Manufacturing

Fiberglass Sinks:

- Kreolab, Inc.

Shelf Standards and Brackets:

- Cooper B-Line, Inc.
- Flex-Strut, Inc.
- Kewaunee Scientific Equip. Corp.
- Nu-Strut framing channel system, Kumar Industries, Inc.
- Unistrut Corp.

Service Fittings:

- Chicago Faucets, a Geberit Company.
- T & S Brass and Bronze Works, Inc.
- Watersaver Faucet Company
- Wolverine Brass, Inc.

Section 122000 - Window Treatment

Review specific window treatment requirements with Design Manager. Small renovation projects will typically match established building standard. New buildings and major renovations will select window treatments based on performance requirements, including solar transmission and thermal properties.

Aluminum Horizontal Blinds

PREFERRED MANUFACTURER LIST

8.2 ARCHITECTURAL PML

- Levolor Window Fashions
- Hunter Douglas
- Springs Window Fashions; Bali

Roller Shade Hardware:

- Springs Window Fashions; Bali
- Draper Inc.; Flexshade
- OpenLight
- MechoShade Systems, Inc.
- Roll Ease, Skyline Series
- SRF Enterprises, Inc.

Shade Fabric: Tested in accordance with NFPA 701.

Section 132100 – Controlled Environment Rooms

Environmental Rooms:

- Bahnsen Environmental Specialties, an EMCOR company
- Environmental Growth Chambers
- Harris Environmental Systems, Inc.
- Insulated-Structures, Ltd.
- Nor-Lake, Inc.

DESIGN GUIDELINE 8.3 MECHANICAL PREFERRED MANUFACTURERS LIST

INTRODUCTION:

Preferred Manufacturers:

The University of Michigan evaluates products (and in some cases services) for reliability, performance, cost effectiveness, and other factors, as pertinent for the product or service. These preferred products/services are to be utilized on U-M projects.

- Preferred products/services for which U-M publishes a master specification on its website are automatically listed in the respective U-M master specification.
- If the Architect/Engineer does not use U-M's master specification as the basis for the project's specification, he/she shall list the same approved manufacturers in the project specification as listed in U-M's master specification.
- If U-M does not publish a master specification for a particular product or service, the preferred products are listed in this list, the "PML".
- If there is a significant need to use a manufacturer or service not listed in the U-M master specification or PML, the A/E shall consult the U-M Design Manager for approval.

In all cases a manufacturer's product must be listed as approved in the project's contract documents or specifications. Listing in U-M's master specifications or the PML does not guarantee a product will automatically be listed in a specific project's documents or specifications.

Conditional Approval: Listed manufacturer's product may be used on select U-M projects, however approval from the respective A & E Technical Committee must first be obtained. If approved, it may be listed as approved in the project's contract documents or specifications. Manufacturers in the Conditional Approval category have gone through successful preliminary review, but the Technical Committee requires additional in-service input prior to final listing.

Under Consideration: Listed manufacturer's product is being evaluated. The product should not be included in U-M projects.

SECTION 211313 - WET-PIPE SPRINKLER SYSTEMS

Preaction Systems

Siemens (Pyrotronics), Notifier, Viking

SECTION 220000 - UNDERGROUND PIPING IN CONDUIT SYSTEM

Piping Systems - Underground

Perma-Pipe, Rovanco, Under Consideration: Urecon

SECTION 220500 - COMMON WORK RESULTS FOR MECHANICAL

Roof Curbs

Pate

Creative Metals
Roof Curbs Engineered and Manufactured by the Manufacturer of the Equipment to be supported

SECTION 220516 - PIPE EXPANSION JOINTS

Expansion Joints - Externally Pressurized

Hyspan, ATS

SECTION 220523 - VALVES

Valves – Safety Relief

Spirax-Sarco, Watts, Leslie, Anderson-Greenwood, Conbraco, Keckley

SECTION 221113 - PIPING MATERIALS & METHODS

Pipe Hangers and Mechanical Supports

Anvil, Cooper B-Line, Carpenter & Paterson, PHD Manufacturing, Unistrut, Powerstrut

SECTION 221519 - GENERAL SERVICE PACKAGED AIR COMPRESSORS AND RECEIVERS

Air Compressors - Screw Type (1800 RPM)

Atlas - Copco
Quincy QSI Series

Air Compressors - Reciprocating

Quincy
Gast
Devilbliss

SECTION 223300/223400 - DOMESTIC WATER HEATERS

Domestic Water Heaters - Gas Fired Or Electric

Lochinvar
A.O. Smith
State
Rheem
Raypak

Under Consideration: Copper Fin (Quality water & air)

Instantaneous Water Heater (Steam Fired)

Cemline
Hubbell

Semi-Instantaneous Water Heater (Steam Fired)

Cemline
Hubbell

SECTION 224200 - PLUMBING FIXTURES

Water Filters - Inline Type

Cuno
Filtrine
Honeywell
Culligan
Dollinger
Bruner

SECTION 226200 - VACUUM SYSTEMS FOR LAB AND HEALTHCARE FACILITIES

Vacuum Pumps

Nash
Domestic
Sehi
Shipco
Under Consideration: Skidmore (K.L.McCoy), Busch (Kerr pump & supply)

SECTION 226719 - PROCESS WATER EQUIPMENT FOR LABORATORY AND HEALTHCARE FACILITIES

Deionized Water and Reverse Osmosis Water Suppliers

Crown Solutions (Veolia)
Siemens/U.S. Filter
Ionpure
Millipore

SECTION 230000 - HEAT EXCHANGERS & CONVERTERS

Dry Coolers

McQuay, Trane, York, Bohn

Laser Heat Exchangers - Water Cooled

Haskris
Remcor
Neslab
Laser Pure (Coherent)

SECTION 230000 - MULTIMEDIA FILTRATION SYSTEM

Acceptable Manufacturers

Crown Equipment Systems, PEP Filters, Everfilt

SECTION 230000 - PACKAGED TERMINAL AIR CONDITIONERS, AIR-COOLED

Air Conditioning Units - Package Type (thru the wall self-contained DX)

IslandAire, McQuay, Trane, York

Air Conditioning Units - Window Type (Flush installation with wall exterior)

Comfort-Aire, Fedders, White Westinghouse

SECTION 230000 - TERMINAL UNITS

Baseboard Radiation, Finned Tube Radiation

Dunham-Bush, Rittling, Slantfin, Sterling Radiator, Trane, Vulcan Radiator

Panel Radiators

Jaga, Runtal Radiator, Sterling, Vulcan Radiator

Convectors

Dunham-Bush, Rittling, Sterling, Trane, Vulcan Radiator

Unit Heaters

Dunham-Bush, McQuay, Modine, Reznor, Rittling, Sterling, Trane, Wing, Vulcan Radiator

Cabinet Heaters

Dunham-Bush, McQuay, Modine, Rittling, Sterling, Trane, Vulcan Radiator

Unit Ventilators

American Air Filter, Trane

Electric Cabinet Heaters

Berko, Qmark, Trane, Markel

Electric Unit Heaters

Berko, Qmark, Trane, Markel

Electric Heating Coils

Brasch, Chromalux, Indeeco, Trane, Markel

Gas Fired Duct Furnaces

Modine, Reznor, Sterling, Trane

Radiant Ceiling Panel - Hot Water

Aero-Tech, Air-Tex, Sun-El, Sterling/TWA, Price

SECTION 232123 – PLUMBING AND HYDRONIC PUMPS

Pumps - Condensate Waste

Little Giant, Hartell, Marsh, Bekette

SECTION 232200 - STEAM CONDENSATE RETURN UNITS

Condensate Receiver

ITT Domestic, Skidmore, Shipco, Spirax-Sarco

Condensate Meters - Magnetic Induction

Refer to U-M Master Specification 230900

Pumps - Condensate (Condensate Receiver Must Be Cast Iron)

ITT Domestic (Hoffman), Skidmore, Spirax-Sarco, Shipco, Weinman

Pumps - Condensate, Steam Or Air Pressure Powered

Sarco, Armstrong

SECTION 232216 - STEAM AND CONDENSATE PIPING SPECIALTIES

Steam Pressure Reducing Stations

Armstrong, Leslie, Spence, Spirax-Sarco,

Steam Safety Relief Valves

Armstrong, Consolidated, Spence, Spirax-Sarco, Watson McDaniel

SECTION 233100 - HVAC DUCTS & CASINGS

Exhaust Ductwork - Teflon Coated Stainless Steel

Fab-Tech (PermaShield Pipe)

Exhaust Ductwork - FRP

Perry, Spunstrand, Tangent

SECTION 233400 - FANS

Fans -FRP Construction

M.K. Plastics

Under Consideration: Harrington

SECTION 235300 – HEATING BOILER FEEDWATER EQUIPMENT

Pumps - Boiler Feed

Skidmore, Spirax-Sarco, Shipco, Weinman

SECTION 236100 – REFRIGERANT COMPRESSORS

Refrigeration Compressors

Copeland, Dunham Bush, McQuay, Tecumseh, Trane, York

SECTION 236313 - AIR COOLED CONDENSING UNITS

Air Cooled Condensers

Bohn, Dunham Bush, McQuay, Trane, York

SECTION 236400 - PACKAGED WATER CHILLERS

Chillers - Screw or Scroll

Dunham-Bush

York by Johnson Controls

Trane

Chillers - Reciprocating, Air-Cooled

Trane, York by Johnson Controls

Under Consideration: Carrier.

Chillers - Process Cooling

Filtrine, Liebert, Trane, Neslab

SECTION 236413 - STEAM ABSORPTION CHILLERS

Chillers - Absorption

Trane, York by Johnson Controls

SECTION 237300/237400 GAS FIRED MAKE-UP UNITS

Gas Fired Make-Up Air Units (direct and indirect)

Rapid, Reznor, Sterling, Trane

Under Consideration: Modine (Air Design), Greenheck

SECTION 238123 - PACKAGED COMPUTER ROOM AIR CONDITIONING SYSTEM

Air Conditioning Units - Computer Room

APC, Liebert, Stulz

SECTION 238126 - SPLIT SYSTEM AIR CONDITIONERS

Air Conditioning Units - Ductless, Spot Coolers

Daikin, Friedrich, Liebert, Mitsubishi, Sanyo, Trane

DESIGN GUIDELINE 8.4
ELECTRICAL PREFERRED MANUFACTURERS LIST

SCOPE

The Electrical Trades Preferred Manufacturers List identifies manufacturers and suppliers who are known to provide good quality products, meet specification and schedule requirements, provide technical support, and provide service after the sales. This list is intended to regulate product quality, standardize electrical designs, and simplify maintenance activities. It is not intended to limit competition. It is not all inclusive. It is a list of manufacturers whose products are well known to the University due to their frequent and successful use.

This List shall be used by A/E's when selecting manufacturers for specification in electrical designs. **A/E'S SHALL SPECIFY ONLY THE LISTED MANUFACTURERS THAT MEET THEIR PROJECT'S REQUIREMENTS, AND SHOULD SPECIFY A MINIMUM OF THREE MANUFACTURERS WHENEVER POSSIBLE.** A/E's may specify manufacturers not on this list to satisfy project requirements, **BUT SHALL OBTAIN UNIVERSITY APPROVAL IN ADVANCE.**

This List **SHALL NOT** be used by Contractors to justify making substitutions for products specified in the construction documents. **CONTRACTORS SHALL PROVIDE THE PRODUCTS SPECIFIED IN THE CONSTRUCTION DOCUMENTS UNLESS THE UNIVERSITY APPROVED THEIR PROPOSED SUBSTITUTIONS AT THE TIME OF BID IN ACCORDANCE WITH THE PROJECT'S STANDARD GENERAL CONDITIONS.**

THIS LIST DOES NOT APPLY to purchases by the University Plant Department of replacement electrical products required to match or maintain existing installations.

This List is revised as needed. Before using it, check the AEC Website for the latest revision.

Conduits, Raceways and Accessories -

EMT, liquid-tight flexible metallic conduit, and/or non-liquid-tight flexible metallic conduit/raceway; plus associated accessories, fittings, junction and pull boxes, and related products

Products of all manufacturers are acceptable as long as they are electro-galvanized steel, have a smooth interior, and are NRTL labeled for the application.

Rigid (galvanized metal), and IMC (intermediate metal) conduits/raceway, plus associated accessories, fittings, junction and pull boxes, and related products

Products of all manufacturers are acceptable, as long as they are hot-dipped galvanized steel inside and out, have a smooth interior, and are NRTL labeled for the application. Boxes shall be cast, not formed. IMC may only be used when tools specifically designed for IMC are used.

PVC conduit/raceway (Type DB, Schedule 40, and Schedule 80), plus associated accessories, fittings, junction and pull boxes, and related products

Products of all manufacturers are acceptable as long as they are sunlight resistant, and NRTL labeled for the application. Products from manufacturers making both the conduit and the fittings are preferred whenever possible.

Fiberglass Reinforced Epoxy (FRE) conduit/raceways, accessories, fittings, and related products

Champion

Tork

Low Voltage, Stand-Alone Room Lighting Control System

The following room control systems are intended to be utilized in spaces in which line voltage controls are unable to comply with ASHRAE 90.1 and other building codes. The intent is to provide simple

control solutions in classrooms, offices, toilet rooms, corridors, small conference rooms, and similar spaces. The following systems are not intended to meet sophisticated control system criteria that may be required in auditoriums, theaters, arenas, executive level conference rooms, and similar complicated spaces. The following systems are low voltage, hard-wired, simple to maintain, user friendly, cost effective, and secure; they are not wireless and they do not require software, building networks, servers, firewalls, clouds, or specialty knowledge to operate or maintain.

AcuityControls nLight nPP16 Series

SECTION 265100 - INTERIOR LIGHTING

Lighting Representatives

Each of the following lighting representatives serves over one hundred lighting manufacturers. After the Design Development phase, the lighting designer shall send a copy of the lighting fixture schedule to each of the lighting representatives below to request comments and recommended equivalents. The lighting designer shall evaluate the proposed recommendations to ensure design compliance and then incorporate equivalents into the lighting fixture schedule. The proposed lighting equivalents shall meet or exceed the design requirements as well as any other requirements in the U of M Design Guidelines.

Technical Committees, Committee Chairs and Email Addresses:

1. Architectural Technical Committee Chair: Jana Hayford, email: hayford@umich.edu
2. Mechanical HVAC Technical Committee Chair: Joe Robinson, email: jrobby@umich.edu
3. Mechanical Hydronics & Steam Technical Committee- Co-Chairs: Allen Farmer, email: alfarmer@umich.edu ; Paul Schmandt, email: pschmand@umich.edu
4. Mechanical Plumbing & Fire Protection Technical Committee- Co-Chairs: Rosie Hood, email: rlhood@umich.edu ; Brian Begg, email: bbegg@umich.edu
5. Electrical Technical Committee Chair: Jeff Walenciak, email: jmwale@umich.edu
6. Civil Technical Committee - Co-Chairs: Patti Spence, email: paspenca@umich.edu ; Dharmesh Joshi, email: shivdhar@umich.edu

Preferred Manufacturers List General Procedure

Policy: A Preferred Manufacturers List (PML) is maintained by Technical Committees at the University of Michigan (U-M) Department of Architecture, Engineering & Construction (AEC). The PML is used as the basis of manufacturer selection for University projects. The PML is updated on an ongoing basis. The A/E should review the included Preferred Manufacturers List (PML) and follow in the preparation of the specification. If the A/E believes other manufacturers should be considered they must discuss this issue with the Design Manager prior to release of the construction documents.

Purpose of Policy: Improve the quality and value of products provided to the University. Improve manufacturer understanding of the U-M PML revision process.

General: Anyone can [Request for Addition or Change of Listing](#) to the PML by contacting the appropriate [Committee Chair](#). The extent of evaluation will vary based on many factors. Therefore, time to evaluate requests will vary.

Manufacturers are listed in the PML in one of three categories:

1. Preferred Manufacturer: Listed manufacturer's product may be used on U-M projects. However, manufacturer's product must also be listed as approved in the project contract documents.
2. Conditional Approval: Listed manufacturer's product may be used on select U-M projects. Approval from the Technical Committee is required. Manufacturer's product must also be listed as approved in the project contract documents. Manufacturers in the Conditional Approval category have gone through successful preliminary review, but Technical Committee requires additional in-service input prior to final category listing.
3. Under Consideration: Listed manufacturer's product is being evaluated. The product should not be included in U-M projects.

All products are expected to meet specification requirements, quality level, and project schedule commitment.

(End of Procedure)

**Request for Addition or Change of Listing to
U-M Preferred Manufacturers List**

Date of Request:

From: (Requestor and Contact Information)

To: (U-M Technical Committee Chair or Co-Chairs)

Please consider addition or change of listing for the following product:

Type of Product/ Specification Article (butterfly valve, interior door, motor starter, etc.):

Product Manufacturer:

Product Make and Model Number(s):

Years Product in Use:

Years Manufacturer in Business:

Standard Warranty Period:

List of Installation Locations Within 50 Miles of Ann Arbor:

Manufacturing Location:

(Consider providing additional product information, such as: product catalogue information, cut sheets, customer reference contacts, code compliance listing, or wiring diagrams)

Note:

1. Requester should submit one product type/ specification article per Request.
2. Requests for Addition do not constitute approval.
3. Requester should submit marked up U-M applicable master specification section, proving full compliance with the specification. In cases where manufacturer's product differs from the U-M specification state whether difference is a betterment or deficiency to the minimum specification requirement. Any stated deficiencies should be fully explained and qualified.
4. The applicable Technical Committee will evaluate requests and may require additional information prior to making a decision on the listing of the product.
5. Requests for Change of Listing should include reason for change, recommended listing, and any appropriate attachments.

FOR INTERNAL USE

Tracking Number: Master Spec Number- YY MM DD

May 2024

Codes and Regulatory Agencies – May 31, 2024

Changes to the page are as follows:

Added requirements for Adult Changing tables and Client/Building Code committee approval to use the exception to not provide accessible means of egress in existing buildings.

Michigan Building Code 2015 added the following sections:

1009 Accessible Means of Egress Exception 1. Accessible means of egress are not required to be provided in existing buildings. (Buildings built prior to 2010 per US Access board are considered existing) Use of this exception must be approved by the University project team and University Building code Committee. As required to use accessibility exceptions for structural infeasibility must be approved by the University project team and the Building Code Committee. Coordinate use of this exemption with the project design manager prior to use.

Chapter 1109.2.1.2 Exception replace with the following: (Adopted June 1, 2024)

Exception: The following additional plumbing fixtures shall be permitted in the family or assisted-use toilet room:

1. A urinal.
2. A child-height water closet.
3. A child-height lavatory
4. An adult changing station also used for bathing

Chapter 11 add Section 1109.3A between section 1109.3 and 1109.4 and corresponding articles up to 1109.3A.4.4. (Adopted June 1, 2024)

1109.3A Adult changing stations: Where provided, adult changing stations shall be accessible.

Where required, adult changing stations shall be accessible and shall comply with Sections 1112.4.1 through 1109.3A.1 Where Required.

Not fewer than one adult changing station shall be provided in the following locations:

1. In Assembly and mercantile occupancies, where family or assisted-use toilet or bathing rooms are required to comply with Section 1109.2.1.
2. In Group B occupancies providing educational facilities for students above the 12th grade, where an aggregate of 12 or more water closets are required to serve the classrooms and lecture halls.

3. In Group E occupancies, where a room or space used for assembly purposes requires an aggregate of six or more water closets for the room or space.
4. In highway rest stops and highway service plazas.

1109.3A.2 Adult changing stations shall be located in toilet rooms that include only one water closet and only one lavatory. Fixtures located in such rooms shall be included in determining the number of fixtures provided in an occupancy. The occupants shall have access to the required adult changing station at all times that the associated occupancy is occupied.

Exception: Adult changing stations shall be permitted to be located in family or assisted toilet rooms required in Section 1109.2.1

1109.3A.3 Prohibited location

The accessible route from the separate-sex toilet or bathing rooms to an accessible adult changing station shall not require travel through security checkpoints.

1109.3A.4 Travel Distance

The adult changing station shall be located on an accessible route such that a person is not more than two stories above or below the story with the adult changing station and the path of travel to such facility shall not exceed 2000, feet (609.6 m).

1109.3A.5 Adult changing table surround walls and partitions within 2 feet (610 mm) measured horizontally from each end of the adult changing table and to a height of not less than 72 inches (1829 mm) above the floor shall have a smooth, hard, nonabsorbent surface, and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture.

Michigan Rehabilitation Code for Existing Buildings 2015 add the following section:

Chapter 3 add Section 306 Accessibility for Existing Buildings

306.7.15 Adult Changing Stations.

Where additional toilet facilities are being added, in occupancies where adult changing stations are required by 1109.3A of the Michigan Building Code, not fewer than one accessible family or assisted toilet room with an adult changing station shall be provided in accordance with Section 1109.3A of the Michigan Building Code. The adult changing station shall be permitted to be located in a single use family or assisted-use toilet room or bathing room.

Michigan Mechanical Code 2021 add the following section:

Add to Table 403.3.11 Minimum Ventilation Rates: Occupancy classification- Room with adult changing station. Exhaust Airflow Rate CFM/square foot a - 50/70 e.

1. Table 403.3.1.1 Footnote a: Based on net occupiable floor area
2. Table 403.3.1.1 Footnote e: Rates are per water closet, urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

Standard Details and Schedules

MD 230920 001 Typical Lab DDC Architecture – May 23, 2024

Changed Lab Integration to more generic descriptor, added max qty of BACnet devices to Siemens controller, added additional note under Scope of Work for component selections by Lab Controls Contractor.

MD 238245 001 Chilled Beam Piping Detail – May 21, 2024

Chilled Beam piping details show the duct/air added detail and additional chilled beams for the zone.

Master Specifications

281300 Access Control & Monitoring System – May 21, 2024

Page. 281300-3

Section 2.2 Access Control Equipment

Subsection A, line 1

Current:

Access Control panels shall be Software House iStar Ultra SE Series only.

Updated:

Access Control panels shall be Software House iStar Ultra G2 SE Series only.

Basically, G2 was added after the word Ultra.

Page. 281300-3

Section 2.2 Access Control Equipment

Subsection B Card Readers (CR)

Line 1.a

Current:

Multi-technology reader: Software House – RM2L-4000-UM.

Updated:

Consult with UM Key Office on specific card reader make/model design currently available.

This will be a temporary change. Software House is actively working on another RM2L model for us.

The following changes were made by the Controls Specification Subcommittee.

- Ball style control valves are now specified to be nickel coated brass or stainless steel construction due to water quality issues causing corrosion and failures within brass construction ball valves.
- LTDE installation requirements have been adjusted to match manufacturer recommended installation requirements.

April 2024

Standard Details and Schedules

Section 232216 – Steam & Condensate Piping Specialties – April 16, 2024

The Team has increased the size of the trap to 12" below equipment or main and the dirt leg to 6" min.

Preferred Manufacturers List

Architectural PML – April 30, 2024

Removed Lab Crafters

Master Specifications

Master Specification 115313 Laboratory Fume Hoods – April 30, 2024

Update:

Section 115313 Laboratory Fume Hoods, Part 2.1 has been updated to remove Lab Crafters Inc. from the list of acceptable manufacturers for both standard and reduced face velocity chemical fume hoods.

Master Specification MS 220523 Valves – April 29, 2024

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

2.3B Added Jomar

2.12 Revised the wording, added Victaulic.

Master Specification MS 223116 Water Softener – April 29, 2024

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

2.1 Updated the manufacturers

Master Specification 262726 Wiring Devices – April 12, 2024

- Split up section 2.4 into sub-paragraphs 2.4.A and 2.4.B, allowing GFCI and AFCI receptacles to hold their own paragraphs.

- For GFCI receptacles 2.4.A, added a requirement for advanced microcontroller technology to prevent false trips. Over the past year or two, U-M campus has been experiencing an increase in false trips with GFCIs, causing nuisance and lost research to users. A number of pilot projects have demonstrably eliminated/reduced the false trips.

These revisions have been discussed and approved by the Interdepartmental Electrical Team and the FCA Electrical Team.

Master Specification MS 220553 Mechanical Identification – April 8, 2024

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

1.4 – Added Manufacturer – Kolbi Marker Co

2.1G – Added Geothermal Heat Supply & Return

Added Process Chilled Water Water Supply & Return

Added Dental Air, Dental Vacuum, Laboratory Compressed Air & Laboratory Vacuum

Added Waste Anesthetic Gas Disposal;

Added a note : ALL labeling shall conform to NFPA 99

2.3 Revised title to EQUIPMENT MARKERS AND DDC POINT TAGS

Added several new labels

Project Procedures

U-M AEC – 2024 Design Professional Cost Benchmarking Submission Form (xlsx) – April 25, 2024

Updated to include 2023 actual inflation.

DG 2.5 Project Estimates – April 5, 2024

Benchmark threshold was increased from \$5 million to \$10 million.

March 2024

Master Specifications

230905 Mechanical Systems Controls (Hospital Projects) – March 20, 2024

230924 Systems Integration (Hospital Projects) – March 20, 2024

These changes include:

- revising the description of our Desigo server architecture and integration requirements to follow the “Hospital Facilities – Desigo BMS Integration Guidelines”.
- updated the link to the UMH BMS Integration Process flow diagram, as the old link was broken.
- updated 230905 to reflect specs around the use of Indoor Air Quality (IAQ) Monitors, which are IP smart sensors that only take a data connection and can monitor a host of environmental data (temperature, humidity, particulates, lighting, sound, etc). We are currently using these monitors on the pharmacy sensor project with good success.

Division 01 General Requirements – March 4, 2024

Updated the color of the construction fence screening to Navy.

Codes and Regulatory Agencies – March 13, 2024

Added link to Michigan Legislature Article VIII section 5 which provides information on regulatory

autonomy in the first paragraph of introduction.

Changed Michigan Mechanical Code to 2021 and Michigan Plumbing code to 2021 page 13 and 14. With local rules

Changed Michigan Electrical Code to incorporation of NFPA 70 2023 edition. Page 15 and 16 With local rules

March 16, 2024

Changed MDEQ to EGLE

Changed Michigan Department of Environmental Quality to Michigan Department of Environment, Great Lakes and Energy

Added Section on floodways/plains and non-potable well installations (e.g. geox wells)

Technical Sections

[230030 Laboratory Ventilation Design](#) – March 13, 2024

Added fire wrapping requirements for laboratory exhaust ductwork.

Updated November 2022, posted March 13, 2024.

[101400 Signage](#) – March 20, 2024

Updated the link to digital signage.

February 2024

Technical Sections

[DG 09300 Ceramic Tile and Waterproofing](#) – February 29, 2024

Changes include recommendations for large format tile to minimize grout lines.

Recommendation for dark grout and polyurethane sealing.

Standard Schedules and Details – Civil Water Main Details

[City of Ann Arbor Standard Details](#) – February 1, 2024

Link was updated.

January 2024

Master Specifications

[Division 01 – General Requirements](#) – January 26, 2024

Updated Submittal Procedures section:

Division 01 – Section 013300 – Submittal Procedures. Updated section to remove references to “ProjectDox” and edited management of submittal exchange (Part 2.1.A.1). AEC’s use of ProjectDox was discontinued in August of 2023.

[237213 Rotary Air-to-Air Energy Recovery Wheels](#) – January 17, 2024

[238216 Coils and Drain Pans](#) – January 17, 2024

Changes reduce costs for the coil spec section. These changes clarify wheel drive requirements for the rotary energy recovery spec section.

[237323 Custom Air Handling Units](#) – January 17, 2024

[237324 Semi-Custom Air Handling Units](#) – January 17, 2024

Changes reduce costs for the air handlers.

MS223116 Water Softener – January 2, 2024

Replaced pneumatically actuated control valves with electronically actuated control valves.

MS233300 Air Duct Accessories & RGDs – January 2, 2024

Revised smoke/fire damper actuators to be electric for all new projects. Pneumatic damper actuators shall only be used in maintenance applications.

MS233400 Fans – January 2, 2024

Removed pneumatic actuation as an option for damper actuators on high-plume induction type lab fan.

MS233600 Air Terminal Units – January 2, 2024

Revised to remove pneumatic controls. For select projects permitted to use pneumatic controls, removed portions of the specification can be found in the editor's notes.

MS238413 Steam Humidifiers – January 2, 2024

Replaced pneumatic controls with electronic controls for control valves and condensate temperature switches.

December 2023

Technical Sections

140000 Conveying Systems – General Requirements – December 15, 2023

Complete rewrite.

Master Specifications

142400 Hydraulic Elevators – December 14, 2023

142100 Electric Traction Elevator – December 14, 2023

142216 Wheelchair Lifts – December 15, 2023

New sections.

Standard Details and Schedules

MD 233600 003 HWH Duct-Mounted Reheat Coil – December 8, 2023

Reheat coil piping details show the control valve on the supply side, but our control diagrams show this valve on the return side (lower temp, helps longevity). Not having the piping diagram match the control detail has caused issues and repetitive drawing revisions internally and externally on projects.

These changes were approved by the Steam and Hydraulic Mech Tech Team.

Curb & Gutter Details Composite – December 15, 2023

New detail that combines the details listed below, which have been removed.

18" Curb & Gutter (U Of M Standard)

City Of Ann Arbor Curb & Gutter

18" Curb & Gutter, Spillout

Mountable Curb & Gutter

November 2023

Special Instructions to Designers

4.10 Telecommunication Cabling System – November 17, 2023

New

Technical Sections

101400 Signage – November 17, 2023

Appendices A and C graphics were updated with the new accessible logo for the design guidelines.

087100 Finish Hardware – November 9, 2023

We have modified and updated hardware model numbers and requirements based on occupancy.

All changes highlighted with yellow.

Master Specifications

033053 Miscellaneous Cast-In-Place Concrete – November 27, 2023

037300 Tunnels Concrete Restoration – November 27, 2023

Two AEC posted concrete specifications have been updated so that cementitious material shall include ASTM C595 to cover the cement industry's production switch to ASTM C595 Type 1L cement (Portland Limestone Cement or PLC) from the past standard ASTM C150 Type 1 (general). MDOT includes both ASTM C150 and ASTM C595 – Local suppliers are using the Type 1L (PLC cement, ASTM C595), and ASTM C150 Type 1 cement will soon only be available as a specialty cement.

Quick Facts about Type 1L Cement:

- MDOT has allowed Type 1L cement to be used in concrete since 2014, but the product has not been produced in significant quantities prior to now.
- Type 1L is often referred to as "portland-limestone cement," or PLC
Cement companies typically formulate Type 1L to perform almost exactly like their Type 1.
- Type 1L allows up to 15% interground limestone, whereas Type 1 has allowed up to 5% for many years now.
- Per the MI Concrete Institute, most Type 1L cements result in an approximate 10% reduction in carbon production vs. the standard Type 1.

261100 Unit Substations – November 3, 2023

Formatting work was done on the word document to correctly display it on the .pdf version.

October 2023

Standard Details and Schedules

Tunnel Toolkit – October 23, 2023

The FY23 Tunnel Toolkit (TK) Update joint effort with AEC and the Tunnels Utilities Group made the following changes:

1. All tunnel Tool-kit Details were reviewed with the tunnels utility group. Revisions and updates were made to the TK sheets indicated by date.
2. Sheets TK-4A and TK-4B were merged into one new sheet named TK-4.
3. Sheet TK-9 details are no longer used so the sheet was removed from masters.

Sustainability

3.2.4 LCCA and Carbon Worksheet – October 19, 2023

Worksheet was updated to fix some bugs in the excel file

Master Specifications

MS235150: Venting Systems for Specialty Gas Fired Appliances: – October 6, 2023

Removed double-wall venting for Category I, Category III, and Category IV non-condensing gas fired appliances (Category II and Category IV condensing remain).

Revised vent support intervals description to be independent of equipment served.

MS235239: Fire Tube Boilers (Hot Water): – October 6, 2023

Removed requirement for hard copies of boiler package documents and O&M manuals.

Added shipping protection requirements for contractor-furnished equipment and spec editor notes indicating paragraphs to include for S&H of pre-purchased equipment.

Revised duct connections execution to include combustion air intake ducting, and removed specific instructions for field fabrication of ducting, with reference to section 235150 and UL 1738.

September 2023

Preferred Manufacturers List

8.4 Electrical – September 19, 2023

In Section 265100 Interior Lighting, we added Wizard Lighting Company as a local lighting representative. The Wizard Lighting line card and representation was reviewed and approved at the Interdepartmental Electrical Team meeting in September.

Project Procedures

DG 2.2.1 Pre-Design Deliverables Checklist – September 7, 2023

Revisions include the following:

- Removed items that U-M is responsible for providing
- Clarified language

- Removed requirements that are not appropriate for pre-design

August 2023

Technical Sections

101400 Signage – August 23, 2023

Corrected the link to appendix D.

Sustainability

3.2 Carbon Reduction and Energy and Water Conservation – August 4, 2023

DG 3.2 has been updated to match the shower head flow requirements included in MS224200.

(Revised July 2023, posted August 2023)

July 2023

Technical Sections

101400 Signage – July 25, 2023

Updated DG101400 Signage and new appendix E. The changes reflect added pictograms that have been approved by the Planning Review Committee.

Preferred Manufacturers Lists

U-M Design Guidelines Technical Committees, Committee Chairs and Email Addresses – July 24, 2023

Updated membership.

Codes and Regulatory Agency – July 21, 2023

The summary of changes are as follows: Update some of the hyperlinks that were broken. Page 8 Under conflicting requirements added to the NFPA 45 2011 – Unless complying with the MBC 428 section on research laboratory. Modified the following under State of Michigan Rules for Construction or Renovation of Swimming Pools updated department from:

Michigan Department of Environmental Quality (Water Division)

to

Michigan Department of Environmental, Great Lakes and Energy and added the following with hyperlink to Public Swimming Pools rules:

which is supplemented with the Administrative rules for Public Swimming Pools. On the BFS listing page 27 the building number for the Dearborn Fairlane Center North was corrected to 5459. Removed the building from the BFS list *1060 Dearborn University Center* per Dearborn Facilities this not a classroom building and not under BFS jurisdiction. In the June update of the Code and Regulatory Agency Page there was an error in removing the following building this has been added back into the BFS listing:

1065 DEARBORN MARDIGIAN LIBRARY

Special Instructions to Designers

DG 4.9 Bird Collision Deterrence – July 17, 2023

Updated to reference the updated LEED credit name.

June 2023

Special Building Areas

5.19 MM Behavioral Health Design Guideline – June 30, 2023

This new Michigan Medicine design guideline provides guidance around acceptable practice/product used in our behavioral health applications.

Project Procedures

2.4 Document Standards And Procedures For Project Deliverables – June 14, 2023

The email address for floor plans was updated.

Codes and Regulatory Agency – June 14, 2023

Changes include the following:

Changed the date from March 2022 to June 2023

State of Michigan Elevator Code (Effective June 27, 2023)

State of Michigan Elevator Code (2016 and 2017 Editions) (Effective June 27, 2023)

(Incorporating by reference the Michigan rules and exceptions for the adoption of ASME A17.1 2016 Safety Code for Elevators and Escalators, the ASME A17.2 2017 Guide for Inspection of Elevators, Escalators, and Moving walks, the ASME 17.3–2017 safety code for existing elevators and escalators, the ASME A17.6–2017 Standard for Elevator Suspension, Compensation and Governor Systems, the ASME A18.1–2017 Safety Code Standard for Platform Lifts, and Stairway Chairlifts, ASME A90.1–2009 Safety Standard for Belt Manlifts, and ANSI A10.4–2016 safety requirements for personnel hoist and employee elevators for construction and demolition and operations.)

Enforcing Agency –

State of Michigan Department of Licensing and Regulatory Affairs

Bureau of Construction Codes

Elevator Safety Division

PO Box 30254

Lansing, MI. 48909

(517) 241-933

Buildings removed from BFS jurisdiction listing:

0225 DANCE BUILDING – Demolished

0226 CENTRAL CAMPUS REC BLD&BELL POOL – Demolished

1065 DEARBORN MARDIGIAN LIBRARY -No longer BFS jurisdiction letter filed from Dearborn facilities for record

Master Specifications

230905 Mechanical Systems Controls (Hospital Projects) – June 14, 2023

Description of changes:

- Modified automatic control valve section 2.14 and damper operators' section 2.16 to include electric actuation as the preferred option for new projects.
- Reorganized section 2.14 to simplify valve requirements per UM Controls AD HOC Specification Subcommittee.
- Clarified thermistor requirements.
- Reformatted sections 2.5 thru 2.11 to align with campus spec formatting, little if any technical changes made.
- Added sections 3.3 thru 3.6 to align with campus.

MS230901 Mechanical Systems Controls TURNKEY – June 6, 2023

Changes:

Modified automatic control valve section 2.17 and damper operators section 2.19 to include electric actuation as the preferred option for new projects. Reorganized section 2.17 to simplify valve requirements per the Controls Ad Hoc Specification subcommittee.

May 2023

Master Specifications

MS336320 Utility Tunnels – Domestic Hot Water Distribution – May 2, 2023

New

April 2023

Master Specifications

MS230900 Mechanical Systems Controls – April 21, 2023

Changes:

April 2023 – Modified automatic control valve section 2.17 and damper operators section 2.19 to include electric actuation as the preferred option for new projects. Reorganized section 2.17 to simplify valve requirements per the Controls Ad Hoc Specification subcommittee.

Preferred Manufacturers Lists

8.4 Electrical PML – April 21, 2023

The following revisions have been made to the 8.4 Electrical PML:

- **Section 265100 – Interior Lighting – Lighting Representatives** – deleted Resource Lighting Group. Resource Lighting Group went out of business.
- **Section 265100 – Interior Lighting – Lighting Representatives** – added Pro-Tech Lighting & Controls. Pro-Tech represents Southeast Michigan with 116 manufacturers, many of which provide commercial-grade light fixtures suitable for UM projects.

Master Specifications

MS028213 Asbestos Remediation – April 7, 2023

Ms028214 Asbestos Remediation – Floor Tile and Mastic – April 7, 2023

MS028215 Asbestos Remediation – Roofing Material – April 7, 2023

1.5 A. B. QUALITY ASSURANCE Pre-Qualified Asbestos Abatement Firms:

Remove: Global Green Service Group, Qualified Abatement Services, Inc.

Add: 21st Century Salvage Inc., Asbestos Abatement Incorporated, Innovative Environmental Solutions & Services DBA Paige Construction

March 2023

MS 220553 Mechanical Identification – March 30, 2023

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

1.4 – Added Manufacturer – Kolbi Marker Co

2.1G – Added Process Chilled Water Water Supply & Return

Added Dental Air, Dental Vacuum Laboratory Compressed Air & Laboratory Vacuum

Added Waste Anesthetic Gas Disposal;

Added a note : ALL labeling shall conform to NFPA 99

MS 224200 Plumbing Fixtures – March 30, 2023

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

Added 2.23 Sink F: Wall-Hung, Healthcare Handwashing

2.39.C .5 Removed the phrase “in base of spout.”

2.39.C.13 Added Manufacturer – Chicago

MS261100 Unit Substations – March 9, 2023

- Under Part 2, – Products, in 2.1 Unit Substation Assembly, section Q, the following words were added “as manufactured by T&B or Burndy”.
- Under Part 2, – Products, in 2.4 Secondary Voltage Distribution Section, section F.8, the following sentence was added “The rear compartments shall be provided with full height doors secured with three point latches with a single quarter turn knob with provision for a padlock.”
- Under Part 2, – Products, in 2.4 Secondary Voltage Distribution Section, section G.5, the following words were added “and an amber trip indication light”.
- Under Part 2, – Products, in 2.4 Secondary Voltage Distribution Section, section G.8, the following sentence was added “Manually operated breakers shall be provided with position indicating lights and an amber trip indication light.”.

February 2023

Technical Sections

261100 Unit Substations – February 9, 2023

DG Summary of Changes Below:

Updated system fault contribution level for determining the required interrupting rating for unit substation equipment. The contribution level is revised to 1000 MVA with an X/R ratio of 23.

Special Building Areas

5.7 Unit Substation Rooms – February 9, 2023

DG Summary of Changes Below:

- Updated OSEH to EHS
- Clarified transformer vault code reference
- Clarified minimum fire resistance rating for substation rooms
- Remove requirement for pre-action sprinkler systems in substation rooms of units serving patient care facilities
- Updated ventilation system requirements for substation rooms to address dust / dirt infiltration.
- Added Appendix – A which includes SOPs for updated ventilation system requirements
- Updated reference of MOSCAD panels to McEdge panels
- Added requirement for diffused acrylic lenses for LED lighting fixtures in substation rooms.
- Added requirement for building wide Wi-Fi coverage to extend into the substation room.

Sustainability

3.3 Sustainable Products Portfolio – February 7, 2023

Retired

Master Specification

Division 01 General Requirements – February 1, 2023

1.5 Work By Owner

Item A

Phrase “shall be conducted...” changed to “shall be coordinated...”

January 2023

Master Specification

MS 230905 Mechanical Systems Controls (Hospital Projects) – February 7, 2023

Changes include:

Changes associated with new Systems Integration spec 230924. See below

Changed UMHHC to UMH to reflect branding change.

Added reference to and contact info for Facilities Applications and Systems Monitoring group.

Added requirements for all IP DDC solutions, as applicable.

Modified DDC controller requirements, including alarm and trend management requirements.

Added requirement for MSCC to provide latest firmware.

Modified demolition of legacy DDC system responsibilities.

Modified requirement that MSCC’s shall configure HMI’s.

Misc changes to incorporate campus changes to 230900 issued some time back, including expanded electronic actuator requirements and control loop tuning requirements.

Added gas detection, including MRI O2 depletion, added occ sensors for ORs.

Added room pressure indicator (RPI) requirements.

Minor changes to submittal and warranty requirements, including new BMS addressing requirements.

MS 230924 – Systems Integration (Hospital Projects) – February 7, 2023

New. This outlines the requirements of the Systems Integrator (SI) in integrating changes to our Desigo BMS.

One of the goals with these changes is to address a new model with how our projects will be delivered. The goal is future projects deliver a turnkey approach to BMS changes, including field control changes (by the MSCC) and changes to the hospital's Desigo frontend (by the SI). This is a departure from the past approach where UMH would self perform the role of the SI.

MS 232116 Hydronic Systems Specialties – January 27, 2023

The Steam & Hydronics Mech Tech Team has made the following changes:

Added: Bell & Gossett CRS Air and Dirt Separator as acceptable Coalescing Separator manufacturer.

Standard Details and Schedules

28160015 – MC-Edge RTU Electrical Detail January 20, 2023

Per the request of UM Radio Shop, we have made a minor revision to Electrical Detail 28160015 – MC-Edge RTU Electrical Detail. The conduit to the roof antenna was revised from 1" C to 1-1/4" C.

Technical Requirements

Civil Sheet Set-up Checklist – January 10, 2023

Updating the link to the City documents and to the topo survey (link was broken) , adding maintenance agreement statement to utilities sheet/water main plan/profile sheet, and adding a fire page comment that the emergency access road needs to be 26 feet wide adjacent to hydrants (otherwise it is 20' wide unless a highrise).

088000 Glazing – January 4, 2023

Added language regarding the application of window films for enhanced Thermal Performance.

December 2022

Project Procedures

RFP for Surveys – December 19, 2022

Changes in italic include:

1. Spatial Reference System and Geodetic Control...

- Minimum two (2) Bench Marks (“BM”) with elevations and locations. *Include a BM schedule with BM# and detailed description (e.g. spike location, top nut arrow of fire hydrant, etc.) Note if the BM location is off plan. Mark the BM in the field with permanent paint of a contrasting color.*

2. Topographic...

- *d. Ground spot elevation directly below BM.*

3. Planimetric...

- b. Building lines, door locations and floor elevations. Include light and window wells and any building protrusion less than 15’ in height (e.g. canopies and overhangs).
 - *If checked, provide a spot elevation of finished floor for all building floors. Do not provide floor elevation obtained from any existing source.*

4. Deliverables...

- a. Provide an electronic copy of the survey in PDF and CAD; MicroStation (dgn) format preferred, AutoCAD (dwg) acceptable. *The PDF and CAD file shall include the dated and signed by a Michigan Registered Land Surveyor.*
- b. Provide a hard paper copy (24” x 36” page size) of the Certified Survey that is sealed....

Sustainability

3.2 Carbon Reduction and Energy and Water Conservation – December 13, 2022

This DG has been corrected to include both the revisions made in July 2022 and November 2022 (the revisions made in July do not appear to have been carried over into the November version).

Standard Details and Schedules

9.3 Electrical Details – December 8, 2022

Nine Lighting Pole Details 26560003, 26560006, 26560010, 26560011, 26560012, 26560013, 26560014, 26560015, 26560017 – for all details, we deleted the 8’-0” long ground rod, cadweld connection, and associated ground wire to the ground lug. Although ground rods are allowed by the NEC at each light pole, they are not required and ultimately serve no purpose in protecting the associated circuit or the luminaire from lightning. The associated circuit contains an equipment ground conductor that routes back to the panelboard, providing all necessary circuit protections. This revision was reviewed and approved by the Interdepartmental Electrical Team, Utilities Outdoor Power & Lighting, as well as UM Electrical Inspectors.

Lighting Pole Detail 26560006 – per Utilities Outdoor Power & Lighting, some of the terminal block heights were adjusted to better suit field conditions.

Lighting Pole Details 26560010, 26560014 – for these details, we deleted all references to metal halide lamps. All projects have been using LED lamps for a number of years now.

Delete the following details from our website: 26560001 – Metal Halide Site Light Schedule, 26560027 – Parking Lot Fixture Schedule Update. We have not had a metal halide project for a number of years now, so these details can be deleted.

Master Specifications

MS260800 Electrical Acceptance Tests – December 16, 2022

The revisions were discussed at an Interdepartmental Electrical Team meeting, and were written, reviewed, and approved by a sub-committee including AEC, FPD, and Utilities. The revisions include:

Added Section 3.11 Molded Case Circuit Breakers (MCCB) Tests

MS 224200 Plumbing Fixtures – December 6, 2022

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

- 2.1 Water Closets General revised flush requirement to 1.28 gpf.
- 2.2.A Water Closets WC-A Wall Mounted – removed Crane, added Zurn.
- 2.2.B Water Closets WC-B Floor Mounted 15" Non-ADA – removed Crane, added Zurn.
- 2.2.C Water Closets WC-C Floor Mounted ADA compliant – removed Crane, added Zurn
- 2.2.E Added specification – Water Closet WC-E Floor Mounted, Floor outlet, close coupled (gravity tank), vitreous china, ADA compliant.
- 2.3.B Added Specification: WC-FLV-B Manual single flush valve (1.28 gpf)
- 2.3.D Added Specification: WC-FLV-D Flushometer Valves – Piston, sensor operated, battery powered (optional, not preferred).
- 2.18.A.1 Updated depth dimension.
- 2.18.A.3 Updated Kohler model name.
- 2.19.A.1 Updated depth dimension.
- 2.19.A.3.c Updated Kohler model name.
- 2.20.A.1 Updated depth dimension.
- 2.26.A.6 Revised SF-A faucet flow rate to 1.5 gpm.
- 2.27.A.6 Revised SF-B faucet flow rate to 1.5 gpm.
- 2.28.A.10.d Updated Chicago model name.
- 2.29.A.9.d Updated Chicago model name.
- 2.36.A Revised SH-A shower system flow rate to 1.5 gpm.
- 2.36.B Revised SH-B shower head flow rate to 1.5 gpm.
- 2.36.C Revised shower control valve flow rate to 1.5 gpm.
- 2.36.D.2.d Revised SS-H shower system flow rate to 1.5 gpm.

November 2022

Sustainability

DG 3.1 has been revised as follows:

DG requires Integrative Design meetings for all new construction projects and major renovation projects that exceed \$10M construction cost.

Visual Display requirements have been removed (these are now being made in-house)

Additional Resources section has been removed (this information is outdated)

In response to the President's Commission on Carbon Neutrality (PCCN) recommendations, the following Design Guidelines have been drafted and/or revised: – November 10, 2022

NEW DG 3.6 Carbon Reduction

Provides information on which projects are required to comply with maximum carbon emissions targets

Explains how a project is to determine the maximum carbon emissions target using the building types included in the project

Reference Documents attachments include: Building Infrastructure Table and Building Type Definitions and Maximum Emissions Table

DG 2.1 OPR and BOD Documents

Revised to include carbon reduction requirements

DG 2.1.1 OPR BOD Report Format

Revised to include carbon reduction requirements

DG 3.2 Carbon Reduction and Energy and Water Conservation

Revised to include documentation requirements associated with carbon targets.

DG 3.2.3 Energy Impact Statement

Revised to include ASHRAE Baseline column and Carbon information

NEW DG 3.2.4 LCCA and Carbon Worksheet

New document for tracking building type breakdown and energy information.

Master Specifications

MS 075323 Ethylene-Propylene-Diene-Monomer (EPDM) Roofing – November 30, 2022

Updated the Acceptable Manufacturers listed in part 2.2 to replace "Firestone building products" with "Holcim Elevate LSFR RubberGard Roofing Systems". Holcim Elevate acquired Firestone's building product division.

MS 220719 Mechanical Systems Insulation – November 11, 2022

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

- 1.2 – Summary: added insulating branch heating and branch chilled water piping
- 1.2.F – Items Not To Be Insulated: Added piping within fin tube or other terminal units.
- 2.2.A – Updated Insulation Thickness Table and added Editors Note on ASHRAE 90.1-2019
- 2.3.B – Added fiberglass piping insulation with polymer film or polypropylene coated vapor barrier
- 2.4.C – Added Editors Note to consider adding insulated jackets on steam trap assemblies and unions.

MS 220523 Valves – November 2, 2022

The Plumbing/Fire Protection Mech Tech Team has made the following changes:

- Added 331100 Water Distribution Piping reference to 1.1.B Related Sections
- Updated 2.1.B High Purity Water Ball Valve Description
- Removed Jomar Ball Valve from 2.3.B
- Added Pratt High Performance Butterfly Valve to 2.4.B

MS 235716 Steam-To-Water Heat Exchangers– November 3, 2022

Revised high temperature/high pressure gasket from Flexitallic to ElastaGraph

October 2022

Technical Sections

DG220010 Plumbing Specialties – October 13, 2022

Corrected department name from:
“Environmental Health Services” to “Environment, Health & Safety”

Master Specifications

233300 Air Duct Accessories & RGDs – October 24, 2022

Revised embedded hyperlink to correct inactive link.

MS 238245 Chilled Beams – October 13, 2022

New

MS 220516 Pipe Expansion Joints – October 12, 2022

Added Hose Master LLC to 2.1.B For Bellows Joints

Standard Details and Schedules

Bike Racks – Various Surfaces – October 6, 2022

The name and contact info for the manufacturer of the bike hoops was updated.

September 2022

Master Specifications

MS 283100 – Fire Detection and Alarm System – September 21, 2022

The revisions include:

Wherever MOSCAD alarm transmitter is mentioned within the specification, it has been revised to “...MOSCAD or MC-Edge RTU...”

Over the past few years, the analog radio system has transitioned to a digital radio system – the backbone of this digital system has been completed. The old analog MOSCAD RTUs still communicate to our radio system with important communications, but our UM Radio Shop has been steadily replacing MOSCAD RTUs with MC-Edge RTUs. The MC-Edge RTUs support digital communications and other modern features. The Life Safety Communications team, consisting of many units across F&O and Hospital/Health, are aware of and endorse the MC-Edge transition.

Standard Details and Schedules

28160015 – MC-Edge RTU Electrical Detail – September 21, 2022

The revisions include:

Renamed from “28160015 – Moscad Rtu Electrical Detail” to “28160015 – MC-Edge RTU Electrical Detail”.

Over the past few years, the analog radio system has transitioned to a digital radio system – the backbone of this digital system has been completed. The old analog MOSCAD RTUs still communicate to our radio system with important communications, but our UM Radio Shop has been steadily replacing MOSCAD RTUs with MC-Edge RTUs. The MC-Edge RTUs support digital communications and other modern features. The Life Safety Communications team, consisting of many units across F&O and Hospital/Health, are aware of and endorse the MC-Edge transition.

Technical Sections

DG 230012 Air Filters – September 19, 2022

1. changed efficiency metric from dust spot efficiency to MERV ratings exclusively.
2. changed secondary filter efficiency requirement from MERV 11 to MERV 13
3. Deleted ring panel filters for the vivarium animal room exhaust applications

DG 230013 Air Handling Units – September 19, 2022

1. Added coil pumping guidelines for hot water heating coils
2. Added coil pumping guidelines for chilled water cooling coils

August 2022

Standard Details and Schedules

MD 235716 002 Water Cooled Chiller VSD Filter Manifold – August 3, 2022

New

July 2022

Preferred Manufacturers Lists

[8.3 Mechanical PML](#) – July 6, 2022

Revised acceptable manufacturers for lubricated plug valves

Master Specifications

[MS 235150 Venting Systems For Specialty Gas Fired Appliances](#) – July 25, 2022

New

[MS 013220 Photographic Documentation](#) – July 22, 2022

New

[MS 231123 Facility Natural Gas Piping](#) – July 6, 2022

Revised acceptable manufacturers for lubricated plug valves

Sustainability

[DG 3.2 Energy and Water Conservation](#) – July 6, 2022

Updated to include the following requirements:

- Exceed the energy code (ASHRAE 90.1-2013) by 20% for New Construction and 15% for Major Renovation projects over \$10M construction cost. This will replace the current requirement that requires project to exceed the energy code on a “project-by-project basis.”
- Include a new mandatory energy conservation measure that will require projects to meet prescriptive envelope requirements as indicated in the energy code. Although projects typically meet or exceed the prescriptive envelope requirements projects may choose to use trade-offs related to the mechanical and/or electrical systems.
- Include a new mandatory energy conservation measure that will require projects to not exceed the window-to-wall ratio values included in the energy code.

June 2022

Preferred Manufacturers Lists

[Technical Committees, Committee Chairs and Email Addresses](#) – June 29, 2022

Updated Mechanical HVAC Technical Committee Chair.

Master Specifications

[MS235239 Fire Tube Boilers \(Hot Water\)](#) – June 29, 2022

New

Project Procedures

[Design Professional Cost Benchmarking Submission form](#) – June 20, 2022

Updated the form from 2021 to 2022 and updated the instructions. The template is linked from [2.5 Project Estimates](#).

Special Building Areas

SBA 5.18 Conference Rooms – June 13, 2022

New. Written in coordination with ITS

Technical Sections

DG 102800 Toilet Accessories – June 13, 2022

1. Added language and guidance for Menstrual Products
2. Clarified installation location of backpack hooks.

273524 Cellular Phone Signal Reinforcement System (CPCRS) – June 13, 2022

New

DG 101400 Signage – June 13, 2022

Updated to include

1. Digital Signage Guidelines
2. Specific Required Signage for Emergency Lockdown Button

May 2022

Technical Sections

DG 102113 Toilet Compartments – May 31, 2022

We have updated the Design Guideline to clarify application for HDPE Toilet Partitions and the installation of coat hooks at an accessible height.

April 2022

Project Procedures

DG 2.5 Project Estimates – April 22, 2022

The spreadsheets linked from DG 2.5 Project Estimates, Estimate Uniformat2.xlsx and Estimate CSI 2012.xls have been updated.

Changes made include:

1. date of revision
2. Design Contingency has been revised to be “Allowance for Undocumented Scope”

Master Specifications

MS081113 Hollow Metal Doors and Frames – April 15, 2022

Modification:

Updated the Acceptable Manufacturers listed in part 2.1.

Standard Details and Schedules

Master Detail 238245 001 Chilled Beams Piping Detail – April 2022

Master Detail 233660 020 Radiant Panel Piping Ceiling Mounted has been renamed to Master Detail 238245 001 Chilled Beams Piping Detail.

Revisions include:

Detail name change

Minor piping changes at the unit

NEW Equipment Schedule

March 2022

Codes and Regulatory Agencies – March 2, 2022

Changes include:

Date update from September 2021 to March 2022

Michigan Building Code Adoption by local rule added:

Article 509.1 General add the following Exception 2:

Exception 2: Incidental use for non-hazardous storage between 100 and 250 square feet in fully suppressed existing ambulatory care facilities and existing 1-2 occupancies, converted to non-hazardous storage rooms: with partitions capable of resisting the passage of smoke with a solid door which self-closes, and automatic sprinkler system.

Added under MIOSHA –

Transmitting or Broadcasting Antenna Installations

Transmitting antenna installations operating on any frequency between 300 kHz to 100 GHz must meet FCC radiofrequency (RF) occupational and general public emission limits. 47 CFR 1.1301 – 1.1320. The emission limits are specified in 47 CFR 1.1310. FCC licensees must be prepared to demonstrate compliance with those emission limits or will be required to submit environmental assessments for review and approval by the FCC. In addition, MIOSHA regulates worker exposure to RF radiation both with a specific standard and under its general duty clause. Michigan Administrative Code R325.60701 et seq and MCL 408.1011 of the Michigan Occupational Safety and Health Act 154 of 197.

<https://www.fcc.gov/general/fcc-policy-human-exposure>

Addition of Buildings to the BFS Listing:

4171 Biological St Residence Hall

Modified University of Michigan Buildings that are Inpatient Health Care Facilities to University of Michigan Buildings that Contain Inpatient Health Care Facilities.

Added asterisk to buildings with compartmentalization of jurisdictions.

Fixed various links.

February 2022

Master Specifications

MS238200 Terminal Heating Units – Hot Water – February 9, 2022

New

January 2022

Project Procedures

DG 2.4.2 Document Standards & Methods for Electronic Document Submissions – January 31, 2022

New.

DG 2.4 Document Standards – January 31, 2022

Revisions have been made to coordinate with the new DG 2.4.2 Document Standards & Methods for Electronic Document Submissions.

Master Specifications

New Master Specification Sections: – January 24, 2022

MS037300 Tunnels Concrete Restoration

MS071025 Utility Tunnel Waterproofing

MS336200 QA/QC for Tunnel Projects

MS336313 Underground Steam and Condensate Distribution Piping

Technical Sections

DG 087100 Finish Hardware – January 14, 2022

The body of the design guidelines has very minimal content changes but is a substantial re-write to better organize the information and remove information that is duplicated in the access control or aluminum storefront DG sections.

The most substantial change is the addition of appendix A, which is a lock/exit device selection guide. Appendix B, the closer selection guide has also been discussed.

Preferred Manufacturers Lists

Electrical PML 8.4 – January 12, 2022

Changes:

Section 26110 Unit Substations

- For 15kV Metal Clad Switchgear, deleted Square D and added Park.
- For Substation Assemblers, deleted Siemens and added Park and Powell Industries.

Section 263300 Battery Equipment

- For Batteries, deleted C&D Technologies

Section 265100 Interior Lighting

- Updated the Gasser Bush contact info

Revised Committee Chairs – January 6, 2022

Revisions include:

Marwan Houry removed from Architectural Technical Committee – Co-Chairs. Jana Hayford is now the sole Chair for this Committee.

Sustainability

Design Guideline 3.1 Sustainable Design and LEED Requirements – January 12, 2022

Updated to reflect the approved requirement LEED Silver mandate (as is indicated on the AEC website).

December 2021

Technical Sections

DG220010 Plumbing Specialties – December 15, 2021

Changes:

Added additional Scope.

Added additional Related Sections.

Revised detail names to current convention.

Added Reference Document.

Added General Material Requirements.

Revised Backflow Prevention.

Added Domestic Hot Water Metering.

Added Trap Seals.

Revised Emergency Eyewashes and Showers.

Added Emergency Fixture Application Schedule.

Added Emergency Fixture Thumbnail pictures (For Reference Only)

Added Garbage Disposal restrictions (and rationale)

Preferred Manufacturers Lists

Revised Committee Chairs – December 7, 2021

Revisions include:

Peg Helner-Peterson removed and Marwan Houry added to Architectural Technical Committee – Co-Chairs

For items 2, 3, and 4 (the three Mechanical Committees), the individuals listed are now both listed as Co-Chairs rather than Chair and Back-up.

DG 8.0 – PML Request Form – December 2, 2021

Revisions include:

- Ask that form be addressed to Committee Chair or Co-Chairs
- Added note 3 that requester should submit marked up U-M applicable master specification section documenting compliance of product.

November 2021

Sustainability

DG 3.2 Energy and Water Conservation – November 17, 2021

Updated to correct a reference to an outdated DG number.

Standard Schedules and Details

Master Detail 233660 020 Radiant Panel Piping Ceiling Mounted – November 15, 2021

Changes include:

- Minor Note changes
- Added Flex Connections at the Panel

These changes were approved by the Steam and Hydraulic Mech Tech Team.

Technical Sections

Design Guideline 321723 Pavement Markings – Posted November 10, 2021

A new design guideline that puts in writing what the Civil group, in particular, has been practicing most recently on campus and pertains to temporary and permanent pavement markings in roads, surface parking lots, and parking structures. The guideline denotes conformance to MDOT standard specifications, Michigan Manual on Uniform Traffic Control Devices (MMUTCD), and Master Painters Institute (MPI) Architectural Painting Specification Manual. The direction in the guideline takes into consideration industry norms in Ann Arbor, Metro Region, and the State of Michigan and also available materials and equipment of contractors who do pavement marking work. Implementation of the guideline is not expected to increase costs to the University. The Civil group will continue to monitor any changes in the industry and will update the guideline accordingly.

Special Building Areas

Special Building Areas 5.9 Tunnels – Posted November 10, 2021

Here is summary of changes:

- Revised Related Specification Sections.
- Defined Tunnel/Building Utility Ownership Delineation Points.
- Updated Utility distribution systems design pressures and temperatures.
- Revised PRV (pressure reducing valve) design requirements.
- Revised CRU (condensate return unit) design requirements.
- Added Utility metering design requirements.
- Revised discharge location of tunnel sump pumps.

October 2021

Preferred Manufacturers Lists

8.3 Mechanical PML – October 20, 2021

Revisions are to Section 230000 – Terminal Units and include:

- Manufacturer Vulcan Radiator added for Panel Radiators, Convectors, Unit Heaters, and Cabinet Unit Heaters
- Manufacturer Markel added for Electric Cabinet Heaters, Electric Unit Heaters, and Electric Heating Coils

These manufacturer additions were approved at the HVAC Mech Tech Team 10-06-21 meeting.

8.4 Electrical PML – October 1, 2021

The revisions include:

- Section 262726 Wiring Devices – Under Low Voltage, Stand-Alone Room Lighting Control Systems, the Hubbell NXRC Series has been added as an equivalent manufacturer.
- Section 281600 Security Systems – the hyperlink to the DPSS security camera website has been repaired.

Master Specifications

MS Division 01 – October 1, 2021

Section *017823 Operation and Maintenance Manuals* updated to eliminate the requirement for paper O&Ms and require electronic (PDF) O&Ms.

MS 262726 Wiring Devices – October 1, 2021

The revisions include:

- Specification 262726 Wiring Devices, Section 2.2 – added the Hubbell NXRC Series as an equivalent to Low Voltage, Stand-Alone Room Lighting Control Systems.

September 2021

Codes and Regulatory Agencies – September 30, 2021

Changes include:

Updating jurisdiction on Building Code, Rehab Code, Residential Code, Mechanical Code, Plumbing Code, and Electrical Code to include EHS.

University of Michigan Environment, Health & Safety Department (EHS) and Architecture, Engineering and Construction (AEC)

Adoption of the State of Michigan 2018 Plumbing Code effective Sept 15, 2021 with local rules.

Additional local rules added below:

403.1.2 Single-user toilet and bathing room fixtures. The plumbing fixtures located in single-user toilet and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the Michigan Building Code, shall contribute toward the total

number of required plumbing fixtures for a building or tenant space. Single-user toilet and bathing rooms, and family or assisted-use toilet rooms and bathing rooms shall be identified as being available for use by all persons regardless of their sex. The total number of fixtures shall be permitted to be based on the required number of separate facilities or based on the aggregate of any combination of single-user or separate facilities.

403.2 Separate facilities.

Where plumbing fixtures are required, separate facilities shall be provided for each sex.

Exceptions:

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile occupancies in which the maximum occupant load is 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.
5. Separate facilities shall not be required to be designated by sex where single-user toilet rooms are provided in accordance with Section 403.1.2. If more than one are required by plumbing calculations provide distribution of men, women and gender inclusive so restrooms are available within 500 feet of travel and traversing no more than one floor.
6. Separate facilities shall not be required where rooms having both water closets and lavatory fixtures are designed for the use by both sexes and privacy for water closets is provided in accordance with Section 405.3.4. Urinals shall be located in an area visually separated from the remainder of the facility or each urinal that is provided is located in a stall. Provide distribution of men, women, and gender inclusive so separate restrooms are available within 500 feet of travel and traversing no more than one floor.

Change all references to the Michigan Department of Environmental Quality (MDEQ) to the Michigan Department of Environment, Great Lakes, and Energy (EGLE).

State of Michigan Underground Storage Tanks (UST) removed the word *ground* after underground and before the word storage.

Updated phone number: Replace EHS/EP3 contact phone # 734 936-1920, with 734 647-1143.

Pages 15-25.

Buildings added to Instructional Space:

5439 DANCE BUILDING

0198 DETROIT OBSERVATORY ADDITION*

0396 DUDERSTADT JAMES AND ANNE CENTER (2 & 3)*

5418 FORD MOTOR COMPANY ROBOTICS BUILDING

Buildings added to outpatient Surgery :

5239 BRIGHTON CENTER FOR SPECIALTY CENTER

Buildings Removed from listing:

8096 LIVONIA CENTER FOR SPECIALTY CENTER

Project Procedures

2.8 Project Manual – September 9, 2021

Minor changes to wording (changed the term “shall” to “will”) and the revision date of the Standard General Condition’s to 8/21.

Sustainability

3.1 Sustainable Design and LEED Requirements – September 2, 2021

Changes include:

DG requires Sustainability Summaries at the start of SD phase.

DG requires Sustainability Summaries for projects with a Construction Cost of over \$10M.

Visual Displays are required at the completion of CD phase and updated at project completion

Minor updates to LEED Registration Document

Master Specifications

MS220719 Mechanical Systems Insulation – September 2, 2021

Changes:

1.2.E.3 – added exception: 12” of chilled beam piping at pipe condensate sensors.

MS224200 Plumbing Fixtures – September 2, 2021

Changes:

2.3 B 5 – Added an approved manufacturer

2.4 C – Added an approved manufacturer

2.37 C 11 – Added an approved manufacturer

2.38 – Renumbered and added 3 new fixtures

MS221319 Drainage Specialties – September 2, 2021

Changes:

- 2.1.A – Added an approved manufacturer.
- 2.2.C – Added an approved manufacturer.
- 2.2.D – Added an approved manufacturer.
- 2.2.E – Added an approved manufacturer.
- 2.3.C – Added an approved manufacturer.
- 2.5.F – Added Trap Seal.
- 2.5.G – Added Air Admittance Valve.
- 3.2.A – Removed hidden note.

MS220523 Valves – September 1, 2021

Changes:

- 1.1B – Added Related sections.
- 1.2.A.9 – Added reference to Section 336300.
- 1.4 – Added Delivery Storage & Handling.
- 2.1 F – Removed utility tunnel spec, added reference to Section 336300 .
- 2.2.D – Moved chain wheel operator installation to Part 3.
- 2.2..J – Removed grooved connections.
- 2.3 B – Removed Grinnell.
- 2.5.B – Added Anvil (Manufacturer for Gruvlock)
- 2.7.B – Removed Utility Tunnel Gate (now in 330336).
- 2.8.B – Added Min. Pressure 200# WOG.
- 2.9.B – Added Min. Pressure 200# WOG.
- 2.9.C.3 – Removed Utility Tunnel Check Valve (now in 330336).
- 2.10.B – Removed Utility Tunnel Drain Valve (now in 330336).
- 2,11,B – Removed obsolete model name.
- 3.1 – Added Examination
- 3.2.B – Relocated chain wheel operator installation
- 3.4 – Removed steam condensate & domestic hot water installation (now in 330336).

Design Guidelines

DG220523 Valves – September 1, 2021

Changes:

Added/Updated Related Sections

Added statement to refer to Section 336330 for steam and condensate valves used in the tunnel system.

Added statement to refer to Section 211313 for valves used in fire protection system.

August 2021

Master Specifications

[MS028213 Asbestos Remediation](#) – August 24, 2021

[MS028214 Asbestos Remediation – Floor Tile and Mastic](#) – August 24, 2021

[MS028215 Asbestos Remediation – Roofing Material](#) – August 24, 2021

Modifications:

Updated the list of pre-qualified abatement firms as follows:

Removed

21st Century Salvage, Inc.

Adamo Demolition Company

Advanced Industrial Services, LLC

Asbestos Abatement, Inc.

Bierlein Companies, Inc.

Environmental Assurance Company, Inc.

North American Dismantling Corp

Special Building Areas

[5.5 Custodial Support Space and Infrastructure](#) – July 22, 2021 (Approved November 2020)

Significant updates and revisions in coordination with our Custodial Services Group

Technical Sections

DG 101400 Signage – July 19, 2021

Appendix A was updated for new 6" icon for gender inclusive. Per plumbing code the icon needs to be 6" high.

Project Procedures

DG 2.1 Owner's Project Requirements and Basis of Design Documents – July 12, 2021

DG 2.1 has been revised as follows:

- DG requires Room Data Sheets to be updated in its entirety through DD phase while select sections are to be updated through As-Builts.
- Room Data Sheet template has been updated to indicate what areas are to be updated beyond the DD phase.

Master Specifications

MS237323 Custom Air Handling Units – July 1, 2021

- Johnson Controls Inc/York – York Custom was added to the list of acceptable manufacturers
- Fiberglass reinforced nylon was added as an acceptable material for door hinges and hardware
- Amp draw, HP, and RPM readings measured at each motor at scheduled design operating conditions was added to factory test requirements

MS237324 Semi-custom Air Handling Units – July 1, 2021

- Johnson Controls Inc/York – Solution XTI (Indoor), Solution XTO (Outdoor) was added to the list of acceptable manufacturers
- Fiberglass reinforced nylon was added as an acceptable material for door hinges and hardware

June 2021

Master Specifications

MS230900 Mechanical Systems Controls – June 17, 2021

MS230901 Mechanical Systems Controls TURNKEY

MS230910 VAV Combo Sash Lab Controls-DDC

Revised to include Change of Value requirements for data sharing. The COVs match those recently included in the revised 230905 Hospital Mechanical Systems Controls master spec.

230901 "Turnkey" now includes a response time requirement for warranty issues.

MS235716 Steam-To-Water Heat Exchangers – June 10, 2021

Gasket material was updated.

May 2021

Preferred Manufacturers Lists

8.4 Electrical Preferred Manufacturers List – May 24, 2021

- Under Section 283100, added i2G Systems as a qualified installer.

Master Specifications

281300 Access Control & Monitoring System – May 24, 2021

- Paragraph 1.4.B – Added i2G Systems as a qualified installer.

230905 Mechanical Systems Controls (Hospital Projects) – May 17, 20121

- Added Change of Value (COV) requirements for DDC controllers
- Modified control damper requirements

April 2021

Master Specifications

MS336330 Utility Tunnels – Steam & Condensate Distribution Systems – April 2, 2021

New

March 2021

Special Building Areas

SBA 5.6 Parking Structures – Update December 2020, Posted March 31, 2021

Complete rewrite. Revised outdated/obsolete codes and standards. Also energy efficient items such as LED lighting, occupancy sensors, etc. were added so it should reduce energy usage and cost.

Project Procedures

DG 2.2 Design Deliverables – March 17, 2021

Note all revised cells are highlighted yellow so we can easily indicate revisions.

1. Relocated Sustainability requirements from various sections and compiled into the LEED and Sustainability category.
2. Added line k Natural features to the Proposed Preliminary Site Plan sheets
3. Added requirement for a specification Appendix that shall be an inclusive list of testing requirements included within specifications. This is intended to assist during the construction phase so the owner and contractor have a combined list of the testing requirements.

Sustainability

Design Guideline DG 3.1 Sustainable Design – March 16, 2021

Revised as follows:

- DG requires all new construction and addition projects over \$10M Construction Cost to achieve a minimum of LEED Silver certification.
- This replaces the previous language that indicated projects would determine LEED certification requirements on a project-by-project basis.

Codes and Regulatory Agencies – March 3, 2021

Livonia Surgery Center has been removed from the outpatient surgery building list and Brighton Surgery Center has been added (page 28).

February 2021

Standard Details and Schedules

New – February 16, 2021

MD 230900 005 Vivarium Non-Holding Room Control Drawing: A new standard control drawing for general vivarium non-holding rooms.

MD 230900 006 Vivarium Surgery Room Control Drawing: A new standard control drawing for vivarium surgery rooms.

MD 230900 007 Vivarium Cage Wash Room Control Drawing: A new standard control drawing for vivarium cage wash rooms.

Project Procedures

DG 2.2 Design Deliverables and DG 2.2.1 Pre-Design Deliverables – February 10, 2021

Corrections to links and minor text updates.

Master Specifications

MS263353 Static Uninterruptible Power Supply – February 2, 2021

The revision adds Eaton as an acceptable manufacturer.

January 2021

Standard Details and Schedules

MD 233660 020 Typical Chilled Beam Piping Diagram – January 21, 2020

New

Special Instructions to Designers

DG 4.7 Building Access Control – January 12, 2021

Major changes include:

Adds interconnected locking systems definition and required evaluation.

Minor other edits to bring the section up to date (abbreviations, terminology, existing system and panel requirements).

Master Specifications

MS220519 Thermometers and Pressure Gauges – January 25, 2021

Added requirement for a pressure gauge across strainers 2.5" and larger, per the Steam and Hydronics MTT.

MS221113 Piping Materials and Methods – January 25, 2021

Strainer requirements were revised.

MS220514 Variable Frequency Drives – January 12, 2021

Revised Part 2.2 Control features, Paragraph 1, to make factory mounted and wired Hand-Off-Auto selector switch for all drives and not just drives required to be equipped with a bypass. Note that the revisions take the spec section back to a previous version, prior to an initiative to reduce the amount of customization needed for the VFDs.

December 2020

Standard Details and Schedules

MD 233660 008 Up-Feed Hot Water Fin-Tube Piping – December 9, 2020

MD 233660 012 Down-Feed Hot Water Fin-Tube Piping – December 9, 2020

New

Master Specifications

220533 Heat Tracing for Piping – December 9, 2020

We have added Nelson Heat Trace as a Preferred Manufacturer.

283100 Access Control and Monitoring System – December 4, 2020

- Adds product information for the lockdown button
- Adds editor notes regarding DSM and RTE
- Updates terminology to match current standards
- Removes local power supply information for EL-exit devices (replaced by QEL which do not require local power supply)

November 2020

Master Specifications

MS237323 Custom Air Handling Units – November 6, 2020

– Revised Part 2.8, D, to add Paragraph 6. Amp draw, HP, and RPM readings shall be measured for each motor at scheduled design operating conditions.

Technical Sections

230900 Mechanical Systems Control – November 6, 2020

Summary of Changes: Updated to explain changes to the recently revised master spec 230900, added requirements for Sequences of Operation, require instruments to have a unique tag number, explain laboratory controls covered by MS 230900, require use of U-M control symbols, explain MS 230901, red/blue box, data acquisition panels, transition from LPIs to HMIs, that central campus field level network is MS/TP, and misc. other updates.

October 2020

Preferred Manufacturer's Lists

Electrical PML – October 28, 2020

The revisions include:

- Pages 2-13 – numerous manufacturer name revisions. A number of companies have been sold, acquired, rebranded. I did not add any new entities. I deleted a few entities that either no longer exist or were entirely absorbed/rebranded by another company.
- Page 13 – Per previous internal discussions, I have added a new ERRC sub-heading titled “Bi-Directional Amplifiers”. I’ve added ADRF, CommScope, and Westell.

Standard Details and Schedules

MD 230900 001 Differential Pressure Transmitter Installation Detail – October 28, 2020

Pressure gauges have been added for high and low pressure lines, instead of one gauge for both lines, 3/8” flare fittings have been added directly before the H/L the differential pressure transmitter ports, and language has been altered slightly.

MD 230900 002 DDC Panel Assembly – October 15, 2020

HMI added to auxiliary panel, “Mechanical Systems Control Contractor” to furnish and install that which was once furnished by the “Temperature Controls Contractor,” dedicated electrical wiring changed to dashed lines, the following text describing the DDC panel was removed: “TCC pulls wires to DDC panel” & “U-M terminates in DDC panel,” the following text was added to describe the LPI panel “(when used),” The Electrical Contractor’s role was removed from the detail.

Codes and Regulatory Agencies – October 15, 2020

Updated 2014 date to 2017 error in document.

The following regulations take precedence over conflicting requirements in the Michigan Building Code:

State of Michigan Electrical Code incorporating “NFPA 70 –National Electrical Code”, 2017 edition with University of Michigan modifications.

September 2020

Sustainability

DG 3.2 Energy and Water Conservation and DG 3.2.3 Energy Impact Statement – September 28, 2020

The documents have been revised as follows:

- Energy Impact Statement required for projects with a construction cost over \$2M (in lieu for being required only for projects over \$10M).
- Units within DG 3.2.3 have been corrected
- Unit definitions have been added to DG 3.2.3.

Technical Sections

334443 Vortex-Type Hydrodynamic Separators – September 24, 2020

New – DG334443 pertains to designing and specifying vortex-type hydrodynamic separators for storm water treatment. Vortex-type hydrodynamic separators are most suitable for use as a treatment device in constrained storm water retrofit or ultra-urban settings and in areas with a high potential for spills, provided the specified unit is capable of capturing and containing floatable materials, such as oils and fuel. Note that these units are not intended for regulatory secondary containment, but rather, capturing contaminants in runoff from incidental small spills and drips.

Master Specifications

MS237213 Rotary Air to Air Energy Recovery Wheels – September 24, 2020

Revised notes to spec editor for Part 2.2, B, Paragraph 5, regarding purge cycle to include all applicable AHU fans be oversized to accommodate and that for high risk applications such as hospital and lab general exhaust a purge angle should be set.

MS 230900 Mechanical Systems Controls – September 21, 2020

Major update by Controls Ad Hoc team, too extensive to describe all changes. Highlights: Contractor will now do all wiring terminations including inside the DDC panel. DDC shop will now do lab controller programming. Flat panel display replaces LPDs (most cases). Improved network design requirements. Controller specifications categorized by BACnet definitions and fully described. Lab DPT spec.s added. Fontanesi and Kann added as approved controls contractor. Improved various instrument spec.s. Limited floating point actuators to VAV box reheat coils and VAV RH w/fin tube. Permit ball valves for control valves 3/4" or less (expanding use of ball valves). Improved wiring and training requirements. VAV box 24VAC power and FLN wiring allowed in the same conduit. Added tuning requirements. Rearranged spec. to make things easier to find.

MS 230901 Mechanical Systems Controls TURNKEY – September 21, 2020

This is a new master specification for "turnkey" controls. It is a duplicate on 230900 except the contractor's work scope is expanded to perform all control work, except for some limited parts which would still be performed by UM DDC. It is designed to allow an Alternate "turnkey" bid to be obtained, and incorporates "lessons learned" from recent turnkey projects. It should only be used with an understanding of its contents and after careful consideration by the project team.

NEW specifications to the AEC web site, 7.3 Electrical: – September 15, 2020

263323 Central Battery Inverters – this specification was developed by an ad hoc committee with representatives from AE, Cx, FM, and Michigan Medicine. These systems are generally intended as an emergency lighting power source. It is an alternative to emergency generator or individual battery strategies.

263353 Static UPS – this specification was developed by an ad hoc committee with representatives from AE, Cx, FM, and Michigan Medicine. These systems are generally intended as battery back-up for non life safety equipment.

Standard Details and Schedules

MD 230900 003 Mechanical Control Symbols – September 2, 2020

The changes are as follows:

Terminal Air Units have been removed

Added Airflow Station symbol

Added Condensate Sensor symbol

Acronyms have been added for the following:

ATTD – Airflow Transmitter Thermal Dispersion

RTC – Room Temperature Controller

RTC-F – Room Temperature Controller Fan

CS – Condensate Sensor

F.I.P. – Fail In Place

N.O. – Normally Open

N.C. – Normally Closed

MD 230900 004 Mechanical Controls Blocks – September 2, 2020

A new standard detail for mechanical controls blocks including Chilled Beams (CB), Cabinet Unit Heaters (CUH), Fan Coil Units (FCU), Terminal Air Units (TAU), and Unit Heaters (UH).

August 2020

Master Specifications

MS 230900 Mechanical Systems Controls – September 21, 2020

Major update by Controls Ad Hoc team, too extensive to describe all changes. Highlights:

Contractor will now do all wiring terminations including inside the DDC panel. DDC shop will now do lab controller programming. Flat panel display replaces LPis (most cases). Improved network design requirements. Controller specifications categorized by BACnet definitions and fully described. Lab DPT spec.s added. Fontanesi and Kann added as approved controls contractor. Improved various instrument spec.s. Limited floating point actuators to VAV box reheat coils and VAV RH w/fin tube. Permit ball valves for control valves 3/4" or less (expanding use of ball valves). Improved wiring and training requirements. VAV box 24VAC power and FLN wiring allowed in the same conduit. Added tuning requirements. Rearranged spec. to make things easier to find.

MS 230901 Mechanical Systems Controls TURNKEY– September 21, 2020

This is a new master specification for "turnkey" controls. It is a duplicate on 230900 except the contractor's work scope is expanded to perform all control work, except for some limited parts which would still be performed by UM DDC. It is designed to allow an Alternate "turnkey" bid to be obtained, and incorporates "lessons learned" from recent turnkey projects. It should only be used with an understanding of its contents and after careful consideration by the project team.

230905 MECHANICAL SYSTEMS CONTROLS (HOSPITAL PROJECTS) – August 27, 2020

Changes include deleting Honeywell as an acceptable mechanical system controls contractor and updating the BACnet controller performance table.

MS237323 Custom Air Handling Units – August 12, 2020

- Manufacturer changed name from Governair to Nortek Air Solutions – Governair Division
- Manufacturer changed name from Ventrol to Nortek Air Solutions – Ventrol Division

MS237324 Semi-custom Air Handling Units – August 12, 2020

- Manufacturer changed name from Governair to Nortek Air Solutions – Governair Division
- Manufacturer changed name from Ventrol to Nortek Air Solutions – Ventrol Division
- Manufacturer changed name from McQuay to Daikin Applied

MS238220 Horizontal Fan Coil Units – August 12, 2020

- Manufacturer changed name from McQuay to Daikin Applied

MS238221 Blower Coil Units – August 12, 2020

- Manufacturer changed name from McQuay to Daikin Applied

MS238216 Coils and Drain Pans – August 12, 2020

- Manufacturer changed name from McQuay to Daikin Applied
- Removed depressed in floor drain pan option

Standard Details and Schedules

26200002 Step Down Transformer Wiring Diagram – August 21, 2020

The revision includes the elimination of the second bonding point at the neutral bar in the panelboard. This is to show a code compliant single bonding point.

Electrical Details – August 7, 2020

In November 2019, an ad hoc electrical committee, composed of various delegates across FO and Michigan Medicine FPD, completed and issued a revised Specification 262726 Wiring Devices. The revisions included new 0-10V Low Voltage Lighting Control specifications, to ensure that newly installed lighting controls were compliant with the latest building and energy codes.

As a supplement to the November 2019 specifications, details enumerated 26272601 through 26272607 with PDF, DWG, and DGN versions of each have been posted. Each detail gives guidance to a common 0-10V lighting control scenario. Although the details are wide-ranging, they are intended to be modified to be project specific.

In addition, it was noticed that existing detail “26272603 Ceiling Mounted Receptacle Detail” as posted on the AEC website was out-of-date and was removed.

July 2020

Special Building Areas

5.8 Personal Rooms – July 21, 2020

Summary of changes as follows:

- Link to Michigan Medicine section

- Link to Signage DG which contains standard lactation pictogram
- Added requirements for finishes, wifi coverage, signage, and temperature control.
- Added desirable features: acoustic separation, electronic room scheduling unit
- Clarified ADA requirements

Master Specifications

230593 – Testing, Adjusting and Balancing (TAB) – July 21, 2020

Added Aerodynamics Inspecting Co. as approved TAB Contractor.

264313 Surge Protection for Low-Voltage Electrical Power Circuits – July 17, 2020

New. Although general University appetite for surge protection devices is low at this time, these devices are code-required in certain instances, such as life safety power distribution. This specification will allow designers and builders to more readily understand UM preferences for these devices, creating consistency and minimizing maintenance nuisance. An ad hoc committee with representation from AEC, EHS, and Michigan Medicine FPD developed and approved this specification.

Technical Sections

DG 017329 Roofing Materials Cutting and Patching – July 15, 2020

Changed OSEH to EHS and updated footer.

DG 099100 Low-Emitting Paint and Coating Products – Removed July 15, 2020

The basis of this DG was before the prominence of low emitting paint and coating products. This information is now covered sufficiently by LEED and industry standard and is no longer needed in our design guidelines.

Special Instructions to Designers

4.6 Utilities for University Buildings – July 1, 2020

Revised the available pressure of low pressure steam to a range due to the CPP recently increasing the steam pressure to the tunnel system. Removed compressed air dew point, revised DHW temperature to 125 deg. F per CPP. Revised May 2020, posted July 1, 2020.

June 2020

Technical Sections

DG 075000 Roofing Systems and Accessories – June 25, 2020

A few minor tweaks were made and a roof detail that was no longer applicable was removed.

DG220719 Mechanical Insulation – June 22, 2020

A complete re-write. There were a number of requirements in the Design Guideline that should have been in the Master Specification. We moved those into the MS 220719 – MECHANICAL SYSTEMS INSULATION. The Design Guideline now requires outside Architect/Engineers to use the U-M Masterspec. Revised March 2019, Posted June 2020.

Master Specifications

Architectural Specifications – June 3, 2020

The following sections have been removed. They are no longer internally maintained.

042000 UNIT MASONRY (full section)
051200 STRUCTURAL STEEL FRAMING
055800 FORMED-METAL FABRICATIONS
083313 COILING COUNTER DOORS
084413 GLAZED ALUMINUM CURTAIN WALLS
085113 ALUMINUM WINDOWS
088000 GLAZING (exterior)
092300 GYPSUM PLASTERING
093033 STONE TILING
096466 WOOD ATHLETIC FLOORING
096723 RESINOUS FLOORING
098433 SOUND ABSORBING WALL UNITS
099110 ELECTROSTATICALLY APPLIED COATING
099310 WOOD FLOOR FINISH
101400 Signage
102213 Wire Mesh Partitions
102239 Folding Panel Partitions
105113 Metal Lockers
115213 Projection Screens
115300 Laboratory Equipment
124600 Furnishing Accessories
124813 Entrance Floor mats and Frames

May 2020

Technical Sections

013639 Tree Preservation – May 28, 2020

Updated University Forester to Campus Forester and removed a link to another design guideline within the text. Added link to Temporary Tree and Plant Protection in division one of the master specification.

Special Building Areas

SBA 5.10 Gender Inclusive Rooms – May 7, 2020

Removed the pages of signage from 5.10 Gender Inclusive Rooms. The correct signage is in DG 101400 Signage and SBA 5.10 Gender Inclusive Rooms references DG 101400 Signage.

Standard Details and Schedules

A new standard detail for mechanical controls symbols.

April 2020

Codes and Regulatory Agencies – April 6, 2020

Significant Changes are as follows:

Michigan Building Code 2015 added definition for Higher Educational Laboratories and Section 428 Higher Educational Laboratories requirements with related table.

Updated from 2007 to 2018 The Health Facilities Engineering Section (HFES) Facility Guidelines Institute (FGI) 2018 edition of Guidelines for Design & Construction of Hospitals; Outpatient Facilities; and Residential Health Care and Support Facilities in Michigan. Including all the included referenced codes and standards as listed within these rules, including but not limited to NFPA 99, NFPA 101, and other NFPA and ASHRAE standards.

March 2020

Master Specifications

Specification 262726 Wiring Devices – March 27,2020

The Interdepartmental Electrical Team discussed and approved the following revision on March 11:

Paragraph 2.3.A – revised Pass & Seymour 5362A to Pass & Seymour 5362.

Preferred Manufacturers Lists

Electrical Preferred Manufacturers List – March 26, 2020

The Interdepartmental Electrical Team approved the following revisions:

Section 260533 – Electrical Materials and Methods – Structural Support Materials: G-Strut has been added as an approved manufacturer.

Section 273523 – Emergency Responder Radio Coverage: RF Connect was added as an approved service provider.

Codes and Regulatory Agencies – March 2, 2020

Michigan Building Code 2015 Chapter 35 Referenced Standards ICC Standard Reference Number ICC A117.1 – 2017 Standard for Accessible and Usable Buildings and Facilities – Effective March 1, 2020 adopted 2017 version in lieu of 2009.

Michigan Residential Code 2015 Chapter 44 Referenced Standards ICC Standard Reference Number ICC/ANSI A117.1 – 2017 Standard for Accessible and Usable Buildings and Facilities – Effective March 1, 2020 adopted 2017 version in lieu of 2009.

University of Michigan Buildings That Contain Instruction Space changed 5128 from a compartment to entire building being BFS.

5128 DB FAIRLANE CENTER – NORTH

February 2020

Standard Details and Schedules

City of Ann Arbor Utility Material Requirements (note that U-M material requirements meet or exceed City requirements) – February 25, 2020

Purpose: New web link added with City of Ann Arbor utility material requirements for water, sewer/drainage, and Aggregates/backfill material.

Project Procedures

2.2 Design Deliverables, 2.2.1 Pre-Design Deliverables, 2.4 Document Standards And Procedures For Project Deliverables –February 14,2020

Pre Design Deliverables and Design Deliverables have many modifications, each change has been highlighted in yellow. A majority of the changes are site and utility related.

Master Specifications

MS220514 Variable Frequency Drives – February 21, 2020

Reformatted Part 2 content for better clarity.

Removed repetitive language.

Modified VFD control option requirements.

MS281300 Access Control & Monitoring System – February 7, 2020

- 1.4.B.3 – Revised “SimplexGrinnell” to “JCI”. Simplex was acquired by Johnson Controls.
- 2.1.A.1 and 3.3.A – Revised “Software House C-Cure 800” to “Software House C-Cure 9000”. 9000 is the current version of our access control database.

Technical Sections

DG 102800 Toilet Accessories – February 13, 2020

Changes include updates to Toilet accessories.

Images include the new layout for toilet paper dispensers (code required) that are currently being installed.

Full length mirrors and hooks for backpacks have been added based on student requests.

Emergency Responder Radio Coverage – 6.3 DG 273523 – February 3, 2020

- Clarified requirements for renovation projects.
- Clarified requirements for system survivability.

- Added registration requirements.
- Added requirement for UL listing.
- Added restriction for combining system with cell phone signal reinforcement systems.
- Added system requirements for channelized amplifiers.
- Clarified requirements and acceptable cable types for serving individual antennas and donor antennas.
- Clarified fire alarm supervisory signal requirements.
- Updated specification requirements.
- Updated testing requirements.

January 2020

Master Specifications

MS238219 Floor Mounted Fan Coil Units (Un-Ducted) – January 23, 2020

– Removed Rittling (No longer manufacturing fan coils)

MS238220 Horizontal Fan Coil Units – January 23, 2020

– Removed Zehnder Rittling (No longer manufacturing fan coils)

MS238413 Steam Humidifiers – January 23, 2020

– Manufacturer changed name from Nortec to Condair

December 2019

Preferred Manufacturers Lists

Design Guideline 8.4 – Electrical Preferred Manufacturers List – December 9, 2019

Minor revisions include:

- 260513 Type MC Cables (600 Volts) – Added Northern Cable Incorporated as an approved equivalent (by the Interdepartmental Electrical Team)
- 273523 Emergency Responder Radio Coverage – Deleted Advance Wireless Telecommunications (out-of-business)

Standard Schedules and Details

MD 236500 004 Cooling Tower Schematic – New – December 19, 2019

MD 232513 002 Closed System Makeup – December 5, 2019

Replaced as incorrect detail was posted.

November 2019

Codes and Regulatory Agency Design Guideline – November 26, 2019

Modifications to the Codes and Regulatory Agency Design Guideline are as follows:

Michigan Building Code:

- Added Chapter 11 Section 1105 article 1105.1: Accessible Public Exterior Entrances.
All public exterior entrances provided in accordance with code must have at least one entrance door complying with Section 404.3 (Automatic and Power-

Assisted Doors and Gates) of the ABAAS. Where an accessible public entrance has a vestibule with exterior and interior entrance doors, at least one exterior door and one interior door must comply with Section 404.3

Michigan Rehabilitation Code:

- Added Chapter 7 Section 705 Article 705.2: When exterior accessible entrances are altered by level 1 or higher alterations/renovations where not already existing provide at that public entrance at least one entrance door complying with Section 404.3 (Automatic and Power-Assisted Doors and Gates) of the ABAAS. Where an accessible public entrance has a vestibule with exterior and interior entrance doors, at least one exterior door and one interior door must comply with Section 404.3

List of Building that Contain Instructional Space:

- Removed 0101 – KRESGE HEARING RESEARCH
- Removed 0138 – COMPUTER & EXECUTIVE EDUCATION BUILDING
- Changed 0188 – LITTLE, CLARENCE COOK SCIENCE BUILDING to 1100 NORTH UNIVERSITY BUILDING
- Added (FA/FS only) to 0193 – RUTHVEN, ALEXANDER G MUSEUMS BUILDING
- Removed 0196 – NORTH HALL
- Changed 0333 – SCHOOL OF NURSING BUILDING to 400 NORTH INGALLS BUILDING
- Changed 0441 – SPACE RESEARCH LABORATORY to CLIMATE AND SPACE RESEARCH BUILDING
- Changed 0897 – PUBLIC POLICY ANNEX to HEALTH MANAGEMENT RESEARCH
- Changed 5235 – SOUTH HALL to JEFFRIES HALL
- Added 5451 – CENTRAL CAMPUS CLASSROOM BUILDING

Master Specifications

Section 262726 – WIRING DEVICES – November 18, 2019

- 1.3 – added lighting control sequence of operations as a submittal requirement.
- 2.1 – reorganized line voltage lighting controls under one subsection, moving 120/277V Light Switches, Dimmers, and Occupancy Sensors to this subsection.
- 2.2 – created a new subsection titled “Low Voltage, Stand-Alone Room Lighting Control Systems” and added subsequent 0-10 volt devices such as room controllers, switches, sensors.
- 3.1.M – updated occupancy sensor settings, to correspond with ASHRAE 90.1-2013 energy code.

Note – the “Low Voltage, Stand-Alone Lighting Control Systems” specification update is the second of three updates, with the PML update having already been completed. A subsequent Design Guideline update is anticipated in the next few months. These updates originate from a special UM Lighting Controls Committee, which has been defining system parameters and making product evaluations since September 2018. The UM Lighting Controls Committee was a collaboration of AEC, Facilities Maintenance, FPD, OCS, DDC Shop, and others.

235716 Steam-To-Water Heat Exchangers – November 13, 2019

We have added Thrush Steam to Water HX as a Preferred Manufacturer.

Standard Details and Schedules

MD 235716 001 Stm to Water HX Critical – November 13, 2019

A valve was removed on the discharged side of the pumps that was not needed.

MD235716 002 Stm to Water HX Non-Critical – November 13, 2019

Relocated isolation valve on Steam Control Valve Station so that each pair of control valves can be separately isolated.

October 2019

Project Procedures

DG 2.4 Document Standards – October 17, 2019

Updated DWG and DGN files linked on first page to indicate “Exit Discharge ” in lieu is just “Exit” on the graphic legend.

Technical Design Guidelines

101400 Signage – October 1, 2019

Updated restroom/locker room signage graphics.

September 2019

Preferred Manufacturers Lists

Electrical PML – September 25, 2019

Revisions include:

- Section 262726 – WIRING DEVICES
 - Created a new subsection titled “Line Voltage Lighting Controls” and moved 120/277V Light Switches, Dimmers, and Occupancy Sensors to this subsection.
 - Created a new subsection titled “Low Voltage, Stand-Alone Room Lighting Control Systems” and added subsequent narrative and approved manufacturers.

- Section 260513 – MEDIUM, LOW & CONTROL VOLTAGE CABLES
 - Added CME Wire and Cable as an approved manufacturer. The Interdepartmental Electrical Team had previously approved this manufacturer as ABC Wire, but we failed to update the PML in a timely fashion. CME Wire and Cable recently acquired ABC Wire and renamed. The previously approved product is the same.

Note – the “Low Voltage, Stand-Alone Lighting Control Systems” PML update is the first of three updates. Subsequent Design Guideline and Specification updates are anticipated in the next few months. These updates originate from a special UM Lighting Controls Committee, which has been defining system parameters and making product evaluations since September 2018. The UM Lighting Controls Committee was a collaboration of AEC, Facilities Maintenance, FPD, OCS, DDC Shop, and others.

Sustainability

3.1 Sustainable Design and 3.2 Energy and Water Conservation – September 5, 2019

Revised to indicate that AEC requirements are in line with the U-M Sustainability goals and carbon neutrality initiative.

Master Specifications

MS224200 Plumbing Fixtures – September 4, 2019

Updated Manufacturers and Model Numbers.

Added additional requirements and fixtures for Michigan Medicine Hospital/Healthcare.

August 2019

Design Guidelines

DG230050 Chilled Water Systems – August 7, 2019

Changes: The Hydronics MTT clarified cooling tower heat trace and header clean-out requirements.

Master Specifications

MS220719 Mechanical Systems Insulation – August 1, 2019

- Simplified/Clarified Applications
- Updated to ASHRAE 90.1 2013

MS028110 Regulated Construction Waste Remediation – August 1, 2019

- Updated ‘EHS – Hazardous Materials’ group to be Environment, Health and Safety Department – Hazardous Materials Management Program / EHS-HMM.
- Added note regarding disassembly of exit signs (do not disassemble).

July 2019

Master Specifications

230905 Mechanical Systems Controls (Hospital Projects) – July 24, 2019

Changes are minor, changed the UPS model #'s.

Special Instructions to Designers

DG 4.9 Bird Collision Deterrence – July 24, 2019

New

Standard Details and Schedules

Section 220020 High Purity Water Systems – July 25, 2019

Added back to Standard Details and Schedules

Civil Notes

Reason/Modification: Edits to reflect City of Ann Arbor review comments and added a separate section for City of Ann Arbor General Notes. – July 18, 2019

Edit to reflect a slight change in manhole covers and in wording based on City plan review comments. – July 23, 2019

May 2019

Sustainability

DG 3.1 Sustainable Design and LEED Requirements – May 29, 2019

Revised LEED requirement. New construction projects with a construction cost of \$10M or more are required to obtain LEED Silver certification.

Master Specifications

230905 Mechanical Systems Controls (Hospital Projects) – May 17, 2019

Added combination room temp & humidity sensor, revised ball valve actuators to modulating type, misc. minor improvements.

230900 Mechanical Systems Controls – May 8, 2019

Added combination room temp and humidity sensor. Added Room Temperature Controller (“RTC”). Revised Room Temperature Controller for fan coils (“RTC-F”). Revised ball valve actuators to modulating type. Added FLN and BLN wire colors. Misc. minor improvements. As approved by the HVAC MTT.

May 30, 2019

Revised Room Temperature Controller for fan coils (“RTC-F”, Article 2.5) to cover ECM fan applications (minor update to May 8, 2019 revision).

April 2019

Codes and Regulatory Agencies – April 22, 2019

Modifications to the Codes and Regulatory Agency Design Guideline are as follows:

- Removed under exception 907.5.2.3 exception 4 the words “other than Group I occupancies and ambulatory care,” and added “all occupancies”.
- Removed reference to Ashrae/Ashe Standard 170 since this is referenced in the mechanical code and provides the version to use.
- Added to classroom list 5413 TROTTER MULTICULTURAL CENTER*

Technical Sections

6.3 DG-261000 Medium Voltage Electrical Distribution – April 22, 2019

- Replaced 'Utilities Plant Engineering' with 'U-M Primary Systems Engineer'.
- Clarified requirements for fire pump power sources.
- Extended time span basis for determining reliability of power sources.
- Included provision for installing double ended unit substations with main-tie-tie-main breaker arrangement.

DG 101400 Signage update to add appendix C Evacuation Assistance signage – April 19, 2019

Appendix C Evacuation Assistance Signage – new – April 19, 2019

DG 140000 Conveying Systems – added reference to DG 101400 Signage – April 19, 2019

Special Building Areas

Tunnel Access/Use Protocols and Work Rules linked from SBA 5.9 Tunnels – April 19, 2019

Updated contact information.

Project Procedures

DG 2.4 Document Standards and Procedures for Project Deliverables – April 18, 2019

We have added a new segment, Life Safety Plans, to the DG 2.4 Document Standards and Procedures For Project Deliverables. The University is requesting Design teams use a specific set of standard linetypes to define smoke rated and fire rated partitions. This will provide consistency in documenting fire rated partitions, smoke rated partitions etc. for future information. We are also requesting specific items regarding occupancy types and egress designations on the life safety plans. The goal is consistency from project to project. In addition the life safety plan contains information that will be helpful in understanding the design intent of the project when renovations are considered in the future.

March 2019

Preferred Manufacturers List

Electrical Preferred Manufacturers List – March 25, 2019

- Under Section 262000 Low Voltage Electrical Distribution and 262900 Motor Controls, deleted General Electric as a preferred manufacturer within a number of subsections.
- Under Section 262726 Wiring Devices, added a notation that instructs designers not to specify modular receptacles and switches.
- Under Section 265100 Interior Lighting, updated the current lighting representative at Michigan Lighting East to Mike Marlow.

Master Specifications

221113 Piping Materials & Methods – March 25, 2019

Changes:

As the result of a recent project construction question by a sharp eyed inspector, revised RO water pipe and fittings to the correct ASTM numbers for schedule 80 CPVC. Tracked version also attached.

262000 Low Voltage Electrical Distribution – March 21, 2019

Specification 262000, Paragraphs 2.1, 2.2, 2.3, 2.4, and 2.5 – Per a meeting on March 13th, the Interdepartmental Electrical Team voted to remove General Electric from our electrical specifications due to product performance and non-responsiveness. The specifications retain 3 or more qualified manufacturers for each affected paragraph.

The following changes were made on March 15, 2019.

MS233100 HVAC Ducts and Casings : Added Peppertree Air Solutions to Acceptable manufacturers for Flexible Nonmetallic Duct.

MS233400 Fans : Added Cook Hi-Plume to Acceptable manufacturers for High-Plume Induction Type Lab Fans.

MS237323 Custom Air Handling Units : Added ClimateCraft to Acceptable manufacturers for Custom Air Handling Units.

Sustainability

3.5 Waste, Recycling, and Compost – March 11, 2019

New

February 2019

Master Specifications

232513 – Chemical Water Treatment – Closed Loop Systems and 232516 – Chemical Water Treatment – Open Loop Systems – February 28, 2019

Change: Crown Solutions changed to Veolia Water, new corporate name.

Technical Sections

6.3 DG 260543 – Underground Services For Electrical Systems – February 18, 2019

- Updated formatting.
- Combined multiple sections for duct banks into one section.
- Combined multiple sections for manholes into one section.
- Expanded 'Related Sections' section.
- Added summarized 'Design Requirements' section
- Revised description of 350 MCM cable to 350 kcmil.
- Revise height requirement for telecom manholes from 6'-6 to 7'-0 to agree with standard detail.
- Clarified bending radius requirements for underground duct banks.
- Update 'Utilities and Plant Engineering Department' to 'Primary Systems Engineer'

- Removed redundant specification of rigid galvanized conduit that is also covered in design guideline 260533.
- Deleted telephone number for UM Code Inspection Department.

February 13, 2019 – Revised the verbiage on the Design Guideline landing page and on “2.7 Effective Date” landing page.

January 2019

Codes and Regulatory Agencies – Effective January 22, 2019

State of Michigan Electrical Code 2017 Part 8 Electrical Code Rules (Adopted January 22, 2019) (Incorporating NFPA 70 – National Electrical Code (2017 Edition) and Michigan Amendments)

promulgated by State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Construction Codes.

By local rule the following exceptions/modifications are applied to the Michigan Electrical Code: Michigan Electrical Code Article 80: Article 80 of the Michigan Electrical Code applies with the following exceptions/modifications:

- 80.15 Electrical Board: Modify “electrical board” to “UM Building Code Committee”.
- 80.19 Permits: Strike section 80.19.
- 80.23(B) Penalties: Strike section 80.23(B)
- 80.25 Connection to Electrical Supply: Modify language to read as follows:
 - “80.25. Connection to electricity supply. Connections to the electric supply shall conform to the following: It is unlawful for any person, firm, or corporation to make connection to a supply of electricity or to supply electricity to any electrical equipment installation for which permission from UM Electrical Utilities Engineering Group is required or that has been disconnected or ordered to be disconnected.”

NEC 2017 Sections 700.32 and 701.27: The University may deviate from full selectivity (overcurrent protective device coordination within the emergency generator distribution system) in order to lower arc-flash energy levels for worker safety. All such deviations from full selectivity will be designed by, and reviewed by, registered professional engineers.

Enforcing Agency –University of Michigan Architecture, Engineering and Construction.

Web site for Part 8:

http://dmbinternet.state.mi.us/DMB/ORRDocs/AdminCode/1677_2017-001LR_AdminCode.pdf

University of Michigan Buildings

That Contain Instructional Space

Modified “5266 NORTH CAMPUS RESEARCH COMPLEX BLDG 35 (Auditorium & Lobby)*” to read:

Standard Details

Electrical

26052607 – Ground Bus Detail Telecom – January 18, 2019

ITS requested updated to comply with ANSI/TIA-507-B standards.

Preferred Manufacturer's Lists

8.4 Electrical PML – January 28, 2019

- Under Section 265100 Interior Lighting, updated the current lighting representative at Gasser Bush to Laura McRandall.
- Under Section 273523 Emergency Responder Radio Coverage, added Extreme Engineering and deleted RF Connect.

8.2 Architectural PML – January 9, 2019

Best 7 pin SFIC changed to *Best Coremax 7 pin SFIC*

Master Specifications

275313 Clock Systems – January 29, 2019

- Specification 275313, Paragraph 3.2.C – In lieu of the contractor installing the GPS signal transmitter, the transmitter shall be turned over to the UM Radio Shop. The Radio Shop has reported that campus is experiencing GPS signal saturation, creating numerous synchronization issues. It is believed that most new clock installations will be able to acquire an existing signal without having to add yet another transmitter. If not, then the Radio Shop will place the transmitter as needed.

281300 Access Control & Monitoring System – January 28, 2019

- 281300, Paragraph 2.2.A – Deleted Software House iStar Pro series and added iStar Ultra SE series (the Pro series has been discontinued by the manufacturer).
- 281300, Paragraph 2.2.F.1.b.1 – Deleted Securitron AQM20 series and added the AQS1216-16C2 series (the AQM20 series has been discontinued by the manufacturer).
- 281300, Paragraph 3.3.G – Added an installation note to provide a ground wire to the card reader.

230905 Mechanical Systems Controls (Hospital Projects) – January 24, 2019

Modified requirements for HMI's. Currently we recognize a couple different HMI types. This change looks to standardize all HMI use around one HMI type.

- Add condensation sensor, alarm indication station, occupancy counter.
- Part 3: Indicated that setpoints on documents are preliminary and must be finalized with the engineer and commissioning authority prior to programming.
- Added self calibration device requirements.

Specification 283100 Fire Detection and Alarm System – January 14, 2019

- 2.23.A.4 – Revised paragraph to comply with NFPA 72-2013, 18.3.3.2 – notification strobes used for signaling other than fire shall not have the word fire. Two-strobed (amber and clear) systems are no longer required.
- 2.23.A.5, 2.23.A.6, 2.23.A.7 – deleted multiple references to amber strobes.

220548 Vibration Control – January 2, 2019

Changes:

Section 3.2 A Floor Mounted Equipment
Pumps

- change Isolator type from Mount 3 to None
- Add "base mounted" to All others

December 2018

Special Instructions to Designers

4.4.1 Landscape – December 14, 2018

Complete re-write.

Technical Sections

013639 Tree Preservation – December 14, 2018

Complete re-write.

328400 Irrigation – December 18, 2018

Complete re-write.

Master Specifications

230900 Mechanical Systems Controls – December 14, 2018

Changes:

Add condensation sensor (typical use: chilled beams), alarm indication station, occupancy counter. Improve TEC specification language. Revise room differential pressure indicating gauge to center zero model. Part 3: Indicated that setpoints on documents are preliminary and must be finalized with the engineer and commissioning authority prior to programming. Added self calibration device requirements. Other minor improvements.

Division 1 General Requirements – December 14, 2018

- Section 011400 "Work Restrictions" – Tree protection requirements removed

- Section 015639 “Temporary Tree and Plan Protection” – section added to provide more detailed requirements for projects impacting trees and plants. The changes have been coordinated with civil engineering, grounds, and campus planning.

November 2018

Project Procedures

2.2.1 Pre-Design Deliverables – November 30, 2018

Renamed from 2.9 Pre-Design Deliverables and moved under 2.2 Design Deliverables to be easier to find.

Technical Sections

DG 230050 Chilled Water Systems – November 26, 2018

Updated to reflect current chiller plant design practices. Additionally, DG 230051 Water Chillers, 230052 Cooling Towers, and 230930 Refrigerant Monitoring Systems were updated and incorporated into the revised DG 230050. 230051, 230052, 230930 are retired. Significant improvements to 230050 include:

- Requirement that new CHW Systems be designed as variable primary.
- More specific requirements for sizing plants to avoid over-sizing.
- Discussion of what building types would typically be considered critical and non-critical applications, to determine appropriate level of chiller redundancy.
- Summary description of required chiller plant controls.
- Utility metering requirements.

Master Specifications

230930 Refrigerant Detection & Alarm – November 28, 2018

Revised to add Bacharach as approved, revised MSA model number, reduced accuracy requirements, and other minor changes, per the Hydronics MTT.

Specification 283100 Electronic Safety and Security – November 15, 2018

Paragraph 1.4.B.1 (page 4) – revised the Siemens contact to Chris Tingley

New 336100 Hydronic Utilities – November 12, 2018

A new specification section for underground hydronic utility piping. Currently only covers ductile iron piping for CHW. Includes expanded detail versus u.g. ductile iron for CHW previously found in MS 221113, however reflects typical practice at U-M ~ 10-15 years.

Revised 221113 Piping Materials & Methods – November 12, 2018

Removed the specification for u.g. ductile iron CHW piping, and referenced MS 336100.

Standard Details

MD 232513 003 Closed System Shot Feeder – November 26, 2018

Delete copper piping because copper pipe fittings are cracking over time from removing and replacing coupon holders. Updated number from 15189001 to 232513.

26110001 – Single Ended Substation – November 1, 2018

26110002 – Double Ended Substation – November 1, 2018

Both details were updated listing requirements for using circuit breakers for the fire pump feeds instead of the direct taps formerly used.

2611003 Substation Fire Pump Disconnect – November 1, 2018

Removed as it is no longer used.

Added Section 235716 Steam to Water Heat Exchanger – November 15, 2018

Section 235716 Steam to Water Heat Exchanger					
	MD 235716 001 Critical Steam to Water Heat Exchanger P & ID	February 2017	PDF	Microstation	AutoCAD
	MD 235716 002 Non-Critical Steam to Water Heat Exchanger P & ID	February 2017	PDF	Microstation	AutoCAD
	MD 235716 003 Steam to Water Heat Exchanger Piping Detail	February 2017	PDF	Microstation	AutoCAD

Preferred Manufacturers Lists

8.4 Electrical

Revision November 1, 2018

1. 261100 Unit Substations

1. Under Current Limiting Fuses, we updated the manufacturers to reflect on-going industry acquisitions.
2. Under Circuit Breakers for 600V Class Switchgear and Switchboards, we updated the manufacturers to match the master specification.
3. Under Transformers, we updated the manufacturers to match the master specification.
4. Under Substation Assemblers, we updated the manufacturers to match the master specification. We also updated the contact information.

Revision November 15, 2018

“Section 281300 ACCESS CONTROL & MONITORING SYSTEMS” (page 13) – revised the Siemens contact to Chris Tingley

October 2018

Master Specifications

261100 Unit Substations – October 31, 2018

The revisions are:

1. Paragraph 2.1.A (page 7 on the PDF with marks), 2.3.A (page 12), and 2.4 (page 15) – updated the acceptable manufacturers for assembly, transformers, and secondary distribution.

2. Paragraph 2.4.D (page 15) – revised fire pump connections from bus taps to a dedicated vertical section with feeder breaker.

220523 Valves – October 16, 2018

Crane Flowseal MS has been removed and replaced with Crane ChemPharma & Energy.

September 2018

Master Specifications

MS010000 Div 01 General Requirements – September 26, 2018

Modification:

- Section 015000: Screen fabric for construction fencing updated to current standard used on projects (Midwest Cover Inc., Construction 85, Color: Royal Blue).

Special Instructions to Designers

4.3.3 Full Construction-Phase Commissioning and 4.3.6 General Commissioning Procedures –

September 25, 2018

Change: O&Ms and TAB reports are to be transmitted by the commissioner to the U-M Project Manager instead of to FIC. The U-M Project Manager will transmit these documents to FIC.

August 2018

Master Specifications

260533 Electrical Materials & Methods – August 28, 2018

Paragraph 2.2.B (page 6) – added wire basket manufacturers to spec that are currently on our PML. Also added new manufacturer Basor Electric (per review and approval of the Interdepartmental Electrical team).

211313 Wet and Dry Pipe Sprinkler Systems – August 28, 2018

Incorporated Michigan Medicine specific requirements (anti-ligature heads and no sch. 10 sprinkler pipe allowed in Inpatient areas). Revised butterfly valve Victaulic model number to 705 (708 no longer available), added Giacomini as approved for fire pump test headers.

Standard Details and Schedules

Mechanical Details and Schedules – August 6, 2018

The Mechanical Details have been updated to the new 6 digit CSI number and we added detail name to the file name. Also added to file name is MD (Master Detail), SD (Standard Detail), MS

(Master Schedule) SS (Standard Schedule). We have updated our look on the web page by sorting the details and schedules by CSI numbers.

July 2018

Special Instructions to Designers

4.4.2 Site Furnishing Standards Manual – July 30, 2018

Project Procedures

DG 2.5 Project Estimates form Design Professional Cost Benchmarking Submission – July 19, 2018

There were no substantive changes, we just improved the functionality of the form to provide more clarity.

Codes and Regulatory Agencies – July 18, 2018

1) Various web site links were updated to new location addresses on the web.

2) An amendment to the Michigan Plumbing Code 2015 section 312.2 was add to adopt the errata that the State of Michigan has adopted on water testing which reads as follows:

“ 312.2 Drainage and vent water test. A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but no section shall be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, at least the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points “

3) Exception to the Michigan Building Code 2015 for locking stair doors to be more consistent with the NFPA 101 2012 requirements. By removing the 1010.1.9.11 exception 6 we previously had on the code page and replacing it with the following:

“Article 1010.1.9.11 add the following: Exception 6. In existing buildings, doors on stair enclosures shall be permitted to be equipped with hardware that prevents reentry into the interior of the building, provided that egress is maintained and the doors are in compliance with the requirements of NFPA 101 – 2012, article 7.2.1.5.8 “

4) Updates to the BFS listing of buildings:

0190 Medical Science I added (A and B wings) * for compartmentalization of BFS which excludes the C wing and cyclotron

Technical Sections

6.3 DG 261100 – Unit Substations – July 17, 2018

- Removal of 'UPE' references
- Included rear clearance allowances for wall mounted ground bars.
- Clarified requirements for specifying primary fuse sizes.
- Added requirement for installing warning labels regarding possible backfeed on primary loop switches.
- Added requirements for installing fire pump feeder breakers.
- Added note requiring the designer, on a project by project basis, to verify if a 'Main-Tie-Tie-Main' arrangement is required.
- Deleted requirement for providing a DDC connection for transformer temperature monitoring system.
- Clarified requirement for specifying breaker settings that will limit arc flash incident energy levels.

Master Specifications

221113 Piping Materials & Methods – July 11, 2018

Changes: Revised strainer mesh sizes for water service to larger sizes.

June 2018

Special Instructions to Designers

4.3.4 Reduced Scope Construction Phase, 4.3.5 Commissioning Plan Procedure, 4.3.6 General Commissioning Procedures – June 26, 2018

The only revision was to add an additional person (Laura North) that the commissioner is to provide an electronic copy of the final Cx Plan and Cx report.

Project Procedures

2.8 Project Manual – June 25, 2018

Removed references to prevailing wage.

2.1 OPR and BOD (Owners Project Requirements and Basis of Design) – June 4, 2018

DG 2.1 has been revised as follows:

- Remove requirement for OPR/BOD revisions after Bid.
- Requires As-Built OPR/BOD documents at project conclusion.
- Minor content clarifications.

Technical Sections

Interior Lighting – 6.3 DG 265100 – June 14, 2018

- Updated energy conservation goal, below ASHRAE 90.1 (2013) baseline requirements, in agreement with DG 3.2 – Water and Energy Conservation.
- Clarified spaces and locations requiring egress lighting.
- Removed requirement for egress lighting to be continuously illuminated.
- Added control requirements for egress lighting that also serves as emergency lighting.
- Added requirement for interfacing egress lighting controls with the fire alarm system in BFS buildings.
- Removed compact fluorescent lamps and ballasts.
- Added lighting control schemes for typical building spaces.
- Expanded occupancy sensor requirements to include vacancy sensors.

Master Specifications

230905 Mechanical Systems Controls (Hospital Projects) – June 28, 2018

Description of changes:

- Revisions to scope of work

- Added Onicon to flowmeter manuf
- New UPS requirements and installations
- Redefined room pressure monitors as HMI's
- New HMI requirements and installations
- Changes to panel and point identification requirements
- Changes in demolition scope

232516 – Chemical Water Treatment – Open Loop Systems – June 27, 2018

Added Novatech and Advantage Controls as approved mfr.s for coupon racks, deleted Vector Industries (does not make racks). Improved rack description (open loop spec only).

233100 HVAC Ducts & Casings – June 18,2018

Ventcon added as approved for duct cleaning per the HVAC MTT.

Division 01 General Requirements – June 12, 2018

Updated the referenced article number in the section 011400 Work Restrictions, parking section for the new standard general conditions.

Standard Details

Straw Bale – June 1, 2018

Removed. Not an EHS approved SESC measure due to material deteriorating too quickly.

May 2018

Master Specifications

230900 Mechanical Systems Controls – May 17, 2018

Change: Onicon added as approved for electromagnetic flow meters per HVAC MTT.

Standard Details

26051301 – Aluminum Wire Terminations – May 9, 2018

Detail has been removed pending review.

April 2018

Standard Details

28130012 – Card Reader Pedestal Detail – April 30, 2018

The revision includes a grounding component that our UM key shop requested and is needed.

Master Specifications

Mechanical has completed a conversion of the mechanical preferred manufactures list (PML) to move all approved manufacturers off the PML and into the respective U-M master specification section. The only manufacturers left on the PML are for products for which we do not currently maintain a master specification. Going forward if a manufacturer is approved they will

immediately be added to the respective master specification section. If no master specification exists, they will be added to the PML. This will result in a much shorter PML, among other benefits.

[028213 Asbestos Remediation](#), [028214 Asbestos Remediation – Floor Tile and Mastic](#) and [028215 Asbestos Remediation – Roofing Material](#) – April 24, 2018

The list of pre-qualified abatement firms has been updated as follows:

Added: Rand Environmental Services

Removed: Building Decommission Services, LLC and Omega Demolition Corporation

[MS232123 Plumbing and Hydronic Pumps](#) and [MS220553 Mechanical Identification](#)– April 23, 2018

The Hydronics Mech Tech Team has approved two Manufacturers, Patterson pumps (MS232123) and Delta Therm (Heat Trace, MS220533).

Sustainability

[3.2 Energy and Water Conservation](#) – April 23, 2018

DG 3.2 has been revised as follows:

Include reference to U-M DG 1.0 Codes and Regulatory Agencies

Removed reference to 90.1 Mandatory Requirements

Removed reference to Energy Cost Budget method

Updated link to the U-M Utilities Rate webpage

March 2018

Master Specifications

MS226313 Medical Gas Certification – March 23, 2018

Description of changes: Modified acceptable certifiers, deleted Pneumatic Medical, added Gassy Girl. Clarified certification report requirements.

Technical Sections

DG088000 Glazing – March 9, 2018

Added: "Design shall allow option for maximum of one treatment per glazing surface, ie. low e coating and frit on different surfaces."

Removed: "For quality control purposes, include a restriction that each type of exterior glass must be supplied by a single manufacturer and fabricator."

Special Instructions To Designers

DG 4.7 Building Access Control – March 9, 2018

section: Interior Doors

Required location (for card reader)

added *Reflection Rooms*.

February 2018

Master Specification – Civil

MS334100 – Storm Utility Drainage – February 7, 2018

New. Base civil specification for editing

January 2018

Master Specifications – Architectural

MS028213 Asbestos Remediation – January 11, 2018

MS028214 Asbestos Remediation – Floor Tile and Mastic – January 11, 2018

MS028215 Asbestos Remediation – Roofing Material – January 11, 2018

Modifications: Global Green Service Group has been added to the list of pre-qualified abatement firms

Master Specifications – Mechanical

MS220523 Valves – January 31, 2018

Change: The Jomar ball valve model number has been updated to reflect a new model number.

The valve is the exact same valve as the previous model including materials. Jomar only changed the model number because the valve has additional listings.

Note that Jomar is the only de-zinc resistant brass alloy ball valve that is approved, other approved ball valves are bronze.

Standard Details – Civil

MDOT Sidewalk Ramp R028J – January 11, 2018

Posted the sidewalk ramp PDF instead of the MDOT reference on the Web for better clarity on UM ramp preferences.

Special Building Areas

5.5 Custodial Support Space and Infrastructure – January 4, 2018

Complete re-write.

Standard Details – Architectural

SBA 5.5 Proposed layout Custodial Room – January 4, 2018

SBA 5.5 Proposed layout Custodial Suite – January 4, 2018

Complete re-write.

December 2017

Project Procedures

Design Professional Cost Benchmarking Submission spreadsheet linked from DG2.5 Project Estimates – December 8, 2017

The form has been updated to include an area to provide the breakdown of GSF as new and/or renovated and the Project Data Sheets have been simplified.

Technical Sections

DG220553 Mechanical Identification and Painting – December 5, 2017

There was a major revision to the Design Guideline.

The Master Specification was revised to contain most of the requirements previously in the Design Guideline.

The Design Guideline now requires the masterspec to be used as basis for specification.

Master Specifications

MS042010 Unit Masonry Assemblies (Limited applications) – December 4, 2017

- Added identification requirements for rated walls

MS092116 Gypsum Board Assemblies – December 4, 2017

- Added identification requirements for rated walls

MS099100 Painting – December 4, 2017

- Added prohibition of products including isocyanate compound (used in some dry erase paints). Includes hidden text directing designers to include to coordination with EHS and specify requirements for mechanical local exhaust ventilation, air monitoring, respiratory protection, and adequate cure time before re-occupancy.

November 2017

Special Building Areas

DG 5.10 Gender Inclusive Rooms – November 27, 2017

Added the option to use room name “Gender Inclusive Restroom” on the room sign. This change is being proposed based on collaboration with the Spectrum Center and the Office of Institutional Equities.

Technical Sections

DG 101400 Signage – November 27, 2017

Updated appendix A to reflect the option noted above to name single occupant rooms as either the room type (e.g. Restroom, Locker Room, Shower Room) or include the description “Gender Inclusive” in addition to the room type (e.g Gender Inclusive Restroom, etc). There were no changes to the text of the written portion of the design guideline document.

DG 095100 Acoustical Ceilings – November 27, 2017

Changes include recommending metal vertical transitions that match ceiling grid.

Vertical application of acoustical ceiling tile is not allowed.

Master Specifications

MS087100 Door Hardware – November 8, 2017

- Model numbers added for oversize ADA thumbturns from all manufacturers
- Mechanical and standalone digital lockset model numbers updated to reflect product changes
- Access control lockset model numbers updated to include request to exit and integral door position switch

Sustainability

DG 3.1 Sustainable Design and LEED Requirements – November 6, 2017

Revised LEED requirements and references to LEED version 2009

DG 3.2 Energy and Water Conservation – November 6, 2017

Revised energy code version, ASHRAE 90.1 stretch goal requirements and references to ASHRAE 90.1-2007+30

3.2.2 Energy and Water Conservation Report Format – Projects Over \$10M – November 6, 2017

Revised to remove references to the previous ASHRAE 90.1-2007 +30 mandate

Codes and Regulatory Agencies – November 2, 2017

Michigan Building Code Section 907.5.2.3 Visual Alarms.

Add Exception 4. In other than Group I occupancies and ambulatory care, visual alarms are not required in the following:

- a) Offices less than 200 square feet.
- b) Closets and coat rooms.
- c) Electrical closets.
- d) Mechanical pipe chases.

- 
- e) Crawl Spaces.
 - f) Small restrooms with access inside classrooms.
 - g) Custodial closets.
 - h) Storage rooms less than 200 square feet.
 - i) Unoccupied spaces.

Michigan Building Code Chapter 13 Energy Efficiency – Michigan Energy Code Part 10a rules incorporating the ASHRAE 90.1 2013 effective October 25, 2017

Joint Commission requirements added MM Accreditation staff to review.

For Leased Health Care Facilities added website.

Replaced Radiation Safety Section with the following per EHS:

State of Michigan Department of Licensing and Regulatory Affairs, MIOsha–Radiation Safety Section / United States Nuclear Regulatory Commission All projects which include ionizing radiation-producing equipment or devices used for clinical or research use. All electronic equipment producing ionizing radiation must be registered with the Michigan Department of Licensing and Regulatory Affairs through EHS/Radiation Safety Service prior to initial use. Irradiators or other similar devices using or producing radioactive materials for clinical or research use will require licensing by the U.S. Nuclear Regulatory Commission in advance. Approvals for registration or licensing may also require submitting shielding construction plans for prior approval by MIOsha–Radiation Safety Section or the U.S. Nuclear Regulatory Commission depending on the type of equipment used and nature of the facility. Contact EHS / Radiation Safety Service for assessment.

Added Buildings to BFS listing of classroom buildings as follows:

1651 Flint Harrison Parking Ramp *

5169 Biological Science Building

5266 NCRC 35 Auditorium/lobby *

5413 Trotter William Monroe Multicultural Center

Moved building 5102 from inpatient to outpatient

Changed the title of Ambulatory Surgery Centers to Hospital Outpatient Surgery Departments

October 2017

Preferred Manufacturers List

8.3 Mechanical PML – October 23, 2017

Changes:

Valves – High Performance Butterfly: Added ABZ

Added: Valves – High Performance Metal-to-Metal Seated Butterfly
Bray Trilok, Crane Flowseal MS, Metso/Neles Neldisc, Adams MAK, ABZ Extreme 6000 Series,
Weir Tricentric, Zwick Tri-Con, Vanessa
Valves – Gate: Added Apollo
Valves – Swing Check: Added Apollo
Valves – Silent Check: Added Apollo
Removed: Valves – City Water Main (Ann Arbor)
Moved: Flexible Metal Hose Connectors (Stainless & Copper), Flexible Connectors (Rubber) from
Section 221113 Piping Materials & Methods to Section 220548 – Vibration Control
Revised Vibration Isolators Manufacturers to match master specification.
Piping – Lab Waste and Vent (Polypropylene): Added Georg Fisher Fuseal
Moved: Valves – Safety Relief from Section 221113 Piping Materials & Methods to Section
232216 Steam and Condensate Piping Specialties.

Coalescing Separator: Added Thrush (Aar-O-Vent Dirt DSR & DHR)
Pumps – Double Suction – Base Mounted; End Suction – Close Coupled – Base Mounted; End
Suction – Flexibly Coupled – Base Mounted, Added: Under Consideration Patterson
Pumps – Inline Circulators; In-Line Closed Coupled – Hanger Supported, Added: Wilo, Under
Consideration Patterson
Air Handlers, Custom and Semi Custom: Added Ingenia
Floor Mounted Fan Coil Units (Un-Ducted): Added Price

Special Instructions to Designers

4.3.6 General Commissioning Procedures – October 13, 2017

Minor editorial changes to sample reports at the end of the design guideline. There is no cost or
technical impact.

Master Specifications

220553 Mechanical Identification – October 4, 2017

Changes:

- Revised Scope of Work
- Revised approved manufacturers names
- Added identification of piping contents by temperature/pressure as necessary
- Added detectable non ferrous locator for plastic pipe labels
- Added additional Piping System, Ductwork and Valve identification locations
- Revised labels to align with the ANSI/AMSE A13.1 Standard
- Added more systems to be identified
- Table Formatting
- Additional label types (6) added for the hospital piping – October 27, 2017

261100 Unit Substations – October 3, 2017

Key revisions include:

- 1.2.A – clarification that substations should not include touch screen displays/interfaces
- Part 2 – added Siemens as an acceptable substation assembler
- 2.2.F – clarification on primary fuse sizing responsibilities
- 2.4.I – revamped section on the control of double-ended substations (including a detailed
sequence of operations)

- 2.4.K.5 – updated the substation meter model number.

232513 Chemical Water Treatment – Closed Loop and 232516 – Chemical Water Treatment – Open Loop Systems – October 2, 2017

Removed GE water as approved CSP per Hydronics and Steam MTT due to poor service.

Technical Sections

283100 Fire Detection and Alarm – October 31, 2017

In September, the Building Code Committee approved the simplified alignment of the fire alarm strobe requirements between the Michigan Building Code and the Life Safety Code. In the “Visual Notification Appliances” section of DG 283100, building areas are identified as either requiring or not requiring a fire alarm strobe.

DG 3.1 Sustainable Design and LEED Requirements – October 10, 2017

Revised to: update exemption request procedure; clarify LEED Project Manager requirements

DG 3.2 Energy and Water Conservation – October 10, 2017

Revised to: update exemption request procedure

265100 Interior Lighting – October 2, 2017

- On page 4 of 8, per discussions with the Construction Cost Reduction team as well as Dave Comers, we added the requirement that lighting designers send a copy of their project lighting fixture schedules to each of our local major lighting representatives at the end of the Design Development phase. Our goal is to achieve more competitive pricing on lighting packages.

September 2017

Master Specifications

087100 Door Hardware – September 22, 2017

Privacy lockset (typically used for single occupant restrooms): Revised to change over-ride from keyed over-ride to coin turn over-ride

102800 Toilet and Bath Accessories – September 22, 2017

Electric Hand driers:

Removed discontinued product previously listed and added the following hidden text. “A&E is reviewing potential models for inclusion in this section. consider ADA compliance, noise, dry time, and air distribution pattern when selecting devices. User experience in other buildings have indicated that driers in the 80-90 dba range are too loud and some air distribution patterns cause maintenance problems on the adjacent walls.”

283100 Fire Detection and Alarm System – September 14, 2017

The revisions are:

1. Paragraph 2.1.A.1 (page 11) – deleted reference to Riverside Integrated Systems. There are other qualified installers of EST-3 fire alarm panels, so bids will be more competitive.
2. Paragraph 2.1.A (page 11) – added Notifier ONYX 3030 series as an equivalent fire alarm system. This update was previously made/approved in the PML list, so now the spec and design guidelines align.

Master specification Division 1 – September 5, 2017

Updated as follows:

- Contractor parking locations and language updated to match current typical locations
- F&O department names revised to match current names

Standard Details

4' Diameter Precast Storm Manhole – September 5, 2017

The detail was updated to specify frame and covers.

August 2017

Project Procedures

2.8 Project Manual – August 30, 2017

Updated to match November 2016 version updated by Project Controls in Contractor Resources section.

Master Specifications

024119 Selective Demolition

028110 Regulated Construction Waste Remediation

028213 Asbestos Remediation

028214 Asbestos Remediation – Floor Tile and Mastic

028215 Asbestos Remediation – Roofing Material

028300 Lead Remediation

028333 Lead Remediation – Renovation, Repair and Painting in Child-Occupied Facilities and Target Housing

028400 PCB Remediation

Modifications: – August 10, 2017

All sections: OSEH has been updated for new name: EHS (Environment, Health & Safety)

220500 Common Work Results for Mechanical – August 8, 2017

Updated to no longer refer to the 2009 versions of the MPC and MMC, per the Plumbing and FP

MTT.

230593 Testing Adjusting & Balancing (TAB) – August 2, 2017

Added requirement for I.D. labels on ceiling near VAV boxes (similar to current requirement for diffusers) per Plumbing MTT as requested by Hospital FPD.

July 2017

Technical Sections

New DG235000 Hot Water Heating Systems – July 11, 2017

Civil Master Specifications

New MS331100 – Water Distribution Piping – July 10, 2017

Adding New U-M utility specification to the standard specs.

Special Instructions to Designers

4.3.6 General Commissioning Procedures – July 1, 2017

The only change was to update the Plant training contact's name and email.

June 2017

Civil Master Specifications

New MS333100 – Sanitary Sewer – June 21, 2017

Civil Details

Add Water Main Details and Sanitary Sewer Details link to City of Ann Arbor Water Main Details – June 21, 2017

Link was accidentally deleted in January 2017 when all Civil Details were updated.

Codes and Regulatory Agencies – June 14, 2017

Update to University of Michigan Buildings that Contain Instructional Space, specifically to buildings, 5370 Jeff T. Blau Hall and 0137 Kresge Business Admin Library.

Project Procedures

New Pre-Design Deliverables Design Guideline 2.9 (spreadsheet) – June 14, 2017

As part of the deliverables for formal UM review at the end of Pre-Design phase, we have compiled the Pre-Design Deliverables Design Guideline 2.9. This is similar to the Design Deliverables that are utilized during the SD, DD and CD phase of project development. The Pre-Design Deliverables have been compiled with input for multiple individuals that are involved in our project reviews and design process. Please note that each item on the list may not apply to every project. A column in the spreadsheet was included to note if required for the project, also date the item was received. The intent is to provide consistency and a guide for the design professionals when compiling Pre-Design Documents.

May 2017

Codes and Regulatory Agencies – May 23, 2017

Center for Medicare and Medicaid Services (CMS) information updated to reflect adoption of NFPA 101 (2012).

CMS requires facilities built before 2016 to comply with NFPA 101 (2012).

Master Specifications

230905 – MECHANICAL SYSTEMS CONTROLS (HOSPITAL PROJECTS) – May 19, 2017

A summary of the changes to this master specification include:

- Consistent with recent campus AEC changes to MS 230900, we've revised MS230905 to add constant volume venture (CVV) fume hood lab airflow controls (VAV fume hood labs airflow controls, including all other mechanical controls in the VAV fume hood lab, remains in MS230910)
- Added miscellaneous flow meter clarifications, including division of work associated with UM Utilities (again, consistent with recent AEC campus changes to MS230900)
- Added clarification to control demolition scope
- Added clarifications to the various Human Machine Interface (HMI) and Room Pressure Monitor requirements
- Changed reference of MCIT to HITS
- Clarified coordination requirements with UMH Systems Monitoring and Systems Integrator
- Modified submittal and project record requirements
- Added additional VAV terminal controller requirements
- Changes to DDC wiring requirements
- Added identification labelling requirements
- Clarified HITS network connection requirements
- Modified trending and alarm requirements

April 2017

Codes and Regulatory Agencies – April 25, 2017

Michigan Building Code updated from 2012 to 2015.

– Associated articles with MBC updated to reflect changes in 2015 edition.

Michigan Mechanical Code updated from 2012 to 2015.

Michigan Plumbing Code updated from 2012 to 2015.

Michigan Rehabilitation Code for Existing Buildings updated from 2012 to 2015.

International Fire Code updated from 2012 to 2015.

Under Michigan Residential Code, addition to include ASHRAE 2013.

Under State of Michigan Elevator Code '2010 Edition' added.

Edition of NFPA13 updated from 2010 to 2013.

Edition of NFPA72 updated from 2010 to 2013.

Edition of NFPA 90A updated from 2009 to 2012.

Building 5266 North Campus Research Complex Building 35 (Auditorium & Lobby) added under 'University of Michigan Buildings that Contain Instruction Space' as BFS.

Codes and Regulatory Agencies – April 11, 2017

The update is minor but includes:

March 2017

Preferred Manufacturers Lists

Electrical PML – March 31, 2017

The revisions include:

1. Under 260526 GROUNDING & BONDING FOR ELECTRICAL, we've added Harger Lightning & Grounding.
2. Under 261100 UNIT SUBSTATIONS, we've added Galco Industrial Electronics as an ABB distributor.
3. Under 262000 LOW VOLTAGE ELECTRICAL DISTRIBUTION, we've updated the company name of Ferraz-Shawmut to Mersen Electrical Power (company merger/acquisition).
4. Under 264100 FACILITIES LIGHTNING PROTECTION, we've added Harger Lightning & Grounding, and deleted Sleeping Bear Lightning Protection.
5. Under 265100 INTERIOR LIGHTING, we've added the contact information of four major, local, lighting reps. Direction is also given to the lighting designers to send their lighting fixture schedules to these four reps for recommended equivalents.
6. Under 283100 FIRE DETECTION & ALARM SYSTEMS, we're now allowing Notifier on all central campus projects, we've updated Simplex's name, and we've clarified that VESDA is now a subsidiary of Honeywell.

February 2017

Codes and Regulatory Agencies – February 15, 2017

Address for agencies updated.

Addition of Biosafety in Microbiological and Biomedical Laboratories (BMBL).

Master Specifications

220548 Vibration Control – February 22, 2017

Significant Revisions/Changes

220523 Valves – February 10, 2017

Added Approved MFRs: ABZ HP B'Fly, Apollo Gate/Globe/Check

Added Metal Seated High Performance Butterfly Valves, Model number spelled out for ABZ HP B'fly Valves

221113 Piping Materials & Methods – February 17, 2107

Added Approved MFRs: Apollo Xpress Fittings, Georg Fisher Fuseal Lab Waste & Vent, IPEX Enfield Dionized Water Piping.

Allow press isolation valves, strainers and check valves (2" and below).

Removed flexible connectors (Added to MS220548).

Changed OSEH to EHS.

Technical Sections

Standard Details and Schedules

Referencing current MDOT ramp details to align with City ramp standards referencing MDOT. – February 10, 2017

[MD 235716 001 Critical Steam to Water Heat Exchanger P & ID](#) – February 6, 2017

[MD 235716 002 Non-Critical Steam to Water Heat Exchanger P & ID](#) – February 6, 2017

[MD 235716 003 Steam to Water Heat Exchanger Piping Detail](#) – February 6, 2017

We changed the schematic to have two steam to water heat exchangers details now – 001 is for a critical installation which has minor changes (detail name and removed all the “non” critical notes) compared to the existing posted detail. 002 is for Non Critical installation with the location of the pumps and separator is different from the critical detail, all the notes are for non critical installation. 003 – is the detail and schedules sheet – we removed all but one detail.

Technical Sections

[101400 Signage](#) – February 3, 2107

Major updates as follows:

- Signage characteristics and room identification updated to require the following:
 - International Symbol of Accessibility: added requirement to specify raised pictogram in lieu of flat. This was requested by Office of Institutional Equity.
 - For room types that have both gender specific and gender inclusive room (restrooms, locker rooms, shower rooms, etc), requirements were added for specific room names pictograms, and informational text that directs occupants to other facilities in a building.
 - Appendix A added to provide additional visual direction regarding signage standards for specific room type, particularly restrooms and other spaces that have both gender specific / gender inclusive rooms. These have been reviewed and approved by Spectrum Center and Office of Institutional Equity
 - Appendix B added to provide a lactation space pictogram that does not indicate gender. This has been approved by Work Life Resources.

January 2017

The following documents had global updates to nomenclature (OSEH now EHS, UPO now Campus Planning); updated links; the UPO storm water management manual has been removed and where applicable, the SEMCOG LID manual is referenced. – January 27, 2017

Special Instructions to Designers [4.4.1 Landscape Materials](#)

Design Guideline [310000 Sitework](#)

Design Guideline [312500 Soil Erosion and Sedimentation Control](#)

Design Guideline [321000 Walks, Roads and Parking Paving](#)

Master Specification [312500 Erosion and Sedimentation Controls](#)

Master Specifications

[232116 Hydronic Piping Specialties](#) – January 30, 2017

Improved the specification for coalescing separators. Tracked version also attached.

232513 Chemical Water Treatment – Closed Loop – January 30, 2017

232516 – Chemical Water Treatment – Open Loop Systems – January 30, 2017

Added US Water as an approved Chemical Services Provider.

Project Procedures

2.2 Design Deliverables – January 24, 2017

Revised related to storm water management. The link in 2.2 Design Deliverables goes to a comprehensive procedure and all the associated documents. This is very similar to what we just did with the sanitary sewer mitigation procedure.

Minor revisions to various other related DGs to replace the UPO storm water best practices with the SEMCOG LID manual and to reflect recent nomenclature changes (OSEH now EHS, UPO to Campus Planning and removal of references to “Plant”).

1.0 Codes and Regulatory Agencies – January 23, 2017

Update of Dormitory Code to NFPA 101 2012 and new rules effective Jan 6, 2017.

OSEH changed to EHS or Occupational Safety and Environmental Health changed to Environmental Health & Safety.

Hospital changed to Michigan Medicine.

Addition of Federal Aviation Administration (FAA).

Standard Details

9.4 Civil/Site Details – January 20, 2017

All details were updated to match current design guidelines and specifications. Civil Standard Detail Change Log.

December 2016

Master Specifications

MS010000 Division 01 General Requirements – December 21, 2016

- Section 012900 – Payment Procedures has been removed, it is now included in the Standard General Conditions.
- Project Commissioning section cross references updated.
- OSEH has been updated for new name: EHS (Environment, Health & Safety)

MS028213 Asbestos Remediation, MS028214 Asbestos Remediation – Floor Tile and Mastic, MS028215 Asbestos Remediation – Roofing Material – December 21, 2016

- OSEH has been updated for new name: EHS (Environment, Health & Safety)
- “National Salvage and Service Corporation” has been removed from the list of pre-qualified abatement firms, they are no longer an approved asbestos abatement company.

MS237213 Rotary Air-to-Air Energy Recovery Wheels – December 12, 2016

Add Innergytech and drop DRI due to DRI not being able to comply with the specification. Updated to drop motors as a related section to allow wheel mfr.s to supply specialty motors that allow slow rotation the energy wheel when driven by a VFD. (Motors do not have to be from an MS 220513 “approved” motor mfr.)

MS226313 – Medical Gas Certification (For Hospital Funded Projects) – December 6, 2016

has been updated to reflect a change in an acceptable manufacturer.

Special Instructions to Designers

4.3.1 Design Phase Commissioning and 4.3.2 MEP Design Coordination – December 2, 2016

General updates to improve clarity, address LEED v4 requirements, add reference documents, improve format, etc.

4.3.3 Full Construction-Phase Commissioning – December 5, 2016

The only change was to update U-M’s water treatment coordinator’s name to new hire Nicholas Vanderkolk.

November 2016

Special Building Areas

5.4 Telecommunication Rooms – November 21, 2016

Revised mounting height of dedicated 120 volt duplex receptacles from 48” AFF to 18” AFF.

Technical Sections

220010 Plumbing Specialties – November 3, 2016

Added that small RO systems for improving drinking water quality are to be avoided, per the Plumbing and FP MTT.

Master Specifications

Division 1 General Requirements – November 3, 2016

Table of Contents revised to remove 019110, because that section no longer appears in the Div 1 spec.

October 2016

Technical Sections

088000 Glazing – October 20, 2016

Removed wired glazing.

230030 Lab Ventilation – October 17, 2016

The requirement that venturi style terminal air flow units be used for most lab applications has been eliminated except for labs containing VAV hoods or hoods with combination sashes.

Instead, most labs can be served by conventional blade style terminal units which will result in considerable cost savings.

Other changes include:

Explanation of the U-M master spec changes due to the change to blade style terminal units.

All labs are to be equipped with a room differential pressure indicator so that room occupants can locally verify the direction of room pressurization. This was felt necessary by the HVAC MTT given that blade style terminal units will now be used for most labs.

Added requirements for stack tip design.

Removed the requirement that chilled beams proposed for labs be approved by the U-M HVAC MTT.

Minor editorial changes.

Master Specifications

232123 Plumbing and Hydronic Pumps – October 20, 2016

Added section for small wet rotor ECM pumps.

220513 Motors – October 14, 2016

All motors operated by VFDs to be equipped with grounding rings. 100 HP and greater to have ceramic bearing on non-drive end. Per ad hoc motor failures committee: Arndt, Brabbs, Comers, Gramza, Girard, Karle, Krantz, Woldt. Note: ceramic bearing requirement may be modified in future after additional investigation complete.

Revised requirements for VFD driven motors. Dropped “rated for inverter duty”, replaced with more specific NEMA citations.

Sustainability

The U-M DG 3.1 Sustainable Design and LEED Requirements includes links to the following documents used on U-M LEED projects:

- Thermal Comfort Survey
- Thermal Comfort Action Plan

The two documents underwent the following minor revisions: October 6, 2016

- Survey revised to include room number as mandatory and a request for contact information (corrective action cannot occur unless specific area is identified).
- Action Plan revised to state that the CxA and Facilities will work together to provide appropriate action. (Previously it was stated that corrective action would occur when 20% of respondents were dissatisfied).

September 2016

Master Specifications

Changes: Improved wording regarding the work scope covered by the specification section, approved by the HVAC MTT.

Summary of changes September 21, 2016: The sections were updated to reference the current adopted NFPA 101 “Life Safety Code”, under submittal requirements for Affidavits of Compliance.

096813 – Tile Carpeting

096816 – Sheet Carpeting

098433 – Sound Absorbing Wall Units

099310 – Wood Floor Finish

095100 – Acoustical Ceilings

096466 – Wood Athletic flooring

096500 – Resilient Flooring

096723 – Resinous Flooring

102113 – Toilet Compartments

102239 – Folding Panel Partitions

101100 – Visual Display Units

Special Building Areas

5.11 Fire Command Center – September 21, 2016

Minor revisions

Project Procedures

2.5 Project Estimates – September 21, 2016

A new requirement was added for the Design Professional to complete a Project Data Sheet for each project that is benchmarked. The form name was changed and has been updated to include the new project data sheet.

2.2 Design Deliverables – September 16, 2016

Design Deliverables document updated to provide a link to supplemental information for the Design Professionals to use when they are calculating sanitary sewer offsets.

August 2016

Special Building Areas

SBA 5.10 Gender Inclusive Rooms – August 18, 2016

- Name changed from “Gender Inclusive Toilet / Locker Room” to “Gender Inclusive Rooms”
- Gender free facilities are required for all types of facilities separated by gender (restrooms, lockrooms, showers, etc...)

Preferred Manufacturers Lists

Electrical Preferred Manufacturers List – August 18, 2016

1. 281600 Closed Circuit TV Systems – deleted four listed camera manufacturers, and now references a much broader and compatible camera manufacturer list posted on the UM DPSS web site. This broader list ensures compatibility with DPSS's Genetec headend and offers a more competitive bid.

Standard Details and Schedules

Adding typical wall details and jointing – designer is to adjust these so that they are structurally project specific. – August 10, 2016

- Concrete Seatwall
- Concrete Retaining Wall
- Wall jointing

Master Specifications

261100 Unit Substations – August 3, 2016

The updates include:

- Within 2.2.D.8 and .9, added door stays to prop open primary switch doors.
- Within 2.2.D.11 and .12, clarified the need for full height insulating barriers between the bus and the switch.
- Within 2.2.E.13, clarified the location of handle position switches.
- Moved paragraphs 2.2.F.5.a and .b into 2.2.D.12.
- Within 2.4.K, clarified the location of current transformers.

211313 Wet and Dry Pipe Sprinkler Systems – August 2, 2016

Eliminated requirement that dry pipe sprinkler piping be galvanized.

232116 Hydronic Piping Specialties – August 2, 2016

Added Thrus as approved mfr. of coalescing separators.

July 2016

Special Instructions to Designers

DG 4.3 Building Commissioning – July 28, 2016

DG 4.3.3 Full Construction-Phase Commissioning – July 28, 2016

DG 4.3.4 Reduced Scope Construction-Phase Commissioning – July 28, 2016

Updated Related Sections, no other changes.

DG 4.3.5 Commissioning Plan Procedure – July 28, 2016

This is a new DG formalizing the commissioning plan (manual) requirements that have been in place informally for many years.

- This procedure defines the process for developing and maintaining a commissioning (Cx) Plan. The Cx Plan is the document that outlines the project specific requirements and responsibilities of the Cx process. The Cx Plan also stores all validating documentation related to the Cx process.

DG 4.3.6 General Commissioning Procedures – July 28, 2016

This new DG covers the minimum commissioning requirements for conducting commissioning meetings, providing Cx reports, obtaining operation and maintenance (O&M) manuals for the Owner, and managing and conducting Owner training

Parts of 4.3.6 were previously covered by internal AEC procedures, these have been revised and will now apply to both internally and externally commissioned projects.

Technical Sections

075000 Roofing Systems and Accessories – July 14, 2016

Clarified and included electrical panels and equipment clearances heights above roofing materials.

Civil Design Details

Notes – Civil Standard – July 13, 2016

Update civil notes to reflect City of Ann Arbor input regarding watermain notes.

Preferred Manufacturers List

Electrical Preferred Manufacturers List – July 5, 2016

1. Under 260533 ELECTRICAL MATERIALS AND METHODS, we've updated a manufacturer name to MP Husky under ladder type tray and added Cope and MP Husky to wire basket tray.
2. Under 263000 ENGINE-GENERATOR SYSTEMS, we've deleted commentary that only belongs in the master specs (e.g. "...14 inches of water column...").
3. Under 283100 FIRE DETECTION & ALARM SYSTEMS, Siemens and National Time & Signal were added as manufacturers.

Master Specifications

Section 0284000 – PCB Remediation – July 14, 2016

Summary of changes: Added additional disposal requirement limiting the size of bagged or wrapped waste.

230900 Mechanical Systems Controls – July 1, 2016

Revised to include non-VAV fume hood labs

230910 VAV/Combination Sash Fume Hood Laboratory Controls-DDC – July 1, 2016

Revised for applicability only to VAV fume hood labs

233600 Air Terminal Units – July 1, 2016

Revised for sheet metal trade furnishing and installing constant flow venturi valves and accessories

June 2016

Project Procedures

2.4 Document Standards And Procedures For Project Deliverables (formerly 2.4 Drawing and Construction Document Standards) – June 27, 2016

2.4 Document Standards And Procedures For Project Deliverables has undergone a complete re-write.

- The guideline has been organized to follow the sequence of tasks for project delivery
- Guidelines describe the preferred format and information required for each document.
- General Project and Drawing/ CAD Standards,
- Titleblock content
- Room Numbering Assignment Procedure
- Procedure for submitting Bid and Construction Sets
- Record Documents, contents and procedures.

Codes and Regulatory Agencies – June 27, 2016

- Updated the State of Michigan Fire Safety Rules for Schools, Colleges, and Universities on page 8 from “(Filed December 13 1989) ... NFPA 101 – Life Safety Code 1997)” to “((Filed May 19 2016) Effective June 20 2016) ... NFPA 101 – Life Safety Code 2012)”
- Removed “0333 School of Nursing Building” from University of Michigan Buildings that Contain Child Care Space

Master Specifications

263000 Engine-Generator System – June 17, 2016

- In 2.1.A.3, deleted note regarding “*up through 300 kW*” for Generac Industrial Power. Generac has provided documents showing they now have factory certification on units beyond 300 kW. Also, this previous note was redundant with the requirement specified in 2.3.B.

283100 Fire Detection and Alarm System – June 17, 2016

- Added 2.1.A.4 and 2.1.A.5 – Added National Time and Signal On-Point and Siemens XLS as acceptable fire alarm panel manufacturers.

Standard Details and Schedules

Detail 15910002 – Laboratory DDC Architecture and Scope of Work – June 13, 2016

Change: Replaced the Phoenix Macroserver with Phoenix Room Integrator to reflect current product offering.

May 2016

Sustainability

3.1 Sustainable Design and LEED Requirements – May 26, 2016

The requirement for an 11x17 digital copy of the visual display has been removed (only a 24x26 digital copy of the visual display is required)

Codes and Regulatory Agencies – May 10, 2016

- moved “()” * Indicates compartment of jurisdiction. Note egress from compartment; fire alarm & fire suppression for entire bldg are under BFS” from the top of page 23 to the bottom of page 22.
- Table of Contents links now clickable

Special Instructions to Designers

SID 4.3 Building Commissioning – May 2, 2016

Now designates that the A/E always edits (makes project specific) and inserts the appropriate U-M master commissioning specification into Division 1 of the project’s specification. The previous version had either the CxA or the A/E edit the commissioning specification which caused confusion and sometimes resulted in projects being issued for bid without a Cx spec.

SID 4.3.3 Full Project Commissioning – May 2, 2016

Significant update to clarify the CxA’s scope of work.

Clarified that certain systems are not commissioned by the CxA but by other parties, e.g. elevators, fire alarm, emergency responder radio systems.

Clarified Cx requirements for Security, Access Control, and AV systems and User Equipment

Provides detailed sampling requirements for high count equipment

Delineated responsibilities between CxA and U-M Inspection regarding emergency power systems

The DG name has been revised to Full Construction Phase Commissioning Procedure.

SID 4.3.4 Project Commissioning for Small Projects – May 2, 2016

The scope of Cx work for small projects has been streamlined to essentials so that Cx will be more affordable for small projects. The DG name has been revised to Reduced Scope Construction Phase Commissioning Procedure.

April 2016

Standard Details and Schedules

Civil Details

Reason: Civil details general clean-up and/or removal to better organize and to comply with campus standards. – April 14, 2016

Concrete Curb Details

- New Curb Pavement Patch – delete detail

Miscellaneous detail

- Frost Free Stoop – moved this detail to the Concrete sidewalk detail section

Removed Civil Wall details as they were project specific details and were not typical campus standards – April 20, 2016

Moved the Building Identification Sign Detail, from Civil Design Details section to the Miscellaneous Details section. – April 28, 2016

Removed the Emergency Telephone details in the Miscellaneous Details section. – April 28, 2016

Added Trench Drain Filter Fabric Detail, under the Trench Detail section. – April 28, 2016

Master Specification

260500 “Common Work Results for Electrical” specification update only includes:

- 3.5.A.5 – revised the contact phone number to (734) 763-4568 OSEH Hazardous Materials Management.

MS 226313 MEDICAL GAS CERTIFICATION (FOR HOSPITAL FUNDED PROJECTS). – April 12, 2016

The change is that AirGas, one of our medical gas certifiers, was bought out and the certification services changed names to Compass Cryogenics (see section 1.6)

MS028213 Asbestos Remediation

MS028214 Asbestos Remediation – Floor Tile and Mastic

MS028215 Asbestos Remediation – Roofing Material

The list of pre-qualified asbestos abatement firms has been updated in each. – April 22, 2016

Special Building Areas

DG 5.8 Personal Rooms – April 7, 2016

Changes are minor and include the following:

- Added language encouraging inclusion of personal rooms
- Added language to remind design teams to consider compatibility of proposed uses during the programming phase.

March 2016

Sustainability

DG 3.1 Sustainable Design and LEED Requirements has been revised to include the following requirements:

- A/E’s LEED Administrator to notify AEC Sustainability Coordinator with LEED certification results.
- A/E to obtain authorization prior to publishing LEED certification results on media platforms.’

Standard Details and Schedules

Electric Drive Water Cooled Water Chiller Piping Schematic – March 15, 2016

A small change to clarify Note 4

Re-added to the website

Technical Sections

Interior Lighting – 6.3 DG 265100

- Removed redundant language that is included in associated specification sections.
- Added NFPA 101 to 'Reference Documents'.
- Added requirement to verify, during the Schematic Design phase, LEED credits (associated with lighting design) that will be pursued.
- Restricted use of battery-inverter systems (for emergency lighting) to small single room applications.
- Clarified LED lamp and driver component requirements.
- Clarified preferred occupancy sensor technologies.
- Added requirement for lighting controls to comply with applicable version of ASHRAE 90.1.
- Added requirement to include schedules indicating settings for occupancy sensors and photocells.
- Added dimming system recommendations.
- Expanded recommendations for daylight harvesting applications.
- Added requirement for performing a cost-benefit analysis to justify use of master automated lighting control systems.

Engine-Generator System and Room – 6.3 DG 263000 – March 3, 2016

- Updated list of reference documents.
- Removed redundant language that is included in associated specification sections.
- Added requirement to evaluate indoor verses outdoor locations and preference for locating generators outdoors on grade level.
- Added requirement to coordinate with U-M OSEH Air Quality Specialist during schematic design phase.
- Clarified requirements for generator main circuit breakers.
- Clarified generator sizing requirements.
- Clarified required available fault current ratings for closed transition automatic transfer switches.
- Simplified load bank testing requirements.
- Added preference for generator rooms not to be located on lowest level of building.
- Added requirement for installation of dry horizontal sidewall fire protection sprinklers.
- Added requirement to indicate working clearances for electrical equipment on plan view drawings.
- Added requirement for phase rotation monitors on generator back feed tap boxes.

Master Specifications

230905 MECHANICAL SYSTEMS CONTROLS (HOSPITAL PROJECTS)

A summary of changes includes:

- Defined that DDC HMI shall be provided & installed by MSCC, programmed by SI.
- Modified submittal requirements.
- Further defined DDC architecture.
- Added Tstat aux comm port.
- Modified HMI & diff pressure transmitter requirements.
- Modified BACnet naming requirements.
- Added DDC installation requirements.

February 2016

Special Instructions to Designers

4.4.5 Site Signage New Design Guideline – February 24, 2016

Standard Details

Concrete Sidewalk Details – Decorative Finishes–Picture Framed – February 24, 2016

The detail has been removed from the web site since picture framed sidewalk is not a campus standard.

New Standard Details – February 17, 2016

D 235716 001 Steam to Water Heat Exchanger P & ID

D 235716 002 Steam to Water Heat Exchanger Details and Schedules

Technical Sections

Common Work Results for Electrical – 6.3 DG 260500 – February 24, 2016

- Updated list of reference documents.
- Added labeling requirements when modifying existing circuits.
- Revised/updated content requirements for short circuit, protective device coordination and arc flash hazard studies and reports.
- Added requirement to indicate working clearances for electrical equipment on electrical plan view drawings.
- Added requirement to include room names and numbers on electrical plan view drawings.
- Removed redundant language that is included in associated specification section regarding electrical coordination.
- Clarified requirements for instructing contractors regarding code inspections.

Fire Detection and Alarm – 6.3 DG 283100 – February 23, 2016

- Updated formatting.

- Removed redundant language that is included in associated specification sections.
- Added summarized design guideline 'Scope' section
- Added 'Related Sections' section.
- Added summarized 'Design Requirements' section
- For new buildings not required by code to have a fire alarm system installed, a requirement was added to perform a risk analysis. This analysis will be used to assist in determining if a fire alarm system should be installed even though it is not code required.
- Clarified component requirements for fire alarm control panels.
- Clarified requirements for initiating devices and notification appliances.
- Clarified requirements for monitor and control modules.
- Added reference to design guideline for Emergency Responder Radio Coverage systems.
- Add requirements for Mass Notification systems.
- Clarified required signal inputs for MOSCAD systems

Unit Substation Energization Requirements – February 24, 2016

- Revised list with UPE updates.
- Deleted redundant items.
- Clarified U-M lock core requirements.
- Clarified requirement regarding verify phasing between primary, transformer and secondary sections.
- Clarified requirements regarding primary cable testing and associated report.
- Added requirement for contractor to install breakers after receipt from testing agency.
- Added requirement for continuity testing of CT wiring.

Master Specifications

MS312500 Erosion and Sedimentation Control – February 8, 2016

The web links have been updated with working links and UM OSEH added text regarding OSEH inspection.

Specification 281300 Access Control & Monitoring – February 11, 2016

Notable updates include:

- 1.4.B – Updated list and contact information for Qualified Installers.
- 2.2.A.2 – Deleted diode noise suppression requirement (UM key office reported intermittent issues with diodes).
- 2.2.F.1.c. – Revised reader heater power supply (the previous power supply is no longer manufactured).
- 3.3.F – Provide dedicated receptacle outlets for reader heater transformers.

Preferred Manufacturers Lists

Electrical Preferred Manufacturers List – February 10, 2016

The revisions include:

1. 260533 Cable Trays – Legrand and Wiremold products are now known as Legrand Cablofil.
2. 262726 Wiring Devices – WattStopper is now known as Legrand WattStopper. Pass & Seymour is now known as Legrand Pass & Seymour.

3. 273523 Emergency Responder Radio Services – Updated contact info for RF Connect.

Added JDRM contact info for signal survey services.

4. 281300 – Card Access Control Designers/Installers – Updated contact info for Siemens.

Deleted Electronic Security Systems, Johnson Controls, and TTI due to lack of service and/or interest.

Codes and Regulatory Agencies

Codes and Regulatory Agencies – Updated February 4, 2016

- Changes to the Codes and Regulatory Agencies for February 2016:
- Changed “Michigan Residential Code 2009 (adopted March 9, 2011)” to “Michigan Residential Code 2015 (adopted February 8, 2016)” on page 6.
- Changed “Rule 408.30401 Rule 401” to “Rule 408.30500 Rule 500” on page 6.
- Removed link to the Safety Management Services “<http://www.med.umich.edu/sms/>” on page 20.
- Checked All Links

January 2016

Technical Sections

Unit Substations – 6.0 DG 261100

- Updated formatting.
- Removed redundant language that is included in associated specification sections.
- Added a summarized design guideline scope section.
- Added a summarized design requirements section
- Consolidated system ratings and space requirements.
- Added vertical bus rating requirements for secondary switchgear feeder sections.
- Clarified Ethernet connection requirements for secondary switchgear.
- Clarified requirements for sub-metering of secondary feeders

Special Building Areas

Unit Substations Rooms – SBA 5.7

- Updated formatting.
- Removed redundant language that is included in associated specification sections.
- Added a summarized design guideline scope section.
- Clarified design requirements regarding sound proofing.
- Clarified design requirements regarding EMF and the possible impact on sensitive electronic equipment.

- Added wall construction requirements for substation rooms (our typical substation room is required by the Michigan Electrical Code to be constructed as a transformer vault).
- Clarified equipment egress path requirements.
- Removed alternative for installing foreign piping and ductwork in substation rooms

Standard Details

Civil notes have been updated with minor organizational changes as well as utility note changes to incorporate City water main review comments.

We have updated storm sewer details based on standard practice and added options for manhole covers.

These details have been removed:

- Double Storm Inlet
- Storm Inlet Section
- Storm Inlet In Pavement Section
- Storm Inlet Section Yard Drain (Typ.)
- Slotted Drain Corrugated Galvanized
- Concrete Block Inlet – Jct. Chamber
- Standard Storm Manhole
- 4' Catch Basin (Curb Inlet)
- Underdrain
- Road Edge Drain
- Typical Underdrain Detail With Existing Curb and Gutter

These details are new:

- 2' Diameter Storm Inlet
- 4' Diameter Precast Catch Basin
- 4' Diameter Precast Storm Manhole
- Double Storm Catch Basin
- Underdrain With Curb & Gutter
- Underdrain

Under storm details, the following 2009 details have been removed due to being outdated.

- Storm water detention/detention outlet restrictor
- sidewalk edge drain
- trench drain

FYI – the only one that will be replaced is the trench detail, but we have not updated it yet.

All of the sanitary sewer details are outdated and have been removed and replaced with a link to the [City of Ann Arbor Sewer details](#) (same as for the water main).

Master Specifications

Division 1: summary of changes

- Section 011400 – Work Restrictions – optional language added for projects that require do not allow use of building toilet facilities.
- Section 015000 Temporary Facilities and Controls: Added elevator use and protection requirements that will be removed from Supplemental Conditions.

Division 8

- Section 087100 Door Hardware – Updated part numbers on office locksets for classroom use.

Division 9

- Section 099100 Painting – updated manufacturer list and formatting changes

December 2015

Technical Sections

Medium Voltage Electrical Distribution – 6.0 DG 261000

- Updated formatting.
- Removed redundant language that is included in associated specification sections.
- Added a summarized design guideline scope section.
- Added a summarized design requirements section.
- Clarified distribution schemes for Central Campus, North Campus and UMHHC.
- Added requirements for coordinating with UPE prior to planning expansions of UM medium voltage distribution systems.
- Clarified electrical service point for new buildings.
- Added requirements for load estimates during design phase of projects.
- Clarified UPE's scope for furnishing and installing medium voltage cables and terminations.
- Added component and configuration standards for unit substations as they relate to the medium voltage distribution system.

Project Procedures

Design Deliverables were updated (in October) to include the new requirement for Design Professionals to benchmark projects with a construction budget of \$5M or greater. Design Guideline 2.5 Project Estimates has been updated to include the template.

Codes and Regulatory Agencies

– Removed from the University of Michigan Buildings that Contain Instructional Space on page 22:

1670 Flint Harding Mott Univ Center

1607 Flint Lapeer St Annex

1671 Flint Recreation Building

5219 Flint Student Housing Facility

1662 Flint University Pavilion

– Added to the University of Michigan Buildings That Contain Instructional Space Lease Properties on page 23:

5403 Flint Beecher Neff Center

5343 Flint Riverfront Center

5360 Flint Urban Alternatives House

– Updated Table of Contents page numbers

Master Specifications

265600 “Exterior Lighting”

The “Exterior Lighting” Specification updates include:

- Various revisions from “Outside Lighting Shop” references to “Utilities Power & Lighting Shop”, including updated phone numbers.
- Various revisions throughout, updating terminal blocks, in-line fuse holders, nuts, bolts, washers, etc. to align with current master details.
- 2.1.A – added designer note describing UM transition towards LED lighting for exterior applications.
- 2.1.A.5 and 6 – deleted metal halide technical requirements and added LED requirements.
- 2.2.A – added designer note outlining potential stakeholders of roadway/parking lot lighting team. Describes proposed LED fixtures suitable for parking lot and roadway applications.
- 2.2.A.1 thru 7 – deleted metal halide technical requirements and added LED requirements.
- 2.9 – added designer note describing preference for DDC control of exterior lighting.
- 2.9.B – deleted stand-alone time clock specification.

November 2015

Codes and Regulatory Agencies

Changes made:

– Changed on page 6 “State of Michigan Electrical Code incorporating “NFPA 70 –National Electrical Code”, 2011 edition with University of Michigan modifications.” to “State of Michigan Electrical Code incorporating “NFPA 70 –National Electrical Code”, 2014 edition with University of Michigan modifications.”

– NFPA 45 updated to 2011.

– Updated the administrative rules website links for the following:

- State of Michigan Health Care Safety Rules on pg 7.

(now http://w3.lara.state.mi.us/orr/Files/AdminCode/1129_2012-

120LR_AdminCode.pdf)

- State of Michigan Dormitory Fire Safety Rules for Schools, Colleges, and Universities on pg 8.

(now http://w3.lara.state.mi.us/orr/Files/AdminCode/965_2011-003LR_AdminCode.pdf)

- State of Michigan Fire Safety Rules for Schools, Colleges, and Universities on pg 8. (now http://w3.lara.state.mi.us/orr/Files/AdminCode/964_2011-002LR_AdminCode.pdf)

– Adopted Michigan Electrical Code 2014 and National Electrical Code 2014 on November 1, 2015 altering page 11 and 12:

FROM:

State of Michigan Electrical Code 2011 Part 8 Electrical Code Rules (Adopted January 17, 2014) (Incorporating NFPA 70 – National Electrical Code (2011 Edition) and Michigan Amendments) promulgated by State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Construction Codes.

Michigan Electrical Code Article 80: Article 80 of the Michigan Electrical Code does not apply. NEC 2011 Section 220.12: When the lighting system is being designed in accordance with the watts/sf and lighting controls requirements of the U-M Energy Code, the exception being added to Section 220.12 of the 2011 NEC may be applied to the 2011 NEC. Applying the exception will result in a more accurate calculation of the lighting power system load and a more appropriate sizing of the lighting power system. NEC 2011 Section 310.15(B)(3)(c) and referenced Table 310.15(B)(3)(c): The requirement for adjusting the ampacities of conductors and cables in circular raceways exposed to sunlight on rooftops shall not be applied. NEC 2011 Section 695.3: The requirements for power sources for electrically driven fire pumps and the requirements for ‘reliable power’ will be determined by the University’s High Voltage Engineer, on a case-by-case basis. NEC 2011 Sections 700.27 and 701.27: The University may deviate from full selectivity (overcurrent protective device coordination within the emergency generator distribution system) in order to lower arc-flash energy levels for worker safety. All such deviations from full selectivity will be designed by, and reviewed by, registered professional engineers. Enforcing Agency – University of Michigan Architecture, Engineering and Construction. Web site for Part 8: http://www.michigan.gov/documents/lara/lara_bcc_rules_2011_electrical_rules_070113_422907_7.pdf

TO:

State of Michigan Electrical Code 2014 Part 8 Electrical Code Rules (Adopted September 21, 2015) (Incorporating NFPA 70 – National Electrical Code (2014 Edition) and Michigan Amendments) promulgated by State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Construction Codes.

By local rule the following exceptions/modifications are applied to the Michigan Electrical Code: Michigan Electrical Code Article 80: Article 80 of the Michigan Electrical Code does not apply. NEC 2014 Sections 700.28 and 701.27: The University may deviate from full selectivity (overcurrent protective device coordination within the emergency generator distribution system) in order to lower arc-flash energy levels for worker safety. All such deviations from full selectivity will be designed by, and reviewed by, registered professional engineers. Enforcing Agency – University of Michigan Architecture, Engineering and Construction. Web site for Part 8: http://www.michigan.gov/documents/lara/lara_bcc_electrical_2014_part_8_rules_492610_7.pdf

– Michigan Buildings that Contain Instructional Space pages 22-23:

- Changed 0150 Literature Science and the Arts to include 4th Floor
- Added 5347 School of Nursing New Building

- Added 5017 Flint North Bank Center
- Added a new subsection ‘University of Michigan Buildings That Contain Instructional Space and Are Rental Properties’ and included the
 - 5382 Woodward Gardens building.
- Necessary format changes and spelling corrections.
- Updated the table of contents.
- All links have been checked.

Master Specifications

MS237324 Semi-custom Air Handling Units

MS238216 Coils and Drain Pans

Changes: Ventrol added as approved mfr. for coils, Ingenia added as approved mfr. for semi-custom AHUs, per HVAC MTT.

Division 1

Summary of updates as follows:

- Section 010000 “Summary:
 - Added language related to non-BFS compartments in BFS buildings.
- Section 011400 “Work Restrictions:
 - Added contractor identity badge requirement and
 - Removed substantial completion date and referenced the FOP.
- Sections 012100 and 012300 “Unit Prices” and “Alternates”:
 - Edited language for better coordination with FOP
- Section 013100 “Project Management and Coordination”
 - Added language regarding inspections, testing, and sequencing.
 - Substantially rewrote coordination drawing requirements to better reflect current practice and expectations.
- Section 013500 “Special Procedures for Fire Marshal Review and Inspection”:
 - Added detailed requirements for finish affidavits for fire marshal inspection.
 - Added language related to non-BFS compartments in BFS buildings.
- Section 014200 “References”: Substantially rewrote to better coordinate with new SGC and with industry standards.

- Section 017300 "Execution": New section added to address general requirements for inspection, preparation, installation, and preparation (some of which were previously in the Supplemental General Conditions).
- Section 017329 "Cutting and Patching": Updated language to better reflect current use of the section.

Standard Details

Civil Details

Removed all current details posted UM Civil standard **water main details** and replace with a link to the City of Ann Arbor standard water main details.

City of Ann Arbor Water Main Standard Details:

<http://www.a2gov.org/departments/engineering/Pages/Division-.aspx>

Deleted the noted below details under pavements/concrete pavement details as they are not typical campus standards.

- Longitudinal lane tie joint symbol D
- transverse expansion joint
- concrete road cross section

Removed the current Expansion Joint from the Civil Details on the AEC Website and replace it with "[Pavement Expansion Joint Detail](#)".

Replaced the current [Sidewalk Detail](#)

- Permeable paver system on porous concrete detail was added as a campus standard.
- Concrete standard sidewalk and pavement expansion joint details were updated to clarify actual campus standard practices.

-

October 2015

Special Instructions to Designers

4.6 – Utilities for University Provided

Revisions have been thoroughly vetted by the UPE Tunnel Dept., the AEC Utilities Group and various mech tech teams.

- Title changed – now addresses all utilities, not just those provide by U-M
- Minor corrections/ clarification to utility temperatures/ pressures.
- Minor format corrections on cross-referenced section, changed "Project Coordinator" reference to "Design Manger" etc.
- Added cross reference to DG 5.9 regarding use of PRVs for back-up.

- Added requirement for flash tanks on high pressure condensate. Though new in this DG, this requirement was routinely enforced but occasionally overlooked by outside AE's not familiar with best practice. AS such, we expect this change will actually lower costs because flash tanks will be less likely to be overlooked and added via CCD.
- Added reference to have AEs check with AEC on required backpressure on pumped condensate. In addressing past condensate pumping issues, A&E developed a flow model of the pumped condensate system throughout the tunnels. By checking with A&E, we can ensure properly sized pumps are installed upfront, thereby lower capital and maintenance costs associated with installing sub-optimal pumps.
- Added minor correction to backflow prevention for domestic HW.
- Reference to a "chilled water tap fee" was removed. While this fee may still apply in some cases, it has not been uniformly applied in the past. We feel its best to negotiate that within AEC, rather than confusing outside AEs. No cost impact.
- New articles were added on "non-university provided utilities (gas, storm, sewer, water), Utility Corridors and Easements. None of these are expected to directly impact cost, but may reduce redesign delays.
- Clarifications were added to "metering" article. Little or no cost impact with these changes.

Special Building Areas

DG 5.9 Tunnels

Revisions have been thoroughly vetted bu the UPE Tunnel Dept., the AEC Utilities Group and various mech tech teams.

- Minor formatting adjustments – no cost impact.
- Added clarification on design pressure versus operating pressure for LPS and HPS. No cost Impact.
- Changed design temperature to be used for LPS and HPS during an excursion due to desuperheater failure from 600F to 450F. This is a major change that could have significant cost savings on future tunnel projects, and potentially reduce maintenance costs as well, by eliminating the need for some expansion joints. This change was made after extensive analysis by AEC and UPE.
- Added guidance on the application and sizing of backup pressure reducing valves. This could provide cost savings on some projects. More importantly, it provides consistent direction to be used for future projects.
- Added requirement for domestic HW valves to be 316 stainless, rather than 304 stainless. Though this will add additional cost on some tunnel projects,

additional cost appears warranted considering continuing corrosion issues associated with City of Ann Arbor water.

- Changed tunnel ventilation requirements, increasing maximum allowable tunnel temperature to 115F (had been 100F). This change will reduce cost of some future projects. However, several sections of the tunnel system do not even meet this less stringent requirement.

5.10 Gender Inclusive Toilet/ Locker Room

Removed “design manager” and replaced with “Associate Vice President for Facilities and Operations” as the entity that can give exception to this guideline.

Project Procedures

Design Deliverables

Cells highlighted yellow indicate revisions

Changes,

Updated Civil/ site requirements

Added, clarified site signage

Master Specifications

“MS2627226 Wiring Devices” Specification updates include:

- 2.3.A & B & D – Cooper Controls (Eaton) was added as an acceptable occupancy sensor manufacturer. This revision brings the specification in-line with the current PML.
- 2.3.C Designer Note – The designer note was updated to reflect the latest track record for ultrasonic occupancy sensors. The latest sensors use a higher frequency and no longer interfere with hearing aids. This was confirmed with UM’s ADA Coordinator.
- 2.5.A – For GFCI receptacles, added self-testing requirement and added blinking light that indicates a GFCI malfunction. This brings the specification in compliance with the latest government and UL requirements for GFCIs.
- 3.1.C – clarified freezer and window air conditioning wiring as #10 AWG minimum, as voltage drop or other derating factors may require larger conductors than #10.
- 3.1.D – reworded/clarified the requirement to have dedicated neutrals for 120 volt and 277 volt branch circuits.

Section 017420 of the U-M Division 01 specification has been revised to clarify that the construction and demolition waste tracking form be completed in one unit.

Revised MS232116 Hydronic Piping Specialties

Revised Part 3 air vent description to match revised U-M Standard Detail for air vents, to be issued soon. Tracked version also attached.

233600 Air Terminal Units

Changes: Eliminated wording that was confusing some bidders regarding who furnishes TECs for terminal units.

233100 HVAC Ducts & Casings

237323 Custom Air Handling Units

238219 Floor Mounted Fan Coil Units (Un-ducted)

Revisions: additional approved mfr.s added, per the HVAC MTT.

Standard Details

New Civil Detail 321400 Paver – Permeable System On Porous Concrete

Automatic Water System Air Vent Detail

Detail notes were improved and a detail for a manual air vent was added. Changes per Hydronics MTT.

Sustainability

- 3.2.1 Energy and Water Conservation Report Format – Projects \$2M to \$10 M Construction Cost
- 3.2.2 Energy and water Conservation Report Format – Projects Over \$10M
- 3.2.3 Energy Impact Statement

These documents have undergone minor revisions.

All have been revised to replace references to old SID and DG names and numbers.

September 2015

Preferred Manufacturers Lists

Electrical PML

1. Under 262726 WIRING DEVICES (page 9/14), we've added four equivalent manufacturers to "USB Charging Port Receptacles". This aligns the PML with the existing master specification.
2. We've deleted 274000 AUDIO VIDEO SYSTEMS and the sub-heading "Wireless Microphone Systems" (page 13/14). The master specifications do not include audio visual systems in general, only their associated raceways. Audio Visual Systems are specialty systems that are constantly evolving; these system designs are best handled by the Audio Visual consultant on each project.
3. We've added 273523 EMERGENCY RESPONDER RADIO COVERAGE (page 13/14). These organizations provide related design and installation services. RF Connect provided the

installation at the new School of Nursing Building. Motor City Technologies provided the installation at the new Munger Graduate Residences.

Technical Sections

DG 230930 Refrigerant Monitoring: This DG was updated to refer to the U-M master specification for refrigerant monitors and the new detail for refrigerant monitor controls, and for general clean-up of formatting. Information now covered in spec editor's notes of the refrigerant monitor spec, or in the new detail, has been deleted from the DG.

DG 230900 Controls: This DG was updated to list DG 230930 as a related section and to refer to the new detail for refrigerant monitor controls. It is otherwise unchanged.

New Standard Details

Notes – Civil Standard

Notes – SESC and OSEH General

August 2015

Preferred Manufacturer Lists

Architectural Preferred Manufacturers List

Added ASI Global Partitions to the toilet partition PML 102113.

The Electrical PML updates include:

- Added WBT as an acceptable manufacturer for wire basket cable tray.
- Deleted General Electric as an acceptable manufacturer for substation equipment and assembly. Added ASEA Brown Boveri (ABB) as an acceptable manufacturer for substation equipment and assembly.
- Added Copper Controls (Eaton) as an acceptable manufacturer for occupancy controls.

Master Specifications

MS 237213 Rotary Air-to-Air Energy Recovery Wheels and MS 230593 Testing Adjusting and

Balancing Changes:

Rotary HX Spec:

Update to improve cross wheel leakage requirements, add rotation detection device, improve bearing requirements, modify dual belt requirement to allow spare belts ILO dual belts, provide AHRI certification documents, add factory testing requirement, advise do not use wheels in hazardous exhaust, add source quality control section, and other minor improvements.

TAB Spec:

Added requirement to label chilled beams. Added requirement to verify purge volumes and cross leakage of air to air heat exchangers.

MS211313 Sprinkler Systems

Change: For sprinkler head mfr.s, change Anvil to Tyco. (Due to various industry buy-outs over the years Anvil is no longer a sprinkler brand name.)

MS261100 Unit Substation Specification updates include:

- 2.1.A.1, 2.3.A.1, 2.4.A.1 – Added ABB and deleted General Electric.
Comment: General Electric has consistently under performed, including in areas of equipment durability, adherence to bid documents, and partnering.
- 3.4.C – Revised training sessions to take place two to four weeks after the start-up of the new substation. *Comment: Training is an important element and should not be lumped together with energization or commissioning activities.*

MS230930 Refrigerant Detection and Alarm

Changes: Horns and lights associated with the refrigerant monitor are now to be provided by the controls contractor, therefore those requirements have been deleted from the spec and are covered on the recently posted new refrigerant monitor control detail D 15635 001. This revised specification along with the new detail include the alarm monitor set points required by U-M OSEH, an alarm horn silence function, signage, and other requirements for refrigerant monitoring. Typically using the spec and detail should be adequate for most projects with minimal editing required (e.g. listing the horn/light qty.s on the detail). Refer to the specification's editor's notes for additional info and guidance.

Standard Details

New 15635 Refrigerant Monitor Control Diagram

July 2015

Division 1

Section: MS010000 Div 01 General Requirements 2015-07-13

The following three sub sections were updated to add new mechanical and electrical systems to the scope of work and revise system names for consistency with specification section nomenclature:

- 017823 – Operation and Maintenance Manuals,
- 019100 – Full Project Commissioning
- 019110 – Project Commissioning for Small Projects
- Section 01770 – Closeout procedures' was accidentally removed in the last update for Division 1 (about 2 weeks ago, 7/13), it has been added back in.

MS033053 Miscellaneous Cast-in-Place Concrete 2015-07-16

- Complete rewrite to meet current industry standards and products

- Complete rewrite to meet current industry standards and products

Master Spec 237323: Custom Air Handling Units

Minor revisions to factory testing requirements to assure proper testing.

Master Spec 237324: Semi-Custom Air Handling Units

Spec editors note added recommending custom AHUs when using air-to-air energy recovery wheels.

DG 6.0 075000 Roofing Systems and Accessories

Maintain minimum of 36" clear between mechanical units and adjacent structures, units, walls etc. for roofing repair and or replacement in the future.

June 2015

Master Specification

237323 Custom Air Handling Units

Revised to indicate when coil vents and drains are to be extended to the OUTSIDE of the casing, per HVAC MTT. (This revision was approved by the HVAC MTT last year but it was mistakenly not sent for posting.)

265100 Interior Lighting

We have updated the Interior Lighting Specification (the Interdepartmental Electrical Team has already had an opportunity to review and discuss). Please upload these to our web site (refer to the PDF and DOCX attachments).

Significant updates include:

1. Added a "night lights" definition in section 1.2. Consultants and contractors too often confuse night lights with emergency lights, leading to unnecessary RFIs or improper installations.
2. Added 1.3 Submittals section and a 1.4 Quality Assurance section. Some of the quality assurance information was reorganized and moved from "PART 2 – PRODUCTS" of the previous version. LED binning is a new item to ensure a level of LED color consistency.
3. Added 1.5 Warranty section. This is essentially a reorganization of items moved from "PART 2 – PRODUCTS" of the previous version.
4. Added 2.1.A.1, identifying that DLC, LED Lighting Facts, and ENERGY STAR listings/labels are preferred manufacturers to tie in with the previous PML revision.

5. In 2.1.C, added a designer note regarding that “throw-away” LED fixtures are not preferred. In general, this should not be an issue with everyday general LED lighting. However, accent and specialty LED lighting may often have “throw-away” fixtures specified still. The general industry tends to find this acceptable yet, as accent and specialty lighting can depreciate to 50% or less light output and still be considered effective for their intended use. If “throw-away” LED fixtures are specified, the lighting designers should discuss this with the project team to receive approval on a project-by-project basis.
6. In 2.2, added a designer note stating a preference for T8 lamping over T5 lamping, unless the T5 lamping strategy demonstrates a reduction in overall fixture quantities.
7. In 2.2.A, revised average fluorescent lamp life from “24,000 hours” to “24,000 hours minimum”. The lamp market seems to be approaching a cross-over in lamp prices. If longer life lamps are produced in larger quantities, then perhaps they may eventually become cheaper than 24,000 hour lamps. Let’s get longer lamp life when market forces allow.
8. In 2.2.B, added a designer note stating a preference of LED fixtures over compact fluorescent fixtures. LED fixtures are generally cost-competitive with compact fluorescent types, and they have the added advantages of dimming, instant on, longer life, broader operating temperature range, and color quality.
9. In 2.3.D, added an LED driver qualification of 85% minimum efficiency.
10. In 2.3.E, added that dimmable LED drivers should be 0-10V type.

MS087100 Door Hardware

- Deleted attic stock per key office request
- Added Sargent closer
- Updated to add 2 additional manufacturers for magnetic door hold opens

MS099100 Painting

- Added second selection option for exterior aluminum surfaces

104400 Fire protection specialties

Updated to remove minimum interior dimension of fire extinguisher cabinets. Cabinets will be sized for specified equipment.

230593 Testing Adjusting & Balancing (TAB)

Added 230910 and 230920 as related sections. Added in Article 3.8 to verify LTAU air flows at design min. and max CFM. d. karle for hvac mtt june 2015.

230920 Lab Terminal Air Flow Units & Controls

June 2015: added requirement for valve calibration certificate under submittals, added post submittals article. improved description of valve operation under 2.3.A to require that characterized valve position be the primary means of achieving air volume setpoint, added that additional or fewer air valves are the RESPONSIBILITY of the contractor to provide if a MANUFACTURER other than the design basis is supplied since flow range v. valve DIAMETER varies between mfr.s, required that +/-5% valve accuracy be over the entire cataloged volumetric operating range of the Itau. Strengthened requirement that LTAU INDICATED air volume not to be adjusted based upon field measurements (Art. 3.2). d. karle per hvac mtt.

caution: analog style Itaus typically not AVAILABLE or used for CURRENT projects so this SPECIFICATION should not normally be used, instead use DDC version (230910). in the unusual condition that this spec is used, edit carefully to make project specific.

230910 Lab Air Flow Controls-DDC

June 2015: Revised to require reheat coil be provided by lcc, added reheat coil spec. added requirement for valve calibration certificate under submittals, added post submittals article. improved description of valve operation under 2.3.A to require that characterized valve position be the primary means of achieving air volume setpoint, added that additional or fewer air valves are the RESPONSIBILITY of the contractor to provide if a MANUFACTURER other than the design basis is supplied since flow range v. valve DIAMETER varies between mfr.s, required that +/-5% valve accuracy be over the entire cataloged volumetric operating range of the Itau, required fume hood monitors be provided with a common ALARM silence button since some mfr.s were providing multiple silence buttons. Revised building automation interface requirements to require phoenix macro server and siemens pxc. Strengthened requirement that LTAU INDICATED air volume not to be adjusted based upon field measurements (Art. 3.2). d. karle per hvac mtt.

220523 Valves

Clarified that high performance butterfly valves are to be used in grooved pipe unless it is specifically noted that grooved style butterfly valves are acceptable.

221119 Domestic Water Piping Specialties

Aligns the spec with related U-M details regarding city water meter purchase and installation.

Preferred Manufacturers List

Revised Electrical PML. The following revisions have been made:

1. Under 261100 Unit Substations, the KWHR/Demand Meters have been revised to Schneider Electric PowerLogic ION8650. This revision now coordinates with the previous specification revision.
2. Under 265100 Interior Lighting, we have added requirements to preferred LED lighting manufacturers. LED fixtures that have a DesignLights Consortium

listing, a US Department of Energy “LED Lighting Facts” label, or a US Environmental Protection Agency ENERGY STAR label will be considered as preferred. These organizations vet the manufacturer data sheets to ensure that LED products live up to their literature. There are over 143,000 listed or labelled LED lighting fixtures between these three organizations. By adopting these preferred manufacturers, we hope to slow down the “fly-by-night” LED product offerings. It is understood that low-volume LED products, such as accent or decorative lighting, may not have these listings or labels, so UM project teams will have to accept them on a case-by-case basis.

3. Under Section 283100 Fire Detection & Alarm Systems, Notifier fire alarms was added for NCRC buildings and a typo for VESDA was corrected.

Special Building Areas

Revised 5.11 Fire Command Center

The changes in the design guideline are due to the following reasons:

- Clarified that safety-related equipment in the room shall be on emergency power, not outside equipment like HVAC serving the room.
- Changed the requirement for a control switch to simultaneously unlock stairway doors except exit discharge doors to the outside that are locked by the card access control system to match the current MBC.
- Specified the room interior door to be keyed for a BA key and the exterior door to have a card reader and be keyed for a ZE key.
- Changed “Fire Alarm Control Panel” to “Fire Alarm Control Unit” (FACU) to match the change in fire alarm code language.
- Added that if the building has emergency responder radio coverage (ERRC), the FACU shall monitor it.
- Added that if the building has emergency responder radio coverage (ERRC), do not provide a fire department two-way communications system.
- Clarified the generator “AUTO-RUN” switch shall be maintained contact, not spring return to center.

May 2015

Master Specifications

221113 – Piping Materials and Methods

Revised: Revise stainless pipe description to allow 316L only for cold domestic and condenser water due to concern with chlorides in city water corroding 304L.

New 230905 Mechanical Systems Controls (Hospital Projects)

New masterspec was based on the campus AEC MS 230900. We have heavily edited Part 1 and Part 3 of the campus masterspec. Much of the Part 2 Products section remains the same, with relatively minor additions/ modifications to reflect work specific to UMH.

Here's a summary of what this new masterspec is allowing us to do:

UMHHC owns and maintains a unified Mechanical Control System (MCS) frontend called Siemens Desigo CC. This frontend is the single and only frontend used to monitor, control, alarm and trend DDC points reporting from a variety of DDC systems used in UMHHC facilities, including Johnson Controls, Siemens, Honeywell & ASI.

- The design A/E shall utilize UMHHC's masterspec MS230905 "Mechanical Systems Controls (Hospital Projects)" for all work on hospital funded projects that are to be maintained and monitored by the UMHHC BMS. AE shall be responsible for editing this masterspec so that it is job specific.
- All UMHHC DDC systems, regardless of manufacturer or type, shall report all points back to the Desigo CC frontend. Proprietary, or vendor specific frontends, are not allowed.
- The complete control system work shall be split between the Mechanical Systems Controls Contractor (MSCC), the Systems Integrator (SI) and UMH's Medical Center Information Technology (MCIT) department. See Masterspec 230905 Mechanical Systems Controls (Hospital Projects), Part 1 section for a detailed description on the division of work.
- The MSCC shall provide a fully integrated BACnet MCS incorporating electric, pneumatic, and direct digital control (DDC) components for the control and monitoring of heating, ventilating and air conditioning (HVAC) equipment and other related systems. Controllers shall natively use the most current ANSI/ASHRAE Standard 135 for communications and shall be BTL certified with BTL published PIC statements.
- UMHHC's Desigo CC frontend is installed on virtual servers in MCIT's datacenter. All communication/ integration to the Desigo CC frontend shall be via BACnet IP over the MCIT layer 3 network. UMHHC's MCIT department shall be responsible for the design and installation of this primary network. The AE shall coordinate and clearly show on the contract documents all MCIT data drops to all IP based DDC controllers.
- UMHHC wishes to maximize the use of its MCIT network for a) communication to the Desigo CC frontend and b) communication between DDC building controllers. Communication to/ between lower level controllers shall be via a MS/TP secondary field level network (FLN), provided & installed by the Mechanical Systems Controls Contractor (MSCC).

- The SI shall be responsible for BACnet device and object discovery, point instantiation, alarm & trend definitions and creating of all front end graphics. The role of Systems Integrator shall be performed by UMH Systems Monitoring staff, or an integration contractor hired by Systems Monitoring. All contracts for Systems Integration, if needed, shall be at the discretion of UMH Systems Monitoring staff and shall be direct contracts with UMH, external to the construction contract.
- All products to be used as an integral part of the proposed MCS must be contained on the vendor's pre-approved parts list (including BTL PIC statements) on file with the UMHHC Facility Planning and Development (FPD) office.
- The AE shall discuss with the FPD mechanical engineer the approved control manufacturers to list in the project specifications. The desire it to competitively bid all control projects to the approved control manufacturers listed in specification 230905. In general, all terminal unit controls (VAV/ CAV boxes, mixing boxes, FCU's, etc) as well as all brand new stand-alone facility installations shall be competitively bid. However, UMH wishes to standardize controller manufacturers (and programming, sequence of operation, setpoints, alarming, etc) on critical equipment within a given facility. Examples of equipment that UMH may wish to sole source includes modifications to chiller plants, heating plants, AHU plants and Operating Room/ Procedure Room terminal controls.

Technical Sections

DG 6.0 102800 Toilet Accessories – prefer the toilet paper be installed above the grab bar.

DG 6.0 096500 Resilient Flooring – in general install flooring under cabinetry.

DG 6.0 123553 Laboratory Casework

Summary:

- Complete rewrite to reflect current practices and coordinate with Laboratory Design and Safety guideline.

Revised Standard Details

Multiple details have been revised to include information for LED fixture installation.

26560001 – Metal Halide Site Light Schedule

26560004 – Site Lighting Trench Detail

26560006 – Typical Pole Wiring Detail

26560007 – Single Globe Unit

26560008 – Double Globe Unit

26560009 – Five Globe Unit

26560022 – Wall Mounting Detail

26560024 – Riser For Building-Mounted Exterior Lighting Power Source

26560025 – Pedestrian Top Wall

April 2015

SBA 5.11 Fire Command Center and DG 230900 Mechanical Systems Controls

SBA 5.11 Fire Command Center was revised to clarify certain code requirements for Fire Command Centers that are subject to interpretation, which often results in changes during construction. In particular, the requirements for smoke control panels are now described, as well as the requirements for controlling air distribution systems not related to smoke controls. It is expected that these revisions will reduce costs by avoiding change orders, and because in many cases designers or contractors were including features not required by the code or the U-M AHJ, or were failing to include code requirements such as air distribution system controls for high rises. These revisions were reviewed and approved by the U-M Fire Marshal.

Because revised SBA 5.11 specifies that building controls be used for air distribution system controls (rather than duplicating similar functions in the fire alarm system), DG 230900 Mechanical Systems Controls was revised to describe that requirement, and therefore is also included for approval.

Master Specifications

MS211313 Wet and Dry Pipe Sprinkler Systems

Revisions: Pipe used on dry systems is now specified to be schedule 40 galvanized steel in all sizes. Dry system piping must be installed with the pipe seam above horizontal, must be sloped to drain at all locations and all trapped sections must be equipped with a drain valve. Added spec for dry pipe valve. Minor format fixes and mfr. updates. Revised spec name to wet and dry pipe sprinkler systems. Changes are due to ongoing problems with microbiological corrosion on dry pipe systems. A tracked version is provided for information.

6.0 Technical Sections

DG210000 Fire Protection

As recommended by the Fire Protection/Plumbing Mech. Tech Team:

Due to significant problems with microbiologically induced corrosion (MIC), dry pipe systems are to be specified with schedule 40 galvanized steel pipe in lieu of schedule 10 steel pipe. This does increase the cost of dry systems somewhat, however U-M is having significant leakage problems with dry pipe systems utilizing the thin-walled schedule 10 pipe within a few years after installation, including incidents at the U-M Museum of Art. Due to the corrosion problems dry pipe systems experience, a thicker wall pipe would now be required. Additionally, galvanized pipe is recommended by FM. This change does not impact wet type sprinkler systems, which are the vast majority of sprinkler systems installed at U-M.

Mains and branch lines are required to be pitched at least 1/2 in. per 10 ft in all locations, regardless if in non-refrigerated areas/areas subject to freezing.

Additionally, antifreeze sprinkler systems are banned due to flammability problems with such systems. The State of Michigan recently banned anti freeze systems.

Formatting improvements were also made to the DG.

1.0 Codes and Regulatory Agencies

- Michigan Electrical Code 2012 on page 11 changed to Michigan Electrical Code 2011.
- Asterisk placed next to Building 108 Lawyers Club due to BFS compartmentalization.
- Removed "Website: <https://www.ashrae.org/news/2013/ashrae-publishes-revised-standard-on-ventilation-in-health-care-facilities->" from ASHRAE Standard 170-2013 on page 20.
- February 2015 changed to March 2015 in footer.

3.0 Sustainability

Design Guideline DG 3.1 Sustainable Design Requirements

This document has been revised to require visual displays for projects over \$10M construction cost. Also, you shall find the AEC Title Block and Sustainable Facts Template.

9.0 Standard Details and Schedules

Tunnel Toolkit

There are two new sheets (TK Cvrsh, TK-9).

Sheet TK-4 was divided into two sheets (TK-4A, TK-4B).

The reference file '2331m101 (reference 1)' was revised and renamed to 'm101'.

The reference file '2331t101 (reference 2)' was revised and renamed to 't101'.

There were numerous changes to the other sheets.

New [Mechanical Design Detail 15910002 Laboratory DDC Architecture and Scope of Work](#).

Equal scope of work will now be placed on both of our approved laboratory controls contractors.

The scope of Plant DDC work is reduced. And baseline guidance can now be provided for future internal and external design of lab controls.

March 2015

University of Michigan AEC has updated the Design Guidelines website. The new Design Guideline format is based on a book of chapters. The book of Design Guidelines has been compiled into 10 Chapters. These chapters originated from previous design guideline titles and categories. The goal of the new format is to create streamlined, adaptable categories of subjects for design professionals. Numbers have replaced letter designations to allow for future expansion, and ease in abbreviation for meeting minutes and comments.

The information contained within the Design Guidelines has not changed.

SID (Special Instructions to Designers) documents are now located within their area of technical interest.

[New Design Guideline chapters and a reference list of relocated SID documents](#).

Preferred Manufacturers List

Mechanical PML

This is a quick update to remove grooved coupling mfr.s listed in the PML that are no longer approved in U-M's master piping specification, and to add approved mfr.s that are listed in the U-M master spec.s to the PML (with an occasional exception).

Outdated expansion joint info revised.

Outdated boiler info deleted.

Master Specifications

MS010000 Div 01 General Requirements

The 017823 – Operation and Maintenance Manuals, 019100 – Full Project Commissioning and 019110 – Project Commissioning for Small Projects sections were revised to incorporate the recent AEC reaffirmation that Contractors shall provide 4 paper copies of O&M manuals and all 4 copies are to be submitted to FIC for distribution. Final Contractor payment will be contingent upon FIC receiving 4 paper copies of the O&M manuals.

MS261100 Unit Substation Specification. The updates include:

- A number of typos and punctuation errors were corrected throughout.
- 1.2.F – clarified that written certification is required prior to energization.
- 1.9.A – clarified the warranty requirements. These are now in better alignment with our general warranty requirements.
- 1.9.A.1 – added a reference to the Substantial Completion date.
- 2.1.F.3 – revised bolt and washer finish to clear zinc.
- 2.1.K – revised metal barriers to barriers
- 2.2.D.6 – clarified the connection between fused switch and transformer

- 2.2.D.9 – refined the rear door requirements
- 2.2.D.14 – clarified the viewing window requirements
- 2.2.E.13 – added position switches for remote indication.
- 2.2.F.2 – updated fuse manufacturer
- 2.2.F.3 and 4 – clarified the role of the Engineer-of-Record in fuse specification and sizing
- 2.3.H.1 – clarified the primary connection type
- 2.4.B and C – clarified CT and PT requirement
- 2.4.F – clarified the blank compartments are not permitted
- 2.4.G.5 – added open and close push buttons
- 2.4.G.17 – added kirk key interlock requirement for tie breakers
- 2.4.J.1.c – clarified control power transfer circuit language
- 2.4.K.1 – revised metering mounting height parameter
- 2.4.K.2.d – clarified current transformers and shorting blocks
- 2.4.K.3.d – deleted redundant height requirement.
- 2.4.K.5 – revised kilowatt meter model number (previous model was discontinued)
- 2.4.K.6.a.4 – added shorting terminal block description
- 3.1.E – added 1” chamfered edge to pad. Deleted leveling channels.
- 3.1.O and P – added one-inch data conduits for metering and position switches
- 3.2.C – deleted warranty language (clarified in 1.9.A above)
- 3.2.D – added written certification requirement
- 3.2.I – clarified study settings required prior to testing
- 3.4.D – added language to coordinate training sessions and topics

MS283100 Fire Detection and Alarm Specification. The updates include:

- 1.2.A and 1.2.B – deletion of all text related to a “design-build” concept. There have been a number of internal meetings over the past few months to discuss the “design-build” process. At this time, the majority of projects allot designers several months to design a fire alarm system, bidders a few weeks to pull numbers together, and then onto construction. With this process, the electricians are at the mercy of the designers and how well the set is documented, and so they can only bid what they see on the drawings to be competitive. Instead of a true “design-build” process, we’re really structured as “bid-build”. Further discussions are anticipated on the overall process, but for now, we are eliminating this text. It’s not clear that the text added value or savings to projects, just confusion.
- 1.5.K – added a designer hidden note to meter and document maximum ambient sound levels in renovation projects. This is a reminder to the designer to properly field verify, with the anticipation of reducing errors/omissions.
- 1.5.L.1 – added a designer hidden note to include room names on all plans, with offices and multi-person offices differentiated. This is a reminder to the designer to properly document, with the anticipation of reducing errors/omissions.

- 1.5.N.2 – added a designer hidden note to identify make and model of existing FACPs in order to determine whether a cross-tie is feasible. This is a reminder to the designer to properly field verify, with the anticipation of reducing errors/omissions.
- 2.3 – added a designer hidden note to identify the fire alarm control panel as an “Elevator Recall Control and Supervisory Control Unit” in special circumstances. This complies with the latest Codes.
- 2.13 – corrected spelling of “plastic” within designer hidden note.
- 2.23.A.8 – deleted “2007” from the NFPA 72 reference. Keeping this one “date neutral” will save on revisions down the road.

MS 260533 Electrical Materials & Methods The updates include:

- 2.3.J.1.c – added MonoSystems as an acceptable manufacturer for metallic raceways.

February 2015.

Standard Details and Master Specifications

Update our master details to include a radiused bend within the surface raceway (PDF, DGN, and DWG versions for each detail).

26053313 – Dual Channel Raceway Installation

26053315 – Metallic Raceway With Modular Furniture Feed

and update the specifications to accompany the detail revisions (refer to Paragraph 2.3.B).

260533 Electrical Materials and Methods

These revisions should help keep project costs down by easing installation of cables and by minimizing the potential of damage to cables.

Master Specifications

Removed 235239 Fire Tube Boilers (Hot Water)

Removed from the U-M web page because it does not reflect current U-M requirements for such boilers. Having it on the website risks it being used by outside A/Es, causing significant issues on projects.

Technical Sections

DG 102800 Toilet Accessories

Feminine product dispensers are not supported by building services, if requested review operational impact with department.

Added in dimensions of the trash receptacles design professional should plan for.

265600 Exterior Lighting

This revision switches exterior roadway, parking lot, pedestrian and building-mounted lighting from metal halide and fluorescent to LED. This change will increase energy efficiency and lamp longevity, reduce up-lighting, glare and light trespass, and reduce fixture maintenance. Project initial cost right now will be a little higher or a little lower depending upon multiple factors.

Because LED prices are continuing to fall, eventually initial cost will always be lower. Energy and maintenance costs will be much lower. Light level requirements remain unchanged.

Codes and Regulatory Agencies

Updated issue date to February 2015

Page 2

– Changed title on table of contents from “State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Fire Services (BFS)” to “State of Michigan Health Care Safety Rules”

Page 6

– Updated Right of Way A2gov.org URL to the new web link

Page 7

– Changed title from “State of Michigan Department of Licensing and Regulatory Affairs, Bureau of Fire Services (BFS)” to “State of Michigan Health Care Safety Rules”

– Included “Bureau of Fire Services (BFS) ((Filed December 23, 2014) Effective February 3, 2015)” after the title

– NFPA 101 – Life Safety Code updated from 2006 to 2012

– Added “Note this requires by reference compliance with NFPA 99 Health Care Facilities Code 2012” at the end of the paragraph

– Updated Administrative rules web site to include the link to the new 2012 code

January 2015.

New Underwriter Insurer Currently under Special Instructions to Designers.

New Lab Design and Safety Under Special Building Areas

Master Specifications

Remove all four specification sections listed under Division 14 – Conveying systems: 142123, 142423, 144200, 146000.

Add the substantially revised and updated:

- Master Specification 142123 – Electric Traction Elevator
- Master Specification 142423 – Hydraulic Elevator

Both specifications were substantially revised to reflect current format and latest code and PML revisions. No significant cost change is associated with the revised specs.

December 2014.

Special Instructions to Designers

SID-L Owner's Review

Updated the format to match our new DG format.

Updated the language to declarative statements.

Updated the reviewers list to incorporate department name changes.

Added the requirement for the A/E to submit for review an updated Energy and Water Conservation Report.

This DG has been updated to match our current Owner's Review process.

No impact on project cost.

SID-G Commissioning

The technical changes include:

Two related documents were added and the name of another was updated,

Spec numbers were updated to match the current 6-digit numbering system.

Revision dates were removed for the reference documents.

Commissioning Authority work scope was clarified.

It has been updated to match our current commissioning processes and updated to match our current DG format.

This revision should have no impact on project cost.

Master Specifications

MS 235716 Steam-To-Water Heat Exchangers – New

MS 220523 Valves

Changes:

- Revised to strike ball valve mfr.s no longer approved or available.
- Add specific Jomar model number ball valve as approved
- Strike Grinnell GHP since it's the same valve as the Keystone that has proven unreliable.
- Restricted use of lead free valves to potable water systems only due to soldering challenges.

MS 221113 Piping Materials & Methods

Add George Fischer as approved for PP pressure piping, add material requirements for storm and sanitary pump discharge piping. Add general requirements for plastic pipe hangers/supports. Per Plumbing and FP MTT.

Technical Section

230030 Laboratory Ventilation Design

Revised: Velocity requirement for snorkels and similar devices added. See page 7. No cost impact.

Standard Details

Updated detail – 27200009 – Area of Refuge Two-way Comm System

We had updated the DGN version in November, but the PDF and DWG versions were not updated.

The PDF and DWG versions now match the DGN version.

New Tunnel Toolkit drawing: TK-12 Tunnel Temporary Shoring Detail.

Procedures and Guidelines for Exterior Elements

- ② BLANKET INSULATION WITH FACTORY-APPLIED VAPOR-RETARDER JACKET, 1 ½" THICK, ¾ LB CU. FT. DENSITY
- ③ FACTORY LAP ALL SEALS (SEALED WITH ADHESIVE AND/OR STAPLES OR VAPOR-RETARDER TAPE).
- ④ MECHANICAL FASTENERS SUPPORTING INSULATION ON UNDERSIDE OF DUCTS OVER 24" WIDE (SPACED 3" MAXIMUM FROM THE BUTT JOINT).
- ⑤ VAPOR-RETARDER TAPE OVER TEARS AND PENETRATIONS OF THE VAPOR-RETARDER JACKET TO KEEP AIR TIGHT CONDITION.
- ⑥ ALTERNATE METHOD OF LAP SEAL - LONGITUDINAL JOINT LAPPED AND FOLDED, THEN STAPLED SECURELY IN PLACE.
- ⑦ HANGER ON EXTERIOR OF INSULATION. ENCAPSULATE EXPOSED END OF ANGLE. SEAL WITH ADHESIVE OR VAPOR-RETARDER TAPE.
- ⑧ HANGER EMBEDDED IN INSULATION. ENCAPSULATE EXPOSED END OF ANGLE. SEAL WITH ADHESIVE OR VAPOR-RETARDER TAPE.
- ⑨ COMPLETELY ENCAPSULATE HANGER ROD AND ANGLE. SEAL TOP PENETRATION. ENCAPSULATE AND SEAL STRAP HANGERS IN A SIMILAR MANNER.

**BLANKET FIBERGLASS
INSULATION DETAIL**

- ① U.L. APPROVED ASSE CERTIFIED DOUBLE CHECK DETECTOR ASSEMBLY OR REDUCED PRESSURE ZONE DETECTOR ASSEMBLY, AS REQUIRED BY CITY OF ANN ARBOR. PROVIDE WITH OS&Y GATE VALVES.
- ② HIGH PERFORMANCE BUTTERFLY VALVE
- ③ WATER METER (OBTAINED FROM CITY OF ANN ARBOR, INSTALLED BY CONTRACTOR)
- ④ PRESSURE GAUGE AND BALL VALVE
- ⑤ REMOTE READOUT (OBTAINED FROM CITY OF ANN ARBOR, INSTALLED BY CONTRACTOR)

- ⑥ ½" EMT CONDUIT WITH 3 WIRE PHONE CABLE. CABLE FURNISHED BY CITY OF ANN ARBOR. CONTRACTOR SHALL FURNISH AND INSTALL CONDUIT AND INSTALL CABLE. CONTACT CITY FOR MAX. CABLE LENGTH.
- ⑦ TERMINATION OF DUCTILE IRON PIPE SHALL BE THREADED AND EQUIPPED WITH SCREW-ON MACHINE TIGHTENED, DUCTILE IRON FLANGE COMPLYING WITH ANSI/AWWA C110 AND C115.
- ⑧ PROVIDE ALL CONNECTIONS, VALVES AND FITTINGS REQUIRED TO PROPERLY TEST THE BACKFLOW PREVENTION DEVICE.

REFRIGERANT MONITOR CONTROL DIAGRAM

NO SCALE

MD 230930 001 2015-08-01

SEQUENCE OF OPERATION:

- DETECTION OF LOW LEVEL REFRIGERANT LEAK: ALARM LIGHTS INSIDE AND OUTSIDE THE MACHINE ROOM (BUT NOT THE HORNS) SHALL ACTIVATE AND A "LOW" REFRIGERANT LEAK ALARM SHALL BE GENERATED AT THE BAS.
- DETECTION OF HIGH LEVEL REFRIGERANT LEAK: ALARM LIGHTS AND HORNS INSIDE AND OUTSIDE THE MACHINE ROOM SHALL ACTIVATE, THE MACHINE ROOM VENTILATION SYSTEM SHALL BE PLACED INTO EMERGENCY EXHAUST/VENTILATION MODE, AND A "HIGH" REFRIGERANT LEAK ALARM SHALL BE GENERATED AT THE BAS.
- DETECTION OF A REFRIGERANT MONITOR FAULT CONDITION OR LOSS OF POWER TO MONITOR PANEL: A COMMON ALARM SHALL BE GENERATED AT BAS INDICATING A FAULT OR LOSS OF POWER.
- IT SHALL BE POSSIBLE TO SILENCE ALL HORNS DURING AN ALARM, WITH A MOMENTARY 2-POSITION KEYED SWITCH LOCATED OUTSIDE THE MACHINE ROOM. HOLDING THE KEYED SWITCH MOMENTARILY IN THE "SILENCE" POSITION AND THEN RELEASING IT SHALL SILENCE ALL HORNS UNTIL THE CONDITION THAT CAUSED THE ALARM, AS DETECTED BY THE REFRIGERANT MONITOR, HAS ABATED. ONCE THE CONDITION THAT CAUSED THE ALARM CLEARS AND THE MONITOR PANEL IS RESET, THE HORN SILENCE FUNCTION SHALL AUTOMATICALLY RESET.
- ALARMS SHALL BE LATCHED, AND SHALL BE RESETTABLE VIA A SWITCH INSIDE THE REFRIGERANT MONITOR PANEL ONCE THE CONDITION THAT CAUSED THE ALARM HAS ABATED.

GENERAL NOTES:

- INSTALL REFRIGERANT MONITOR, SENSING TUBES, MULTIPOINT SEQUENCERS, REMOTE RELAY MODULES, ETC. PER REFRIGERANT MONITOR MANUFACTURER'S RECOMMENDATIONS.
- PROVIDE MOMENTARY KEYED SWITCH, ADDITIONAL RELAYS, ETC. AS REQUIRED TO MEET THE SEQUENCE OF OPERATION. ROUTE ALL DDC POINTS THROUGH AND LOCATE ALL RELAYS AND RELATED COMPONENTS IN AN AUXILIARY PANEL MOUNTED ADJACENT TO THE REFRIGERANT MONITOR.
- MOUNT THE MONITOR PANEL 5'-6" AFF, INSIDE THE MACHINE ROOM AT THE LOCATION INDICATED ON THE PLANS. IF THE LOCATION IS NOT INDICATED, MOUNT INSIDE AND NEAR THE MAIN ENTRY DOOR TO THE ROOM.
- LOCATE ALARM LIGHTS, HORNS, AND SAMPLE TUBE TIPS AT THE LOCATIONS INDICATED ON THE PLANS. MOUNT SAMPLE TIPS AT LOCATIONS THAT ALLOW SENSING A LEAK, DO NOT INSTALL IN DEAD-AIR LOCATIONS. LIGHTS, SIGNS AND HORNS SHALL BE EASILY VISIBLE FROM THE FLOOR.
- ALARM LIGHTS AT THE EXTERIOR SIDE OF EACH MACHINE ROOM ENTRANCE DOOR SHALL BE FLASHING BLUE LED TYPE, MINIMUM 4" DIAMETER DOME.
- ALARM LIGHTS INSIDE MACHINE ROOMS SHALL BE STROBE TYPE WITH BLUE LENS, APPROXIMATELY 5" HIGH LENS.
- PROVIDE HORNS ADJACENT TO ALL WARNING LIGHT LOCATIONS. THE HORN VOLUME (MEASURED AT 10 FEET) SHALL BE ADJUSTABLE BETWEEN 85 TO 100 DB.
- ADJUST HORN OUTPUT TO BE DISTINCTLY AUDIBLE ABOVE NORMAL BACKGROUND NOISE BUT NOT BE EXCESSIVELY LOUD.
- PROVIDE MINIMUM 3/16" I.D. RIGID COPPER OR STAINLESS STEEL TUBING WITH COMPRESSION JOINTS FOR SENSING AND EXHAUST TUBES. PROVIDE STAINLESS STEEL TUBING FOR AMMONIA REFRIGERANT DETECTION. INSTALL END-OF-LINE FILTERS SUPPLIED BY THE REFRIGERANT MONITOR MANUFACTURER.
- PROVIDE PHENOLIC PLASTIC SIGNS, MINIMUM 1/2" HIGH WHITE ENGRAVED LETTERS ON RED BACKGROUND, AT EACH LIGHT/HORN LOCATION, AND AT THE REFRIGERANT MONITOR PANEL.

NOMENCLATURE SHALL BE AS FOLLOWS:

LIGHT AND/OR HORN INDICATE REFRIGERANT DETECTION ALARM.
UNAUTHORIZED PERSONNEL STAY OUT OF MACHINE ROOM
REPORT ALARM TO PLANT OPERATIONS CALL CENTER (734)-647-2059

FOR U-M HOSPITAL PROJECTS:

LIGHT AND/OR HORN INDICATE REFRIGERANT DETECTION ALARM.
UNAUTHORIZED PERSONNEL STAY OUT OF MACHINE ROOM
REPORT ALARM TO SYSTEMS MONITORING (734)-936-7521

- MECHANICALLY FASTEN SIGNS TO WALLS OUTSIDE OF MACHINE ROOM, HANG FROM CHAINS INSIDE MACHINE ROOM. OBTAIN IN-FIELD APPROVAL FROM OWNER'S REPRESENTATIVE OF THE EXACT MOUNTING LOCATION OF ALL SIGNAGE.
- MOUNT THE KEYED SWITCH TO SILENCE THE HORNS OUTSIDE AND ADJACENT TO THE MAIN ENTRY DOOR TO THE MACHINE ROOM. LABEL SWITCH "REFRIGERANT ALARM SILENCE SWITCH". THE KEYED SWITCH (SIMILAR TO BEST MODEL 1W7) SHALL BE CORED FOR A U-M MACHINE ROOM BEST LOCK "BA" KEY - FOR HOSPITAL PROJECTS, BEST LOCK "1W5" KEY. LABEL TO BE ENGRAVED PLASTIC IN COMPLIANCE WITH 230900.
- ALL DEVICES EXTERIOR TO THE MACHINE ROOM SHALL BE MOUNTED IN RECESSED ELECTRICAL BOXES (BOX FRONT EDGE FLUSH WITH WALL).

- NOTES:**
- LOCATE STEAM SEPARATOR AS CLOSE AS POSSIBLE TO CONTROL VALVES. PROVIDE SEPARATOR SIZE HAVING A PRESSURE DROP THAT DOES NOT EXCEED THAT OF AN EQUIVALENT LENGTH OF PIPE AT THE DESIGN STEAM FLOW RATE, BUT NOT LESS THAN DIMENSION "A". PROVIDE ECCENTRIC INCREASERS SEPARATOR WHEN REQUIRED.
 - ORIENT BASKET PORTION OF STRAINER IN HORIZONTAL POSITION. SEE STEAM STRAINER INSTALLATION DETAIL.

NON CRITICAL HEAT EXCHANGER STEAM CONTROL STATION DETAIL
NO SCALE

STRAINER INSTALLATION DETAIL
NO SCALE

NON-CRITICAL HEAT EXCHANGER SYSTEM

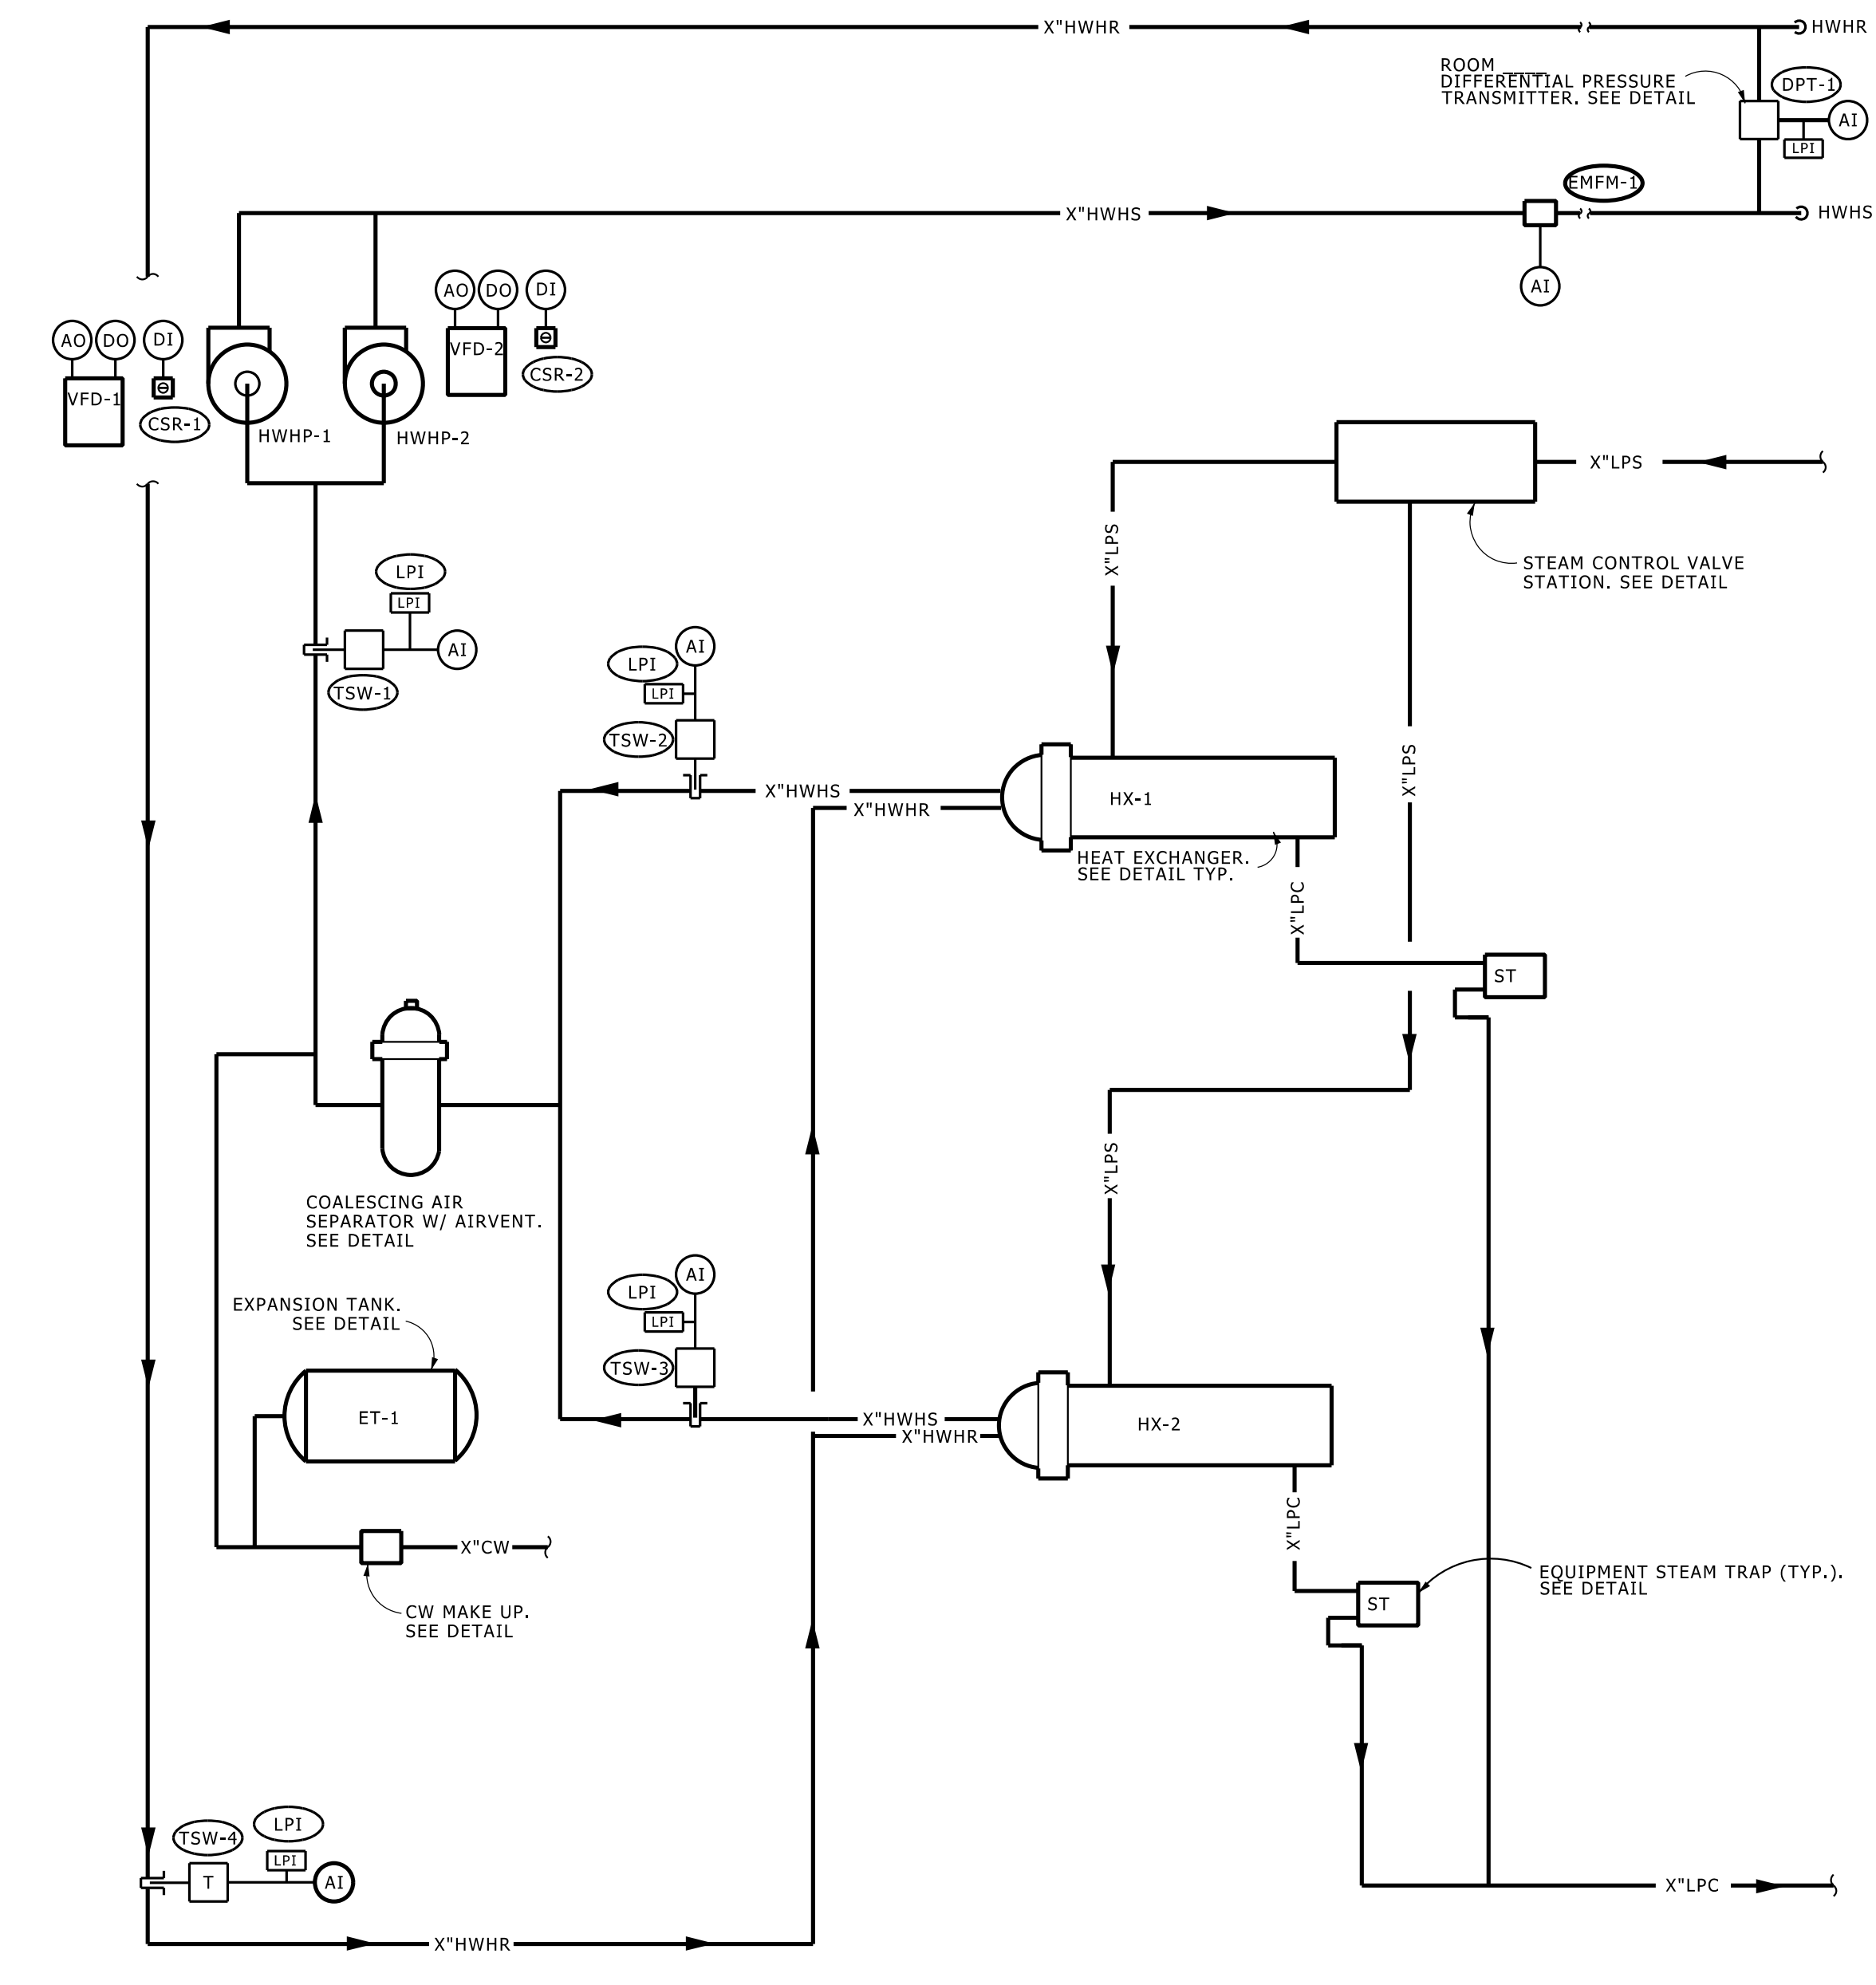

DESIGN INTENT:
EACH HEAT EXCHANGER, STEAM CONTROL VALVE STATION, AND PUMP ARE SIZED TO HANDLE APPROXIMATELY <FILL IN PERCENT> OF THE PEAK DIVERSIFIED HWH LOAD.
ALL HEAT EXCHANGERS, STEAM CONTROL VALVES, AND PUMPS MUST BE IN SERVICE TO MEET THE PEAK DIVERSIFIED HWH LOAD.
HWH FLOWS PROPORTIONALLY AND CONTINUOUSLY THROUGH ALL HEAT EXCHANGERS.
MINIMUM <FILL IN GPM> HWH FLOW IS ATTAINED BY <BYPASS? THREE-WAY VALVES? INCLUDE IN SEQUENCE IF REQUIRED>

SEQUENCE OF OPERATION:
SUMMARY

- ALL PUMPS AND HEAT EXCHANGERS WILL OPERATE.
- ALL PUMPS AND HEAT EXCHANGERS SHALL HAVE THEIR MANUAL ISOLATION VALVES OPEN.
- THE MANUAL VALVE IN THE COMMON PUMP CROSS-OVER HEADER SHALL BE OPEN.
- THE MANUAL BYPASS VALVE AT THE STEAM CONTROL VALVES SHALL BE CLOSED.
- THE SYSTEM SHALL OPERATE CONTINUOUSLY, OR BE SCHEDULED OFF AND ON AS DESCRIBED BELOW.
- THE DDC SHALL SEQUENTIALLY CONTROL THE STEAM VALVE STATION (WHICH IS COMMON TO ALL HEAT EXCHANGERS) TO ACHIEVE THE SUPPLY WATER SETPOINT AT TSW-1.
- THE PUMPS SHALL BE CONTROLLED IN SEQUENCE TO ACHIEVE THE DPT-1 SETPOINT BY CONTROLLING PUMP SPEEDS.

DETAILED SEQUENCE

- SYSTEM SHALL OPERATE CONTINUOUSLY, AUTOMATICALLY START WHEN <DESIGNER TO COMPLETE THE SEQUENCE>.
- ROTATING PUMP ORIENTATION
 - EACH PUMP SHALL BE ROTATED WEEKLY IN OR OUT OF SERVICE BY DDC TO EQUALIZE RUN TIME. PUMP ROTATION SHALL ALSO OCCUR WHEN INITIATED BY AN OPERATING CONDITION DESCRIBED IN OTHER SEQUENCE PARAGRAPHS. TO ROTATE OPERATION, DDC SHALL FIRST START THE LAG PUMP. THE SPEED OF THE LAG PUMP WILL RAMP UP GRADUALLY (AS SET IN THE VFD) UNTIL IT MATCHES THE LEAD PUMP'S SPEED. AFTER A ONE MINUTE TIME DELAY (ADJ), DDC SHALL STOP THE LEAD PUMP. THE LAG PUMP WILL CONTINUE TO OPERATE AND BE CONSIDERED THE LEAD PUMP.
- STEAM VALVE CONTROL
 - THE DDC SHALL SEQUENTIALLY MODULATE THE STEAM CONTROL VALVES TO PRODUCE THE REQUIRED SETPOINT AT TSW-1. THE TSW-1 SETPOINT CHANGES BASED ON THE INDICATED RESET SCHEDULE.
 - UPON AN INCREASE IN LOAD, FIRST MODULATE OPEN THE SMALLEST CONTROL VALVE. UPON CONTINUED INCREASE IN LOAD, MODULATE OPEN THE NEXT LARGER CONTROL VALVE. UPON A DECREASE IN LOAD, THE OPPOSITE SHALL OCCUR, FIRST MODULATING CLOSED THE LARGEST CONTROL VALVE.
 - IF TSW-1 IS $\pm 10^{\circ}\text{F}$ FROM SETPOINT AFTER TIME DELAY, DDC SHALL ALARM A FAULT.
 - IF THE TEMPERATURE AT TSW-1 TEMPERATURE TRANSMITTER EXCEEDS 220°F , DDC SHALL ALARM AT BAS (NO TIME DELAY).
- PUMP CONTROL
 - THE MINIMUM PUMP OPERATING SPEED (PROGRAMMED INTO THE VFD) SHALL BE 12HZ.
 - DDC SHALL MODULATE THE LEAD AND LAG PUMP VFD IN SEQUENCE AS REQUIRED TO MEET THE DIFFERENTIAL PRESSURE SETPOINT AT DPT-1. THE INITIAL SETPOINT SHALL BE (FILL IN PSI). THE FINAL SETPOINT SHALL BE DETERMINED WITH THE WATER BALANCER DURING TEST AND BALANCE.
 - (DPT-1 SETPOINT CHANGES TO MAINTAIN WORST CASE TERMINAL VALVE AT 90% OF FULL OPENING DESIGNER TO EXPAND UPON THIS PART OF THE SEQUENCE IF THE DPT-1 SETPOINT IS TO BE RESET IN SOME WAY.)
 - IF DPT-1 FALLS TO 2 PSI BELOW SETPOINT FOR 5 MINUTES (ADJUSTABLE), OR IF LEAD PUMP IS OPERATING AT 50 HZ OR GREATER FOR 5 MINUTES (ADJUSTABLE), DDC SHALL START THE LAG PUMP. DDC SHALL MODULATE BOTH PUMPS AT EQUAL SPEEDS TO MEET THE DPT-1 SETPOINT.
 - DURING OPERATION OF BOTH PUMPS, WHEN THE FLOW RATE FALLS BELOW <DESIGNER TO FILL IN FLOW RATE, TYPICALLY HALF OF DESIGN FLOW RATE> GPM FOR 5 MINUTES (ADJUSTABLE), DDC SHALL GRADUALLY DECREASE THE LAG PUMP SPEED UNTIL IT REACHES MINIMUM SPEED. THEN, LAG PUMP SHALL STOP.
 - IF DPT-1 FALLS MORE THAN 2 PSI BELOW SETPOINT AFTER A 10 MINUTE (ADJ) TIME DELAY, DDC SHALL ALARM A FAULT.
- ADDITIONAL BAS DDC ALARMS (AFTER AN APPROPRIATE TIME DELAY)
 - PUMP STATUS DOES NOT MATCH DDC COMMAND (AS DETECTED BY CSR)
- BAS TREND LOGGING:
 - BTU/HR, 30 MINUTE READING [EMFM-1, TSW-1, TSW-4]
 - HWH GPM, 30 MINUTE READING [EMFM-1]
 - TSW-1, 2, 3, 4, 30 MINUTE READING
 - PUMP TOTAL RUN TIME, EACH PUMP

DESIGNER NOTES (DELETE FROM CONTRACT DRAWINGS)

- A. FOR A CONDENSER WATER SYSTEM WITH MULTIPLE CHILLERS AND CONDENSER WATER PUMPS, EACH SUPPLY PIPE BETWEEN THE PUMPS AND THE CHILLERS REQUIRES A TAP WITH A BALL VALVE AND CHECK VALVE.
- B. THE COOLING TOWER DRAIN AND OVERFLOW DRAIN SHOULD BE CONNECTED BEFORE THE BLOWDOWN METER.
- C. IF THE CONDENSER WATER SYSTEM INCLUDES A CENTRIFUGAL OR COALESCING SEPARATOR, THE BLOWDOWN CONNECTION SHOULD BE FROM THE SEPARATOR DRAIN TO PROVIDE PERIODIC SOLIDS BLOWDOWN.
- D. PROVIDE LOCKABLE 120V SWITCH LOCATED AT/NEAR CITY WATER MAG METERS.
- E. PROVIDE 110V DEDICATED CIRCUIT FOR CHEMICAL PANEL AND CITY BLOWDOWN MAG METER.
- F. CONTROL DRAWINGS SHOWN SHOULD BE INCLUDED WITH CONTROL DRAWING SHEETS.
- G. REFER TO SCHEDULE BELOW FOR REQUIRED BLOWDOWN PIPE SIZES. INDICATE PIPE SIZES ON PROJECT DRAWINGS.

SCHEDULE	
SYSTEM TONS	PIPE SIZE

 == HEAT TRACING

DESIGNER NOTES:

1. REVISE DETAIL TO MAKE IT PROJECT SPECIFIC, E.G. NUMBER OF TOWERS CELLS APPLICABLE TO PROJECT; REVISING OTHER PIPING ACCORDINGLY.
2. WHEN THE INTENT IS TO DRAIN THE CELLS DOWN IN WINTER, LOCATE NPW, CWS & CWR ISOLATION VALVES AND DRAINS SO THAT TOWERS CAN BE DRAINED TO A POINT JUST BELOW THE ROOF LINE. ASSURE VALVES BELOW ROOF ARE LOCATED IN AN EASILY ACCESSIBLE LOCATION. LOCATE VALVES ON PLAN VIEW IN CLOSE PROXIMITY TO ONE ANOTHER.
3. DETAIL SHOWS BASIN HEATERS AND HEAT TRACE TYPICAL FOR A TOWER OPERATING YEAR AROUND. REVIEW EXTENT REQUIRED FOR YOUR SPECIFIC PROJECT AND REVISE DETAIL ACCORDINGLY. TOWERS DRAINED SEASONALLY TYPICALLY DON'T REQUIRE BASIN HEATERS OR HEAT TRACING.
4. CONSIDER IF AN AUTOMATED VALVE IS REQUIRED ON THE CWR TO EACH TOWER FOR YOUR APPLICATION AND UPDATE DETAIL ACCORDINGLY.

NOTES:

- ① TO CITY OF ANN ARBOR COOLING TOWER MAKE-UP METER.
- ② PROVIDE ELECTRIC HEAT TRACE WHERE INDICATED BY DASHED LINE.
- ③ PITCH CWS AND CWR HEADER BACK TO HEADER ISOLATION VALVE. PROVIDE 3/4" MANUAL DRAIN ON HEADERS.
- ④ LOCATE VALVE IMMEDIATELY AT BASIN CONNECTION (TYPICAL).
- ⑤ TO CITY OF ANN ARBOR BLOW DOWN METER.
- ⑥ CONNECT TO COOLING TOWER HOT WATER BASIN DISTRIBUTION PIPING (TYPICAL).

PHOENIX LAB DDC ARCHITECTURE

SIEMENS LAB DDC ARCHITECTURE

LAB DDC ARCHITECTURE AND SCOPE OF WORK

1. GENERIC DDC ARCHITECTURE IS IDENTIFIED FOR CONNECTION BETWEEN LAN/ALN AND UM BAS. SEE PROJECT SPECIFIC LABORATORY AIRFLOW CONTROLS DIAGRAMS FOR REQUIREMENTS WITHIN EACH LABORATORY.
2. REFER TO MASTER SPECIFICATION 230900/230901 FOR UPS TYPE AND SIZING REQUIREMENTS.
3. FINAL SELECTION OF THE TYPE AND QUANTITY OF COMPONENTS FOR THE INTEGRATION OF THE LAB CONTROLS SYSTEM INTO THE U-M LAB BACNET SERVER IS THE RESPONSIBILITY OF THE LAB CONTROLS CONTRACTOR. REFER TO MASTER SPECIFICATIONS 230910/230920 FOR ADDITIONAL SYSTEM REQUIREMENTS AND INTEGRATION SCOPE OF WORK.

ALUMINUM WIRE TERMINATION
TO DRILLED BUS

ALUMINUM WIRE TERMINATION
TO MECHANICAL CLAMP CONNECTOR

NOTES:

1. ALUMINUM WIRES SHALL BE TERMINATED TO BUS BARS USING 2-HOLE COMPRESSION LUGS AND TO MECHANICAL CLAMP CONNECTORS USING COPPER WIRE PIGTAIL COMPRESSION LUGS. ALUMINUM WIRES SHALL NOT BE CLAMPED DIRECTLY IN MECHANICAL CLAMP CONNECTORS.
2. ONLY THE SPECIFIED BRANDS AND MODELS OF COMPRESSION LUGS ARE ACCEPTABLE.
3. COMPRESSION LUGS SHALL BE PRE-FILLED WITH AN OXIDE INHIBITOR.
4. ONLY THE CRIMPING TOOLS AND DIES RECOMMENDED BY THE LUG MANUFACTURER ARE ACCEPTABLE. DIE AND CRIMP TOOL NUMBERS SHALL BE CLEARLY VISIBLE FOR INSPECTION AFTER THE LUGS ARE CRIMPED.
5. ALUMINUM WIRES HAVE LARGER MINIMUM BEND RADII THAN EQUIVALENT COPPER WIRES, AND COMPRESSION LUGS INCREASE BEND RADII EVEN MORE. OVERSIZE SUBSTATION SECONDARY GEAR, ELECTRICAL ENCLOSURES, AND PANEL WIRING GUTTERS ACCORDINGLY.
6. VERIFY THAT OVERSIZED EQUIPMENT FITS IN AVAILABLE SPACE.

NO SCALE

26054319.DGN

NOTES:

NEW DUCT BANK CONCRETE ENCASEMENT SHOULD OVERLAP EXISTING ENCASEMENT, ESPECIALLY UNDERNEATH TO GIVE ADDITIONAL SHEER STRENGTH.

CONTRACTOR MAY ALSO USE A 4" SCHEDULE 40 PVC COUPLING WITH THE INSIDE BORED TO THE O.D. OF THE ORANGEBURG, OR HEAT THE COUPLING UP (GLUED TO THE END OF 4" SCHEDULE 60 TYPE DB DUCT) UNTIL IT IS SOFT ENOUGH TO BE SWEDGED OVER THE ORANGEBURG DUCT, WHEN COOL FASTEN IN PLACE USING AN ADHESIVE SEALANT TO PREVENT CONCRETE FROM PENETRATING.

IF TRANSITION REQUIRES ANY VARIATIONS TO THIS STANDARD, CONTACT UNIVERSITY OF MICHIGAN UTILITIES AND PLANT ENGINEERING ELECTRICAL SHOPS FOR APPROVAL 647-2044

CONSTRUCTION NOTES (CASING):

- AUGERS OR SIMILAR DEVICES USED FOR PIPE IMPLACEMENT SHALL BE PROVIDED WITH MECHANICAL ARRANGEMENT THAT WILL PREVENT THE CUTTING HEAD FROM LEADING THE PIPE SO THAT THERE WILL BE NO UNSUPPORTED EXCAVATION AHEAD OF PIPE.
- THE USE OF WATER OR OTHER LIQUIDS TO FACILITATE THE CASING IMPLACEMENT AND SOIL REMOVAL IS PROHIBITED.
- WHEN AN OBSTRUCTION IS ENCOUNTERED DURING INSTALLATION, AND IT BECOMES EVIDENT THAT IT IS IMPOSSIBLE TO ADVANCE THE PIPE, ALL OPERATIONS WILL CEASE. THE CASING PIPE SHALL BE ABANDONED IN PLACE AND FILLED COMPLETELY WITH 1:6 GROUT.
- AFTER CONDUIT IS PULLED INTO PLACE VIA THE CONDUIT SLED, CASING PIPE IS TO BE COMPLETELY FILLED WITH PRESSURE GROUTING WITH A UNIFORM 1:6 MIXTURE.
- GROUT PUMP TO BE MONITORED BY PRESSURE GAUGE, PRESSURE NOT TO EXCEED 100 PSI.
- CONTRACTOR MAY SUBSTITUTE SLED AND SPACERS WITHIN CASING PIPE WITH BORING SPACERS MANUFACTURED BY UNDERGROUND DEVICES, CONTRACTOR MUST FOLLOW MANUFACTURERS INSTALLATION GUIDELINES.

PREFIX (ADD WHEN APPROPRIATE):

A. Campus Projects

E - Panel or equipment backed up by generator or battery inverter, e.g. ERP-1050

B. Hospital and Health Care Projects

C - Critical Branch, as defined by N.E.C. 517, e.g. CRP-1050
E - Equipment System, as defined by N.E.C. 517, e.g. ERP-1050
L - Life Safety Branch, as defined by N.E.C. 517, e.g. LRP-1050

ELECTRICAL PANELS:

A. Panel Type

DP - Distribution Panel (panel primarily feeding other panels)
IPS - Interruptible Power Supply (battery inverter)
LP - Lighting Panel (typically a 480/277V panel feeding lighting)
MCC - Motor Control Center
PP - Power Panel (panel primarily feeding loads directly)
RP - Receptacle Panel (typically a 208/120V panel feeding receptacles)
UPS - Uninterruptable Power Supply

B. Add the Substation Number - If more than 1 substation exists

C. Insert a hyphen and identify the room number

D. Insert a hyphen and add sequence # if there is more than one of that type Panel/MCC in a room

Example:

ELECTRICAL EQUIPMENT:

Transformers:

T - (Location Room #), e.g. **T-380**. If more than one transformer in room, add sequence # after room #, e.g. T-380-1

Disconnects (Safety Switches):

A. Fused: **DF** - (Location Room #), e.g., **DF-380**. If more than one in room, add sequence #, e.g. **DF-380-1**.
B. Non-Fused: **D** - (Location Room #), e.g. **D-380**. If more than one in room, add sequence #, e.g. **D-380-2**.

**STANDARD PROCEDURE
FOR PANEL & EQUIPMENT NAMING**

SEQUENCE OF OPERATION FOR CONTROLLED AREAS:

FIXTURES WITH AN 'NL/EM' OR 'NL' DESIGNATION SHALL NOT BE CONTROLLED. THEY SHALL BURN FULL OUTPUT 24 HOURS PER DAY, 7 DAYS PER WEEK.

ALL CONTROLLED LIGHTING SHALL BE TURNED ON AND DIMMED MANUALLY. LIGHTING SHALL NOT AUTOMATICALLY TURN ON UPON INITIAL DETECTION OF OCCUPANCY.

ALL CONTROLLED LIGHTING SHALL BE MANUALLY TURNED ON AND DIMMABLE (FROM 0% TO 100%) VIA THE COMBINATION WALL DEVICE.

UPON LOSS OF POWER TO THE CONTROLLED AREA, EMERGENCY LIGHT FIXTURES SHALL ILLUMINATE TO THEIR FULL SPECIFIED EMERGENCY OUTPUT.

ALL CONTROLLED LIGHTING SHALL TURN OFF AFTER THE DURATION OF TIME NOTED IN UNIVERSITY OF MICHIGAN MASTER SPECIFICATION SECTION 262726, PART 3.

SMALL ROOM LINE VOLTAGE LIGHTING CONTROL DIAGRAM

OFF	0%	0%	0%

ENGINEER OF RECORD SHALL CUSTOMIZE THIS SCENE TABLE PER INDIVIDUAL PROJECT REQUIREMENTS.

IT IS ANTICIPATED THAT THIS DETAIL WILL HAVE LIMITED USE. ENGINEER OF RECORD SHALL GET CONFIRMATION FROM AEC PRIOR TO USING THIS SYSTEM IN ANY SPACE.

- NOTES:
1. MAKE AND MODEL OF ALL LIGHTING CONTROL DEVICES SHALL BE COMPLIANT WITH THE UNIVERSITY OF MICHIGAN MASTER SPECIFICATION SECTION 262726 FOR WIRING DEVICES.
 2. E.C. SHALL PROVIDE ALL WIRING AND CAT 5E CABLING REQUIRED FOR A COMPLETE AND FULLY FUNCTIONAL LIGHTING SYSTEM.

MULTIPLE PRESET SCENE LOW VOLTAGE LIGHTING CONTROL DIAGRAM

NO SCALE

26272607.dgn

SEQUENCE OF OPERATION FOR CONTROLLED SCENES:

THE SYSTEM MANUFACTURER SHALL WORK WITH THE OWNER'S REPRESENTATIVE TO DIM EACH ZONE AND PROGRAM EACH SCENE AS PART OF THE COMMISSIONING PROCESS.

FIXTURES WITH AN 'NL/EM' OR 'NL' DESIGNATION SHALL NOT BE CONTROLLED. THEY SHALL BURN FULL OUTPUT 24 HOURS PER DAY, 7 DAYS PER WEEK.

UPON DETECTION OF OCCUPANCY, NO CONTROLLED LIGHTING SHALL COME ON. THE SYSTEM SHALL WAIT FOR A MANUAL INPUT AT THE CONTROL STATION.

THE SELECTION OF A PARTICULAR SCENE BUTTON SHALL ADJUST THE LIGHTING IN THE CONTROLLED AREA(S) FOR THAT SCENE TO THE PRE-PROGRAMMED LEVEL(S). THE SELECTION OF THE "ON" BUTTON SHALL DEFAULT TO SCENE 1.

ONCE A SCENE IS SELECTED, PRESSING A DIMMING BUTTON SHALL RAISE/LOWER THE LIGHTING FOR THE ENTIRE SCENE. INDIVIDUAL ZONES SHALL NOT BE INDEPENDANTLY CONTROLLED AFTER THE INITIAL PROGRAMMING OF THE SCENES.

UPON SYSTEM TIMEOUT OR PUSHING OF THE "OFF" BUTTON, THE SYSTEM SHALL REVERT TO THE ORIGINALLY PROGRAMMED LEVELS FOR ALL SCENES.

UPON LOSS OF POWER TO THE CONTROLLED AREA, EMERGENCY LIGHT FIXTURES SHALL ILLUMINATE TO THEIR FULL SPECIFIED EMERGENCY OUTPUT.

ALL CONTROLLED LIGHTING SHALL TURN OFF AFTER THE DURATION OF TIME NOTED IN UNIVERSITY OF MICHIGAN MASTER SPECIFICATION SECTION 262726, PART 3.

SENSOR SYSTEM - GENERAL NOTES:

1. ALL WIRING SHALL BE IN RACEWAYS.
2. USE TWO (OR MORE) JUNCTION BOXES, BOLTED TOGETHER AS NEEDED TO ACCOMMODATE WIRING OF DEVICES SO 277 VOLT, 120 VOLT AND 24 VOLT APPLICATIONS ARE NOT IN SAME BOX, OR RACEWAY. SUPPORT BOXES ABOVE CEILING, AT LOCATIONS OF SENSOR.
3. LIGHT SWITCHING WILL BE PLACED AT DOOR OF ROOM AND WILL ALLOW COMPLETE CONTROL OF LIGHTS WHEN ROOM IS OCCUPIED. PART OR ALL OF LIGHTING MAY BE TURNED OFF, OR BACK ON, AS NEEDED.
4. PROVIDE THREE-WAY SWITCHING IN NOTED ROOMS. IN SUCH ROOMS ONLY ONE "SENSOR SYSTEM" IS NEEDED. WIRE THREE-WAYS IN STANDARD FASHION.
5. NO OCCUPANCY SENSORS SHALL BE PLACED ON LIGHTING FOR CORRIDORS OR STAIRWAYS.
6. ALL SENSOR SYSTEM RELATED EQUIPMENTS SHALL BE FROM ONE MANUFACTURER.

SENSOR SYSTEM - REFERENCE NOTES:

- A** USE THESE CONTACTS FOR CONTROL OF HVAC VIA TEMPERATURE CONTROL SYSTEM. COORDINATE WIRING EXTENSIONS WITH TC CONTRACTOR.
- B** DIAGRAM SHOWS TWO LEVEL LIGHTING FOR (FIXTURES WITH 3 OR 4 LAMPS). FIXTURES WITH TWO LAMPS, OR AS NOTED OTHERWISE, WILL ONLY NEED AN LIGHT SWITCH.
- C** USE A 277 TO 24 VOLT POWER SUPPLY HAVING A 277 VOLTS, 20 AMP RATED CONTROL CONTACT CAPABLE OF SWITCHING POWER FOR LIGHTS. USE WATTSTOPPER A277-E, OR A FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- D** USE A 24 VOLT CONTROL RELAY WITH A 24 VOLT COIL, AND A 120 VOLT, 20 AMP CONTACT. USE WATTSTOPPER S-277-E, OR FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- E** USE A 360° SENSITIVITY, PASSIVE INFRARED SENSOR, HAVING 24 VOLT CONTROLS, AND MOUNTABLE IN THE CEILING. PLACE SENSOR IN CENTER OF ROOM TO BEST SENSE MOVEMENT THROUGHOUT ROOM. SENSOR SHALL HAVE HOUSING AND TRIM TO RESULT IN A CLEAN FINISHED LOOK IN CEILING WHEN INSTALLED. PROVIDE SENSOR IN WHITE. USE WATTSTOPPER CI-200, OR EQUIVALENT TO COVER 1200 SQUARE FEET, FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- F** SEE LIGHTING PLAN FOR CIRCUIT NUMBER. PLEASE NOTE THAT ONE CIRCUIT SERVES MULTIPLE ROOMS.
- G** SEE RECEPTACLE PANEL SCHEDULE FOR CIRCUIT NUMBERS. PLEASE NOTE THAT FAN COIL UNITS IN SEVERAL ROOMS MAY BE ON ONE CIRCUIT.

SCHEMATIC FOR OS F (LIGHTS, HVAC, FCU)

NO SCALE

26510011.dgn

SENSOR SYSTEM - GENERAL NOTES:

1. ALL WIRING SHALL BE IN RACEWAYS.
2. USE TWO (OR MORE) JUNCTION BOXES, BOLTED TOGETHER AS NEEDED TO ACCOMMODATE WIRING OF DEVICES SO 277 VOLT, 120 VOLT AND 24 VOLT APPLICATIONS ARE NOT IN SAME BOX, OR RACEWAY. SUPPORT BOXES ABOVE CEILING, AT LOCATIONS OF SENSOR.
3. LIGHT SWITCHING WILL BE PLACED AT DOOR OF ROOM AND WILL ALLOW COMPLETE CONTROL OF LIGHTS WHEN ROOM IS OCCUPIED. PART OR ALL OF LIGHTING MAY BE TURNED OFF, OR BACK ON, AS NEEDED.
4. PROVIDE THREE-WAY SWITCHING IN NOTED ROOMS. IN SUCH ROOMS ONLY ONE "SENSOR SYSTEM" IS NEEDED. WIRE THREE-WAYS IN STANDARD FASHION.
5. NO OCCUPANCY SENSORS SHALL BE PLACED ON LIGHTING FOR CORRIDORS OR STAIRWAYS.
6. ALL SENSOR SYSTEM RELATED EQUIPMENTS SHALL BE FROM ONE MANUFACTURER.

SENSOR SYSTEM - REFERENCE NOTES:

- A** USE THESE CONTACTS FOR CONTROL OF HVAC VIA TEMPERATURE CONTROL SYSTEM. COORDINATE WIRING EXTENSIONS WITH TC CONTRACTOR.
- B** DIAGRAM SHOWS TWO LEVEL LIGHTING FOR (FIXTURES WITH 3 OR 4 LAMPS). FIXTURES WITH TWO LAMPS, OR AS NOTED OTHERWISE, WILL ONLY NEED AN LIGHT SWITCH.
- C** USA A 277 TO 24 VOLT POWER SUPPLY HAVING A 277 VOLTS, 20 AMP RATED CONTROL CONTACT CAPABLE OF SWITCHING POWER FOR LIGHTS. USE WATTSTOPPER A277-E, OR A FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- D** USE A 24 VOLT CONTROL RELAY WITH A 24 VOLT COIL, AND A 120 VOLT, 20 AMP CONTACT. USE WATTSTOPPER S-277-E, OR FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- E** USE A DUAL TECHNOLOGY TYPE SENSOR UTILIZING PASSIVE INFRARED SENSOR AND ULTRASONIC DETECTION. SENSOR SHALL TURN ON WHEN BOTH TECHNOLOGIES ARE SENSED, AND SHALL TURN OFF WHEN NEITHER TECHNOLOGY IS SENSED. SENSOR TO COVER AREAS OF UP TO 1500 SQUARE FEET AND MOUNTABLE ON WALL. MOUNT SENSOR ON "LONG" WALL OF ROOM, CENTERED ON WALL, APPROXIMATELY 6" BELOW CEILING. USE WATTSTOPPER DT-100L WITH CM 100 MOUNTING BRACKET, OR FUNCTIONALLY EQUIVALENT DEVICE THAT IS APPROVED FOR PURPOSE SHOWN.
- F** SEE LIGHTING PLAN FOR CIRCUIT NUMBER. PLEASE NOTE THAT ONE CIRCUIT SERVES MULTIPLE ROOMS.
- G** SEE RECEPTACLE PANEL SCHEDULE FOR CIRCUIT NUMBERS. PLEASE NOTE THAT FAN COIL UNITS IN SEVERAL ROOMS MAY BE ON ONE CIRCUIT.

CONTROL WIRING FOR CONTACTOR

NOTE 1:
LABEL LIGHTING CONTACTOR
"BUILDING EXTERIOR LIGHTING CIRCUIT E-XXXX-X"
BUILDING NUMBER _____
SEQUENCE NUMBER _____

TYPICAL RISER FOR BUILDING-MOUNTED EXTERIOR LIGHTING POWER SOURCE

PART 1 - GENERAL

- A. Contact Miss Dig (1-800-482-7171) before performing any excavation work.
- B. Contact the University Electrical Inspectors for an inspection before backfilling any sleeves, conduits and junction boxes, and before energizing any circuits.
- C. During the installation of new wall lighting, the existing wall and Detroit Edison lighting shall be kept operational at the Contractor's expense. Coordinate with the University Electric Shop (Duane Briggs at 310-1041) for repairs to existing lighting.
- D. The University will provide the fixtures, lamps and base covers for the wall lighting. The contractor must pick them up from a North Campus warehouse on Baxter Road. Contact the University Electric Shop (Duane Briggs at 310-1041) to arrange for pick-up of these items.

PART 2 - PRODUCTS

- A. Fixture mounting components shall be as detailed on the drawings.
- B. Sleeves for underground site lighting installations shall be 6" Schedule 40 PVC, UL Labeled for use with 90 Deg.C cables, Cantex or Carlon.
- C. Conduits shall be Schedule 40 PVC, UL Labeled for use with 90 Deg.C cables, Cantex or Carlon.
- D. Junction boxes shall be pre-cast polymer concrete or polymer foam, heavy duty rated, one size larger than required by the NEC, bottomless, with a single piece cover engraved "UM Outside Lighting" and attached with pentahed stainless steel bolts. CDR Systems, Carson-Brooks or Quartzite.
- E. Marking tape shall be plastic, vinyl or mylar, 6" wide, red for electrical and orange for telephone circuits, and labeled to indicate the type of circuit buried below.
- F. Wire shall be single conductor stranded copper, with Type XHHW Insulation rated 90 Deg.C in dry locations and 75 Deg.C in wet locations, 600 volts. American Insulated Wire, Rockbestos, Rome, Service Wire, Southwire or Triangle.
- G. Terminations
 - 1. Connectors for splicing and terminating lighting conductors in junction boxes shall be Homac No. RAB4 or RAB6 "Flood Seal" only.
 - 2. Connectors for terminating lighting conductors in fixture bases shall be copper split bolt connectors with full tin plating. Blackburn 1HPW for #3 AWG wire and 4HPW for #6 AWG ground wire.
- H. Fuse holders for lighting fixtures shall be Bussmann TRON No. HEB-AA In-line, waterproof fuse holders rated 300 volts, 30 amps.
- I. Fuses for lighting fixtures shall be Bussmann No. KTK-5 rated 5 amps.

PART 3 - EXECUTION

- A. Sleeves
 - 1. Sleeves shall be buried at a minimum depth of 24" to their top. Sleeves shall extend a minimum of 12" beyond the pavement they pass under.
 - 2. Sleeves shall be taped closed at both ends with duct tape.
 - 3. Sleeve ends shall be marked with steel stakes, pipes or conduits that are 3' long minimum, driven vertically down at the sleeve ends to a depth of 6" below grade to their top.
- B. Conduits
 - 1. Conduit bends shall not be smaller than the radius of standard manufactured elbows (7-1/4" bend radius for 1-1/4" conduit).
 - 2. Locate underground conduits as close to curbs, sidewalks and walls as possible to avoid interferences with future landscaping.
 - 3. Where conduits can not be installed at a minimum depth of 24", install rigid steel conduits or pour concrete over the conduits in accordance with NEC Table 300-5.
- C. Junction Boxes
 - 1. Keep the number of junction boxes to a minimum. Splice inside fixtures wherever possible. Stagger splices as required to fit.
 - 2. Locate junction boxes in mulched areas wherever possible. The top of the junction box shall be level with the existing grade.
 - 3. Install junction boxes on a base of pea gravel or Class 2 sand at least 1'-0" deep.
 - 4. Provide metal barriers in junction boxes containing circuits of two different voltages or containing both power and telephone circuits.
- D. Sleeves and conduits shall be marked for their entire length with a marking tape buried 12" above them.
- E. Fixture bases shall be plumb.
- F. Lighting fixtures shall be aligned so that one spoke of the globe basket is perpendicular to the wall.
- G. The center band of lighting fixtures shall be level.
- H. Terminations
 - 1. Provide one fuse holder and fuse for each globe.
 - 2. Provide adequate slack in the fixture conductors so that the conductors can be pulled out for maintenance.

1. Grounding

- 1. Provide a 1/2" minimum diameter copper ground rod 8' minimum long for each light fixture.
- 2. Provide exothermic weld type ground connections or acorn clamps for concealed, underground and concrete encased ground connections, splices and taps.
- 3. Coordinate carefully with general contractor to insure needed conduits, wire, backfill, fixture mounting components and other materials are scheduled and installed to allow for required electrical inspections and proper long term operation of the lighting systems.

NOTES:

1. EMERGENCY TELEPHONE MANUFACTURED BY GAI-TRONICS CORP., MODEL 397-001. TELEPHONE AND TELEPHONE CABLE FURNISHED AND INSTALLED BY ITSComm. BACKBOX FURNISHED BY ITSComm AND INSTALLED BY CONTRACTOR.
2. TELEPHONE IS 10" TALL X 8.5" WIDE X 2.5' DEEP AND INCLUDES A FLUSH MOUNT BACK BOX. FLUSH MOUNT TELEPHONE UNLESS SURFACE MOUNTING IS SHOWN ON PLAN DRAWING. TO SURFACE MOUNT, REQUEST OPTIONAL GAI-TRONICS MODEL 238 BACK BOX FROM ITSComm.
3. MOUNT TELEPHONE SO TOP OF RED EMERGENCY CALL BUTTON IS CLOSE TO BUT NO MORE THAN 48" ABOVE FINISHED FLOOR.
4. PROVIDE TELECOM CONDUIT AND ASSOCIATED FITTINGS.
5. BOND THE TELECOM CONDUIT AT THE TELECOM CABLE TRAY OR TELECOM ROOM GROUND BUS BAR.
6. PROVIDE 24" WIDE X 13" TALL LAMINATED PLASTIC SIGN WITH BLACK TEXT AND GRAPHIC ON WHITE BACKGROUND AS SHOWN. TEXT SHALL COMPLY WITH ADA SECTION 703.5. BRAILLE SHALL COMPLY WITH ADA SECTION 703.3. MOUNT SIGN IN COMPLIANCE WITH ADA SECTIONS 703.5.5 AND 703.5.6 SO BASELINE OF CHARACTERS IS A MINIMUM OF 40" ABOVE FINISHED FLOOR.
7. UM PROJECT MANAGER SHALL ARRANGE FOR ITSComm TO PROVIDE A DEDICATED TELEPHONE IN THE BUILDING'S FIRE COMMAND CENTER (IF FIRE COMMAND CENTER EXISTS). EACH AREA OF REFUGE TWO-WAY COMMUNICATION DEVICE SHALL BE PROGRAMMED BY ITSComm TO RING DIRECTLY TO THE BUILDING FIRE COMMAND CENTER PHONE. IF THE CALL IS NOT ANSWERED IN 3 RINGS, THE CALL SHALL AUTOMATICALLY BE TRANSFERRED TO THE U OF M DPSS COMMAND CENTER.
8. IF THE PROJECT DOES NOT INCLUDE A FIRE COMMAND CENTER, EACH AREA OF REFUGE TWO-WAY COMMUNICATION DEVICE SHALL BE PROGRAMMED TO RING DIRECTLY TO THE UM DPSS COMMAND CENTER.

GENERAL NOTES

1. RACEWAYS TO MOST CARD READERS, ETC., NOT SHOWN HERE, TYPICALLY MINIMUM 1" (AS NOTED ON ELEVATION ABOVE) TO EACH CARD READER LOCATION.
2. ALTERNATE MOUNTING CONFIGURATIONS MAY BE REQUIRED FOR PANEL INSTALLATIONS IN EXISTING CLOSETS. SUBMITTALS REQUIRED.
3. MOUNT PANEL ASSEMBLY TO $\frac{3}{4}$ " PLYWOOD BACKING BY ARCHITECTURAL TRADES.
4. REFER TO SPECIFICATION SECTION 281300 ACCESS CONTROL AND MONITORING SYSTEM FOR DETAILED INFORMATION REGARDING ASSEMBLY COMPONENTS.

REFERENCE NOTES

- ① PROVIDE MINIMUM OF (2) DEDICATED 120V, 20A CIRCUITS TO POWER SUPPLIES FOR ACCESS CONTROL PANELS AND LOCKS. INSTALL LOCKS ON BREAKERS. PROVIDE ADDITIONAL CIRCUITS AS MAY BE REQUIRED FROM SYSTEM REQUIREMENTS.
- ② 4"x4" METAL LAY-IN NEMA 1 TYPE HINGE COVER WIREWAY FOR LOW VOLTAGE, INTER-PANEL WIRING. PROVIDE IN LIGHT GRAY. HOFFMAN F44G SERIES.
- ③ INSTALL BUSHINGS IN PANEL SIDES AS NEEDED TO ALLOW WIRING TO REACH WIREWAY.
- ④ CLEAR SPACE FOR CONDUIT EXITS. CONDUITS MAY EXIT ABOVE OR BELOW.
- ⑤ PROVIDE ONE POWER SUPPLY WITH BATTERY BACK-UP SIZED PER SPECIFICATION.
- ⑥ PROVIDE POWER SUPPLY FOR READER HEAT.
- ⑦ PROVIDE POWER SUPPLY FOR ACCESS CONTROL PANEL.

PROPERTY OF THE UNIVERSITY OF MICHIGAN.
NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT

TYP. INSTALLATION FOR CARD READER PANEL IN BUILDING

NOTE: NEW DOOR CONNECT TO EXISTING LEVEL ACCESS CONTROL SYSTEM. ELECTRICAL CONTRACTOR SHALL PROVIDE COMPOSITE CABLE FROM ACCESS CONTROL PANEL TO EACH DOOR. PROVIDE CONDUIT AND/OR CABLE SUPPORT AS REQUIRED PER NEC. RUN CABLES IN UNBROKEN LENGTHS FROM CONTROL PANEL TO EACH DOOR. COORDINATE SPECIFIC CABLE REQUIREMENTS WITH SECURITY CONTRACTOR. SECURITY CONTRACTOR SHALL PROVIDE FINAL CONNECTIONS, PROGRAMMING AND CONTROL PANEL MODIFICATION. APPROVED SECURITY CONTRACTOR: D/A CENTRAL, 13155 CLOVERDALE, OAK PARK MI. 48237 (248) 399-0600 TERRY WOYCIK x116

GENERAL NOTES

1. ALL RACEWAYS INCLUDING JUNCTION BOXES TO BE RECESSED UNLESS OTHERWISE NOTED.
2. DETERMINE EXACT RACEWAY ROUTING BASED ON FIELD CONDITIONS.
3. POWER FOR ELECTRIFIED DEVICES OBTAINED FROM POWER SUPPLIES AT ACCESS CONTROL PANEL ASSEMBLY UNLESS OTHERWISE NOTED.
4. PROVIDE WEATHER-PROOF (WP) JUNCTION BOXES
5. WIRE SIZES SHALL BE IN ACCORDANCE WITH MANUFACTURERS INSTRUCTIONS.
6. SEE 03710 FOR SEQUENCE OF OPERATIONS.

LEGEND

CR	CARD READER. MOUNT ON JUNCTION BOX ON UNSECURED SIDE OF DOOR. (CARD READER OWNER FURNISHED, CONTRACTOR INSTALLED)
DM	DOOR MONITOR CONTACT
EM	ELECTRIC MORTISE LOCKSET WITH REQUEST TO EXIT SWITCH
EPT	ELECTRICAL POWER TRANSFER
J	JIC-JUNCTION BOX, 6x6 MINIMUM. MOUNT ABOVE DROPPED CEILING ON SECURED SIDE OF DOOR. IF CEILING IS NOT REMOVABLE, PROVIDE ACCESS PANEL FOR MAINTENANCE.

PROPERTY OF THE UNIVERSITY OF MICHIGAN.

NOTES:

1. PROVIDE ALARM JUNCTION BOX, HOFFMAN NO. A-14N124 WITH NO. A-14N2LP PANEL, AND STANDARD SLOTTED FLUSH LATCH.
2. FINAL LOCATION OF ANTENNA TO BE SELECTED BY U OF M RADIO SHOP.
3. ANTENNA CONDUIT SHALL HAVE A MAXIMUM OF TWO 90 DEGREE BENDS WITH A MINIMUM BEND RADIUS OF 6". IF THIS IS NOT POSSIBLE, INSTALL 6"x6"x4" JB'S AT BENDS TO MEET THIS REQUIREMENT. THE COAX RUN FROM RTU TO ANTENNA SHALL NOT EXCEED 50'.
4. PROVIDE A GREENLEE CONDUIT MEASURING TAPE: PART # 435 FROM MC-EDGE RTU BOX TO ANTENNA.
5. ALL CONDUITS SHALL ENTER RTU BOX WITHIN 6" OF CORNERS TO PREVENT INTERFERENCE WITH RTU ELECTRONICS INSTALLATION.
6. PROVIDE 12 CONDUCTOR (MINIMUM) CABLE COMPATIBLE WITH FIRE ALARM SYSTEM INSTALLED IN BUILDING. CONNECT ONE PAIR OF WIRES TO "BUILDING FIRE ALARM" CONTACTS IN THE FIRE ALARM CONTROL PANEL, ONE PAIR TO "FIRE ALARM SUPERVISORY", ONE PAIR TO "FIRE ALARM SYSTEM TROUBLE" AND ONE PAIR TO "FIRE ALARM SYSTEM MAINTENANCE ALERT". THE REMAINING CONDUCTORS ARE SPARES. THE CONTACTS IN THE FIRE ALARM CONTROL PANEL SHALL BE NORMALLY CLOSED SO CIRCUITS CAN BE SUPERVISED.
7. PROVIDE DEDICATED, LOCKING 20A, 1-P CIRCUIT BREAKER & CIRCUIT W/INSULATED GROUND WIRE TO MC-EDGE. PROVIDE QUAD RECEPTACLES ON DEDICATED CIRCUIT. INSIDE OF ALARM JUNCTION BOX. INSTALL LOCK ON BRANCH CIRCUIT BREAKER SERVING FIRE ALARM PANEL.
8. U of M RADIO SHOP PROVIDES MC-EDGE RTU BOX, ELECTRONICS IN MC-EDGE RTU AND ALARM JUNCTION BOXES, ANTENNA CABLE, ANTENNA, FINAL MC-EDGE RTU CONNECTIONS AND PROGRAMMING, FINAL CONNECTIONS IN ALARM JUNCTION BOX AND ANTENNA INSTALLATION & CONNECTIONS.
9. PROVIDE 22AWG, 25 TWISTED PAIR JACKETED CABLE.
10. PROVIDE 6 CONDUCTOR (MINIMUM) CABLE. CONNECT ONE PAIR OF WIRES TO "FIRE PUMP RUNNING" CONTACTS IN FIRE PUMP CONTROLLER AND ONE PAIR TO "FIRE PUMP TROUBLE". THE REMAINING CONDUCTORS ARE SPARES. THE CONTACTS IN FIRE PUMP CONTROLLER SHALL BE NORMALLY CLOSED.
11. RF SITES LOCATED AT WOLVERINE TOWER, WEISER HALL, NC SERVICE BUILDING #1, AND MOTT'S CHILDRENS HOSPITAL.

**PROPERTY OF THE UNIVERSITY OF MICHIGAN.
NOT TO BE DISCLOSED TO PERSONS OUTSIDE OF THIS PROJECT.**

NOTES

1. THE FOLLOWING IS A MATERIAL LIST FOR THE HEARING ASSISTANCE SYSTEM.

- PHONIC EAR MODEL PE-550T FM TRANSMITTER. TRANSMITTERS SHALL BE TUNABLE FOR CHANNELS 33, 35, 36, 37, & 38.
- PHONIC EAR MODEL AT-209A PLUG IN POWER SUPPLY UNITS.
- PHONIC EAR MODEL AT-565 ANTENNA WITH PHONIC EAR MODEL AT-567 GROUNDING PLANE.
- 100 FOOT SECTIONS OF (XLR) CABLE, WITH CONNECTORS, TO GO BETWEEN THE TRANSMITTER AND ANTENNA.
- PHONIC EAR MODEL AT-575 RACK MOUNTING KITS.
- PHONIC EAR PE-350 R SIX CHANNEL FM RECEIVERS TUNABLE FOR CHANNELS 33, 34, 35, 36, 37, & 38.
- PHONIC EAR MODEL AT-541 WALKMAN STYLE HEADPHONE.
- PHONIC EAR MODEL AT-538M MONAURAL EARBUD UNITS.
- PHONIC EAR MODEL AT-538S BINAURAL EARBUD UNITS.
- PHONIC EAR MODEL AT-163-B TELELOOP UNITS WITH PHONIC EAR MODEL AT-1543 CONNECTORS.

2. THE ADA REQUIRES THE NUMBER OF RECEIVERS TO BE NO LESS THAN 4% OF THE NUMBER OF SEATS, AND IN NO CASE LESS THAN TWO RECEIVERS. SO A 100 SEAT ROOM WILL REQUIRE 4 RECEIVERS.

- B** PANEL MOUNTING BNC-BNC FEED THROUGH.
- J** PANEL MOUNTING ¼" PHONE JACK.
- M** PANEL MOUNTING MICROPHONE JACK.
- 1** SPECIAL "TSC" THREADED COAXIAL CONNECTOR. SEE "WIRING DETAIL HEARING ASSISTANCE ANTENNA"

REFERENCE NOTES

- 1 DETECTOR SHALL BE SUPPLIED AND DEVICE CONNECTIONS MADE BY THE FIRE ALARM SYSTEM CONTRACTOR.
- 2 DETECTOR SHALL BE WIRED TO ITS OWN ZONE, OR SHALL BE ASSIGNED ITS OWN ADDRESS IN THE ADDRESSABLE FIRE ALARM SYSTEM.
- 3 DETECTOR SHALL BE RESETTABLE FROM THE FIRE ALARM CONTROL PANEL.
- 4 UPDATE FIRE ALARM SYSTEM ANNUNCIATOR AND ZONE/ADDRESS LIST FOR EACH DUCT SMOKE DETECTOR.
- 5 CABLE & CONDUIT FOR DETECTOR & INTERFACE BOX SHALL BE FURNISHED BY ELECTRICAL CONTRACTOR. DETECTOR LOCATION AND TEMPERATURE CONTROL WIRING TO INTERFACE BOX SHALL BE INSTALLED BY THE TEMPERATURE CONTROLS CONTRACTOR
- 6 USE 4" SQUARE DEEP BOX WITH 4 TERMINAL, TERMINAL STRIP INSTALLED INSIDE. STRIP TO BE 120 VOLT RATED.
- 7 INTERFACE BOX AND CONTROLLED OUTPUT DEVICE (OF FIRE ALARM SYSTEM) SHOULD BE CLOSE TO MOTOR STARTER OF ASSOCIATED FAN SYSTEM.
- 8 PAINT INTERFACE BOX EXTERIOR AND COVER RED AND BLUE; FIRE ALARM SYSTEM HALF IS RED, TEMPERATURE CONTROL SIDE IS BLUE
- 9 PLACE AND INSTALL DUCT SMOKE DETECTOR IN AN ACCESSIBLE LOCATIONS, AND IN FULL COMPLIANCE WITH SMOKE DETECTOR MANUFACTURER'S PLACEMENT AND INSTRUCTIONS.

GENERAL NOTES

1. THE CONTRACTORS SHALL VERIFY LOCATIONS OF ALL U/G UTILITY LINES AND NOTIFY "MISS DIG" 811 PRIOR TO EXCAVATING. THE CONTRACTOR WILL BE RESPONSIBLE TO REPAIR ANY UTILITY LINE DAMAGED BY CONSTRUCTION ACTIVITIES.
2. IF PLAN INFORMATION INDICATES AN EXISTING UNDERGROUND UTILITY IS OR WILL BE OUT OF SERVICE WITHIN THE LIMITS OF THIS CONTRACT, THE CONTRACTOR IS CAUTIONED TO TREAT SUCH A LINE AS IF IT WERE STILL IN SERVICE AND NOTIFY "MISS DIG" WHEN WORKING IN THE AREA OF THE OUT OF SERVICE FACILITY.
3. ALL WORK SHALL BE COMPLETED IN CONFORMANCE WITH CURRENT ADA STANDARDS.
4. ALL MATERIALS, EQUIPMENT AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE CURRENT UNIVERSITY OF MICHIGAN STANDARD SPECIFICATIONS FOR CONSTRUCTION AND THE MICHIGAN DEPARTMENT OF TRANSPORTATION STANDARD SPECIFICATIONS FOR CONSTRUCTION.
5. THE OMISSION OF ANY CURRENT STANDARD DETAIL DOES NOT RELIEVE THE CONTRACTORS OF THEIR OBLIGATION TO CONSTRUCT ITEMS IN COMPLETE ACCORDANCE WITH U-M AND CITY OF ANN ARBOR STANDARD SPECIFICATIONS, AS WELL AS FOLLOW CURRENT MDOT STANDARD SPECIFICATIONS FOR CONSTRUCTION.
6. ALL WORK WITHIN CITY OF ANN ARBOR RIGHT-OF-WAY (ROW) SHALL MEET OR EXCEED THE CURRENT CITY OF ANN ARBOR STANDARD SPECIFICATIONS FOR CONSTRUCTION.
7. CONTRACTOR IS RESPONSIBLE FOR ALL PERMITS & FEES – ALLOW ADEQUATE TIME FOR OBTAINING PERMITS. CITY OF ANN ARBOR BARRICADE PERMIT IS REQUIRED IF CONTRACTOR IS INSTALLING BARRICADED IN THE ROW TO ACCESS WORK NOT IN ROW. A CITY OF ANN ARBOR ROW PERMIT IS REQUIRED TO PERFORM WORK IN THE CITY OF ANN ARBOR ROW, INCLUDING SIDEWALK RESTORATION. A CITY OF ANN ARBOR TRAFFIC CONTROL PERMIT IS REQUIRED TO IMPACT A LANE OF TRAFFIC IN THE CITY OF ANN ARBOR ROW, INCLUDING VEHICULAR DETOURS OR LANE CLOSURES. *(NOTE TO DESIGNER – EDIT AS JOB APPROPRIATE)*
8. WALKS WITHIN THE CITY ROW SHALL BE INSPECTED BY THE CITY OF ANN ARBOR ACCORDING TO THE CITY STANDARDS.
9. ALL BARRICADES AND TRAFFIC CONTROL REQUIRED SHALL BE PROVIDED BY THE CONTRACTOR AND MEET MMUTCD REQUIREMENTS. ALL PEDESTRIAN BARRICADES SHALL MEET MDOT ADA PEDESTRIAN RAIL REQUIREMENTS.
10. CONTRACTOR SHALL PROVIDE A PEDESTRIAN DETOUR IN ALL INSTANCES WHERE A SIDEWALK WIDTH IS CLOSED OR REDUCED TO LESS THAN 5 FEET IN WIDTH. THIS INCLUDES BUT NOT LIMITED TO BARRICADES, SIDEWALK CLOSED, DETOUR ARROWS AS OUTLINED IN THE MMUTCD.
11. CONTRACTOR SHALL CONTACT REPUBLIC PARKING (734-761-7235) TO COORDINATE ANY NECESSARY CLOSURE OF CITY OF ANN ARBOR ON-STREET PARKING AND SHALL PAY ANY ASSOCIATED

FEES. TEMPORARY RESTRICTION OF ON-STREET PARKING (NON-METERED) IS ARRANGED THROUGH CITY OF ANN ARBOR ENGINEERING AFTER PAYMENT OF FEES.

12. IT IS THE CONTRACTOR'S RESPONSIBILITY FOR INSTALLATION OF SESC CONTROL MATERIALS. THE CONTRACTOR SHALL PROVIDE, INSTALL AND MAINTAIN INLET FILTER BAGS ON ALL STORM WATER INLETS IN THE VICINITY OF THE PROJECT SITE WHICH MAY RECEIVE STORM WATER RUNOFF FROM THE SITE. THE CONTRACTOR SHALL REMOVE THE INLET FILTER BAGS AT THE CONCLUSION OF THE PROJECT WORK.

13. CONTRACTORS SHALL AVOID NOISE GENERATING WORK AROUND CAMPUS BUILDINGS DURING UNIVERSITY SEMESTER EXAM PERIODS.

14. MATERIAL TESTING WILL BE PROVIDED BY A 3RD PARTY HIRED BY OWNER. CONTRACTOR IS RESPONSIBLE FOR COORDINATION OF ALL MATERIAL TESTING.

15. NO EQUIPMENT OR VEHICLES MAY BE PARKED IN LAWN OR LANDSCAPED AREAS WITHOUT PRIOR APPROVAL BY U-M PROJECT MANAGER.

16. NO STORAGE OF MATERIALS, PARKING, OR DRIVING IS ALLOWED WITHIN THE LIMITS OF TREE CANOPIES.

17. EGRESS TO BUILDINGS SHALL BE MAINTAINED AT ALL TIMES - WORK WITH U-M PROJECT MANAGER TO COORDINATE ANY LOCATIONS WHERE WORK WILL CUT OFF BUILDING ACCESS.

18. MAINTAIN VISIBILITY AND ACCESSIBILITY TO FIRE HYDRANTS AND BUILDING FIRE DEPARTMENT CONNECTION LOCATIONS.

19. GOOD HOUSEKEEPING PRACTICES MUST BE EMPLOYED AT THE JOB SITE. MINIMIZE DUST.

20. ALL DISTURBED U-M LANDSCAPE GRASS AREAS SHALL BE RESTORED BY THE CONTRACTOR BY INSTALLING A MINIMUM OF 6" OF TOP SOIL, SEED AND MULCH OR HYDROSEED UNLESS NOTED OTHERWISE.

21. ALL BROKEN ASPHALT, CONCRETE, & DEBRIS SHALL BECOME THE PROPERTY OF THE CONTRACTOR AND SHALL BE PROPERLY REMOVED FROM THE SITE PRIOR TO THE COMPLETION OF THE CONTRACT. NO STOCK PILING WILL BE ALLOWED ON SITE.

22. SEQUENCING OF WORK IS TO BE APPROVED BY PROJECT MANAGER PRIOR TO STARTING CONSTRUCTION.

23. PARKING LOT LIGHTING WORK WILL BE CARRIED OUT BY U-M PLANT POWER AND LIGHTING SHOP. CONTRACTOR SHALL COORDINATE GRADING & U/G WORK WITH DAVE LAMMERS AT 734-647-2049. COORDINATE SITE LIGHTING WORK AND PANEL ACCESS FOR SHUTDOWNS WITH U-M POWER AND LIGHTING, DAVE LAMMERS AT 734-647-2049. *(NOTE TO DESIGNER – EDIT AS JOB APPROPRIATE)*

CITY OF ANN ARBOR GENERAL NOTES

1. PER CHAPTER 49, SECTION 4:58 OF CITY CODE: ALL SIDEWALKS WITHIN THE CITY SHALL BE KEPT AND MAINTAINED IN GOOD REPAIR BY THE OWNER OF THE LAND, ADJACENT TO AND ABUTTING UPON THE

SAME; AND IF ANY OWNER SHALL NEGLECT TO KEEP AND MAINTAIN THE SIDEWALK OR ANY WALKS AND RAMPS LEADING TO A CROSSWALK ALONG THE FRONT, REAR, SIDE OF THE LAND IN GOOD REPAIR AND SAFE FOR THE USE OF THE PUBLIC, THE SAID OWNER SHALL BE LIABLE TO THE CITY FOR ANY DAMAGES RECOVERED AGAINST THE CITY SUSTAINED BY ANY PERSON OF SAID SIDEWALK BEING UNSAFE AND OUT OF REPAIR. CONTRACTOR WILL REPLACE ANY DAMAGED SIDEWALK (FULL FLAGS) AS A RESULT OF CONTRACTOR OPERATIONS.

2. THE CONSTRUCTION OF ANY PUBLIC UTILITY AND WORK WITHIN THE CITY OF ANN ARBOR RIGHT OF WAY COVERED BY THESE PLANS SHALL CONFORM TO THE CURRENT CITY OF ANN ARBOR PUBLIC SERVICES STANDARD SPECIFICATIONS AND SUBSEQUENT UPDATES.

3. THE CONTRACTOR SHALL TAKE ALL NECESSARY PRECAUTIONS TO PROTECT THE EXISTING PUBLIC ROAD PAVEMENT SURFACES TO REMAIN. DAMAGE TO THE ROAD PAVEMENT DURING THE COURSE OF CONSTRUCTION MAY NECESSITATE MILLING AND RESURFACING OF THE DAMAGED AREAS AT THE COST OF THE CONTRACTOR AND PRIOR TO PROJECT ACCEPTANCE.

4. PAVEMENT MARKINGS DISTURBED DUE TO PAVEMENT CUTS OR CONSTRUCTION RELATED ACTIVITIES SHALL BE REPLACED AS DIRECTED BY ENGINEERING. REPLACEMENT DURING CONSTRUCTION OF THE PROJECT MAY BE CONSIDERED TEMPORARY, WITH FINAL PAVEMENT MARKING RESTORATION TO OCCUR AT THE END OF THE PROJECT.

CONCRETE NOTES

1. ALL CONCRETE SHALL BE 4000 PSI MINIMUM COMPRESSIVE STRENGTH AT 28 DAYS AND CONSIST OF AIR ENTRAINED PORTLAND CEMENT WITH A TOTAL AIR CONTENT OF NOT LESS THAN 5% AND NOT MORE THAN 8%. CEMENT CONTENT SHALL BE MINIMUM OF SIX BAGS PER CUBIC YARD. THE SLUMP SHALL NOT BE MORE THAN 4 INCHES NOR LESS THAN 1- 1/2" AS DETERMINED BY THE SLUMP CONE TEST ASTM-143. SLUMP GREATER THAN 5" WITH USE OF AN ADMIXTURE REQUIRES ENGINEER AND U-M PROJECT MANAGER APPROVAL. CONC. WALKS AND PAVEMENT SHALL INCLUDE POLYPROPYLENE FIBRILLATED FIBERS WITH A VOLUME OF 1.5 LBS/CY. ALL MATERIALS, EQUIPMENT AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH MICHIGAN DEPARTMENT OF TRANSPORTATION SPECIFICATIONS FOR CONSTRUCTION.

2. CONCRETE CURING COMPOUND SHALL BE CLEAR MEMBRANE CONFORMING TO ASTM C-309, TYPE I OR II, CLASS A AND B AND APPLIED AT A RATE OF NOT LESS THAN ONE GALLON PER 200 SQ. FT. OF CONCRETE SURFACE IMMEDIATELY AFTER FINISHING OPERATIONS ARE COMPLETE. CURING COMPOUND USED WITHIN CLOSE PROXIMITY OF BUILDING DOORS, WINDOWS OR AIR INTAKES SHALL BE WATER BASED.

3. GRANULAR MATERIAL SHALL BE A MINIMUM OF MDOT CLASS II COMPACTED TO 98% ASTM 1557 VALUE. GRANULAR MATERIAL WITHIN THE ROW SHALL MEET CITY OF ANN ARBOR CLASS II REQUIREMENTS. COMPACTED GRANULAR MATERIAL SHALL EXTEND HORIZONTALLY FOR MINIMUM DISTANCE OF 6" BEYOND THE EDGES OF NEW CONCRETE.

4. ALL PREPARED GRANULAR FILL BASE SHALL MEET COMPACTION REQUIREMENTS PRIOR TO THE SCHEDULING OF CONCRETE/PAVING MATERIAL DELIVERY. CONTRACTOR IS RESPONSIBLE FOR ALL COORDINATION OF REQUIRED MATERIAL TESTING.
5. PLACE CONCRETE ON A MOIST COMPACT BASE.
6. PROVIDE 1/2" THICK SEALED EXPANSION JOINTS AT ALL POINTS OF CONTACT WITH FIXED OBJECTS SUCH AS BUILDING, CURBS, PAVING, POLES, SIGNS AND HYDRANTS. EXPANSION JOINTS SHALL BE INCIDENTAL TO CONCRETE INSTALLATION.
7. PROVIDE HAND TOOLED CONTROL JOINTS IN CONCRETE WALKS TO FORM PANELS OF SIZES INDICATED OR MATCH EXISTING PATTERN. HAND TOOL 1/2" WIDE CONTROL JOINTS TO A MINIMUM DEPTH OF ONE (1) INCH. TOTAL DEPTH OF CONTROL JOINT SHALL BE 1/4 OF SLAB THICKNESS. FOR SLAB THICKNESS GREATER THAN 8", SAWCUTTING, IN ADDITION TO AND AFTER HAND TOOLING JOINTS, IS REQUIRED TO MEET A FINAL DEPTH OF 1/4 THICKNESS OF THE SLAB. SAWCUTTING SHALL OCCUR AS SOON AS POSSIBLE AND WITHIN 24 HOURS OF CONCRETE INSTALLATION. INITIAL SURFACE SAWCUT CONTROL JOINTS (SAWCUT ONLY) ARE PROHIBITED UNLESS APPROVED BY OWNER.
8. SAWCUT & GRINDING TOOLS MUST BE ATTACHED TO A WATER SOURCE OR A VACUUM DEVICE TO MINIMIZE DUST EXPOSURE.
9. SAWCUTTING FOR REMOVALS SHALL BE INCIDENTAL TO REMOVAL.

UTILITY NOTES

SANITARY SEWER

1. ALL SANITARY SEWER SPECIFIED AS PVC SHALL BE SDR26 POLYVINYL CHLORIDE (PVC) CONFORMING TO CURRENT ASTM DESIGNATION D3034-94, OR CURRENT REFERENCE FOR SDR 26, "STANDARD SPECIFICATIONS FOR TYPE PSM POLYVINYL CHLORIDE (PVC) SEWER IPE AND FITTINGS. PIPE SHALL HAVE AN INTEGRAL WALL, SDR26 BELL & SPIGOT RUBBER O-RING GASKET JOINTS, UNLESS NOTED OTHERWISE.
2. THE REPAIR OF SDR-26 PVC PIPE IS TO BE DONE WITH SDR-26 REPAIR COUPLINGS. FLEXIBLE BOOT CONNECTORS ARE NOT ALLOWED.
3. CONTRACTOR TO FOLLOW MDOT REQUIREMENTS FOR VIDEO INSPECTION OF SEWER PIPE. ALL PVC SANITARY SEWER MAINS SHALL BE MANDREL TESTED FOR DEFLECTION BY THE CONTRACTOR. NO PIPE SHALL EXCEED A DEFLECTION OF 5 PERCENT. IF DEFLECTION EXCEEDS 5 PERCENT, THE PIPE SHALL BE EXCAVATED AND REPLACED IN ACCORDANCE WITH REQUIREMENTS OF APPROVED SPECIFICATIONS. THE RIGID BALL OR MANDREL USED FOR THE DEFLECTION TEST SHALL HAVE A DIAMETER NOT LESS THAN 95 PERCENT OF THE BASE INSIDE DIAMETER OR AVERAGE INSIDE DIAMETER OF THE PIPE PER ASTM SPECIFICATION. THE TEST SHALL BE PERFORMED WITHOUT MANUAL PULLING DEVICES. SANITARY SEWER AIR TESTING SHALL BE BASED ON THE AUTHORITY HAVING JURISDICTION. THE CONTRACTOR SHALL FURNISH ALL LABOR, EQUIPMENT AND MATERIALS NECESSARY FOR TESTING AS INCIDENTAL TO THE SANITARY SEWER INSTALLATION.

STORM

1. REINFORCED CONCRETE PIPE (RCP) SHALL CONFORM TO THE REQUIREMENTS OF REINFORCED CONCRETE PIPE OF ASTM DESIGNATION C 76, CLASS IV, UNLESS OTHERWISE DESIGNATED ON THE PLANS. JOINTS FOR REINFORCED CONCRETE PIPE SHALL MEET ASTM C443 AND SHALL BE RUBBER GASKET FOR TONGUE AND GROOVE, FULL BELL AND SPIGOT RUBBER O-RING GASKET, OR MODIFIED GROOVED TONGUE WITH RUBBER GASKET.

2. STORM SEWER SPECIFIED AS HIGH DENSITY POLYETHYLENE (HDPE) SHALL MEET THE REQUIREMENTS OF AASHTO M294. THE PIPE SHALL BE CORRUGATED WITH AN INTEGRALLY FORMED SMOOTH INTERIOR. JOINTS SHALL BE GASKETED WATER TIGHT JOINTS USING WATERTIGHT SLEEVES. SLEEVES SHALL BE FACTORY INSTALLED ON ONE END OF THE PIPE WITH A FACTORY INSTALLED GASKET ON THE OPPOSITE END OF THE PIPE.

3. AFTER TRENCH BACKFILL AND COMPACTION IS COMPLETE, ENGINEER WILL SELECT AT LEAST 50% OF THE INSTALLED LENGTH OF EACH SIZE OF STORM SEWER HDPE PIPE FOR THE CONTRACTOR TO MANDREL TEST FOR DEFORMATION. UNLESS APPROVED OTHERWISE, CONTRACTOR TO PERFORM THE MANDREL TESTING FROM 5 TO 10 DAYS BEFORE PAVEMENT SURFACING OR COMPLETION OF FINAL GRADE. ALLOW TIME FOR CORRECTIVE ACTION. FOLLOW MDOT TESTING REQUIREMENTS FOR MANDREL TESTING OF HDPE STORM SEWERS. MANDREL TESTING IS INCIDENTAL TO HDPE STORM SEWER INSTALLATION.

4. CONTRACTOR TO FOLLOW MDOT AND CITY OF ANN ARBOR REQUIREMENTS FOR VIDEO INSPECTION OF SEWER PIPE. VIDEO INSPECTION IS NOT REQUIRED FOR EXTENSIONS OF EXISTING CATCH BASIN LEADS LESS THAN 20 FEET. ALLOW TIME FOR CORRECTIVE ACTION. THE CONTRACTOR SHALL FURNISH ALL LABOR, EQUIPMENT AND MATERIALS NECESSARY FOR ALL TESTING AND IS INCIDENTAL TO THE STORM SEWER INSTALLATION.

5. ALL U-M STORM SEWER LIDS (SOILD AND OPEN GRATED) SHALL HAVE THE ENVIRONMENTAL NOTICE AND THE WORD "STORM" CAST INTO THE LID. CITY STORM LIDS SHALL MEET CURRENT CITY STANDARDS. ALL CATCH BASIN GRATES/BACKS SHALL HAVE THE ENVIRONMENTAL NOTICE CAST. CONTRACT U-M EHS TO PROVIDE AN ALUMINUM STORM DRAIN MARKER TO BE CAST ADJACENT TO TRENCH DRAINS.

WATERMAIN

1. ALL MATERIALS, EQUIPMENT AND CONSTRUCTION SHALL BE IN ACCORDANCE WITH THE CURRENT CITY OF ANN ARBOR STANDARD SPECIFICATIONS AND DETAILS. THE OMISSION OF ANY CURRENT STANDARD DETAIL DOES NOT RELIEVE THE CONTRACTOR FROM THIS REQUIREMENT.

2. CONTRACTOR SHALL COORDINATE CITY OF ANN ARBOR INSPECTION A MINIMUM OF 72 HOURS PRIOR TO IMPACTING WATER MAINS.

3. DUCTILE IRON PIPE SHALL BE A MINIMUM THICKNESS OF CLASS 52 WITH POLYETHYLENE WRAP AND PUSH-ON JOINTS, UNLESS OTHERWISE NOTED.

4. GATE VALVES SHALL BE RESILIENT SEAT NON-RISING STEM PUSH-ON GATE VALVE WITH 2" SQUARE OPERATING NUT, OPENING RIGHT, COMPLETE WITH ACCESSORIES. GATE VALVE SHALL MEET AWWA

SPECIFICATION C509 OR C515 AND CURRENT CITY OF ANN ARBOR STANDARDS. SEE CITY OF ANN ARBOR [DIVISION III MATERIAL STANDARDS](#).

5. ALL HORIZONTAL BENDS, TEES AND FITTINGS SHALL INCLUDE THRUST BLOCKS. RESTRAINED JOINT GASKETS RATED FOR 350 PSI ARE REQUIRED FOR VERTICAL BENDS.

6. CITY CAPITAL COST RECOVERY CHARGES, PERMANENT METER FEES AND CITY CONSTRUCTION INSPECTION ESCROW FEE WILL BE PAID BY THE UNIVERSITY OF MICHIGAN. ANY INSPECTION FOR REWORK INCLUDING REPEAT BACTERIA TESTING WILL BE PAID BY THE UNIVERSITY AND BACK-CHARGED TO THE CONTRACTOR BY THE UNIVERSITY. TEMPORARY HYDRANT METER/WATER FEES AND/OR TESTING CORPORATIONS ARE TO BE PAID BY THE CONTRACTOR.

7. ALL WATER MAIN SHALL HAVE A TYPICAL 5.5 FT COVER. MAINTAIN A MINIMUM OF 18 INCHES VERTICAL CLEARANCE FOR STORM AND SANITARY CROSSINGS AND A MINIMUM OF 12 INCHES VERTICAL CLEARANCE WITH ALL OTHER UTILITIES.

8. UNLESS OTHERWISE NOTED, THE CONTRACTOR SHALL UTILIZE STANDARD ALLOWABLE PIPE DEFLECTIONS FOR THE PROPOSED ALIGNMENT.

9. FIRE HYDRANT ASSEMBLIES SHALL INCLUDE ALL NECESSARY THRUST BLOCKS, BENDS, PIPE AND FITTINGS, INCLUDING ADJUSTMENT OF THE STOP BOX. FIRE HYDRANT ASSEMBLY INCLUDES 6 INCH STOP BOX LOCATED 3 FEET FROM HYDRANT.

10. FIRE HYDRANTS SHALL CONFORM WITH THE CITY OF ANN ARBOR'S CURRENT FIRE HYDRANT STANDARDS AND SHALL BE EJ 5BR 250 FURNISHED WITH ONE 5" STORZ CONNECTION, ONE 3-3/8" ANN ARBOR PUMPER NOZZLE, A 1-3/8" PENTAGON OPERATING NUT, PUSH ON JOINT AND NO BARREL DRAIN. CITY OF ANN ARBOR FIRE HYDRANT PRODUCT NUMBER IS 55931D.

11. LINE STOPS SHALL BE INSTALLED WHERE EXISTING WATER MAINS CANNOT BE SUFFICIENTLY ISOLATED TO COMPLETE THE WORK. THE CITY OF ANN ARBOR IS NOT RESPONSIBLE FOR THE COST OF INSTALLING LINE STOPS.

12. WATER MAIN FITTINGS SUCH AS BLOW-OFF ASSEMBLIES, CONCRETE THRUST BLOCKS, SOLID SLEEVES AND MECHANICAL PLUGS WHICH ARE REQUIRED TO COMPLETE THE WORK, OTHER THAN THOSE SPECIFICALLY LISTED AS SEPARATE PAY ITEMS, SHALL NOT BE PAID FOR SEPARATELY BUT SHALL BE INCLUDED IN THE PIPE PAY ITEMS AND INCIDENTAL TO THE COST OF DOING THE WORK.

13. THE CONTRACTOR SHALL CONSTRUCT, FLUSH, AND BACTERIOLOGICALLY TEST THE WATERMAIN PER CITY OF ANN ARBOR SPECIFICATIONS. ALL CHLORINATED WATER SHALL BE DISCHARGED DIRECTLY INTO AN APPROVED SANITARY SEWER. THE CONTRACTOR SHALL SUPPLY ALL NECESSARY PERSONNEL, HOSES, FITTINGS, AND THE LIKE TO ACCOMPLISH THIS WORK AND IS INCIDENTAL TO THE INSTALLATION OF WATER MAIN.

14. HYDROSTATIC TESTING MUST BE PERFORMED IN ACCORDANCE WITH ANSI/AWWA C600. DISINFECTION AND BACTERIOLOGICAL TESTING MUST BE PERFORMED IN ACCORDANCE WITH ANSI/AWWA C651. ALL TESTING MUST BE COORDINATED WITH THE CITY OF ANN ARBOR AND BE PER CITY OF ANN ARBOR SPECIFICATIONS.

15. CONNECTIONS TO EXISTING WATER MAIN SHALL NOT BE MADE UNTIL THE NEW WATER MAIN HAS BEEN SUCCESSFULLY PRESSURE TESTED AND HAS PASSED BACTERIOLOGICAL TESTING. FINAL CONNECTIONS SHALL BE COORDINATED WITH THE ENGINEER. THE CONTRACTOR SHALL COORDINATE ALL WATER SYSTEM SHUT DOWNS WITH THE UNIVERSITY OF MICHIGAN AND THE CITY OF ANN ARBOR AFTER APPROPRIATE NOTIFICATIONS HAVE BEEN PROVIDED TO THOSE AFFECTED. CONTRACTOR SHALL NOT OPERATE VALVES OWNED BY THE CITY OF ANN ARBOR.

16. GATE WELL STRUCTURE FRAME AND COVERS SHALL BE EJCO 1040 WITH TYPE "A" LIDS WITH THE CITY OF ANN ARBOR ART WORK AND THE WORD "WATER" CAST ON THE LID.

**Notes – SESC and EHS General
Updated 9/11/15 by A&E Civil**

SOIL EROSION AND SEDIMENTATION CONTROL SEQUENCE

IN ACCORDANCE WITH RULE 1709 PROMULGATED UNDER THE AUTHORITY OF PART 91, SOIL EROSION AND SEDIMENTATION CONTROL, OF THE NATURAL RESOURCES AND ENVIRONMENTAL PROTECTION ACT, 1994PA 451, AS AMENDED, AND IN ADDITION TO THE INFORMATION IN THE PROJECT PLANS AND SPECIFICATIONS, THE FOLLOWING GENERAL CONDITIONS APPLY TO THE EARTH CHANGE AUTHORIZED BY THIS DOCUMENT:

1. DESIGN, CONSTRUCT, AND COMPLETE THE EARTH CHANGE IN A MANNER THAT LIMITS THE EXPOSED AREA OF DISTURBED LAND FOR THE SHORTEST PERIOD OF TIME.
2. REMOVE SEDIMENT CAUSED BY ACCELERATED SOIL EROSION FROM RUNOFF WATER BEFORE IT LEAVES THE SITE OF THE EARTH CHANGE.
3. TEMPORARY OR PERMANENT CONTROL MEASURES SHALL BE DESIGNED AND INSTALLED TO CONVEY WATER AROUND, THROUGH OR FROM THE EARTH CHANGE AT A NON-EROSIVE VELOCITY.
4. INSTALL TEMPORARY SOIL AND SEDIMENTATION CONTROL MEASURES BEFORE OR UPON COMMENCEMENT OF THE EARTH CHANGE ACTIVITY AND MAINTAIN THE MEASURES ON A DAILY BASIS. REMOVE TEMPORARY SOIL EROSION AND SEDIMENTATION CONTROL MEASURES AFTER PERMANENT SOIL EROSION MEASURES ARE IN PLACE AND THE AREA IS STABILIZED. (STABILIZED MEANS THE ESTABLISHMENT OF VEGETATION OR THE PROPER PLACEMENT, GRADING OR COVERING OF SOIL TO ENSURE RESISTANCE TO SOIL EROSION, SLIDING OR OTHER EARTH MOVEMENT.)
5. COMPLETE PERMANENT SOIL EROSION CONTROL MEASURES FOR THE EARTH CHANGE WITHIN FIVE (5) CALENDAR DAYS AFTER FINAL GRADING OR UPON COMPLETION OF FINAL EARTH CHANGE. IF IT IS NOT POSSIBLE TO PERMANENTLY STABILIZE THE EARTH CHANGE, THEN MAINTAIN TEMPORARY SOIL EROSION AND SEDIMENTATION CONTROL MEASURES UNTIL PERMANENT SOIL EROSION CONTROL MEASURES ARE IN PLACE AND STABILIZED.
6. THE CONTRACTOR IS RESPONSIBLE FOR MAINTAINING LANDSCAPING DURING THE WARRANTY PERIOD. AFTER THE WARRANTY HAS EXPIRED, THE PERMANENT SESC MEASURES WILL BE MAINTAINED BY UNIVERSITY OF MICHIGAN PLANT OPERATIONS GROUNDS AND WASTE DEPARTMENT AND THE PLUMBING SHOP AS APPROPRIATE. THE GROUNDS MANAGER WILL BE RESPONSIBLE FOR MAINTENANCE OF ANY PERMANENT LANDSCAPING SESC MEASURES. THE PLUMBING SHOP FOREMAN WILL BE RESPONSIBLE FOR THE MAINTENANCE OF ANY SESC MEASURES THAT ARE PART OF THE WATER DRAINAGE SYSTEM.

SOIL EROSION AND SEDIMENTATION CONTROL MAINTENANCE NOTES

1. INSTALL TEMPORARY INLET FILTERS AT ALL ADJACENT AND DOWN-GRADIENT STORM WATER INLETS, CATCH BASINS AND MANHOLES THAT MAY BE IMPACTED. CATCH BASIN INLET FILTERS SHALL BE MAINTAINED CLEAN AT ALL TIMES THROUGHOUT THE CONSTRUCTION PERIOD. IF A FILTER HAS HOLES OR IS INUNDATED WITH SEDIMENT, THE FILTER WILL REQUIRE REPLACEMENT.
2. INSTALL AN ANTI-TRACKING PAD AT THE SITE ENTRY AND EXIT(S), THE ANTI-TRACKING PAD SHOULD BE CONSTRUCTED OF GEOTEXTILE FABRIC WITH LIMESTONE OVER IT.

3. SILT FENCE SHALL BE MAINTAINED AT ALL TIMES THROUGHOUT THE CONSTRUCTION PERIOD. IF REPAIR OR REPLACEMENT IS NECESSARY, IT SHALL BE PERFORMED ACCORDING TO THE MANUFACTURER'S SPECIFICATIONS. MAINTENANCE INCLUDES THE REMOVING OF BUILT-UP SEDIMENT ACCUMULATES TO ½ THE HEIGHT OF THE FENCE. CONTRACTOR SHALL REMOVE, REPLACE, RETRENCH, OR RE-BACKFILL THE FENCE IF IT FAILS. ADDITIONALLY, THE CONTRACTOR SHALL REINSTALL ANY PORTION OF THE FENCING DAMAGED BY CONSTRUCTION MACHINERY.

4. PLACE STOCKPILES AND OTHER SPOIL PILES AWAY FROM THE DRAINAGE SYSTEM TO MINIMIZE SEDIMENT TRANSPORT. IF THE STOCKPILE AND/OR SPOIL PILE MUST REMAIN ON-SITE OVERNIGHT, OR IF THE WEATHER CONDITIONS INDICATE THE CHANCE FOR PRECIPITATION, A) COVER THE PILE WITH WATER REPELLENT MATERIAL TO PREVENT EROSION AND/OR B) INSTALL SILT FENCING AROUND THE BASE OF THE PILE TO PREVENT TRANSPORT OF SEDIMENT TO THE STORM WATER SYSTEM, OR APPLY OTHER CONTROL METHODS APPROPRIATE TO THE SIDE. CONTROL MEASURES TO GUARD AGAINST WIND EROSION MUST ALSO BE EMPLOYED, SUCH AS WETTING OR COVERING THE STOCKPILES. KEEP AS FEW STOCKPILES AS POSSIBLE DURING THE COURSE OF THE PROJECT.

5. THROUGHOUT THE CONSTRUCTION PERIOD, ALL MUD/SILT TRACKED ONTO EXISTING ROADS FROM THE SITE DUE TO CONSTRUCTION SHALL BE IMMEDIATELY REMOVED BY THE CONTRACTOR.

6. SEEDING OR OTHER STABILIZATION SHALL BE REQUIRED IMMEDIATELY TO AREAS WHICH HAVE BEEN DAMAGED BY RUNOFF.

7. THE CONTRACTOR SHALL MAINTAIN DUST CONTROL ON THE SITE THROUGHOUT THE DURATION OF THE CONSTRUCTION PROCESS.

8. WEEKLY INSPECTIONS BY A UNIVERSITY SESC TRAINED CERTIFIED STORM WATER MANAGEMENT OPERATOR AS WELL AS PERIODIC INSPECTIONS WITHIN 24 HOURS OF ANY RAINFALL WILL BE REQUIRED. THESE INSPECTIONS MAY RESULT IN RECOMMENDATIONS FOR ROUTINE MAINTENANCE OF THE SOIL EROSION CONTROL DEVICES, AS WELL AS ADDITIONAL CONTROLS.

GENERAL NOTES

1. DURING WORK ACTIVITIES IF SUSPECT CONTAMINATED SOIL, GROUNDWATER, OR OTHER UNKNOWN MATERIAL IS ENCOUNTERED CONTACT YOUR UNIVERSITY OF MICHIGAN CONSTRUCTION MANAGEMENT REPRESENTATIVE AND THE U-M OCCUPATIONAL SAFETY & ENVIRONMENTAL HEALTH DEPARTMENT (763-6973) IMMEDIATELY. SUSPECT CONTAMINATED SOIL MAY EXHIBIT CHEMICAL OR UNUSUAL ODORS, STAINING, UNUSUAL COLORING, AND/OR CONTAIN MAN-MADE DEBRIS. SUSPECT CONTAMINATED GROUNDWATER MAY EXHIBIT CHEMICAL OR UNUSUAL ODORS, UNUSUAL COLORING, AND/OR SHEEN. IMMEDIATELY CEASE ALL EXCAVATION, DEWATERING, TRANSPORT, OR DISTURBANCE OF THE SUSPECT MATERIAL UNTIL GIVEN DIRECTION BY THE U-M CONSTRUCTION MANAGEMENT REPRESENTATIVE.

2. MANAGEMENT AND DISPOSAL OF REGULATED WASTE MATERIALS. CONTRACTOR SHALL COORDINATE WITH EHS-HAZARDOUS MATERIALS MANAGEMENT (HMM) PROGRAM AT (753-4568) FOR THE REMOVAL OF ALL REGULATED WASTE MATERIALS. REGULATED WASTE MATERIALS INCLUDE, BUT ARE NOT LIMITED TO: USED CHEMICAL PRODUCTS, PAINTS, SOLVENTS, ADHESIVES, OILS, GREASES, CLEANERS, DEGREASERS, CONTAMINATED OR OILY RAGS, GLYCOLS, HEAT TRANSFER FLUIDS, AND BOILER CHEMICALS. A REPRESENTATIVE FROM THE EHS-HMM PROGRAM SHALL SIGN ALL WASTE DISPOSAL MANIFESTS FOR REGULATED WASTES. WASTE MATERIALS SHALL BE STAGED FOR PICK UP IN AREAS THAT ARE EASILY ACCESSIBLE TO EHS-HMM STAFF. WASTE CONTAINERS SHALL BE STORED ON A HARD SURFACE SUCH AS ASPHALT, CONCRETE, OR TILED FLOORING. ALL WASTE

CONTAINERS SHALL BE LABELED WITH EITHER A HAZARDOUS WASTE LABEL, OR A NON RCRA REGULATED WASTE LABEL AS APPROPRIATE. LABELS SHALL REMAIN VISIBLE, AND SHALL BE COMPLETED LEGIBLY. LABELS MAY BE OBTAINED BY CALLING EHS-HMM PROGRAM OFFICE. ALL CONTAINERS SHALL BE TIGHTLY CLOSED WHEN NOT ACTIVELY BEING FILLED. CONTAINERS SHALL BE INSPECTED DAILY FOR LEAKS, CLOSURE, LABELING AND CONTAINER INTEGRITY. CONTRACTOR SHALL PROVIDE U OF M EHS WITH MATERIALS SAFETY DATA SHEETS FOR ALL CHEMICALS USED IN THE PROJECT. CONTRACTOR SHALL CLEAN UP ALL SPILLS IMMEDIATELY. FOR SPILLS

3. CONCRETE, ASPHALT & SAWCUTTING WORK

UM PROJECTS SHALL NOT DISCHARGE TO THE SURFACE WATERS OF THE STATE ANY WASTEWATER GENERATED FROM CUTTING, GRINDING, DRILLING, OR HYDRODEMOLITION OF CONCRETE, INCLUDING ASPHALT WITHOUT AUTHORIZATION UNDER AN NPDES WASTEWATER DISCHARGE PERMIT.

THE FOLLOWING REQUIREMENTS APPLY:

- **DISCHARGE** OF WATER, DUST, OR DEBRIS FROM CONCRETE AND ASPHALT WORK TO STORM OR SANITARY SYSTEMS **IS PROHIBITED**.
- STORM DRAINS MUST BE PROTECTED FROM DUST AND DEBRIS.
- ANY WATER USED DURING CONCRETE AND ASPHALT WORK (INCLUDING SWEEPING AND SAW-CUTTING) MUST BE CONTAINED AND COLLECTED FOR PROPER DISPOSAL. SUGGESTED CONTROLS INCLUDE WET VACUUM, OR ABSORBENTS.
- GOOD HOUSEKEEPING PRACTICES MUST BE EMPLOYED AT THE JOBSITE. MINIMIZE DUST.
- PROJECTS SHALL NOT DISCHARGE TO THE SURFACE WATERS OF THE STATE ANY WASTEWATER GENERATED FROM CUTTING, GRINDING, DRILLING, HYDRO-DEMOLITION OF CONCRETE WITHOUT AUTHORIZATION UNDER A NPDES WASTEWATER DISCHARGE PERMIT.

4. CONCRETE AND GROUT WASHOUT

- A. DO NOT DISCHARGE CONCRETE/GROUT WASHOUT INTO STORM DRAINS, CATCH BASINS OR TO THE SANITARY SEWER SYSTEM. PERFORM WASHING OF CONCRETE TRUCKS IN DESIGNATED AREAS OR AN APPROVED OFFSITE LOCATION.
 - 1. DESIGNATED AREAS SHOULD BE CLEARLY LABELED. THEY SHOULD BE IN A PIT TO PREVENT RUN-OFF OF WASTE WATER. PLACE DESIGNATED AREAS A MINIMUM OF 50 FEET FROM STORM DRAINS, BODIES OF WATER AND DITCHES. ALL DESIGNATED AREAS SHOULD BE LINED TO PREVENT SEEPAGE AND SHOULD HAVE A BARRIER.
 - 2. ALTERNATIVE TO A DESIGNATED AREA: PROVIDE A CONCRETE BOX. IF ONLY A SMALL OF CONCRETE WASHINGS IS TO OCCUR, ONE OPTION IS TO LINE A ROLL-OFF BOX. FOR VERY SMALL PROJECTS THIS COULD BE DONE WITH A DRUM.
- B. ONCE CONCRETE WASHOUT HAS HARDENED, BREAK UP AND DISPOSE OF PROPERLY. DISPOSAL OF HARDENED CONCRETE/GROUT SHOULD OCCUR ON A REGULAR BASIS.
- C. WASHOUT FACILITIES MUST BE CLEANED, OR NEW FACILITIES PROVIDED ONCE THE WASHOUT AREA IS 75% FULL.

5. FERTILIZER

USE ONLY PHOSPHORUS-FREE FERTILIZERS ON TURFGRASS. PHOSPHORUS MAY BE ADDED TO TURFGRASS ONLY IF SOILS ARE TESTED (A MINIMUM OF ONCE EVERY FOUR (4) YEARS) AND A NEED FOR PHOSPHORUS IS DEMONSTRATED. PHOSPHORUS FERTILIZERS SHALL BE APPLIED TO LANDS THAT PERMITTEE OWNS OR OPERATES

ONLY AS PRESCRIBED IN THE SOIL TEST RESULTS. PROVIDE EHS EP3 WITH SOIL TESTING RESULTS IF PHOSPHORUS IS PROPOSED FOR USE ON TURFGRASS. SEEDING OR OTHER STABILIZATION SHALL BE REQUIRED IMMEDIATELY TO AREAS WHICH HAVE BEEN DAMAGED BY RUNOFF.

6. DEWATERING

UNCONTAMINATED GROUNDWATER AND SURFACE WATER WHICH IS FREE OF SEDIMENT MAY BE DISCHARGED TO A STORM DRAIN. ALL DEWATERING OPERATIONS MUST USE A FILTER (DEWATERING) BAG CONNECTED TO THE END OF THE DISCHARGE PIPE. THE FINAL DISCHARGE MUST BE CLEAR (NO TURBIDITY) AND ON A CLEAN SURFACE (NOT ON EXPOSED SOILS) TO PREVENT THE DISCHARGE FROM PICKING UP SEDIMENT. THE STORM DRAIN INLET SHALL BE PROTECTED WITH FILTER FABRIC OR FILTER BAG. THE CONTRACTOR SHALL ENSURE ROUTINE INSPECTION AND MAINTENANCE OF THE PUMP HOSES & FILTER BAGS DAILY, REPLACE EQUIPMENT WHEN SIGNS OF DETERIORATION ARE EVIDENT AND/OR IF INSTRUCTED BY THE CONSTRUCTION SITE STORM OPERATOR. IF THERE ARE INDICATIONS OF POSSIBLE CONTAMINATION, OR IF THE WATER IS TURBID, IMMEDIATELY CEASE DISCHARGE AND CONTACT YOUR UNIVERSITY OF MICHIGAN CONSTRUCTION MANAGEMENT REPRESENTATIVE AND U-M OCCUPATIONAL SAFETY & ENVIRONMENTAL HEALTH DEPARTMENT (763-6973) FOR INSPECTION OF THE WATER AND DISPOSAL OPTIONS. POTENTIALLY CONTAMINATED GROUNDWATER MAY EXHIBIT CHEMICAL OR UNUSUAL ODORS, HAVE AN UNUSUAL COLOR, OR SHEEN.

7. CRUSHED CONCRETE

DUE TO THE POTENTIAL FOR LEACHATE FROM CRUSHED CONCRETE TO IMPACT SURFACE WATERS, AVOID WHERE FEASIBLE AND PRACTICAL THE USE OF CRUSHED CONCRETE ON SITE LOCATIONS WHERE THERE IS A POTENTIAL FOR RUNOFF TO ENTER STORM DRAINS AND WATERS OF THE STATE. EHS RECOMMENDS THE PROJECT UTILIZES CLEAN LIMESTONE (NO FINES) WHERE SURFACE WATERS MAY BE IMPACTED BY RUNOFF.

8. ASPHALT SEALANTS

U-M'S STORMWATER PERMIT REQUIRES THAT ALL U-M PROJECTS COMPLY WITH THE FOLLOWING: THE USE OF COAL TAR EMULSIONS TO SEAL ASPHALT SURFACES **IS PROHIBITED**.

Notes to designer

1. HYDRODYNAMIC SEPARATORS, POROUS PAVEMENT, UNDERGROUND DETENTION SYSTEMS, ETC.

PER U-M'S STORMWATER PERMIT, ALL STRUCTURAL AND VEGETATIVE BEST MANAGEMENT PRACTICES (BMPS) INSTALLED AS A REQUIREMENT UNDER THE STORMWATER PERMIT SHALL INCLUDE A PLAN FOR MAINTAINING MAXIMUM DESIGN PERFORMANCE THROUGH LONG-TERM OPERATION AND MAINTENANCE (O&M). DESIGN/PROJECT MANAGERS ARE TO FORWARD THIS PLAN ONTO EHS FOR REVIEW

2. STORMWATER MANAGEMENT REQUIREMENTS – PROJECTS WITH EARTH DISTURBANCE

SITES DISTURBING 1 ACRE OR GREATER REQUIRE STORMWATER MANAGEMENT UNDER U-M'S STORMWATER PERMIT. THE (04/09) U-M NPDES PERMIT STATES THAT U-M MUST, ADDRESS POST-CONSTRUCTION STORMWATER RUNOFF FROM ALL NEW AND REDEVELOPED PROJECTS THAT DISTURB ONE (1) ACRE OR MORE, INCLUDING PROJECTS LESS THAN ONE (1) ACRE THAT ARE PART OF A LARGER COMMON PLAN OF DEVELOPMENT OR SALE THAT WOULD DISTURB ONE (1) ACRE OR MORE. THE PROGRAM SHALL INCLUDE THE FOLLOWING GENERAL REQUIREMENTS:

- A MINIMUM TREATMENT VOLUME STANDARD TO ADDRESS WATER QUALITY IMPACTS
- CHANNEL PROTECTION CRITERIA TO ADDRESS RESOURCE IMPAIRMENT RESULTING FROM FLOW VOLUMES AND RATES
- REFER TO THE EHS GUIDELINE – EP3-001 STORMWATER MANAGEMENT -- POST-CONSTRUCTION REQUIREMENTS FOUND AT THE FOLLOWING LINK FOR THE DETAILED CALCULATION AND DESIGN REQUIREMENTS: [HTTP://WWW.EHS.UMICH.EDU/PDF/GUIDELINE/GUIDEPCSW.PDF](http://www.ehs.umich.edu/pdf/guideline/guidepcsw.pdf)

NOTE TO DESIGNER: EHS REQUIRES THAT AN ENGINEERING PACKAGE BE PUT TOGETHER THAT DETAILS ALL OF THE CALCULATIONS AND ASSUMPTIONS REQUIRED TO MEET THE NPDES PERMIT REQUIREMENTS. PLEASE CLEARLY DOCUMENT WHAT BMP'S ARE REQUIRED BY THE PERMIT, AND WHAT IS BEING ELECTIVELY INSTALLED. THIS PACKAGE MUST BE REVIEWED AND APPROVED BY EHS. ONCE APPROVED, IT WILL NEED TO BE SIGNED AND PE STAMPED BY THE DESIGN ENGINEER PLEASE NOTE THE PACKAGE MUST ALSO CONTAIN O&M PROCEDURES AND SCHEDULE, DETAILS ON INSTALLED SYSTEMS, AND LOCATIONS OF THE STORMWATER CONTROLS SO WE CAN TRACK. PLEASE CONTACT JOHN KOSCO IN THE EHS DEPARTMENT WITH ANY QUESTIONS PERTAINING TO THE POST CONSTRUCTION STORMWATER MANAGEMENT REQUIREMENTS (734-615-6153 OR JKOSCO@UMICH.EDU).

IN ADDITION, ONCE THE PROJECT IS COMPLETE, A SECOND SIGNED AND STAMPED MEMO IS REQUIRED INDICATING THAT THE STORMWATER CONTROLS WERE INSTALLED AS DETAILED IN THE EHS APPROVED STORMWATER POST CONSTRUCTION ENGINEERING PACKAGE.

PLEASE NOTE THAT FOR THE U-M PERMIT, WE MUST RETAIN (INFILTRATE) THE NEW RUNOFF THAT A PROJECT MAY GENERATE. IN ORDER TO HELP DESIGN THE SYSTEM, INFILTRATION TESTING MUST BE PERFORMED IN AREAS WHERE THE PROJECT IS PROPOSING TO MITIGATE THE NEW RUNOFF. THE INFILTRATION TESTING MUST BE PERFORMED BY A FIRM WITH ADEQUATE EXPERIENCE IN THIS FIELD. ALSO, THE TESTING MUST BE PERFORMED AT THE PROPOSED BOTTOM ELEVATION OF THE PROPOSED INFILTRATION AREA, TO ENSURE THAT IT WILL WORK. THIS TESTING WILL HELP GUIDE THE DESIGN OF THE FOOTPRINT OF THE STORMWATER MANAGEMENT PRACTICE REQUIRED TO ENSURE INFILTRATION OF THE RETAINED VOLUME OCCURS WITHIN THE REQUIRED TIME FRAME (24-48HRS).

EXPANSION JOINTS TO BE PLACED EVERY 50 FEET, TOOLED JOINTS TO BE PLACED EVERY 10 FT.

CONCRETE FASTENER STRIP

NO SCALE

NOTES:

- 1) AT 90° ANGLE POINTS IN THE CURB LINE, PLACE EXPANSION JOINTS IN THE "LONG LEG" - 18" FROM THE BACK-OF-CURB OF THE "SHORT LEG."
- 2) DOWEL CURB PATCHES TO ADJACENT CURB

18" GUTTER PAN

Notes to designer (do not print on detail):
 1. Install on ramps at street crossings.
 2. Detectable warnings are typically not installed on ramps in parking lots.
 3. Use most recent detail from MDOT website.

DOME SECTION

DOME SPACING

DOME ALIGNMENT

DETECTABLE WARNING DETAILS

NOTES:

DETAILS SPECIFIED ON THIS PLAN APPLY TO ALL CONSTRUCTION, RECONSTRUCTION, OR ALTERATION OF STREETS, CURBS, OR SIDEWALKS IN THE PUBLIC RIGHT OF WAY.

SIDEWALK RAMP ARE TO BE LOCATED AS SPECIFIED ON THE PLANS OR AS DIRECTED BY THE ENGINEER.

RAMP SHALL BE PROVIDED AT ALL CORNERS OF AN INTERSECTION WHERE THERE IS EXISTING OR PROPOSED SIDEWALK AND CURB. RAMP SHALL ALSO BE PROVIDED AT MARKED AND/OR SIGNALIZED MID-BLOCK CROSSINGS.

SURFACE TEXTURE OF THE RAMP SHALL BE THAT OBTAINED BY A COARSE BROOMING, TRANSVERSE TO THE RUNNING SLOPE.

SIDEWALK SHALL BE RAMPED WHERE THE DRIVEWAY CURB IS EXTENDED ACROSS THE WALK.

CARE SHALL BE TAKEN TO ASSURE A UNIFORM GRADE ON THE RAMP, WHERE CONDITIONS PERMIT, IT IS DESIRABLE THAT THE SLOPE OF THE RAMP BE IN ONLY ONE DIRECTION, PARALLEL TO THE DIRECTION OF TRAVEL.

RAMP WIDTH SHALL BE INCREASED, IF NECESSARY, TO ACCOMMODATE SIDEWALK SNOW REMOVAL EQUIPMENT NORMALLY USED BY THE MUNICIPALITY.

WHEN 5' MINIMUM WIDTHS ARE NOT PRACTICABLE, RAMP WIDTH MAY BE REDUCED TO NOT LESS THAN 4' AND LANDINGS TO NOT LESS THAN 4' x 4'.

CURB RAMP WITH A RUNNING SLOPE $\leq 5\%$ DO NOT REQUIRE A TOP LANDING. HOWEVER, ANY CONTINUOUS SIDEWALK OR PEDESTRIAN ROUTE CROSSING THROUGH OR INTERSECTING THE CURB RAMP MUST INDEPENDENTLY MAINTAIN A CROSS SLOPE NOT GREATER THAN 2% PERPENDICULAR TO ITS OWN DIRECTION(S) OF TRAVEL.

DETECTABLE WARNING SURFACE COVERAGE IS 24" MINIMUM IN THE DIRECTION OF RAMP/PATH TRAVEL AND THE FULL WIDTH OF THE RAMP/PATH OPENING EXCLUDING CURBED OR FLARED CURB TRANSITION AREAS. A BORDER OFFSET NOT GREATER THAN 2" MEASURED ALONG THE EDGES OF THE DETECTABLE WARNING IS ALLOWABLE. FOR RADIAL CURB THE OFFSET IS MEASURED FROM THE ENDS OF THE RADIUS.

FOR NEW ROADWAY CONSTRUCTION, THE RAMP CROSS SLOPE MAY NOT EXCEED 2.0%. FOR ALTERATIONS TO EXISTING ROADWAYS, THE CROSS SLOPE MAY BE TRANSITIONED TO MEET AN EXISTING ROADWAY GRADE. THE CROSS SLOPE TRANSITION SHALL BE APPLIED UNIFORMLY OVER THE FULL LENGTH OF THE RAMP.

THE MAXIMUM RUNNING SLOPE OF 8.3% IS RELATIVE TO A FLAT (0%) REFERENCE. HOWEVER, IT SHALL NOT REQUIRE ANY RAMP OR SERIES OF RAMP TO EXCEED 15 FEET IN LENGTH NOT INCLUDING LANDINGS OR TRANSITIONS.

DRAINAGE STRUCTURES SHOULD NOT BE PLACED IN LINE WITH RAMP. THE LOCATION OF THE RAMP SHOULD TAKE PRECEDENCE OVER THE LOCATION OF THE DRAINAGE STRUCTURE. WHERE EXISTING DRAINAGE STRUCTURES ARE LOCATED IN THE RAMP PATH OF TRAVEL, USE A MANUFACTURER'S ADA COMPLIANT GRATE. OPENINGS SHALL NOT BE GREATER THAN 1/2". ELONGATED OPENINGS SHALL BE PLACED SO THAT THE LONG DIMENSION IS PERPENDICULAR TO THE DOMINANT DIRECTION OF TRAVEL.

THE TOP OF THE JOINT FILLER FOR ALL RAMP TYPES SHALL BE FLUSH WITH THE ADJACENT CONCRETE.

CROSSWALK AND STOP LINE MARKINGS, IF USED, SHALL BE SO LOCATED AS TO STOP TRAFFIC SHORT OF RAMP CROSSINGS. SPECIFIC DETAILS FOR MARKING APPLICATIONS ARE GIVEN IN THE "MICHIGAN MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES".

FLARED SIDES WITH A SLOPE OF 10% MAXIMUM, MEASURED ALONG THE ROADSIDE CURB LINE, SHALL BE PROVIDED WHERE AN UNOBSTRUCTED CIRCULATION PATH LATERALLY CROSSES THE SIDEWALK RAMP. FLARED SIDES ARE NOT REQUIRED WHERE THE RAMP IS BORDERED BY LANDSCAPING, UNPAVED SURFACE OR PERMANENT FIXED OBJECTS, WHERE THEY ARE NOT REQUIRED, FLARED SIDES CAN BE CONSIDERED IN ORDER TO AVOID SHARP CURB RETURNS AT RAMP OPENINGS.

DETECTABLE WARNING PLATES MUST BE INSTALLED USING FABRICATED OR FIELD CUT UNITS CAST AND/OR ANCHORED IN THE PAVEMENT TO RESIST SHIFTING OR HEAVING.

FIGURE 1: OVERVIEW OF EROSION CONTROL BLANKET

NOTES:

1. PREPARE SUBGRADE TO PROPER GRADE AND COMPACTION REQUIREMENTS.
2. REMOVE RUTS, ROOTS, SOIL CLODS, OR OTHER DEBRIS FROM SURFACE SUBJECT TO MULCH BLANKET INSTALLATION.
3. SPREAD OR DRILL SEED.
4. INSTALL BLANKET AT TOP OF SLOPE, FIRST ANCHORING TOE IN TRENCH 6" WIDE X 6" DEEP, PROGRESSING DOWN-SLOPE OR DOWN-GRADIENT WITH APPROXIMATELY 36" OF BLANKET EXTENDED BEYOND THE UP-SLOPE PORTION OF THE TRENCH.
5. ANCHOR THE BLANKET WITH STAPLES/STAKES PLACED APPROXIMATELY 12" APART IN THE BOTTOM OF THE TRENCH. BACKFILL AND COMPACT THE TRENCH AFTER SECURING.
6. APPLY SEED TO COMPACTED SOIL AND FOLD 12" PORTION OF THE BLANKET OVER COMPACTED AREA AND SECURE WITH A ROW OF STAPLES/STAKES PLACED 12" APART ACROSS THE WIDTH OF THE BLANKET.
7. UNROLL THE BLANKETS DOWN OR HORIZONTALLY ACROSS THE SLOPE.

PRODUCT SELECTION:

FOR SLOPES OF 3:1 + 4:1 AND FLOW RATES OF LESS THEN 1.52 FT/SEC (12 MONTH OR LESS DEVIATION) USE NORTH AMERICAN GREEN S75BN OR APPROVED EQUAL.

FOR SLOPES OF 3:1 + 2:1 AND FLOW RATES OF LESS THEN 1.85 FT/SEC (12 MONTH OR LESS DEVIATION) USE NORTH AMERICAN GREEN S150BN OR APPROVED EQUAL.

FOR SLOPES OF 2:1 + 1:1 AND FLOW RATES OF LESS THEN 2.44 FT/SEC (18 MONTH OR LESS DEVIATION) USE NORTH AMERICAN GREEN SC150BN OR APPROVED EQUAL.

FOR SLOPES OF 1:1 OR GREATER AND FLOW RATES OF LESS THEN 3.05 FT/SEC (24 MONTH OR LESS DEVIATION) USE NORTH AMERICAN GREEN C125BN OR APPROVED EQUAL.

SLOPE CREST ANCHOR METHOD "A" (NO TRENCH)

STRAW BALE DETAIL

NO SCALE

SD-SESC-STRAW_BALE

1. BEGIN AT THE LOCATION WHERE THE WATTLE IS TO BE INSTALLED BY EXCAVATING A 2-3" DEEP X 9" WIDE TRENCH ALONG THE CONTOUR OF THE SLOPE. EXCAVATED SOIL SHOULD BE PLACED UP-SLOPE FROM THE ANCHOR TRENCH AND COMPACTED.
2. PLACE THE WATTLE IN THE TRENCH SO THAT IT CONTOURS TO THE SOIL SURFACE. COMPACT SOIL FROM THE EXCAVATED TRENCH AGAINST THE WATTLE ON THE UPHILL SIDE. ADJACENT WATTLES SHOULD TIGHTLY ABUT.
3. SECURE THE WATTLE WITH 18-24" STAKES EVERY 3-4' AND WITH A STAKE ON EACH END. STAKES SHOULD BE DRIVEN THROUGH THE MIDDLE OF THE WATTLE LEAVING AT LEAST 2-3" OF STAKE EXTENDING ABOVE THE WATTLE. STAKES SHOULD BE DRIVEN PERPENDICULAR TO SLOPE FACE.
4. UNLESS SPECIFIED, CONTRACTOR CAN ELECT TO USE ANY STANDARD STRAW WATTLE SIZING 8" IN DIAMETER OR LARGER.
5. GUIDELINES FOR WATTLE SPACING BASED ON SLOPE GRADIENT:

SLOPE	SPACING
<6:1	50 FEET
5:1 - 4:1	25 FEET
4:1 - 2:1	20 FEET
2:1 - 1:1	10 FEET
> 1:1	5 FEET

NOTE: REFER TO PROJECT DRAWINGS FOR ACTUAL WATTLE LOCATION AND SPACING, WHICH IS SPECIFIC TO EACH PROJECT.
